M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R4 that must include, but is not limited to, dated electronic or hard copy records which document the implementation of each CAP and action plan and the completion of actions for each CAP or action plan. The evidence may also include dated work management program records, dated work orders, or dated maintenance records.

Rationale for R4: The CAP or action plan must be completed to accomplish all identified objectives. During the course of implementing a CAP or action plan, revisions may be necessary for a variety of reasons such as scheduling conflicts or resource issues. Documenting the CAP or action plan provides auditable progress and completion confirmation on any plan. When the cause of a Misoperation is determined from implementing an action plan, a CAP must be developed in accordance with Requirement R2.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority (CEA)

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance.

The Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System shall keep data or evidence to show compliance with Requirements R1, R2, R3, and R4 and Measures M1, M2, M3, and M4, since the last audit unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System shall retain evidence for all Misoperations with an open investigation, action plan, or CAP even if the BES interrupting device operation occurred prior to the current audit period.

If a Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

Periodic Data Submittal

1.4. Additional Compliance Information

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Assessment, Operations Planning**	**Medium**	The responsible entity performed the actions in accordance with Requirement R1, Parts 1.1 and 1.2 in more than 120 calendar days but less than or equal to 150 calendar days of the operation's occurrence. OR The responsible entity identified a Protection System operation that operated one of its BES interrupting devices but failed to review the operation in accordance with Requirement R1, Part 1.1.	The responsible entity performed the actions in accordance with Requirement R1, Parts 1.1 and 1.2 in more than 150 calendar days but less than or equal to 160 calendar days of the operation's occurrence.	The responsible entity performed the actions in accordance with Requirement R1, Parts 1.1 and 1.2 in more than 160 calendar days but less than or equal to 170 calendar days of the operation's occurrence.	The responsible entity performed the actions in accordance with Requirement R1, Parts 1.1 and 1.2 in more than 170 calendar days of the operation's occurrence. OR The responsible entity failed to identify and review a Protection System operation that operated one of its BES interrupting devices in accordance with Requirement R1, Part 1.1. OR

			OR The responsible entity completed its review of a Protection System operation that operated one of its BES interrupting devices in 120 calendar days and determined the operation was a Misoperation and failed to document the findings in accordance with Requirement R1, Part 1.2.			The responsible entity failed to investigate a Misoperation and document the findings in accordance with Requirement R1, Part 1.2. OR The entity that owns the BES interrupting device but does not own the entire Protection System could not determine if the operation was correct and failed to notify the other owner(s) of the Protection System component(s) and provide any requested investigative information in accordance with Requirement R1, Part 1.1.
R2	**Operations Planning, Long-Term Planning**	**Medium**	The responsible entity developed a CAP, or a declaration in accordance with Requirement R2, in more than 60 calendar	The responsible entity developed a CAP, or a declaration in accordance with Requirement R2, in more than 70 calendar	The responsible entity developed a CAP, or a declaration in accordance with Requirement R2, in more than 80 calendar	The responsible entity developed a CAP, or a declaration in accordance with Requirement R2, more than 90 calendar days

			days but less than or equal to 70 calendar days following the identification of the cause of the Misoperation.	days but less than or equal to 80 calendar days following the identification of the cause of the Misoperation.	days but less than or equal to 90 calendar days following the identification of the cause of the Misoperation.	following the identification of the cause of the Misoperation. OR The responsible entity failed to develop a CAP or make a declaration in accordance with Requirement R2.
R3	**Operations Planning, Long-Term Planning**	**Medium**	The responsible entity developed an action plan, or made a declaration in accordance with Requirement R3, in more than 180 calendar days but less than or equal to 210 calendar days following the associated BES interrupting device operation.	The responsible entity developed an action plan, or made a declaration in accordance with Requirement R3, in more than 210 calendar days but less than or equal to 220 calendar days following the associated BES interrupting device operation.	The responsible entity developed an action plan, or made a declaration in accordance with Requirement R3, in more than 220 calendar days but less than or equal to 230 calendar days following the associated BES interrupting device operation.	The responsible entity developed an action plan, or made a declaration in accordance with Requirement R3, more than 230 calendar days following the associated BES interrupting device operation. OR The responsible entity failed to develop an action plan or a declaration in accordance with Requirement R3.

R4	**Operations Planning, Long-Term Planning**	**High**	The responsible entity failed to revise a CAP or action plan as needed in accordance with Requirement R4.	N/A	N/A	The responsible entity failed to implement a CAP or action plan in accordance with Requirement R4.

Guidelines and Technical Basis

The composite Protection System in the context of this standard is the total complement of protection for a system Element. All protection for a given Element such as primary, secondary, backup, pilot and non-pilot relay schemes are included in the composite Protection System for the Element. These individual schemes or systems may be isolated or function independently, but aggregate as part of one composite Protection System.

A Protection System is defined in the NERC Glossary of Terms as:

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

Circuit breaker and other interrupting device mechanisms are not part of a Protection System.

A revised Misoperation definition is being proposed for industry adoption; the failure of an Element's composite Protection System to operate as intended. The definition includes the following categories:

(1) A failure of a Protection System to operate for a Fault within the zone it is designed to protect. The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for the Element it is designed to protect is correct.

A failure of a transformer's composite Protection System to operate for a transformer Fault is an example of a "failure to trip" Misoperation. This type of Misoperation typically results in the Fault being cleared by remote backup Protection System operations.

A failure of a "primary" transformer relay (or any other component) to operate for a transformer Fault is not a "failure to trip" Misoperation as long as another component of the transformer's composite Protection System operated to clear the Fault. Please see category 3 to see if the "slow trip" classification applies to the operation.

A lack of target information, e.g. when a high-speed pilot system does not target because a high-speed zone element trips first, does not by itself constitute a Misoperation.

(2) A failure of a Protection System to operate for a non-Fault condition for which the Protection System was intended to operate, such as a power swing, under-voltage, over excitation, or loss of excitation. The failure of a Protection System

component is not a Misoperation as long as the overall performance of the Protection System for the Element it is designed to protect is correct.

A failure of a generator's composite Protection System to operate for a loss of field condition is an example of a "failure to trip" Misoperation. This type of Misoperation may require manual operator intervention.

A failure of a "primary" reverse power relay (or any other component) is not a "failure to trip" Misoperation as long as another component of the generator's composite Protection System operated to shut down the generator. Please see category 4 to see if the “slow trip” classification applies to the operation.

The non-Fault conditions cited in the definition are examples only, and do not constitute an all inclusive list.

(3) A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high-speed performance has not been identified to meet the dynamic stability performance requirements of the TPL standards nor is it required to ensure coordination with other Protection Systems.

A failure of a line's composite Protection System to operate as quickly as intended for a line Fault is an example of a "slow trip" Misoperation. This type of Misoperation typically results in remote backup Protection System operations before the Fault is cleared.

In many cases, high-speed protection is installed as part of the utility’s standard practice without having the need for high-speed protection for meeting TPL requirements. A slow trip of this Protection System would not negatively impact the dynamic performance of the BES; so, it does not need to be reported. However, even if high-speed clearing is not required, the Protection Systems must coordinate to prevent an “unnecessary trip” Misoperation (e.g. an over trip).

The phrase “slower than intended” means the Protection System operated slower than the objective of the owner(s). It would be impossible to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent additional harm, and ultimately be able to decide whether the speed or outcome of its Protection System operation was adequate.

The reference to the TPL standards is meant to place some bounds on the time to clear a Fault and prevent dynamic instability. The performance requirements in the TPL standards are found in Table 1, and are applicable to all contingencies mentioned for Type A, B and C contingencies.

Coordination with other Protection Systems refers to the need to ensure that relaying operates in the proper or planned sequence (i.e. the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

(4) A Protection System operation that is slower than intended for a non-Fault condition such as a power swing, under-voltage, over excitation, or loss of excitation for which it was intended to operate.

A failure of a generator's composite Protection System to operate as quickly as intended for an over excitation condition is an example of a "slow trip" Misoperation. This type of Misoperation may result in equipment damage.

The phrase “slower than intended” means the composite Protection System operated slower than the objective of the owner(s). It would be impossible to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent additional harm, and ultimately be able to decide whether the speed or outcome of its Protection System was adequate.

The non-Fault conditions cited in the definition are examples only, and do not constitute an all inclusive list.

(5) A Protection System operation for a Fault for which the Protection System is not intended to operate.

An operation of a transformer's composite Protection System which over trips for a properly cleared line Fault is an example of an "unnecessary trip" Misoperation. For this type of Misoperation, the Fault is typically cleared properly by the faulted equipment's composite Protection System (line relaying, in this case) without the need for an external Protection System’s operation.

An operation of a properly coordinated remote Protection Systems is not a Misoperation if the Fault has persisted for a sufficient time to allow the correct operation of the local Protection System to clear the Fault. An interrupting device failure, a “failure to trip” Misoperation, or a “slow trip” Misoperation may result in a proper remote Protection System operation.

(6) A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate, and is unrelated to on-site maintenance, testing, inspection, construction or commissioning activities.

Non-Fault conditions include but are not limited to power swings, over excitation, loss of excitation, frequency excursions and normal conditions.

An operation of a line's composite Protection System due to a relay failure during normal conditions is an example of an "unnecessary trip other than Fault" Misoperation.

In a second example, tripping a generator by the operation of loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation. In a third example, an impedance line relay trip for a power swing that entered the relay’s characteristic is a Misoperation if the power swing was stable and the relay operated because it was set with an excessive reach that unnecessarily restricted the line's load carrying capability.

An operation that occurs during a non-fault condition but was initiated by on-site maintenance, testing, inspection, construction or commissioning is not a Misoperation. However, once the maintenance, testing, inspection, construction or commissioning has been completed, the "on-site" Misoperation exclusion no longer applies, regardless of the presence of the technical personnel.

This definition is based on the established IEEE/PSRC I3 Working Group on 'Transmission Protective Relay System Performance Measuring Methodology' categories (excluding Failure to Reclose) of Relay System Misoperation. The phrase abnormal condition has been replaced with "non-fault condition" to remove ambiguity.

The exclusion of a component failure, as long as the composite Protection System operates correctly, was based on recommendations by the NERC SPCS. Entities still need to review each Protection System operation. Covering these types of component failures within the standard constitutes additional administrative burden for types of failures that have no immediate reliability impacts.

Failure to automatically reclose after a Fault is not included as a Misoperation because reclosing equipment is not included under the definition of Protection Systems.

BES interrupting device operations which are initiated by non-protective functions, such as those associated with generator controls, or turbine/boiler controls, Static VAR Compensators (SVCs), Flexible AC Transmission Systems (FACTS), High-Voltage DC (HVDC) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. Additionally, operations initiated by control functions within protective relays are not considered Protection System operations. For example, in cases where a component of the Protection System or a function of a component within the Protection System is used for control of a generator, such as when a reverse power relay is used to trip a breaker during generator shutdown, the operation of the control component or the function when not providing protection is not included in the definition of Misoperation and its operation would not be reviewed under this standard. Automation (e.g. data collection) is also not a protective function and is not subject to this standard.

A generator Protection System operation prior to closing the unit breaker(s) is not considered a Misoperation provided no in-service BES Elements are tripped. These types of operations are excluded when the generating unit is not synchronized and is isolated from the BES. Protection System operations which occur with the protected Element out of service, that do not trip any in-service Elements are not Misoperations. Protection System operations unrelated to on-site maintenance, testing, inspection, construction or commissioning activities which occur with the protected Element out of service, that trip any in-service Elements are Misoperations.

In some cases where zones of protection overlap, the owner of BES Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element. For example, the high side of a transformer connected to a line may be within the zone of protection of the supplying line's relaying.

In this case, the line relaying is planned to protect the area of the high side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for Faults on the high side of the connected transformer. Therefore, the operation of the line relaying for a high side transformer Fault would not be considered a Misoperation.

This standard addresses the reliability issues identified in the letter[1] from Gerry Cauley, NERC President and CEO, dated January 7, 2011. "Nearly all major system failures include misoperation of relays as a factor contributing to the propagation of the events…….. Reducing the risk to reliability from relay Misoperations requires consistent collection of misoperation information by regional entities, along with systematic analysis and correction of the underlying causes of preventable Misoperations." The standard also addresses the findings in the 2011 Risk Assessment of Reliability Performance[2]; July 2011 "….a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry."

In the event of a natural disaster, note that the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

Requirement R1

This requirement promotes the prudent evaluation of each Protection System operation to determine if the operation was correct or a Misoperation, even those Misoperations difficult to detect. Unless all BES Protection System operations and Faults that challenge them are reviewed, it cannot be determined with certainty that all Misoperations are identified. For example, if you only reviewed operations resulting in an overtrip, you would not necessarily identify Misoperations caused by slow trips.

Requirement R1 places the responsibility on the BES interrupting device owner to investigate operations initiated by a Protection System. The drafting team believes the owner of the BES interrupting device that operated would be in the best position to analyze the Protection System operation, determine if a Misoperation occurred, and perform the initial investigation to determine the cause of the Misoperation. If the BES interrupting device owner does not own all of the Protection System and cannot determine that the Protection System operation was correct, then notify the other owner(s) of the Protection System component(s) and provide any requested investigative information. In this case, it is expected that both entities will work together to investigate the cause of the operation.

[1] http://www.nerc.com/news_pr.php?npr=723
[2] http://www.nerc.com/files/2011_RARPR_FINAL.pdf

Protection Systems are made of many components. These components may be owned by more than one entity. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner's differential relay. All of these components and many more are part of a Protection System. It is expected that all the owners will communicate with each other, sharing any information freely, so that operations can be analyzed, Misoperations identified and corrective actions taken. If an entity feels it cannot get the level of cooperation it needs to adequately address a Misoperation, the entity should appeal to its Regional Entity for help in resolving the situation.

Determining the cause of Protection System Misoperations is essential in developing an effective remedy to avoid future Misoperations. The drafting team recognizes that there may be multiple causes for a Misoperation; in these circumstances the CAP would include a remedy for the identified causes. The 60 day clock for developing the CAP will be associated with the determination of the first cause. A CAP can be revised if additional causes are found. The drafting team believes 120 calendar days is a reasonable period of time to investigate operations, determine the cause for most Misoperations and document findings in a Misoperation investigation report. This time frame takes into account the seasonal nature of Protection System operations. Both the volume of Protection System operations as well as outage constraints for investigative purposes can be seasonal.

Regardless of whether a cause is identified, the BES interrupting device owner must document the investigation as a potential aid in possible future Misoperation investigations. If a single Protection System causes multiple BES interrupting device owners to be affected, the entities may work together to produce a common Misoperation investigation report. Similarly, if the BES interrupting device owner and the Protection System component owner that caused a Misoperation are different entities, they may work together to produce a common report.

A Misoperation investigation report or documented findings may include the following information: 1) initial evidence, 2) probable causes, 3) tests and studies, and 4) conclusions. A brief description of the event surrounding the Misoperation may be included if not separately documented. The initial evidence, which may also be documented separately, contains the sequence of events, relay targets and a summary of Disturbance Monitoring Equipment (DME) records as appropriate. Probable causes are those causes which are most likely to have contributed to the Misoperation and could be considered for further testing. The test and studies documented in the report would describe and provide findings of those tests if the entity was able to perform them during the initial investigation phase (e.g. relay calibration and simulation tests, communication noise and attenuation tests, CT/VT ratio tests, DC continuity checks and functional tests) and studies (e.g. short circuit and coordination studies) performed in the attempt to determine the cause. The conclusions should summarize the cause(s) substantiated by the evidence and findings of the tests and studies.

Requirement R2

If the Misoperation cause is identified within 120 days of the event, Requirement R2 requires Protection System owners to develop a CAP or to make a declaration of no additional action within 60 calendar days of determining the cause. The drafting team recognizes there may be multiple causes for a Misoperation; in these circumstances the CAP would include a remedy for the identified causes. The 60 day clock for developing the CAP will be associated with the determination of the first cause. A CAP can be revised if additional causes are found. Based on industry experience and operational coordination timeframes, the drafting team believes 60 calendar days is reasonable for considering such things as alternative solutions, coordination of resources, or development of a schedule for a CAP, or to prepare a declaration justifying the lack of a CAP.

The 120 day time period and the 60 day time period are distinct and within the context of Requirement R1 and Requirement R2 respectively, need to remain separate. With the ultimate goal of keeping the implementation time of a CAP as short as possible, if a cause of a Misoperation is determined quickly the CAP creation timeframe (60 days) becomes applicable and requires the CAP implementation be less than 180 days. Also, if the interrupting device owner is tardy in informing another Protection System component owner and using up much of the 120 day period, it still leaves a considerable amount of time (at least 60 days) to develop an action plan for further investigation by the Protection System component owner, or if a cause is determined the creation of the CAP.

Where there are multiple Protection System owners involved in a Misoperation, the one or more owners whose Protection System component(s) contributed to the Misoperation will create a CAP or declaration as required by Requirement R2. Owners whose Protection System components operated correctly do not need to create a CAP.

Resolving Misoperations benefits the Protection System owner and the BES by maintaining reliability and security. The CAP is an established tool for resolving operational problems. The NERC Glossary of Terms defines a Corrective Action Plan as "A list of actions and an associated timetable for implementation to remedy a specific problem".

Protection System owners are expected to exercise due diligence in the development and implementation of a CAP. Typically included would be any corrective actions taken to prevent recurrence (along with the date performed), any corrective actions planned to be taken to prevent recurrence (along with the planned date), and an evaluation of the CAP's applicability to other Protection Systems owned by the entity.

The evaluation of the CAP’s applicability to other Protection Systems owned by the entity is intended to encourage diligence in preventing similar Misoperations. The Protection System owner is responsible for determining the scope of the problem, and for including appropriate actions in the CAP. The evaluation may result in adding preemptive actions to the CAP. The CAP is complete when all specified actions are completed.

<u>The following are examples of Corrective Action Plans (CAPs):</u>

CAP Example 1 – Corrective actions for a failed relay only:

> The impedance relay was removed from service on 6/2/12 because it was applying a standing trip. Relay testing was performed on 6/4/12. A failed capacitor was found within the impedance relay. The capacitor was replaced on 6/5/12. The impedance

relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 6/5/12.

Applicability to other Protection Systems: Undesired trips of this type of impedance relay due to capacitor failures have occurred only occasionally within our system. This type of impedance relay is gradually being replaced with microprocessor relays as Protection Systems are modernized. It is therefore our assessment that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for our system.

CAP Example 2 - Corrective actions for a failed relay, and a program for preemptive actions at similar installations:

The impedance relay was removed from service on 6/2/12 because it was applying a standing trip. Relay testing was performed on 6/4/12. A failed capacitor was found within the impedance relay. The capacitor was replaced on 6/5/12. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 6/5/12.

Applicability to other Protection Systems: Undesired trips of this type of impedance relay due to capacitor failures have occurred frequently. It is therefore our assessment that a program should be established by 12/1/12 for wholesale preemptive replacement of capacitors in this type of impedance relay.

A program for wholesale preemptive replacement of capacitors in this type of impedance relay was established on 10/28/12.

CAP Example 3 - Corrective actions for a failed relay; and preemptive actions for similar installations:

The impedance relay was removed from service on 6/2/12 because it was applying a standing trip. Relay testing was performed on 6/4/12. A failed capacitor was found within the impedance relay. The capacitor was replaced on 6/5/12. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 6/5/12.

Applicability to other Protection Systems: Undesired trips of this type of impedance relay due to capacitor failures have occurred frequently. It is therefore our assessment that preemptive replacement of capacitors in this type of impedance relay should be pursued.

It is planned to replace the impedance relay capacitors at stations A, B, and C by 9/1/12. It is planned to replace the impedance relay capacitors at stations D, E, and F by 11/1/12. It is planned to replace the impedance relay capacitors at stations G, H, and I by 2/1/13.

The impedance relay capacitor replacement was completed at stations A, B, and C on 8/16/12. The impedance relay capacitor replacement was completed at stations

D, E, and F on 10/26/12. The impedance relay capacitor replacement was completed at stations G, H, and I on 1/9/13.

CAP Example 4 - Corrective actions for a firmware problem; and preemptive actions for similar installations:

Fault records were provided to the manufacturer on 6/4/12. On 6/11/12, the manufacturer responded that the misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 6/12/12.

Applicability to other Protection Systems: Based on our risk assessment, we plan to install firmware version 3 at all of our installations that are determined to be version 2. Proposed completion date is 12/31/12.

The firmware replacements were completed on 12/4/12.

If the Misoperation cause is identified within 120 days, and no corrective action has been or is intended to be taken, Protection System owners are required to make a declaration to this effect. A "no CAP declaration" would typically include the Misoperation cause and justification for taking no corrective action.

An example of a "no CAP declaration" due to BES reliability might be: "The investigation showed the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Our studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations." A "no CAP declaration" due to BES reliability is expected to be used sparingly.

There are some cases where a Misoperation cause is outside of an entity's control and would result in a "no CAP declaration." Items that may be considered outside of an entity's control could be a non-registered entity communications provider problem or a transmission transformer tapped industrial customer who initiates a direct transfer trip to a registered entity's transmission breaker. Generally, situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity's control. The "outside an entity's control" declaration is expected to be used sparingly.

Requirement R3

If the Misoperation cause is not identified within 120 days, and reasonable investigative actions have not been exhausted, Protection System owners are expected to exercise due diligence in the development and implementation of an action plan for additional investigation. This action plan would typically include any investigative actions taken to determine the cause (along with the date performed), and any investigative actions planned to be taken to determine the cause (along with the planned date).

At the end of 180 days, the Protection System owner must have an action plan or a declaration why no further actions will be taken. The action plan does not need to have been implemented within the 180 days, but it must have been developed within this time frame. The 180 calendar days are the sum of 120 calendar days (investigative period in Requirement R1) and a 60 calendar day period (similar timeframe as in Requirement R2 for developing a CAP.)

Where there are multiple Protection System owners involved in a Misoperation and no cause has been determined, then each Protection System owner must either develop an action plan or declare why no further actions will be taken.

An example of an investigative action plan for more testing might be: "All relays at station A functioned properly during testing on xx/xx/xx. An outage is required to test the relays at station B. The outage is scheduled for xx/xx/xx."

An example of an action plan for adding monitoring might be: "All relays at station A and B functioned properly during testing on xx/xx/xx. It is planned to install a temporary DFR at station A on xx/xx/xx and to monitor the currents for at least 3 months."

An example of an action plan for reviewing relay settings might be: "All relays at station A functioned properly during testing on xx/xx/xx. All relays at station B functioned properly during testing on xx/xx/xx. The carrier system functioned properly during testing on xx/xx/xx. It is planned to complete a relay settings review by xx/xx/xx."

If the Misoperation cause is not identified and reasonable investigative actions have been exhausted within 180 days, Protection System owners are required to make a declaration to this effect. A "no action plan" declaration would typically include any investigative actions taken to determine the cause (along with the date performed), and justification for taking no additional investigative actions.

An example of a "no action plan" declaration might be: "All relays at station A and B functioned properly during testing on xx/xx/xx. The carrier system functioned properly during testing on xx/xx/xx. The carrier coupling equipment functioned properly during testing on xx/xx/xx. A settings review completed on xx/xx/xx indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be proper, and the equipment at station A and station B is already monitored, we have decided to close this investigation."

Requirement R4

The goal of the standard has not been met unless CAPs or action plans are actually implemented, as is required in Requirement R4. The responsible entity is required to implement and complete a CAP or action plan to accomplish the purpose of this standard, which is to prevent future Misoperations, thereby minimizing risk to the BES. The responsible entity is also required to complete the CAP or action plan, document the plan implementation, and retain the appropriate evidence to demonstrate implementation and completion.

The goal of an action plan created in Requirement R3 is to determine a cause so a CAP can be created to ultimately remedy the cause of the Misoperation. If the cause is determined as a result of the action plan, the entity must develop a CAP or a declaration within 60 days of determination of cause per Requirement R2. This requirement sets the expectation that the work identified in the CAP or action plan will be completed on schedule as planned. Deferrals or other relevant changes to the CAP or action plan need to be documented so that the record includes not only what was planned, but what was implemented. Depending on the planning and documentation format used by the responsible entity, evidence of successful CAP or action plan execution could consist of signed-off work orders, printouts from work management systems, spreadsheets of planned versus completed work, timesheets, work inspection reports, paid invoices, photographs, walk-through reports or other evidence.

Documentation of a CAP or action plan provides an auditable progress and completion confirmation for specific Misoperations. In addition, the investigative documentation may aid the responsible entity in remedying future Misoperations of a similar nature.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

~~1. The SAR posted for informal comment June 10, 2011 through July 11, 2011.~~

~~2.~~1. SC authorized moving the SAR forward to standard development at the June 9, 2011 meeting.

2. ~~First posting of Draft Version 1 on~~ The SAR posted for informal comment June 10 – July 11, 2011 ~~with~~.

3. Draft 1 of PRC-004-3 was posted for a 30-day comment period ~~closed on~~from June 10 – July 11, 2011.

4. Draft 2 of PRC-004-3 was posted for a 45-day concurrent comment and initial ballot period from July 25 – September 7, 2012.

Description of Current Draft

~~This is~~Draft 3 of PRC-004-3 posted for a ~~45~~ 30-day formal comment period with parallel ~~initial~~successive ballot.

Anticipated Actions	Anticipated Date
~~45~~30-day Formal Comment Period with ~~Parallel Initial~~Successive Ballot	~~July, 2012~~January, 2013
Recirculation ballot	~~October, 2012~~February, 2013
BOT Approval	~~November, 2012~~May, 2013

Effective Dates: First day of the first calendar quarter that is ~~six~~twelve months beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is ~~six~~twelve months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Misoperation:

~~Failure of a~~The failure of an Element's composite Protection System to operate as intended.

Any of the following is considered a Misoperation:

1. **Failure to Trip - During Fault** - A failure of a Protection System to operate for a Fault within the zone it is designed to protect. ~~(~~The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for ~~an~~the Element it is designed to protect is correct~~.)~~.
2. **Failure to Trip - Other Than Fault** - A failure of a Protection System to operate for a non-Fault condition for which the Protection System was intended to operate, such as a power swing, under-voltage, over excitation, or loss of excitation. ~~(~~The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for ~~an~~the Element it is designed to protect is correct~~.)~~.
3. **Slow Trip - During Fault** - A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. ~~(~~Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high-speed performance ~~is required~~has not been identified to meet the dynamic stability performance requirements of the TPL standards ~~or by~~nor is it required to ensure coordination ~~requirements~~ with other Protection Systems~~.)~~.
4. **Slow Trip** - **Other Than Fault** - A Protection System operation that is slower than intended for a non-Fault condition such as a power swing, under-voltage, over excitation, or loss of excitation for which the Protection System was intended to operate.
5. **Unnecessary Trip - During Fault** - A Protection System operation for a Fault for which the Protection System is not intended to operate~~, excluding any remote Protection System operation that resulted from a failure to trip or slow trip of a local Protection System in a faulted adjacent zone.~~.

6. **Unnecessary Trip - Other Than Fault** - A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate, and is unrelated to on-site maintenance, testing, inspection, construction or commissioning activities.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Protection System Misoperation Identification and Correction**
2. **Number:** PRC-004-3
3. **Purpose:** Identify and correct the causes of Misoperations of Bulk Electric System (BES) Protection Systems.
4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Transmission Owner

   4.1.2 Generator Owner

   4.1.3 Distribution Provider

~~**Applicability:** SPS and RMS schemes are not included in this version of the standard because they will be handled in the second phase of this project. UVLS is covered by PRC-022. Some functions of relays are not used as protection but as control function or for automation, therefore, any operation of the control function portion of the automation portion of relays are excluded from this standard.~~

Applicability: Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are not included in this version of the standard because they will be handled in the second phase of this project. UVLS is covered by PRC-022-1. Some functions of relays are not used as protection but as control function or for automation, therefore, any operation of the control function portion or the automation portion of relays are excluded from this standard. See the Guidelines and Technical Basis section of the standard for detailed examples of non-protective functions.

4.2. Facilities

4.2.1 Protection Systems for ~~Facilities that are part of the BES~~BES Elements

~~**4.2.2** Facilities not included~~

4.2.2 Underfrequency Load Shedding (UFLS) that trips a BES Element

~~**4.2.2.1**~~ Special Protection Systems (SPS~~) or~~), Remedial Action Schemes (RAS~~)~~

~~**4.2.2.2**~~), and Undervoltage Load Shedding (UVLS)

4.2.3 ~~Relay functions not included (these~~ are ~~non~~excluded

~~**4.2.3**~~**4.2.4** Non-protective functions that may be imbedded within a Protection System~~)~~ are excluded

~~**4.2.3.1** Control (e.g. controlled shut down of generators or capacitor bank switching. Also see Guidelines and Technical Basis section for detailed examples)~~

~~**4.2.3.2** **Automation (e.g.** data collection)~~

5. Background:

A key element for BES reliability is the correct performance of Protection Systems. Monitoring BES Protection System events, as well as identifying and correcting the causes of Misoperations, will improve Protection System performance. PRC-004-3 Protection System ~~Misoperations~~Misoperation Identification and Correction is a revision of PRC-004-2a Analysis and Mitigation of Transmission and Generation Protection System Misoperations with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated. PRC-003-1 Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems required the Regions to establish procedures for analysis of Misoperations. In ~~the NOPR~~FERC Order No. 693, the Commission identified PRC-003-0 as a fill-in-the-blank standard. The ~~NOPR~~Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2a.

This project includes revising the existing definition of Misoperation, which reads:

Misoperation

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity

In general, this definition needs more specificity and clarity. The terms “specified time” and “abnormal condition” are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical yet explainable condition is a Misoperation.

The SAR for this project also includes clarifying reporting requirements. Misoperation data, as currently collected and reported, is not usable to establish ~~a~~ consistent metrics for measuring Protection System performance. ~~The SAR includes establishing a~~ As such, the drafting team is removing the data obligation from the standard ~~with uniform applicability, revising the definition~~and is developing a data request under Section 1600 of ~~Misoperation, and clarifying reporting requirements~~the NERC Rules of Procedure. NERC will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. The data submitted as part of the data request will not be used for compliance or enforcement purposes. The removal of the data collection from the standard does not result in a reduction of reliability as Responsible Entities are required to retain evidence of compliance for audit and compliance purposes under the Compliance Section C 1.2 Evidence Retention portion of the standard.

The proposed requirements of the revised Reliability Standard PRC-004-3 meet~~s~~ the following objectives:

- Review all Protection System operations on the BES to identify those that are Misoperations of Protection Systems for Facilities that are part of the BES.
- Analyze Misoperations of Protection Systems for Facilities that are part of the BES to determine the cause(s).

- Develop and implement Corrective Action Plans to address the cause(s) of Misoperations of Protection Systems for Facilities that are part of the BES.

Misoperations of or associated with Special Protection Schemes, Remedial Action Schemes, and Under-Voltage Load Shedding are not addressed in this standard due to their inherent complexities. NERC intends to address these areas through future projects.

Note that the WECC Regional Reliability Standard PRC-004-WECC-1 relates to the reporting of Misoperations for a limited set of WECC Paths and Remedial Action Schemes. In those cases where PRC-004-WECC-1 overlaps with the Continent-wide standard, entities are expected to comply with the more stringent standard.

B. Requirements and Measures

R1. ~~Within 120 calendar days of an interrupting device operation in its Facility caused by a Protection System operation, each~~Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

Rationale for R1: This requirement is the first step to ensuring that practices for reviewing and classifying Protection System operations and correcting Misoperations are consistently employed. The ~~SDT~~drafting team believes 120 calendar days takes into account the seasonal nature of Protection System operations; both the volume of Protection System operations as well as outage constraints for investigative purposes can be seasonal. This requirement mandates entities identify and review Protection System operations. Risks to the BES caused by Misoperations are reduced by reviewing all Protection System operations and investigating any Misoperations to find their cause(s). Requirement R1 places the responsibility on the BES interrupting device owner to investigate operations initiated by a Protection System. The initial investigation documentation should be provided to the owner of the Protection System component(s) that contributed to the Misoperation, upon request. The owner of the interrupting device and the entity that owned the component that contributed to the Misoperation should be communicating about the operation before this notification is transmitted. The owner of the component that contributed to the Misoperation will create the CAP, action plan or declaration required by Requirements R2 and R3.

1.1 ~~Identify~~Within 120 calendar days of a BES interrupting device operation in its Facility caused by a Protection System operation, identify and review each Protection System operation.

- If the entity ~~suspects a~~owns both the BES interrupting device and the Protection System, determine if it was a correct operation or a Misoperation.

~~1.1~~
- If the entity owns the BES interrupting device but does not own all of the Protection System and cannot determine that the Protection System operation was correct, then notify the other owner(s) of the Protection System

component(s) ~~owned by another entity contributed to a Misoperation, notify the owner of that Protection System component~~ and provide any requested investigative information.

~~1.2 Designate each Misoperation (if any).~~

- ~~Investigate each~~The Protection System component owner(s) that was notified by the BES interrupting device owner shall determine if there was a correct operation or a Misoperation of their component.

~~1.3~~1.2 Within the same 120 day period of a BES interrupting device operation caused by a Protection System operation, the owner of the Protection System component identified as contributing to the Misoperation ~~(if any)~~shall investigate and document the findings ~~including a cause~~ for each Misoperation including a cause, if identified.

M1. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Part 1.1 that may include, but is not limited to, dated lists, logs, or a database (electronic or hard copy format) that documents the date and time of each applicable interrupting device operation and ~~an indication~~indicates when each related Protection System operation was reviewed. Acceptable evidence for the notification required by Part 1.1 may include, but is not limited to, emails, electronic files, or hard copy records demonstrating transmittal ~~and receipt~~ of information. Acceptable evidence for Part 1.2 may include, but is not limited to, dated lists, logs, or a database (electronic or hard copy format) that documents the date, time, Facility and equipment name associated with each Misoperation~~. Acceptable evidence for Part 1.3 may include, but is not limited to~~, a copy of a dated Misoperation investigation report or documented findings, which may include sequence of events, relay targets, summary of DME records for each Misoperation.

Rationale for R2: A formal CAP is a proven tool for resolving operational problems. Based on industry experience and operational coordination timeframes, the SDT believes 60 calendar days is reasonable for considering such things as alternative solutions, coordination of resources, or development of a schedule for a CAP. When the cause of a Misoperation is determined from implementing an action plan in accordance with Requirement R4, a CAP must be developed in accordance with Requirement R2.

In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, documenting the reasons for taking no corrective actions is essential for justifying the close of the Misoperation investigation process and for future reference.

R2. ~~Within 60 calendar days of identifying the cause(s) of each Misoperation, the~~Each Transmission Owner, Generator Owner, or Distribution Provider shall, within 60 calendar days of identifying the cause of each Misoperation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

- Develop ~~and document~~ a Corrective Action Plan (CAP) for the identified Protection System component(s) that includes an evaluation of the CAP's applicability to the entity's Protection Systems at other locations, or
- Explain in a declaration why corrective actions are beyond the entity's control or would reduce BES reliability.

M2. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R2 that must include a dated CAP or a dated declaration explaining why there is no need to develop a CAP.

~~**Rationale for R2**: A formal CAP is a proven tool for resolving operational problems. Based on industry experience and operational coordination timeframes, the SDT believes 60 calendar days is reasonable for considering such things as alternative solutions, coordination of resources, development of a schedule, or procurement of funds for a CAP.~~

~~In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, documenting the reasons for taking no corrective actions is essential for justifying the close out the Misoperation investigation process and future reference.~~

R3. ~~For each Misoperation without an identified cause(s), the~~Each Transmission Owner, Generator Owner, or Distribution Provider shall, within 180 calendar days of the associated BES interrupting device operation, complete for each Misoperation without an identified cause: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

- Development of an action plan that identifies any additional investigative actions and/or Protection System modifications, including a work timetable, or
- A declaration explaining why no further actions will be taken.

Rationale for R3: Where a Misoperation cause is not determined during the initial investigation~~,~~; implementing an action plan of additional investigation/monitoring may determine a cause~~.~~ and lead to the development of a CAP in accordance with Requirement R2. The 180 calendar ~~days~~day period is the sum of 120 calendar days (investigative period in Requirement R1) and a 60 calendar day period (similar timeframe as in Requirement R2 for developing a CAP.)

If the ~~investigation~~action plan completion does not provide direction for identifying the cause, then pursuing further action is not warranted. In these cases, documenting the reasons is essential for justifying the close ~~out~~of the Misoperation investigation process and for future reference.

M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R3 that must include a dated action plan or a dated declaration.

R4. ~~For each CAP or action plan, the~~Each Transmission Owner, Generator Owner, or Distribution Provider shall~~:~~ implement each CAP or action plan, and revise as needed through completion. [*Violation Risk Factor: High] [Time Horizon: Operations Planning, Long-Term Planning]*

~~**4.1** Implement the CAP or action plan~~

~~**4.2** Maintain detailed implementation records of each CAP or action plan including dated information~~

~~**Rationale for R4**: The CAP or action plan must be fully implemented to accomplish all identified objectives. During the course of implementing a CAP or action plan, revisions may be necessary for a variety of reasons such as scheduling conflicts or resource issues. Documenting the CAP or action plan provides auditable progress and completion confirmation on any plan.~~

Rationale for R4: The CAP or action plan must be completed to accomplish all identified objectives. During the course of implementing a CAP or action plan, revisions may be necessary for a variety of reasons such as scheduling conflicts or resource issues. Documenting the CAP or action plan provides auditable progress and completion confirmation on any plan. When the cause of a Misoperation is determined from implementing an action plan, a CAP must be developed in accordance with Requirement R2.

~~surrounding any revision(s) and completion~~

M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R4 that must include, but is not limited to, dated electronic or hard copy records which document the implementation of each CAP and action plan~~,~~ and the completion of actions ~~and revisions~~ for each CAP or action plan~~;~~. The evidence may also include dated work management program records, dated work orders, or dated maintenance records.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority (CEA)

- As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.~~Regional Entity or if the Responsible Entity is owned, operated or controlled by the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity) to be responsible for compliance enforcement.~~

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. ~~For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.~~

The Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System shall keep data or evidence to show compliance with Requirements R1, R2, R3, and R4 and Measures M1, M2, M3, and M4, since the last audit unless directed by its ~~Compliance Enforcement Authority~~CEA to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System shall retain evidence for all Misoperations with an open investigation, action plan, or CAP even if the BES interrupting device operation occurred prior to the current audit period.

If a Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

~~The Compliance Enforcement Authority~~The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

Periodic Data Submittal

1.4. Additional Compliance Information

~~Each Transmission Owner, Generator Owner, and Distribution Provider that owns BES protection Systems will submit the data identified in PRC-004 – Attachment 1 to the CEA within two calendar months following the end of each calendar quarter.~~

~~The CEA will report the Misoperation information provided by the responsible entities to NERC on a quarterly basis.~~

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Assessment, Operations Planning**	**Medium**	The responsible entity performed the actions in accordance with Requirement R1, Parts 1.1 ~~–~~and 1.~~3~~2 in more than 120 calendar days but less than or equal to ~~130~~150 calendar days of the operation's occurrence. OR The responsible entity	The responsible entity performed the actions in accordance with Requirement R1, Parts 1.1 ~~–~~and 1.~~3~~2 in more than ~~130~~150 calendar days but less than or equal to ~~140~~160 calendar days of the operation's occurrence.	The responsible entity performed the actions in accordance with Requirement R1, Parts 1.1 ~~–~~and 1.~~3~~2 in more than ~~140~~160 calendar days but less than or equal to ~~150~~170 calendar days of the operation's occurrence.	The responsible entity performed the actions in accordance with Requirement R1, Parts 1.1 ~~–~~and 1.~~3~~2 in more than ~~150~~170 calendar days of the operation's occurrence. OR The responsible entity failed to identify and

			identified a Protection System operation that operated one of its BES interrupting devices but failed to review the operation in accordance with Requirement R1, Part 1.1. OR The responsible entity completed its review of a Protection System ~~O~~operation that operated one of its BES interrupting devices in 120 calendar days and determined the operation was a Misoperation and failed to document the findings in accordance with Requirement R1, Part 1.~~3~~2.			review a Protection System operation that operated one of its BES interrupting devices in accordance with Requirement R1, Part 1.1. ~~OR~~ ~~The responsible entity completed its review of a Protection System operation that operated one of its interrupting devices in 120 calendar days and determined the operation was a Misoperation and failed to designate the operation as a Misoperation in accordance with Requirement R1, Part 1.2.~~ OR The responsible entity failed to investigate a Misoperation and document the findings in accordance with Requirement R1, Part 1.~~3~~2.

						OR The ~~responsible~~ entity ~~completed its investigation of a~~that owns the BES interrupting device but does not own the entire Protection System ~~Operation that operated one of its interrupting devices in 120 calendar days and suspected that another entity's~~could not determine if the operation was correct and failed to notify the other owner(s) of the Protection System component~~contributed to the Misoperation, and failed to notify~~(s) and provide any requested investigative information ~~to that entity~~ in accordance with Requirement R1, Part 1.1.
R2	**Operations Planning, Long-Term Planning**	**Medium**	The responsible entity developed a CAP, or a declaration in accordance with Requirement R2, in	The responsible entity developed a CAP, or a declaration in accordance with Requirement R2, in	The responsible entity developed a CAP, or a declaration in accordance with Requirement R2, in	The responsible entity developed a CAP, or a declaration in accordance with Requirement R2, more

			more than 60 calendar days but less than or equal to 70 calendar days following the ~~completion~~identification of the ~~investigation or receiving notification~~cause of the Misoperation.	more than 70 calendar days but less than or equal to 80 calendar days following the ~~completion~~identification of the ~~investigation or receiving notification~~cause of the Misoperation.	more than 80 calendar days but less than or equal to 90 calendar days following the ~~completion~~identification of the ~~investigation or receiving notification~~cause of the Misoperation.	than 90 calendar days following the ~~completion~~identification of the ~~investigation or receiving notification~~cause of the Misoperation. OR The responsible entity failed to develop a CAP or make a declaration in accordance with Requirement R2.
R3	**Operations Planning, Long-Term Planning**	**Medium**	The responsible entity developed an action plan, or made a declaration in accordance with Requirement R3, in more than 180 calendar days but less than or equal to ~~190~~210 calendar days following the associated BES interrupting device operation.	The responsible entity developed an action plan, or made a declaration in accordance with Requirement R3, in more than ~~190~~210 calendar days but less than or equal to ~~200~~220 calendar days following the associated BES interrupting device operation.	The responsible entity developed an action plan, or made a declaration in accordance with Requirement R3, in more than ~~200~~220 calendar days but less than or equal to ~~210~~230 calendar days following the ~~completion of the investigation~~associated BES interrupting device operation.	The responsible entity developed an action plan, or made a declaration in accordance with Requirement R3, more than ~~210~~230 calendar days following the ~~completion of the investigation~~associated BES interrupting device operation. OR The responsible entity failed to develop~~, implement, and documented~~ an action plan~~,~~ or a declaration in

						accordance with Requirement R3.
R4	**Operations Planning, Long-Term Planning**	**High**	The responsible entity failed to revise ~~maintained records of~~ a CAP or action plan as needed in accordance with Requirement R4. ~~but the records were incomplete.~~	N/A	N/A	The responsible entity failed to implement a CAP or action plan in accordance with Requirement R4. ~~OR~~ ~~The responsible entity failed to maintain records of a CAP or action plan.~~

F. Associated Documents

None.

Guidelines and Technical Basis

The composite Protection System in the context of this standard is the total complement of protection for a system Element. All protection for a given Element such as primary, secondary, backup, pilot and non-pilot relay schemes are included in the composite Protection System for the Element. These individual schemes or systems may be isolated or function independently, but aggregate as part of one composite Protection System.

A Protection System is defined in the NERC Glossary of Terms as:

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

Circuit breaker and other interrupting device mechanisms are not part of a Protection System.

A revised Misoperation definition is being proposed for industry adoption~~. It~~; the failure of an Element's composite Protection System to operate as intended. The definition includes the following ~~conditions:~~ categories:

(1) A failure of a Protection System to operate for a Fault within the zone it is designed to protect. ~~A lack of target information, e.g. when a high-speed pilot system does not trip because a high-speed zone element trips first, is not a Misoperation. If a fault or abnormal condition is cleared within the time normally expected with proper functioning of at least one Protection System element, then failure of another Protection System element associated with the protection scheme is not a Misoperation~~**The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for the Element it is designed to protect is correct.**

A failure of a transformer's composite Protection System to operate for a transformer Fault is an example of a "failure to trip" Misoperation. This type of Misoperation typically results in the Fault being cleared by remote backup Protection System operations.

A failure of a "primary" transformer relay (or any other component) to operate for a transformer Fault is not a "failure to trip" Misoperation as long as another component of the transformer's composite Protection System operated to clear the Fault. Please see category 3 to see if the "slow trip" classification applies to the operation.

A lack of target information, e.g. when a high-speed pilot system does not target because a high-speed zone element trips first, does not by itself constitute a Misoperation.

(2) A failure of a Protection System to operate for a non-Fault condition for which the Protection System was intended to operate, such as a power swing, under-voltage, over excitation, or loss of excitation. ~~For example,~~**The failure** ~~to trip the generator by loss~~ **of** ~~field protection for~~ **a** ~~loss of field condition on that generator~~**Protection System component is not a Misoperation**~~.~~ **as long as the overall performance of the Protection System for the Element it is designed to protect is correct.**

A failure of a generator's composite Protection System to operate for a loss of field condition is an example of a "failure to trip" Misoperation. This type of Misoperation may require manual operator intervention.

A failure of a "primary" reverse power relay (or any other component) is not a "failure to trip" Misoperation as long as another component of the generator's composite Protection System operated to shut down the generator. Please see category 4 to see if the "slow trip" classification applies to the operation.

The non-Fault conditions cited in the definition are examples only, and do not constitute an all inclusive list.

(3) A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. Delayed ~~f~~**Fault clearing associated with an installed high**~~-~~**-speed performance** ~~is~~**has not** ~~required by planning studies associated with~~**been identified to meet the dynamic stability performance requirements of the TPL standards** ~~or by~~**nor is it required to ensure coordination**~~requirements~~ **with other Protection Systems.**

A failure of a line's composite Protection System to operate as quickly as intended for a line Fault is an example of a "slow trip" Misoperation. This type of Misoperation typically results in remote backup Protection System operations before the Fault is cleared.

In many cases, high-speed protection is installed as part of the utility's standard practice without having the need for high-speed protection for meeting TPL requirements. A slow trip of this Protection System would not negatively impact the dynamic performance of the BES; so, it does not need to be reported. However, even if high-speed clearing is not required, the Protection Systems must coordinate to prevent an "unnecessary trip" Misoperation (e.g. an over trip).

The phrase "slower than intended" means the Protection System operated slower than the objective of the owner(s). It would be impossible to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent additional harm, and ultimately be able to decide whether the speed or outcome of its Protection System operation was adequate.

The reference to the TPL standards is meant to place some bounds on the time to clear a Fault and prevent dynamic instability. The performance requirements in the TPL standards are found in Table 1, and are applicable to all contingencies mentioned for Type A, B and C contingencies.

Coordination with other Protection Systems refers to the need to ensure that relaying operates in the proper or planned sequence (i.e. the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

(4) A Protection System operation that is slower than intended for a non-Fault condition such as a power swing, under-voltage, over excitation, or loss of excitation for which it was intended to operate. ~~An example of this type of Misoperation is an over excitation condition where the protection designed to detect this condition operated slower than intended resulting in a higher degree of insulation stress than desired.~~

A failure of a generator's composite Protection System to operate as quickly as intended for an over excitation condition is an example of a "slow trip" Misoperation. This type of Misoperation may result in equipment damage.

The phrase "slower than intended" means the composite Protection System operated slower than the objective of the owner(s). It would be impossible to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent additional harm, and ultimately be able to decide whether the speed or outcome of its Protection System was adequate.

The non-Fault conditions cited in the definition are examples only, and do not constitute an all inclusive list.

(5) A Protection System operation for a Fault for which the Protection System is not intended to operate~~, excluding any remote Protection System operation that resulted from a failure to trip or slow trip of a local Protection System in a faulted adjacent zone.~~ .

An ~~example of~~ operation of a transformer's composite Protection System which over trips for a properly cleared line Fault is an example of an "unnecessary trip" Misoperation. For this type of Misoperation ~~is an over-reaching trip due to a lack of coordination between remote and local Protection Systems. Note: Operation of~~, the Fault is typically cleared properly by the faulted equipment's composite Protection System (line relaying, in this case) without the need for an external Protection System's operation.

An operation of a properly coordinated remote Protection Systems is not a Misoperation if the Fault has persisted for a sufficient time to allow the correct operation of the local Protection System to clear the Fault ~~in adjacent zones is not~~. An interrupting device failure, a "failure to trip" Misoperation ~~of the~~, or a "slow trip" Misoperation may result in a proper remote Protection System ~~if the local Protection System of the faulted Element~~

~~fails to clear the Fault within the intended time; however, the failure of the local Protection System for the faulted zone is a Misoperation~~operation.

(6) A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate~~. These non~~, and is unrelated to on-site maintenance, testing, inspection, construction or commissioning activities.

Non-Fault conditions ~~may~~ include but are not limited to power swings, over excitation~~ or~~, loss of excitation ~~but could include even~~, frequency excursions and normal conditions. ~~For example,~~

An operation of a line's composite Protection System due to a relay failure during normal conditions ~~could conceivably cause~~is an ~~incorrect~~example of an "unnecessary trip ~~and a~~other than Fault" Misoperation.

In a second example, tripping a generator by the operation of loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation. In a third example, an impedance line relay trip for a power swing that entered the relay's characteristic is a Misoperation if the power swing was stable and the relay operated because it was set with an excessive reach that unnecessarily restricted the line's load carrying capability. ~~This category of Misoperation cannot address at this time other operations during power swings unless the relay is clearly improperly set. Additional clarity on this specific issue will need to await completion of Phase III of Project 2010-13 on Relay Loadability which will address protective relay operations due to power swings as directed by FERC Order No. 733. Finally, an example of an operation that is not a Misoperation under this category is an unintended operation as a result of on-site maintenance, testing, construction or commissioning.~~

An operation that occurs during a non-fault condition but was initiated by on-site maintenance, testing, inspection, construction or commissioning is not a Misoperation. However, once the maintenance, testing, inspection, construction or commissioning has been completed, the "on-site" Misoperation exclusion no longer applies, regardless of the presence of the technical personnel.

This definition is based on the established IEEE/PSRC I3 Working Group on 'Transmission Protective Relay System Performance Measuring Methodology' categories (excluding Failure to Reclose) of Relay System Misoperation. The phrase abnormal condition has been replaced with "non-fault condition" to remove ambiguity.

The exclusion of a component failure, as long as the composite Protection System operates correctly, was based on recommendations by the NERC SPCS. Entities still need to review each Protection System operation. Covering these types of component failures within the standard constitutes additional administrative burden for types of failures that have no immediate reliability impacts.

Failure to automatically reclose after a Fault is not included as a Misoperation because reclosing equipment is not included under the definition of Protection Systems.

~~Interrupting Device~~BES interrupting device operations which are initiated by ~~control systems~~non-protective functions, such as those associated with generator controls, or turbine/boiler controls, Static VAR Compensators (SVCs), Flexible AC Transmission Systems (FACTS), High-Voltage DC (HVDC) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. Additionally, operations initiated by control functions within protective relays are not considered Protection System operations. For example, in cases where a component of the Protection System or a function of a component within the Protection System is used for control of a generator, such as when a reverse power relay is used to trip a breaker during generator shutdown, the operation of the control component or the function when not providing protection is not included in the definition of Misoperation and its operation would not be reviewed under this standard. Automation (e.g. data collection) is also not a protective function and is not subject to this standard.

A generator Protection System operation prior to closing the unit breaker(s) is not considered a Misoperation~~.~~ provided no in-service BES Elements are tripped. These types of operations are excluded ~~because~~when the generating unit is not synchronized and is isolated from the BES. Protection System operations which occur with the protected Element out of service, that do not trip any in-service Elements are not Misoperations. Protection System operations unrelated to on-site maintenance, testing, inspection, construction or commissioning activities which occur with the protected Element out of service, that trip any in-service Elements are Misoperations.

In some cases where zones of protection overlap, the owner of BES Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element. For example, the high side of a transformer connected to a line may be within the zone of protection of the supplying line's relaying. In this case, the line relaying is planned to protect the area of the high side of the transformer and into its primary winding. ~~-~~In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for Faults on the high side of the connected transformer. Therefore, the operation of the line relaying for a high side transformer Fault would not be considered a Misoperation.

This standard addresses the reliability issues identified in the letter[1] from Gerry Cauley, NERC President and CEO, dated January ~~17, 2010~~7, 2011. "Nearly all major system failures include misoperation of relays as a factor contributing to the propagation of the events…….. Reducing the risk to reliability from relay Misoperations requires consistent collection of misoperation information by regional entities, along with systematic analysis and correction of the underlying causes of preventable Misoperations." The standard also addresses the findings in the 2011 Risk Assessment of Reliability Performance[2]; July 2011 "….a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry."

[2] http://www.nerc.com/files/2011_RARPR_FINAL.pdf

In the event of a natural disaster, note that the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

Requirement R1

This requirement promotes the prudent evaluation of ~~all~~each Protection System operation~~s~~ to ~~designate~~determine if the operation was correct or a Misoperation, even those Misoperations~~, even those~~ difficult to detect. Unless all BES Protection System operations and Faults that challenge them are reviewed, it cannot be determined with certainty that all Misoperations are identified. For example, if you only reviewed ~~Faults~~operations resulting in an overtrip, you would not necessarily identify Misoperations caused by slow trips.

Requirement ~~1~~R1 places the responsibility on the BES interrupting device owner to investigate operations initiated by a Protection System.~~-~~ The ~~SDT~~drafting team believes the owner of the BES interrupting device that operated would be in the best position to analyze the Protection System operation, determine if a Misoperation occurred, and perform the initial investigation to determine the cause of the Misoperation. If the BES interrupting device owner ~~suspects~~does not own all of the Protection System and cannot determine that the ~~Misoperation~~Protection System operation was ~~caused by a~~correct, then notify the other owner(s) of the Protection System component~~ owned by another entity, they must notify that component owner and document the notification~~(s) and provide any requested investigative information. In this case, it is expected that both entities will work together to investigate the cause of the operation.

Protection Systems are made of many components. These components may be owned by more than one entity. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner's differential relay. All of these components and many more are part of a Protection System. It is expected that all the owners will communicate with each other, sharing any information freely, so that operations can be analyzed, Misoperations identified and corrective actions taken. If an entity feels it cannot get the level of cooperation it needs to adequately address a Misoperation, the entity should appeal to its Regional Entity for help in resolving the situation.

Determining the cause of Protection System Misoperations is essential in developing an effective remedy to avoid future Misoperations. ~~The SDT~~The drafting team recognizes that there may be multiple causes for a Misoperation; in these circumstances the CAP would include a remedy for the identified causes. The 60 day clock for developing the CAP will be associated with the determination of the first cause. A CAP can be revised if additional causes are found. The drafting team believes 120 calendar days is a reasonable period of time to investigate operations, determine the cause for most Misoperations and document findings in ~~an~~a Misoperation investigation report. This time frame takes into account the seasonal nature of Protection System operations. Both the volume of Protection System operations as well as outage constraints for investigative purposes can be seasonal.

Regardless of whether a cause is identified, the BES interrupting device owner must document the investigation as a potential aid in possible future Misoperation investigations. If a single Protection System causes multiple BES interrupting device owners to be affected, the entities may work together to produce a common Misoperation investigation report. Similarly, if the BES interrupting device owner and the Protection System component owner that caused a Misoperation are different entities, they may work together to produce a common report.~~ Each TO, GO, or DP would be expected to have a copy of the common investigation report.~~

~~An~~A Misoperation investigation report or documented findings may include the following information: 1) initial evidence, 2) probable causes, 3) tests and studies, and 4) conclusions. A brief description of the event surrounding the Misoperation may be included if not separately documented. The initial evidence, which may also be documented separately, contains the sequence of events, relay targets and a summary of Disturbance Monitoring Equipment (DME) records~~.~~ as appropriate. Probable causes are those causes which are most likely to have contributed to the Misoperation and could be considered for further testing. The test and studies documented in the report would describe and provide findings of those tests if the entity was able to perform them during the initial investigation phase (e.g. relay calibration and simulation tests, communication noise and attenuation tests, CT/VT ratio tests, DC continuity checks and functional tests) and studies (e.g. short circuit and coordination studies) performed in the attempt to determine the cause. The conclusions should summarize the cause(s) substantiated by the evidence and findings of the tests and studies.

Requirement ~~2~~R2

If the Misoperation cause is identified within 120 days of the event, Requirement R2 requires Protection System owners to develop a CAP or to make a declaration of no additional action within 60 calendar days of determining the cause. The drafting team recognizes there may be multiple causes for a Misoperation; in these circumstances the CAP would include a remedy for the identified causes. The 60 day clock for developing the CAP will be associated with the determination of the first cause. A CAP can be revised if additional causes are found. Based on industry experience and operational coordination timeframes, the ~~SDT~~drafting team believes 60 calendar days is reasonable for considering such things as alternative solutions, coordination of resources, or development of a schedule~~, or procurement of funds~~ for a CAP, or to prepare a declaration justifying the lack of a CAP.

The 120 day time period and the 60 day time period are distinct and within the context of Requirement R1 and Requirement R2 respectively, need to remain separate. With the ultimate goal of keeping the implementation time of a CAP as short as possible, if a cause of a Misoperation is determined quickly the CAP creation timeframe (60 days) becomes applicable and requires the CAP implementation be less than 180 days. Also, if the interrupting device owner is tardy in informing another Protection System component owner and using up much of the 120 day period, it still leaves a considerable amount of time (at least 60 days) to develop an action plan for further investigation by the Protection System component owner, or if a cause is determined the creation of the CAP.

Where there are multiple Protection System owners involved in a Misoperation, the one or more owners whose Protection System component(s) contributed to the Misoperation will create a CAP or declaration as required by Requirement ~~2~~R2. Owners whose Protection System components operated correctly do not need to create a CAP~~. All owners should update their investigation documentation to indicate which party or parties are performing a CAP to address the Misoperation~~.

Resolving Misoperations benefits the Protection System owner and the BES by ~~improving~~maintaining reliability and security. The CAP is an established tool for resolving operational problems. The NERC Glossary of Terms defines a Corrective Action Plan as "A list of actions and an associated timetable for implementation to remedy a specific problem".

Protection System owners are expected to exercise due diligence in the development and implementation of a CAP. Typically included would be any corrective actions taken to prevent recurrence (along with the date performed), ~~and~~ any corrective actions planned to be taken to prevent recurrence (along with the planned date~~).~~), and an evaluation of the CAP's applicability to other Protection Systems owned by the entity.

~~An example~~The evaluation of ~~a CAP for a Misoperation determined~~the CAP's applicability to ~~have been caused~~other Protection Systems owned by the entity is intended to encourage diligence in preventing similar Misoperations. The Protection System owner is responsible for determining the scope of the problem, and for including appropriate actions in the CAP. The evaluation may result in adding preemptive actions to the CAP. The CAP is complete when all specified actions are completed.

The following are examples of Corrective Action Plans (CAPs):

CAP Example 1 – Corrective actions for a failed relay ~~that has not been repaired might be: "Temporarily~~only:

> The impedance relay was removed ~~failed relay~~ from service on ~~xx/xx/xx. Plan to repair then return~~6/2/12 because it was applying a standing trip. Relay testing was performed on 6/4/12. A failed capacitor was found within the impedance relay. The capacitor was replaced on 6/5/12. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on ~~xx/xx/xx."~~6/5/12.
>
> ~~An example of a CAP for a Misoperation determined to have been caused by~~ Applicability to other Protection Systems: Undesired trips of this type of impedance relay due to capacitor failures have occurred only occasionally within our system. This type of impedance relay is gradually being replaced with microprocessor relays as Protection Systems are modernized. It is therefore our assessment that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for our system.

CAP Example 2 - Corrective actions for a failed relay ~~that has been repaired might be: "Temporarily~~, and a program for preemptive actions at similar installations:

The impedance relay was removed ~~failed relay~~ from service on ~~xx/xx/xx. Repaired then returned relay~~ 6/2/12 because it was applying a standing trip. Relay testing was performed on 6/4/12. A failed capacitor was found within the impedance relay. The capacitor was replaced on 6/5/12. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on ~~xx/xx/xx."~~6/5/12.

~~An example~~Applicability to other Protection Systems: Undesired trips of this type of impedance relay due to capacitor failures have occurred frequently. It is therefore our assessment that a program should be established by 12/1/12 for wholesale preemptive replacement of capacitors in this type of impedance relay.

A program for wholesale preemptive replacement of capacitors in this type of impedance relay was established on 10/28/12.

CAP Example 3 - Corrective actions for a ~~Misoperation suspected to have been caused by an intermittent relay failure might be: "Temporarily~~failed relay; and preemptive actions for similar installations:

The impedance relay was removed ~~suspect relay~~ from service on ~~xx/xx/xx. Replaced with like kind, and placed in~~ 6/2/12 because it was applying a standing trip. Relay testing was performed on 6/4/12. A failed capacitor was found within the impedance relay. The capacitor was replaced on 6/5/12. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on ~~xx/xx/xx."~~6/5/12.

Applicability to other Protection Systems: Undesired trips of this type of impedance relay due to capacitor failures have occurred frequently. It is therefore our assessment that preemptive replacement of capacitors in this type of impedance relay should be pursued.

It is planned to replace the impedance relay capacitors at stations A, B, and C by 9/1/12. It is planned to replace the impedance relay capacitors at stations D, E, and F by 11/1/12. It is planned to replace the impedance relay capacitors at stations G, H, and I by 2/1/13.

The impedance relay capacitor replacement was completed at stations A, B, and C on 8/16/12. The impedance relay capacitor replacement was completed at stations D, E, and F on 10/26/12. The impedance relay capacitor replacement was completed at stations G, H, and I on 1/9/13.

CAP Example 4 - Corrective actions for a firmware problem; and preemptive actions for similar installations:

Fault records were provided to the manufacturer on 6/4/12. On 6/11/12, the manufacturer responded that the misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 6/12/12.

Applicability to other Protection Systems: Based on our risk assessment, we plan to install firmware version 3 at all of our installations that are determined to be version 2. Proposed completion date is 12/31/12.

The firmware replacements were completed on 12/4/12.

If the Misoperation cause is identified within 120 days, and no corrective action has been or is intended to be taken, Protection System owners are required to make a declaration to this effect. A "no CAP declaration" would typically include the Misoperation cause and justification for taking no corrective action.

An example of a "no CAP declaration" due to BES reliability might be: "The investigation showed the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Our studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations." A "no CAP declaration" due to BES reliability is expected to be used sparingly.

~~CAPs should include an evaluation as to whether the entity's Protection Systems at other locations are also vulnerable to the same type of Misoperation.~~

~~Requirement 3~~

There are some cases where a Misoperation cause is outside of an entity's control and would result in a "no CAP declaration." Items that may be considered outside of an entity's control could be a non-registered entity communications provider problem or a transmission transformer tapped industrial customer who initiates a direct transfer trip to a registered entity's transmission breaker. Generally, situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity's control. The "outside an entity's control" declaration is expected to be used sparingly.

Requirement R3

If the Misoperation cause is not identified within 120 days, and reasonable investigative actions have not been exhausted, Protection System owners are expected to exercise due diligence in the development and implementation of an action plan for additional investigation. This action plan would typically include any investigative actions taken to determine the cause (along with the date performed), and any investigative actions planned to be taken to determine the cause (along with the planned date).

At the end of 180 days, the Protection System owner must have an action plan or a declaration why no further actions will be taken. The action plan does not need to have been implemented within the 180 days, but it must have been developed within this time frame. The 180 calendar days ~~is~~are the sum of 120 calendar days (investigative period in Requirement R1) and a 60 calendar day period (similar timeframe as in Requirement R2 for developing a CAP.)

Where there are multiple Protection System owners involved in a Misoperation and no cause has been determined, then each Protection System owner must either develop an action plan or declare why no further actions will be taken.

An example of an investigative action plan for more testing might be: "All relays at station A functioned properly during testing on xx/xx/xx. An outage is required to test the relays at station B. The outage is scheduled for xx/xx/xx."

An example of an action plan for adding monitoring might be: "All relays at station A and B functioned properly during testing on xx/xx/xx. It is planned to install a temporary DFR at station A on xx/xx/xx and to monitor the currents for at least 3 months."

An example of an action plan for reviewing relay settings might be: "All relays at station A functioned properly during testing on xx/xx/xx. All relays at station B functioned properly during testing on xx/xx/xx. The carrier system functioned properly during testing on xx/xx/xx. It is planned to complete a relay settings review by xx/xx/xx."

If the Misoperation cause is not identified and reasonable investigative actions have been exhausted within 180 days, Protection System owners are required to make a declaration to this effect. A "no action plan" declaration~~"~~ would typically include any investigative actions taken to determine the cause (along with the date performed), and justification for taking no additional investigative actions.

An example of a "no action plan" declaration~~"~~ might be: "All relays at station A and B functioned properly during testing on xx/xx/xx. The carrier system functioned properly during testing on xx/xx/xx. The carrier coupling equipment functioned properly during testing on xx/xx/xx. A settings review completed on xx/xx/xx indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be proper, and the equipment at station A and station B is already monitored, we have decided to close this investigation."

Requirement R4

~~Finally, the~~The goal of the standard has not been met unless ~~CAP(s)~~CAPs or action plans are actually implemented, as is required in Requirement R4. The responsible entity is required to implement and complete a CAP or action plan to accomplish the purpose of this standard, which is to prevent future Misoperations, thereby minimizing risk to the BES. The responsible entity is also required to complete the CAP or action plan, document the plan implementation, and retain the appropriate evidence to demonstrate implementation and completion.

The goal of an action plan created in Requirement R3 is to determine a cause so a CAP can be created to ultimately remedy the cause of the Misoperation. If the cause is determined as a result of the action plan, the entity must develop a CAP or a declaration within 60 days of determination of cause per Requirement ~~2~~R2. This requirement sets the expectation that the work identified in the CAP or action plan will be completed on schedule as planned. Deferrals or other relevant changes to the CAP or action plan need to be documented so that the record includes not only what was planned, but what was implemented. Depending on the planning and documentation format used by the responsible entity, evidence of successful CAP or action plan execution could consist of signed-off work orders, printouts from work management systems, spreadsheets of planned versus completed work, timesheets, work inspection reports, paid invoices, photographs, walk-through reports or other evidence.

Documentation of a CAP or action plan provides an auditable progress and completion confirmation for specific Misoperations. In addition, the investigative documentation may aid the responsible entity in remedying future Misoperations of a similar nature.

~~**Reporting:**~~

~~A review of the Transmission Availability Data System (TADS) data for the years 2008 – 2010 revealed that the fourth ranked initiating cause of BES outages not related to weather was "Failed Protection System Equipment." Given the high ranking of this metric, it is appropriate to collect data on Protection System Misoperations for analysis to drive improvements in Protection System reliability.~~

~~**Section C-1.4** requires periodic data reporting and references a common reporting format to facilitate consistent reporting of Misoperation data by all Transmission Owners, Generator Owners, and Distribution Providers. Reporting Misoperation data in a common format permits the ERO to analyze the data, develop meaningful metrics for measuring Protection System performance, identify trends in Protection System performance that negatively impact reliability, and identify lessons learned.~~

~~Analysis of data from all Misoperations across North America makes possible identification of issues and trends that may not be identifiable through analysis of smaller data sets on an entity or regional basis. Information regarding identified issues and trends and recommended actions will be shared with Transmission Owners, Generator Owners, and Distribution Providers through lessons learned or industry alerts. Sharing this information will permit recipients to take appropriate actions to drive improvements in Protection System performance.~~

~~The common reporting template also will improve the usefulness of metrics developed to track Protection System performance. While the most relevant category defined in TADS is titled "Failed Protection System Equipment," the title is not an accurate description of the information reported in the metric. This metric includes all Protection System Misoperations that are not related to human error, which is only a subset of all Protection System Misoperations. The Protection System Misoperations related to human error (e.g., miscoordinated settings, incorrect setting calculations, and errors in applying settings to the relay, etc.) are tracked separately from Protection System equipment-related Misoperations, and are grouped together with other human errors by a utility employee or contractor. Similarly, Protection System Misoperations related to failed equipment such as a failed CVT on the primary insulation side are reported under "Failed AC Substation Equipment." Reporting of Misoperations data using the common format specified in C-1.4 will permit development of metrics specific to Protection System Misoperations, with the potential to break down the metric by category of Misoperation (e.g., failure to trip, slow trip, unnecessary trip, etc.) and cause of Misoperation (ac system, dc system, as-left personnel error, incorrect setting/logic/design, and relay failures/malfunctions).~~

~~Reporting Misoperations and their CAPs or action plans provides a means of monitoring and assessing Misoperations. Reviewing and tracking this information provides a method~~

~~of validating the actions taken to address the causes of Misoperations. A second need for reporting Misoperations is to facilitate the identification of trends in Protection System performance that negatively impact reliability. Analyzing data from all Misoperations across North America will make it possible to identify trends that may not be discernible through analysis of smaller data sets on an entity or regional basis.~~

~~Misoperations and updates will be submitted to the Regional Entity on a quarterly basis per the following schedule:~~

~~**Reporting Quarter**~~	~~**Submission Date**~~
~~1st Quarter (Jan 1 – March 31)~~	~~May 31~~
~~2nd Quarter (Apr 1 – June 30)~~	~~August 31~~
~~3rd Quarter (July 1 – Sept 30)~~	~~November 30~~
~~4th Quarter (Oct 1 – Dec 31)~~	~~February 28~~

~~The two calendar months reporting of Misoperations that occurred within the quarterly reporting period corresponds to the recommendations provided by ERO-RAPA and also correlates to the time which the majority of Regional Entities were using in 2011. It is believed that two calendar months is a reasonable time for an entity to submit their Misoperations data after the close of a reporting period. Reporting and updating on a limited time interval and lag (from occurrence) aids in focusing on high trend items of common mode failures. A longer period of time for reporting could prevent high trend failures from being quickly recognized.~~

~~Examples of reporting:~~

1. ~~If a Misoperation occurred on March 30 but was not identified as a Misoperation until June 2, then this Misoperation would be reported in the second quarter reporting period.~~
2. ~~If the Misoperation in example 1 was not completely investigated in the second quarter but a cause was determined on July 2, then a resubmittal should be reported in the third quarter.~~
3. ~~If the Misoperation in examples 1 and 2 had its CAP completed on November 2, then a resubmittal indicating that the CAP was completed should be reported in the fourth quarter.~~

Implementation Plan

Project 2010-05.1 Protection Systems: Phase 1 (Misoperations)

Requested Approvals

- PRC-004-3 – Protection System Misoperation Identification and Correction

Requested Retirements

- PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection System
- PRC-004-2a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

Prerequisite Approvals

- None

Revisions to Defined Terms in the NERC Glossary

The standards drafting team proposes modifying the following approved definition:

Misoperation:

The failure of an Element's composite Protection System to operate as intended.

Any of the following is considered a Misoperation:

1. **Failure to Trip - During Fault -** A failure of a Protection System to operate for a Fault within the zone it is designed to protect. The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for the Element it is designed to protect is correct.

2. **Failure to Trip - Other Than Fault -** A failure of a Protection System to operate for a non-Fault condition for which the Protection System was intended to operate, such as a power swing, under-voltage, over excitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for the Element it is designed to protect is correct.

3. **Slow Trip - During Fault -** A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high-speed performance has not been identified to meet the dynamic stability performance requirements of the TPL standards nor is it required to ensure coordination with other Protection Systems.

4. **Slow Trip - Other Than Fault -** A Protection System operation that is slower than intended for a non-Fault condition such as a power swing, under-voltage, over excitation, or loss of excitation for which the Protection System was intended to operate.

5. **Unnecessary Trip - During Fault -** A Protection System operation for a Fault for which the Protection System is not intended to operate.

6. **Unnecessary Trip - Other Than Fault -** A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate, and is unrelated to on-site maintenance, testing, inspection, construction or commissioning activities.

Background

PRC-004-3 Protection System Misoperation Identification and Correction is a revision of PRC-004-2a Analysis and Mitigation of Transmission and Generation Protection System Misoperations with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated. PRC-003-1 Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems required the Regions to establish procedures for analysis of Misoperations. In FERC Order No. 693, the Commission identified PRC-003-0 as a fill-in-the-blank standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2a.

General Considerations

PRC-004-WECC-1 – This regional standard is related to reporting of Misoperations for a limited set of WECC Paths and Remedial Action Schemes. In those cases where PRC-004-WECC-1 overlaps with the Continent-wide standard, entities are expected to comply with the more stringent standard.

Applicability

This standard applies to the following functional entities:

- Transmission Owner
- Generator Owner
- Distribution Provider

This standard applies to the following Facilities:

- Protection Systems for BES Elements.
- Underfrequency Load Shedding (UFLS) that trips a BES Element
- Special Protection Systems (SPS), Remedial Action Schemes (RAS), and Undervoltage Load Shedding (UVLS) are excluded
- Non-protective functions that may be imbedded within a Protection System are excluded

Effective Date of New or Revised Standards and Definitions

First day of the first calendar quarter that is twelve months beyond the date that PRC-004-3 is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

The proposed definition of Misoperation shall become effective on the same date as PRC-004-3. Entities shall use this definition when implementing any portions of Requirements R1, R2 R3 and R4 that use this defined term.

Implementation Plan for Requirements R1, R2, R3 and R4

Entities shall be 100% compliant for any new Protection System Operation on the first day of the first calendar quarter twelve months following applicable regulatory approvals, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter twelve months following Board of Trustees adoption. Protection System operations that occur before the compliance date shall comply with the previous version of the Standard.

Retirement of Existing Standards

The existing standards PRC-003-1 and PRC-004-2a shall be retired at midnight of the day immediately prior to the effective date of PRC-004-3.

Implementation Plan

Project 2010-05.1 Protection Systems: Phase 1 (Misoperations)

Requested Approvals

- PRC-004-3 – Protection System Misoperation Identification and Correction

Requested Retirements

- PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection System
- PRC-004-2a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

Prerequisite Approvals

- None

Revisions to Defined Terms in the NERC Glossary

The standards drafting team proposes modifying the following approved definition:

Misoperation: ~~Any of the following:~~

The failure of an Element's composite Protection System to operate as intended.

Any of the following is considered a Misoperation:

1. **Failure to Trip - During Fault -** A failure of a Protection System to operate for a Fault within the zone it is designed to protect. ~~(~~The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for ~~an~~the Element it is designed to protect is correct~~.)~~.
2. **Failure to Trip - Other Than Fault -** A failure of a Protection System to operate for a non-Fault condition for which the Protection System was intended to operate, such as a power swing, under-voltage, over excitation, or loss of excitation. ~~(~~The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for ~~an~~the Element it is designed to protect is correct~~.)~~.
3. **Slow Trip - During Fault -** A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. ~~(~~Delayed Fault ~~C~~clearing associated with an installed high-speed protection scheme is not a Misoperation if the high-speed performance ~~is required~~has not been identified to meet the dynamic stability performance requirements of the TPL standards ~~or by~~nor is it required to ensure coordination ~~requirements~~ with other Protection Systems~~.)~~.
4. **Slow Trip - Other Than Fault -** A Protection System operation that is slower than intended for a non-Fault condition such as a power swing, under-voltage, over excitation, or loss of excitation for which the Protection System was intended to operate.

5. **Unnecessary Trip - During Fault -** A Protection System operation for a Fault for which the Protection System is not intended to operate~~, excluding any remote Protection System operation that resulted from a failure to trip or slow trip of a local Protection System in a faulted adjacent zone~~.

6. **Unnecessary Trip - Other Than Fault -** A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate, and is unrelated to on-site maintenance, testing, inspection, construction or commissioning activities.

Background

PRC-004-3 Protection System ~~Misoperations~~Misoperation Identification and Correction is a revision of PRC-004-2a Analysis and Mitigation of Transmission and Generation Protection System Misoperations with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated. PRC-003-1 Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems required the Regions to establish procedures for analysis of Misoperations. In ~~the NOPR~~FERC Order No. 693, the Commission identified PRC-003-0 as a fill-in-the-blank standard. The ~~NOPR~~Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2a.

General Considerations

PRC-004-WECC-1 – This regional standard is related to reporting of Misoperations for a limited set of WECC Paths and Remedial Action Schemes. In those cases where PRC-004-WECC-1 overlaps with the Continent-wide standard, entities are expected to comply with the more stringent standard.

Applicability

This standard applies to the following functional entities:

- Transmission Owner
- Generator Owner
- Distribution Provider

This standard applies to the following Facilities:

- Protection Systems for ~~Facilities that are part of the BES~~BES Elements.

~~Facilities not included~~

- Underfrequency Load Shedding (UFLS) that trips a BES Element
- Special Protection Systems (SPS~~) or~~), Remedial Action Schemes (RAS~~)~~

- ~~•~~), and Undervoltage Load Shedding (UVLS)
- ~~Relay functions not included (these~~ are ~~non~~excluded
- Non-protective functions that may be imbedded within a Protection System~~)~~ are excluded
- ~~Control (e.g. controlled shut down of generators or capacitor bank switching. Also see Guidelines and Technical Basis section for detailed examples)~~
- ~~Automation (e.g. data collection)~~

Effective Date of New or Revised Standards and Definitions

First day of the first calendar quarter that is ~~six~~twelve months beyond the date that PRC-004-3 is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is ~~six~~twelve months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

The proposed definition of Misoperation shall become effective on the same date as PRC-004-3. Entities shall use this definition when implementing any portions of Requirements R1, R2 R3 and R4 that use this defined term.

Implementation Plan for Requirements R1, R2, R3 and R4

Entities shall be 100% compliant for any new Protection System Operation on the first day of the first calendar quarter ~~six~~twelve months following applicable regulatory approvals, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter ~~six~~twelve months following Board of Trustees adoption. Protection System operations that occur before the compliance date shall comply with the previous version of the Standard.

Retirement of Existing Standards

The existing standards PRC-003-1 and PRC-004-2a shall be retired at midnight of the day immediately prior to the effective date of PRC-004-3.

Unofficial Comment Form

Project 2010-05.1 Protection System Misoperations

Please **DO NOT** use this form for submitting comments. Please use the electronic form to submit comments on the PRC-004-3 Standard. The comment form must be completed by **February 20, 2013**.

If you have questions please contact Al McMeekin at al.mcmeekin@nerc.net or by telephone at 803-530-1963.

http://www.nerc.com/filez/standards/Project2010-05_Protection_System_Misoperations.html

Background Information

This posting is soliciting formal comment.

The second draft of PRC-004-3 was posted for a 45-day formal comment period with concurrent initial ballot from July 25 – September 7, 2012. Stakeholders from approximately 145 companies representing 9 of the 10 Industry Segments provided feedback. The Protection System Misoperation Standard Drafting Team (PSM SDT) has responded to all commenters and developed a third draft of the standard for Protection System Misoperation Identification and Correction based on stakeholder input. Changes to the standard include:

- Revisions to the definition of Protection System Misoperation.
- Revisions to the Applicability 'Facilities' section.
- Revisions to the Requirements and Measures.
- Modifications to the VSLs to reflect the changes in the requirements.
- Revisions to the Implementation Plan including extending the Effective Date from six months to twelve months following applicable regulatory approvals.
- Removal of the Misoperations reporting aspects from the standard.
- Modifications to the Guidelines and Technical Basis section to include more explanation and examples.

You do not have to answer all questions. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

Questions

1. Based on stakeholder input, the drafting team revised the definition of a Misoperation. The categories as well as the introductory sentence of the definition were modified for clarity. The introductory sentence indicates that a Misoperation pertains to 'the failure of an Element's composite Protection System to operate as intended.' Do you agree with the revised definition? If not, please provide specific suggestions for improvement.

   ☐ Yes
   ☐ No
   Comments:

2. Requirement R1 was revised to to provide more clarity regarding the responsibilities of the BES interrupting device owner and the Protection System owner (if they are different entities) when a Protection System operation occurs. Do you agree with these changes? If not, please provide specific suggestions for improvement.

   ☐ Yes
   ☐ No
   Comments:

3. The Measures and VSLs were revised to reflect changes to the requirements. Do you agree with these changes? If not, please provide specific reasons why not and alternative recommendations and justifications.

   ☐ Yes
   ☐ No
   Comments:

4. The drafting team modified the Guidelines and Technical Basis section to provide more supporting discussions, explanations, and examples for the various aspects of the standard. Do you have any specific suggestions for further improvements?

   ☐ Yes
   ☐ No
   Comments:

5. If you have any other comments on this Standard that you haven't already mentioned above, please provide them here:

   Comments:

Project 2010-05.1 – PRC-004-3: Protection System Misoperations

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-004-3 — Protection System Misoperations.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Protection System Misoperations Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

PRC-004-3 Protection System Misoperations is a revision of PRC-004-2a Analysis and Mitigation of Transmission and Generation Protection System Misoperations with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated. PRC-003-1 Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems required the Regions to establish procedures for analysis of Misoperations. In the NOPR, the Commission identified PRC-003-0 as a fill-in-the-blank standard. The NOPR stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2a.

PRC-004-3 has four (4) requirements that incorporate and enhance the intent of the requirements of PRC-004-2.1a and PRC-003-1. The revised standard requires entities to identify and review Protection System operations and designate each Misoperation; then investigate each Misoperation and document the findings. If a cause is identified, the entity either creates a Corrective Action Plan (CAP) or writes a declaration that they cannot correct the misoperating device(s). If a cause is not identified, the entity either creates an action plan for additional investigation or a writes a declaration that no further work will be done. The next step is to implement and complete the CAP or action plan. If the action plan leads to the determination of a cause, then the entity would either create a Corrective Action Plan (CAP) or write a declaration. The requirements recognize and encompass the possibility that components of a Protection System can be owned by different entities.

The requirements of PRC-004-3 do not map, one-to-one, with the requirements of the legacy standards. The new requirements comingle various reliability attributes of the legacy standards with new reliability objectives, thus a requirement-to-requirement comparison of VRFs is not possible. In developing the new VRFs for the requirements of PRC-004-3, the Standard Drafting Team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. The VRFs of the FERC approved PRC-004-WECC-1, EOP-008-1, PRC-004-2a and of TPL-001-2 influenced (citing FERC VRF Guideline 3) the drafting team's VRF decisions, as such, the VRFs for PRC-004-3 Requirements R1, R2 and R3 are assigned a VRF of Medium, while Requirement R4 is assigned a VRF of High.

PRC-004-3 Requirements R1, R2 and R3 are related to identifying Protection System operations, designating Misoperations, investigating Misoperations and developing Corrective Action Plans (CAP) or action plans. The SDT determined that the assignment of a VRF of Medium was consistent with the NERC criterion that states "A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures…"

PRC-004-3 Requirement R4 relates to implementing and completing CAPs or action plans. The SDT determined that the assignment of a VRF of High was consistent with the NERC criterion that states "A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures…"

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF and VSL Justifications – PRC-004-3, R1	
Proposed VRF	Medium
NERC VRF Discussion	Failure to identify and review each Protection System operation to designate Misoperations, investigate each Misoperation and document the findings could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. Unresolved Misoperations could contribute to more severe future disturbances affecting a wider area, or result in equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The applicable entities are always responsible for maintaining the reliability of the bulk electric system regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The requirement has Parts that all support the reliability objective so only one VRF was assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: The SDT has assigned a Medium VRF which is consistent with EOP-008-1 Requirement R8 (which is similar in nature to PRC-004-3 Requirement R1.)
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to identify and review each Protection System operation to designate Misoperations, investigate each Misoperation and document the findings could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. Unresolved Misoperations could contribute to more severe future disturbances affecting a wider area, or result in equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The applicable entities are always responsible for maintaining the reliability of the bulk electric system regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; the assigned VRF of Medium is consistent throughout the requirement.

Project 2010-05.1 – PRC-004-3: Protection System Misoperations

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-004-3 — Protection System Misoperations.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Protection System Misoperations Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.
In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities

- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.
PRC-004-3 Protection System Misoperations is a revision of PRC-004-2a Analysis and Mitigation of Transmission and Generation Protection System Misoperations with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated. PRC-003-1 Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems required the Regions to establish procedures for analysis of Misoperations. In the NOPR, the Commission identified PRC-003-0 as a fill-in-the-blank standard. The NOPR stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2a.

PRC-004-3 has four (4) requirements that incorporate and enhance the intent of the requirements of PRC-004-2.1a and PRC-003-1. The revised standard requires entities to identify and review Protection System operations and designate each Misoperation; then investigate each Misoperation and document the findings. If a cause is identified, the entity either creates a Corrective Action Plan (CAP) or writes a declaration that they cannot correct the misoperating device(s). If a cause is not identified, the entity either creates an action plan for additional investigation or a writes a declaration that no further work will be done. The next step is to implement and complete the CAP or action plan. If the action plan leads to the determination of a cause, then the entity would either create a Corrective Action Plan (CAP) or write a declaration. The requirements recognize and encompass the possibility that components of a Protection System can be owned by different entities.

The requirements of PRC-004-3 do not map, one-to-one, with the requirements of the legacy standards. The new requirements comingle various reliability attributes of the legacy standards with new reliability objectives, thus a requirement-to-requirement comparison of VRFs is not possible. In developing the new VRFs for the requirements of PRC-004-3, the Standard Drafting Team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. The VRFs of the FERC approved PRC-004-WECC-1, EOP-008-1, PRC-004-2a and of TPL-001-2 influenced (citing FERC VRF Guideline 3) the drafting team's VRF decisions, as such, the VRFs for PRC-004-3 Requirements R1, R2 and R3 are assigned a VRF of Medium, while Requirement R4 is assigned a VRF of High.

PRC-004-3 Requirements R1, R2 and R3 are related to identifying Protection System operations, designating Misoperations, investigating Misoperations and developing Corrective Action Plans (CAP) or action plans. The SDT determined that the assignment of a VRF of Medium was consistent with the NERC criterion that states "A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures…"

PRC-004-3 Requirement R4 relates to implementing and completing CAPs or action plans. The SDT determined that the assignment of a VRF of High was consistent with the NERC criterion that states "A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures…"

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF and VSL Justifications – PRC-004-3, R1	
Proposed VRF	Medium
NERC VRF Discussion	Failure to identify and review each Protection System operation to designate Misoperations, investigate each Misoperation and document the findings could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. Unresolved Misoperations could contribute to more severe future disturbances affecting a wider area, or result in equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The applicable entities are always responsible for maintaining the reliability of the bulk electric system regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The requirement has Parts that all support the reliability objective so only one VRF was assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: The SDT has assigned a Medium VRF which is consistent with EOP-008-1 Requirement R8 (which is similar in nature to PRC-004-3 Requirement R1.)
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to identify and review each Protection System operation to designate Misoperations, investigate each Misoperation and document the findings could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. Unresolved Misoperations could contribute to more severe future disturbances affecting a wider area, or result in equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The applicable entities are always responsible for maintaining the reliability of the bulk electric system regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.

A. Introduction

1. **Title: Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems**

2. **Number:** PRC-003-1

3. **Purpose:** To ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated.

4. **Applicability**

   4.1. Regional Reliability Organization

5. **Effective Date:** May 1, 2006.

B. Requirements

R1. Each Regional Reliability Organization shall establish, document and maintain its procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations. These procedures shall include the following elements:

R1.1. The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).

R1.2. Data reporting requirements (periodicity and format) for Misoperations.

R1.3. Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.

R1.4. Identification of the Regional Reliability Organization group responsible for the procedures and the process for approval of the procedures.

R2. Each Regional Reliability Organization shall maintain and periodically update documentation of its procedures for review, analysis, reporting, and mitigation of transmission and generation Protection System Misoperations.

R3. Each Regional Reliability Organization shall distribute procedures in Requirement 1 and any changes to those procedures, to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners within 30 calendar days of approval of those procedures.

C. Measures

M1. The Regional Reliability Organization shall have procedures for the review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations as defined in R1.

M2. The Regional Reliability Organization shall have evidence it maintained and periodically updated its procedures for review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations as defined in Requirement 2.

M3. The Regional Reliability Organization shall have evidence it provided its procedures for the review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners as defined in Requirement 3.

D. Compliance

1. **Compliance Monitoring Process**

1.1. Compliance Monitoring Responsibility

NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The Regional Reliability Organization shall retain documentation of its procedures for analysis of transmission and generation Protection System Misoperations and any changes to those procedures for three years.

The Compliance Monitor shall retain any audit data for three years.

1.4. Additional Compliance Information

The Regional Reliability Organization shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Levels of Non-Compliance

2.1. Level 1: Procedures were not reviewed and updated within the review cycle period as required in R2.

2.2. Level 2: Procedures did not include one of the elements defined in R1.1 through R1.4.

2.3. Level 3: Procedures did not include two or more of the elements defined in R1.1 through R1.4.

2.4. Level 4: There shall be a level four non-compliance if either of the following conditions exist:

2.4.1 No evidence of Procedures.

2.4.2 Procedures were not provided to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners as defined in R3.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to “en dash” (–) and “em dash (—).” 2. Added “periods” to items where appropriate. 3. Changed “Timeframe” to “Time Frame” in item D, 1.2.	01/20/06

A. Introduction

1. **Title: Analysis and Mitigation of Transmission and Generation Protection System Misoperations**

2. **Number:** PRC-004-1a

3. **Purpose:** Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated.

4. **Applicability**

   4.1. Transmission Owner.

   4.2. Distribution Provider that owns a transmission Protection System.

   4.3. Generator Owner.

5. **Effective Date:** To be determined

B. Requirements

R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's procedures developed for Reliability Standard PRC-003 Requirement 1.

R2. The Generator Owner shall analyze its generator Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's procedures developed for PRC-003 R1.

R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Reliability Organization, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Reliability Organization's procedures developed for PRC-003 R1.

C. Measures

M1. The Transmission Owner, and any Distribution Provider that owns a transmission Protection System shall each have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Reliability Organization procedures developed for PRC-003 R1.

M2. The Generator Owner shall have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's procedures developed for PRC-003 R1.

M3. Each Transmission Owner, and any Distribution Provider that owns a transmission Protection System, and each Generator Owner shall have evidence it provided documentation of its Protection System Misoperations, analyses and Corrective Action Plans according to the Regional Reliability Organization procedures developed for PRC-003 R1.

D. Compliance

1. **Compliance Monitoring Process**

1.1. Compliance Monitoring Responsibility

Regional Reliability Organization.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The Transmission Owner, and Distribution Provider that own a transmission Protection System and the Generator Owner that owns a generation Protection System shall each retain data on its Protection System Misoperations and each accompanying Corrective Action Plan until the Corrective Action Plan has been executed or for 12 months, whichever is later.

The Compliance Monitor shall retain any audit data for three years.

1.4. Additional Compliance Information

The Transmission Owner, and any Distribution Provider that owns a transmission Protection System and the Generator Owner shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Levels of Non-Compliance for Transmission Owners and Distribution Providers that own a Transmission Protection System:

2.1. Level 1: Documentation of Misoperations is complete according to PRC-004 R1, but documentation of Corrective Action Plans is incomplete.

2.2. Level 2: Documentation of Misoperations is incomplete according to PRC-004 R1 and documentation of Corrective Action Plans is incomplete.

2.3. Level 3: Documentation of Misoperations is incomplete according to PRC-004 R1 and there are no associated Corrective Action Plans.

2.4. Level 4: Misoperations have not been analyzed and documentation has not been provided to the Regional Reliability Organization according to Requirement 3.

3. Levels of Non-Compliance for Generator Owners

3.1. Level 1: Documentation of Misoperations is complete according to PRC-004 R2, but documentation of Corrective Action Plans is incomplete.

3.2. Level 2: Documentation of Misoperations is incomplete according to PRC-004 R2 and documentation of Corrective Action Plans is incomplete.

3.3. Level 3: Documentation of Misoperations is incomplete according to PRC-004 R2 and there are no associated Corrective Action Plans.

3.4. Level 4: Misoperations have not been analyzed and documentation has not been provided to the Regional Reliability Organization according to R3.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to “en dash” (–) and “em dash (—).” 2. Added “periods” to items where appropriate. Changed “Timeframe” to “Time Frame” in item D, 1.2.	01/20/06
1	February 7, 2006	Adopted by the Board of Trustees	
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by the Board of Trustees	
1a	September 26, 2011	FERC Order issued approving the interpretation of R1 and R3 (FERC’s Order is effective as of September 26, 2011)	

Appendix 1

Requirement Number and Text of Requirement
R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's procedures developed for Reliability Standard PRC-003 Requirement 1. **R3**. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Reliability Organization, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Reliability Organization's procedures developed for PRC-003 R1.
Question:
Is protection for a radially-connected transformer protection system energized from the BES considered a transmission Protection System subject to this standard?
Response:
The request for interpretation of PRC-004-1 Requirements R1 and R3 focuses on the applicability of the term "transmission Protection System." The NERC Glossary of Terms Used in Reliability Standards contains a definition of "Protection System" but does not contain a definition of transmission Protection System. In these two standards, use of the phrase transmission Protection System indicates that the requirements using this phrase are applicable to any Protection System that is installed for the purpose of detecting faults on transmission elements (lines, buses, transformers, etc.) identified as being included in the Bulk Electric System (BES) and trips an interrupting device that interrupts current supplied directly from the BES. A Protection System for a radially connected transformer energized from the BES would be considered a transmission Protection System and subject to these standards only if the protection trips an interrupting device that interrupts current supplied directly from the BES and the transformer is a BES element.

A. Introduction

1. **Title:** Analysis and Mitigation of Transmission and Generation Protection System Misoperations

2. **Number:** PRC-004-2

3. **Purpose:** Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated.

4. **Applicability**

   4.1. Transmission Owner.

   4.2. Distribution Provider that owns a transmission Protection System.

   4.3. Generator Owner.

5. **(Proposed) Effective Date:** The first day of the first calendar quarter, one year after applicable regulatory approval; or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter one year after Board of Trustees' adoption.

B. Requirements

R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.

R2. The Generator Owner shall analyze its generator Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.

R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.

C. Measures

M1. The Transmission Owner, and any Distribution Provider that owns a transmission Protection System shall each have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.

M2. The Generator Owner shall have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.

M3. Each Transmission Owner, and any Distribution Provider that owns a transmission Protection System, and each Generator Owner shall have evidence it provided documentation of its Protection System Misoperations, analyses and Corrective Action Plans according to the Regional Entity's procedures.

D. Compliance

1. **Compliance Monitoring Process**

   1.1. Compliance Enforcement Authority

   Regional Entity.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

The Transmission Owner, and Distribution Provider that own a transmission Protection System and the Generator Owner that owns a generation Protection System shall each retain data on its Protection System Misoperations and each accompanying Corrective Action Plan until the Corrective Action Plan has been executed or for 12 months, whichever is later.

The Compliance Monitor shall retain any audit data for three years.

1.5. Additional Compliance Information

The Transmission Owner, and any Distribution Provider that owns a transmission Protection System and the Generator Owner shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Violation Severity Levels (no changes)

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking

1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to “en dash” (–) and “em dash (—).” 2. Added “periods” to items where appropriate. Changed “Timeframe” to “Time Frame” in item D, 1.2.	01/20/06
2	TBD	Modified to address Order No. 693 Directives contained in paragraph 1469.	Revised.

Standards Announcement

Project 2010-05.1 Protection Systems: Phase 1 (Misoperations) PRC-004-3

Successive Ballot and Non-Binding Poll is now open through February 20, 2013

Now Available

A successive ballot of **PRC-004-3** and non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) is now open **through 8 p.m. Eastern on Wednesday, February 20, 2013**.

Instructions
Members of the ballot pools associated with this project may log in and submit their vote for the standard and non-binding poll of the associated VRFs and VSLs by clicking here.

Next Steps
The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a recirculation ballot.

Background
PRC-004-3 Protection System Misoperations is a revision of PRC-004-2a Analysis and Mitigation of Transmission and Generation Protection System Misoperations with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated. PRC-003-1 Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems required the Regions to establish procedures for analysis of Misoperations. In the NOPR, the Commission identified PRC-003-0 as a fill-in-the-blank standard. The NOPR stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2a.

Project 2010-05.1 is an important part of the ERO's strategic goal to develop technically sufficient standards with requirements that provide clear and unambiguous performance expectations and reliability benefits.

Standards Development Process

The Standards Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Standards Announcement

Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)
PRC-004-3

Formal Comment Period Open: January 22, 2013 – February 20, 2013

Upcoming:
Successive Ballot and Non-Binding Poll: February 11-20, 2013

Now Available

A formal comment period for **PRC-004-3 – Protection System Misoperation Identification and Correction** is now open through 8 p.m. Eastern on **Wednesday, February 20, 2013**.

A successive ballot of **PRC-004-3** and non-binding poll of the associated VRFs and VSLs will be conducted beginning on **Monday, February 11, 2013 through 8 p.m. Eastern on Wednesday, February 20, 2013**.

Instructions
Members of the ballot pools associated with this project may log in and submit their vote for the standard and non-binding poll of the associated VRFs and VSLs by clicking here.

Next Steps
The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a recirculation ballot.

Background
PRC-004-3 Protection System Misoperations is a revision of PRC-004-2a Analysis and Mitigation of Transmission and Generation Protection System Misoperations with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated. PRC-003-1 Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems required the Regions to establish procedures for analysis of Misoperations. In the NOPR, the Commission identified PRC-003-0 as a fill-in-the-blank standard. The NOPR stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2a.

Project 2010-05.1 is an important part of the ERO's strategic goal to develop technically sufficient standards with requirements that provide clear and unambiguous performance expectations and reliability benefits.

PacifiCorp believes that the definition used for a Slow Trip During Fault misoperation on Page 4 should be amended to provide more clarity. The current definition reads as follows: “Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high-speed performance has not been identified to meet the dynamic stability performance requirements of the TPL standards nor is it required to ensure coordination with other Protection Systems.” PacifiCorp suggests changing “identified to meet” to “identified as necessary to meet.”
No
In the second draft of PRC-004-3 PacifiCorp commented that the 120-day time limit in R1 is insufficient. PacifiCorp maintains that when two registered entities are involved in the interrupting device operation, 120 days is not enough time for both entities to complete the activities required by the requirement. PacifiCorp proposes an increase of 60 days for each entity to complete their respective activities in sequence. This would increase the total from 120 to 180 in R1.
No
PacifiCorp is concerned that the VSLs are not commensurate with the reliability risk of the associated violations. In many cases, the difference between a “Lower” and a “Severe” VSL is an arbitrary additional number of days during which the reporting or documentation requirement was not satisfied. The fact that a report is an additional 30 days late should not increase the VSL from “Lower” to “Severe.” A later report does not increase the likelihood of additional adverse impact to the BES. A registered entity’s failure to remediate a protection issue is much more critical. A more reasonable timeframe for the VSLs would be 20 days per severity level instead of the proposed 10 days. PacifiCorp recognizes that the drafting team has made this change for the “Lower” VSL in Draft 3, but the remaining VSLs still reflect the 10 day timeframe. Moreover, in keeping with PacifiCorp’s comment under Question 1, the “Lower” VSL should be amended from 120 calendar days to 180 calendar days to allow each entity enough time to complete their respective activities before incurring a violation of the standard.

I suggest using the word “entire” versus “composite” for clarity sake. composite (adj) Merriam Webste of or relating to a very large family entire (adj) Merriam Webster having no element or part left out ELEMENT NERC Glossary Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components.
Yes
Yes
Yes
Prefer the term "entire" to "composite" again for clarity sake since entire seems more intuitive in nature rather than composite which requires some anylitical thought to apply it. Example, a transformers entire protection system is slow to operate. Versus, a transformers composite protection system is slow to operate.

Midwest Reliability Organization NERC Standards Review Forum (NSRF)
Russel Mountjoy
No
The NSRF would like to see a RSAW for this particular standard to better understand what level of review and or evidence, if any, auditors will require to determine that you assessed your operations adequately for R1. For instance if you didn’t have certain monitoring equipment that captures data for protection system elements, then the data available would be limited for assessing slow trips.
No
The NSRF believes there should be exception for Acts of Nature such as tornados, ice storms and other natural disasters with, at minimum, the 120 day rule being waived. In previous comments the SDT agreed with this concern but did not add this exception. A wide spread thunderstom with heavy lightning can set off multiple trips and recloses in a short time. There should be a process to excempt such events. Please verify that reclosing relays are not within scope of this Reliability Standard.
Yes
The NSRF appreciates the addition of the Application Guide at the end of the Standard. The Application Guide will help NERC, the Regional Entities and Registered Entities to move away from a zero defact CMEP process.
For R2, depending on time of year, budget cycle, scope of work, 60 days is not sufficient to obtain funding for CAPs for some entities. Also, the first bullet under R2 would require evaluation of the applicability of all CAPs to all BES locations which, depending on the CAP, could be overly burdensome. As worded, a wiring or setting error would require that all wiring and all settings at all BES locations be checked. The evaluation should be limited to CAPs related to scheme logic or relay design deficiencies.

Please consider clarification of the terms “BES Protection System”, “Protection System”, “BES interrupting device” and “interrupting device” throughout the proposed standard. Specifically in R1.1

the proposed requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning] 1.1 Within 120 calendar days of a BES interrupting device operation in its Facility caused by a Protection System operation, identify and review each Protection System operation. The wording of this requirement infers that the proposed standard is intended to include investigation of non-BES protection systems that cause the operation of a BES interrupting device. While such investigation is sound business practice, it may be outside the intended scope of the standard. An example would be the operation of a load serving transformer (say a 230kv to 13.2 kv unit) differential Protection System that operates both a BES interrupting device (a 230kv circuit breaker) and a non-BES interrupting device (a 13.2kv circuit breaker). The stated purpose of this standard is to “Identify and correct the causes of Misoperations of Bulk Electric System (BES) Protection Systems” and is supported by the terminology used in the opening paragraph of the Background statement and the content of the Compliance section. Operation of a load serving facility protection system normally will have no impact on the reliability of the BES unless its failure to operate results in a subsequent operation of a BES bus differential Protection System or BES transmission element Protection System, for example. A similar argument can be offered for operation of protection system on non-BES radial lines and local network that cause operation of a high-side interrupting device which may also be part of a BES Protection System. Based on this line of thinking, it is proposed that the wording of requirement 1.1 be revised to state “Within 120 calendar days of an interrupting device operation in its Facility caused by a BES Protection System operation, identify and review each BES Protection System operation.” The wording of Requirements R1.2 and R3 should also be modified for consistency.
Yes
No
As noted in the response regarding R1. We believe that the specific terms need to be clarified in R3 as well to clarify the intended scope of covered situations.

6. Unnecessary Trip - Other Than Fault: ...is not intended to operate. An Operation caused by on-site maintenance, testing, inspection, construction or commissioning activities on the designated Protection System are not considered as a Misoperation. alternatively: ...is not intended to operate. Operation of a Protection System that is not the focus of on-site maintenance, testing, inspection, construction or commissioning activity is considered a Misoperation. Suggested to highlight the second sentence in the 4th paragraph for defintition 6 in the Application Guidelines.
Yes
While reporting falls under 1600, should PRC-004 clarify which of the two should file the Misoperation?
Yes
No

No
The Protection System component owner who does not also own the interrupting device may be placed in a non-compliant situation through no fault of their own. Their compliance is contingent upon a timely notification from the owner of the BES interrupting device. If the notification is not made in a timely fashion to allow for investigation the Protection System component owner would be non-compliant for not conducting an investigation and documenting the findings within 120 days. For this situation the BES interrupting device owner should have an abbreviated time frame to notify the Protection System component owner to provide sufficient time to collect the appropriate information and investigate the operation. Conversely, the owner of the Protection System component could be granted more time to investigate (i.e. 120 days from the notification by the BES interrupting device owner). A misoperation investigation if Protection Systems are shared between two or more entities is often a joint effort. The Application Guide clearly defines that “it is expected that both entities will work together to investigate the cause of the operation”, which is desired. This is not clearly defined in R1 and should be clarified. The Application Guide should indicate that this notification should be done as soon as possible.
No
We agree with the content of all the measures and VSLs, however measure M1 would have to be modified accordingly to coincide with the modifications suggested in question 2 above.
No
The Compliance Section of Standard has “The Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System shall retain evidence for all Misoperations with an open investigation, action plan, or CAP even if the BES interrupting device operation occurred prior to the current audit period.” The word “open” should precede not only investigation, but action plan and CAP for clarity. It should be made to read “open investigation, open action plan, or open CAP even if the BES interrupting device operation occurred prior to the current audit period”. What is an Entity’s compliance obligation for an open investigation or open action plan that occurred prior to regulatory approval of this Standard but in the current audit period of an entity? The new standard establishes specific time limits. If an entity has an operation to investigate the day prior to the compliance obligation date, does the 120 day time limit apply the day the Standard is obligatory? Regarding the Implementation Plan for Requirements R1, R2, R3 and R4: “Entities shall be 100% compliant for any new Protection System Operation on the first day of the first calendar quarter twelve months” (this is the compliance obligation date) “following applicable regulatory approvals, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter twelve months following Board of Trustees adoption. Protection System operations that occur before the compliance date shall comply with the previous version of the Standard.” In this section of the Implementation Plan, what is meant by “new”? Is “new” any operation that occur after the compliance obligation date, or during the window of implementation between regulatory approval and compliance obligation date?

a. (This is the single issue causing us to vote negative.) Many generating units with legacy electromechanical protective relay based protection systems do not have DME for high-speed recording of relay-operation events. Although the generating circuit breakers may be on the HV side of GSU transformers and may be monitored via the associated substation DME, the initiating signals from protective relays on the generator side of the GSU may not provide an input or trigger signal to the substation DME. As such, there is little or no value in requiring Generator Owners to try to identify and analyze slow trip events when such data to perform the analysis is not required to be available. In particular, we are concerned that examples provided in the Slow to Trip – Other than Fault bullet of the Misoperation definition (undervoltage, over excitation and loss of excitation) point explicitly toward application of this portion of the definition towards Generator Owners. We are concerned how various auditors may judge entirely qualitative evaluations of the adequacy of GO Protection System performance for Slow to Trip – Other than Fault events when DME is not available, nor required, to quantify performance. b. Under "Slow Trip - During Fault", is the phrase “Delayed Fault clearing"

intended to be the same as the Glossary term “Delayed Fault Clearing”? If not, the similarity of the existing usage with the defined term introduces ambiguity and confusion about intent. Suggest rewording the second sentence under "Slow Trip - During Fault" to eliminate this potential confusion. Note that similar confusion between the term “Delayed Clearing” used in TPL Standards and the Glossary term “Delayed Fault Clearing” resulted in the NERC Interpretation Request 2012-INT-02.
Yes
Yes
No
It is important to be able to see the draft RSAW, as it relates to what kind of evidence, if any, would be required to demonstrate accurate assessment of a slow trip. This could be particularly problematic, as not all have DME installed to be able to capture data to be able to measure both the start and stop of the operation.

R1 addresses the situation where a BES interrupting device operation may be the result of the operation of a Protection System operation owned by an entity that does not own the BES interrupting device. As written, the owner of the BES interrupting device has no deadline to notify the owners of other Protection Systems when cannot determine that the Protection System operation was correct (the second bullet in Part 1.1). R1 presently allows 120 calendar days in total for the owner of the BES interrupting device to notify the other Protection System owners and for those other owners to determine if their Protection System operated correctly and if they did not, to document each Misoperation, including a cause if one can be identified. As drafted, the owner of the BES interrupting device could notify the other Protection System owners on the 119th day following the operation of its interrupting device, making it impossible for those other Protection System owners to perform their required analysis by the 120th day. The change identified to Part 1.1 below requires the owner of the BES interrupting device to make a notification to the other Protection System owners within 60 calendar days of the operation of its BES interrupting device if the situation described above occurs. The changes to Part 1.2 below allows either Protection System owner 90 calendar days to document the findings of each Protection System Misoperation that may have occurred, making the total number of days allowed from the date of the operation of the BES interrupting device 150 calendar

days. Only 30 calendar days has been added to the timeline, but this additional 30 days is needed to correct the potential inequity for owners of Protection Systems that do not own the BES interrupting device to complete their analysis. For consistency, 30 calendar days was added to the R3 timeline of 180 days, making it 210 days from the date of the operation of the associated BES interrupting. R2 is unchanged, but is shown for completeness. We have also added a provision in a footnote that allows a Regional Entity to extend deadlines that are referenced to the operation date of a BES interrupting device for instances such as natural disasters. Personnel that might normally evaluate the operation of a Protection System may not be available to do so due to their involvement in restoration efforts. Here is our suggested changes. Additional language is CAPITALIZED. R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning] 1.1 Within [delete "120"] 60 calendar days of a BES interrupting device operation in its Facility caused by a Protection System operation, identify and review each Protection System operation AND [FOOTNOTE 1];. • If the entity owns both the BES interrupting device and the Protection System, determine if it was a correct operation or a Misoperation, OR;. • If the entity owns the BES interrupting device but does not own all of the Protection System and cannot determine that the Protection System operation was correct, then notify the other owner(s) of the Protection System component(s) and provide any requested investigative information. o The Protection System component owner(s) that was notified by the BES interrupting device owner shall determine if there was a correct operation or a Misoperation of their component. FOOTNOTE 1: Such 60 day period and subsequent periods in the standard that have a deadline that references the operation date of a BES interrupting device may be extended by the Regional Entity for instances such as a natural disaster. 1.2 Within the same [delete "120 day period"] 150 CALENDAR DAYS of a BES interrupting device operation caused by a Protection System operation, the owner of the Protection System component identified as contributing to the Misoperation shall investigate and document the findings for each Misoperation including a cause, if identified. R2. Each Transmission Owner, Generator Owner, or Distribution Provider shall, within 60 calendar days of identifying the cause of each Misoperation: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-Term Planning] • Develop a Corrective Action Plan (CAP) for the identified Protection System component(s) that includes an evaluation of the CAP's applicability to the entity's Protection Systems at other locations, or • Explain in a declaration why corrective actions are beyond the entity's control or would reduce BES reliability. R3. Each Transmission Owner, Generator Owner, or Distribution Provider shall, within 180 210 calendar days of the associated BES interrupting device operation, complete for each Misoperation without an identified cause: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-Term Planning] • Development of an action plan that identifies any additional investigative actions and/or Protection System modifications, including a work timetable, or • A declaration explaining why no further actions will be taken.

M1 – DME is not defined. M3 - What was the reason for removing the words at the end 'explaining why no further investigation or actions will be taken' - these words are helpful and should be retained. VSLs – R1 – Severe VSL – the final option in this column seems to suggest that you would need both a failure to notify the other owners AND a failure to provide any investigative information. It doesn't contemplate a situation where an entity may have notified the other owners but failed to provide investigative information.

No
Background - The words 'by requiring applicable entities to' would make sense after the words "The proposed requirements of the revised Reliability Standard PRC-004-3 meets the following objectives". Moreover, the terms Special Protection Systems, Remedial Action Schemes and Under-Voltage Load Shedding are used at the end of the Background section when these terms have already had acronyms attached to them above. R2 - the words 'If a cause is identified' after the words 'cause(s) of each Misoperation' would be helpful. The way It reads, R2 is only applicable if a cause is identified and R3 is applicable if a cause if not identified so the Measures for each should be drafted in a way that makes that point clear. R3 – the words 'caused by a Protection System operation' should be added after BES interrupting device operation to make the wording consistent with the other requirements. R4 – In reading the rationale for R4, it states that if a cause of a Misoperation is determined when implementing the action plan, you go back to R2 and develop a CAP. This isn't evident on the face on the wording of the standard and the Rationale will be deleted going forward. R4/M4 – should be consistent with use of 'and' or 'or' when referring to the CAP and action plan, perhaps best option is to use 'and/or'. Compliance – 1.1 – Manitoba Hydro has never before seen a reference to the definition of CEA per the NERC Rules of Procedure in this section, it seems unnecessary. Compliance - the phrase BES Protection System is elsewhere referred to as Protection System for Facilities that are part of the BES which seems more accurate and should be consistently used.

The topic of slow trips should be removed from PRC-004-3 and the proposed re-definition of a Misoperation, for the following reasons: -The standard incorrectly assumes that every NERC-registered generation unit is required to have DME for high-speed recording of relay-operation events. -Where DME is present it is generally installed on the HV side of a unit, and may therefore not yield any useful information for problems occurring at the generator or other low-side components. -The standard incorrectly assumes that all GOs have, or should have, design-level relay personnel, ref. the Application Guidelines statements regarding being able to decide whether the speed of the Protection System was adequate (pp. 15 and 16). -Independent GOs in particular have finite resources, and mandating an unreasonable focus on Protection System event record-keeping and analysis will leave other operation and maintenance tasks that much less well covered, resulting in a negative impact on reliability.
No
The requirement R1 can be simplified by wording it in this manner: "Each entity shall identify, review, investigate, classify, document, and, for misoperations, determine the cause (if identified) of each Protection System operation that they own…" by the required time frame. There is a timing problem with R1.2 for the Protection System owner who is notified on day 119 following a Protection System operation. It is not reasonable or just to require this Protection System owner to complete the requirements of R1 in one day's time after being notified by the owner of an interrupting device whose operation was suspected to be caused by a Misoperation of another entity's Protection System. The evidence listing in M1 is unnecessarily duplicative. Measure M1 (and likewise all of R1) could be greatly simplified by stating that the required evidence for proving compliance with R1 may include, but is not limited to …then list the items once.

The standard should completely exclude operation of reverse power relays when shutting-down units, or (better) classify such devices as not being part of Protection Systems (they do not protect BES equipment; they prevent turbine mechanical damage). This subject is discussed in the Application Guidelines (p.17), but the distinction attempted between control and protection functions of reverse power relays is obscure.
There is too much bookkeeping required in the Requirements. We recommend deleting all date clocks

linked to each event and replace them with a final resolution time limit for action plans/CAPs and/or replace them with a filing date deadline to identify, review, and disposition of each operation for each event. The establishment of multiple time frames for each detail of a Protection System operation will not improve reliability; the completion of any necessary Corrective Action Plans are the actions which will affect the reliability of the Protection System operations. In various locations of the draft, Protection System misoperations are discounted as misoperations for situations where other redundant protection may have adequately operated. In these instances, perhaps the classification should be changed to non-reportable misoperation rather than simply that they are not Misoperations. The three bullets found at the top of page 6 of draft 3 of the standard should be the three requirements of this standard. Has any consideration been given to making those three items the actual requirements?

This Standard allows 120 days for the entity to investigate the operation. We do not feel that this activity warrants a severe violation factor if only 1 operation was investigated 50 days later. We agree that if an activity has a significant impact on the BES than the violation severity level should be higher. In this case, however, immediate action is not required and therefore we disagree with the severe violation penalty suggested by the drafting team. We suggest that the penalty for not investigating an operation timely should only qualify for a moderate VSL given immediate (within 1 hour or 1 day) activity is not required. We feel investigation of all operations and determination and implementation of correction misoperations is important to the long-term reliability of the BES. However, the system should be designed with redundancies to resolve any short-term issues and this Standard, while important, is designed to ensure long-term protection. Furthermore, we are not aware of any company who feels that the violation severity level determines whether they comply or not. Our organization strives to comply with all Standards with no violations, regardless of the violation severity level.

There is a lack of clarity on which entity is responsible for developing and implementing a CAP. We agree with the revision to Requirement R1, but believe that there needs to be corresponding revisions to R2 and R3 to clearly indicate which entity needs to be held responsible, expecially in view of the rationale provided in the text box for R1, whose excerpt says: “The owner of the component that contributed to the Misoperation will create the CAP, action plan or declaration required by Requirements R2 and R3”. We interpret the quoted excerpt (above) to mean that the component that contributed to the Misoperation may not be owned (in full or in part) by the owner of the BES interrupting device. It follows that in such cases, the owner of the component that contributed to the Misoperation is responsible for complying with R2 and R3. If this interpretation is correct, then Requirements R2 and R3 are not clear as to which entity is held responsible. To clarify this, we suggest to revise the leading part of R2 to: “Each Transmission Owner, Generator Owner, or

Distribution Provider that owns the component that contributed to the Misoperation shall, within 60 calendar days of identifying….”. The Same revision should apply to R3, as follows: “Each Transmission Owner, Generator Owner, or Distribution Provider that owns the component that contributed to the Misoperation shall, within 180 calendar days of of the associated BES interrupting device operation,…..” Further, though not explicitly stated, we assume that the owner of the component that contributed to the Misoperation is also held responsible for complying with R4 to implement and complete the CAP or action plan to accomplish all identified objectives. Hence, the same qualifier should also be added to Requirement R4.
No
As we noted in our comments in the previous draft, the VSLs should recognize that some relay misoperations place a greater risk/impact on the BES than others.

Although supportive of the proposed revisions to the definition of Misoperation, LES is concerned that the phrase “slower than intended” within the definition of a “Slow Trip – During Fault” may lead to unnecessary administrative work in an effort to prove what is considered an acceptable operation time for each Protection System. To avoid requiring entities to develop documentation stating “how fast is fast enough”, recommend modifying the Application Guidelines as follows: (3) …The phrase “slower than intended” means the Protection System operated slower than the objective of the owner(s). It would be impossible to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent additional harm, and ultimately be able to decide whether the speed or outcome of its Protection System operation was adequate. [The intent is not to require documentation of adequate Protection System operation times, but to assure consideration by the owner(s) reviewing each Protection System operation.]
No
LES recommends additional clarification be provided regarding the statement in R1.1 to “identify and review each Protection System operation”. As currently written, it is unclear how an entity would comply with R1.1 in the event that an incident involves multiple breaker operations with automatic reclosing, but were the result of a single cause. In such a scenario, would the entity be required to maintain separate documentation for investigation, designation, etc for each breaker operation?

ATC believes that the investigation for relay misoperation should be performed by the owner of the initiating relay as opposed to the interrupting device owner for the following reasons: • By definition, “Circuit breaker and other interrupting device mechanisms are not part of a Protection System”. As such, PRC-004 should not require the interrupting device owner to be responsible for R1. • PRC-004 is

based on Protection System operation, not breaker operation. • Bus design can have multiple breakers owned by different entities but the ownership of the initiating relay is clear. • The BES interrupting device owner lacks the information that the protective relay owner has to be able to perform a root cause analysis of a misoperation.

It is not appropriate to make the owner of the interrupting device responsible to investigate Protection System operations. Interrupting devices as such are not components of a Protection System as defined by NERC. Responsibility for this investigation should be solely with the owner of the Protection System initiating the operation, and/or the owner of the Protection System which failed to operate.
No
Since owners of BES Protection Systems will be required by this standard to review all operations, it would be helpful to define the term "Protection System operation", at least as it is used in this standard.

Under R4 there is confusion when the words "complete" is used. It should be stated (here and in the requirement) that an entity can extend the 180 days to complete if they have supporting documentation, i.e., parts on order, work orders, etc.
: As written in R1.1, if a BES generator's normal shut down cycle is caused by a Protection System operation (a set trip point in the relay) then each shut down would be required to be "identified and reviewed". This is similar to issues that a generator operator has under Project 2011-INT-02 AVR control during start up and shut down. MGE recommends that either a footnote be provided to address the exclusion of normal shut down processes or add another bullet excluding a generators normal shut down processes where the unit's breaker is activated via a set point within the Protection System (i.e., relay). R4 could be viewed as allowing for CAPs to be extended beyond 180 days (the maximum days in the combonation of R1 and R2). If this is the intent of the SDT, then clearly state this within the requirement. As written, an entity could be in violation of the maximum time frame of 180 days by extending the CAP under R4.

The following changes are suggested: R1 – Add a Lower VSL condition that states, "The responsible entitiy failed to identify and review at least 2% or 2 (whichever is greater) Protection System

operations that operated one of its BES interrupting devices in accordance with Requirement R1, Part 1.1". Add a Moderate VSL condition that states, "The responsible entitiy failed to identify and review at leastr 3% or 3 (whichever is greater) Protection System operations that operated one of its BES interrupting devices in accordance with Requirement R1, Part 1.1". Add a High VSL condition that states, "The responsible entitiy failed to identify and review at least 4% or 4 (whichever is greater) Protection System operations that operated one of its BES interrupting devices in accordance with Requirement R1, Part 1.1". Modify the 2nd Severe VSL condition with, "The responsible entitiy failed to identify and review at least 5% or 5 (whichever is greater) Protection System operations that operated one of its BES interrupting devices in accordance with Requirement R1, Part 1.1". Eliminate the 2nd Lower VSL condition all together because it is redundant with the 1st Severe VSL condition that addresses performing the actions in accordance with Requirement R1, Parts 1.1 and 1.2 in more than 170 days. R2 – Eliminate the last Severe VSL condition that is listed because it is redundant with the 1st Severe VSL condition listed. R3 – Eliminate the last Severe VSL condition that is listed because it is redundant with the 1st Severe VSL condition listed. R4 – Eliminate the last Severe VSL condition that is listed because it is redundant with the 1st Severe VSL condition listed.
Yes
Exelon would like additional clarification added to the Application Guide regarding the inclusion of CAP corrective actions for addressing the application of the CAP to other Protection Systems owned by the utility. Specifically, the Guide should address that such a CAP can be considered complete once a program (required to address application of the CAP to other Protection Systems) is developed. Example 2 in the Application Guide exemplifies this notion. Additionally, application of the CAP to other Protection Systems owned by the utility should be considered fulfilled if an existing program (such as Protection System maintenance and testing practices) fulfill the actions necessary to address such a CAP.

We would like to see a RSAW for this particular standard to better understand what level of review and or evidence, if any, auditors will require to determine that you assessed your operations adequately for R1. For instance if you didn't have certain monitoring equipment that captures data for protection system elements, then the data available would be limited for assessing slow trips. Depending upon the guidance requested in the SPP comments (what will be required to prove that all faults have been analyzed) the time frames may become difficult to maintain especially during storm seasons. Likewise, the 60 days required to develop a corrective action once the cause is determined could become difficult for severe or extreme events. In extreme cases dynamic power flow models may need to be developed and applied to system studies before the CAP can be developed.

Requirement R1 places the responsibility on the BES interrupting device owner to investigate all operations initiated by a Protection System which trips the interrupting device. We vigorously disagree with this assignment of responsibility. The responsibility for R1 through R4 should be on the owner of the Protection System which initiated the tripping of the interrupting device, not the owner of the interrupting device. All previously approved versions of PRC-004 rightly place the responsibility for reviewing and analyzing Protective System operations on the owners of the Protective Systems, not the owners of the interrupting device. The interrupting device is, by definition, not even a component of a Protective System. Therefore, nowhere in this standard should compliance responsibility be assigned to the owner of an interrupting device. The entity who owns the interrupting device is not necessarily the one who owns the Protective System. For example, it is not uncommon for a generator to be interconnected to a TO switchyard, where the TO owns the breakers (interrupting devices) in the switchyard but the GO owns the Protection Systems protecting his generator unit. The GO Protection Systems trip the TO's breakers to isolate the unit from the system. The way the present standard is written the TO would be responsible for reviewing and identifying all GO protection initiated trips just because the TO owns the interrupting device. This is totally unreasonable. In a power plant, when a generator unit trips off line due to a plant Protective System operation lockout relays are employed to prevent re-energization of the unit until the cause of the trip can be determined. When this occurs, the investigation of this event should be initiated and pursued solely by the GO (i.e. the owner of the protective system that caused the tripping of the BES interrupting device) and not by the TO, who may happen to own the interrupting device. The GO may request data and information from the TO to assist in their investigation, however, all compliance responsibility for reviewing operations and identifying misoperations should solely rest on the owners of the Protective System(s) that initiated the trip of the BES facility (in this case the GO). In this case, involving the TO solely because they are the owner of the interrupting device places an unwarranted compliance burden on the TO. Although the TO may be aware that the interrupting device opened, they are not is a position to determine if it was opened due to a plant Protective System operation, or was opened due to a manually initiated trip of the unit as it was being taken offline, since the GO, rather than the TO, usually has operational control over these breakers. In order to properly assign compliance responsibility to the appropriate entities, and eliminate the unwarranted compliance obligation on the interrupting device owner, we would suggest re-wording R1 in either one of two ways: OPTION 1 - Preferred: (assign responsibility to each Protection System owner rather than to the interrupting device owner) R1.1 "Within 120 calendar days of the operation of an interrupting device(s) which interrupts a BES Facility (i.e., line terminal, transformer, generator unit, etc.) that was caused by a Protective System operation, each Transmission Owner, Generator Owner, and Distribution Provider, who owns a Protective System which is connected to trip the interrupting device(s) shall review the event to determine if their Protection System operation was correct, or a misoperation." With the above language the responsibility is clearly and properly assigned to the owner(s) of the Protective System(s) which initiated the tripping. We agree that if the owner of the relay that initiated the trip does not own all the remaining components of the associated Protection System (i.e., CTs or VT's) they may require assistance and support from the owners of those additional components to complete their analysis. However, the owner of the Protective System that initiated the trip should be the party responsible for analyzing if a protective system misoperation occurred. If in the course of that investigation they determine the cause was attributed to a component of the Protection System which they did not own (such as a blown VT fuse owned by others), they should notify the other party, who would in turn be responsible for appropriate corrective action. While retaining this approach for shared Protection Systems the remaining Parts of Requirement R1 will also need to be re-worded to remove references to the interrupting device owner. OPTION 2 - Alternate: (replace owner of the interrupting device with owner of the interrupted BES Facility) R1.1 "Within 120 calendar days of the interruption of a BES Facility (i.e., line terminal, transformer, generator unit, etc.) that was caused by a Protective System operation, the Transmission Owner, Generator Owner, and Distribution Provider, who owns the Facility that was interrupted shall identify and review each Protective System operation. If the entity owns both the BES Facility and the Protective System, determine if it was a correct operation, or a Misoperation. If the entity owns the BES Facility but does not own all of the Protective System and cannot determine that the Protection System operation was correct, then notify the other owner(s) of the Protective System component(s) and provide any requested investigative information. The Protective System component owner(s) that was notified by the Facility owner shall determine if there was a correct operation or a Misoperation of their component. 1.2 Within the same 120 day period of the

interruption of a BES Facility caused by a Protective System operation, the owner of the Protective System component identified as contributing to the Misoperation shall investigate and document the findings for each Misoperation including a cause, if identified." The above language is consistent with the way TADS and GADS data is entered (i.e. by the Facility Owners). In addition, the Protective System(s) which protect and trip a specific Facility are almost entirely owned by the owners of the Facility. This Option adequately addresses the example raised previously, eliminating the need to involve the TO for generator initiated trips. The only complication arises when dealing with transmission lines terminating between two separate companies. The line terminals at each end may be owned by each respective company but the line itself may be entirely owned by only one company. To overcome this deficiency, this proposed re-write of R1 uses the term "line terminal" in the parenthetical list of BES Facilities. This would make the owners of the Protective Systems on each respective line terminal responsible for the review and analysis of their systems rather than the owner of the line itself.
No
Measure M1 requires evidence "that documents the date and time of each applicable interrupting device operation and indicates when each related Protective System Operation was reviewed." Based on our comments from Question 2 and proposed re-wording of Requirement R1, Measure M1 should also be revised to require evidence "that documents the date and time that each BES Facility was interrupted due to the operation of a Protection System and the date the Protection System operation was reviewed."
Yes
On page 18 of the Guidelines and Technical Basis section it states "Requirement R1 places the responsibility on the BES interrupting device owner to investigate operations initiated by a Protection System. The drafting team believes the owner of the BES interrupting device that operated would be in the best position to analyze the Protection System Operation, determine if a Misoperation occurred, and perform the initial investigation to determine the cause of the Misoperation." Furthermore, on page 19 it states "Regardless of whether a cause is identified, the BES interrupting device owner must document the investigation …" Based on the arguments presented in our response to Question 2 we vigorously disagree with this assertion. When a Protective System operates, a means is provided to determine which protective component initiated the trip (i.e., relay targets, lockout relay operations, microprocessor relay event logs, etc.) The owners of these Protective System devices, which initiated the trip of the interruption device, are much better suited to investigate the cause of the Protective System operation than the owners of the interrupting device. In addition, all previously approved versions of PRC-004 rightly place the responsibility for reviewing and analyzing Protective System operations on the owners of the Protective Systems, not the owners of the interrupting device. The interrupting device is, by definition, not even a component of a Protective System. We agree that if the owner of the relay that initiated the trip does not own all the remaining components of the associated Protection System (i.e., CTs or VT's) they may require assistance and support from the owners of those additional components to complete their analysis. However, the owner of the Protective System that initiated the trip should be the party responsible for analyzing if a protective system misoperation occurred. If in the course of that investigation they determine the cause was attributed to a component of the Protection System which they did not own (such as a blown VT fuse owned by others), they should notify the other party, who would in turn be responsible for appropriate corrective action. In conclusion, nowhere in this standard should compliance responsibility be assigned to the owner of an interrupting device.
To avoid confusion, Requirements R2, R3, and R4 should be re-worded to make it clear that they apply only to those entities whose Protective System misoperated and not to the interrupting device owner. The following language is suggested: R2. "Each Transmission Owner, Generation Owner, or Distribution Provider, whose Protection System misoperated, shall within 60 calendar days of identifying the cause of each Misoperation…" R3. "Each Transmission Owner, Generation Owner, or Distribution Provider shall, within 180 calendar days of the interruption of the BES Facility due to a Protective System Misoperation, complete for each Misoperation without an identified cause…." R4. "Each Transmission Owner, Generation Owner, or Distribution Provider, whose Protection System misoperated, shall implement each CAP or action plan, and revise as needed through completion."

Is mechanical failure of an interrupting device during a fault a mis-operation? (The interrupting device is not part of the Protection System.) Is inappropriate operation of a relay that operates upon mechanical inputs a mis-operation? For example, what if the relay causes a trip when it should have restrained?
Yes
Yes
No
Comments: Is it the intention of the PSM SDT that this version of the standard would require that all BES interrupting device operations be logged (documented) with a determination of whether the operation was caused by a Protection System? While it appears to be the intent of the draft revised standard that all interrupting device operations be reviewed at some level to determine if a Protection System caused the operation, it is unclear whether explicit documentation of each interrupting device operation must be generated and retained for purposes of compliance with PRC-004-3.

AEP recommends removing the reference to "TPL standards" from the "Slow Trip - During Fault" category of the definition. AEP believes the intent of the "TPL standards" reference can be maintained

by capturing all slow trip events that result in clearing more Elements than necessary. AEP's first preference is to reword the category as follows "Slow Trip - During Fault - An Element's composite Protection System operation that, due to the duration of the composite Protection System's operating time, resulted in the clearing of other Elements in addition to the Faulted Element.". AEP's second preference is "Slow Trip - During Fault - A composite Protection System operation for the Faulted Element it was designed to protect which was slower than intended. Delayed Fault Clearing due to the non-operation of an installed high-speed protection scheme is not a Misoperation provided the duration of the composite Protection System's operating time did not result in instability or cascading, and did not result in miscoordination with any other composite Protection Systems." AEP recommends adding to both “Failure to Trip - During Fault” and “Failure to Trip – other than Fault” - “Please see Category 3(4) to determine if the “slow trip” classification applies to the operation.”
No
AEP recommends the following modification to 1.1: "Within 120 calendar days of a BES interrupting device operation in its Facility caused by a BES Protection system operation or by manual intervention due to a BES Protection System failure to trip, identify and review each BES Protection System operation and BES Protection System failure to trip.” AEP requests the standard be modified to clarify the liability of the notified entity if the notification occurs near the end of the 120 day period, and the notified entity does not have sufficient time to determine if their component operated properly or misoperated within the 120 day period. AEP requests the standard be modified to clarify the liability of the notified entity if the notification occurs more than 180 days after the BES interrupting device operation. AEP requests that R1 should be modified to clearly indicate whether the term “entity” includes separate Functional Entities within the same Registered Entity. As written, it is unclear if the Transmission Owner function is required to notify the Generator Owner function within the same Registered Entity for compliance with R1.1 Bullet 2 or if the Registered Entity with multiple Functional Entities is treated as a single unit for ownership purposes. R1.2 appears to add little value as a standalone requirement. AEP recommends removing R1.2. and incorporating the requirement to identify a cause within the remaining R1 and R3 wording.
No
AEP recommends adjusting the time requirements specified in the VSL tables for R1, R2 and R3 to extend the timeframe for Moderate and High VSLs to 20 days, and eliminate the time requirement for the Severe VSL. Example: For R1, the Low VSL remains the same, Moderate becomes >150 to 170, High becomes >170 to 190, and Severe only applies when “The responsible entity failed to identify and review… “. Measure M1 repeatedly lists the same evidence examples and AEP suggests simplifying the measure by stating “evidence for R1 may include but is not limited to….” followed by a single list of items. The wording for the R4 VSL references failure to revise a CAP “as needed”. This statement is very broad, may be subject to interpretation and should be clarified or removed from the VSL.
No
AEP recommends adding "remote backup relaying is not considered to be part of the composite Protection System" to the end of the description for the composite Protection System in the Application Guidelines. AEP requests that SDT include a clarification of the meaning of "BES interrupting device" within the context of this standard (similar to how "composite Protection System" is addressed). AEP recommends replacing both instances of the word "implementation" with "development" in the second paragraph of page 20 of the clean version of the standard. Otherwise it is implied that there are situations where a CAP must be fully implemented within 180 days. Please include a clarification of the CAP and action plan modification tracking. For example, if a CAP or action plan is modified, is it sufficient to document the modifications, or must the date the modifications were made also be tracked? On page 15 of the clean version of the standard AEP recommends adding “unintentional” before “loss of field” in the first paragraph. On page 15 of the clean version of the standard AEP recommends replacing “shut down” in the second paragraph with “as intended to isolate.” AEP recommends adding generation examples of both a normal time delay operation and a misoperation to category 3 of the application guidelines.
In the Rationale for R2 box, a reference is made to R4. This appears to be a typo and should be changed to R3. Since an evaluation is not part of the Corrective Action Plan definition, please make the following modification to the first bullet of R2: " Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and also an evaluation of the Action Items applicability to the entity’s Protection Systems at other locations, or..” AEP recommends revising R2, R3, and R4 to

specify that only the owner(s) of the Protection System component(s) that misoperated are responsible for applicable requirements. Measure 2 should be revised to remove the statement “explaining why there is no need to develop a CAP.” This is consistent with Measure 3. Declaration is described elsewhere in the standard. The Standard may read more clearly if the existing R2 and R3 were switched such that the requirement to develop a CAP (R2) came *after* the requirement to identify a cause or develop an action plan (R3) to complete further investigation. The phrase "composite Protection System", which is described in the Application Guidelines section, is not used in the Requirements, Measures, or Compliance sections. AEP requests "Protection System" to be replaced with "composite Protection System" where appropriate throughout the standard.

No
The addition of the word “composite” adds nothing to the existing term Protection System and in fact introduces confusion. Dominion assumes a Missoperation occurs only if all protection (primary, secondary, backup, pilot and non-pilot relay schemes) failed to operate as intended. If this assumption is incorrect, please clarify.
Yes
No
The addition of the word “composite” adds nothing to the existing term Protection System and in fact introduces confusion. The revision to part three of the definition that converted the original parenthetical example into an exclusion by stating it inversely creates a potential loophole. The revised wording would consider correct the slow operation of a Protection System that caused avoidable equipment damage (due to the delayed fault clearing) as long as it did not cause a dynamic stability or coordination issue. The Protection System also needs to coordinate with the damage curves of the equipment within its zone. As the exclusionary sentence stands, it actually uses double negatives. It would be better to restate the sentence positively. A suggested improvement would to replace the second sentence in part three of the definition with the following: Delayed Fault clearing associated with an installed high-speed protection scheme is an example of a Misoperation if high-speed performance is required to meet the dynamic stability performance of the TPL standards or is required to ensure coordination with other Protection Systems.
No
Requirement R1 relies on the operation of an interrupting device and the identification by its owner that a Protection System operated and further that it may have operated due to a Misoperation. There are two issues with using this as the focal point of the actions within the standard. 1) First, the owner

of the interrupting device may not be in the best position to decide why the device operated, if a Protection System was involved and if a Protection System component contributed to a Misoperation. This partly is because the interrupting device excluding its trip coils and CTs is not part of the Protection System. The owner of the relay that activated the trip or the owner of the associated Disturbance Monitoring Equipment would be in a much better position to evaluate the operation. The requirement circumvents what may be a natural process of investigating the operation by its individual owners separately or collectively. The requirement may create a weak link in a chain because of its reliance on the interrupting device owner to start the identification and review process. 2) Second, not all Misoperations result in an interrupting device operation particularly if no Fault occurred or the Fault is a high impedance transient Fault. The owner of the Protection System that failed to operate would not be required to investigate it. 3) Finally, the requirement should be rewritten to obligate the owner of its Protection Systems to investigate their performance and to notify joint owners of their findings if they need to take follow up actions. Inserting the interrupting device owner unnecessarily into the process of investigation does not serve a reliability purpose but an administrative one.
Yes
No
Although this draft of the standard is considered a Results-Based Standard it is difficult to see how the requirements are written to achieve a measurable outcome associated with reaching a level of reliability performance, a reduction in reliability risk or a necessary level of competency. This draft standard instead appears to be administrative in nature that is more concerned with creating documentation solely for compliance purposes. The following are specific issues or suggestions: 1) the standard contains extra 120 day and 60 day deadlines that do not provide reliability benefit. Although there is value in investigating Misoperations quickly, it is more important to fix the problem and prevent its reoccurrence. 2) Late identification of Misoperations will be a violation even if they are not particularly significant. Specifically, Misoperations that occur with no Fault present may not be readily apparent. The deadlines in the standard could cause disincentives to fully investigate Protection System performance because it may result in compliance violations. 3) The standard provides no means of ensuring that Misoperations are addressed by CAPs on a timely basis. Of particular concern is failure to trip (- during Fault) type Misoperations. The cause for this type of Misoperation should be either mitigated or the CAP completed in less 12 months. 4) It is suggested that the drafting team embrace a reliability performance based approach that would fit into the results-based philosophy. Specifically, adherence to the standard should be based on achieving or surpassing certain metrics such as Misoperation rate, the percent of causes unidentified (Unknowns/All in a year) and the percentage of open CAPs (Open CAPS/Misoperations in a year). These metrics are meant only as potential examples for measuring performance. By requiring certain levels of performance or continuous improvement in these metrics, then the goal of the standard can be met without the administrative burden of tracking relatively unimportant dates such as when a cause was identified or when a CAP was developed and the storage of large volumes of evidence records.

Some of the scenerios for possible mis-operations are too vague. For example what constitutes a slow trip and what would constitute how a protection system is designed? If a protection scheme is designed to trip in 2-3 cycles and it trips in 5-6 cycles yet still protects the equipment, an auditor could see that as a mis-operation however it still would protect the equipment as it was designed. Also, it can be difficult at times to determine if a fault actually occurred within a relay's zone of reach. If a bolt of lightning causes a fault on a line unless there is physical damage there can be little visual indication of a fault. It can be difficult to confirm if a mis-operation occurred if you can not first confirm what caused the fault.
No
There should be some provision in the standard to take in to account extenuating circumstances such as natural disasters. It would be unfair to expect entities to be able to perform an analysis within 120 days following a major disaster. Also, there are some circumstances when an investigation is out of the control of the entity. For example if a relay or protection device potentially failed but needed to be investigated by the manufacturer or an outside company it may take longer than 120 days to perform a thoroughly investigation.

Indiana Municipal Power Agency
Agree
Indiana Municipal Power Agency agrees with the comments submitted by Florida Municipal Power Agency and has a couple of additional comments. Since the comment document is not formatted for this purpose, we will submit them here. The standard is titled Protection System Misoperation Identification and Correction, not Operation Identification and Submittal. IMPA does see that an organzation might keep track of operations but to require this action by a standard requirement and then potentially find an enitity in non-compliance is over reaching for this Protection System Misoperation standard. In order to be in compliant with this stadnard, an entity should only be required to perform the action of Protection System Misoperation Identification and Correction which is the standard title. Another problematic area involves the "same 120 day period of a BES interrupting device operation caused by a Protection System operation". What happens if the owner of the Protection System component is notified toward the end of the 120 day period of a BES interrupting device operation (say 119 day) and there is not sufficient time for an investigation by the Protection System owner into the cause of the trip? The Protection System owner should not be found non-compliant for requirement 1.2 if not enough time is given to them to properly investigate the reason for the operation of the Protection System.

The proposed Misoperation definition is based on the “Protection System” definition defined in the NERC Glossary of Terms (GoT). However, the NERC GoT does not provide the elements that are considered “Protective System” elements. The actual descriptions of the “Protection System” elements are found in PRC-005-2, 4.2 Faciliities. Recommend this PRC-004-3 revision include a new GoT definition of “Protective System Element” based on PRC-005-2, 4.2, Facilities, or a revision to the NERC GoT to include an abbreviated summary of the PRC-005, 4.2, Facilities in the “Protection System” definition; or include an abbreviated summary of the PRC-005-2, 4.2 Facilities into the PRC-004-3 definition of “Misoperations;” or revise both the NER GoT definition of “Protection System”, and PRC-004-3 definition of “Misoperation” to reference PRC-005, 4.2, Facilities, as the elements that are “Protection System elements.”
No
The changed wording of R1 was an improvement. However, our concern comes from our company enduring a major natural disaster and the aftermath. When recovering from a major event such as Hurricane Sandy, the first priority is to get lights on and rebuild the system. Because a large natural event produces an influx of unique system configurations that may not have been planned for by system planners or relay setters, analyzing and investigating all the operations and misoperations that occur takes weeks and is not the top priority for a utility that endures such an event. The Standard needs wording to allow additional time when a utility endures a natural disaster.
No
As per Req. 2 - CAP Devlopment is too stringent. Troubleshooting and determining which element could take longer than the time allowed in the VSLs. Under PRC-004-1 a 12 month time period was given to develop and implement a CAP. Recommend a CAP not developed w/in 120 days or a declaration in accordance with Req. R3 (Lower VSL), CAP not developed w/in 120 days or a declaration in accordance with Req. R3 w/in 120 days or CAP declared in accordance with Req. R2 not implemented within 150 days (Medium VSL), CAP not developed w/in 150 days or a declaration in accordance with Req. R3 w/in 150 days or CAP declared in accordance with Req. R2 not implemented w/in 180 days (High VSL), CAP not developed w/in 180 days or a declaration in accordance with Req. R3 w/in 180 days or CAP declared in accordance with Req. R2 not implemented w/in 210 days.
No
The PRC-004-3 requirements’ rationale for each requirement (gray boxes next to each requirement) and the Guidelines and Technical Basis (at the end of the document) are well thought out and contain significant justification and logic for each standard requirement. Recommend either keeping this information attached to the standard or formalizing it into a reference document that will will be easily accessible to the electric power industry. There was no indication in the draft standard as to the repository of this significant information.

The revised definition still contains the incorrect reference to TPL standards in “Slow Trip – During Fault”. The TPL standards Category A, B and C do not require Planning to identify every place where high speed protection is required for dynamic stability. If a Category B issue is identified, high speed protection is installed and it is no longer on the Category B list. If a Category C issue is identified, a redundant relay scheme is installed and it is no longer a Category C issue. Therefore, the list of places where “high-speed performance has been identified to meet the dynamic stability performance requirements of the TPL standards” is just a list of where the appropriate corrective action has not yet been implemented and could, in theory, be empty. “Slow Trip – During Fault” should be revised as follows: “A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high-speed performance has not been identified as needed by the Planning Authority or the Transmission Operator, or if it is not required to ensure coordination with other Protection Systems.”
Yes

Yes
Yes
See our comment above on Question #1. The following paragraph should be deleted from the accompanying Guidelines and Technical Basis section: “The reference to the TPL standards is meant to place some bounds on the time to clear a Fault and prevent dynamic instability . The performance requirements in the TPL standards are found in Table 1, and are applicable to all contingencies mentioned for Type A, B and C contingencies.”

Agree with the other changes but VSL severity levels are spaced 10 days apart. It should be at least 30 days apart. It is not justifiable to go from Lower to Sever VSL for 22 days of delay (149 days to 171 days). There is no justification for such strict time lines.

The SDT may want to consider adding loadability as an example under “Failure to Trip – Other Than Fault” and under “Unnecessary Trip – Other Than Fault”. The existing definition of the ‘Slow Trip-During Fault’ needs to include that the delayed fault clearing associated with the installed high-speed performance of the protection system is not required to meet the voltage ride-through capabilities of the generators. Generators should not be tripping off line due to suppressed voltage in the system stemming from the delayed fault clearing. This could create steady state voltage issues. Suggested language: "Slow Trip - During Fault - A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. (Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high-speed performance has not been identified to meet the dynamic stability performance requirements of the TPL standards nor is it required to ensure coordination with other Protection Systems ***or result in loss of generation due to delayed fault clearing time***." Also, the definition of “Slow Trip – During Fault” refers to stability performance requirements of the TPL Standards, however, the TPL Standards do not cover delayed three-phase fault clearing studies. Delayed three-phase fault clearing can create undesired system conditions.
No
See comments submitted in response to Question 5 below.
Yes
No
The first paragraph of the Guidelines and Technical Basis defines the composite protection system to include the backup protection. This needs to be clearly defined as “local backup” only and not to

include remote backup protection.
We are concerned that the applicability of the Standard limits the misoperation analysis only to BES Element Protection Systems. Under the new BES definition and guidance documents, there will be numerous examples of misoperations on non-BES Element Protection Systems which could have a major impact on the BES when the fault must be cleared by remote backup relays. Example: Consider a 50MVA generator connected to a substation via a radial line. Under the new BES guidance, the generator is part of the BES while the interconnecting radial line would not be part of the BES under exclusion E1(b). If a fault occurs on the non-BES radial line and the Protection System fails to trip, the fault must then be cleared by either local or remote backup relays at the interconnecting substation(s). Under this scenario with the current proposed PRC-004 requirements, the owner of the non-BES radial line has no obligation to analyze or correct the Misoperation. The PRC-027 SDT received comments with similar concerns in its last revision. They have drafted language to ensure that coordination of non-BES Protection Systems between different Functional Entities. The PRC-004 SDT may want to consider similar language to ensure that all Misoperations which can affect the reliable operation of the BES are analyzed and corrected.

1) Please revise the Slow Trip – During Fault second sentence for clarity. We suggest: “Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation unless the high-speed performance has either been identified to meet the dynamic stability performance requirements of the TPL standards, or is required to ensure coordination with other Protection Systems.” 2) We suggest clarifying Definition (6) by replacing "is unrelated to on-site" with "the Protection System that operated is not directly associated with" as shown below to be consistent with page 17, and to exclude transfer trip testing: Unnecessary Trip - Other Than Fault - A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate, and the Protection System that operated is not directly associated with maintenance, testing, inspection, construction or commissioning activities. 3) Add an Application Guideline example showing that transfer trip testing would not be considered Misoperation as well. Even though the BES interrupting device is at a different location than the testing error, the transfer trip composite system is involved. We suggest: "An operation that occurs during a non-fault condition but was initiated by remote transfer trip system maintenance, testing, inspection, construction or commissioning activities is not a Misoperation."
Yes
none
Yes
none
Yes

1) Unknown / unexplainable is the ‘cause’ of about 12% of Misoperations per NERC reports. An R3 ‘no further action’ declaration example would be helpful. Perhaps your ‘no action plan’ declaration example on page 23 was intended for this. If so, please so state there. 2) Please replace ‘reverse power’ with ‘overexcitation’ on page 15 in the failure to operate for a non-fault condition section. Reverse power relays are usually excluded so the example is confusing as is.
1) Some entities presently use their PRC-004 reporting as a means of documenting CAPs. They may prefer to use your proposed data request under Section 1600 of the NERC Rules of Procedure for these purposes. Please change page 5 wording to “The data submitted as part of the data request will not be used by NERC or the Regions for compliance or enforcement purposes.” 2) Compliance section 1.2 on page 9 states “The Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System shall keep data or evidence to show compliance with Requirements R1, R2, R3, and R4 and Measures M1, M2, M3, and M4, since the last audit unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.” Please delete “and Measures M1, M2, M3, and M4” because entities must comply with Requirements, but Measures are not allowed to expand that scope. 3) In the first sentence of R2 on page 7, please add “first” before “cause” so it reads “Each Transmission Owner, Generator Owner, or Distribution Provider shall, within 60 calendar days of identifying the first cause of each Misoperation: …” Pages 19 and 20 make it clear that this is triggered by the first cause, but some entities may miss this application guidance. 4) Please include ‘Composite Protection System’ as a defined term that remains with this standard (similar to PRC-005-2 approach for Component, Component Type, etc.). Your definition on page 14 is fine, but move it up to just after the page 3 Definitions. Regarding commments for all questions 1-5 above: The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Protection and Control Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.

R1.1 second bulleted item states: If the entity owns the BES interrupting device but does not own all of the Protection System and cannot determine that the Protection System operation was correct, then notify the other owner(s) of the Protection System component(s) and provide any requested investigative information. o The Protection System component owner(s) that was notified by the BES interrupting device owner shall determine if there was a correct operation or a Misoperation of their component. This requirement statement is confusing and should be revised to clearly describe the intent. Additionally, this statement requires action by more than one entity within the 120 day time period. There is no requirement for BES interrupting device owner to notify the owner of the protection system component identified as contributing to the misoperation prior to 120 days which could leave the protection system component owner no time to investigate and determine if the operation was correct or not as required in R1.1 and determine the cause as required in R1.2 (which also must be completed within the first 120 days). We suggest that the above statement be a separate requirement under R1 and be worded as follows: If the BES interrupting device owner cannot determine that the Protection System operation was correct, and concludes that protection system components owned by another entity contributed to a possible misoperation, the BES interrupting device owner shall notify the other owner(s) of the Protection System component(s) of their preliminary conclusions and provide any requested investigative information within 90 days of an interrupting device operation. It is suggested that a 90 day timeframe for this situation is still reasonable for the interrupting device owner and allows 30 days for the owner(s) of the Protection System component(s) to comply with the existing R1.1 and R1.2. During the 120 day review period, requirement 1.1 does not ensure that there will be adequate time for ALL Protection System owners to review the operation. If the BES interrupting device owner is tardy in informing another Protection System component owner, then that Protection System owner may not have time to perform a review. There should be some milestone within the 120 day review period where all Protection System owners need to be informed of the operation and their need to review it.

Suggest Misoperation definition #6 be revised from “unrelated to on-site maintenance….” to “unrelated to maintenance….” to clearly allow as an exclusion, a Protection System maintenance or commissioning activity which results in an inadvertent remote end station trip. For example, a direct transfer trip scheme.
Yes
Since actual Misoperation data reporting will now be addressed outside of this standard, entity data communication requirements within this standard need to be consistent with respect to data reporting criteria. As an example, since there is no requirement for a contributing component entity owner to forward the required investigative and CAP data to the interrupting device entity owner, one would expect that reporting will be the responsibility of the Protection System contributing component entity owner.
Yes
No
Suggest “Composite Protection System” as listed in the Guidelines and Technical Basis section (page 14 of 24) be a defined term for this standard.
Individual
Michelle R D'Antuono
Ingleside Cogeneration LP
No
Ingleside Cogeneration believes that the latest version of the definition correctly captures the intent that the action of the composite Protection System is the gating factor in the determination of a Misoperation. The aggregate action of the primary, secondary, and pilot systems should form the basis of the expected performance, not each individual group of components. However, we still believe that the project team’s intent to allow Protection System owners some flexibility to determine when a “slow trip” occurs is not captured. We fully agree with your statement in the last Consideration of Comments that it is up to the owners to have “an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent any additional harm,

and ultimately be able to decide whether the speed or outcome of its Protection System was adequate.” However, unless the language is captured in the standard or the definition, CEAs may choose a different basis. In the extreme, they may determine that any delay outside the settings or manufacturer’s specifications to be a Misoperation – even if reliability is not threatened or monitoring equipment cannot resolve down to that level of granularity.
No
Ingleside Cogeneration agrees that the owner of the tripping device should own the investigation and bring in other entities as needed. In addition, R1 takes out any guesswork about the responsibilities of each Protection System owner who may have contributed to the Misoperation. What we still do not understand is the recourse available to the Protection System owner if the request for assistance from an adjacent entity is sent late. The requirement does not account for the fact that a notification may be issued weeks after the fact – the 180 day assessment deadline applies regardless. Under these circumstances, the recipient may be forced to declare that a cause was not found, as allowed by R3, and develop an action plan to investigate further. However, this leaves that owner in the position to explain the delay to auditors; which we do not believe is appropriate. Even more concerning, there appears to be nothing that stops the CEA from deciding that the reduced interval was adequate and assessing a violation as a result.
Yes
No
Ingleside Cogeneration shares the project team’s desire to retain a scholarly and cooperative approach to the assessment of Misoperations. However, we believe that the regulatory pressure will mount – particularly as NERC’s events analysis numbers continue to show Misoperations as a primary component in nearly every wide area outage. This means concepts that are implicitly understood today will be immaterial in the future. For example, it is easy to see that a CEA may assess a violation for a single missing relay operation evaluation out of hundreds that may have occurred during a wide-area weather event. Despite assurances that the CEA will take the circumstances “under consideration”, we are not convinced that that will always be the case. If the drafting team is reluctant to modify the definition of “Misoperation” or PRC-004-3’s requirements, there may be an opportunity to capture these understandings in a binding way in the RSAW. There is a new program that has been initiated by NERC to include Compliance representatives in the standards drafting process for situations just like these. If we are able to provide commentary on the auditors’ instructions captured in the RSAW, it would alleviate our doubts that understandings reached during the development phase would be retained when the standard becomes mandatory.

FMPA appreciates the response to our comments, but, we do not believe our issues have been resolved. First, on “Slow Trip”; however, we disagree with your perspective. The SDT is taking a relativistic approach to time, e.g., interpreting the words it drafted “slower than intended” as relating to whether the Protection System operated “fast enough to prevent additional harm” and not a more common interpretation of it operated slower than it was designed to operate. FMPA believes that an auditor would interpret this using the latter interpretation and instead ask for the design clearing time of the protection system as a comparison of whether actual operation was “slow”, e.g., if the system is designed to operate in 5 or 6 cycles and instead it operates in 7 or 8 cycles, fast enough to prevent backup protection from operating, but slower than designed, is that slow? If the SDT intends “slower than intended” to mean that it operates “fast enough to prevent any additional harm”, e.g., the clearing time of the back-up protection, then state that in the definition. The response to our comment (and the Application Guidelines) focuses on the owner of the Protection System “should have an understanding of the objectives of its Protection Systems”; that is not FMPA’s concern. FMPA’s concern is how an auditor will audit R1 and verify that the entity identified all misoperations, and how an auditor will interpret “slower than intended”. Second, FMPA commented last time

(commenting on R1) on the difficulty of measuring whether a fault actually occurred and where the fault in regards to the definitions of "Failure to Trip" and "Unnecesary Trip". For both, an auditable investigation would need to determine if: 1) a fault actually existed, which can be quite difficult to verify for something like a lighnting strike with automatic reclosing; and 2) where the fault was; so that it can be determined whether or not the fault was "within the zone it was designed to protect". In investigating tripping of BES Elements, a large number of those events are indeterminent, meaning that physical evidence could not be found. With microprocessor based protection systems, if may be possible to set up a sort of event recording function that may be able to provide evidence of fault condition and roughly where a fault was; however, with electromechanical relays, that is not possible without installing additional equipment. Is the SDT intending to require a form of event recording at each substation so that the existence and location of a fault can be determined for every protection system trip? If no evidence of a fault exists, would the default assumption be that everything operated as intended unless the evidence of protection system operation indicated otherwise (e.g., both primary and backup systems operated)? If that is the intent, then that intent should be stated within the requirements. Third, how would a high impedance fault be treated? Such a fault could occur within the relay reach, but, the impedance of the fault could in essence cause the fault to appear further away than it actually is. For instance, assume a line is protected by an instantaneous ground overcurrent relay protecting about 70% of the line and by an inverse time ground overcurrent relay as local backup. And let's say a high impedance fault occurs 50% of the length of the line, but the impedance of the fault reduced the fault current to below the instantaneous relay setting such that the inverse time ground overcurrent relay operates instead. Is that a misoperation because the instantaneous ground overcurrent relay failed to operate for a "Fault within the zone it was designed to protect"? Which leads to the ambiguity of the phrase "within the zone it was designed to protect". Does zone mean a distance as derived from the relay settings, or is it the relay settings themselves? If it is the relay settings themselves, then FMPA suggests changing the phrase to eliminate "zone" and instead refer to the actual protection system settings. Fourth, FMPA is also concerned about how "composite Protection Systems" works, especially with the combination of "within the zone it was designed to protect". For instance, let's assume Line 1 has typical stepped disctance scheme of zones, 1 through 3, and let's assume the adjacent Line 2 has a fault and there is a failed breaker at the intermediate substation. The breaker is not part of any protection system, but, the zone 3 remote backup relay of Line 1 operates to help clear the fault on Line 2, which is a correct operation. So, is Line 1's zone 3 relay part of Line 1's composite Protection System, and if so, then there is not a single "zone" for composite Protection Systems, which again adds to the ambiguity of the phrase "within the zone it is designed to protect". Fifth, some misoperations are due to mistakes made by protection engineers, e.g., mistakes in establishing relay settings; so does: "within the zone it was designed to protect" the actual design of the protection engineer, e.g., the mistaken relay setting, or what the design should have been? If the latter, how will the 'what the design should have been' be determined? If the SDT has not already done so, FMPA recommends involving NERC and RE enforcement staff to discuss how R1 would be audited in combination with these definitions.
No
First, as currently drafted, R1 means that each investigation into a protection system operation is auditable, which in turn means that the definition of misoperation as discussed in question 1 need to be easily measurable. Please see discussion in question 1 about the difficulty in measuring: 1) "slower than intended"; 2) whether or not a Fault occurred; and 3) whether or not that Fault was "within the zone it was designed to protect". Second, there are numerous Protection System operations wtihin a year, which results in a high-volume problem similar to those found in CIP standards, COM-003 and PRC-005. FMPA continues to recommend, as we did last time, that this standard would be better served by instituting internal controls language for R1 similar to what the CIP v5 and COM-003 SDTs adopted. Adopting such language would have the additional benefit of allowing the entity more latitude for how they deal with the ambiguities described in response to question 1. Third, FMPA commented last time that there ought to be an exception for Acts of Nature such as hurricanes and other natural disasters with, at minimum, the 120 day rule being waived. In response to FMPA's comments, the SDT agreed with this concern. However, rather than change the standard, the response was: "The drafting team agrees with your comment about instances when major disturbances occur. As noted in the Guidelines and Technical Basis section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines

outlined in this standard." That means that the entity would still be in violation of the standard if it were not able to investigate all relay operations that occurred dueing a natural disaster. This is not acceptable to FMPA and we desire language to extend the time of the investigations as a result of Acts of Nature (e.g., a named storm, an earthquake that resulted in severe damage, etc. – maybe anytime a State's Governor declares an emergency) to a longer hodl th entity to the 120 day time period, e.g., but instead to a longer period such as 240 days, to allow time for more pressing disaster recovery efforts, without actually incurring multiple violations to the standard that would remain on the entities "record". Fourth, there is no recognition that it is possible to have a condition where it cannot be determined whether the operation was correct or a Misoperation, e.g., if the location of the fault cannot be determined, or whether a fault condition actually existed or not, especially for something like a trip with successful reclose. See the second point made in response to question 1 for further discussion.
First, R4 uses the phrase "as needed." In doing research for legal precedence interpreting the phase "as needed," both in terms of contract interpretation and statutory construction, numerous cases throughout the country make it clear that, unless this phrase is clearly defined in the context in which it is used, this phrase is ambiguous and will only lead to conflict. For instance, the phrase indicates that (1) there is a level of discretion involved regarding an action that must be taken, and (2) someone must make a determination as to when such action is deemed "needed." However, the standard is silent both as to what factors trigger the exercise of discretion and who makes the determination that a change to the CAP is "needed" - the entity or compliance staff. In this regard, FMPA recommends making it crystal clear what "as needed" means. For example, it could state "as needed to reflect any CAP revisions made by the responsible entity, as determined at the sole discretion of the responsible entity." Second, R4 should recognize that not every investigation of a Misoperation ends in a CAP, e.g., those where no cause was found in accordance with R3.

Yes
No
R1 and the rationale for R1 assume that the BES interrupting device owner and the Protection System owner have been talking and R1 requires identification and review of each operation within 120 days. R1 should require that the BES interrupting device owner notify the Protection System owner or vice versa, depending on which entity discovers the event first, within a specific time after the entity is aware of the operation in order to ensure that the other entity has adequate time within the 120 day period to finish the review.
No
R4 VSL wording is not clear as presently stated; "The responsible entity failed to revise a CAP or action plan as needed in accordance with Requirement R4." It might not be intended, however this wording implies that all CAP's must be revised and if not revised there is a compliance issue. The wording should state; "A CAP revision was needed in accordance with R4 and the responsible entity failed to make the revision."
Yes
There are some examples of CAP in the document. Adding examples relative to my comment in question 5 would be beneficial.
R2 requires a CAP except in cases where the entity can "Explain in a declaration why corrective actions are beyond the entity's control or would reduce BES reliability" R2 does not recognize that every CAP requires resources to complete and that the industry has limited resources. There are cases where the required resources to complete a CAP at multiple locations provides minimal increase in reliability. If these low productivity CAPs are required to be completed the net result is a decrease in BES reliability since other more productive work will not be done due to lack of resources. The entity should be able to state the CAP was completed at only the affected site and was not rolled out

system wide due to poor ratio of resources required to reliability benefit gained.

I agree with the position of the Standards Development Team of the North American Generator Forum, which states: The topic of slow trips should be removed from PRC-004-3 and the proposed re-definition of a Misoperation, for the following reasons: - The standard incorrectly assumes that every NERC-registered generation unit is required to have DME for high-speed recording of relay-operation events. - Where DME is present it is generally installed on the HV side of a unit, and may therefore not yield any useful information for problems occurring at the generator or other low-side components. - The standard incorrectly assumes that all GOs have, or should have, design-level relay personnel, ref. the Application Guidelines statements regarding being able to decide whether the speed of the Protection System was adequate (pp. 15 and 16). - Independent GOs in particular have finite resources, and mandating an unreasonable focus on Protection System event record-keeping and analysis will leave other operation and maintenance tasks that much less well covered, resulting in a negative impact on reliability.
No
The "same 120 days" could place an impossible burden on an entity notified late in the 120 day period. Notification that an issue with an entity's system contributed to a misoperation should start a new compliance clock.
No
Agree with the comments of the Standards Development Team of the North American Generator Forum, which state: The standard should completely exclude operation of reverse power relays when shutting-down units, or (better) classify such devices as not being part of Protection Systems (they do not protect BES equipment; they prevent turbine mechanical damage). This subject is discussed in the Application Guidelines (p.17), but the distinction attempted between control and protection functions of reverse power relays is obscure.
The standard would be simplified by combining R1 through R4 to state: R1 For each activation of a BES interrupting device initiated by a Protection System, the entity shall identify the cause of the operation. R1.1 If the activation is determined to be a misoperation, the entity shall develop a corrective action plan, or explain in a declaration why a CAP cannot reasonably be instituted. R1.2 If no cause can be determined, the entity shall develop an action plan for further investigation, or explain in a declaration why no further action is warranted. R1.3 All action plans shall be developed within 180 days of the operation, or notification of an operation of a BES interrupting device caused by the RE's Protection System. R2 All action plans developed under R1 shall be implemented or revised as needed until complete. The additional detail in the current version (work timetables, other facilites) should be moved to the measures, as they are the output of the requirements.

There still seems to be a contradiction in R1 regarding the responsibilities of the BES interrupting device owner (IDO) vs. the Protection System owner (PSO) when owned by different entities (as we commonly have on the 138 system). The breaker, other than the trip coils and CTs, is not part of the Protection System, so the responsibility to investigate operations initiated by a protection system should be with the PSO. NERC’s response below to Q4 seems to agree with this (regarding documenting, CAP, and reporting), but R1 still places responsibility for investigation on the IDO. As a matter of fact, the Rationale for R1 added into draft 3 the statement “Requirement R1 places the responsibility on the BES interrupting device owner to investigate operations initiated by a Protection

System." When an interrupting device operates, logically the IDO would investigate why their device operated. As soon as the IDO finds out that the operation was initiated by a protection system (the situation described in R1) they should then only have to notify the PSO of the situation (the PSO may not be aware of a protection system operation). The IDO would not be in the best position to investigate, and should not be validating Protection System operations for the PSO. The seems to be mostly a contradiction of the wording in R1 vs. the Rationale section. If the Rationale is not included in the final version of the standard, I could probably agree with the wording of the rest of it.

CenterPoint Energy
Yes
No
CenterPoint Energy is concerned the wording of R1.1 to review a BES interrupting device "operation" within 120 days and the wording of R1.2 to investigate a "misoperation" within the same 120 day period of a BES interrupting device operation could be unworkable. The owner of the BES interrupting device could notify the owner of the Protection System component identified as contributing to the Misoperation well into the 120 day period, which would give the Protection System component owner little time to investigate and determine a cause. CenterPoint Energy recommends R1.2 wording be the following: "The owner of the Protection System component identified as contributing to the Misoperation shall investigate and document the findings for each Misoperation including a cause, if identified, by the latter of 120 days of a BES interrupting device operation or 30 days after receiving notification from the owner of the BES interrupting device."

See response under Question #5 with specific recommendations to implement Internal Controls.
No
The current Requirements and their current approach are not supported as noted in the response in Question #5. As such the VSL and Measures cannot be supported.
We would like to reiterate our previous comments that this Drafting Team give due weight to the Internal Controls Process (ICP). We believe the responsible entity should be allowed the latitude to determine the Corrective Action Plan (CAP) that follows the ICP approach. We would also suggest that the standard include specifications that the entity identify mitigating factors performed under the CAP that specifically address the misoperation.

(1) The term “composite” Protection System is unclear, used inconsistently and should be defined. Based on the first sentence on Page 14 of the Guidelines and Technical Basis section, it appears that all Protection Systems protecting an Element are intended to be included in composite Protection System. That is any primary, secondary, backup, pilot and non-pilot relay schemes for a given Element would be included in its composite Protection System. If this is the case, we suggest just writing a definition so it will be clear where the term comes from and what the meaning is. However, it is not clear that the term is even needed since the definition of Protection System would already include all of these Protection Systems. The definition includes “Protective relays which respond to electrical quantities.” The inconsistent use of “composite” in the standard documents only creates more questions for the need of the definition. For example, on page 14 of Guidelines and Technical Basis section under the section (1) title, the “overall performance of the Protection System for the Element it is designed to protect” is used. This is understood to be all “protective relays” including secondary, backup, pilot and non-pilot relay schemes. As defined, Protection System includes the plural use of protective relays so all could be included. (2) Why does the definition need an introductory sentence? The clarifying statement “any of the following is considered a Misoperation” provides the same outcome. Also, several of the sub-parts of the definition discuss the “overall performance of the Protection System,” so this introductory sentence seems redundant. Instead of adding confusion, we recommend that the drafting team strike the entire introduction sentence of the definition. (3) For sub-part “3. Slow Trip – During Fault” of the definition, we recommend revising the second sentence. It is a run-on sentence, uses incorrect grammar, contains a triple negative statement, and is confusing. We recommend revising the sentence to clearly state when delayed fault clearing should be excluded and what conditions must be met before the operation is not to be considered a Misoperation. For sub-part “5. Unnecessary Trip – During Fault” of the definition, we believe that the revised sentence now overlaps other sub-parts of the definition. “A Protection System operation for a Fault for which the Protection System is not intended to operate” is almost the exact definition of Misoperation in the introductory sentence. Nothing in this sub-part discusses an unnecessary trip. The phrase “not intended to operate” could apply to all of the other sub-parts because a failure to trip, slow trip, or unnecessary to trip would be the result of a Protection System not operating the way it was intended. More detail is needed for this sub-part.
No
(1) Also it is still unclear who has the ultimate responsibility for identifying and reviewing each operation if the interrupting device and Protection System are owned by two or more parties. What should occur if there is disagreement over the responsibility or the ownership of a component? What if multiple parties owned components that contributed to an operation or a Misoperation? Are both parties responsible? The rationale may provide additional guidance, but the words in the requirements are unclear. (2) “BES interrupting device” is not a defined term and is vague and ambiguous. We understand that devices that interrupt fault current, such as circuit breakers and circuit switchers would be included but what other devices such as motor operated disconnects? Are they not included because they don’t interrupt any current? What if they are equipped to interrupt charging and load current? Failure to define “BES interrupting device” could result in an informal definition that results in inconsistent enforcement by including components outside of the scope of what is intended to be a BES interrupting device. This term adds uncertainty and creates opportunities for multiple interpretations.
No
(1) The measures are not consistent with the revisions to the requirements. For instance, Requirement R1 requires the owner of the component that led to the Misoperation to identify and review its performance. However, the Measures require the applicable entities to have evidence without any statement regarding the ownership of Protection Systems or circuit breakers.
No
(1) If the drafting team intends to move forward with “composite Protection System,” we recommend adding it as a new proposed definition. After reading the technical guidelines, we are not persuaded that the drafting team has articulated the difference between a Protection System and a composite Protection System. A proposed glossary term would allow industry the opportunity to provide the feedback as to whether an additional term is needed in order to have the proper scope for identifying Misoperations.
(1) We recommend introducing the term “BES interrupting device” as a new definition with clearly defined parameters. (2) We would like more information on the Section 1600 data request for

Misoperation data. Also, if a data request is going to be utilized, will registered entities still need to continue reporting under PRC-004-2? This would be a redundant process and we encourage NERC to coordinate the timing of the data request to take the place of the current reporting requirements. Further, we disagree with the evidence retention section of this standard. TO, GO, and DP are audited on a six-year cycle, which is too long of a timeframe to retain evidence. We suggest shortening the amount of time to three years, unless there is an open or ongoing investigation, action plan, or CAP. If there is a section 1600 data request, why does the data need to be retained? NERC already has the information. (3) This standard is another candidate for implementing internal controls, and should not contain “zero-defect” language. For example, an entity should be able to have controls in place to determine whether Misoperations are being identified, assessed and corrected. This is the essence of PRC-004-3, and therefore should be revised to include these concepts. There should not be zero-defect penalties if an entity has controls to catch errors and fix them. Currently, the standard would penalize an entity for each instance of noncompliance. (4) We continue to be confused by the interaction of Requirements R1 and R3. While R1 does not compel the protective relay owner to identify the cause of a Misoperation, it does compel the owner to investigate the Misoperation. One would presume an auditor would expect investigative actions conducted for Requirement R1 to be reasonable. However the application guidelines section for Requirement R3 states clearly on page 14 that this requirement only applies if “reasonable investigative actions have not been exhausted”. Thus, it would appear that Requirement R3 could never apply without a violation of Requirement R1 Part 1.2. We think the interaction of these requirements need further clarification. Furthermore, we suggest that Requirement R3 could actually be made part of Requirement R1 which would help alleviate the confusion. For example, Part 1.2 could have a subpart that states that an action plan should be developed for any reasonable investigative actions that may require more than 120 days to complete. Another part could be to document why the cause cannot be identified. (5) Since UVLS is specifically excluded in the applicability section does it make sense to include it under voltage conditions in part 2 and 4 of the Misoperation definition? (6) Why can’t the implementation requirement R4 be included as a Part of the other requirements? Furthermore, it is questionable if it is even needed for FERC has stated in past orders that there is an implied obligation to implement plans, policies and procedures when a requirement compels their development. This requirement is similar to the types of standards that would be subject to Paragraph 81. (7) Thank you for the opportunity to comment.

Pamela R. Hunter
Yes
Southern Company supports the SERC comments and are including the following additional comments: 1. We believe that the same consideration of whether or not the composite Protection

System operated as intended could be addressed with a much simpler definition: "The failure of the Protection System to operated as intended, including failing to trip when it should have, unnecessarily tripping with it should not have, or tripping more slowly than intended." This definition allows the Protection System owner to evaluate the operation and determine if it operated appropriately. 2. We believe that the shift in focus to "composite" and "overall performance" does not clarify the ability to identify misoperating Protection System components.
No
1. The requirement R1 can be simplfied by wording it in this manner: "Each entity shall identify, review, investigate, classify, document, and, for misoperations, determine the cause (if identified) of each Protection System operation that they own..." by the required time frame. 2. The notification and response requirement of R1 is not needed, as the owner of the Protection System that operated is already required to investigate each operation in Requirement R1. An additional requirement for notifications and responses is superfluous. 3. There is a timing problem with R1.2 for the protection system owner who is notified on day 119 following a protection system operation. It is not reasonable or just to require this protetion sytem owner to complete the requirements of R1 in one day's time after being notified by the owner of an interrupting device whose operation was suspected to be caused by a misoperation of another entitiy's protection system.
No
1. The evidence listing in M1 is unnecessarily duplicative. Measure M1 (and likewise all of R1) could be greatly simplified by stating that the required evidence for proving compliance with R1 may include, but is not limited to ...then list the items once. 2. The severe VSL for R1, R2, and R3 can be simplified by changing a few words in the first item of each requirement. For R1, change "...entity performed the actions in ... and 1.2 in more than 170..." to "...entity did not perform the actions in .... and 1.2 within 170 ...". This would allow the 2nd and 3rd items in the OR statement to be eliminated. For R2, change "entity developed a CAP, or a declaration .... R2, more than 90 ..." to "entity did not develop a CAP or a declaration ...R2 within 90 ...". This would allow the second part of the OR statement to be eliminated. For R3, change "entity developed an action plan, or made a declaration ... R3, more than 230 ..." to "entity did not develop an action plan or make a declaration ... R3 within 230 ...". This would allow the second part of the OR statement to be eliminated. 3. The VSL should be have a weighting factor in the % of operations not analyzed (otherwise it is one strike and you're out and this could be one event out of many). Equal severity for 1/10 events is not just compared to 1/100 events.
Yes
Southern Company supports the SERC comments and are including the following additional comments: 1. In various locations of the text, Protection System misoperations are discounted as misoperations for situations where other redundant protection may have adequately operated. In these instances, perhaps the classification should be changed to non-reportable misopeartion rather than simply that they are not misoperations (we believe that they are still misoperations). We believe that entities should be allowed to determine whether or not the Protection System operated appropriately. This is inherent in our suggested simpler definition of Misoperation through including "than intended". 2. In the text for section 6 of the Misoperation definition, we disagree with the phrase "An operation that occurs during a non-fault condition but was initiated by on-site maintenance, testing, inspetion, construction or commissioning is not a Misoperation." This is obviously an unnecessary trip - other than fault. This should be included in a list of non-reportable misoperations.
Southern Company supports the SERC comments and are including the following additional comments: 1. By using the definition of a Corrective Action Plan (CAP) in the NERC Glossary of terms as well as the term ‘action plan’ in R3, it is unclear what differences exist between a CAP and an “action plan” as written in PRC-004-3. Please modify language to be consistent or add language that describes the intent and difference between a CAP and an “action plan”. 2. R2 and R3 should be restructured such that it is immediately apparent that R2 deals with Misoperations with an identified cause and R3 deals with Misoperations without an identified cause. This could be accomplished by phasing that condition first in the requirement so that the required actions that are bulleted immediately follow the "shall" such as: "R2: For each Misoperation with an identified cause, the entity shall either develop a CAP ... or declare why ..." and "R3: For each Misoperation without an identifed cause, the entitiy shall either develop an action plan ... or declare why ..." 3. R4 should be re-structured to flow more smoothly, as follows; “R4. Each entity shall implement and revise, as needed, each CAP or action plan. 4. The three bullets found at the top of page 6 of draft 3 of the standard

should be the three requirements of this standard. Has any consideration of making those three items the actual requirements? 5. Please consider using the phrase "component that misoperated" rather than "component that contributed to the misoperation" in the standard for clarity. 6. There is too much unnecessary date bookkeeping in the Requirements. We recommend deleting all existing date clocks linked to each event and specify a resolution time limit for investigative action plans/CAPs to be the filing date deadline for each quarter. The establishment of multiple time frames for each detail of a Protection System operation will not improve reliability. The establishment of investigative action plans and/or completion of necessary Corrective Action Plans in a timely fashion are the actions which will affect the reliability of the Protection System. 7. In reference to the above comment, if the timeframe are to remain, the SDT is strongly encouraged to move toward an internal controls format for this standard.

(1) We disagree with the VSL escalation, for R1, R2 and R3, from Moderate to High to Severe at 10 days interval each.
Yes
(1) Please clarify the sentence on page 17, the second to last paragraph, "Protection System operations unrelated to on-site maintenance, testing, inspection, construction or commissioning activities which occur with the protected Element out of service, that trip any in-service Elements are Misoperations" by putting it in a new paragraph and including some examples. Does the protected Element have to be out of service? Is this intended to include human error (e.g. bumping the panel) caused trips by personnel other than Protection System maintenance personnel? (2) Please add "completed" on page 20, near the bottom, so that the title reads " The following are examples of completed Corrective Action Plans (CAPs):" (3) In addition to our comments, we also agree with the SERC Protection & Control Subcommittee (PCS) comments and include them by reference.
Group
PPL NERC Registered Entities
Brent Ingebrigtson
No
The topic of slow trips should be removed from PRC-004-3 and the proposed re-definition of a Misoperation, for the following reasons: • The standard incorrectly assumes that every NERC-registered generation unit is required to have DME for high-speed recording of relay-operation events. • Where DME is present it is generally installed on the HV side of a unit, and may therefore not yield any useful information for problems occurring at the generator or other low-side components. • The standard incorrectly assumes that all GOs have, or should have, design-level relay personnel, ref. the Application Guidelines statements regarding being able to decide whether the speed of the Protection System was adequate (pp. 15 and 16). • Independent GOs in particular have finite resources, and mandating an unreasonable focus on Protection System event record-keeping and analysis will leave other operation and maintenance tasks that much less well covered, resulting in a negative impact on reliability.
No
The requirement R1 can be simplified by wording it in this manner: "Each entity shall identify, review, investigate, classify, document, and, for misoperations, determine the cause (if identified) of each Protection System operation that they own…" by the required time frame. There is a possible time coordination issue for identification and review of misperations with R1.2. As stated in the proposed

standard, R1 places the responsibility on the BES interrupting device owner to investigate operations initiated by a Protection System. If timely communication of misoperation information is delayed by a Protection System component owner, the BES interrupting device owner could possibly bear the responsibility of not meeting the 120 day reporting requirement per R1. Fundamentally, R1 frames the time period for reviewing and analyzing a misoperations where multiple responsible entities are involved. However, R1 does not take in to account that one entity's analysis may be dependent upon the other's final analysis and that parallel review of misoperations are not possible. More consideration should be given to the cases where one entity's actions impact another's ability to meet the requirements of R1. However, concur in overall concept with clarifying coordination roles between BES interrupting device owner and the Protection System owner.
No
The VSLs are hard-wired to response/reporting timelines specified per R1-R3. Some consideration should be given to technical complexity and circumstance of the SPS Misoperation. The R1 evidence listing in M1 is unnecessarily duplicative. Measure M1 (and likewise all of R1) could be greatly simplified by stating that the required evidence for proving compliance with R1 may include, but is not limited to …then list the items once.
Yes
The standard should completely exclude operation of reverse power relays when shutting-down units, or (better) classify such devices as not being part of Protection Systems (they do not protect BES equipment; they prevent turbine mechanical damage). This subject is discussed in the Application Guidelines (p.17), but the distinction attempted between control and protection functions of reverse power relays is obscure.
The PPL NERC Registered Entities (PPL Electric Utilities, PPL Generation LLC, PPL Energy Plus, LG&E and KU Services) are in agreement with the spirit of the North America Generator Forum Standards Review Team comments for the successive ballot for Project 2010-05.1 Protection Systems: Misoperations. We recommend deleting all date clocks linked to each event and replace them with a final resolution time limit for action plans/CAPs and/or replace them with a filing date deadline to identify, review, and disposition of each operation for each event. The establishment of multiple time frames for each detail of a Protection System operation will not improve reliability; the completion of any necessary Corrective Action Plans are the actions which will affect the reliability of the Protection System operations. In various locations of the draft, Protection System misoperations are discounted as misoperations for situations where other redundant protection may have adequately operated. In these instances, perhaps the classification should be changed to non-reportable misoperation rather than simply that they are not Misoperations. The three bullets found at the top of page 6 of draft 3 of the standard are possibly sufficient requirements for this standard. Has any consideration been given to making those three items the actual requirements?

The documentation requirements for maintaining a database of every operation of a BES interrupting device, which are laid out in Measure M1, represent a significant step change in documentation requirements when compared with the current misoperation analysis and reporting requirements. Unintentional mismanagement of a database that identifies every operation by time, date, and date of review during a six year audit window poses no significant risk to the reliabile operation of the Bulk Electric System. However, enforcement of this measure will likely identify clerical or other

unintentional errors made during the process of tracking misoperations that will impede NERC's ability to address violations that pose a moderate or severe threat to the reliability of the Bulk Electric System. The underlying objective of the data compiled in the measure appears to be a 'best practice' method for retaining data necessary to meet the quarterly reporting requirements for misoperation reporting; specifically reporting of the 'total number of operations'. While it is understood, that NERC is utilizing this quarterly reporting data to develop metrics to track the performance of BES Protective Systems, the required implementation of a prescriptive tracking method in a Reliability Standard does not balance the need and method for addressing the need, and compliance with the quarterly reporting of misoperation data is already driven by NERC's Rules of Procedure. The SDT should consider modifying Measure M1 in such a way that it requires misoperation analysis reports (Corrective Action Plans and Action Plans) to include the level of detail addressed in Measurement M1 (time & date of operation, date analysis determined it was a misoperation, etc.). This modification would address the need to ensure that misoperations are appropriately analyzed within a reasonable amount of time while avoiding the implementation of a Reliability Standard requirement that could create enforcement actions that hinder NERC's ability to address potential violations that pose a moderate or serious threat to the Bulk Electric System.

ramping up the violation level simply on the number of days that pass to complete the analysis does not seep appropriate for situations where the discovery may have been delayed in the first place
Yes
Generally, the standard does not seem to address the reporint of no events now being required by the RE, especially for entities that have only a few devices, the reporting burden for non-events shoudl be clearly eliminated. It is not clear that it is eliminated. Only the reporting of actual misoperations should be required as defined.

The drafting team should review the BES Definition drafting team documents and evaluated how it relates to misoperations. It would be desirable to avoid any disconnects or conflicts between these definitions and standards. Some BES Definition drafting team documents indicate individual wind turbine generators are part of the BES. Is misoperation data desired down to this level? During Webinars explaining the BES definition documentation questions were asked regarding how the BES documentation helps identify or determine what protection systems are included for PRC-005. The BES drafting team stated that protections systems for PRC-005 are not to be defined by the equipment identified in the BES definitions documentation but instead are to be defined the PRC-005 standard and documentation. Would this be the case for PRC-004-3 as well?

Some of the scenerios for possible mis-operations are too vague. For example what constitutes a slow trip and what would constitute how a protection system is designed? If a protection scheme is designed to trip in 2-3 cycles and it trips in 5-6 cycles yet still protects the equipment, an auditor could see that as a mis-operation however it still would protect the equipment as it was designed. Also, it can be difficult at times to determine if a fault actually occurred within a relay's zone of reach. If a bolt of lightning causes a fault on a line unless there is physical damage there can be little visual indication of a fault. It can be difficult to confirm if a mis-operation occurred if you can not first confirm what caused the fault.
No
There should be some provision in the standard to take in to account extenuating circumstances such as natural disasters. It would be unfair to expect entities to be able to perform an analysis within 120 days following a major disaster. Also, there are some circumstances when an investigation is out of the control of the entity. For example if a relay or protection device potentially failed but needed to be investigated by the manufacturer or an outside company it may take longer than 120 days to perform a thoroughly investigation.

It can be difficult to confirm if a mis-operation occurred if you cannot first confirm what caused the fault.
No
There should be some provision in the standard to take into account extenuating circumstances such as natural disasters. It would be unfair to expect entities to be able to perform an analysis within 120 days following a major disaster. Also, there are some circumstances when an investigation is out of the control of the entity. For example, if a relay or protection device potentially failed but needed to be investigated by the manufacturer or an outside company, it may take longer than 120 days to perform a thorough investigation.

NPCC uses different terms, such as failure to operate (not operating when required) vs misoperation (operating when not required). We think that the definition here has the intention of defining more generally an "incorrect operation", and perhaps the "incorrect operation" should be used for both different terms.
No
1 We belive that R1 should be written more clearly, by saying that: “Within 120 calendar days of a BES interrupting device operation casued by a Protection System operation, each Transmission Owner, Generator Owner, or Distribution Provider - that owns the BES interrupting device - shall identify and review each Protection System Operation.” 2 Also, there is a lack of clarity on which entity is responsible for developing and implementing a Corrective Action Plan. We believe that there has to be corresponding revisions to R2 and R3 to clearly indicate which entity needs to be held responsible for the CAP, especially in view of the rationale provided in the text box for R1, whose excerpt says: “The owner of the component that contributed to the Misoperation will create the CAP, action plan or declaration required by Requirements R2 and R3”. We interpret the quoted excerpt (above) to mean that the component that contributed to the Misoperation may not be owned (in full or in part) by the owner of the BES interrupting device. It follows that in such cases, the owner of the component that contributed to the Misoperation is responsible for complying with R2 and R3. If this interpretation is correct, then Requirements R2 and R3 are not clear as to which entity is held responsible. To clarify this, we suggest revising the leading part of R2 to: “Each Transmission Owner, Generator Owner, or Distribution Provider that owns the component that contributed to the Misoperation shall, within 60 calendar days of identifying….”. The Same revision should apply to R3, as follows: “Each Transmission Owner, Generator Owner, or Distribution Provider that owns the component that contributed to the Misoperation shall, within 180 calendar days of the associated BES interrupting device operation,…..” Further, though not explicitly stated, we assume that the owner of the component that contributed to the Misoperation is also held responsible for complying with R4 to implement and complete the CAP or action plan to accomplish all identified objectives. Hence, the same qualifier should also be added to Requirement R4.
Yes
Yes
Generally speaking, the standard is difficult to read, focusing on how instead of what. The drafting team should strengthen the description of the outcomes, and try to reduce the reliance on the application guideline and the rationales. (One has to read the rationales before understanding the meaning of the requirements.)

By using the definition of a Corrective Action Plan (CAP) in the NERC Glossary of terms, it is unclear what differences exist between a CAP and an “action plan” as written in PRC-004-3. Both appear to be the same until the Rationale for R3 states “implementing an action plan of additional investigation/monitoring may determine cause and lead to the development of a CAP in accordance to Requirement R2.” Oncor recommends that additional language be added that describes the intent and difference between a CAP and an “action plan”. Oncor would also like clarification as to what authority the CEA holds in determining the effectiveness of the corrective actions detailed in the CAP and/or “action plan”.

LADWP recommends that the Drafting Team give due weight to the Internal Controls Process (ICP). We believe the responsible entity should be allowed the latitude to determine the Corrective Action Plan (CAP) that follows the ICP approach. LADWP also recommends that the standard include specifications that the entity identify mitigating factors performed under the CAP that specifically address the misoperation.

The NERC STD defines a Slow Trip as a “Protection System operation that is slower than intended… .” (emphasis added). My preliminary read of this language was that if the Protection System operated slower, i.e., took even 1 cycle longer in time to operate, than how it was intended to be set, that such delay would be a Slow Trip. However, reading your responses to comments, it appears that “time” is not the measure of compliance, but in fact, the compliance metric is based on intended protective objective. By this I mean, if the overall goal of protection is met, then there is no slow trip no matter how much time has passed. To clarify even more, so as long as no additional harm has occurred during the time delay, time is not the measurement for compliance, but harm to the protected equipment is the compliance measure. With that said, can you please describe in some more detail how this compliance metric, i.e., additional harm, will be documented and audited?
1. The Proposed PRC-004-3 combines PRC-004-2a and PRC-003-1. This project is applicable to a “Distribution Provider” whereas PRC-004-2a is applicable to a “Distribution Provider that owns a transmission Protection System.” Does the STD believe that the additional caveat should be added to the Distribution Provider (DP) applicability, i.e., that the DP need to own a transmission Protection System? 2. In the “Purpose/Industry Need” section that the STD developed for this Project, the STD states that because PRC-003-1 was never approved by the Commission, “there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2… This could lead to a potential reliability gap.” (Emphasis added). This infers that there is a need for some form of standardized regional mitigation requirements. When NERC drafted PRC-003-1, NERC made RROs the applicable entity in order for each RRO to “establish, document and maintain is procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations.” (See R1. of PRC-003-1). However, in the proposed action, PRC-004-3 does not appear to require any such regional processes for misoperations mitigation. In fact, the new proposed Standard is not even applicable to RRO as the new standard does not require the RRO to perform any action. It does not appear that the new draft Standard mitigates the deficiency left by the non-approval of PRC-003-1 and so this should be addressed via the addition of some form of regional analysis requirement.

(1) The changes made to R1 are an improvement over the previous draft, but they still do not adequately clarify the responsibilities. Both the Rationale for R1 (blue box) and the Application

Guidelines indicate that the responsibility to investigate operations is placed on the owner of the interrupting device. However, BPA believes that the actual wording of R1 does not necessarily place the responsibility on the owner of the interrupting device. Instead, R1 places the responsibility on the TO, GO, or DP which has an interrupting device operation in its facility. Since it is quite common in the industry for TOs, GOs, or DPs to own interrupting devices within another entity's facility, R1 will sometimes place the responsibility on the owner of the facility where the interrupting device is located instead of on the owner of the interrupting device. In addition, the bullet points of R1 address the cases where the entity owns both the interrupting device and the protection system and where the entity owns the interrupting device but not all of the protection system, but there is no bullet point to address the case where the entity owns the protection system but not the interrupting device. It is not unusual for the owner of a facility to own a protection system but not the interrupting device that is operated by the protection system. Because it is vital that there is no ambiguity about who is responsible to initiate the investigation when an interrupting device operates, BPA recommends that the responsibility be placed on the owner of the protective relays which caused the interrupting device to operate because the owner of the protective relays will have access to the primary information that will determine how the investigation should proceed. After the owner of the protective relays makes an initial investigation, the owners of the interrupting device or the owner of other components of the protection system can be notified to investigate their part of the protection system. If the responsibility to initiate the investigation is placed on the owner of the interrupting device, that entity will have to immediately turn to the owner of the protective relays to start the investigation. (2) The use of Facility as defined by NERC in Requirement 1 does not make sense. As used in Requirement 1, Facility seems to indicate a substation or switching station, which is not in agreement with the NERC definition, which is a set of equipment that operates as a single element. BPA recommends that Facility not be used in Requirement R1 to avoid this problem.
Yes
No
R2 requires each TO, GO, or DP to develop a corrective action plan, but it does not indicate which TO, GO, or DP must do this. Is this intended to be the TO, GO, or DP that owns the interrupting device or the TO, GO, or DP that owns the protection system? BPA recommends the following wording for the beginning of R2: Each TO, GO, or DP that owns a component of a protection system identified as contributing to a misoperation, as determined per R1, shall within 60 calendar days of identifying the cause of each misoperation: (insert bullet points for R2). Similar to the comment above for R2, BPA believes that R3 does not make it clear which TO, GO, or DP the requirement applies to. BPA recommends that the entity identified by R1 as required to initiate the investigation of an interrupting device operation (BPA believes this should be the owner of the protective relays) should be the entity required to complete the actions in R3. BPA believes that similar to R2 and R3, R4 should be more specific about which TO, GO, or DP the requirement applies to. The last paragraph of the Background section states that where PRC-004-WECC-1 overlaps with this continent-wide standard, entities are expected to comply with the more stringent standard. In our comments to the previous draft, BPA suggested that the Background section simply state which of the standards takes precedence instead of leaving it to the entities to determine which standard is more stringent. The response to this comment was that entities are required to comply with both the continent-wide standard and any applicable regional standards. This response seems to contradict the Background statement. BPA requests clarification on whether entities are expected to comply with both standards or only the more stringent standard, and how an entity should determine which standard is more stringent as the standards cover very different issues. BPA believes that if an entity is expected to comply with both standards, that should be stated, or perhaps this part of the Background statement should be removed.

City of Austin dba Austin Energy
Yes

No
Austin Energy agrees with Luminant’s comment and copies it here for convenience. Requirement R1 requires all BES interrupting device operations be reviewed within 120 days. Under the Application Guidelines (Definition of a Misoperation - item 6 (page 17)), reverse power relaying used for normal unit shutdown is excluded. We recommend that this clarification be included in the Standard; either in language in the Definition of a Misoperation (items 2, 5, and 6) or in Requirement R1.
Yes
Yes
Austin Energy (AE) recommends the following changes in the Guidelines and Technical Basis section: (1) Remove the reference of reverse power relaying from item #2. This reference can be confusing because the protection scheme is used for safe shutdown of a generating unit. A substitute example would be “A failure of a “primary” loss of field relay is not a failure to trip Misoperation as long as another component of the generator’s composite Protection System opertated to shut down the generator.” (2) References to generator Protection Systems that are exempt should be removed and placed in the opening section similar to the exclusions used to exempt circuit breaker and other interrupting device mechanisms. AE believes this would clarify what relay systems are excluded before reading the parts of the definition and requirements. (3) The second paragraph on page 26 of the redline, which reads “With the ultimate goal of keeping the implementation time of a CAP as short as possible, if a cause of a Misoperation is determined quickly the CAP creation timeframe (60 days) becomes applicable and requires the CAP implementation be less than 180 days” is not consistent with the Standard Requirements and should be removed. The standard requires CAP development within 180 days, not CAP implementation or completion in 180 days.
(1) For events where a BES breaker operates but the Registered Entity does not own all of the Protection Systems, it is possible the other owner would not be notified until 120 days has elapsed. This is counter the the expectation of the drafting team that “it is expected that both entities will work together to investigate the cause of the operation.” Austin Energy (AE) recommends re-writing the bullets of R1 to require notification within a set number of days (AE recommends 15 calendar days) and then require the entities to work together as necessary. AE provides language revisions for consideration: R1.1. Within 120 calendar days of a BES interrupting device operation in its Facility caused by a Protection System operation, identify and review each Protection System operation. --If the entity owns both the BES interrupting device and the Protection System, determine if it was a correct operation or a Misoperation. --If the entity owns the BES interrupting device but does not own all of the Protection System and cannot determine that the Protection System operation was correct, notify the other owner(s) of the Protection System component(s) within 15 calendar days. --The BES interrupting device and Protection System component owner(s) notified by the BES interrupting device owner shall work together to determine if there was a correct operation or a Misoperation of their component. (2) By using the definition of a Corrective Action Plan (CAP) in the NERC Glossary of terms, it is unclear what differences exist between a CAP and an Action Plan in the standard. They may appear to be the same. AE believes the intent of the action plan is to document an investigation plan, so recommends that additional language be added to the Rationale box for R2 that describes the intent of a CAP (as Corrective Action to avoid future recurrance) and an action plan as an investigation or other non-Corrective plan of action to investigate the cause of a misoperation or to determine if a misoperation has occured. (3) AE appreciates the efforts of the Standard Drafting Team and supports the goal of keeping the misoperation identification and correction processes as short as possible. There can be cases where extra time is necessary and the entire process may take longer than 180 days. The Standard allows for these extreme cases as written, assuming an action plan allows for the additional investigation of an operation or misoperation. For instance, if the cause of a misoperation cannot be identified, the entity may create an action plan to further research/analyze the cause (possibly the entity must ship equipment back to the OEM for cause determination). Once the cause is identified, then the Corrective Action Plan must be developed within 60 days. AE recognizes, and agrees with the Standard Drafting Team’s intent to ensure active analysis and appropriate corrective actions are adequately considered and/or implemented. Although it is likely there is sufficient time to analyze operations, identify misoperations and take corrective action for most events within the standard as written, there is a significant administrative burden involved to demonstrate action plans and/or corrective action plans are developed within the proper timelines. Therefore, although AE believes the timelines are workable as written, AE provides the following

alternative recommendation (4) Remove all of the required timelines and instead require the investigation/action plans and Corrective Action Plans only. These action plans and Corrective Action Plans contain timelines that must be followed by their very nature.

Consideration of Comments

Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)

The Project 2010-05.1 Drafting Team thanks all commenters who submitted comments on the proposed standard, PRC-004-3. There were 76 sets of comments, including comments from approximately 210 different people from approximately 132 companies representing all 10 of the Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary of Changes

The PSMSDT made substantive revisions to the previous draft 3 of PRC-004-3 – Protection System Misoperation Identification and Correction Reliability Standard following its previous 30-day formal comment posting of the standard and successive ballot which received 50.60% stakeholder approval. The following narrative is a summary of the substantive revisions made to the proposed draft 4 of the PRC-004-3 standard.

Definitions

Composite Protection System: The SDT is proposing a new definition to support the revisions to the definition of Misoperation.

Misoperation: The SDT made updated occurrences of "composite Protection System" with the newly proposed term of Composite Protection System. Other revisions include removing the uses of "zone," and most notably updated the category of "Slow Trip – During Fault" to address high-speed performance. The last category of "Unnecessary Trip – Other Than Fault" was modified to be clear that a Protection System operation due to on-site personnel is not a Misoperation.

Purpose

The purpose statement was reorganized to clarify that the standard applies to those Protection Systems for Bulk Electric System Elements.

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

Facilities

The SDT revised the Facilities section of the Applicability to remove exclusions for Special Protection Systems (SPS) and Remedial Action Schemes (RAS). As a general rule, Reliability Standards should address what is applicable, not what is excluded; therefore, SPS and RAS are not referenced in the Applicability. Exclusions concerning non-protective functions embedded within a Protection System and protective functions intended to operate as a control function (e.g., reverse power when removing a generator from service) have been moved to the main Applicability for Facilities to add clarity that these are not applicable as Protection Systems for Bulk Electric System (BES) Elements.

Effective Dates

The effective dates have not materially changed even though the language shows significant modification. This language change is being applied to Reliability Standards that are currently under development. The change is an outcome of NERC working with Canadian authorities to address their specific circumstances. Also, the Effective Date language now incorporates a provision for the Western Interconnection due to identified overlap between the Regional Reliability Standard PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation and the proposed continent-wide Reliability Standard PRC-004-3 – Protection System Misoperation Identification and Correction. The provision is to allot time for the Western Interconnection to modify the Regional Reliability Standard.

Requirement R1

The SDT reorganized Requirement R1 to improve clarity of the required performance, allotted time periods, and a single reliability objective in a Requirement. The main part of the Requirement begins with defining what starts the review of a Misoperation, which is the operation of a BES interrupting device. In replacing the earlier Part 1.1 and its sub-bullets, the responsible entity will perform a review when the criteria (i.e., 1.1, 1.2, and 1.3) are met. The three criteria include when: the BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; the BES interrupting device owner owns all or part of the Protection System component(s); and the BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation. Part 1.2 is now represented in Requirement R4 to investigate the identified Misoperation to determine a cause, if not previously revealed during the initial review of a Misoperation.

There were a significant number of comments from stakeholders about the confusion between the proposed “action plan” and the “Corrective Action Plan” found in previous Requirement R3. To address these comments, the SDT created Requirement R4 to allow an entity to continue its investigation, as needed, only requiring the entity to demonstrate actions taken at least once in every two full calendar quarters toward determining the cause of an identified Misoperation.

Requirement R2

This requirement is essentially unchanged and is now represented in Requirement R5, the development of a Corrective Action Plan (CAP) to address the cause(s) of an identified Misoperation. The SDT made clarifying revisions to pinpoint the Protection System component that caused the Misoperation as being subject to the (CAP). Also, the word “first” was added before “…identifying the cause…” to improve clarity that upon identifying the “first cause” starts the 60 calendar day time period for developing the CAP. Last, the SDT added the clause “…and that no further corrective actions will be taken” to require entities to clearly state that no additional actions are planned to be taken to provide a measurable close to the performance in the declaration. Also, the phrase “would reduce BES reliability” was replaced with “would not improve BES reliability” to align with those conditions where corrective action may not be practical.

Requirement R3

This requirement was removed by the SDT in the current draft as comments revealed the use of “action plan” along with Corrective Action Plan created unnecessary confusion. The proposed Requirement R4 fills this performance by requiring entities to continue its investigative actions in determining a cause of an identified Misoperation.

Requirement R4

This requirement is now Requirement R6 and is essentially the same as the previous Requirement R4, except that “action plan” was removed. Implementation is further clarified that the CAP must be updated when actions or timetables change through completion of the CAP.”

Compliance

The SDT corrected this section to comport with the standard language NERC uses in Reliability Standards. Also, the Evidence Retention section was changed to reduce the minimum time periods that were previously proposed at six years (i.e., the last audit) for all Requirements to 12 calendar months for all Requirements according to the Standard Drafting Guidelines for evidence retention.

VRFs and VSLs

After further review, the SDT lowered the earlier Requirement R4 (implement the CAP) Violation Risk Level (VRF) from High to Medium. This comports with the VRF found in PRC-016-0.1 – Special Protection System Misoperation, Requirement R2 and PRC-022-1 - Under-Voltage Load Shedding Program Performance, Requirement R1.2. See the VRF and VSL Justifications document for additional information.

The Violation Severity Levels were completely rewritten due to the substantive changes made in restructuring the Requirements to meet a single reliability objective in a requirement. The SDT notes that it applied the VSL Guidelines in establishing the VSLs including the incremental differences between each level.

Application Guidelines

The SDT substantially reorganized the Guidelines and Technical Basis section of the Application Guidelines for organization and flow. Section headers were added and reordered as well as creating additional examples for guidance. For instance, the examples for Requirement R5 and R6 mirror one another to demonstrate an example of Corrective Action Plan (CAP) development (R5) and its implementation (R6).

1. **Based on stakeholder input, the drafting team revised the definition of a Misoperation. The categories as well as the introductory sentence of the definition were modified for clarity. The introductory sentence indicates that a Misoperation pertains to 'the failure of an Element's composite Protection System to operate as intended.' Do you agree with the revised definition? If not, please provide specific suggestions for improvement.**

Summary Consideration:

The following resulted in a revision to the proposed standard. There were approximately 15 comments supported by 44 individuals concerns expressing concern about the "Slow Trip – During Fault" category of the proposed Misoperation definition. Concerns varied and included; a reference to the NERC Transmission Planning (TPL) Reliability Standards which was removed; the need for precise operating times which were clarified in the Application Guidelines; compliance concerns questioning how entities will be measured in this category; and last, what if adequate data was not available to make a determination.

Concerning the use of the phrase "composite Protection System," there were about four comments representing about 24 individuals requesting clarification which also resulted in a modification to the proposed standard. The drafting team is proposing the new term "Composite Protection System" for inclusion in the *Glossary of Terms used in NERC Reliability Standards*.

The last item that resulted in a change to the proposed standard concerned on-site activities pertaining to the Misoperation definition category, "Unnecessary Trip – Other Than Fault." This was supported by two minority comments and individuals requesting clarity that an operation due to on-site or activity activities that result in a Protection System operation would not be a Misoperation. The drafting team concurred and made clarifications to this last category.

The following did not result in a change to the proposed standard. Approximately eight comments supported by about 17 individuals were concerned that the proposed definition of Misoperation (or standard) was inferring that entities will be required to install Disturbance Monitoring Equipment (DME). Although useful in determinations (i.e., slow trips), the standard nor definition require the installation of DME which is being addressed by Project 2007-11 – Disturbance Monitoring (PRC-002 and PRC-018).

One comment supported by about 17 individuals requested that a Reliability Standard Audit Worksheet (RSAW) be posted contemporaneously with the proposed standard and definition of Misoperation. The drafting team anticipates posting a draft PRC-004-3 RSAW so that entities will have an opportunity to consider auditing approaches. Posting is expected mid-way through the draft 4 posting of PRC-004-3.

Last, a minority set of comments from approximately ten individuals concerning the "Slow Trip – During Fault" offered suggestions that were not implemented – in the judgment of the drafting team, these suggestions did not provide improve clarity.

Organization	Yes or No	Question 1 Comment
ACES Standard Collaborators	No	(1) The term “composite” Protection System is unclear, used inconsistently and should be defined. Based on the first sentence on Page 14 of the Guidelines and Technical Basis section, it appears that all Protection Systems protecting an Element are intended to be included in composite Protection System. That is any primary, secondary, backup, pilot and non-pilot relay schemes for a given Element would be included in its composite Protection System. If this is the case, we suggest just writing a definition so it will be clear where the term comes from and what the meaning is. However, it is not clear that the term is even needed since the definition of Protection System would already include all of these Protection Systems. The definition includes “Protective relays which respond to electrical quantities.” The inconsistent use of “composite” in the standard documents only creates more questions for the need of the definition. For example, on page 14 of Guidelines and Technical Basis section under the section (1) title, the “overall performance of the Protection System for the Element it is designed to protect” is used. This is understood to be all “protective relays” including secondary, backup, pilot and non-pilot relay schemes. As defined, Protection System includes the plural use of protective relays so all could be included. **Response:** The use of the term “composite” Protection System is intended to address the fact that the term Protection System by itself does not indicate that it is the complete set of protective relaying for an Element such as any primary, secondary, local backup, and communication-assisted relay systems. The word “composite” used as a modifier to Protection System was developed by the NERC SPCS to indicate the total complement of protection for a system Element (line, bus, transformer, generator, etc). To clarify the usage of the terminology, the drafting team is proposing a definition for “Composite Protection System” and has made corresponding changes where “composite Protection System” occurs in the body of the project documents. Change made. (2) Why does the definition need an introductory sentence? The clarifying statement “any of the following is considered a Misoperation” provides the same outcome. Also, several of the sub-parts of the definition discuss the “overall performance of the

Organization	Yes or No	Question 1 Comment
		Protection System," so this introductory sentence seems redundant. Instead of adding confusion, we recommend that the drafting team strike the entire introduction sentence of the definition. **Response:** The introductory sentence provides the essential introduction to the numbered parts. The six categories provide the different categories of a Misoperation which classify a Misoperation in terms of Fault or non-Fault conditions, and security or dependability. No change made. (3) For sub-part "3. Slow Trip - During Fault" of the definition, we recommend revising the second sentence. It is a run-on sentence, uses incorrect grammar, contains a triple negative statement, and is confusing. We recommend revising the sentence to clearly state when delayed fault clearing should be excluded and what conditions must be met before the operation is not to be considered a Misoperation. **Response:** The drafting team agrees and is proposing a revision of "Slow Trip - During Fault" to address this comment and others. Change made. (4) For sub-part "5. Unnecessary Trip - During Fault" of the definition, we believe that the revised sentence now overlaps other sub-parts of the definition. "A Protection System operation for a Fault for which the Protection System is not intended to operate" is almost the exact definition of Misoperation in the introductory sentence. Nothing in this sub-part discusses an unnecessary trip. The phrase "not intended to operate" could apply to all of the other sub-parts because a failure to trip, slow trip, or unnecessary to trip would be the result of a Protection System not operating the way it was intended. More detail is needed for this sub-part. **Response:** The drafting team agrees and is proposing a revision of "Unnecessary Trip – During Fault" to make clear that this part is for an unnecessary operation for a Fault on another Element. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		

Organization	Yes or No	Question 1 Comment
Xcel Energy	No	a. (This is the single issue causing us to vote negative.) Many generating units with legacy electromechanical protective relay based protection systems do not have DME for high-speed recording of relay-operation events. Although the generating circuit breakers may be on the HV side of GSU transformers and may be monitored via the associated substation DME, the initiating signals from protective relays on the generator side of the GSU may not provide an input or trigger signal to the substation DME. As such, there is little or no value in requiring Generator Owners to try to identify and analyze slow trip events when such data to perform the analysis is not required to be available. In particular, we are concerned that examples provided in the Slow to Trip - Other than Fault bullet of the Misoperation definition (undervoltage, over excitation and loss of excitation) point explicitly toward application of this portion of the definition towards Generator Owners. We are concerned how various auditors may judge entirely qualitative evaluations of the adequacy of GO Protection System performance for Slow to Trip - Other than Fault events when DME is not available, nor required, to quantify performance. **Response:** The definition and standard do not require the installation of Disturbance Monitoring Equipment (DME); however, the entity must use its available information to determine whether there was a Misoperation. The standard requires all applicable entities to review Protection System operations for Misoperation. Other changes were made to category “4. Slow to Trip - Other than Fault” to identify other conditions for these types of Misoperations and to incorporate the proposed term “Composite Protection System.” Change made. b. Under "Slow Trip - During Fault", is the phrase “Delayed Fault clearing" intended to be the same as the Glossary term “Delayed Fault Clearing”? If not, the similarity of the existing usage with the defined term introduces ambiguity and confusion about intent. Suggest rewording the second sentence under "Slow Trip - During Fault" to eliminate this potential confusion. Note that similar confusion between the term “Delayed Clearing” used in TPL Standards and the Glossary term “Delayed Fault Clearing” resulted in the NERC Interpretation Request 2012-INT-02.

Organization	Yes or No	Question 1 Comment
		Response: The drafting team did not intend "Delayed Fault clearing" to be associated with the NERC glossary definition. The NERC glossary term, "Fault," was moved to improve the clarity for "Slow Trip – During Fault." Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
American Electric Power	No	AEP recommends removing the reference to "TPL standards" from the "Slow Trip - During Fault" category of the definition. AEP believes the intent of the "TPL standards" reference can be maintained by capturing all slow trip events that result in clearing more Elements than necessary. **Response:** The drafting team agrees and has removed the TPL standards reference from "Slow Trip – During Fault." Change made. AEP's first preference is to reword the category as follows "Slow Trip - During Fault - An Element's composite Protection System operation that, due to the duration of the composite Protection System's operating time, resulted in the clearing of other Elements in addition to the Faulted Element.". AEP's second preference is "Slow Trip - During Fault - A composite Protection System operation for the Faulted Element it was designed to protect which was slower than intended. Delayed Fault Clearing due to the non-operation of an installed high-speed protection scheme is not a Misoperation provided the duration of the composite Protection System's operating time did not result in instability or cascading, and did not result in miscoordination with any other composite Protection Systems." **Response:** The drafting team disagrees with the first suggestion. Remote backup Protection System operation before the Fault is cleared is one indicator of a slow trip. A Composite Protection System that operates slower than required for a Fault on an Element is a Misoperation regardless of whether other Elements operated or not. The drafting team disagrees with the second suggestion because the Composite Protection System must operate as intended (e.g., meet the intended high-speed operation) regardless of whether something bad happened or not. The drafting team

Organization	Yes or No	Question 1 Comment
		made other clarifying changes to the definition of Misoperation. Change made. AEP recommends adding to both “Failure to Trip - During Fault” and “Failure to Trip - other than Fault” - “Please see Category 3(4) to determine if the “slow trip” classification applies to the operation.” **Response:** The drafting team does not agree that adding references to category 3 (or 4) at the end of category 1 (or 2) is needed. These same types of references could apply elsewhere in the definition and only complicate the definition. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
Lincoln Electric System	No	Although supportive of the proposed revisions to the definition of Misoperation, LES is concerned that the phrase “slower than intended” within the definition of a “Slow Trip - During Fault” may lead to unnecessary administrative work in an effort to prove what is considered an acceptable operation time for each Protection System. To avoid requiring entities to develop documentation stating “how fast is fast enough”, recommend modifying the Application Guidelines as follows: (3) ...The phrase “slower than intended” means the Protection System operated slower than the objective of the owner(s). It would be impossible to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent additional harm, and ultimately be able to decide whether the speed or outcome of its Protection System operation was adequate. [The intent is not to require documentation of adequate Protection System operation times, but to assure consideration by the owner(s) reviewing each Protection System operation.]
Response: The drafting team thanks you for your comments and agrees with your sentiment and will add an extra sentence in the paragraph noted in the Application Guidelines regarding the intent. Also, the part of the definition “Slow Trip – During Fault” has		

Organization	Yes or No	Question 1 Comment
been revised to improve clarity. Change made.		
Florida Municipal Power Agency	No	FMPA appreciates the response to our comments, but, we do not believe our issues have been resolved. First, on “Slow Trip”; however, we disagree with your perspective. The SDT is taking a relativistic approach to time, e.g., interpreting the words it drafted “slower than intended” as relating to whether the Protection System operated “fast enough to prevent additional harm” and not a more common interpretation of it operated slower than it was designed to operate. FMPA believes that an auditor would interpret this using the latter interpretation and instead ask for the design clearing time of the protection system as a comparison of whether actual operation was “slow”, e.g., if the system is designed to operate in 5 or 6 cycles and instead it operates in 7 or 8 cycles, fast enough to prevent backup protection from operating, but slower than designed, is that slow? If the SDT intends “slower than intended” to mean that it operates “fast enough to prevent any additional harm”, e.g., the clearing time of the back-up protection, then state that in the definition. The response to our comment (and the Application Guidelines) focuses on the owner of the Protection System “should have an understanding of the objectives of its Protection Systems”; that is not FMPA’s concern. FMPA’s concern is how an auditor will audit R1 and verify that the entity identified all misoperations, and how an auditor will interpret “slower than intended”. **Response:** The phrase “slower than required” means the Composite Protection System operated slower than the objective of the owner(s). It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation was adequate. The intent is not to require documentation of exact Protection System operation times; however, each entity must determine what evidence it needs to support compliance with the requirements. The definition of Misoperation has been revised to clarify slow trips and additional detail added to the Application Guidelines.

Organization	Yes or No	Question 1 Comment
		Change made. Second, FMPA commented last time (commenting on R1) on the difficulty of measuring whether a fault actually occurred and where the fault in regards to the definitions of “Failure to Trip” and “Unnecesary Trip”. For both, an auditable investigation would need to determine if: 1) a fault actually existed, which can be quite difficult to verify for something like a lighnting strike with automatic reclosing; and 2) where the fault was; so that it can be determined whether or not the fault was “within the zone it was designed to protect”. In investigating tripping of BES Elements, a large number of those events are indeterminent, meaning that physical evidence could not be found. With microprocessor based protection systems, if may be possible to set up a sort of event recording function that may be able to provide evidence of fault condition and roughly where a fault was; however, with electromechanical relays, that is not possible without installing additional equipment. Is the SDT intending to require a form of event recording at each substation so that the existence and location of a fault can be determined for every protection system trip? If no evidence of a fault exists, would the default assumption be that everything operated as intended unless the evidence of protection system operation indicated otherwise (e.g., both primary and backup systems operated)? If that is the intent, then that intent should be stated within the requirements. **Response:** Although it is true that it may be difficult to precisely locate a Fault, it is incorrect to consider that these events are indeterminate. As proposed in the PRC-004-3 standard, an entity is not required to precisely locate or find residual evidence of Faults nor is an entity required to install Disturbance Monitoring Equipment (DME). See Project 2007-11 – Disturbance Monitoring (PRC-002 and PRC-018) for requirements concerning DME. An entity should review the documentation it can obtain for an event, and if there is no evidence of a Misoperation, then the entity could

Organization	Yes or No	Question 1 Comment
		document the operation was correct. No change made. Third, how would a high impedance fault be treated? Such a fault could occur within the relay reach, but, the impedance of the fault could in essence cause the fault to appear further away than it actually is. For instance, assume a line is protected by an instantaneous ground overcurrent relay protecting about 70% of the line and by an inverse time ground overcurrent relay as local backup. And let's say a high impedance fault occurs 50% of the length of the line, but the impedance of the fault reduced the fault current to below the instantaneous relay setting such that the inverse time ground overcurrent relay operates instead. Is that a misoperation because the instantaneous ground overcurrent relay failed to operate for a "Fault within the zone it was designed to protect"? Which leads to the ambiguity of the phrase "within the zone it was designed to protect". Does zone mean a distance as derived from the relay settings, or is it the relay settings themselves? If it is the relay settings themselves, then FMPA suggests changing the phrase to eliminate "zone" and instead refer to the actual protection system settings. **Response:** The example provided would not be a Misoperation simply because the instantaneous element in the relay did not operate. The drafting team has removed the reference(s) to "zone" in the proposed definition of Misoperation. Change made. Fourth, FMPA is also concerned about how "composite Protection Systems" works, especially with the combination of "within the zone it was designed to protect". For instance, let's assume Line 1 has typical stepped disctance scheme of zones, 1 through 3, and let's assume the adjacent Line 2 has a fault and there is a failed breaker at the intermediate substation. The breaker is not part of any protection system, but, the zone 3 remote backup relay of Line 1 operates to help clear the fault on Line 2, which is a correct operation. So, is Line 1's zone 3 relay part of Line 1's composite Protection System, and if so, then there is not a single "zone" for composite Protection Systems, which again adds to the ambiguity of the phrase "within the zone it is designed to protect".

Organization	Yes or No	Question 1 Comment
		Response: Line 1's zone 3 is a backup relay element that covers Line 1's primary zone of protection and provides remote protection for other zones. In the example cited, the zone 3 operation is not a Misoperation because it provided proper backup for Line 2 and its zone of protection extends into Line 2. The prior use of the phrase "composite Protection System" was intended to indicate that the collective operations of the entire Protection Systems for an Element that determines whether a Misoperation occurred. To clarify the usage of the phrase, the drafting team is proposing a definition for "Composite Protection System." Change made. Fifth, some misoperations are due to mistakes made by protection engineers, e.g., mistakes in establishing relay settings; so does: "within the zone it was designed to protect" the actual design of the protection engineer, e.g., the mistaken relay setting, or what the design should have been? If the latter, how will the 'what the design should have been' be determined? If the SDT has not already done so, FMPA recommends involving NERC and RE enforcement staff to discuss how R1 would be audited in combination with these definitions. **Response:** "Within the zone it was designed to protect" referred to the intended design. The entity must determine and know the intended zone of protection. The drafting team has removed the reference(s) to "zone" in the proposed definition of Misoperation. An incorrect design is a valid cause of a Misoperation. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
Liberty Electric Power LLC	No	I agree with the position of the Standards Development Team of the North American Generator Forum, which states: The topic of slow trips should be removed from PRC-004-3 and the proposed re-definition of a Misoperation, for the following reasons: - The standard incorrectly assumes that every NERC-registered generation unit is required to have DME for high-speed recording of relay-operation events. - Where DME is present it is generally installed on the HV side of a unit, and may

Organization	Yes or No	Question 1 Comment
		therefore not yield any useful information for problems occurring at the generator or other low-side components. - The standard incorrectly assumes that all GOs have, or should have, design-level relay personnel, ref. the Application Guidelines statements regarding being able to decide whether the speed of the Protection System was adequate (pp. 15 and 16). - Independent GOs in particular have finite resources, and mandating an unreasonable focus on Protection System event record-keeping and analysis will leave other operation and maintenance tasks that much less well covered, resulting in a negative impact on reliability.
Response: The drafting team thanks you for your comments. The slow trip category is included because it is a type of Misoperation which should be identified when possible. In cases where the entity does not have access to Disturbance Monitoring Equipment (DME), a slow trip may be revealed by BES instability and tripping of more than then minimum Element(s). The proposed standard does not require the installation of DME which is being addressed by Project 2007-11 – Disturbance Monitoring (PRC-002 and PRC-018). The proposed standard does not require an entity to have certain personnel and only specifies the performance required for Misoperation identification and correction. Entities with Protection Systems that are applicable to the standard are required to identify any Misoperation, determine its cause(s), and correct the cause(s) to prevent future occurrences. The standard does, however, require entities to determine if Protection System operations were correct or were Misoperations. Misoperations should be investigated and the causes of those Misoperations should be corrected. To consider if a slow trip Misoperation occurred, the entity must determine if the Protection System operation resulted (due to the operating time) in either the operation of other Elements, instability, or slower than required for a Fault condition for which it was designed. The categories of the definition that are associated with slow trips have been modified to help identify the conditions for these types of Misoperations. No change made.		
Rayburn Country Electric Cooperative	No	I suggest using the word “entire” versus “composite” for clarity sake. composite (adj) Merriam Webste of or relating to a very large family entire (adj) Merriam Webster having no element or part left out ELEMENT NERC Glossary Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be

Organization	Yes or No	Question 1 Comment
		comprised of one or more components.
Response: The drafting team thanks you for your suggestion. The drafting team is proposing a definition for the term "Composite Protection System." Change made.		
Ingleside Cogeneration LP	No	Ingleside Cogeneration believes that the latest version of the definition correctly captures the intent that the action of the composite Protection System is the gating factor in the determination of a Misoperation. The aggregate action of the primary, secondary, and pilot systems should form the basis of the expected performance, not each individual group of components. However, we still believe that the project team's intent to allow Protection System owners some flexibility to determine when a "slow trip" occurs is not captured. We fully agree with your statement in the last Consideration of Comments that it is up to the owners to have "an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent any additional harm, and ultimately be able to decide whether the speed or outcome of its Protection System was adequate." However, unless the language is captured in the standard or the definition, CEAs may choose a different basis. In the extreme, they may determine that any delay outside the settings or manufacturer's specifications to be a Misoperation - even if reliability is not threatened or monitoring equipment cannot resolve down to that level of granularity.
Response: The drafting team thanks you for your comments and cannot speak to the approach that might be used by the Compliance Enforcement Authority (CEA). Based on the Requirements and definition of Misoperation, an entity must identify any Misoperation according to the information available at the time. The drafting team is proposing a definition for "Composite Protection System." The categories of the definition that are associated with slow trips have been revised to identify the other conditions for these types of Misoperations. No change made.		
Independent Electricity System Operator	No	NPCC uses different terms, such as failure to operate (not operating when required) vs misoperation (operating when not required). We think that the definition here has the intention of defining more generally an "incorrect operation", and perhaps the

Organization	Yes or No	Question 1 Comment
		"incorrect operation" should be used for both different terms.
Response: The drafting team thanks you for your comments. The defined term “Misoperation” in the *Glossary of Terms used in NERC Reliability Standards* covers Protection System security and dependability failures. The proposed Misoperation definition revision is intended to provide additional clarity. No change made.		
PacifiCorp	No	PacifiCorp believes that the definition used for a Slow Trip During Fault misoperation on Page 4 should be amended to provide more clarity. The current definition reads as follows: ”Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high-speed performance has not been identified to meet the dynamic stability performance requirements of the TPL standards nor is it required to ensure coordination with other Protection Systems.” PacifiCorp suggests changing “identified to meet” to “identified as necessary to meet.”
Response: The drafting team thanks you for your comments and has revised the “Slow Trip - During Fault” category of the proposed Misoperation definition to incorporate this suggestion. Change made.		
City of Tallahassee	No	Some of the scenerios for possible mis-operations are too vague. For example what constitutes a slow trip and what would constitute how a protection system is designed? If a protection scheme is designed to trip in 2-3 cycles and it trips in 5-6 cycles yet still protects the equipment, an auditor could see that as a mis-operation however it still would protect the equipment as it was designed. **Response:** If the Protection System operates slower than required on the Element(s) it is designed to protect or the Protection System operates slower than what was previously identified as being necessary to prevent voltage or dynamic instability, then it is a “Slow Trip” Misoperation. Your example would not be a Misoperation unless it resulted in an over-trip or instability. No change made. Also, it can be difficult at times to determine if a fault actually occurred within a relay’s

Organization	Yes or No	Question 1 Comment
		zone of reach. If a bolt of lightning causes a fault on a line unless there is physical damage there can be little visual indication of a fault. It can be difficult to confirm if a mis-operation occurred if you can not first confirm what caused the fault. **Response:** Although it is true that it may be difficult to precisely locate a Fault, it is incorrect to consider that these events are indeterminate. As proposed in the PRC-004-3 standard, an entity is not required to precisely locate or find residual evidence of Faults nor is an entity required to install Disturbance Monitoring Equipment (DME). See Project 2007-11 – Disturbance Monitoring (PRC-002 and PRC-018) for requirements concerning DME. An entity should review the evidence it can obtain for an event, and if there is no evidence of a Misoperation, then the entity could document the operation was correct. No change made. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
City of Tallahassee	No	Some of the scenerios for possible mis-operations are too vague. For example what constitutes a slow trip and what would constitute how a protection system is designed? Organization	Yes or No	Question 1 Comment
		an event, and if there is no evidence of a Misoperation, then the entity could document the operation was correct. No change made. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
Entergy Services, Inc. (Transmission)	No	Suggest Misoperation definition #6 be revised from “unrelated to on-site maintenance....” to “unrelated to maintenance....” to clearly allow as an exclusion, a Protection System maintenance or commissioning activity which results in an inadvertent remote end station trip. For example, a direct transfer trip scheme.
Response: The drafting team thanks you for your comments. It is important to emphasize that the maintenance exclusion is for active maintenance. A remote-end trip is included in the existing exclusion if it resulted from “on-site” activities at a different location. The Application Guidelines have also been enhanced with an example (6d) related to this topic. Change made.		
Dominion	No	The addition of the word “composite” adds nothing to the existing term Protection System and in fact introduces confusion. Dominion assumes a Missoperation occurs only if all protection (primary, secondary, backup, pilot and non-pilot relay schemes) failed to operate as intended. If this assumption is incorrect, please clarify.
Response: The drafting team thanks you for your comments. The composite Protection System is the collective operation of the entire Protection System for an Element which is included in determining whether a Misoperation occurred. To clarify the usage of the terminology, the drafting team is proposing the definition “Composite Protection System” which has an exclusion for backup protection provided by a remote Protection System. Change made.		
Midwest Reliability Organization NERC Standards Review Forum (NSRF)	No	The NSRF would like to see a RSAW for this particular standard to better understand what level of review and or evidence, if any, auditors will require to determine that you assessed your operations adequately for R1. For instance if you didn’t have certain monitoring equipment that captures data for protection system elements, then the data available would be limited for assessing slow trips.
Response: The drafting team thanks you for your comments. The drafting team anticipates posting a draft PRC-004-3 RSAW so that		

Organization	Yes or No	Question 1 Comment
entities will have an opportunity to consider auditing approaches. Posting is expected mid-way through the draft 4 posting of PRC-004-3. No change made.		
Tennessee Valley Authority	No	The proposed Misoperation definition is based on the "Protection System" definition defined in the NERC Glossary of Terms (GoT). However, the NERC GoT does not provide the elements that are considered "Protective System" elements. The actual descriptions of the "Protection System" elements are found in PRC-005-2, 4.2 Faciliities. Recommend this PRC-004-3 revision include a new GoT definition of "Protective System Element" based on PRC-005-2, 4.2, Facilities, or a revision to the NERC GoT to include an abbreviated summary of the PRC-005, 4.2, Facilities in the "Protection System" definition; or include an abbreviated summary of the PRC-005-2, 4.2 Facilities into the PRC-004-3 definition of "Misoperations;" or revise both the NER GoT definition of "Protection System", and PRC-004-3 definition of "Misoperation" to reference PRC-005, 4.2, Facilities, as the elements that are "Protection System elements."
Response: The drafting team thanks you for your comments. The composite Protection System is the collective operation of the entire Protection System for an Element which is included in determining whether a Misoperation occurred. To clarify the usage of the terminology, the drafting team is proposing the definition "Composite Protection System" which has an exclusion for backup protection provided by a remote Protection System. Change made.		
Duke Energy	No	The revised definition still contains the incorrect reference to TPL standards in "Slow Trip - During Fault". The TPL standards Category A, B and C do not require Planning to identify every place where high speed protection is required for dynamic stability. If a Category B issue is identified, high speed protection is installed and it is no longer on the Category B list. If a Category C issue is identified, a redundant relay scheme is installed and it is no longer a Category C issue. Therefore, the list of places where "high-speed performance has been identified to meet the dynamic stability performance requirements of the TPL standards" is just a list of where the appropriate corrective action has not yet been implemented and could, in theory, be empty.

Organization	Yes or No	Question 1 Comment
		“Slow Trip - During Fault” should be revised as follows: “A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high-speed performance has not been identified as needed by the Planning Authority or the Transmission Operator, or if it is not required to ensure coordination with other Protection Systems.”
Response: The drafting team thanks you for your comments. The reference to the TPL standards in both the Misoperation definition and body of the standard has been removed. Change made.		
ReliabilityFirst	No	The revision to part three of the definition that converted the original parenthetical example into an exclusion by stating it inversely creates a potential loophole. The revised wording would consider correct the slow operation of a Protection System that caused avoidable equipment damage (due to the delayed fault clearing) as long as it did not cause a dynamic stability or coordination issue. The Protection System also needs to coordinate with the damage curves of the equipment within its zone. As the exclusionary sentence stands, it actually uses double negatives. It would be better to restate the sentence positively. A suggested improvement would to replace the second sentence in part three of the definition with the following: Delayed Fault clearing associated with an installed high-speed protection scheme is an example of a Misoperation if high-speed performance is required to meet the dynamic stability performance of the TPL standards or is required to ensure coordination with other Protection Systems.
Response: The drafting team thanks you for your comments and has modified the “Slow Trip - During Fault” category of the Misoperation definition. Change made.		
Texas Reliability Entity	No	The SDT may want to consider adding loadability as an example under “Failure to Trip - Other Than Fault” and under “Unnecessary Trip - Other Than Fault”. **Response:** It would be incorrect to add loadability as an example under “Failure to Trip

Organization	Yes or No	Question 1 Comment
		– Other than Fault" as normally there would not be a need to trip under load. There are no inclusion examples under "Unnecessary Trip - Other Than Fault" as this category could include a broad range of conditions including normal conditions. The examples in this category are exclusionary and loadability is not a case that should be excluded. No Change made. The existing definition of the 'Slow Trip-During Fault' needs to include that the delayed fault clearing associated with the installed high-speed performance of the protection system is not required to meet the voltage ride-through capabilities of the generators. Generators should not be tripping off line due to suppressed voltage in the system stemming from the delayed fault clearing. This could create steady state voltage issues. Suggested language: "Slow Trip - During Fault - A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. (Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high-speed performance has not been identified to meet the dynamic stability performance requirements of the TPL standards nor is it required to ensure coordination with other Protection Systems ***or result in loss of generation due to delayed fault clearing time***." Also, the definition of "Slow Trip - During Fault" refers to stability performance requirements of the TPL Standards, however, the TPL Standards do not cover delayed three-phase fault clearing studies. Delayed three-phase fault clearing can create undesired system conditions. **Response:** The suggested condition, loss of generation due to delayed fault clearing time, is a specific class of coordination issues which are included in the "Slow Trip - During Fault" part of the Misoperation definition. "Slow Trip - During Fault" has been revised and the reference to the TPL standards has been removed. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		

Organization	Yes or No	Question 1 Comment
Cogentrix Energy Power Management, LLC	No	The topic of slow trips should be removed from PRC-004-3 and the proposed re-definition of a Misoperation, for the following reasons: - The standard incorrectly assumes that every NERC-registered generation unit is required to have DME for high-speed recording of relay-operation events. - Where DME is present it is generally installed on the HV side of a unit, and may therefore not yield any useful information for problems occurring at the generator or other low-side components. - The standard incorrectly assumes that all GOs have, or should have, design-level relay personnel, ref. the Application Guidelines statements regarding being able to decide whether the speed of the Protection System was adequate (pp. 15 and 16). - Independent GOs in particular have finite resources, and mandating an unreasonable focus on Protection System event record-keeping and analysis will leave other operation and maintenance tasks that much less well covered, resulting in a negative impact on reliability.

Response: The drafting team thanks you for your comments. The slow trip category is included because it is a type of Misoperation which should be identified when possible. In cases where the entity does not have access to Disturbance Monitoring Equipment (DME), a slow trip may be revealed by BES instability and tripping of more than then minimum Element(s). The proposed standard does not require the installation of DME which is being addressed by Project 2007-11 – Disturbance Monitoring (PRC-002 and PRC-018). The proposed standard does not require an entity to have certain personnel and only specifies the performance required for Misoperation identification and correction. Entities with Protection Systems that are applicable to the standard are required to identify any Misoperation, determine its cause(s), and correct the cause(s) to prevent future occurrences.

The standard does, however, require entities to determine if Protection System operations were correct or were Misoperations. Misoperations should be investigated and the causes of those Misoperations should be corrected. To consider if a slow trip Misoperation occurred, the entity must determine if the Protection System operation resulted (due to the operating time) in either the operation of other Elements or instability, or slower than required for a Fault condition for which it was designed. The categories of the definition that are associated with slow trips have been modified to help identify the conditions for these types of Misoperations. No change made.

Organization	Yes or No	Question 1 Comment
PPL NERC Registered Entities	No	The topic of slow trips should be removed from PRC-004-3 and the proposed re-definition of a Misoperation, for the following reasons: o The standard incorrectly assumes that every NERC-registered generation unit is required to have DME for high-speed recording of relay-operation events. o Where DME is present it is generally installed on the HV side of a unit, and may therefore not yield any useful information for problems occurring at the generator or other low-side components. o The standard incorrectly assumes that all GOs have, or should have, design-level relay personnel, ref. the Application Guidelines statements regarding being able to decide whether the speed of the Protection System was adequate (pp. 15 and 16). o Independent GOs in particular have finite resources, and mandating an unreasonable focus on Protection System event record-keeping and analysis will leave other operation and maintenance tasks that much less well covered, resulting in a negative impact on reliability.
Response: The drafting team thanks you for your comments. The slow trip category is included because it is a type of Misoperation which should be identified when possible. In cases where the entity does not have access to Disturbance Monitoring Equipment (DME), a slow trip may be revealed by BES instability and tripping of more than then minimum Element(s). The proposed standard does not require the installation of DME which is being addressed by Project 2007-11 – Disturbance Monitoring (PRC-002 and PRC-018). The proposed standard does not require an entity to have certain personnel and only specifies the performance required for Misoperation identification and correction. Entities with Protection Systems that are applicable to the standard are required to identify any Misoperation, determine its cause(s), and correct the cause(s) to prevent future occurrences. No change made.		
Essential Power, LLC	No	The topic of slow trips should be removed from PRC-004-3 and the proposed re-definition of a Misoperation, for the following reasons: -The standard incorrectly assumes that every NERC-registered generation unit is required to have DME for high-speed recording of relay-operation events. -Where DME is present it is generally installed on the HV side of a unit, and may

Organization	Yes or No	Question 1 Comment
		therefore not yield any useful information for problems occurring at the generator or other low-side components. -The standard incorrectly assumes that all GOs have, or should have, design-level relay personnel, ref. the Application Guidelines statements regarding being able to decide whether the speed of the Protection System was adequate (pp. 15 and 16). -Independent GOs in particular have finite resources, and mandating an unreasonable focus on Protection System event record-keeping and analysis will leave other operation and maintenance tasks that much less well covered, resulting in a negative impact on reliability.
Response: The drafting team thanks you for your comments. The slow trip category is included because it is a type of Misoperation which should be identified when possible. In cases where the entity does not have access to Disturbance Monitoring Equipment (DME), a slow trip may be revealed by BES instability and tripping of more than then minimum Element(s). The proposed standard does not require the installation of DME which is being addressed by Project 2007-11 – Disturbance Monitoring (PRC-002 and PRC-018). Entities with Protection Systems that are applicable to the standard are required to identify any Misoperation, determine its cause(s), and correct the cause(s) to prevent future occurrences. No change made.		
ExxonMobil Research and Engineering	No	
SERC Protection and Controls Subcommittee	Yes	1) Please revise the Slow Trip - During Fault second sentence for clarity. We suggest: “Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation unless the high-speed performance has either been identified to meet the dynamic stability performance requirements of the TPL standards, or is required to ensure coordination with other Protection Systems.” **Response:** The “Slow Trip - During Fault” category of the definition has been revised for clarity. Change made. 2) We suggest clarifying Definition (6) by replacing "is unrelated to on-site" with "the

Organization	Yes or No	Question 1 Comment
		Protection System that operated is not directly associated with" as shown below to be consistent with page 17, and to exclude transfer trip testing: Unnecessary Trip - Other Than Fault - A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate, and the Protection System that operated is not directly associated with maintenance, testing, inspection, construction or commissioning activities. **Response:** Replacing "is unrelated to on-site" in category 6 of the definition removes the implication that these activities were actively being performed. The inadvertent operation of transfer trip during "on-site" activities is excluded from being considered a Misoperation. The Application Guidelines before and after Example 6d has been revised to emphasize this point. Change made. 3) Add an Application Guideline example showing that transfer trip testing would not be considered Misoperation as well. Even though the BES interrupting device is at a different location than the testing error, the transfer trip composite system is involved. We suggest: "An operation that occurs during a non-fault condition but was initiated by remote transfer trip system maintenance, testing, inspection, construction or commissioning activities is not a Misoperation." **Response:** See Example 6d which was added to the Application Guidelines. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
Georgia Transmission Corp	Yes	6. Unnecessary Trip - Other Than Fault: ...is not intended to operate. An Operation caused by on-site maintenance, testing, inspection, construction or commissioning activities on the designated Protection System are not considered as a Misoperation. alternatively: ...is not intended to operate. Operation of a Protection System that is not the focus of on-site maintenance, testing, inspection, construction or commissioning

Organization	Yes or No	Question 1 Comment
		activity is considered a Misoperation. Suggested to highlight the second sentence in the 4th paragraph for defintition 6 in the Application Guidelines.
Response: The drafting thanks you for your comments and declines to make the suggested change since it does not add clarity. No change made.		
City of Tacoma, Tacoma Public Utilities	Yes	Is mechanical failure of an interrupting device during a fault a mis-operation? (The interrupting device is not part of the Protection System.) **Response:** No, a mechanical failure of an interrupting device is not considered a Misoperation since the interrupting device is not part of the Protection System. No change made. Is inappropriate operation of a relay that operates upon mechanical inputs a mis-operation? For example, what if the relay causes a trip when it should have restrained? **Response:** If the mechanical input is not part of the Protection System it is not a Misoperation. Special Protection Systems (SPS) are not applicable to this Standard. If the mechanical input is part of the Protection System, like an incorrectly set selector switch on a relay, then the operation would be considered a Misoperation. Your example indicates that the mechanical inputs are status points that are used to restrain operation. If these status points are not indicating properly because of a personnel error (e.g., wrong switch position), a problem with a switch, or faulty contacts and a false operation occurs, then it is a Misoperation unless the operation occurred during on-site maintenance. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
Southern Company - Southern Company Services, Inc.;	Yes	Southern Company supports the SERC comments and are including the following additional comments:

Organization	Yes or No	Question 1 Comment
Alabama Power Company; Georgia Power Company; Mississippi Power Company; Gulf Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing		1. We believe that the same consideration of whether or not the composite Protection System operated as intended could be addressed with a much simpler definition:"The failure of the Protection System to operated as intended, including failing to trip when it should have, unnecessarily tripping with it should not have, or tripping more slowly than intended." This definition allows the Protection System owner to evaluate the operation and determine if it operated appropriately. **Response:** Although a simpler definition has advantages, it has significant shortfalls. For example, by using the word “when” it is not clear whether an operation is a Misoperation if it was slow or just whether it did or didn’t operate. The proposed definition does not achieve the clarity that the specific exceptions in the six categories provide. No change made. 2. We believe that the shift in focus to "composite" and "overall performance" does not clarify the ability to identify misoperating Protection System components. **Response:** The standard proposes a new definition for “Composite Protection System to clarify what is in scope when reviewing Protection System operations. The word “overall” has been removed as it is subjective and not necessary with the inclusion of the proposed Composite Protection System definition. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.

Seminole Electric		The NERC STD defines a Slow Trip as a "Protection System operation that is slower than intended... ." (emphasis added). My preliminary read of this language was that if the Protection System operated slower, i.e., took even 1 cycle longer in time to operate, than how it was intended to be set, that such delay would be a Slow Trip. However, reading your responses to comments, it appears that "time" is not the measure of compliance, but in fact, the compliance metric is based on intended protective objective. By this I mean, if the overall goal of protection is met, then there is no slow trip no matter how much time has passed. To clarify even more, so as long as no additional harm has occurred during the time delay, time is not the measurement for compliance, but harm to the protected equipment is the compliance measure. With that said, can you please describe in some more detail how this compliance metric, i.e., additional harm, will be documented and audited?
Response: The drafting team thanks you for your comments. The slow trip category is included because it is a type of Misoperation which should be identified when possible. In cases where the entity does not have access to Disturbance Monitoring Equipment (DME), a slow trip may be revealed by BES instability and tripping of more than then minimum Element(s). The proposed standard does not require the installation of DME which is being addressed by Project 2007-11 – Disturbance Monitoring (PRC-002 and PRC-018). No change made. The phrase "slower than required" means the Composite Protection System operated slower than the objective of the owner(s). It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its		

Organization	Yes or No	Question 1 Comment
Protection System operation was adequate. The intent is not to require documentation of exact Protection System operation times; however, each entity must determine what evidence it needs to support compliance with the requirements. The definition of Misoperation has been revised to clarify slow trips and additional detail added to the Application Guidelines. Change made.		

2. ***Requirement R1 was revised to to provide more clarity regarding the responsibilities of the BES interrupting device owner and the Protection System owner (if they are different entities) when a Protection System operation occurs. Do you agree with these changes? If not, please provide specific suggestions for improvement.***

Summary Consideration:

The following resulted in a revision to the proposed standard. This first summary response addresses the majority comment which accounted for at least 16 comments represented by 63 individuals and a change to the proposed standard. Stakeholders raised issues about the lack of clarity concerning who had responsibility under Requirement R1. To resolve this, the drafting team revised Requirement R1 to provide clarity on each Protection System owners' responsibilities following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components, time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation.

Also resulting in a change to the proposed standard, approximately six comments supported by 11 stakeholders had concern about initiating the review for Misoperation based on the operation of the BES interrupting device. The drafting team noted that according to definition of Protection System which became effective April 1, 2013, the BES interrupting device owner owns a component of the Protection System, namely the trip coil(s) of that BES interrupting device (at a minimum). And that the BES interrupting device owner is in the best position to be aware of the operation and to initiate the identification of any Misoperation. In the case where the relays or other Protection System component(s) are owned by another entity, that owner may not know of the operation until it receives notification from the BES interrupting device owner. Requirement R1 was revised to bring clarity to the obligations of each applicable entity.

The drafting team revised the standard based on at least two comments represented by 27 stakeholders that were concerned about working cooperatively when the Protection System is jointly owned. The drafting team clarified that the notification starts the period for the Protection System component owner to begin its investigation. More importantly, having the BES interrupting device owner "officially notifying" other Protection System component owners when there may be no need to do so, will create an unnecessary compliance obligation for the other owners, especially when there is little possibility that another owner's Protection System component(s) caused a Misoperation. The requirements do not preclude the entity that is reviewing the operation from working with the other owners and when necessary, make the official notification. Requirement R1 has been revised to clarify that the BES interrupting device must make notifications (now R2) when Protection System component(s) did not cause the BES interrupting device(s) operation.

The use of "BES interrupting device" was raise in at least two comments representing 13 stakeholders. The drafting team clarified the use of "BES interrupting device" in the standard's Application Guidelines under the "Definitions" section.

About five comments supported by individual stakeholders expressed concern about the action plan which resulted in a revision to the proposed standard. The standard now provides the entity a periodic time frame for continuing its investigation into the cause of the Misoperation beyond the 120 calendar day period. This also replaced the previous Requirement for having an "action plan" and is now addressed by Requirement R4.

The phrase "slower than required" means the Composite Protection System operated slower than the objective of the owner(s). It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation was adequate. The intent is not to require documentation of exact Protection System operation times; however, each entity must determine what evidence it needs to support compliance with the requirements. The definition of Misoperation has been revised to clarify slow trips and additional detail added to the Application Guidelines. Change made.

Last, a few comments by stakeholders led to revising the Measures. Only one comment resulted in the drafting team including a suggestion to incorporate the "manual intervention" due to a BES Protection System failure to operate into Requirement R1 to address a failure to trip. The drafting team responded to this single minority comment recognizing that the condition is possible and has adequate merit to be included in the requirement.

The following did not result in a change to the proposed standard. The remaining text summarizes industry concerns that did not result in a change to the proposed standard. Approximately seven comments supported by at least 40 stakeholders were concerned that the standard unnecessarily places entities a risk of a violation should they miss the review period due to natural disasters or some other unusual circumstance. The drafting team responded that the Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, says: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." While the drafting team recognizes the concern and that there are other standards which have similar provisions for natural disasters, including specific language in the proposed standard complicates a low frequency event where a compliance violation might occur and does not benefit the standard overall.

At least one comment representing about eight individuals suggested the standard lean more toward performance objectives to remove ambiguities and judgment concerns (e.g., slow trips). The drafting team continues to support the proposed standard as currently structured noting that the draft requirements allow Compliance Enforcement Authorities to take into account use of internal controls in connection with monitoring activities.

Another single comment supported by eight stakeholders was concerned about what to do when there is a lack of information to determine whether a Misoperation occurred or not. Although this did not result in a change to the proposed standard, the drafting team noted that an entity should review the documentation it can obtain for an event, and if there is no evidence of a Misoperation, then the entity could judge the operation was correct. No change made.

Two single comments that did not result in a revision to the proposed standard were concerned with how to review Protection System operations. The drafting team responded that the construction of Requirement R1 requires that each operation of a Protection System that causes a BES interrupting device operation must be reviewed to ensure that the Protection System responded correctly. An entity may choose to group operations by event; however, in the case of a single permanent fault caused an initial operation and a subsequent reclose and operation, all operations must be reviewed to determine if the Protection System responded appropriately. This achieves the objectives of the standard in ensuring correct performance of Protection Systems, as well as identifying and correcting the root causes of Misoperations which do affect reliability of the BES.

A single minority comment was concerned about which entity would report for jointly owned Protection Systems where each entity had a Misoperation cause. The NERC Rules of Procedure, Section 1600 Request for Information or Data (i.e., Data Request) specify the Protection System owner that caused the Misoperation will report.

Organization	Yes or No	Question 2 Comment
Kansas City Power & Light	No	R1 and the rationale for R1 assume that the BES interrupting device owner and the Protection System owner have been talking and R1 requires identification and review of each operation within 120 days. R1 should require that the BES interrupting device owner notify the Protection System owner or vice versa, depending on which entity discovers the event first, within a specific time after the entity is aware of the operation in order to ensure that the other entity has adequate time within the 120 day period to finish the review.

Response: The drafting team thanks you for your comment. Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of

Organization	Yes or No	Question 2 Comment
the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. The standard now provides the entity an extended period for continuing its investigation of a potential Misoperation beyond the 120 calendar day period. See proposed Requirement R4. Change made.		
Bonneville Power Administration	No	(1) The changes made to R1 are an improvement over the previous draft, but they still do not adequately clarify the responsibilities. Both the Rationale for R1 (blue box) and the Application Guidelines indicate that the responsibility to investigate operations is placed on the owner of the interrupting device. However, BPA believes that the actual wording of R1 does not necessarily place the responsibility on the owner of the interrupting device. Instead, R1 places the responsibility on the TO, GO, or DP which has an interrupting device operation in its facility. Since it is quite common in the industry for TOs, GOs, or DPs to own interrupting devices within another entity's facility, R1 will sometimes place the responsibility on the owner of the facility where the interrupting device is located instead of on the owner of the interrupting device. **Response:** Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made. In addition, the bullet points of R1 address the cases where the entity owns both the interrupting device and the protection system and where the entity owns the interrupting device but not all of the protection system, but there is no bullet point to address the case where the entity owns the protection system but not the interrupting device. It is not unusual for the owner of a facility to own a protection system but not the interrupting device that is operated by the protection system. Because it is vital that there is no ambiguity about who is responsible to initiate the investigation when an interrupting device operates, BPA recommends that the responsibility be placed on

Organization	Yes or No	Question 2 Comment
		the owner of the protective relays which caused the interrupting device to operate because the owner of the protective relays will have access to the primary information that will determine how the investigation should proceed. After the owner of the protective relays makes an initial investigation, the owners of the interrupting device or the owner of other components of the protection system can be notified to investigate their part of the protection system. If the responsibility to initiate the investigation is placed on the owner of the interrupting device, that entity will have to immediately turn to the owner of the protective relays to start the investigation. **Response:** According to definition of Protection System which became effective April 1, 2013, the BES interrupting device owner owns a component of the Protection System, namely the trip coil(s) of that BES interrupting device (at a minimum). The BES interrupting device owner is in the best position to be aware of the operation and to initiate the identification of any Misoperation. In the case where the relays or other Protection System component(s) are owned by another entity, that owner may not know of the operation until it receives notification from the BES interrupting device owner. Requirement R1 was revised to bring clarity to the obligations of each applicable entity. Change made. (2) The use of Facility as defined by NERC in Requirement 1 does not make sense. As used in Requirement 1, Facility seems to indicate a substation or switching station, which is not in agreement with the NERC definition, which is a set of equipment that operates as a single element. BPA recommends that Facility not be used in Requirement R1 to avoid this problem. **Response:** Requirement R1 was revised to remove the use of "Facility." Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
ACES Standard Collaborators	No	(1) Also it is still unclear who has the ultimate responsibility for identifying and reviewing each operation if the interrupting device and Protection System are owned by two or more parties. What should occur if there is disagreement over the responsibility or the ownership of a component? What if multiple parties owned

Organization	Yes or No	Question 2 Comment
		components that contributed to an operation or a Misoperation? Are both parties responsible? The rationale may provide additional guidance, but the words in the requirements are unclear. **Response:** Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. According to the standard, each entity has an independent responsibility to identify a Misoperation of its Protection System components, if any, beginning with the BES interrupting device owner through any notified Protection System owner. Change made. (2) "BES interrupting device" is not a defined term and is vague and ambiguous. We understand that devices that interrupt fault current, such as circuit breakers and circuit switchers would be included but what other devices such as motor operated disconnects? Are they not included because they don't interrupt any current? What if they are equipped to interrupt charging and load current? Failure to define "BES interrupting device" could result in an informal definition that results in inconsistent enforcement by including components outside of the scope of what is intended to be a BES interrupting device. This term adds uncertainty and creates opportunities for multiple interpretations. **Response:** The use of "BES interrupting device" has been clarified in the standard's Application Guidelines under the "Definitions" section. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
Independent Electricity System Operator	No	1 We belive that R1 should be written more clearly, by saying that: "Within 120 calendar days of a BES interrupting device operation casued by a Protection System operation, each Transmission Owner, Generator Owner, or Distribution Provider - that owns the BES interrupting device - shall identify and review each Protection System Operation."

Organization	Yes or No	Question 2 Comment
		Response: Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made. 2 Also, there is a lack of clarity on which entity is responsible for developing and implementing a Corrective Action Plan. We believe that there has to be corresponding revisions to R2 and R3 to clearly indicate which entity needs to be held responsible for the CAP, especially in view of the rationale provided in the text box for R1, whose excerpt says: "The owner of the component that contributed to the Misoperation will create the CAP, action plan or declaration required by Requirements R2 and R3". We interpret the quoted excerpt (above) to mean that the component that contributed to the Misoperation may not be owned (in full or in part) by the owner of the BES interrupting device. It follows that in such cases, the owner of the component that contributed to the Misoperation is responsible for complying with R2 and R3. If this interpretation is correct, then Requirements R2 and R3 are not clear as to which entity is held responsible. To clarify this, we suggest revising the leading part of R2 to: "Each Transmission Owner, Generator Owner, or Distribution Provider that owns the component that contributed to the Misoperation shall, within 60 calendar days of identifying....". The Same revision should apply to R3, as follows: "Each Transmission Owner, Generator Owner, or Distribution Provider that owns the component that contributed to the Misoperation shall, within 180 calendar days of the associated BES interrupting device operation,....." Further, though not explicitly stated, we assume that the owner of the component that

Organization	Yes or No	Question 2 Comment
		contributed to the Misoperation is also held responsible for complying with R4 to implement and complete the CAP or action plan to accomplish all identified objectives. Hence, the same qualifier should also be added to Requirement R4. **Response:** The concept of an action plan has been eliminated from the standard; however, the proposed Requirement R4 requires the entity to perform investigative action when circumstances require additional study or time to determine the cause(s) of a Misoperation. Requirement R5 and R6 respectively address CAP development and implementation by the Protection System component owner to correct the cause(s) of a Misoperation. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
Southern Company - Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Mississippi Power Company; Gulf Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	No	1. The requirement R1 can be simplfied by wording it in this manner: "Each entity shall identify, review, investigate, classify, document, and, for misoperations, determine the cause (if identified) of each Protection System operation that they own..." by the required time frame. **Response:** Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made. 2. The notification and response requirement of R1 is not needed, as the owner of the Protection System that operated is already required to investigate each operation in Requirement R1. An additional requirement for notifications and responses is superfluous. **Response:** Notification is necessary to require other owners of the Protection System

Organization	Yes or No	Question 2 Comment
		components to review their Protection System components for Misoperation. Notification and requirements for other owners have been removed from Requirement R1 and replaced by Requirements R2 and R3, respectively. Change made. 3. There is a timing problem with R1.2 for the protection system owner who is notified on day 119 following a protection system operation. It is not reasonable or just to require this protetion sytem owner to complete the requirements of R1 in one day's time after being notified by the owner of an interrupting device whose operation was suspected to be caused by a misoperation of another entitiy's protection system. **Response:** Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
American Electric Power	No	AEP recommends the following modification to 1.1: "Within 120 calendar days of a BES interrupting device operation in its Facility caused by a BES Protection system operation or by manual intervention due to a BES Protection System failure to trip, identify and review each BES Protection System operation and BES Protection System failure to trip." **Response:** This suggestion has been incorporated into Requirement R1 to address manual intervention due to a BES Protection System failure to operate. Change made. AEP requests the standard be modified to clarify the liability of the notified entity if the notification occurs near the end of the 120 day period, and the notified entity does not have sufficient time to determine if their component operated properly or

Organization	Yes or No	Question 2 Comment
		misoperated within the 120 day period. AEP requests the standard be modified to clarify the liability of the notified entity if the notification occurs more than 180 days after the BES interrupting device operation. **Response:** Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made. AEP requests that R1 should be modified to clearly indicate whether the term "entity" includes separate Functional Entities within the same Registered Entity. As written, it is unclear if the Transmission Owner function is required to notify the Generator Owner function within the same Registered Entity for compliance with R1.1 Bullet 2 or if the Registered Entity with multiple Functional Entities is treated as a single unit for ownership purposes. **Response:** The use of "entity" following the first use of the applicable entities (e.g., Distribution Provider, Generator Owner, and Transmission Owner) in the requirement is clear by the construction of the requirement. No change made. R1.2 appears to add little value as a standalone requirement. AEP recommends removing R1.2. and incorporating the requirement to identify a cause within the remaining R1 and R3 wording. **Response:** Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s)

Organization	Yes or No	Question 2 Comment
		operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
American Transmission Company, LLC	No	ATC believes that the investigation for relay misoperation should be performed by the owner of the initiating relay as opposed to the interrupting device owner for the following reasons: By definition, "Circuit breaker and other interrupting device mechanisms are not part of a Protection System". As such, PRC-004 should not require the interrupting device owner to be responsible for R1. PRC-004 is based on Protection System operation, not breaker operation. Bus design can have multiple breakers owned by different entities but the ownership of the initiating relay is clear. The BES interrupting device owner lacks the information that the protective relay owner has to be able to perform a root cause analysis of a misoperation.
Response: The drafting team thanks you for your comment. According to definition of Protection System which became effective April 1, 2013, the BES interrupting device owner owns a component of the Protection System, namely the trip coil(s) of that BES interrupting device (at a minimum). The BES interrupting device owner is in the best position to be aware of the operation and to initiate the identification of any Misoperation. In the case where the relays or other Protection System component(s) are owned by another entity, that owner may not know of the operation until it receives notification from the BES interrupting device owner. Requirement R1 was revised to bring clarity to the obligations of each applicable entity. Change made.		
City of Austin dba Austin Energy	No	Austin Energy agrees with Luminant's comment and copies it here for convenience. Requirement R1 requires all BES interrupting device operations be reviewed within 120 days. Under the Application Guidelines (Definition of a Misoperation - item 6 (page 17)), reverse power relaying used for normal unit shutdown is excluded. We recommend that this clarification be included in the Standard; either in language in the

Organization	Yes or No	Question 2 Comment
		Definition of a Misoperation (items 2, 5, and 6) or in Requirement R1.
Response: The drafting team thanks you for your comment. According to the IEEE Guide for AC Generator Protection (C37.102-2006), Section 4.5.5 (Motoring), sub-section 4.5.5.6 (Tripping mode), "Primary motoring protection is provided by reverse power relays for all unit types." Reverse power relays, by definition, are a Protection System and cannot be categorically excluded. Because reverse power relays provide motoring protection, the drafting team has provided an exclusion in the Applicability of the standard. Also, this exclusion is clarified in the Application Guidelines concerning the relay's use as a control function for shutting down a unit and as anti-motoring protective protection for a generating unit. Change made.		
CenterPoint Energy	No	CenterPoint Energy is concerned the wording of R1.1 to review a BES interrupting device "operation" within 120 days and the wording of R1.2 to investigate a "misoperation" within the same 120 day period of a BES interrupting device operation could be unworkable. The owner of the BES interrupting device could notify the owner of the Protection System component identified as contributing to the Misoperation well into the 120 day period, which would give the Protection System component owner little time to investigate and determine a cause. CenterPoint Energy recommends R1.2 wording be the following: "The owner of the Protection System component identified as contributing to the Misoperation shall investigate and document the findings for each Misoperation including a cause, if identified, by the latter of 120 days of a BES interrupting device operation or 30 days after receiving notification from the owner of the BES interrupting device."
Response: The drafting team thanks you for your comment. Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made.		
Florida Municipal Power Agency	No	First, as currently drafted, R1 means that each investigation into a protection system operation is auditable, which in turn means that the definition of misoperation as

Organization	Yes or No	Question 2 Comment
		discussed in question 1 need to be easily measurable. Please see discussion in question 1 about the difficulty in measuring: 1) “slower than intended”; 2) whether or not a Fault occurred; and 3) whether or not that Fault was “within the zone it was designed to protect”. **Response:** The phrase “slower than required” means the Composite Protection System operated slower than the objective of the owner(s). It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation was adequate. The intent is not to require documentation of exact Protection System operation times; however, each entity must determine what evidence it needs to support compliance with the requirements. The definition of Misoperation has been revised to clarify slow trips and additional detail added to the Application Guidelines. Change made. Second, there are numerous Protection System operations wtihin a year, which results in a high-volume problem similar to those found in CIP standards, COM-003 and PRC-005. FMPA continues to recommend, as we did last time, that this standard would be better served by instituting internal controls language for R1 similar to what the CIP v5 and COM-003 SDTs adopted. Adopting such language would have the additional benefit of allowing the entity more latitude for how they deal with the ambiguities described in response to question 1. **Response:** The drafting team continues to support the proposed standard as currently structured. The draft requirements allow Compliance Enforcement Authorities to take into account use of internal controls in connection with monitoring activities. However, internal controls are only a mechanism to help auditors determine the depth and breadth of testing as it pertains to compliance with the related Reliability Standard and specific requirements and when necessary understand the facts and circumstances of instances of potential non-compliance. How any possible violations may be treated is outside of the scope of the project and reserved to the enforcement process. No

Organization	Yes or No	Question 2 Comment
		change made. Third, FMPA commented last time that there ought to be an exception for Acts of Nature such as hurricanes and other natural disasters with, at minimum, the 120 day rule being waived. In response to FMPA's comments, the SDT agreed with this concern. However, rather than change the standard, the response was: "The drafting team agrees with your comment about instances when major disturbances occur. As noted in the Guidelines and Technical Basis section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard." That means that the entity would still be in violation of the standard if it were not able to investigate all relay operations that occurred dueing a natural disaster. This is not acceptable to FMPA and we desire language to extend the time of the investigations as a result of Acts of Nature (e.g., a named storm, an earthquake that resulted in severe damage, etc. - maybe anytime a State's Governor declares an emergency) to a longer hodl th entity to the 120 day time period, e.g., but instead to a longer period such as 240 days, to allow time for more pressing disaster recovery efforts, without actually incurring multiple violations to the standard that would remain on the entities "record". **Response:** The *Sanction Guidelines of the North American Electric Reliability Corporation*, Section 2.8, Extenuating Circumstances, says: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." While the drafting team recognizes the concern and that there are other standards which have similar provisions for natural disasters, including specific language in the proposed standard complicates a low frequency event where a compliance violation might occur. No change made. Fourth, there is no recognition that it is possible to have a condition where it cannot be determined whether the operation was correct or a Misoperation, e.g., if the location

Organization	Yes or No	Question 2 Comment
		of the fault cannot be determined, or whether a fault condition actually existed or not, especially for something like a trip with successful reclose. See the second point made in response to question 1 for further discussion. **Response:** Although it is true that it may be difficult to precisely locate a Fault, it is incorrect to consider that these events are indeterminate. As proposed in the PRC-004-3 standard, an entity is not required to precisely locate or find residual evidence of Faults nor is an entity required to install Disturbance Monitoring Equipment (DME). See Project 2007-11 – Disturbance Monitoring (PRC-002 and PRC-018) for requirements concerning DME. In regards to the default assumption, an entity should review the documentation it can obtain for an event, and if there is no evidence of a Misoperation, then the entity should document the operation was correct. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
Hydro-Québec Procution	No	In the previous version, the purpose has been centered on the reliability of the BES. The removal of that concept (reliability of the BES) implies the analysis of all the events that occured on the BES have to be done, even if the event do not affect the reliability of the BES.
Response: The drafting team thanks you for your comment. The construction of Requirement R1 requires that each operation of a Protection System that causes a BES interrupting device operation must be reviewed to ensure that the Protection System responded correctly. An entity may choose to group operations by event; however, in the case of a single permanent fault caused an initial operation and a subsequent reclose and operation, all operations must be reviewed to determine if the Protection System responded appropriately. This achieves the objectives of the standard in ensuring correct performance of Protection Systems, as well as identifying and correcting the root causes of Misoperations which do affect reliability of the BES. No change made.		
PacifiCorp	No	In the second draft of PRC-004-3 PacifiCorp commented that the 120-day time limit in R1 is insufficient. PacifiCorp maintains that when two registered entities are involved in the interrupting device operation, 120 days is not enough time for both entities to complete the activities required by the requirement. PacifiCorp proposes an increase

Organization	Yes or No	Question 2 Comment
		of 60 days for each entity to complete their respective activities in sequence. This would increase the total from 120 to 180 in R1.

Response: The drafting team thanks you for your comment. Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made.

Organization	Yes or No	Question 2 Comment
Ingleside Cogeneration LP	No	Ingleside Cogeneration agrees that the owner of the tripping device should own the investigation and bring in other entities as needed. In addition, R1 takes out any guesswork about the responsibilities of each Protection System owner who may have contributed to the Misoperation. What we still do not understand is the recourse available to the Protection System owner if the request for assistance from an adjacent entity is sent late. The requirement does not account for the fact that a notification may be issued weeks after the fact - the 180 day assessment deadline applies regardless. Under these circumstances, the recipient may be forced to declare that a cause was not found, as allowed by R3, and develop an action plan to investigate further. However, this leaves that owner in the position to explain the delay to auditors; which we do not believe is appropriate. Even more concerning, there appears to be nothing that stops the CEA from deciding that the reduced interval was adequate and assessing a violation as a result.

Response: The drafting team thanks you for your comment. Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection

Organization	Yes or No	Question 2 Comment
System component(s) caused a Misoperation. Change made.		
Wisconsin Electric Power Company	No	It is not appropriate to make the owner of the interrupting device responsible to investigate Protection System operations. Interrupting devices as such are not components of a Protection System as defined by NERC. Responsibility for this investigation should be solely with the owner of the Protection System initiating the operation, and/or the owner of the Protection System which failed to operate.
Response: The drafting team thanks you for your comment. According to definition of Protection System which became effective April 1, 2013, the BES interrupting device owner owns a component of the Protection System, namely the trip coil(s) of that BES interrupting device (at a minimum). The BES interrupting device owner is in the best position to be aware of the operation and to initiate the identification of any Misoperation. In the case where the relays or other Protection System component(s) are owned by another entity, that owner may not know of the operation until it receives notification from the BES interrupting device owner. Requirement R1 was revised to bring clarity to the obligations of each applicable entity. Change made.		
Lincoln Electric System	No	LES recommends additional clarification be provided regarding the statement in R1.1 to “identify and review each Protection System operation”. As currently written, it is unclear how an entity would comply with R1.1 in the event that an incident involves multiple breaker operations with automatic reclosing, but were the result of a single cause. In such a scenario, would the entity be required to maintain separate documentation for investigation, designation, etc for each breaker operation?
Response: The drafting team thanks you for your comment. The construction of Requirement R1 requires that each operation of a Protection System that causes a BES interrupting device operation must be reviewed to ensure that the Protection System responded correctly. An entity may choose to group operations by event; however, in the case of a single permanent fault caused an initial operation and a subsequent reclose and operation, all operations must be reviewed to determine if the Protection System responded appropriately. This achieves the objectives of the standard in ensuring correct performance of Protection Systems, as well as identifying and correcting the root causes of Misoperations which do affect reliability of the BES. No change made.		
Colorado Springs Utilities	No	Please consider clarification of the terms “BES Protection System”, “Protection System”, “BES interrupting device” and “interrupting device” throughout the proposed

Organization	Yes or No	Question 2 Comment
		standard. Specifically in R1.1 the proposed requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning] 1.1 Within 120 calendar days of a BES interrupting device operation in its Facility caused by a Protection System operation, identify and review each Protection System operation. The wording of this requirement infers that the proposed standard is intended to include investigation of non-BES protection systems that cause the operation of a BES interrupting device. While such investigation is sound business practice, it may be outside the intended scope of the standard. An example would be the operation of a load serving transformer (say a 230kv to 13.2 kv unit) differential Protection System that operates both a BES interrupting device (a 230kv circuit breaker) and a non-BES interrupting device (a 13.2kv circuit breaker). The stated purpose of this standard is to “Identify and correct the causes of Misoperations of Bulk Electric System (BES) Protection Systems” and is supported by the terminology used in the opening paragraph of the Background statement and the content of the Compliance section. Operation of a load serving facility protection system normally will have no impact on the reliability of the BES unless its failure to operate results in a subsequent operation of a BES bus differential Protection System or BES transmission element Protection System, for example. A similar argument can be offered for operation of protection system on non-BES radial lines and local network that cause operation of a high-side interrupting device which may also be part of a BES Protection System. Based on this line of thinking, it is proposed that the wording of requirement 1.1 be revised to state “Within 120 calendar days of an interrupting device operation in its Facility caused by a BES Protection System operation, identify and review each BES Protection System operation.” The wording of Requirements R1.2 and R3 should also be modified for consistency.

Response: The drafting team thanks you for your comment. The occurrences of “BES Protection System” have been revised to

Organization	Yes or No	Question 2 Comment
pertain to Protection Systems for BES Elements. The use of "BES interrupting device" has been clarified in the standard's Application Guidelines under the "Definitions" section. Change made.		
Los Angeles Department of Water and Power	No	Please see answer to Question 5

Madison Gas and Electric Company	No	Please see question 5.
Response: The drafting team thanks you for your comment; and refers to the response provided in Question 5.		
Public Service Enterprise Group	No	R1 addresses the situation where a BES interrupting device operation may be the result of the operation of a Protection System operation owned by an entity that does not own the BES interrupting device. As written, the owner of the BES interrupting device has no deadline to notify the owners of other Protection Systems when cannot determine that the Protection System operation was correct (the second bullet in Part 1.1). R1 presently allows 120 calendar days in total for the owner of the BES interrupting device to notify the other Protection System owners and for those other owners to determine if their Protection System operated correctly and if they did not, to document each Misoperation, including a cause if one can be identified. As drafted, the owner of the BES interrupting device could notify the other Protection System owners on the 119th day following the operation of its interrupting device, making it impossible for those other Protection System owners to perform their required analysis by the 120th day. The change identified to Part 1.1 below requires the owner of the BES interrupting device to make a notification to the other Protection System owners within 60 calendar days of the operation of its BES interrupting device if the situation described

Organization	Yes or No	Question 2 Comment
		above occurs. The changes to Part 1.2 below allows either Protection System owner 90 calendar days to document the findings of each Protection System Misoperation that may have occurred, making the total number of days allowed from the date of the operation of the BES interrupting device 150 calendar days. Only 30 calendar days has been added to the timeline, but this additional 30 days is needed to correct the potential inequity for owners of Protection Systems that do not own the BES interrupting device to complete their analysis. For consistency, 30 calendar days was added to the R3 timeline of 180 days, making it 210 days from the date of the operation of the associated BES interrupting. R2 is unchanged, but is shown for completeness. **Response:** Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made. We have also added a provision in a footnote that allows a Regional Entity to extend deadlines that are referenced to the operation date of a BES interrupting device for instances such as natural disasters. Personnel that might normally evaluate the operation of a Protection System may not be available to do so due to their involvement in restoration efforts. Here is our suggested changes. Additional language is CAPITALIZED. R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]1.1 Within [delete "120"] 60 calendar days of a BES interrupting device operation in its Facility caused by a Protection System operation, identify and review

Organization	Yes or No	Question 2 Comment
		each Protection System operation AND [FOOTNOTE 1];. If the entity owns both the BES interrupting device and the Protection System, determine if it was a correct operation or a Misoperation, OR; If the entity owns the BES interrupting device but does not own all of the Protection System and cannot determine that the Protection System operation was correct, then notify the other owner(s) of the Protection System component(s) and provide any requested investigative information. The Protection System component owner(s) that was notified by the BES interrupting device owner shall determine if there was a correct operation or a Misoperation of their component. FOOTNOTE 1: Such 60 day period and subsequent periods in the standard that have a deadline that references the operation date of a BES interrupting device may be extended by the Regional Entity for instances such as a natural disaster. 1.2 Within the same [delete "120 day period"] 150 CALENDAR DAYS of a BES interrupting device operation caused by a Protection System operation, the owner of the Protection System component identified as contributing to the Misoperation shall investigate and document the findings for each Misoperation including a cause, if identified. R2. Each Transmission Owner, Generator Owner, or Distribution Provider shall, within 60 calendar days of identifying the cause of each Misoperation: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-Term Planning] Develop a Corrective Action Plan (CAP) for the identified Protection System component(s) that includes an evaluation of the CAP's applicability to the entity's Protection Systems at other locations, or Explain in a declaration why corrective actions are beyond the entity's control or would reduce BES reliability. R3. Each Transmission Owner, Generator Owner, or Distribution Provider shall, within

Organization	Yes or No	Question 2 Comment
		180 210 calendar days of the associated BES interrupting device operation, complete for each Misoperation without an identified cause: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-Term Planning] Development of an action plan that identifies any additional investigative actions and/or Protection System modifications, including a work timetable, or A declaration explaining why no further actions will be taken. **Response:** The *Sanction Guidelines of the North American Electric Reliability Corporation*, Section 2.8, Extenuating Circumstances, says: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." While the drafting team recognizes the concern and that there are other standards which have similar provisions for natural disasters, including specific language in the proposed standard complicates a low frequency event where a compliance violation might occur. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
Northeast Utilities	No	R1.1 second bulleted item states: If the entity owns the BES interrupting device but does not own all of the Protection System and cannot determine that the Protection System operation was correct, then notify the other owner(s) of the Protection System component(s) and provide any requested investigative information. The Protection System component owner(s) that was notified by the BES interrupting device owner shall determine if there was a correct operation or a Misoperation of their component. This requirement statement is confusing and should be revised to clearly describe the intent. Additionally, this statement requires action by more than one entity within the 120 day time period. There is no requirement for BES interrupting device owner to

Organization	Yes or No	Question 2 Comment
		notify the owner of the protection system component identified as contributing to the misoperation prior to 120 days which could leave the protection system component owner no time to investigate and determine if the operation was correct or not as required in R1.1 and determine the cause as required in R1.2 (which also must be completed within the first 120 days). We suggest that the above statement be a separate requirement under R1 and be worded as follows: If the BES interrupting device owner cannot determine that the Protection System operation was correct, and concludes that protection system components owned by another entity contributed to a possible misoperation, the BES interrupting device owner shall notify the other owner(s) of the Protection System component(s) of their preliminary conclusions and provide any requested investigative information within 90 days of an interrupting device operation. It is suggested that a 90 day timeframe for this situation is still reasonable for the interrupting device owner and allows 30 days for the owner(s) of the Protection System component(s) to comply with the existing R1.1 and R1.2.During the 120 day review period, requirement 1.1 does not ensure that there will be adequate time for ALL Protection System owners to review the operation. If the BES interrupting device owner is tardy in informing another Protection System component owner, then that Protection System owner may not have time to perform a review. There should be some milestone within the 120 day review period where all Protection System owners need to be informed of the operation and their need to review it.
Response: The drafting team thanks you for your comment. Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made.		
Pepco Holdings Inc & Affiliates	No	Requirement R1 places the responsibility on the BES interrupting device owner to

Organization	Yes or No	Question 2 Comment
		investigate all operations initiated by a Protection System which trips the interrupting device. We vigorously disagree with this assignment of responsibility. The responsibility for R1 through R4 should be on the owner of the Protection System which initiated the tripping of the interrupting device, not the owner of the interrupting device. All previously approved versions of PRC-004 rightly place the responsibility for reviewing and analyzing Protective System operations on the owners of the Protective Systems, not the owners of the interrupting device. The interrupting device is, by definition, not even a component of a Protective System. Therefore, nowhere in this standard should compliance responsibility be assigned to the owner of an interrupting device. The entity who owns the interrupting device is not necessarily the one who owns the Protective System. For example, it is not uncommon for a generator to be interconnected to a TO switchyard, where the TO owns the breakers (interrupting devices) in the switchyard but the GO owns the Protection Systems protecting his generator unit. The GO Protection Systems trip the TO's breakers to isolate the unit from the system. The way the present standard is written the TO would be responsible for reviewing and identifying all GO protection initiated trips just because the TO owns the interrupting device. This is totally unreasonable. In a power plant, when a generator unit trips off line due to a plant Protective System operation lockout relays are employed to prevent re-energization of the unit until the cause of the trip can be determined. When this occurs, the investigation of this event should be initiated and pursued solely by the GO (i.e. the owner of the protective system that caused the tripping of the BES interrupting device) and not by the TO, who may happen to own the interrupting device. The GO may request data and information from the TO to assist in their investigation, however, all compliance responsibility for reviewing operations and identifying misoperations should solely rest on the owners of the Protective System(s) that initiated the trip of the BES facility (in this case the GO). In this case, involving the TO solely because they are the owner of the interrupting device places an unwarranted compliance burden on the TO. Although the TO may be aware that the interrupting device opened, they are not is a position to determine if it was

Organization	Yes or No	Question 2 Comment
		opened due to a plant Protective System operation, or was opened due to a manually initiated trip of the unit as it was being taken offline, since the GO, rather than the TO, usually has operational control over these breakers. In order to properly assign compliance responsibility to the appropriate entities, and eliminate the unwarranted compliance obligation on the interrupting device owner, we would suggest re-wording R1 in either one of two ways: OPTION 1 - Preferred: (assign responsibility to each Protection System owner rather than to the interrupting device owner) R1.1 "Within 120 calendar days of the operation of an interrupting device(s) which interrupts a BES Facility (i.e., line terminal, transformer, generator unit, etc.) that was caused by a Protective System operation, each Transmission Owner, Generator Owner, and Distribution Provider, who owns a Protective System which is connected to trip the interrupting device(s) shall review the event to determine if their Protection System operation was correct, or a misoperation." With the above language the responsibility is clearly and properly assigned to the owner(s) of the Protective System(s) which initiated the tripping. We agree that if the owner of the relay that initiated the trip does not own all the remaining components of the associated Protection System (i.e., CTs or VT's) they may require assistance and support from the owners of those additional components to complete their analysis. However, the owner of the Protective System that initiated the trip should be the party responsible for analyzing if a protective system misoperation occurred. If in the course of that investigation they determine the cause was attributed to a component of the Protection System which they did not own (such as a blown VT fuse owned by others), they should notify the other party, who would in turn be responsible for appropriate corrective action. While retaining this approach for shared Protection Systems the remaining Parts of Requirement R1 will also need to be re-worded to remove references to the interrupting device owner. OPTION 2 - Alternate: (replace owner of the interrupting device with owner of the interrupted BES Facility)

Organization	Yes or No	Question 2 Comment
		R1.1 "Within 120 calendar days of the interruption of a BES Facility (i.e., line terminal, transformer, generator unit, etc.) that was caused by a Protective System operation, the Transmission Owner, Generator Owner, and Distribution Provider, who owns the Facility that was interrupted shall identify and review each Protective System operation. If the entity owns both the BES Facility and the Protective System, determine if it was a correct operation, or a Misoperation. If the entity owns the BES Facility but does not own all of the Protective System and cannot determine that the Protection System operation was correct, then notify the other owner(s) of the Protective System component(s) and provide any requested investigative information. The Protective System component owner(s) that was notified by the Facility owner shall determine if there was a correct operation or a Misoperation of their component. 1.2 Within the same 120 day period of the interruption of a BES Facility caused by a Protective System operation, the owner of the Protective System component identified as contributing to the Misoperation shall investigate and document the findings for each Misoperation including a cause, if identified." The above language is consistent with the way TADS and GADS data is entered (i.e. by the Facility Owners). In addition, the Protective System(s) which protect and trip a specific Facility are almost entirely owned by the owners of the Facility. This Option adequately addresses the example raised previously, eliminating the need to involve the TO for generator initiated trips. The only complication arises when dealing with transmission lines terminating between two separate companies. The line terminals at each end may be owned by each respective company but the line itself may be entirely owned by only one company. To overcome this deficiency, this proposed re-write of R1 uses the term "line terminal" in the parenthetical list of BES Facilities. This would make the owners of the Protective Systems on each respective line terminal responsible for the review and analysis of their systems rather than the owner of the line itself.

Organization	Yes or No	Question 2 Comment
Response: The drafting team thanks you for your comment. According to definition of Protection System which became effective April 1, 2013, the BES interrupting device owner owns a component of the Protection System, namely the trip coil(s) of that BES interrupting device (at a minimum). The BES interrupting device owner is in the best position to be aware of the operation and to initiate the identification of any Misoperation. In the case where the relays or other Protection System component(s) are owned by another entity, that owner may not know of the operation until it receives notification from the BES interrupting device owner. Requirement R1 was revised to bring clarity to the obligations of each applicable entity. Change made.		
ReliabilityFirst	No	Requirement R1 relies on the operation of an interrupting device and the identification by its owner that a Protection System operated and further that it may have operated due to a Misoperation. There are two issues with using this as the focal point of the actions within the standard. 1) First, the owner of the interrupting device may not be in the best position to decide why the device operated, if a Protection System was involved and if a Protection System component contributed to a Misoperation. This partly is because the interrupting device excluding its trip coils and CTs is not part of the Protection System. The owner of the relay that activated the trip or the owner of the associated Disturbance Monitoring Equipment would be in a much better position to evaluate the operation. The requirement circumvents what may be a natural process of investigating the operation by its individual owners separately or collectively. The requirement may create a weak link in a chain because of its reliance on the interrupting device owner to start the identification and review process. 2) Second, not all Misoperations result in an interrupting device operation particularly if no Fault occurred or the Fault is a high impedance transient Fault. The owner of the Protection System that failed to operate would not be required to investigate it. 3) Finally, the requirement should be rewritten to obligate the owner of its Protection Systems to investigate their performance and to notify joint owners of their findings if they need to take follow up actions. Inserting the interrupting device owner unnecessarily into the process of investigation does not serve a reliability purpose but an administrative one.

Organization	Yes or No	Question 2 Comment
Response: The drafting team thanks you for your comment. According to definition of Protection System which became effective April 1, 2013, the BES interrupting device owner owns a component of the Protection System, namely the trip coil(s) of that BES interrupting device (at a minimum). The BES interrupting device owner is in the best position to be aware of the operation and to initiate the identification of any Misoperation. <table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 2 Comment</th></tr>
<tr><td>Tennessee Valley Authority</td><td>No</td><td>The changed wording of R1 was an improvement. However, our concern comes from our company enduring a major natural disaster and the aftermath. When recovering from a major event such as Hurricane Sandy, the first priority is to get lights on and rebuild the system. Because a large natural event produces an influx of unique system configurations that may not have been planned for by system planners or relay setters, analyzing and investigating all the operations and misoperations that occur takes weeks and is not the top priority for a utility that endures such an event. The Standard needs wording to allow additional time when a utility endures a natural disaster.</td></tr>
<tr><td colspan="3">Response: The drafting team thanks you for your comment. The Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, says: “In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties.” While the drafting team recognizes the concern and that there are other standards which have similar provisions for natural disasters, including specific language in the proposed standard complicates a low frequency event where a compliance violation might occur. No change made.</td></tr>
<tr><td>Midwest Reliability Organization NERC Standards Review Forum (NSRF)</td><td>No</td><td>The NSRF believes there should be exception for Acts of Nature such as tornados, ice storms and other natural disasters with, at minimum, the 120 day rule being waived. In previous comments the SDT agreed with this concern but did not add this exception. A wide spread thunderstom with heavy lightning can set off multiple trips and recloses in a short time. There should be a process to excempt such events.

Please verify that reclosing relays are not within scope of this Reliability Standard.</td></tr>
<tr><td colspan="3">Response: The drafting team thanks you for your comment. No change made. Presently reclosing relays are not part of the definition of Protection System thus are excluded from the scope of this standard. No change made.</td></tr>
</table>

Organization	Yes or No	Question 2 Comment
Northeast Power Coordinating Council	No	The Protection System component owner who does not also own the interrupting device may be placed in a non-compliant situation through no fault of their own. Their compliance is contingent upon a timely notification from the owner of the BES interrupting device. If the notification is not made in a timely fashion to allow for investigation the Protection System component owner would be non-compliant for not conducting an investigation and documenting the findings within 120 days. For this situation the BES interrupting device owner should have an abbreviated time frame to notify the Protection System component owner to provide sufficient time to collect the appropriate information and investigate the operation. Conversely, the owner of the Protection System component could be granted more time to investigate (i.e. 120 days from the notification by the BES interrupting device owner). **Response:** Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made. A misoperation investigation if Protection Systems are shared between two or more entities is often a joint effort. The Application Guide clearly defines that "it is expected that both entities will work together to investigate the cause of the operation", which is desired. This is not clearly defined in R1 and should be clarified. The Application Guide should indicate that this notification should be done as soon as possible. **Response:** Notification starts the period for the Protection System component owner to begin its investigation. If the BES interrupting device owner officially notifies other Protection System component owners when there may be no need to do so, it will create an unnecessary compliance obligation for the other owners, especially when there is little possibility that another owner's Protection System component(s) caused

Organization	Yes or No	Question 2 Comment
		a Misoperation. The requirements do not preclude the initial entity that is reviewing the operation from working with the other owners and when necessary, make the official notification. Requirement R1 has been revised to move notification into a separate new Requirement now R2. This requirement clarifies that the BES interrupting device must make notifications when (1) it share components of a Composite Protection System, (2) it determined a Misoperation or cannot rule out a Misoperation, and (3) its Protection System component(s) did not cause the BES interrupting device(s) operation or is unsure. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
PPL NERC Registered Entities	No	The requirement R1 can be simplified by wording it in this manner: "Each entity shall identify, review, investigate, classify, document, and, for misoperations, determine the cause (if identified) of each Protection System operation that they own..." by the required time frame. There is a possible time coordination issue for identification and review of misperations with R1.2. As stated in the proposed standard, R1 places the responsibility on the BES interrupting device owner to investigate operations initiated by a Protection System. If timely communication of misoperation information is delayed by a Protection System component owner, the BES interrupting device owner could possibly bear the responsibility of not meeting the 120 day reporting requirement per R1. Fundamentally, R1 frames the time period for reviewing and analyzing a misoperations where multiple responsible entities are involved. However, R1 does not take in to account that one entity’s analysis may be dependent upon the other’s final analysis and that parallel review of misoperations are not possible. More consideration should be given to the cases where one entity’s actions impact another’s ability to meet the requirements of R1.However, concur in overall concept with clarifying coordination roles between BES interrupting device owner and the Protection System owner.
Response: The drafting team thanks you for your comment. Requirement R1 was split into two separate Requirements (R1 and R3) to		

Organization	Yes or No	Question 2 Comment
provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made.		
Essential Power, LLC	No	The requirement R1 can be simplified by wording it in this manner: "Each entity shall identify, review, investigate, classify, document, and, for misoperations, determine the cause (if identified) of each Protection System operation that they own..." by the required time frame. There is a timing problem with R1.2 for the Protection System owner who is notified on day 119 following a Protection System operation. It is not reasonable or just to require this Protection System owner to complete the requirements of R1 in one day's time after being notified by the owner of an interrupting device whose operation was suspected to be caused by a Misoperation of another entity's Protection System. **Response:** Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made. The evidence listing in M1 is unnecessarily duplicative. Measure M1 (and likewise all of R1) could be greatly simplified by stating that the required evidence for proving compliance with R1 may include, but is not limited to ...then list the items once. **Response:** The Measure has been revised for clarity and to be more concise. Change made.

Change made. The evidence listing in M1 is unnecessarily duplicative. Measure M1 (and likewise all of R1) could be greatly simplified by stating that the required evidence for proving compliance with R1 may include, but is not limited to ...then list the items once. **Response:** The Measure(s) have been revised for clarity and to be more concise. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
City of Tallahassee	No	There should be some provision in the standard to take in to account extenuating circumstances such as natural disasters. It would be unfair to expect entities to be able

Organization	Yes or No	Question 2 Comment
		to perform an analysis within 120 days following a major disaster. **Response:** The *Sanction Guidelines of the North American Electric Reliability Corporation*, Section 2.8, Extenuating Circumstances, says: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." While the drafting team recognizes the concern and that there are other standards which have similar provisions for natural disasters, including specific language in the proposed standard complicates a low frequency event where a compliance violation might occur. No change made. Also, there are some circumstances when an investigation is out of the control of the entity. For example if a relay or protection device potentially failed but needed to be investigated by the manufacturer or an outside company it may take longer than 120 days to perform a thoroughly investigation. **Response:** The standard now provides the entity an extended period for continuing its investigation of a potential Misoperation beyond the 120 calendar day period. See proposed Requirement R4. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
City of Tallahassee - Electric Utility	No	There should be some provision in the standard to take into account extenuating circumstances such as natural disasters. It would be unfair to expect entities to be able to perform an analysis within 120 days following a major disaster. **Response:** The *Sanction Guidelines of the North American Electric Reliability Corporation*, Section 2.8, Extenuating Circumstances, says: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." Consumers Energy	No	There still seems to be a contradiction in R1 regarding the responsibilities of the BES interrupting device owner (IDO) vs. the Protection System owner (PSO) when owned by different entities (as we commonly have on the 138 system). The breaker, other than the trip coils and CTs, is not part of the Protection System, so the responsibility to investigate operations initiated by a protection system should be with the PSO. NERC's response below to Q4 seems to agree with this (regarding documenting, CAP, and reporting), but R1 still places responsibility for investigation on the IDO. As a matter of fact, the Rationale for R1 added into draft 3 the statement "Requirement R1 places the responsibility on the BES interrupting device owner to investigate operations initiated by a Protection System." When an interrupting device operates, logically the IDO would investigate why their device operated. As soon as the IDO finds out that the operation was initiated by a protection system (the situation described in R1) they should then only have to notify the PSO of the situation (the PSO may not be aware of a protection system operation). The IDO would not be in the best position to investigate, and should not be validating Protection System operations for the PSO. The seems to be mostly a contradiction of the wording in R1 vs. the Rationale section. If the Rationale is not included in the final version of the standard, I could probably

Organization	Yes or No	Question 2 Comment
		agree with the wording of the rest of it.
Response: The drafting team thanks you for your comment. According to definition of Protection System which became effective April 1, 2013, the BES interrupting device owner owns a component of the Protection System, namely the trip coil(s) of that BES interrupting device (at a minimum). The BES interrupting device owner is in the best position to be aware of the operation and to initiate the identification of any Misoperation. In the case where the relays or other Protection System component(s) are owned by another entity, that owner may not know of the operation until it receives notification from the BES interrupting device owner. Requirement R1 was revised to bring clarity to the obligations of each applicable entity. Change made. Notification starts the period for the Protection System component owner to begin its investigation. If the BES interrupting device owner officially notifies other Protection System component owners when there may be no need to do so, it will create an unnecessary compliance obligation for the other owners, especially when there is little possibility that another owner's Protection System component(s) caused a Misoperation. The requirements do not preclude the initial entity that is reviewing the operation from working with the other owners and when necessary, make the official notification. Requirement R1 has been revised to move notification into a separate new Requirement now R2. This requirement clarifies that the BES interrupting device must make notifications when (1) it share components of a Composite Protection System, (2) it determined a Misoperation or cannot rule out a Misoperation, and (3) its Protection System component(s) did not cause the BES interrupting device(s) operation or is unsure. Change made.		
ExxonMobil Research and Engineering	No	
SERC Protection and Controls Subcommittee	Yes	none
Entergy Services, Inc. (Transmission)	Yes	Since actual Misoperation data reporting will now be addressed outside of this standard, entity data communication requirements within this standard need to be consistent with respect to data reporting criteria. As an example, since there is no requirement for a contributing component entity owner to forward the required investigative and CAP data to the interrupting device entity owner, one would expect that reporting will be the responsibility of the Protection System contributing

Organization	Yes or No	Question 2 Comment
		component entity owner.
Response: The drafting team thanks you for your comment. The NERC Rules of Procedure, Section 1600 Request for Information or Data (i.e., Data Request) will dictate the specific entity (i.e., Protection System component owner) that is to report a Misoperation and the format for reporting. Reporting under the standard will end. No change made.		
ISO RTO Council Standards Review Committee	Yes	There is a lack of clarity on which entity is responsible for developing and implementing a CAP. We agree with the revision to Requirement R1, but believe that there needs to be corresponding revisions to R2 and R3 to clearly indicate which entity needs to be held responsible, expecially in view of the rationale provided in the text box for R1, whose excerpt says: “The owner of the component that contributed to the Misoperation will create the CAP, action plan or declaration required by Requirements R2 and R3”. We interpret the quoted excerpt (above) to mean that the component that contributed to the Misoperation may not be owned (in full or in part) by the owner of the BES interrupting device. It follows that in such cases, the owner of the component that contributed to the Misoperation is responsible for complying with R2 and R3. If this interpretation is correct, then Requirements R2 and R3 are not clear as to which entity is held responsible. To clarify this, we suggest to revise the leading part of R2 to: “Each Transmission Owner, Generator Owner, or Distribution Provider that owns the component that contributed to the Misoperation shall, within 60 calendar days of identifying....”. The Same revision should apply to R3, as follows: “Each Transmission Owner, Generator Owner, or Distribution Provider that owns the component that contributed to the Misoperation shall, within 180 calendar days of of the associated BES interrupting device operation,.....” Further, though not explicitly stated, we assume that the owner of the component that

Organization	Yes or No	Question 2 Comment
		contributed to the Misoperation is also held responsible for complying with R4 to implement and complete the CAP or action plan to accomplish all identified objectives. Hence, the same qualifier should also be added to Requirement R4.
Response: The drafting team thanks you for your comment. The concept of an action plan has been eliminated from the standard; however, the proposed Requirement R4 requires the entity to perform investigative action when circumstances require additional study or time to determine the cause(s) of a Misoperation. Requirement R5 and R6 respectively address CAP development and implementation by the Protection System component owner to correct the cause(s) of a Misoperation. Change made.		
Georgia Transmission Corp	Yes	While reporting falls under 1600, should PRC-004 clarify which of the two should file the Misoperation?
Response: The drafting team thanks you for your comment. The NERC Rules of Procedure, Section 1600 Request for Information or Data (i.e., Data Request) will dictate the specific entity (i.e., Protection System component owner) that is to report a Misoperation and the format for reporting. Reporting under the standard will end. No change made.

3. **The Measures and VSLs were revised to reflect changes to the requirements. Do you agree with these changes? If not, please provide specific reasons why not and alternative recommendations and justifications.**

Summary Consideration:

The following resulted in a revision to the proposed standard. Due to the significant changes to the proposed standard (e.g., removal of the action plan), the Violation Severity Levels (VSL) have been rewritten to align with the revised Requirements. The drafting team contends that the revisions to the Requirements have resulted in more understandable VSLs. Likewise, there were at least seven comments supported by about 57 individuals that suggested revisions to the Measures. The drafting team also revised the Measures to focus on evidence examples and to be more concise.

Approximately seven comments represented by 23 stakeholders expressed concern with the escalation values in the VSLs. Because the new version of the VSL Guidelines provides more flexibility in the intervals, the drafting team has responded by increasing the interval periods for Requirement R1.

Although summarized earlier, about three comments represented by at least 13 individuals were concerned about ambiguity with the time periods for completing its investigation. The proposed standard now provides the entity a periodic time frame for continuing its investigation into the cause of the Misoperation beyond the 120 calendar day period in Requirement R1, Part 1.4.

Also summarized earlier, at least two comments supported by about eight stakeholders expressing concern about the time period for an entity that is notified to review its Protection System for Misoperation. Requirement R1 was revised to provide clarity on each Protection System owners' responsibilities following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components, time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made.

Several comments suggested minor editorial clarifications which were implemented by the drafting team.

The following did not result in a change to the proposed standard. The following did not result in a change to the proposed standard. Approximately two comments supported by eight individuals wanted to use percentages for determining the level of violations. The drafting team contends that a weighting factor (i.e., use of percentages) is the most practical for assessing violations for fixed quantities and not for the VSLs in this proposed standard.

Organization	Yes or No	Question 3 Comment
Ameren	No	(1) We disagree with the VSL escalation, for R1, R2 and R3, from Moderate to High to Severe at 10 days interval each.
Response: The drafting team thanks you for your comment. In the previous posting, the drafting team followed the guidelines for VSL escalation that were in effect at the time. However, the current version of the Violation Severity Level Guidelines provides more flexibility in the interval. Based on comments received, the drafting team increased the interval for Requirement R1 (including the new R2 and R3) severity levels to 30 days for the Lower VSL and 15 calendar days for the Moderate and High VSL. The interval for creation and implementation of the CAP in Requirements R5 and R6 (previously R2 & R4) have been updated. Change made.		
ACES Standard Collaborators	No	(1) The measures are not consistent with the revisions to the requirements. For instance, Requirement R1 requires the owner of the component that led to the Misoperation to identify and review its performance. However, the Measures require the applicable entities to have evidence without any statement regarding the ownership of Protection Systems or circuit breakers.
Response: The drafting team thanks you for your comment. The Measure(s) have been revised for clarity and to be more concise. Change made.		
Southern Company - Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Mississippi Power Company; Gulf Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	No	1. The evidence listing in M1 is unnecessarily duplicative. Measure M1 (and likewise all of R1) could be greatly simplified by stating that the required evidence for proving compliance with R1 may include, but is not limited to ...then list the items once. **Response:** The Measure(s) have been revised for clarity and to be more concise. Change made. 2. The severe VSL for R1, R2, and R3 can be simplified by changing a few words in the first item of each requirement. For R1, change "...entity performed the actions in ... and 1.2 in more than 170..." to "...entity did not perform the actions in .... and 1.2 within 170 ...". This would allow the 2nd and 3rd items in the OR statement to be eliminated. For R2, change "entity developed a CAP, or a declaration .... R2, more than 90 ..." to

Organization	Yes or No	Question 3 Comment
		"entity did not develop a CAP or a declaration ...R2 within 90 ...". This would allow the second part of the OR statement to be eliminated. For R3, change "entity developed an action plan, or made a declaration ... R3, more than 230 ..." to "entity did not develop an action plan or make a declaration ... R3 within 230 ...". This would allow the second part of the OR statement to be eliminated. **Response:** The VSL have been extensively revised due to the revisions to the requirements. Change made. 3. The VSL should be have a weighting factor in the % of operations not analyzed (otherwise it is one strike and you're out and this could be one event out of many). Equal severity for 1/10 events is not just compared to 1/100 events. **Response:** A weighting factor (i.e., use of percentages) is practical for assessing violations for fixed quantities, because Protection System operations are variable and event driven. The drafting team constructed the VSL according to the NERC Violation Severity Level Guidelines. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
American Electric Power	No	AEP recommends adjusting the time requirements specified in the VSL tables for R1, R2 and R3 to extend the timeframe for Moderate and High VSLs to 20 days, and eliminate the time requirement for the Severe VSL. Example: For R1, the Low VSL remains the same, Moderate becomes >150 to 170, High becomes >170 to 190, and Severe only applies when "The responsible entity failed to identify and review... ". **Response:** In the previous posting, the drafting team followed the guidelines for VSL escalation that were in effect at the time. However, the current version of the Violation Severity Level Guidelines provides more flexibility in the interval. Based on comments received, the drafting team increased the interval for Requirement R1 (including the new R2 and R3) severity levels to 30 days for the Lower VSL and 15 calendar days for the Moderate and High VSL. The interval for creation and

Organization	Yes or No	Question 3 Comment
		implementation of the CAP in Requirements R5 and R6 (previously R2 & R4) have been updated. Change made. Measure M1 repeatedly lists the same evidence examples and AEP suggests simplifying the measure by stating "evidence for R1 may include but is not limited to...." followed by a single list of items. **Response:** The Measure(s) have been revised for clarity and to be more concise. Change made. The wording for the R4 VSL references failure to revise a CAP "as needed". This statement is very broad, may be subject to interpretation and should be clarified or removed from the VSL. **Response:** The VSL was modified to be consistent with the revised CAP implementation requirement and to clarify the violation is on the CAP that was not updated when actions or timetables changed. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
Arizona Public Service Company	No	Agree with the other changes but VSL severity levels are spaced 10 days apart. It should be at least 30 days apart. It is not justifiable to go from Lower to Sever VSL for 22 days of delay (149 days to 171 days). There is no justification for such strict time lines.
Response: The drafting team thanks you for your comment. In the previous posting, the drafting team followed the guidelines for VSL escalation that were in effect at the time. However, the current version of the Violation Severity Level Guidelines provides more flexibility in the interval. Based on comments received, the drafting team increased the interval for Requirement R1 (including the new R2 and R3) severity levels to 30 days for the Lower VSL and 15 calendar days for the Moderate and High VSL. The interval for creation and implementation of the CAP in Requirements R5 and R6 (previously R2 & R4) have been updated. Change made.		
Tennessee Valley Authority	No	As per Req. 2 - CAP Devlopment is too stringent. Troubleshooting and determining which element could take longer than the time allowed in the VSLs. Under PRC-004-1

Organization	Yes or No	Question 3 Comment
		a 12 month time period was given to develop and implement a CAP. **Response:** The standard now provides the entity an extended period for continuing its investigation of a potential Misoperation beyond the 120 calendar day period. See proposed Requirement R4. Change made. Recommend a CAP not developed w/in 120 days or a declaration in accordance with Req. R3 (Lower VSL), CAP not developed w/in 120 days or a declaration in accordance with Req. R3 w/in 120 days or CAP declared in accordance with Req. R2 not implemented within 150 days (Medium VSL), CAP not developed w/in 150 days or a declaration in accordance with Req. R3 w/in 150 days or CAP declared in accordance with Req. R2 not implemented w/in 180 days (High VSL), CAP not developed w/in 180 days or a declaration in accordance with Req. R3 w/in 180 days or CAP declared in accordance with Req. R2 not implemented w/in 210 days. **Response:** In the previous posting, the drafting team followed the guidelines for VSL escalation that were in effect at the time. However, the current version of the Violation Severity Level Guidelines provides more flexibility in the interval. Based on comments received, the drafting team increased the interval for Requirement R1 (including the new R2 and R3) severity levels to 30 days for the Lower VSL and 15 calendar days for the Moderate and High VSL. The interval for creation and implementation of the CAP in Requirements R5 and R6 (previously R2 & R4) have been updated. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
ISO RTO Council Standards Review Committee	No	As we noted in our comments in the previous draft, the VSLs should recognize that some relay misoperations place a greater risk/impact on the BES than others.
Response: The drafting team thanks you for your comments. A Violation Severity Level (VSL) is a measure of how badly did the entity violated the requirement which, in this case, applies to all Protection Systems for BES Elements. Providing a risk-based VSL would reward an entity (i.e., safe harbor) for failing to identify a Misoperation and correcting the cause for a Protection System that may have a lower risk to the BES. The objective of the standard is to identify and correct the causes of Misoperations of Protection		

Organization	Yes or No	Question 3 Comment
Systems for BES Elements. The Compliance Enforcement Authority will assess the circumstances concerning potential violations. No change made. As stated in response to your previous comments, the FERC-approved description of "Violation Risk Factor" is "Each requirement must have an associated violation risk factor (High, Medium, or Lower). The risk factor is one of several elements used to determine an appropriate sanction when the associated requirement is violated. The risk factor assesses the impact to reliability of violating a specific requirement." However, the NERC Sanction Guidelines state that "Violation Risk Factors are assigned to standards' requirements as indicators of the expected risk or harm to the bulk power system posed by the violation of a requirement by a typical or median entity that is required to comply. NERC or the regional entity may consider the specific circumstances of the violator to determine if the violation of the requirement in question actually produced the degree of risk or harm anticipated by the Violation Risk Factor. If that expected risk or harm was not or would not have been produced, NERC or the regional entity may set the Base Penalty Amount to a value it (i) deems appropriate and (ii) is within the initial value range set above pursuant to Section 4.1." The drafting team believes that the NERC Sanction Guidelines address your comment.		
Hydro-Québec Procution	No	In the previous version, the purpose has been centered on the reliability of the BES. The removal of that concept (reliability of the BES) implies the analysis of all the events that occurred on the BES have to be done, even if the event do not affect the reliability of the BES.
Response: The drafting team thanks you for your comment. The construction of Requirement R1 requires that each operation of a Protection System that causes a BES interrupting device operation must be reviewed to ensure that the Protection System responded correctly. An entity may choose to group operations by event; however, in the case of a single permanent fault caused an initial operation and a subsequent reclose and operation, all operations must be reviewed to determine if the Protection System responded appropriately. This achieves the objectives of the standard in ensuring correct performance of Protection Systems, as well as identifying and correcting the root causes of Misoperations which do affect reliability of the BES. No change made.		
Manitoba Hydro	No	M1 - DME is not defined. **Response:** The abbreviation "DME" is a NERC defined term and acronym in the NERC Glossary of Terms Used in NERC Reliability Standards. For clarity, the acronym has

Organization	Yes or No	Question 3 Comment
		been spelled out. Change made. M3 - What was the reason for removing the words at the end 'explaining why no further investigation or actions will be taken' - these words are helpful and should be retained. **Response:** The phrase was redundant with the Requirement. No change made. VSLs - R1 - Severe VSL - the final option in this column seems to suggest that you would need both a failure to notify the other owners AND a failure to provide any investigative information. It doesn't contemplate a situation where an entity may have notified the other owners but failed to provide investigative information. **Response:** The requirement to provide investigative information was removed from the standard. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
Pepco Holdings Inc & Affiliates	No	Measure M1 requires evidence "that documents the date and time of each applicable interrupting device operation and indicates when each related Protective System Operation was reviewed." Based on our comments from Question 2 and proposed re-wording of Requirement R1, Measure M1 should also be revised to require evidence "that documents the date and time that each BES Facility was interrupted due to the operation of a Protection System and the date the Protection System operation was reviewed."
Response: The drafting team thanks you for your comment. The Measure(s) have been revised for clarity and to be more concise. Change made.		
PacifiCorp	No	PacifiCorp is concerned that the VSLs are not commensurate with the reliability risk of the associated violations. In many cases, the difference between a "Lower" and a "Severe" VSL is an arbitrary additional number of days during which the reporting or documentation requirement was not satisfied. The fact that a report is an additional

Organization	Yes or No	Question 3 Comment
		30 days late should not increase the VSL from “Lower” to “Severe.” A later report does not increase the likelihood of additional adverse impact to the BES. A registered entity’s failure to remediate a protection issue is much more critical. A more reasonable timeframe for the VSLs would be 20 days per severity level instead of the proposed 10 days. PacifiCorp recognizes that the drafting team has made this change for the “Lower” VSL in Draft 3, but the remaining VSLs still reflect the 10 day timeframe. **Response:** In the previous posting, the drafting team followed the guidelines for VSL escalation that were in effect at the time. However, the current version of the Violation Severity Level Guidelines provides more flexibility in the interval. Based on comments received, the drafting team increased the interval for Requirement R1 (including the new R2 and R3) severity levels to 30 days for the Lower VSL and 15 calendar days for the Moderate and High VSL. The interval for creation and implementation of the CAP in Requirements R5 and R6 (previously R2 & R4) have been updated. Change made. Moreover, in keeping with PacifiCorp’s comment under Question 1, the “Lower” VSL should be amended from 120 calendar days to 180 calendar days to allow each entity enough time to complete their respective activities before incurring a violation of the standard. **Response:** Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners’ responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made. **Response:** The standard now provides the entity an extended period for continuing its

Organization	Yes or No	Question 3 Comment
		investigation of a potential Misoperation beyond the 120 calendar day period. See proposed Requirement R4. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
Los Angeles Department of Water and Power	No	Please see answer to Question 5
Response: The drafting team thanks you for your comment; and refers to the response provided in Question 5.		
Kansas City Power & Light	No	R4 VSL wording is not clear as presently stated; "The responsible entity failed to revise a CAP or action plan as needed in accordance with Requirement R4." It might not be intended, however this wording implies that all CAP's must be revised and if not revised there is a compliance issue. The wording should state; "A CAP revision was needed in accordance with R4 and the responsible entity failed to make the revision."
Response: The drafting team thanks you for your comment. The VSL was modified to be consistent with the revised CAP implementation requirement and to clarify the violation is on the CAP that was not updated when actions or timetables changed. Change made.		
Flathead Electric Cooperative, Inc.	No	ramping up the violation level simply on the number of days that pass to complete the analysis does not seep appropriate for situations where the discovery may have been delayed in the first place
Response: The drafting team thanks you for your comment. In the previous posting, the drafting team followed the guidelines for VSL escalation that were in effect at the time. However, the current version of the Violation Severity Level Guidelines provides more flexibility in the interval. Based on comments received, the drafting team increased the interval for Requirement R1 (including the new R2 and R3) severity levels to 30 days for the Lower VSL and 15 calendar days for the Moderate and High VSL. The interval for creation and implementation of the CAP in Requirements R5 and R6 (previously R2 & R4) have been updated. The standard now provides the entity an extended period for continuing its investigation of a potential Misoperation beyond the 120 calendar day period. See proposed Requirement R4. Change made.

Cogentrix Energy Power Management, LLC	No	See comments to question 2
Response: The drafting team thanks you for your comment; and refers to the response provided in Question 2.		
Sacramento Municipal Utility District	No	The current Requirements and their current approach are not supported as noted in the response in Question #5. As such the VSL and Measures cannot be supported.
Response: The drafting team thanks you for your comment; and refers to the response provided in Question 5.		
Public Utility District No. 1 of Snohomish County	No	The current Requirements and their current approach are not supported as noted in the response in Question #5. As such the VSL and Measures cannot be supported.
Response: The drafting team thanks you for your comment; and refers to the response provided in Question 5.		
PPL NERC Registered Entities	No	The VSLs are hard-wired to response/reporting timelines specified per R1-R3. Some consideration should be given to technical complexity and circumstance of the SPS Misoperation. **Response:** The VSLs assess time-based violations based on factors such as, the BES interrupting device operation, notification, and creation of the Corrective Action Plan (CAP). Requirements for SPS Misoperation analysis and corrective action are addressed in PRC-016, not this standard. No change made. The R1 evidence listing in M1 is unnecessarily duplicative. Measure M1 (and likewise all of R1) could be greatly simplified by stating that the required evidence for proving compliance with R1 may include, but is not limited to ...then list the items once. **Response:** The Requirement(s) and Measure(s) have been revised for clarity and to be

Organization	Yes or No	Question 3 Comment
		more concise. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
Mary Jo Cooper	No	This Standard allows 120 days for the entity to investigate the operation. We do not feel that this activity warrants a severe violation factor if only 1 operation was investigated 50 days later. We agree that if an activity has a significant impact on the BES than the violation severity level should be higher. In this case, however, immediate action is not required and therefore we disagree with the severe violation penalty suggested by the drafting team. **Response:** In the previous posting, the drafting team followed the guidelines for VSL escalation that were in effect at the time. However, the current version of the Violation Severity Level Guidelines provides more flexibility in the interval. Based on comments received, the drafting team increased the interval for Requirement R1 (including the new R2 and R3) severity levels to 30 days for the Lower VSL and 15 calendar days for the Moderate and High VSL. The interval for creation and implementation of the CAP in Requirements R5 and R6 (previously R2 & R4) have been updated. Change made. We suggest that the penalty for not investigating an operation timely should only qualify for a moderate VSL given immediate (within 1 hour or 1 day) activity is not required. We feel investigation of all operations and determination and implementation of correction misoperations is important to the long-term reliability of the BES. However, the system should be designed with redundancies to resolve any short-term issues and this Standard, while important, is designed to ensure long-term protection. Furthermore, we are not aware of any company who feels that the violation severity level determines whether they comply or not. Our organization strives to comply with all Standards with no violations, regardless of the violation severity level. **Response:** Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners’

Organization	Yes or No	Question 3 Comment
		responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
Northeast Power Coordinating Council	No	We agree with the content of all the measures and VSLs, however measure M1 would have to be modified accordingly to coincide with the modifications suggested in question 2 above.
Response: The drafting team thanks you for your comment. The Measure(s) have been revised for clarity and to be more concise. Change made.		
Northeast Utilities	No	We agree with the content of all the measures and VSLs, however measure M1 would have to be modified accordingly to coincide with the modifications suggested in question 2 above.
Response: The drafting team thanks you for your comment. The Measure(s) have been revised for clarity and to be more concise. Change made.		
ExxonMobil Research and Engineering	No	
SERC Protection and Controls Subcommittee	Yes	none
Tri-State G&T	Yes	The first instance of the abbreviation, DME, is undefined in M1 on page 7. It is defined as Disturbance Monitoring Equipment on page 19 in the Guidelines and Technical

Organization	Yes or No	Question 3 Comment
		Basis section for R1. The definition should be moved to page 7.
Response: The drafting team thanks you for your comment. The abbreviation "DME" is a NERC defined term and acronym in the NERC Glossary of Terms Used in NERC Reliability Standards. For clarity, the acronym has been spelled out. Change made.		
Exelon Corporation and it's affiliates	Yes	The following changes are suggested: R1 - Add a Lower VSL condition that states, "The responsible entitiy failed to identify and review at least 2% or 2 (whichever is greater) Protection System operations that operated one of its BES interrupting devices in accordance with Requirement R1, Part 1.1". Add a Moderate VSL condition that states, "The responsible entitiy failed to identify and review at leastr 3% or 3 (whichever is greater) Protection System operations that operated one of its BES interrupting devices in accordance with Requirement R1, Part 1.1". Add a High VSL condition that states, "The responsible entitiy failed to identify and review at least 4% or 4 (whichever is greater) Protection System operations that operated one of its BES interrupting devices in accordance with Requirement R1, Part 1.1". Modify the 2nd Severe VSL condition with, "The responsible entitiy failed to identify and review at least 5% or 5 (whichever is greater) Protection System operations that operated one of its BES interrupting devices in accordance with Requirement R1, Part 1.1". **Response:** A weighting factor (i.e., use of percentages) is practical for assessing violations for fixed quantities, because Protection System operations are variable and event driven. The drafting team constructed the VSL according to the NERC Violation Severity Level Guidelines. No change made. Eliminate the 2nd Lower VSL condition all together because it is redundant with the 1st Severe VSL condition that addresses performing the actions in accordance with

Organization	Yes or No	Question 3 Comment
		Requirement R1, Parts 1.1 and 1.2 in more than 170 days. **Response:** The standard has been revised to provide one activity for a single reliability goal in accordance with standard drafting guidelines. The drafting team restructured the previous requirements into separate requirements which required the VSLs to be modified substantively. Change made. R2 - Eliminate the last Severe VSL condition that is listed because it is redundant with the 1st Severe VSL condition listed. R3 - Eliminate the last Severe VSL condition that is listed because it is redundant with the 1st Severe VSL condition listed. R4 - Eliminate the last Severe VSL condition that is listed because it is redundant with the 1st Severe VSL condition listed. **Response:** The VSL parts are not redundant. One part addresses a completed action, but was late and the other an incomplete action. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.

4. **The drafting team modified the Guidelines and Technical Basis section to provide more supporting discussions, explanations, and examples for the various aspects of the standard. Do you have any specific suggestions for further improvements?**

Summary Consideration:

The following resulted in a revision to the proposed standard. The most significant comment here was presented by at least four comments supported by 20 individuals concerning the use of "composite Protection System." The composite Protection System is the collective operation of the entire Protection System for an Element which is included in determining whether a Misoperation occurred. To clarify the usage of the terminology, the drafting team is proposing the term "Composite Protection System" which has an exclusion for backup protection provided by a remote Protection System.

Approximately four comments from individuals were concerned about the use of reverse power relays. Because reverse power relays provide anti-motoring protection for generators, the drafting team has clarified in the Application Guidelines the relay's protective function intended use as a control function for shutting down a generating unit and as anti-motoring protection.

The remaining narrative responds to comments from two or fewer comments that are not addressed in other summaries:

- The Application Guidelines have been clarified not to infer the implementation of the CAP must be completed in 180 days (See draft 3, page 20 "…and requires the CAP implementation be less than 180 days."). The CAP has its own timetable which is required to be updated by the entity when actions or timetables change.
- Requirement R4 now addresses the "action plan" as investigative action the entity performs when circumstances require additional study or time to determine the cause of a Misoperation. Requirement R5 and R6 respectively address CAP development and implementation by the Protection System component owner to correct the cause(s) of a Misoperation.

Other single comments were too numerous and different to summarize here. Please see the comments below for these comments.

Organization	Yes or No	Question 4 Comment
ACES Standard Collaborators	No	(1) If the drafting team intends to move forward with "composite Protection System," we recommend adding it as a new proposed definition. After reading the technical guidelines, we are not persuaded that the drafting team has articulated the difference

Organization	Yes or No	Question 4 Comment
		between a Protection System and a composite Protection System. A proposed glossary term would allow industry the opportunity to provide the feedback as to whether an additional term is needed in order to have the proper scope for identifying Misoperations.
Response: The drafting team thanks you for your comment. The use of the term "composite" Protection System is intended to address the fact that the term Protection System by itself does not indicate that it is the complete set of protective relaying for an Element such as any primary, secondary, local backup, and communication-assisted relay systems. The word "composite" used as a modifier to Protection System was developed by the NERC SPCS to indicate the total complement of protection for a system Element (line, bus, transformer, generator, etc). To clarify the usage of the terminology, the drafting team is proposing a definition for "Composite Protection System" and has made corresponding changes where "composite Protection System" occurs in the body of the project documents. Change made.		
American Electric Power	No	AEP recommends adding "remote backup relaying is not considered to be part of the composite Protection System" to the end of the description for the composite Protection System in the Application Guidelines. **Response:** This recommendation has been incorporated into the proposed term "Composite Protection System." Change made. AEP requests that SDT include a clarification of the meaning of "BES interrupting device" within the context of this standard (similar to how "composite Protection System" is addressed). **Response:** The use of "BES interrupting device" has been clarified in the standard's Application Guidelines under the "Definitions" section. Change made. AEP recommends replacing both instances of the word "implementation" with "development" in the second paragraph of page 20 of the clean version of the standard. Otherwise it is implied that there are situations where a CAP must be fully implemented within 180 days. **Response:** The Application Guidelines have been clarified not to infer the implementation of the CAP must be completed in 180 days (See draft 3, page 20 "…and

Organization	Yes or No	Question 4 Comment
		requires the CAP implementation be less than 180 days.”). The CAP has its own timetable which is required to be updated by the entity when actions or timetables change. Change made. Please include a clarification of the CAP and action plan modification tracking. For example, if a CAP or action plan is modified, is it sufficient to document the modifications, or must the date the modifications were made also be tracked? **Response:** The concept of an action plan has been eliminated from the standard; however, the proposed Requirement R4 requires the entity to perform investigative action when circumstances require additional study or time to determine the cause(s) of a Misoperation. Requirement R5 and R6 respectively address CAP development and implementation by the Protection System component owner to correct the cause(s) of a Misoperation. Change made. The Measure M6 includes “dated” documentation to improve clarity. Also, examples were added to the Application Guidelines under Requirement R6. Change made. On page 15 of the clean version of the standard AEP recommends adding “unintentional” before “loss of field” in the first paragraph. **Response:** See Example 2a in the Application Guidelines under the Misoperation category 2 (Failure to Trip – Other Than Fault) discussion. Change made. On page 15 of the clean version of the standard AEP recommends replacing “shut down” in the second paragraph with “as intended to isolate.” **Response:** See Example 2b in the Application Guidelines under the Misoperation category 2 (Failure to Trip – Other Than Fault) discussion. Change made. AEP recommends adding generation examples of both a normal time delay operation and a misoperation to category 3 of the application guidelines. **Response:** Alternatively, the drafting team revised the definition of Misoperation category 3 (Slow Trip – During Fault) for clarity. Changed made.

Organization	Yes or No	Question 4 Comment
Response: The drafting team thanks you for your comments; please see the above responses.		
Liberty Electric Power LLC	No	Agree with the comments of the Standards Development Team of the North American Generator Forum, which state: The standard should completely exclude operation of reverse power relays when shutting-down units, or (better) classify such devices as not being part of Protection Systems (they do not protect BES equipment; they prevent turbine mechanical damage). This subject is discussed in the Application Guidelines (p.17), but the distinction attempted between control and protection functions of reverse power relays is obscure.
Response: The drafting team thanks you for your comment. According to the IEEE Guide for AC Generator Protection (C37.102-2006), Section 4.5.5 (Motoring), sub-section 4.5.5.6 (Tripping mode), "Primary motoring protection is provided by reverse power relays for all unit types." Reverse power relays, by definition, are a Protection System and cannot be categorically excluded. Because reverse power relays provide motoring protection, the drafting team has provided an exclusion in the Applicability of the standard. Also, this exclusion is clarified in the Application Guidelines concerning the relay's use as a control function for shutting down a unit and as anti-motoring protective protection for a generating unit. Change made.		
Idaho Power Company	No	Only a request that the application guidelines be maintained with the final version of the standard.
Response: The drafting team thanks you for your comment. The Application Guidelines will remain part of the standard. Change made.		
Los Angeles Department of Water and Power	No	Please see answer to Question 5
Response: The drafting team thanks you for your comment; and refers to the response provided in Question 5.		
Dominion	No	The addition of the word "composite" adds nothing to the existing term Protection System and in fact introduces confusion. Dominion assumes a Missoperation occurs

Organization	Yes or No	Question 4 Comment
		only if all protection (primary, secondary, backup, pilot and non-pilot relay schemes) failed to operate as intended. If this assumption is incorrect, please clarify.
Response: The drafting team thanks you for your comments. The composite Protection System is the collective operation of the entire Protection System for an Element which is included in determining whether a Misoperation occurred. To clarify the usage of the terminology, the drafting team is proposing the definition "Composite Protection System" which has an exclusion for backup protection provided by a remote Protection System. Change made.		
Texas Reliability Entity	No	The first paragraph of the Guidelines and Technical Basis defines the composite protection system to include the backup protection. This needs to be clearly defined as "local backup" only and not to include remote backup protection.
Response: The drafting team thanks you for your comments. The composite Protection System is the collective operation of the entire Protection System for an Element which is included in determining whether a Misoperation occurred. To clarify the usage of the terminology, the drafting team is proposing the definition "Composite Protection System" which has an exclusion for backup protection provided by a remote Protection System. Change made.		
Tennessee Valley Authority	No	The PRC-004-3 requirements' rationale for each requirement (gray boxes next to each requirement) and the Guidelines and Technical Basis (at the end of the document) are well thought out and contain significant justification and logic for each standard requirement. Recommend either keeping this information attached to the standard or formalizing it into a reference document that will will be easily accessible to the electric power industry. There was no indication in the draft standard as to the repository of this significant information.
Response: The drafting team thanks you for your comment. The rationale boxes will be moved to the Application Guidelines portion of the standard upon industry approval and remains with the standard. No change made.		
Madison Gas and Electric Company	No	Under R4 there is confusion when the words "complete" is used. It should be stated (here and in the requirement) that an entity can extend the 180 days to complete if they have supporting documentation, i.e., parts on order, work orders, etc.

Organization	Yes or No	Question 4 Comment
Response: The drafting team thanks you for your comment. The Application Guidelines have been clarified not to infer the implementation of the CAP must be completed in 180 days (See draft 3, page 20 "…and requires the CAP implementation be less than 180 days."). The CAP has its own timetable which is required to be updated by the entity when actions or timetables change. Change made.		
Colorado Springs Utilities	No

City of Tallahassee - Electric Utility	No	

Organization	Yes or No	Question 4 Comment
Hydro-Québec Procution	No	
Public Service Company of New Mexico	No	
ITC Holdings	Yes	We have no issues with the guidelines, provided there is clarification that the guidelines are not to be used to support audit data request or findings.
Response: The drafting team thanks you for your comment. The Measures are used to support performance with the Requirements. The Application Guidelines are not enforceable. No change made.		
SERC Protection and Controls Subcommittee	Yes	1) Unknown / unexplainable is the 'cause' of about 12% of Misoperations per NERC reports. An R3 'no further action' declaration example would be helpful. Perhaps your 'no action plan' declaration example on page 23 was intended for this. If so, please so state there. **Response:** In the Application Guidelines, see the last paragraph of the section Requirement R5 (previously R3) which notes a declaration that no further corrective actions will be taken is expected to be used sparingly. No change made. 2) Please replace 'reverse power' with 'overexcitation' on page 15 in the failure to operate for a non-fault condition section. Reverse power relays are usually excluded so the example is confusing as is. **Response:** The Application Guidelines (Failure to Trip – Other Than Fault) have been clarified. Example 2b replaced "reverse power" with "over excitation." Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
City of Austin dba Austin Energy	Yes	Austin Energy (AE) recommends the following changes in the Guidelines and Technical Basis section: (1) Remove the reference of reverse power relaying from item #2. This reference can

Organization	Yes or No	Question 4 Comment
		be confusing because the protection scheme is used for safe shutdown of a generating unit. A substitute example would be "A failure of a "primary" loss of field relay is not a failure to trip Misoperation as long as another component of the generator's composite Protection System opertated to shut down the generator." **Response:** The Application Guidelines (Failure to Trip – Other Than Fault) have been clarified. Example 2b replaced "reverse power" with "over excitation." Change made. (2) References to generator Protection Systems that are exempt should be removed and placed in the opening section similar to the exclusions used to exempt circuit breaker and other interrupting device mechanisms. AE believes this would clarify what relay systems are excluded before reading the parts of the definition and requirements. **Response:** The Application Guidelines have been revised for clarity by grouping topics. See the heading "Special Cases." Change made. (3) The second paragraph on page 26 of the redline, which reads "With the ultimate goal of keeping the implementation time of a CAP as short as possible, if a cause of a Misoperation is determined quickly the CAP creation timeframe (60 days) becomes applicable and requires the CAP implementation be less than 180 days" is not consistent with the Standard Requirements and should be removed. The standard requires CAP development within 180 days, not CAP implementation or completion in 180 days. **Response:** The Application Guidelines have been clarified not to infer the implementation of the CAP must be completed in 180 days (See draft 3, page 20 "…and requires the CAP implementation be less than 180 days."). The CAP has its own timetable which is required to be updated by the entity when actions or timetables change. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
Exelon Corporation and it's	Yes	Exelon would like additional clarification added to the Application Guide regarding the inclusion of CAP corrective actions for addressing the application of the CAP to other

Organization	Yes or No	Question 4 Comment
affiliates		Protection Systems owned by the utility. Specifically, the Guide should address that such a CAP can be considered complete once a program (required to address application of the CAP to other Protection Systems) is developed. Example 2 in the Application Guide exemplifies this notion. Additionally, application of the CAP to other Protection Systems owned by the utility should be considered fulfilled if an existing program (such as Protection System maintenance and testing practices) fulfill the actions necessary to address such a CAP.
Response: The drafting team thanks you for your comment. Examples have been provided in the Application Guidelines to illustrate the evaluation of the entity's other Protection Systems including other locations within the CAP. The CAP is not complete until all actions in the CAP are satisfied. An entity may create an action within a CAP in which it states that a program outside the CAP will be used to address similar issues at other locations. In this case the CAP is not declared complete until the program is developed. See Example R6b in the Application Guidelines. Change made.		
Pepco Holdings Inc & Affiliates	Yes	On page 18 of the Guidelines and Technical Basis section it states "Requirement R1 places the responsibility on the BES interrupting device owner to investigate operations initiated by a Protection System. The drafting team believes the owner of the BES interrupting device that operated would be in the best position to analyze the Protection System Operation, determine if a Misoperation occurred, and perform the initial investigation to determine the cause of the Misoperation." Furthermore, on page 19 it states "Regardless of whether a cause is identified, the BES interrupting device owner must document the investigation ..."Based on the arguments presented in our response to Question 2 we vigorously disagree with this assertion. When a Protective System operates, a means is provided to determine which protective component initiated the trip (i.e., relay targets, lockout relay operations, microprocessor relay event logs, etc.) The owners of these Protective System devices, which initiated the trip of the interruption device, are much better suited to investigate the cause of the Protective System operation than the owners of the interrupting device. In addition, all previously approved versions of PRC-004 rightly place the responsibility for reviewing and analyzing Protective System operations on the owners

Organization	Yes or No	Question 4 Comment
		of the Protective Systems, not the owners of the interrupting device. The interrupting device is, by definition, not even a component of a Protective System. We agree that if the owner of the relay that initiated the trip does not own all the remaining components of the associated Protection System (i.e., CTs or VT's) they may require assistance and support from the owners of those additional components to complete their analysis. However, the owner of the Protective System that initiated the trip should be the party responsible for analyzing if a protective system misoperation occurred. If in the course of that investigation they determine the cause was attributed to a component of the Protection System which they did not own (such as a blown VT fuse owned by others), they should notify the other party, who would in turn be responsible for appropriate corrective action. In conclusion, nowhere in this standard should compliance responsibility be assigned to the owner of an interrupting device.
Response: The drafting team thanks you for your comment. According to definition of Protection System which became effective April 1, 2013, the BES interrupting device owner owns a component of the Protection System, namely the trip coil(s) of that BES interrupting device (at a minimum). The BES interrupting device owner is in the best position to be aware of the operation and to initiate the identification of any Misoperation. In the case where the relays or other Protection System component(s) are owned by another entity, that owner may not know of the operation until it receives notification from the BES interrupting device owner. Requirement R1 was revised to bring clarity to the obligations of each applicable entity. Change made.		
Rayburn Country Electric Cooperative	Yes	Prefer the term "entire" to "composite" again for clarity sake since entire seems more intuitive in nature rather than composite which requires some anylitical thought to apply it. Example, a transformers entire protection system is slow to operate. Versus, a transformers composite protection system is slow to operate.
Response: The drafting team thanks you for your suggestion. The drafting team is proposing a definition for the term "Composite Protection System." Change made.		
Duke Energy	Yes	See our comment above on Question #1. The following paragraph should be deleted

Organization	Yes or No	Question 4 Comment
		from the accompanying Guidelines and Technical Basis section: “The reference to the TPL standards is meant to place some bounds on the time to clear a Fault and prevent dynamic instability. The performance requirements in the TPL standards are found in Table 1, and are applicable to all contingencies mentioned for Type A, B and C contingencies.”
Response: The drafting team thanks you for your comments. The reference to the TPL standards in both the Misoperation definition and body of the standard has been removed. Change made.		
Southern Company - Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Mississippi Power Company; Gulf Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	Yes	Southern Company supports the SERC comments and are including the following additional comments: 1. In various locations of the text, Protection System misoperations are discounted as misoperations for situations where other redundant protection may have adequately operated. In these instances, perhaps the classification should be changed to non-reportable misopeartion rather than simply that they are not misoperations (we believe that they are still misoperations). We believe that entities should be allowed to determine whether or not the Protection System operated appropriately. This is inherent in our suggested simpler definition of Misoperation through including "than intended". **Response:** The composite Protection System is the collective operation of the entire Protection System for an Element which is included in determining whether a Misoperation occurred. To clarify the usage of the terminology, the drafting team is proposing the definition “Composite Protection System” which has an exclusion for backup protection provided by a remote Protection System. Change made. 2. In the text for section 6 of the Misoperation definition, we disagree with the phrase "An operation that occurs during a non-fault condition but was initiated by on-site maintenance, testing, inspetion, construction or commissioning is not a Misoperation." This is obviously an unnecessary trip - other than fault. This should be included in a list of non-reportable misoperations.

Organization	Yes or No	Question 4 Comment
		Response: The on-site maintenance exception in the Misoperation definition, Unnecessary Trip – Other Than Fault (category 6) was added during the draft 2 development of the standard based on industry comment. An operation due to on-site maintenance would not be a Misoperation; therefore, not reportable. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.		
Nebraska Public Power District	Yes	The drafting team should review the BES Definition drafting team documents and evaluated how it relates to misoperations. It would be desirable to avoid any disconnects or conflicts between these definitions and standards. Some BES Definition drafting team documents indicate individual wind turbine generators are part of the BES. Is misoperation data desired down to this level? During Webinars explaining the BES definition documentation questions were asked regarding how the BES documentation helps identify or determine what protection systems are included for PRC-005. The BES drafting team stated that protections systems for PRC-005 are not to be defined by the equipment identified in the BES definitions documentation but instead are to be defined the PRC-005 standard and documentation. Would this be the case for PRC-004-3 as well?
Response: The drafting team thanks you for your comment. This standard applies to Protection Systems for BES Elements in achieving its goal to identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements. Entities will apply the BES definition to determine applicability to its Protection Systems. No change made.		
Midwest Reliability Organization NERC Standards Review Forum (NSRF)	Yes	The NSRF appreciates the addition of the Application Guide at the end of the Standard. The Application Guide will help NERC, the Regional Entities and Registered Entities to move away from a zero defact CMEP process.
Response: The drafting team thanks you for your comment.		
PPL NERC Registered Entities	Yes	The standard should completely exclude operation of reverse power relays when

Organization	Yes or No	Question 4 Comment
		shutting-down units, or (better) classify such devices as not being part of Protection Systems (they do not protect BES equipment; they prevent turbine mechanical damage). This subject is discussed in the Application Guidelines (p.17), but the distinction attempted between control and protection functions of reverse power relays is obscure.
Response: The drafting team thanks you for your comment. According to the IEEE Guide for AC Generator Protection (C37.102-2006), Section 4.5.5 (Motoring), sub-section 4.5.5.6 (Tripping mode), "Primary motoring protection is provided by reverse power relays for all unit types." Reverse power relays, by definition, are a Protection System and cannot be categorically excluded. Because reverse power relays provide motoring protection, the drafting team has provided an exclusion in the Applicability of the standard. Also, this exclusion is clarified in the Application Guidelines concerning the relay's use as a control function for shutting down a unit and as anti-motoring protective protection for a generating unit. Change made.		
Essential Power, LLC	Yes	The standard should completely exclude operation of reverse power relays when shutting-down units, or (better) classify such devices as not being part of Protection Systems (they do not protect BES equipment; they prevent turbine mechanical damage). This subject is discussed in the Application Guidelines (p.17), but the distinction attempted between control and protection functions of reverse power relays is obscure.
Response: The drafting team thanks you for your comment. According to the IEEE Guide for AC Generator Protection (C37.102-2006), Section 4.5.5 (Motoring), sub-section 4.5.5.6 (Tripping mode), "Primary motoring protection is provided by reverse power relays for all unit types." Reverse power relays, by definition, are a Protection System and cannot be categorically excluded. Because reverse power relays provide motoring protection, the drafting team has provided an exclusion in the Applicability of the standard. Also, this exclusion is clarified in the Application Guidelines concerning the relay's use as a control function for shutting down a unit and as anti-motoring protective protection for a generating unit. Change made.		
Cogentrix Energy Power Management, LLC	Yes	The standard should completely exclude operation of reverse power relays when shutting-down units, or (better) classify such devices as not being part of Protection Systems (they do not protect BES equipment; they prevent turbine mechanical damage). This subject is discussed in the Application Guidelines (p.17), but the

Organization	Yes or No	Question 4 Comment
		distinction attempted between control and protection functions of reverse power relays is obscure.
Response: The drafting team thanks you for your comment. According to the IEEE Guide for AC Generator Protection (C37.102-2006), Section 4.5.5 (Motoring), sub-section 4.5.5.6 (Tripping mode), "Primary motoring protection is provided by reverse power relays for all unit types." Reverse power relays, by definition, are a Protection System and cannot be categorically excluded. Because reverse power relays provide motoring protection, the drafting team has provided an exclusion in the Applicability of the standard. Also, this exclusion is clarified in the Application Guidelines concerning the relay's use as a control function for shutting down a unit and as anti-motoring protective protection for a generating unit. Change made.		
Kansas City Power & Light	Yes	There are some examples of CAP in the document. Adding examples relative to my comment in question 5 would be beneficial.
Response: The drafting team thanks you for your comments. The comment in Question 5 ("Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability…") contains an example and discussion that was previously addressed in the Application Guidelines under Requirement R2 in the last paragraphs. No change made.		
Luminant Power	Yes	Luminant recommends the following changes in the Guideleins and Technical Basis section. 1) Remove the reference of reverse power relaying from item #2. This reference can be confusing since the protection scheme is used for safe shutdown of a generating unit. An substitute example would be "A failure of a "primary" loss of field relay is not a failure to trip Misoperation as long as another component of the generator's composite Protection System opertated to shut down the generator." **Response:** Change made. 2) References to generator Protection Systems that are exempt should be removed and placed in the opening section similar to the exclusions used to exempt circuit breaker and other interrupting device mechanisms. Luminant believes that this would clarify what relay systems are excluded before reading the parts of the definition and

Organization	Yes or No	Question 4 Comment
		requirements. **Response:** A section called "Special Cases" has been added to the Application Guidelines. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.

seattle city light	Yes	
American Transmission Company, LLC	Yes	
Ameren	Yes	
Flathead Electric Cooperative, Inc.	Yes	
Independent Electricity System Operator	Yes	
Oncor Electric Delivery Company LLC	Yes	

5. If you have any other comments on this Standard that you haven't already mentioned above, please provide them here:

Summary Consideration:

The following resulted in a revision to the proposed standard. Many of the comments here were also summarized above. These are the most significant comment themes that resulted in a change to the proposed standard. They are summarized here and may be duplicative of other summaries:

At least another five comments supported by about 17 individuals raised questions concerning the action plan of investigative actions. Requirement R1 now includes identification of Misoperation and determination of a cause. If a cause is not readily apparent, further investigative actions may be undertaken (Requirement R4) until a cause is determined or a declaration of no cause can be determined. The concept of an action plan has been eliminated from the standard.

About five comments supported by ten stakeholders requested clarity concerning time periods or Protection System owner's responsibilities. The result was that the drafting team revised Requirement R1 to provide clarity on each Protection System owners' responsibilities following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components, time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation.

Approximately two comments represented by 17 individuals raised questions concerning the data request. The NERC Rules of Procedure, Section 1600 Request for Information or Data (i.e., Data Request) will dictate the specific entity (i.e., Protection System component owner) that is to report a Misoperation and the format for reporting. Reporting under the standard will end.

At least two comments supported by about 13 individuals asked for clarification on the use of "BES interrupting device." The drafting team has clarified the use in the standard's Application Guidelines under the "Definitions" section.

The following did not result in a change to the proposed standard. This next summary lists the most significant themes of these comments that did not result in a change to the proposed standard. They are summarized here and may be duplicative of other summaries:

Approximately seven comments supported by 26 stakeholders addressed the topic of internal controls. The drafting team continues to support the proposed standard as currently structured. The draft requirements allow Compliance Enforcement Authority (CEA) to take into account use of internal controls in connection with monitoring activities. However, internal controls are only a mechanism to help auditors determine the depth and breadth of testing as it pertains to compliance with the related

Reliability Standard and specific requirements and when necessary understand the facts and circumstances of instances of potential non-compliance. How any possible violations may be treated is outside of the scope of the project and reserved to the enforcement process.

About three comments representing at least 22 individuals mentioned having a Reliability Standard Audit Worksheet (RSAW). The drafting team anticipates posting a draft PRC-004-3 RSAW so that entities will have an opportunity to consider auditing approaches. Posting is expected mid-way through the draft 4 posting of PRC-004-3.

At least four comments supported by 13 stakeholders requested clarity about the Corrective Action Plan (CAP). The drafting team noted that the NERC Glossary definition of Corrective Action Plan includes the phrase “remedy a specific problem”. In the context of this standard, the “problem” is the cause a Misoperation. Mitigating actions may be included as a part of the CAP.

About four comments supported by at least ten individuals suggested alternatives to make the standard less burdensome using metrics. One of the objectives of this project is to bring consistency to metrics through the Section 1600 data request. In conjunction with data reporting, the proposed definition of Misoperation will improve identifying the appropriate category of Misoperation. The drafting team agrees that a results-based approach using metrics could simplify the standard and reduce compliance burdens; however, it may take several years of data collection to develop consistent and meaningful metrics for measure performance.

Two comments were concerned about the slow trip category of the Misoperation definition as it pertains to having the ability to measure a slow operation. This includes having Disturbance Monitoring Equipment (DME) and the compliance approach.

The remaining comments were individual in nature; please see the individual comments for detail.

Organization	Question 5 Comment
City of Austin dba Austin Energy	(1) For events where a BES breaker operates but the Registered Entity does not own all of the Protection Systems, it is possible the other owner would not be notified until 120 days has elapsed. This is counter the the expectation of the drafting team that “it is expected that both entities will work together to investigate the cause of the operation.” Austin Energy (AE) recommends re-writing the bullets of R1 to require notification within a set number of days (AE recommends 15 calendar days) and then require the entities to work together as necessary. AE provides language revisions for

Organization	Question 5 Comment
	consideration: R1.1. Within 120 calendar days of a BES interrupting device operation in its Facility caused by a Protection System operation, identify and review each Protection System operation. --If the entity owns both the BES interrupting device and the Protection System, determine if it was a correct operation or a Misoperation. --If the entity owns the BES interrupting device but does not own all of the Protection System and cannot determine that the Protection System operation was correct, notify the other owner(s) of the Protection System component(s) within 15 calendar days. --The BES interrupting device and Protection System component owner(s) notified by the BES interrupting device owner shall work together to determine if there was a correct operation or a Misoperation of their component. **Response:** Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made. (2) By using the definition of a Corrective Action Plan (CAP) in the NERC Glossary of terms, it is unclear what differences exist between a CAP and an Action Plan in the standard. They may appear to be the same. AE believes the intent of the action plan is to document an investigation plan, so recommends that additional language be added to the Rationale box for R2 that describes the intent of a CAP (as Corrective Action to avoid future recurrance) and an action plan as an investigation or other non-Corrective plan of action to investigate the cause of a misoperation or to determine if a misoperation has occured.

Organization	Question 5 Comment
	Response: Action plan has been removed from the Standard and replaced with investigative actions in R4. CAP development is covered by Requirement R5 and CAP implementation by Requirement R6. Change made. (3) AE appreciates the efforts of the Standard Drafting Team and supports the goal of keeping the misoperation identification and correction processes as short as possible. There can be cases where extra time is necessary and the entire process may take longer than 180 days. The Standard allows for these extreme cases as written, assuming an action plan allows for the additional investigation of an operation or misoperation. For instance, if the cause of a misoperation cannot be identified, the entity may create an action plan to further research/analyze the cause (possibly the entity must ship equipment back to the OEM for cause determination). Once the cause is identified, then the Corrective Action Plan must be developed within 60 days. AE recognizes, and agrees with the Standard Drafting Team's intent to ensure active analysis and appropriate corrective actions are adequately considered and/or implemented. Although it is likely there is sufficient time to analyze operations, identify misoperations and take corrective action for most events within the standard as written, there is a significant administrative burden involved to demonstrate action plans and/or corrective action plans are developed within the proper timelines. Therefore, although AE believes the timelines are workable as written, AE provides the following alternative recommendation. Remove all of the required timelines and instead require the investigation/action plans and Corrective Action Plans only. These action plans and Corrective Action Plans contain timelines that must be followed by their very nature. **Response:** The timelines within the standard provide the entity a period of time from the BES interrupting device operation to identify any potential Misoperation and its cause. For cases where an entity needs to perform additional investigation beyond 120 calendar days, the drafting team added a proposed Requirement R4 which provides the entity a mechanism to continue investigative actions by documenting its progress within established periods. The owner of the Protection System components that Misoperated has the ability to establish its own timetables within each CAP. The

Organization	Question 5 Comment
	requirements and associated timeframes ensure that the responsible entities are diligent about Misoperation identification, determining the cause, and the development and implementation of the CAP. The associated dates and timetables allow the Requirements to be measurable. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Ameren	(1) Please clarify the sentence on page 17, the second to last paragraph, "Protection System operations unrelated to on-site maintenance, testing, inspection, construction or commissioning activities which occur with the protected Element out of service, that trip any in-service Elements are Misoperations" by putting it in a new paragraph and including some examples. Does the protected Element have to be out of service? Is this intended to include human error (e.g. bumping the panel) caused trips by personnel other than Protection System maintenance personnel? **Response:** It is important to emphasize that the maintenance exclusion is for active maintenance. A remote-end trip is included in the existing exclusion if it resulted from “on-site” activities at a different location. The Application Guidelines have also been enhanced with an example (6d) related to this topic. Change made. An example of an “Element out of service” would be a breaker that is switched out of service with the breaker disconnects open. If the breaker failure scheme operates due to a problem with the scheme, several in-service Elements could be tripped. No change made. (2) Please add "completed" on page 20, near the bottom, so that the title reads " The following are examples of completed Corrective Action Plans (CAPs):" **Response:** The word “completed” was incorporated into the text discussing the completed CAPs. See the examples under Requirement R6 in the Application Guidelines. Change made. (3) In addition to our comments, we also agree with the SERC Protection & Control

Organization	Question 5 Comment
	Subcommittee (PCS) comments and include them by reference. **Response:** Please see the response to the SERC Protection & Control Subcommittee (PCS).
Response: The drafting team thanks you for your comments; please see the above responses.	
ACES Standard Collaborators	(1) We recommend introducing the term "BES interrupting device" as a new definition with clearly defined parameters. **Response:** The use of "BES interrupting device" has been clarified in the standard's Application Guidelines under the "Definitions" section. Change made. (2) We would like more information on the Section 1600 data request for Misoperation data. Also, if a data request is going to be utilized, will registered entities still need to continue reporting under PRC-004-2? This would be a redundant process and we encourage NERC to coordinate the timing of the data request to take the place of the current reporting requirements. **Response:** The NERC Rules of Procedure, Section 1600 Request for Information or Data (i.e., Data Request) will dictate the specific entity (i.e., Protection System component owner) that is to report a Misoperation and the format for reporting. Reporting under the standard will end. No change made. Further, we disagree with the evidence retention section of this standard. TO, GO, and DP are audited on a six-year cycle, which is too long of a timeframe to retain evidence. We suggest shortening the amount of time to three years, unless there is an open or ongoing investigation, action plan, or CAP. If there is a section 1600 data request, why does the data need to be retained? NERC already has the information. **Response:** The Evidence Retention section has been revised using the Drafting Team Guidelines guidance for evidence retention that was endorsed by the Standards Committee, April 2009. All requirements have been reduced to 12 calendar months as the minimum retention period according to standard drafting guidelines. Change made.

Organization	Question 5 Comment
	The drafting team removed the reporting obligations from the standard and is working with NERC staff to develop a data request under Section 1600 of the NERC Rules of Procedure. The drafting team notes that the standard and data request have been developed in a manner such that evidence used for compliance of the standard and data request are intended to be independent of each other. The 1600 data request does not eliminate the need to retain PRC-004 data. The data request will be submitted for approval at the time the revised standard is submitted. Data retention is included as part of the standard because it is essential for auditing compliance with the standard. No change made. (3) This standard is another candidate for implementing internal controls, and should not contain “zero-defect” language. For example, an entity should be able to have controls in place to determine whether Misoperations are being identified, assessed and corrected. This is the essence of PRC-004-3, and therefore should be revised to include these concepts. There should not be zero-defect penalties if an entity has controls to catch errors and fix them. Currently, the standard would penalize an entity for each instance of noncompliance. **Response:** The drafting team continues to support the proposed standard as currently structured. The draft requirements allow Compliance Enforcement Authorities to take into account use of internal controls in connection with monitoring activities. However, internal controls are only a mechanism to help auditors determine the depth and breadth of testing as it pertains to compliance with the related Reliability Standard and specific requirements and when necessary understand the facts and circumstances of instances of potential non-compliance. How any possible violations may be treated is outside of the scope of the project and reserved to the enforcement process. No change made. (4) We continue to be confused by the interaction of Requirements R1 and R3. While R1 does not compel the protective relay owner to identify the cause of a Misoperation, it does compel the owner to investigate the Misoperation. One would presume an auditor would expect investigative actions conducted for Requirement R1 to be

Organization	Question 5 Comment
	reasonable. However the application guidelines section for Requirement R3 states clearly on page 14 that this requirement only applies if "reasonable investigative actions have not been exhausted". Thus, it would appear that Requirement R3 could never apply without a violation of Requirement R1 Part 1.2. We think the interaction of these requirements need further clarification. Furthermore, we suggest that Requirement R3 could actually be made part of Requirement R1 which would help alleviate the confusion. For example, Part 1.2 could have a subpart that states that an action plan should be developed for any reasonable investigative actions that may require more than 120 days to complete. Another part could be to document why the cause cannot be identified. **Response:** This has been clarified by the new Requirement R1 (and R3) that requires the identification of Misoperation which is typically when the entity will determine the cause. If a cause is not identified, further investigative actions must be taken (see new Requirement R4) until a cause is determined or a declaration of no cause is made. The concept of an action plan has been eliminated from the standard. Change made. (5) Since UVLS is specifically excluded in the applicability section does it make sense to include it under voltage conditions in part 2 and 4 of the Misoperation definition? **Response:** There are other Protection Systems that trip for undervoltage conditions besides UVLS. No change made. (6) Why can't the implementation requirement R4 be included as a Part of the other requirements? Furthermore, it is questionable if it is even needed for FERC has stated in past orders that there is an implied obligation to implement plans, policies and procedures when a requirement compels their development. This requirement is similar to the types of standards that would be subject to Paragraph 81. **Response:** Placing the implementation in a separate requirement makes it more visible and makes it a separate compliance element. No change made. (7) Thank you for the opportunity to comment.

Organization	Question 5 Comment
	Response: Thank you for your comments.
Response: The drafting team thanks you for your comments; please see the above responses.	
Madison Gas and Electric Company	: (1) As written in R1.1, if a BES generator's normal shut down cycle is caused by a Protection System operation (a set trip point in the relay) then each shut down would be required to be "identified and reviewed". This is similar to issues that a generator operator has under Project 2011-INT-02 AVR control during start up and shut down. MGE recommends that either a footnote be provided to address the exclusion of normal shut down processes or add another bullet excluding a generators normal shut down processes where the unit's breaker is activated via a set point within the Protection System (i.e., relay). **Response:** The drafting team has provided additional detail concerning the use of protection and control functions for generators in the Application Guidelines regarding reverse power relays. The proposed standard's Applicability excludes certain intended uses of protection functions as control functions. Change made. (2) R4 could be viewed as allowing for CAPs to be extended beyond 180 days (the maximum days in the combonation of R1 and R2). If this is the intent of the SDT, then clearly state this within the requirement. As written, an entity could be in violation of the maximum time frame of 180 days by extending the CAP under R4. **Response:** The Application Guidelines have been clarified not to infer the implementation of the CAP must be completed in 180 days (See draft 3, page 20 "…and requires the CAP implementation be less than 180 days."). The CAP has its own timetable which is required to be updated by the entity when actions or timetables change. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Dominion	: (1) Suggest the Implementation Plan be modified under the Applicaibility section as

Organization	Question 5 Comment
	indicated below: This standard applies to the following Facilities: Protection Systems for BES Elements. Underfrequency Load Shedding (UFLS) that trips a BES Element This standard does not apply to the following Facilities: The flowing Special Protection Systems (SPS), Remedial Action Schemes (RAS), and Undervoltage Load Shedding (UVLS) Non-protective functions that may be imbedded within a Protection System **Response:** The exclusion language concerning SPS and RAS in the previous posting has been removed from the Applicability and added to the rationale. Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are not included in this version of the standard because they will be handled in the second phase of this project. UVLS is covered by PRC-022-1 under Project 2008-02 – Undervoltage Load Shedding. Change made. (2)Suggest the Mapping Document be modified under the Proposed Language in PRC-004-3 column as indicated below: 4.2.1 Protection Systems for BES Facilities, Facilities needs to be replaced with Elements. **Response:** The mapping document has been corrected to be consistent with the standard. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
SERC Protection and Controls Subcommittee	(1) Some entities presently use their PRC-004 reporting as a means of documenting CAPs. They may prefer to use your proposed data request under Section 1600 of the NERC Rules of Procedure for these purposes. Please change page 5 wording to “The data submitted as part of the data request will not be used by NERC or the Regions for compliance or enforcement purposes.” **Response:** The sentence, “The data submitted as part of the data request will not be used for compliance or enforcement purposes” has been removed because the drafting

Organization	Question 5 Comment
	team does not have this authority. The drafting team notes that the standard and data request have been developed in a manner such that evidence used for compliance of the standard and data request are intended to be independent of each other. Change made. (2) Compliance section 1.2 on page 9 states "The Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System shall keep data or evidence to show compliance with Requirements R1, R2, R3, and R4 and Measures M1, M2, M3, and M4, since the last audit unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation." Please delete "and Measures M1, M2, M3, and M4" because entities must comply with Requirements, but Measures are not allowed to expand that scope. **Response:** The reference to each Measure under Section 1.2 – Evidence Retention is consistent with the standard drafting guidelines. No change made. (3) In the first sentence of R2 on page 7, please add "first" before "cause" so it reads "Each Transmission Owner, Generator Owner, or Distribution Provider shall, within 60 calendar days of identifying the first cause of each Misoperation: ..." Pages 19 and 20 make it clear that this is triggered by the first cause, but some entities may miss this application guidance. **Response:** The word "first" has been included. Change made. (4) Please include 'Composite Protection System' as a defined term that remains with this standard (similar to PRC-005-2 approach for Component, Component Type, etc.). Your definition on page 14 is fine, but move it up to just after the page 3 Definitions. Regarding commments for all questions 1-5 above: **Response:** The composite Protection System is the collective operation of the entire Protection System for an Element which is included in determining whether a Misoperation occurred. To clarify the usage of the terminology, the drafting team is proposing the definition "Composite Protection System" which has an exclusion for backup protection provided by a remote Protection System. Change made.

Organization	Question 5 Comment
	The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Protection and Control Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.
Response: The drafting team thanks you for your comments; please see the above responses.	
Seminole Electric	1. The Proposed PRC-004-3 combines PRC-004-2a and PRC-003-1. This project is applicable to a "Distribution Provider" whereas PRC-004-2a is applicable to a "Distribution Provider that owns a transmission Protection System." Does the STD believe that the additional caveat should be added to the Distribution Provider (DP) applicability, i.e., that the DP need to own a transmission Protection System? **Response:** Applicability 4.2.1 specifies that PRC-004-3 is applicable to Protection Systems for BES Elements; therefore, the reference is not necessary. No change made. 2. In the "Purpose/Industry Need" section that the STD developed for this Project, the STD states that because PRC-003-1 was never approved by the Commission, "there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2... This could lead to a potential reliability gap." (Emphasis added). This infers that there is a need for some form of standardized regional mitigation requirements. When NERC drafted PRC-003-1, NERC made RROs the applicable entity in order for each RRO to "establish, document and maintain is procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations." (See R1. of PRC-003-1). However, in the proposed action, PRC-004-3 does not appear to require any such regional processes for misoperations mitigation. In fact, the new proposed Standard is not even applicable to RRO as the new standard does not require the RRO to perform any action. It does not appear that the new draft Standard mitigates the deficiency left by the non-approval of PRC-003-1 and so this should be addressed via the addition of some form of regional analysis requirement. **Response:** This standard or any NERC Reliability Standard cannot place any requirements on the Regional Entity. The proposed PRC-004-3 standard addresses

Organization	Question 5 Comment
	mitigation through the development of the CAP to correct the cause(s) of Misoperations. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
ReliabilityFirst	Although this draft of the standard is considered a Results-Based Standard it is difficult to see how the requirements are written to achieve a measurable outcome associated with reaching a level of reliability performance, a reduction in reliability risk or a necessary level of competency. This draft standard instead appears to be administrative in nature that is more concerned with creating documentation solely for compliance purposes. The following are specific issues or suggestions: 1) the standard contains extra 120 day and 60 day deadlines that do not provide reliability benefit. Although there is value in investigating Misoperations quickly, it is more important to fix the problem and prevent its reoccurrence. **Response:** Identifying Protection System Misoperations then determining and rectifying their causes will improve reliability. The time frames stated within the standard are maximum times, not minimum. An entity should resolve Misoperations as quickly as possible. However, due to the possibility of seasonal peaks in operations it was deemed necessary to provide for ample time to review large numbers of operations and schedule the outages sometimes necessary for investigations. No change made. 2) Late identification of Misoperations will be a violation even if they are not particularly significant. Specifically, Misoperations that occur with no Fault present may not be readily apparent. The deadlines in the standard could cause disincentives to fully investigate Protection System performance because it may result in compliance violations. **Response:** Prompt identification of a Misoperation is important regardless of its perceived significance. Identifying a Misoperation and its cause(s) leads to preventing reoccurrence which, without correction, could lead to a reduction in reliability. Additionally, the identification of a Misoperation cause leads the entity to considering

Organization	Question 5 Comment
	its other Protection Systems including other locations which may result in identifying and correcting a potential problem with another Protection System which may be significant to reliability. The standard provides options for entities to explain why actions were not taken. No change made. **Response:** Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made. 3) The standard provides no means of ensuring that Misoperations are addressed by CAPs on a timely basis. Of particular concern is failure to trip (- during Fault) type Misoperations. The cause for this type of Misoperation should be either mitigated or the CAP completed in less 12 months. **Response:** The scope of a CAP can vary greatly depending on whether the entity chooses to implement a CAP to correct a single cause or multiple causes (e.g., including other locations); therefore, the risk prioritization and timetable to complete the CAP is at the discretion of the entity. No change made. 4) It is suggested that the drafting team embrace a reliability performance based approach that would fit into the results-based philosophy. Specifically, adherence to the standard should be based on achieving or surpassing certain metrics such as Misoperation rate, the percent of causes unidentified (Unknowns/All in a year) and the percentage of open CAPs (Open CAPS/Misoperations in a year). These metrics are meant only as potential examples for measuring performance. By requiring certain levels of performance or continuous improvement in these metrics, then the goal of the standard can be met without the administrative burden of tracking relatively unimportant dates such as when a cause was identified or when a CAP was developed

Organization	Question 5 Comment
	and the storage of large volumes of evidence records. **Response:** One of the objectives of this project is to bring consistency to metrics through the Section 1600 data request. In conjunction with data reporting, the proposed definition of Misoperation will improve identifying the appropriate category of Misoperation. The drafting team agrees that a results-based approach using metrics could simplify the standard and reduce compliance burdens; however, it may take several years of data collection to develop consistent and meaningful metrics for measure performance. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Colorado Springs Utilities	As noted in the response regarding R1. We believe that the specific terms need to be clarified in R3 as well to clarify the intended scope of covered situations.
Response: The drafting team thanks you for your comments. The occurrences of “BES Protection System” have been revised to pertain to “Protection Systems for BES Elements.” The use of “BES interrupting device” has been clarified in the standard’s Application Guidelines. Change made.	
Manitoba Hydro	Background - The words 'by requiring applicable entities to' would make sense after the words "The proposed requirements of the revised Reliability Standard PRC-004-3 meets the following objectives". Moreover, the terms Special Protection Systems, Remedial Action Schemes and Under-Voltage Load Shedding are used at the end of the Background section when these terms have already had acronyms attached to them above. **Response:** The suggested change does not provide any additional clarity. No change made. R2 - the words 'If a cause is identified' after the words 'cause(s) of each Misoperation' would be helpful. The way It reads, R2 is only applicable if a cause is identified and R3 is applicable if a cause if not identified so the Measures for each should be drafted in a

Organization	Question 5 Comment
	way that makes that point clear. **Response:** This has been clarified by the new Requirement R1 (and R3) that requires the identification of Misoperation which is typically when the entity will determine the cause. If a cause is not identified, further investigative actions must be taken (see new Requirement R4) until a cause is determined or a declaration of no cause is made. The concept of an action plan has been eliminated from the standard. Change made. R3 - the words 'caused by a Protection System operation' should be added after BES interrupting device operation to make the wording consistent with the other requirements. **Response:** The phrase "caused by a Protection System operation " is only used in Requirement R1 when determining if a Protection System Misoperation has occurred. Once a Protection System Misoperation has been identified, an associated Protection System does not need to be restated in the requirements. The concept of an action plan (previously R3) has been eliminated from the standard. Change made. R4 - In reading the rationale for R4, it states that if a cause of a Misoperation is determined when implementing the action plan, you go back to R2 and develop a CAP. This isn't evident on the face on the wording of the standard and the Rationale will be deleted going forward. R4/M4 - should be consistent with use of 'and' or 'or' when referring to the CAP and action plan, perhaps best option is to use 'and/or'. **Response:** The rationale boxes will be moved to the Application Guidelines portion of the standard upon industry approval and remains with the standard. No change made. The concept of an action plan has been eliminated from the standard. Change made. Compliance - 1.1 - Manitoba Hydro has never before seen a reference to the definition of CEA per the NERC Rules of Procedure in this section, it seems unnecessary. **Response:** This is standardized text established by NERC for a Reliability Standard. No change made. Compliance - the phrase BES Protection System is elsewhere referred to as Protection

Organization	Question 5 Comment
	System for Facilities that are part of the BES which seems more accurate and should be consistently used. **Response:** The drafting team revised all the associated documents to reflect "Protection Systems for BES Elements." Change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Oncor Electric Delivery Company LLC	By using the definition of a Corrective Action Plan (CAP) in the NERC Glossary of terms, it is unclear what differences exist between a CAP and an "action plan" as written in PRC-004-3. Both appear to be the same until the Rationale for R3 states "implementing an action plan of additional investigation/monitoring may determine cause and lead to the development of a CAP in accordance to Requirement R2." Oncor recommends that additional language be added that describes the intent and difference between a CAP and an "action plan". **Response:** The concept of an action plan has been eliminated from the standard. Change made. Oncor would also like clarification as to what authority the CEA holds in determining the effectiveness of the corrective actions detailed in the CAP and/or "action plan". **Response:** The CEA may determine if there is sufficient evidence that the entity has implemented their CAPs according to the criteria in each requirement. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
City of Tacoma, Tacoma Public Utilities	Comments: Is it the intention of the PSM SDT that this version of the standard would require that all BES interrupting device operations be logged (documented) with a determination of whether the operation was caused by a Protection System? While it appears to be the intent of the draft revised standard that all interrupting device operations be reviewed at some level to determine if a Protection System caused the

Organization	Question 5 Comment
	operation, it is unclear whether explicit documentation of each interrupting device operation must be generated and retained for purposes of compliance with PRC-004-3.
Response: The drafting team thanks you for your comment and intends that logging of the review occurs for those BES interrupting device operations caused by a Protection System operation or by manual intervention in response to a Protection System operation failure that meet the criteria in R1. The BES interrupting device owner would have evidence of its equipment operations and whether it was a Misoperation or not. The notified Protection System owner will use its notification to establish evidence of an operation. Routine switching operations are not intended to be logged and retained as evidence of compliance with this standard. No change made.	
Florida Municipal Power Agency	First, R4 uses the phrase “as needed.” In doing research for legal precedence interpreting the phase “as needed,” both in terms of contract interpretation and statutory construction, numerous cases throughout the country make it clear that, unless this phrase is clearly defined in the context in which it is used, this phrase is ambiguous and will only lead to conflict. For instance, the phrase indicates that (1) there is a level of discretion involved regarding an action that must be taken, and (2) someone must make a determination as to when such action is deemed “needed.” However, the standard is silent both as to what factors trigger the exercise of discretion and who makes the determination that a change to the CAP is “needed” - the entity or compliance staff. In this regard, FMPA recommends making it crystal clear what “as needed” means. For example, it could state “as needed to reflect any CAP revisions made by the responsible entity, as determined at the sole discretion of the responsible entity.” **Response:** The drafting team has revised Requirement R6 (previously R4) to removed “as needed” and added specificity that the CAP is updated when actions or the timetable changes. Change made. Second, R4 should recognize that not every investigation of a Misoperation ends in a CAP, e.g., those where no cause was found in accordance with R3. **Response:** This has been clarified by the new Requirement R1 (and R3) that requires the identification of Misoperation which is typically when the entity will determine the

Organization	Question 5 Comment
	cause. If a cause is not identified, further investigative actions must be taken (see new Requirement R4) until a cause is determined or a declaration of no cause is made. The concept of an action plan has been eliminated from the standard. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Midwest Reliability Organization NERC Standards Review Forum (NSRF)	For R2, depending on time of year, budget cycle, scope of work, 60 days is not sufficient to obtain funding for CAPs for some entities. **Response:** The 60-day period is to develop the CAP and not necessarily to obtain funding. Part of the CAP itself can be time to obtain the funding necessary to complete the CAP. No change made. Also, the first bullet under R2 would require evaluation of the applicability of all CAPs to all BES locations which, depending on the CAP, could be overly burdensome. As worded, a wiring or setting error would require that all wiring and all settings at all BES locations be checked. The evaluation should be limited to CAPs related to scheme logic or relay design deficiencies. **Response:** It is the responsibility of the Protection System owner to determine how wide spread the situation is and include the appropriate actions in its CAP. An evaluation of the CAP's applicability to the entity's other Protection Systems including other locations is intended to encourage diligence to prevent future Misoperations of the same cause and having an adverse effect on reliability. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Independent Electricity System Operator	Generally speaking, the standard is difficult to read, focusing on how instead of what. The drafting team should strengthen the description of the outcomes, and try to reduce the reliance on the application guideline and the rationales. (One has to read the rationales before understanding the meaning of the requirements.)
Response: The drafting team thanks you for your comment. Standards must focus on "what" is the required performance and not the	

Organization	Question 5 Comment
"how" to achieve the required performance. The standard may appear written as the "how," because requirements are based on the natural progression of the required performance. Several changes were made to the Requirements to improve clarity. Change made.	
Flathead Electric Cooperative, Inc.	Generally, the standard does not seem to address the reporint of no events now being required by the RE, especially for entities that have only a few devices, the reporting burden for non-events shoudl be clearly eliminated. It is not clear that it is eliminated. Only the reporting of actual misoperations should be required as defined.
Response: The drafting team thanks you for your comment. The reporting requirement has been removed from the standard. Change made.	
American Electric Power	In the Rationale for R2 box, a reference is made to R4. This appears to be a typo and should be changed to R3. **Response:** The requirements have been restructured causing the rationale boxes to change. Change made. Since an evaluation is not part of the Corrective Action Plan definition, please make the following modification to the first bullet of R2: " Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and also an evaluation of the Action Items applicability to the entity's Protection Systems at other locations, or.." **Response:** The drafting team agrees an "evaluation" is separate from the CAP and has modified the proposed Requirement R5 (previously R2). Change made. AEP recommends revising R2, R3, and R4 to specify that only the owner(s) of the Protection System component(s) that misoperated are responsible for applicable requirements. **Response:** Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. According to the standard, each entity has an independent responsibility to identify a Misoperation of its Protection System components, if any,

Organization	Question 5 Comment
	beginning with the BES interrupting device owner through any notified Protection System owner. Change made. Measure 2 should be revised to remove the statement “explaining why there is no need to develop a CAP.” This is consistent with Measure 3. **Response:** Measure M2 was revised and is now M5. Change made. Declaration is described elsewhere in the standard. The Standard may read more clearly if the existing R2 and R3 were switched such that the requirement to develop a CAP (R2) came *after* the requirement to identify a cause or develop an action plan (R3) to complete further investigation. **Response:** The Requirements were rewritten to clarify the two instances where a declaration can be used, one to end the entity’s investigation for a the cause of a Misoperation and the other to state why corrective actions (i.e., CAP) are beyond the entity’s control or would not improve BES reliability and that no further corrective actions will be taken. No change made. The phrase "composite Protection System", which is described in the Application Guidelines section, is not used in the Requirements, Measures, or Compliance sections. AEP requests "Protection System" to be replaced with "composite Protection System" where appropriate throughout the standard. **Response:** The drafting team is proposing a definition for the term “Composite Protection System.” Change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Ingleside Cogeneration LP	Ingleside Cogeneration shares the project team’s desire to retain a scholarly and cooperative approach to the assessment of Misoperations. However, we believe that the regulatory pressure will mount - particularly as NERC’s events analysis numbers continue to show Misoperations as a primary component in nearly every wide area outage. This means concepts that are implicitly understood today will be immaterial in

Organization	Question 5 Comment
	the future. For example, it is easy to see that a CEA may assess a violation for a single missing relay operation evaluation out of hundreds that may have occurred during a wide-area weather event. Despite assurances that the CEA will take the circumstances “under consideration”, we are not convinced that that will always be the case. **Response:** Use of percentages is practical for assessing violations for fixed quantities; however, Protection System operations are variable and event driven. The drafting team constructed the VSL according to the NERC Violation Severity Level Guidelines. No change made. If the drafting team is reluctant to modify the definition of “Misoperation” or PRC-004-3’s requirements, there may be an opportunity to capture these understandings in a binding way in the RSAW. There is a new program that has been initiated by NERC to include Compliance representatives in the standards drafting process for situations just like these. If we are able to provide commentary on the auditors’ instructions captured in the RSAW, it would alleviate our doubts that understandings reached during the development phase would be retained when the standard becomes mandatory. **Response:** The drafting team anticipates posting a draft PRC-004-3 RSAW so that entities will have an opportunity to consider auditing approaches. Posting is expected mid-way through the draft 4 posting of PRC-004-3. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Xcel Energy	It is important to be able to see the draft RSAW, as it relates to what kind of evidence, if any, would be required to demonstrate accurate assessment of a slow trip. This could be particularly problematic, as not all have DME installed to be able to capture data to be able to measure both the start and stop of the operation.
Response: The drafting team thanks you for your comments. The drafting team anticipates posting a draft PRC-004-3 RSAW so that entities will have an opportunity to consider auditing approaches. Posting is expected mid-way through the draft 4 posting of PRC-004-3. No change made.	

Organization	Question 5 Comment
The slow trip category is included because it is a type of Misoperation which should be identified when possible. In cases where the entity does not have access to Disturbance Monitoring Equipment (DME), a slow trip may be revealed by BES instability and tripping of more than then minimum Element(s). The proposed standard does not require the installation of DME which is being addressed by Project 2007-11 – Disturbance Monitoring (PRC-002 and PRC-018). The proposed standard does not require an entity to have certain personnel and only specifies the performance required for Misoperation identification and correction. Entities with Protection Systems that are applicable to the standard are required to identify any Misoperation, determine its cause(s), and correct the cause(s) to prevent future occurrences. No change made.	
Los Angeles Department of Water and Power	LADWP recommends that the Drafting Team give due weight to the Internal Controls Process (ICP). We believe the responsible entity should be allowed the latitude to determine the Corrective Action Plan (CAP) that follows the ICP approach. **Response:** The drafting team continues to support the proposed standard as currently structured. The draft requirements allow Compliance Enforcement Authorities to take into account use of internal controls in connection with monitoring activities. However, internal controls are only a mechanism to help auditors determine the depth and breadth of testing as it pertains to compliance with the related Reliability Standard and specific requirements and when necessary understand the facts and circumstances of instances of potential non-compliance. How any possible violations may be treated is outside of the scope of the project and reserved to the enforcement process. No change made. LADWP also recommends that the standard include specifications that the entity identify mitigating factors performed under the CAP that specifically address the misoperation. **Response:** The NERC Glossary definition of Corrective Action Plan includes the phrase “remedy a specific problem”. In the context of this standard, the “problem” is the cause a Misoperation. Mitigating actions may be included as a part of the CAP. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.	

Organization	Question 5 Comment
Kansas City Power & Light	R2 requires a CAP except in cases where the entity can "Explain in a declaration why corrective actions are beyond the entity's control or would reduce BES reliability" R2 does not recognize that every CAP requires resources to complete and that the industry has limited resources. There are cases where the required resources to complete a CAP at multiple locations provides minimal increase in reliability. If these low productivity CAPs are required to be completed the net result is a decrease in BES reliability since other more productive work will not be done due to lack of resources. **Response:** Prompt identification of a Misoperation is important regardless of its perceived significance. Identifying a Misoperation and its cause(s) leads to preventing reoccurrence which, without correction, could lead to a reduction in reliability. Additionally, the identification of a Misoperation cause leads the entity to considering its other Protection Systems including other locations which may result in identifying and correcting a potential problem with another Protection System which may be significant to reliability. The standard provides options for entities to explain why actions were not taken. No change made. The entity should be able to state the CAP was completed at only the affected site and was not rolled out system wide due to poor ratio of resources required to reliability benefit gained. **Response:** An entity may elect not to address/correct the causes of Protection System Misoperations at other locations as there is no required performance at this time; however, the drafting team believes responsible entities will create a program to address other locations that is commensurate with its resources and impact to reliability. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Bonneville Power Administration	R2 requires each TO, GO, or DP to develop a corrective action plan, but it does not indicate which TO, GO, or DP must do this. Is this intended to be the TO, GO, or DP that owns the interrupting device or the TO, GO, or DP that owns the protection system?

Organization	Question 5 Comment
	BPA recommends the following wording for the beginning of R2: Each TO, GO, or DP that owns a component of a protection system identified as contributing to a misoperation, as determined per R1, shall within 60 calendar days of identifying the cause of each misoperation: (insert bullet points for R2). Similar to the comment above for R2, BPA believes that R3 does not make it clear which TO, GO, or DP the requirement applies to. BPA recommends that the entity identified by R1 as required to initiate the investigation of an interrupting device operation (BPA believes this should be the owner of the protective relays) should be the entity required to complete the actions in R3. BPA believes that similar to R2 and R3, R4 should be more specific about which TO, GO, or DP the requirement applies to. **Response:** Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made. The last paragraph of the Background section states that where PRC-004-WECC-1 overlaps with this continent-wide standard, entities are expected to comply with the more stringent standard. In our comments to the previous draft, BPA suggested that the Background section simply state which of the standards takes precedence instead of leaving it to the entities to determine which standard is more stringent. The response to this comment was that entities are required to comply with both the continent-wide standard and any applicable regional standards. This response seems to contradict the Background statement. BPA requests clarification on whether entities are expected to comply with both standards or only the more stringent standard, and

Organization	Question 5 Comment
	how an entity should determine which standard is more stringent as the standards cover very different issues. BPA believes that if an entity is expected to comply with both standards, that should be stated, or perhaps this part of the Background statement should be removed. **Response:** An entity in the Western Interconnection will be responsible for meeting the PRC-004-3 requirements and those in the regional standard PRC-004-WECC-1. The drafting team identified potential concerns between the standards and is proposing 12 additional calendar months for implementation of PRC-004-3. This is additional time to allow the Western Interconnection to revise its regional standard to correct an identified compliance overlap and any potential gaps in reliability. The drafting team removed the regional references to avoid confusion. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Wisconsin Electric Power Company	Since owners of BES Protection Systems will be required by this standard to review all operations, it would be helpful to define the term "Protection System operation", at least as it is used in this standard.
Response: The drafting team thanks you for your comments and contends that the phrase "Protection System operation" is a common industry phrase and does not need a definition. No change made.	
Southern Company - Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Mississippi Power Company; Gulf Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	Southern Company supports the SERC comments and are including the following additional comments: 1. By using the definition of a Corrective Action Plan (CAP) in the NERC Glossary of terms as well as the term 'action plan' in R3, it is unclear what differences exist between a CAP and an "action plan" as written in PRC-004-3. Please modify language to be consistent or add language that describes the intent and difference between a CAP and an "action plan". **Response:** The concept of an action plan has been eliminated from the standard.

Organization	Question 5 Comment
	Change made. 2. R2 and R3 should be restructured such that it is immediately apparent that R2 deals with Misoperations with an identified cause and R3 deals with Misoperations without an identified cause. This could be accomplished by phasing that condition first in the requirement so that the required actions that are bulleted immediately follow the "shall" such as: "R2: For each Misoperation with an identified cause, the entity shall either develop a CAP ... or declare why ..." and "R3: For each Misoperation without an identifed cause, the entitiy shall either develop an action plan ... or declare why ..." **Response:** The concept of an action plan has been eliminated from the standard; however, the proposed Requirement R4 requires the entity to perform investigative action when circumstances require additional study or time to determine the cause(s) of a Misoperation. Requirement R5 and R6 respectively address CAP development and implementation by the Protection System component owner to correct the cause(s) of a Misoperation. Change made. 3. R4 should be re-structured to flow more smoothly, as follows; “R4. Each entity shall implement and revise, as needed, each CAP or action plan. **Response:** Requirements R5 and R6 (previously R2 and R4) now clearly delineate CAP development and implementation. Change made. 4. The three bullets found at the top of page 6 of draft 3 of the standard should be the three requirements of this standard. Has any consideration of making those three items the actual requirements? **Response:** The standard’s Requirements meet the intended objectives of the three bullets. No change made. 5. Please consider using the phrase "component that misoperated" rather than

Organization	Question 5 Comment
	"component that contributed to the misoperation" in the standard for clarity. **Response:** This clause was in the rationale box of the previous draft 3; however, Requirement R1 has been revised for clarification and does not use the phrasing "contributed to." Change made. 6. There is too much unnecessary date bookkeeping in the Requirements. We recommend deleting all existing date clocks linked to each event and specify a resolution time limit for investigative action plans/CAPs to be the filing date deadline for each quarter. The establishment of multiple time frames for each detail of a Protection System operation will not improve reliability. The establishment of investigative action plans and/or completion of necessary Corrective Action Plans in a timely fashion are the actions which will affect the reliability of the Protection System. **Response:** One of the objectives of this project is to bring consistency to metrics through the Section 1600 data request. In conjunction with data reporting, the proposed definition of Misoperation will improve identifying the appropriate category of Misoperation. The drafting team agrees that a results-based approach using metrics could simplify the standard and reduce compliance burdens; however, it may take several years of data collection to develop consistent and meaningful metrics for measure performance. No change made. **Response:** The associated dates and timetables allow the Requirements to be measurable. No change made. 7. In reference to the above comment, if the timeframe are to remain, the SDT is strongly encouraged to move toward an internal controls format for this standard. **Response:** The drafting team continues to support the proposed standard as currently structured. The draft requirements allow Compliance Enforcement Authorities to take into account use of internal controls in connection with monitoring activities. However, internal controls are only a mechanism to help auditors determine the depth and breadth of testing as it pertains to compliance with the related Reliability Standard and specific requirements and when necessary understand the facts and circumstances of

Organization	Question 5 Comment
	instances of potential non-compliance. How any possible violations may be treated is outside of the scope of the project and reserved to the enforcement process. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Entergy Services, Inc. (Transmission)	Suggest "Composite Protection System" as listed in the Guidelines and Technical Basis section (page 14 of 24) be a defined term for this standard.
Response: The drafting team thanks you for your suggestion. The drafting team is proposing a definition for the term "Composite Protection System." Change made.	
Northeast Power Coordinating Council	The Compliance Section of Standard has "The Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System shall retain evidence for all Misoperations with an open investigation, action plan, or CAP even if the BES interrupting device operation occurred prior to the current audit period." The word "open" should precede not only investigation, but action plan and CAP for clarity. It should be made to read "open investigation, open action plan, or open CAP even if the BES interrupting device operation occurred prior to the current audit period". **Response:** The evidence retention section has been revised to require evidence to be retained a defined period after the completion. This would include any "open" CAPs and other ongoing performance of the standard. Change made. What is an Entity's compliance obligation for an open investigation or open action plan that occurred prior to regulatory approval of this Standard but in the current audit period of an entity? **Response:** The entity must be compliant with the standard that was enforceable at the time through the transition (implementation) of the new standard. No change made. The new standard establishes specific time limits. If an entity has an operation to investigate the day prior to the compliance obligation date, does the 120 day time limit

Organization	Question 5 Comment
	apply the day the Standard is obligatory? **Response:** No. The new standard will only apply from the effective date forward. No change made. Regarding the Implementation Plan for Requirements R1, R2, R3 and R4: "Entities shall be 100% compliant for any new Protection System Operation on the first day of the first calendar quarter twelve months" (this is the compliance obligation date) "following applicable regulatory approvals, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter twelve months following Board of Trustees adoption. Protection System operations that occur before the compliance date shall comply with the previous version of the Standard." In this section of the Implementation Plan, what is meant by "new"? Is "new" any operation that occur after the compliance obligation date, or during the window of implementation between regulatory approval and compliance obligation date? **Response:** The reference to "new" has been removed. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
ExxonMobil Research and Engineering	The documentation requirements for maintaining a database of every operation of a BES interrupting device, which are laid out in Measure M1, represent a significant step change in documentation requirements when compared with the current misoperation analysis and reporting requirements. Unintentional mismanagement of a database that identifies every operation by time, date, and date of review during a six year audit window poses no significant risk to the reliabile operation of the Bulk Electric System. However, enforcement of this measure will likely identify clerical or other unintentional errors made during the process of tracking misoperations that will impede NERC's ability to address violations that pose a moderate or severe threat to the reliability of the Bulk Electric System. The underlying objective of the data compiled in the measure appears to be a 'best

Organization	Question 5 Comment
	practice' method for retaining data necessary to meet the quarterly reporting requirements for misoperation reporting; specifically reporting of the 'total number of operations'. While it is understood, that NERC is utilizing this quarterly reporting data to develop metrics to track the performance of BES Protective Systems, the required implementation of a prescriptive tracking method in a Reliability Standard does not balance the need and method for addressing the need, and compliance with the quarterly reporting of misoperation data is already driven by NERC's Rules of Procedure. The SDT should consider modifying Measure M1 in such a way that it requires misoperation analysis reports (Corrective Action Plans and Action Plans) to include the level of detail addressed in Measurement M1 (time & date of operation, date analysis determined it was a misoperation, etc.). This modification would address the need to ensure that misoperations are appropriately analyzed within a reasonable amount of time while avoiding the implementation of a Reliability Standard requirement that could create enforcement actions that hinder NERC's ability to address potential violations that pose a moderate or serious threat to the Bulk Electric System.
Response: The drafting team thanks you for your comments and notes that Measures are not enforceable. Measures provide examples of evidence that may be used to demonstrate compliance with the requirements. The drafting team removed all of the reporting requirements from the proposed standard. The data will be collected through the NERC Rules of Procedure, Section 1600, Request for Information or Data process. Metrics will be developed by NERC for reliability assessments, for example. The requirements and associated time frames ensure that the responsible entities are diligent about Misoperation identification, CAP development and completion. No change made.	
PPL NERC Registered Entities	The PPL NERC Registered Entities (PPL Electric Utilities, PPL Generation LLC, PPL Energy Plus, LG&E and KU Services) are in agreement with the spirit of the North America Generator Forum Standards Review Team comments for the successive ballot for Project 2010-05.1 Protection Systems: Misoperations. We recommend deleting all date clocks linked to each event and replace them with a final resolution time limit for action plans/CAPs and/or replace them with a filing date

Organization	Question 5 Comment
	deadline to identify, review, and disposition of each operation for each event. The establishment of multiple time frames for each detail of a Protection System operation will not improve reliability; the completion of any necessary Corrective Action Plans are the actions which will affect the reliability of the Protection System operations. **Response:** The requirements and associated timeframes ensure that the responsible entities are diligent about Misoperation identification, CAP development and completion. Having time periods accounts for seasonal workloads and unforeseen issues with implementing a CAP. The timetables make the requirements auditable. No change made. In various locations of the draft, Protection System misoperations are discounted as misoperations for situations where other redundant protection may have adequately operated. In these instances, perhaps the classification should be changed to non-reportable misoperation rather than simply that they are not Misoperations. **Response:** The composite Protection System is the collective operation of the entire Protection System for an Element which is included in determining whether a Misoperation occurred. To clarify the usage of the terminology, the drafting team is proposing the definition "Composite Protection System" which has an exclusion for backup protection provided by a remote Protection System. Change made. The three bullets found at the top of page 6 of draft 3 of the standard are possibly sufficient requirements for this standard. Has any consideration been given to making those three items the actual requirements? **Response:** The standard's Requirements meet the intended objectives of the three bullets. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Liberty Electric Power LLC	The standard would be simplified by combining R1 through R4 to state: R1 For each activation of a BES interrupting device initiated by a Protection System, the

Organization	Question 5 Comment
	entity shall identify the cause of the operation. R1.1 If the activation is determined to be a misoperation, the entity shall develop a corrective action plan, or explain in a declaration why a CAP cannot reasonably be instituted. R1.2 If no cause can be determined, the entity shall develop an action plan for further investigation, or explain in a declaration why no further action is warranted. R1.3 All action plans shall be developed within 180 days of the operation, or notification of an operation of a BES interrupting device caused by the RE's Protection System. R2 All action plans developed under R1 shall be implemented or revised as needed until complete. **Response:** The standard has been revised to provide one activity for a single reliability goal in accordance with standard drafting guidelines. The drafting team restructured the previous requirements into separate requirements. Change made. The additional detail in the current version (work timetables, other facilites) should be moved to the measures, as they are the output of the requirements. **Response:** Examples of CAPs are provided in the Application Guidelines. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Essential Power, LLC	There is too much bookkeeping required in the Requirements. We recommend deleting all date clocks linked to each event and replace them with a final resolution time limit for action plans/CAPs and/or replace them with a filing date deadline to identify, review, and disposition of each operation for each event. The establishment of multiple time frames for each detail of a Protection System operation will not improve reliability; the completion of any necessary Corrective Action Plans are the actions which will affect the reliability of the Protection System operations. **Response:** One of the objectives of this project is to bring consistency to metrics

Organization	Question 5 Comment
	through the Section 1600 data request. In conjunction with data reporting, the proposed definition of Misoperation will improve identifying the appropriate category of Misoperation. The drafting team agrees that a results-based approach using metrics could simplify the standard and reduce compliance burdens; however, it may take several years of data collection to develop consistent and meaningful metrics for measure performance. No change made. **Response:** The associated dates and timetables allow the Requirements to be measurable. No change made. In various locations of the draft, Protection System misoperations are discounted as misoperations for situations where other redundant protection may have adequately operated. In these instances, perhaps the classification should be changed to non-reportable misoperation rather than simply that they are not Misoperations. **Response:** The composite Protection System is the collective operation of the entire Protection System for an Element which is included in determining whether a Misoperation occurred. To clarify the usage of the terminology, the drafting team is proposing the definition "Composite Protection System" which has an exclusion for backup protection provided by a remote Protection System. Change made. The three bullets found at the top of page 6 of draft 3 of the standard should be the three requirements of this standard. Has any consideration been given to making those three items the actual requirements? **Response:** The standard's Requirements meet the intended objectives of the three bullets. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Cogentrix Energy Power Management, LLC	There is too much bookkeeping required in the Requirements. We recommend deleting all date clocks linked to each event and replace them with a final resolution time limit for action plans/CAPs and/or replace them with a filing date deadline to identify, review, and disposition of each operation for each event. The establishment of

Organization	Question 5 Comment
	multiple time frames for each detail of a Protection System operation will not improve reliability; the completion of any necessary Corrective Action Plans are the actions which will affect the reliability of the Protection System operations. **Response:** One of the objectives of this project is to bring consistency to metrics through the Section 1600 data request. In conjunction with data reporting, the proposed definition of Misoperation will improve identifying the appropriate category of Misoperation. The drafting team agrees that a results-based approach using metrics could simplify the standard and reduce compliance burdens; however, it may take several years of data collection to develop consistent and meaningful metrics for measure performance. To clarify the usage of the terminology, the drafting team is proposing the definition "Composite Protection System" which has an exclusion for backup protection provided by a remote Protection System. Change made. The three bullets found at the top of page 6 of draft 3 of the standard should be the three requirements of this standard. Has any consideration been given to making those three items the actual requirements? **Response:** The standard's Requirements meet the intended objectives of the three bullets. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.	

Organization	Question 5 Comment
Pepco Holdings Inc & Affiliates	To avoid confusion, Requirements R2, R3, and R4 should be re-worded to make it clear that they apply only to those entities whose Protective System misoperated and not to the interrupting device owner. The following language is suggested: R2. "Each Transmission Owner, Generation Owner, or Distribution Provider, whose Protection System misoperated, shall within 60 calendar days of identifying the cause of each Misoperation..." R3. "Each Transmission Owner, Generation Owner, or Distribution Provider shall, within 180 calendar days of the interruption of the BES Facility due to a Protective System Misoperation, complete for each Misoperation without an identified cause...." R4. "Each Transmission Owner, Generation Owner, or Distribution Provider, whose Protection System misoperated, shall implement each CAP or action plan, and revise as needed through completion."
Response: The drafting team thanks you for your comments. Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made.	
Texas Reliability Entity	We are concerned that the applicability of the Standard limits the misoperation analysis only to BES Element Protection Systems. Under the new BES definition and guidance documents, there will be numerous examples of misoperations on non-BES Element Protection Systems which could have a major impact on the BES when the fault must be cleared by remote backup relays. Example: Consider a 50MVA generator connected to a substation via a radial line. Under the new BES guidance, the generator is part of the BES while the interconnecting radial line would not be part of the BES under exclusion E1(b). If a fault occurs on the non-BES radial line and the Protection System fails to trip, the fault must then be

Organization	Question 5 Comment
	cleared by either local or remote backup relays at the interconnecting substation(s). Under this scenario with the current proposed PRC-004 requirements, the owner of the non-BES radial line has no obligation to analyze or correct the Misoperation. The PRC-027 SDT received comments with similar concerns in its last revision. They have drafted language to ensure that coordination of non-BES Protection Systems between different Functional Entities. The PRC-004 SDT may want to consider similar language to ensure that all Misoperations which can affect the reliable operation of the BES are analyzed and corrected.
Response: The drafting team thanks you for your comment. The standard addresses the Misoperation of Protection Systems for BES Elements. If the Composite Protection System operated correctly in backing up the failure of a non-BES Element, the operation would be considered correct. If the Composite Protection System failed to operate correctly for the non-BES Element fault, that would be considered a Misoperation. No change made.	
JEA	We believe that the issues should be handled through modification of PRC003 not PRC004.
Response: The drafting team thanks you for your comment. In FERC Order No. 693, the Commission identified PRC-003-0 as a fill-in-the-blank standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004; therefore, PRC-003-1 will be retired. No change made.	
seattle city light	We would like to reiterate our previous comments that this Drafting Team give due weight to the Internal Controls Process (ICP). We believe the responsible entity should be allowed the latitude to determine the Corrective Action Plan (CAP) that follows the ICP approach. **Response:** The drafting team continues to support the proposed standard as currently structured. The draft requirements allow Compliance Enforcement Authorities to take into account use of internal controls in connection with monitoring activities. However, internal controls are only a mechanism to help auditors determine the depth and

Organization	Question 5 Comment
	breadth of testing as it pertains to compliance with the related Reliability Standard and specific requirements and when necessary understand the facts and circumstances of instances of potential non-compliance. How any possible violations may be treated is outside of the scope of the project and reserved to the enforcement process. No change made. We would also suggest that the ICP include specifications that the entity identify mitigating factors performed under the CAP that specifically address the Misoperation. **Response:** The NERC Glossary definition of Corrective Action Plan includes the phrase "remedy a specific problem". In the context of this standard, the "problem" is the cause a Misoperation. Mitigating actions may be included as a part of the CAP. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Sacramento Municipal Utility District	We would like to reiterate our previous comments that this Drafting Team give due weight to the Internal Controls Process (ICP). We believe the responsible entity should be allowed the latitude to determine the Corrective Action Plan (CAP) that follows the ICP approach. **Response:** The drafting team continues to support the proposed standard as currently structured. The draft requirements allow Compliance Enforcement Authorities to take into account use of internal controls in connection with monitoring activities. However, internal controls are only a mechanism to help auditors determine the depth and breadth of testing as it pertains to compliance with the related Reliability Standard and specific requirements and when necessary understand the facts and circumstances of instances of potential non-compliance. How any possible violations may be treated is outside of the scope of the project and reserved to the enforcement process. No change made. We would also suggest that the standard include specifications that the entity identify mitigating factors performed under the CAP that specifically address the misoperation.

Organization	Question 5 Comment
	Response: The NERC Glossary definition of Corrective Action Plan includes the phrase "remedy a specific problem". In the context of this standard, the "problem" is the cause a Misoperation. Mitigating actions may be included as a part of the CAP. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Public Utility District No. 1 of Snohomish County	We would like to reiterate our previous comments that this Drafting Team give due weight to the Internal Controls Process (ICP). We believe the responsible entity should be allowed the latitude to determine the Corrective Action Plan (CAP) that follows the ICP approach. **Response:** The drafting team continues to support the proposed standard as currently structured. The draft requirements allow Compliance Enforcement Authorities to take into account use of internal controls in connection with monitoring activities. However, internal controls are only a mechanism to help auditors determine the depth and breadth of testing as it pertains to compliance with the related Reliability Standard and specific requirements and when necessary understand the facts and circumstances of instances of potential non-compliance. How any possible violations may be treated is outside of the scope of the project and reserved to the enforcement process. No change made. We would also suggest that the standard include specifications that the entity identify mitigating factors performed under the CAP that specifically address the misoperation. **Response:** The NERC Glossary definition of Corrective Action Plan includes the phrase "remedy a specific problem". In the context of this standard, the "problem" is the cause a Misoperation. Mitigating actions may be included as a part of the CAP. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Southwest Power Pool Reliability Standards	We would like to see a RSAW for this particular standard to better understand what

Organization	Question 5 Comment
Development Team	level of review and or evidence, if any, auditors will require to determine that you assessed your operations adequately for R1. **Response:** The drafting team anticipates posting a draft PRC-004-3 RSAW so that entities will have an opportunity to consider auditing approaches. Posting is expected mid-way through the draft 4 posting of PRC-004-3. No change made. For instance if you didn't have certain monitoring equipment that captures data for protection system elements, then the data available would be limited for assessing slow trips. **Response:** The slow trip category is included because it is a type of Misoperation which should be identified when possible. In cases where the entity does not have access to Disturbance Monitoring Equipment (DME), a slow trip may be revealed by BES instability and tripping of more than then minimum Element(s). The proposed standard does not require the installation of DME which is being addressed by Project 2007-11 – Disturbance Monitoring (PRC-002 and PRC-018). No change made. Depending upon the guidance requested in the SPP comments (what will be required to prove that all faults have been analyzed) the time frames may become difficult to maintain especially during storm seasons. **Response:** The *Sanction Guidelines of the North American Electric Reliability Corporation*, Section 2.8, Extenuating Circumstances, says: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." While the drafting team recognizes the concern and that there are other standards which have similar provisions for natural disasters, including specific language in the proposed standard complicates a low frequency event where a compliance violation might occur. No change made. Likewise, the 60 days required to develop a corrective action once the cause is determined could become difficult for severe or extreme events. In extreme cases dynamic power flow models may need to be developed and applied to system studies

Organization	Question 5 Comment
	before the CAP can be developed. **Response:** The CAP by definition is a set of actions and a timetable to remedy a specific problem (i.e., Misoperation cause). In this case, the entity would include performing dynamic power flow simulations as an action within the CAP. Similarly, the timetable would account for the time needed to perform the simulation. No change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Indiana Municipal Power Agency	Indiana Municipal Power Agency agrees with the comments submitted by Florida Municipal Power Agency and has a couple of additional comments. Since the comment document is not formatted for this purpose, we will submit them here. The standard is titled Protection System Misoperation Identification and Correction, not Operation Identification and Submittal. IMPA does see that an organzation might keep track of operations but to require this action by a standard requirement and then potentially find an enitity in non-compliance is over reaching for this Protection System Misoperation standard. In order to be in compliant with this stadnard, an entity should only be required to perform the action of Protection System Misoperation Identification and Correction which is the standard title. **Response:** Each entity must review its Protection System operations according to Requirement R1 (including R3) in order to identify potential Misoperations. Without that requirement, there is no measure whether or not the entity reviewed the necessary operations. No change made. Another problematic area involves the "same 120 day period of a BES interrupting device operation caused by a Protection System operation". What happens if the owner of the Protection System component is notified toward the end of the 120 day period of a BES interrupting device operation (say 119 day) and there is not sufficient time for an investigation by the Protection System owner into the cause of the trip? The Protection System owner should not be found non-compliant for requirement 1.2 if not enough time is given to them to properly investigate the reason for the operation of

Organization	Question 5 Comment
	the Protection System. **Response:** Requirement R1 was split into two separate Requirements (R1 and R3) to provide clarity on the BES interrupting device Protection System owners' responsibilities (R1) following the operation of the BES interrupting device to identify any Misoperation. In cases where a Protection System owner is notified to review its Protection System components (R3), time has been allocated (i.e., the greater of either 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation) to that owner to investigate the operation and make a determination whether its Protection System component(s) caused a Misoperation. Change made.
Response: The drafting team thanks you for your comments; please see the above responses.	
Western Electricity Coordinating Council	WECC believes that an Internal Controls Process with Risk Based requirements should be implemented in this standard.
Response: The drafting team thanks you for your comments and continues to support the proposed standard as currently structured. The draft requirements allow Compliance Enforcement Authorities to take into account use of internal controls in connection with monitoring activities. However, internal controls are only a mechanism to help auditors determine the depth and breadth of testing as it pertains to compliance with the related Reliability Standard and specific requirements and when necessary understand the facts and circumstances of instances of potential non-compliance. How any possible violations may be treated is outside of the scope of the project and reserved to the enforcement process. No change made.	

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. The SC authorized moving the SAR forward for standard development at their June 9, 2011 meeting.
2. The SAR was posted for informal comment June 10 – July 11, 2011.
3. Draft 1 of PRC-004-3 was posted for a 30-day formal comment period from June 10 – July 11, 2011.
4. Draft 2 of PRC-004-3 was posted for a 45-day formal comment period from July 25 – September 7, 2012 and an initial ballot in the last ten days of the comment period from August 29 – September 7, 2012.
5. Draft 3 of PRC-004-3 was posted for a 30-day formal comment period from January 22 – February 20, 2013 and a successive ballot in the last ten days of the comment period from February 11-20, 2013.

Description of Current Draft

The Protection System Misoperations Standard Drafting Team (PSMSDT) is posting Draft 4 of PRC-004-3 – Protection System Misoperation Identification and Correction for a 45-day comment period and ballot in the last ten days of the comment period under the new Standards Process Manual (Effective: June 26, 2013).

Anticipated Actions	Anticipated Date
Additional 45-day Formal Comment Period with Parallel Ballot	January 2014
10-day Final Ballot	March 2014
BOT Approval	May 2014

Effective Dates

Except in the Western Interconnection, the standard and definitions shall become effective on the first day of the first calendar quarter that is twelve months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Except in the Western Interconnection, where approval by an applicable governmental authority is not required, the standard and definitions shall become effective on the first day of the first calendar quarter that is twelve months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

In the Western Interconnection, the standard and definitions shall become effective on the first day of the first calendar quarter that is twenty-four months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. In the Western Interconnection, where approval by an applicable governmental authority is not required, the standard and definitions shall become effective on the first day of the first calendar quarter that is twenty-four months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Version History

Version	Date	Action	Change Tracking
1	TBD	Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the *Glossary of Terms used in NERC Reliability Standards* are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the glossary.

Composite Protection System:

The total complement of the Protection System(s) that function collectively to protect an Element, such as any primary, secondary, local backup, and communication-assisted relay systems. Backup protection provided by a remote Protection System is excluded.

Misoperation:

The failure of a Composite Protection System to operate as intended. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition for which it is designed. Delayed clearing of a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or resulted in the operation of any other Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. Delayed clearing of a non-Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or resulted in the operation of any other Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Protection System operation for a Fault condition on another Element.
6. **Unnecessary Trip – Other Than Fault** – An unnecessary Protection System operation for a non-Fault condition for which it is not designed. A Protection System operation that is caused by on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System Misoperation Identification and Correction**
2. **Number:** PRC-004-3
3. **Purpose:** Identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements.
4. **Applicability:**

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities:

4.2.1 Protection Systems for BES Elements. Non-protective functions that are embedded within a Protection System are excluded. Protective functions intended to operate as a control function during switching are excluded.[1]

4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

Rationale for Applicability: Protection Systems that protect BES Elements are integral to the operation and reliability of the BES. Some functions of relays are not used as protection but as control functions or for automation; therefore, any operation of the control function portion or the automation portion of relays is excluded from this standard. See the Application Guidelines for detailed examples of non-protective functions. Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are not included in this standard because they are planned to be handled in the second phase of this project.

5. **Background**:

A key element for BES reliability is the correct performance of Protection Systems. The monitoring of Protection System events for BES Elements, as well as identifying and correcting the causes of Misoperations, will improve Protection System performance. This Reliability Standard PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of

[1] For additional information and examples, see the “Non-Protective Functions” and “Control Functions” sections in the Application Guidelines.

Misoperations. In FERC Order No. 693, the Commission identified PRC-003-0 as a “fill-in-the-blank” standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

This project includes revising the existing definition of Misoperation, which reads:

Misoperation

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity.

In general, this definition needs more specificity and clarity. The terms “specified time” and “abnormal condition” are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical yet explainable condition is a Misoperation.

The SAR for this project also includes clarifying reporting requirements. Misoperation data, as currently collected and reported, is not optimal to establish consistent metrics for measuring Protection System performance. As such, the data reporting obligation for this standard is being removed and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information (“data request”). As a result of the data request, NERC will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. The removal of the data collection obligation from the standard does not result in a reduction of reliability. The standard and data request have been developed in a manner such that evidence used for compliance with the standard and data request are intended to independent of each other.

The proposed requirements of the revised Reliability Standard PRC-004-3 meet the following objectives:

- Review all Protection System operations on the BES to identify those that are Misoperations of Protection Systems for Facilities that are part of the BES.
- Analyze Misoperations of Protection Systems for Facilities that are part of the BES to identify the cause(s).
- Develop and implement Corrective Action Plans to address the cause(s) of Misoperations of Protection Systems for Facilities that are part of the BES.

Misoperations associated with Special Protection Schemes (SPS) and Remedial Action Schemes (RAS) are not addressed in this standard due to their inherent complexities. NERC plans to handle SPS and RAS in the second phase of this project.

The Western Electric Coordinating Council (WECC) Regional Reliability Standard PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation relates to the reporting of Misoperations of Protection Systems and RAS for a limited set of WECC Paths. The WECC region plans to conduct work to harmonize the regional standard with this continent-wide proposed standard and the second phase of this project concerning SPS and RAS.

6. **Effective Dates:** See Implementation Plan

B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation when: *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and

1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and

1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

M1. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to, the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R1: This requirement ensures that entities review those Protection System operations meeting the criteria in all three Parts (1.1, 1.2, and 1.3) and identify any that are Misoperations. The BES interrupting device owner has the responsibility to initiate the review because the owner is in the best position to be aware of the operation. Manual intervention is included as a condition that initiates a review. Occasionally, Protection System failures do not yield other Protection System operations and manual intervention is required to isolate the problematic equipment. The 120 calendar day period accounts for the sporadic volumes of Protection System operations, and provides the opportunity to identify any Misoperations which were initially missed.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, notify the other owner(s) of the Protection System of the operation when: *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

2.1 The BES interrupting device owner shares the Composite Protection System ownership with any other entity; and

2.2 The BES interrupting device owner determined that a Misoperation occurred or cannot rule out a Misoperation; and

2.3 The BES interrupting device owner determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.

M2. Acceptable evidence for Requirement R2, including Parts 2.1, 2.2, and 2.3 may include, but is not limited to, the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

Rationale for R2: This requirement ensures that the BES interrupting device owner notifies the other owners of the Composite Protection System when the criteria in all three Parts (2.1, 2.2, and 2.3) are met, within the same 120 calendar day period as R1. This ensures other entities are notified to review their Protection System components. The expectation is that entities will communicate accordingly and when it is clear that the three conditions are met, the entity would make the notification. It is not intended for entities to automatically and unnecessarily notify other entities before adequate detail is known.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, shall identify whether its Protection System component(s) caused a Misoperation. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

M3. Acceptable evidence for Requirement R3 may include, but is not limited to, the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R3: When an entity receives notification of a Protection System operation by the BES interrupting device owner, the Protection System owner is allotted at least 60 calendar days to identify whether it was a Misoperation. A shorter time period is allotted on the basis that the BES interrupting device owner has already performed preliminary work, collaborated with the other owners, and that other owners generally have fewer associated Protection System components.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation identified in accordance with Requirement R1 or R3 shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: *[Violation Risk Factor: Medium] [Time Horizon: Operations Assessment, Operations Planning]*

- The identification of the cause(s) of the Misoperation; or
- A declaration that no cause was identified.

M4. Acceptable evidence for Requirement R4 may include, but is not limited to, the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R4: If a Misoperation cause is not identified within the time period established by Requirements R1 or R3 (120 calendar days), the Protection System component owner must demonstrate investigative actions toward identifying the cause(s). Performing at least one action every two full calendar quarters from first identifying the Misoperation encourages periodic focus on finding the cause of the Misoperation.

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations, or
- Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.

M5. Acceptable evidence for Requirement R5 may include, but is not limited to, the following documentation (electronic or hardcopy format): a dated CAP or a dated declaration.

Rationale for R5: A formal CAP is a proven tool for resolving and reducing the possibility of reoccurrence of operational problems. A time period of 60 calendar days is based on industry experience and operational coordination time needed for considering such things as alternative solutions, coordination of resources, or development of a schedule. When the cause of a Misoperation is identified, a CAP will generally be developed. In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, a statement documenting the reasons for taking no corrective actions is essential for justifying the close of the Misoperation in lieu of a CAP and for future reference.

R6. Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. *[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Long-Term Planning]*

M6. Acceptable evidence for Requirement R6 may include, but is not limited to, the following documentation (electronic or hard copy format): dated records that document the implementation of each CAP and the completion of actions for each CAP. Evidence may also include work management program records, work orders, and maintenance records.

Rationale for R6: The CAP must accomplish all identified objectives to be complete. During the course of implementing a CAP, updates may be necessary for a variety of reasons such as new information, scheduling conflicts, or resource issues. Documenting changes or completion of CAP activities provides measurable progress and confirmation of completion.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirements R1, R2, R3, and R4, Measures M1, M2, M3, and M4 for 12 calendar months.
- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R5, Measure M5 for 12 calendar months following completion of each CAP, evaluation, and declaration.
- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R6, Measure M6 for 12 calendar months following completion of each CAP.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

Periodic Data Submittal

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to identify whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R2	Operations Assessment, Operations Planning	Medium	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late. OR The responsible entity failed to identify whether or not a Misoperation its Protection System component(s) occurred in accordance with Requirement R3.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	Operations Assessment, Operations Planning	Medium	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late. OR The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	Operations Planning, Long-Term Planning	Medium	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop a CAP or explain in a declaration in accordance with Requirement R5. OR (See next page)

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	(Continued)		The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop an evaluation in accordance with Requirement R5.
R6	Operations Planning, Long-Term Planning	Medium	The responsible entity implemented, but failed to update a CAP, when actions or timetables changed, in accordance with Requirement R6.	N/A	N/A	The responsible entity failed to implement a CAP in accordance with Requirement R6.

D. Regional Variances

None.

Guidelines and Technical Basis

Introduction

This standard addresses the reliability issues identified in the letter[2] from Gerry Cauley, NERC President and CEO, dated January 7, 2011.

> "Nearly all major system failures, excluding perhaps those caused by severe weather, have misoperations of relays or automatic controls as a factor contributing to the propagation of the failure. …Relays can misoperate, either operate when not needed or fail to operate when needed, for a number of reasons. First, the device could experience an internal failure – but this is rare. Most commonly, relays fail to operate correctly due to incorrect settings, improper coordination (of timing and set points) with other devices, ineffective maintenance and testing, or failure of communications channels or power supplies. Preventable errors can be introduced by field personnel and their supervisors or more programmatically by the organization."

The standard also addresses the findings in the 2011 Risk Assessment of Reliability Performance[3]; July 2011.

> "…a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry."

Definitions

The Misoperation definition is based on the IEEE/PSRC Working Group I3 "Transmission Protective Relay System Performance Measuring Methodology[4]." Misoperations of a Protection System include failure to operate, slowness in operating, or operating when not required either during a Fault or non-Fault condition.

[4] "Transmission Protective Relay System Performance Measuring Methodology," Working Group I3 of Power System Relaying Committee of IEEE Power Engineering Society, 1999.

For reference, a “Protection System” is defined in the *Glossary of Terms used in NERC Reliability Standards* (“NERC Glossary”) as:

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

A BES interrupting device is a BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current. Although BES interrupting device mechanisms are not part of a Protection System, the standard uses the operation of a BES interrupting device by a Protection System to initiate the review for Misoperation.

The following two definitions are being proposed for inclusion in the NERC Glossary:

> **Composite Protection System –** *The total complement of the Protection System(s) that function collectively to protect a Element, such as any primary, secondary, local backup, and communication-assisted relay systems. Backup protection provided by a remote Protection System is excluded.*

This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the entity must consider the entire Protection System associated with the BES interrupting device that operated. Additionally, the definition accounts for those Protection Systems with multiple levels of protection (e.g., redundant systems), such that if one component fails, but the overall intended performance of the composite protection is met – it would not be identified as a Misoperation under the definition.

> **Misoperation –** *The failure a Composite Protection System to operate as intended. Any of the following is a Misoperation:*

1. **Failure to Trip – During Fault –** *A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*
2. ***Failure to Trip – Other Than Fault –*** *A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*

3. ***Slow Trip – During Fault*** *– A Composite Protection System operation that is slower than required for a Fault condition for which it is designed. Delayed clearing of a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or resulted in the operation of any other Composite Protection System.*
4. ***Slow Trip – Other Than Fault*** *– A Composite Protection System operation that is slower than required for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. Delayed clearing of a non-Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or resulted in the operation of any other Composite Protection System.*
5. ***Unnecessary Trip – During Fault*** *– An unnecessary Protection System operation for a Fault condition on another Element.*
6. ***Unnecessary Trip – Other Than Fault*** *– An unnecessary Protection System operation for a non-Fault condition for which it is not designed. A Protection System operation that is caused by on-site maintenance, testing, inspection, construction or commissioning activities is not a Misoperation.*

Failure to automatically reclose after a Fault condition is not included as a Misoperation because reclosing equipment is not included within the definition of Protection System.

This proposed definition of Misoperation provides additional clarity over the current version. A Misoperation is the failure of a Composite Protection System to operate as intended. The definition includes six categories which provide further differentiation and examples of what is a Misoperation. These categories are discussed in greater detail in the following sections.

Failure to Trip – During Fault

This category of Misoperation typically results in the Fault condition being cleared by remote backup Protection System operation.

> **Example 1a:** A failure of a transformer's Composite Protection System to operate for a transformer Fault is a Misoperation.
>
> **Example 1b:** A failure of a "primary" transformer relay (or any other component) to operate for a transformer Fault is not a Misoperation as long as another component of the transformer's Composite Protection System operated to clear the Fault.
>
> **Example 1c:** A lack of target information does not by itself constitute a Misoperation. When a high-speed pilot system does not target because a high-speed zone element trips first would not in and of itself be a Misoperation.

In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – During Fault” category applies to the operation.

Failure to Trip – Other Than Fault

This category of Misoperation may have resulted in operator intervention. The “Failure to Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

> **Example 2a:** A failure of a generator's Composite Protection System to operate for an unintentional loss of field condition is a Misoperation.

> **Example 2b:** A failure of an overexcitation relay (or any other component) is not a "Failure to Trip – Other Than Fault" Misoperation as long as another component of the generator's Composite Protection System operated as intended (e.g., isolating the generator).

In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – Other Than Fault” category applies to the operation.

Slow Trip – During Fault

This category of Misoperation typically results in remote backup Protection System operation before the Fault is cleared.

> **Example 3:** A failure of a line's Composite Protection System to operate as quickly as intended for a line Fault is a Misoperation.

Installing high-speed protection may be a part of a utility’s standard practice without having the need for high-speed protection to prevent voltage or dynamic instability or to maintain relay coordination. For this case, a “Slow Trip – During Fault” of the high-speed protection is not a Misoperation because it would not negatively impact the dynamic BES performance, unless the Composite Protection System operation is slower than previously identified as being necessary to prevent voltage or dynamic instability. The Composite Protection System must also coordinate with other Protection Systems to prevent the trip (e.g., an over-trip) of additional Protection Systems.

The phrase “slower than required” means the Composite Protection System operated slower than the objective of the owner(s). It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and stability by the owner(s) reviewing each Protection System operation.

The phrase “resulted in the operation of any other Composite Protection System” refers to the need to ensure that relaying operates in the proper or planned sequence (i.e., the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

In analyzing the Protection System for Misoperation, the entity must also consider the “Unnecessary Trip – During Fault” category to determine if an “unnecessary trip” applies to the Protection System operation of an Element other than the faulted Element.

Slow Trip – Other Than Fault

The phrase “slower than required” means the Composite Protection System operated slower than the objective of the owner(s). It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and stability by the owner(s) reviewing each Protection System operation.

> **Example 4:** A failure of a generator's Composite Protection System to operate as quickly as intended for an overexcitation condition is a Misoperation. This category of Misoperation could result in equipment damage.

The “Slow Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

Unnecessary Trip – During Fault

An operation of a properly coordinated remote Protection System is not in and of itself a Misoperation if the Fault has persisted for a sufficient time to allow the correct operation of the Composite Protection System of the Faulted Element to clear the Fault. A BES interrupting device failure, a “failure to trip” Misoperation, or a “slow trip” Misoperation may result in a proper remote Protection System operation.

> **Example 5:** An operation of a transformer's Composite Protection System which trips (i.e., over-trips) for a properly cleared line Fault is a Misoperation. The Fault is cleared properly by the faulted equipment's Composite Protection System (i.e., line relaying) without the need for an external Protection System operation resulting in an unnecessary trip of the transformer protection; therefore, the transformer Protection System operation is a Misoperation.

Unnecessary Trip – Other Than Fault

Unnecessary trips for non-Fault conditions include but are not limited to, power swings, overexcitation, loss of excitation, frequency excursions, and normal operations.

> **Example 6a:** An operation of a line's Composite Protection System due to a relay failure during normal operation is a Misoperation.

> **Example 6b:** Tripping a generator by the operation of the loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation assuming the Composite Protection System was not intended to operate under this condition.

> **Example 6c:** An impedance line relay trip for a power swing that entered the relay’s characteristic is a Misoperation if the power swing was stable and the relay operated because power swing blocking was enabled and should have prevented the trip, but did not.

Additionally, an operation that occurs during a non-Fault condition but was initiated directly by on-site (i.e., real-time) maintenance, testing, inspection, construction, or commissioning is not a Misoperation.

> **Example 6d:** A BES interrupting device operation that occurs at the remote end of a line during a non-Fault condition because a direct transfer trip was initiated by system maintenance and testing activities at the local end of the line is not a Misoperation.

The "on-site" activities at one location that initiates a trip to another location are included in this exemption; however, once the maintenance, testing, inspection, construction, or commissioning is complete, the "on-site" Misoperation exclusion no longer applies, regardless of the presence of on-site personnel.

Special Cases

Protection System operations for these cases would not be a Misoperation.

> **Example 7a:** A generator Protection System operation prior to closing the unit breaker(s) is not a Misoperation provided no in-service Elements are tripped.

This type of operation is not a Misoperation because the generating unit is not synchronized and is isolated from the BES. Protection System operations which occur with the protected Element out of service, that do not trip any in-service Elements, are not Misoperations.

In some cases where zones of protection overlap, the owner(s) of Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element.

> **Example 7b:** The high-side of a transformer connected to a line may be within the zone of protection of the supplying line's relaying. In this case, the line relaying is planned to protect the area of the high side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for Faults on the high-side of the connected transformer. Therefore, the operation of the line relaying for a high-side transformer Fault operated as intended and would not be a Misoperation.

The above are examples only, and do not constitute an all-inclusive list of conditions that would not be a Misoperation.

Non-Protective Functions

BES interrupting device operations which are initiated by non-protective functions, such as those associated with generator controls, excitation controls, or turbine/boiler controls, static voltampere-reactive compensators (SVC), flexible ac transmission systems (FACTS), high-voltage dc (HVdc) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. The standard is not applicable to non-protective functions such as automation (e.g., data collection) or control functions that are embedded within a Protection System.

Control Functions

The entity must make a determination as to whether the standard is applicable to its Protection System in accordance with the provided exclusions in the standard's Applicability, see Section 4.2.1. The subject matter experts (SME) developing this standard recognize that entities use Protection Systems as part of a routine practice to control BES Elements. This standard is not applicable to protective functions within a Protection System when intended for controlling a BES Element as a part of an entity's process or planned switching sequence. The following are examples of conditions to which this standard is not applicable:

> **Example 8a:** The reverse power protective function that operates to remove a generating unit from service using the entity's normal or routine process.
>
> **Example 8b:** The reverse power relay enables a permissive trip and the generator operator trips the unit.

In the example above, the standard is not applicable; however, the standard remains applicable to the reverse power relay as a part of the generator Protection System when intended to provide generator anti-motoring protection. For example, reverse power relays are typically installed as the primary protection for a generating unit to guard against motoring. Though, operators often take advantage of this functionality and use the Protection System's reverse power protective function as a normal procedure to shutdown a generating unit.

The following is another example of a condition to which this standard is not applicable:

> **Example 8c:** Operation of a capacitor bank interrupting device for voltage control using functions embedded within a microprocessor based relay that is part of a Protection System.

The above are examples only, and do not constitute an all-inclusive list to which the standard is not applicable.

Extenuating Circumstances

In the event of a natural disaster or other extenuating circumstances, the December 20, 2012 Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, says: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." The Regional Entities to whom NERC has delegated authority will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

The volume of Protection System operations tend to be sporadic. If a high rate of Protection System operations is not sustained, utilities will have an opportunity to catch up within the 120 day period.

Requirement R1

This requirement initiates a review of each BES interrupting device operation to identify whether or not a Misoperation may have occurred. Since the BES interrupting device owner typically monitors and tracks device operations, the owner is the logical starting point for identifying Misoperations of Protection Systems for BES Elements. A review is required when (1) a BES interrupting device operates that is caused by a Protection System or by manual intervention in response to a Protection System failure to operate, (2) regardless of whether the owner owns all or part of the Protection System component(s), and (3) the owner identified that its Protection System component(s) as causing the BES interrupting device operation.

Since most Misoperations result in the operation of one or more BES interrupting devices, these operations initiate a review to identify any Misoperation. If an Element is manually isolated in response to a failure to operate, the manual isolation of the Element triggers a review for Misoperation.

> **Example R1a:** The failure of a loss of field relay on a generating unit where an operator takes action to isolate the unit.

Manual intervention may indicate a Misoperation has occurred, thus requiring the initiation of an investigation by the BES interrupting device owner.

Protection Systems are made of many components. These components may be owned by different entities. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner’s differential relay. All of these components and many more are part of a Protection System. It is expected that all of the owners will communicate with each other, sharing information freely, so that Protection System operations can be analyzed, Misoperations identified, and corrective actions taken.

Each entity is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation regardless of the level of ownership. A combination of available information from resources such as counters, relay targets, Supervisory Control and Data Acquisition (SCADA) systems, or Disturbance Monitoring Equipment (DME) would typically be used to determine whether or not a Misoperation occurred. The entity is allotted 120 calendar days from the date of its BES interrupting device operation to identify whether or not a Misoperation of its Protection System component(s) occurred.

The Protection System operation may be documented in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System.

Requirement R2

For Requirement R2 (i.e., case of multi-entity ownership), the entity that owns the BES interrupting device that operated is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation under Requirement R1; however, if the entity that owns a BES interrupting device determines that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation, it must notify the other Protection System owner(s) when the criteria in Requirement R2 is met.

This requirement does not preclude the Protection System owners from initially communicating and working together to determine whether a Misoperation occurred and, if so, the cause. The BES interrupting device owner is only required to officially notify the other owners when it: (1) shares the Composite Protection System ownership with other entity(ies), (2) determines that a Misoperation occurred or cannot rule out a Misoperation, and (3) determines its Protection System component(s) did not cause a Misoperation or is unsure. Officially notifying the other owners without performing a preliminary review may unnecessarily burden the other owners with compliance obligations, redirect valuable resources, and add little benefit to reliability. The BES interrupting device owner should officially notify other owners when appropriate within the established time period.

The following is an example of a notification to another Protection System owner:

> **Example R2a:** Circuit breakers A and B at the Charlie station tripped from directional comparison blocking or DCB relaying on 03/03/2014 at 15:43 UTC during an external fault. As discussed last week, the fault records indicate that a problem with your equipment (failure to transmit) caused the operation.

Requirement R3

For Requirement R3 (i.e., notification received), the entity that also owns a portion of the Composite Protection System is expected to use judgment to identify whether the Protection System operation is a Misoperation. A combination of available information from resources such as counters, relay targets, SCADA, DME, and information from the other owner(s) would typically be used to determine whether or not a Misoperation occurred.

The entity that is notified by the BES interrupting device owner is allotted the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation date to determine if its portion of the Composite Protection System caused the Protection System operation. It is expected that in most cases of a jointly owned Protection System, the entity making notification would have been in communication with the other owner(s) early in the process. This means that the shorter 60 calendar days only comes into play if the notification occurs in the latter half of the 120 calendar days allotted to the BES interrupting device owner.

The Protection System review may be organized in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System. The BES interrupting device owner's notification received may be documented in a variety of ways such an email or a facsimile.

Requirement R4

The entity in Requirement R4 (i.e., cause identification), whether it is the entity that owns the BES interrupting device or an entity that was notified, the entity is expected to use due diligence in taking investigative action(s) to determine the cause(s) of an identified Misoperation for its portion of the Composite Protection System. The SMEs developing this standard recognize there will be cases where the cause(s) of a Misoperation will not be revealed during the allotted time periods in Requirements R1 or R3; therefore, Requirement R4 provides the entity a mechanism to continue its investigative work to determine the cause(s) of the Misoperation when the cause is not known.

A combination of available information from resources such as counters, relay targets, SCADA, DME, test results, and studies would typically be used to determine the cause of the Misoperation. At least one investigative action must be performed every two full calendar quarters until the investigation is completed.

The following is an example of investigative actions taken to determine the cause of an identified Misoperation:

> **Example R4a**: A Misoperation was identified on 03/18/2014. A line outage to test the Protection System was scheduled on 03/24/2014 for 12/15/2014 (i.e., beyond the next two full calendar quarters) due to summer peak conditions. The protection engineer contacted the manufacturer on 04/10/2014 (i.e., within two full calendar quarters) to obtain any known issues. The engineer reviewed manufacturer's documents on 05/27/2014. The outage schedule was confirmed on 08/29/2014 and was taken on 12/15/2014. Testing was completed on 12/16/2014 (i.e., in the second two full quarters) revealing the microprocessor relay as the cause of the Misoperation. A CAP is being developed to replace the relay.

Periodic action minimizes compliance burdens and focuses the entity's effort on determining the cause(s) of the Misoperation while providing measurable evidence. The SMEs recognize that certain planned investigative actions may require months to schedule and complete; therefore, the entity is only required to perform at least one investigative action every two full calendar quarters. Investigative actions may include a variety of actions, such as reviewing DME records, performing or reviewing studies, completing relay calibration or testing, requesting manufacturer review, or requesting a necessary outage.

The entity's investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for identifying the Misoperation cause.

Although the entity only has to document its specific investigative actions taken to determine the cause(s) of an identified Misoperation, the entity should consider the benefits of formally organizing (e.g., in a report or database) its actions and findings. Well documented investigative actions and findings may be helpful in future investigations of a similar event or circumstances. A thorough report or database may contain a detailed description of the event, information gathered, investigative actions, findings, possible causes, identified causes, and conclusions. Multiple owners of a Composite Protection System might consider working together to produce a common report for their mutual benefit.

The following are examples of a declaration where no cause was determined:

Example R4b: All relays at station A and B functioned properly during testing on 08/26/2014. The carrier system functioned properly during testing on 08/27/2014. The carrier coupling equipment functioned properly during testing on 08/28/2014. A settings review completed on 09/03/2014 indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be correct, and the equipment at station A and station B is already monitored. The investigation is being closed because no cause was found.

Example R4c: The protection scheme was replaced before the cause was identified. The power line carrier or PLC based protection was replaced with fiber-optic based protection with an in service date of 04/16/2014. The new system will be monitored for recurrence of the Misoperation.

Requirement R5

Resolving the causes of Protection System Misoperations benefits BES reliability by preventing recurrence. The Corrective Action Plan or CAP is an established tool for resolving operational problems. The NERC Glossary defines a Corrective Action Plan as, *"A list of actions and an associated timetable for implementation to remedy a specific problem."* When the Misoperation cause is identified in Requirement R1, R3 or R4, Requirement R5 requires Protection System owner(s) to develop a CAP or explain why corrective actions are beyond the entity's control or would not improve BES reliability. The entity must create the CAP or make a declaration why additional actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken within 60 calendar days of first determining a cause.

The SMEs developing this standard recognize there may be multiple causes for a Misoperation; in these circumstances, the CAP would include a remedy for the identified causes. The CAP may be revised if additional causes are found; therefore, the entity has the option to create a single or multiple CAPs to correct multiple causes of a Misoperation. The 60 calendar day period for developing a CAP (or declaration) is established on the basis of industry experience which includes operational coordination timeframes, time to consider alternative solutions, coordination of resources, and development of a schedule.

The time periods within Requirement R1, R3 and Requirement R5 are distinct and separate. If a cause of a Misoperation is identified quickly, the time period in Requirement R1 or R3 ends and the 60 calendar day period to develop the CAP becomes applicable. The ultimate goal is to keep all time periods as short as possible, including the correction of the cause(s) of the Misoperation. Where there are multiple Protection System owners involved in a Misoperation, each owner whose Protection System component(s) contributed to the Misoperation is subject to Requirement R5.

The development of a CAP is intended to document the specific corrective actions needed to be taken to prevent Misoperation recurrence, the timetable for executing such actions, and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. The evaluation of these other Protection Systems aims to reduce the risk and likelihood of similar Misoperations in other Protection Systems. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection

Systems at other locations or the reasoning for not taking any action. The CAP must include an evaluation of other Protection Systems including other locations to be complete.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor and the evaluation of the cause at similar locations which determined capacitor replacement was not necessary.

> **Example R5a:** Actions: Remove the relay from service. Replace capacitor. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay has not been experiencing problems and is systematically being replaced with microprocessor relays as Protection Systems are modernized. Therefore, it was assessed that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for the system.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

> **Example R5b:** Actions: Remove the relay from service. Replace capacitor. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, a program should be established by 12/01/2014 for wholesale preemptive replacement of capacitors in this type of impedance relay.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

> **Example R5c:** Actions: Remove the relay from service. Replace capacitor. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, the preemptive replacement of capacitors in this type of impedance relay should be pursued for the identified stations A through I by 04/30/2015.
>
> A plan is being developed to replace the impedance relay capacitors at stations A, B, and C by 09/01/2014. A second plan is being developed to replace the impedance relay capacitors at stations D, E, and F by 11/01/2014. The last plan will replace the impedance relay capacitors at stations G, H, and I by 02/01/2015.

The following is an example of a CAP for a relay Misoperation that was due to a version 2 firmware problem and the evaluation of the cause at similar locations which determined the firmware needs preemptive correction action.

Example R5d: Actions: Provide the manufacturer Fault records. Install new firmware pending manufacturer results by 10/01/2014.

Applicability to other Protection Systems: Based on the evaluation of other locations and a risk assessment, the newer firmware version 3 should be installed at all installations that are identified to be version 2. Twelve relays were identified across the system. Proposed completion date is 12/31/2014.

The following are examples of a declaration made where corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken.

Example R5e: The cause of the Misoperation was due to a non-registered entity communications provider problem.

Example R5f: The cause of the Misoperation was due to a transmission transformer tapped industrial customer who initiated a direct transfer trip to a registered entity's transmission breaker.

In situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity's control.

The following in an example of a declaration made why corrective actions would not improve BES reliability.

Example R5g: The investigation showed that the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations.

Example R5h: As a result of an operation that left a portion of the power system in an electrical island condition, circuit XYZ within that island tripped, resulting in loss of load within the island. Subsequent investigation showed an overfrequency condition persisted after the formation of that island and the XYZ line protective relay operated. Since this relay was operating outside of its designed frequency range and would not be subject to this condition when line XYZ is operated normally connected to the BES, no corrective action will be taken because BES reliability would not be improved.

Example R5i: During a major ice storm, four of six circuits were lost at Station A. Subsequent to the loss of these circuits, a skywire (i.e., shield wire) broke near station A on line AB (between Station A and B) resulting in a phase-phase fault. The protection scheme utilized for both protection groups is a POTT. The Line AB protection at Station B tripped timed for this event (i.e., Slow Trip – During Fault) even though this line had been identified as requiring high speed clearing. A weak infeed condition was created at Station A due to the loss of 4 transmission circuits resulting in the absence of a permissive signal on Line AB from Station A during this fault. No corrective action will be taken for this Misoperation as even under N-1 conditions, there is normally enough infeed at Station A to send a proper permissive signal to station B. Any changes to the protection scheme to account for this would not improve BES reliability.

A declaration why corrective actions are beyond the entity's control or would not improve BES reliability should include the Misoperation cause and the justification for taking no corrective action. Furthermore, a declaration that no further corrective actions will be taken is expected to be used sparingly.

Requirement R6

To achieve the stated purpose of this standard, which is to identify and correct the causes of Misoperations of Protection Systems for BES Elements, the responsible entity is required to implement a CAP that addresses the specific problem (i.e., cause(s) of the Misoperation) through completion. Protection System owners are required in the implementation of a CAP to update it when actions or timetable change, until completed. Accomplishing this objective is intended to reduce the occurrence of future Misoperations of a similar nature, thereby improving reliability and minimizing risk to the BES.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip (See also, Example R5a).

> **Example R6a:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. The failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.
>
> CAP completed on 06/25/2014.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip that resulted in the correction and the establishment of a program for further replacements (See also, Example R5b).

> **Example R6b:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. The failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.
>
> A program for wholesale preemptive replacement of capacitors in this type of impedance relay was established on 10/28/2014.
>
> CAP completed on 10/28/2014.

The following is an example of a completed CAP of corrective actions with a timetable that required updating for a failed relay; and preemptive actions for similar installations (See also, Example R5c).

Example R6c: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. The failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

The impedance relay capacitor replacement was completed at stations A, B, and C on 08/16/2014. The impedance relay capacitor replacement was completed at stations D, E, and F on 10/24/2014. The impedance relay capacitor replacement for stations G, H, and I were postponed due resource rescheduling from 02/01/15 to 03/01/2015. Following the timetable change, capacitor replacement was completed on 03/09/2015 at stations G, H, and I. All stations identified in the evaluation have been completed.

CAP completed on 03/09/2015.

The following is an example of a completed CAP for corrective actions with updated actions for a firmware problem; and preemptive actions for similar installations. (See also, Example R5d).

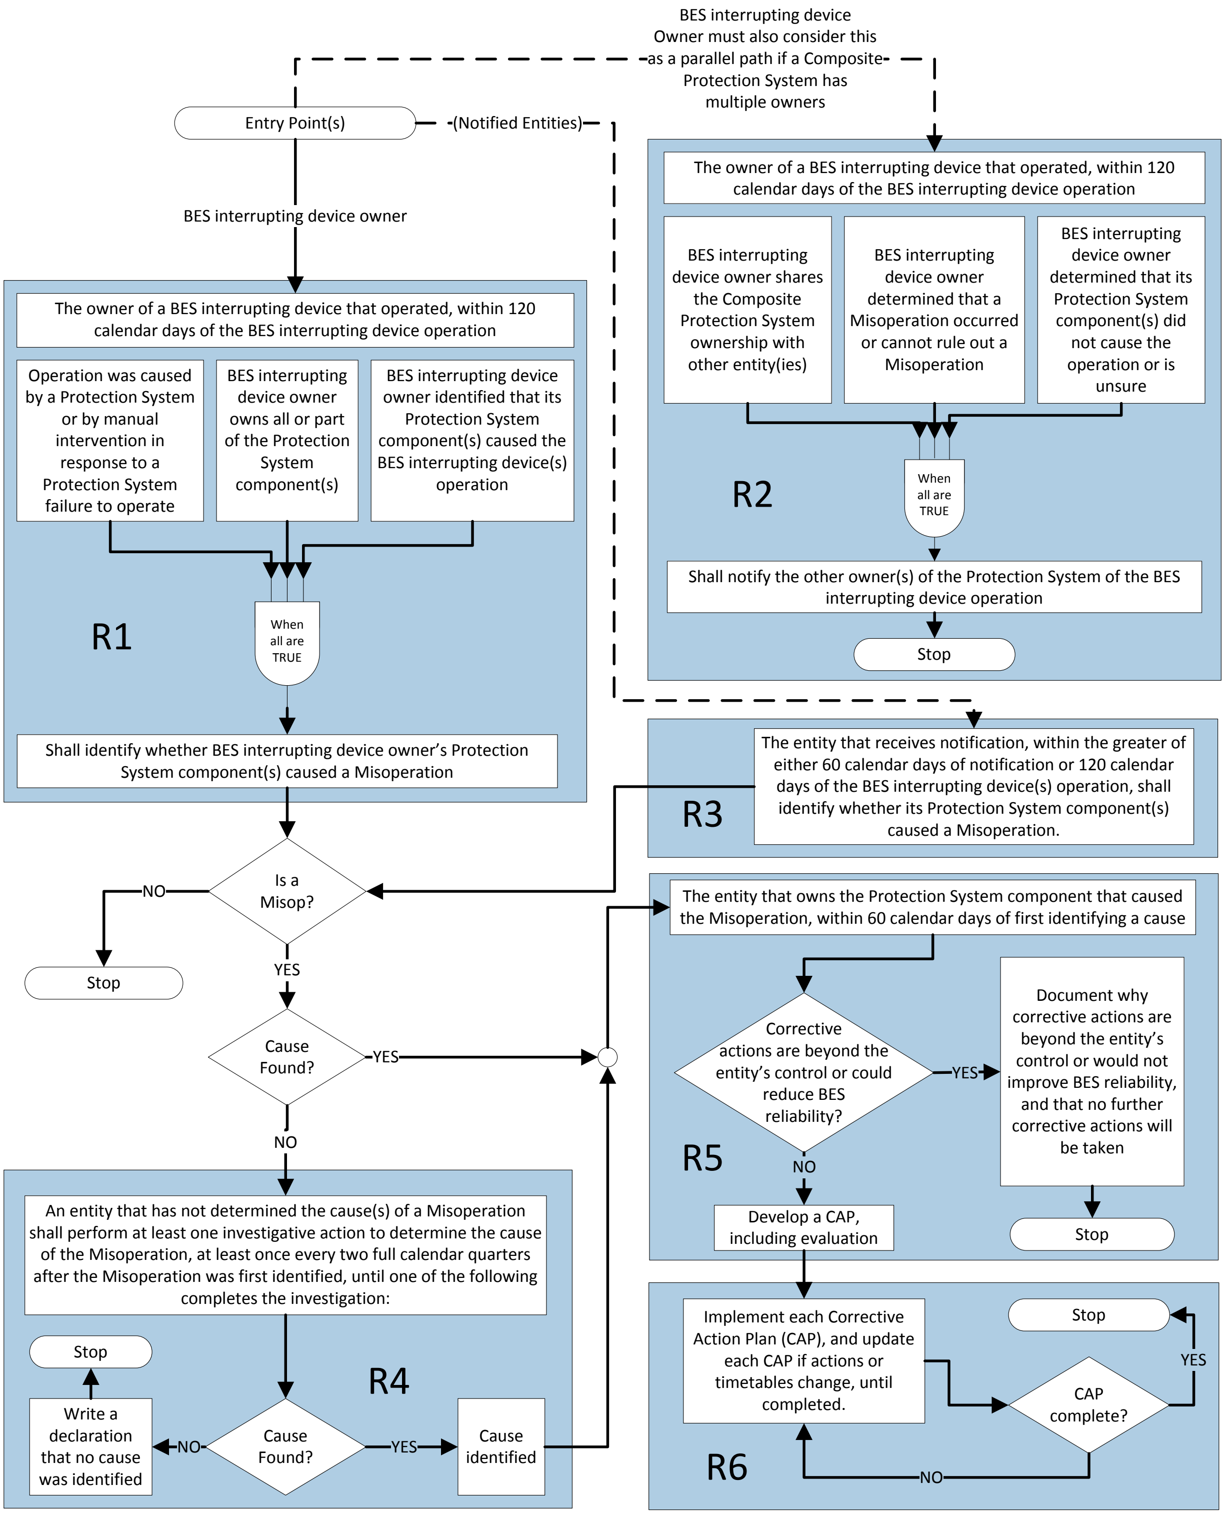
Example R6d: Actions: Fault records were provided to the manufacturer on 06/04/2014. The manufacturer responded that the Misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 08/12/2014.

Nine of the twelve relays were updated to version 3 firmware on 09/23/2014. The manufacturer provided a subsequent update which was determined to be beneficial for the remaining relays. The remaining three of twelve relays identified as having the version 2 firmware were updated to version 3.01 firmware on 11/10/2014.

CAP completed on 11/10/2014.

The CAP is complete when all the documented actions to resolve the specific problem (i.e., Misoperation) are completed which may include those actions resulting from the entity’s evaluation of other locations, if not addressed through a separate CAP.

Process Flow Chart: Below is a graphical representation of the expected process created by the standard, including the relationships between requirements:



Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. The SC authorized moving the SAR forward ~~to~~for standard development at their June 9, 2011 meeting.
2. The SAR was posted for informal comment June 10 – July 11, 2011.
3. Draft 1 of PRC-004-3 was posted for a 30-day formal comment period from June 10 – July 11, 2011.
4. Draft 2 of PRC-004-3 was posted for a 45-day ~~concurrent~~formal comment ~~and initial ballot~~ period from July 25 – September 7, 2012~~.~~ and an initial ballot in the last ten days of the comment period from August 29 – September 7, 2012.
5. Draft 3 of PRC-004-3 was posted for a 30-day formal comment period from January 22 – February 20, 2013 and a successive ballot in the last ten days of the comment period from February 11-20, 2013.

Description of Current Draft

The Protection System Misoperations Standard Drafting Team (PSMSDT) is posting Draft ~~3~~4 of PRC-004-3 ~~posted –~~ Protection System Misoperation Identification and Correction for a ~~30~~45-day ~~formal~~ comment period ~~with parallel successive~~and ballot~~.~~ in the last ten days of the comment period under the new Standards Process Manual (Effective: June 26, 2013).

Anticipated Actions	Anticipated Date
~~30~~Additional 45-day Formal Comment Period with ~~Successive~~Parallel Ballot	January~~,~~ 201~~3~~4
~~Recirculation ballot~~10-day Final Ballot	~~February, 2013~~March 2014
BOT Approval	May~~,~~ 201~~3~~4

Effective Dates~~: First day of~~

Except in the ~~first calendar quarter that is twelve months beyond the date that this~~ Western Interconnection, the standard ~~is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes~~and definitions shall become effective on the first day of the first calendar quarter that is twelve months ~~beyond the date this standard is approved by~~ after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Except in the Western Interconnection, where approval by an applicable governmental authority is not required, the standard and definitions shall become effective on the first day of the first calendar quarter that is twelve months after the date the standard is adopted by the NERC Board of Trustees~~,~~ or as otherwise ~~made effective pursuant to the laws applicable~~ provided for in that jurisdiction.

In the Western Interconnection, the standard and definitions shall become effective on the first day of the first calendar quarter that is twenty-four months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to ~~such ERO governmental authorities~~go into effect. In the Western Interconnection, where approval by an applicable governmental authority is not required, the standard and definitions shall become effective on the first day of the first calendar quarter that is twenty-four months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the *Glossary of Terms used in NERC Reliability Standards* ~~*Glossary of Terms*~~ are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the ~~*G*~~glossary.

Composite Protection System:

> The total complement of the Protection System(s) that function collectively to protect an Element, such as any primary, secondary, local backup, and communication-assisted relay systems. Backup protection provided by a remote Protection System is excluded.

Misoperation:

> The failure of ~~an Element's composite~~a Composite Protection System to operate as intended. Any of the following is ~~*considered*~~ a Misoperation:

1. **Failure to Trip ~~-~~– During Fault ~~-~~–** A failure of a Composite Protection System to operate for a Fault ~~within the zone~~ condition for which it is designed~~ to protect~~. The failure of a Protection System component is not a Misoperation as long as the ~~overall~~ performance of the Composite Protection System ~~for the Element it is designed to protect~~ is correct.
2. **Failure to Trip ~~-~~– Other Than Fault ~~-~~–** A failure of a Composite Protection System to operate for a non-Fault condition for which ~~the Protection System was intended to operate~~it is designed, such as a power swing, ~~under-voltage, over excitation~~undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the ~~overall~~ performance of the Composite Protection System ~~for the Element it is designed to protect~~ is correct.
3. **Slow Trip ~~-~~– During Fault ~~-~~–** A Composite Protection System operation that is slower than ~~intended~~required for a Fault ~~within the zone~~ condition for which it is designed~~ to protect~~. Delayed ~~Fault~~ clearing ~~associated with an installed high-speed protection scheme is not~~ of a Fault condition is a Misoperation if ~~the~~ high-speed performance ~~has not been~~was previously identified ~~to meet the~~ as being necessary to prevent voltage or dynamic ~~stability performance requirements of the TPL standards nor is it required to ensure coordination with~~instability, or resulted in the operation of any other Composite Protection System~~s~~.
4. **Slow Trip ~~-~~– Other Than Fault ~~-~~–** A Composite Protection System operation that is slower than ~~intended~~required for a non-Fault condition for which it is designed, such as a power swing, ~~under-voltage, over excitation~~undervoltage, overexcitation, or loss of excitation~~ for which the Protection System was intended to operate~~. Delayed clearing of a non-Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or resulted in the operation of any other Composite Protection System.

5. **Unnecessary Trip ~~-~~– During Fault** ~~- A~~ An unnecessary Protection System operation for a Fault ~~for which the Protection System is not intended to operate.~~ condition on another Element.

6. **Unnecessary Trip ~~-~~– Other Than Fault** ~~- A~~ An unnecessary Protection System operation for a non-Fault condition for which ~~the~~it is not designed. A Protection System ~~is not intended to operate, and~~operation that is ~~unrelated to~~caused by on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System Misoperation Identification and Correction**
2. **Number:** PRC-004-3
3. **Purpose:** Identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) ~~Protection Systems~~Elements.
4. **Applicability:**

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities:

~~**4.2.1**~~ Protection Systems for BES Elements

~~**4.2.2** Underfrequency Load Shedding (UFLS) that trips a BES Element~~

~~**4.2.3** Special Protection Systems (SPS), Remedial Action Schemes (RAS), and Undervoltage Load Shedding (UVLS) are excluded~~

~~4.2.4~~4.2.1 . Non-protective functions that ~~may be imbedded~~are embedded within a Protection System are excluded. Protective functions intended to operate as a control function during switching are excluded.[1]

4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

Rationale for Applicability: Protection Systems that protect BES Elements are integral to the operation and reliability of the BES. Some functions of relays are not used as protection but as control functions or for automation; therefore, any operation of the control function portion or the automation portion of relays is excluded from this standard. See the Application Guidelines for detailed examples of non-protective functions. Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are not included in this standard because they are planned to be handled in the second phase of this project.

5. **Background**:

A key element for BES reliability is the correct performance of Protection Systems. ~~Monitoring BES~~The monitoring of Protection System events for BES Elements, as well

[1] For additional information and examples, see the "Non-Protective Functions" and "Control Functions" sections in the Application Guidelines.

as identifying and correcting the causes of Misoperations, will improve Protection System performance. This Reliability Standard PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-~~2a~~2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations~~ with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated. ~~. The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems ~~required the Regions~~requires Regional Entities to establish procedures for analysis of Misoperations. In FERC Order No. 693, the Commission identified PRC-003-0 as a "fill-in-the-blank" standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the requirements of PRC-004-~~2a.~~ 2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-~~2a~~2.1a.

This project includes revising the existing definition of Misoperation, which reads:

Misoperation

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity.

In general, this definition needs more specificity and clarity. The terms "specified time" and "abnormal condition" are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical yet explainable condition is a Misoperation.

The SAR for this project also includes clarifying reporting requirements. Misoperation data, as currently collected and reported, is not ~~usable~~optimal to establish consistent metrics for measuring Protection System performance. As such, the ~~drafting team is removing the~~ data reporting obligation ~~from the~~for this standard is being removed and is ~~developing a data request~~being developed under ~~Section 1600 of~~ the NERC Rules of Procedure~~.~~, Section 1600 – Request for Data or Information ("data request"). As a result of the data request, NERC will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry.~~ The data submitted as part of the data request will not be used for compliance or enforcement purposes. The~~ The removal of the data collection obligation from the standard does not result in a reduction of reliability~~ as Responsible Entities are required to retain~~. The standard and data request have been developed in a manner such that evidence ~~of~~used for compliance ~~for audit and compliance purposes under the Compliance Section C 1.2 Evidence Retention portion of~~with the standard and data request are intended to independent of each other.

The proposed requirements of the revised Reliability Standard PRC-004-3 meet the following objectives:

- ~~•~~ Review all Protection System operations on the BES to identify those that are Misoperations of Protection Systems for Facilities that are part of the BES.
- ~~•~~ Analyze Misoperations of Protection Systems for Facilities that are part of the BES to ~~determine~~identify the cause(s).
- ~~•~~ Develop and implement Corrective Action Plans to address the cause(s) of Misoperations of Protection Systems for Facilities that are part of the BES.

Misoperations ~~of or~~ associated with Special Protection Schemes~~,~~, (SPS) and Remedial Action Schemes~~, and Under-Voltage Load Shedding~~ (RAS) are not addressed in this standard due to their inherent complexities. NERC ~~intends~~plans to ~~address these areas through future projects~~handle SPS and RAS in the second phase of this project.

~~Note that the WECC~~The Western Electric Coordinating Council (WECC) Regional Reliability Standard PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation relates to the reporting of Misoperations of Protection Systems and RAS for a limited set of WECC Paths~~ and Remedial Action Schemes. In those cases where PRC-004-~~. The WECC~~-1 overlaps with the Continent-wide~~ region plans to conduct work to harmonize the regional standard~~, entities are expected to comply with the more stringent~~ with this continent-wide proposed standard and the second phase of this project concerning SPS and RAS.

6. Effective Dates: See Implementation Plan

B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider ~~shall~~that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation when: *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

~~**1.1** Within 120 calendar days of a BES interrupting device operation in its Facility caused by a Protection System operation, identify and review each Protection System operation.~~

- ~~If the entity owns both the BES interrupting device and the Protection System, determine if it was a correct operation or a Misoperation.~~
- ~~If the entity owns the~~**1.1** The BES interrupting device ~~but does not own all of the Protection System and cannot determine that the Protection System operation was correct, then notify the other owner(s) of the Protection System component(s) and provide any requested investigative information.~~

~~**Rationale for R1**: This requirement is the first step to ensuring that practices for reviewing and classifying Protection System operations and correcting Misoperations are consistently employed. The drafting team believes 120 calendar days takes into account the seasonal nature of Protection System operations; both the volume of Protection System operations as well as outage constraints for investigative purposes can be seasonal. This requirement mandates entities identify and review Protection System operations. Risks to the BES caused by Misoperations are reduced by reviewing all Protection System operations and investigating any Misoperations to find their cause(s). Requirement R1 places the responsibility on the BES interrupting device owner to investigate operations initiated by a Protection System. The initial investigation documentation should be provided to the owner of the Protection System component(s) that contributed to the Misoperation, upon request. The owner of the interrupting device and the entity that owned the component that contributed to the Misoperation should be communicating about the operation before this notification is transmitted. The owner of the component that contributed to the Misoperation will create the CAP, action plan or declaration required by Requirements R2 and R3.~~

- ~~The Protection System component owner(s) that was notified by the BES interrupting device owner shall determine if there was a correct operation or a Misoperation of their component.~~

~~Within the same 120 day period of a BES interrupting device operation~~ operation was caused by a Protection System ~~operation, the owner of the Protection System component identified as contributing to the Misoperation shall investigate and document the findings for each Misoperation including a cause, if identified.~~or by manual intervention in response to a Protection System failure to operate; and

~~**M1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Part 1.1 that may include, but is not limited to, dated lists, logs, or a database (electronic or hard copy format) that documents the date and time of each applicable interrupting device operation and indicates when each related Protection System operation was reviewed. Acceptable evidence for the notification required by Part 1.1 may include, but is not limited to, emails, electronic files, or hard copy records demonstrating transmittal of information. Acceptable evidence for Part 1.2 may include, but is not limited to, dated lists, logs, or a database (electronic or hard copy format) that documents the date, time, Facility and equipment name associated with each Misoperation, a copy of a dated Misoperation investigation report or documented findings, which may include sequence of events, relay targets, summary of DME records for each Misoperation.~~

1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and

1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

M1. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to, the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R1: This requirement ensures that entities review those Protection System operations meeting the criteria in all three Parts (1.1, 1.2, and 1.3) and identify any that are Misoperations. The BES interrupting device owner has the responsibility to initiate the review because the owner is in the best position to be aware of the operation. Manual intervention is included as a condition that initiates a review. Occasionally, Protection System failures do not yield other Protection System operations and manual intervention is required to isolate the problematic equipment. The 120 calendar day period accounts for the sporadic volumes of Protection System operations, and provides the opportunity to identify any Misoperations which were initially missed.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, notify the other owner(s) of the Protection System of the operation when: *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

2.1 The BES interrupting device owner shares the Composite Protection System ownership with any other entity; and

2.2 The BES interrupting device owner determined that a Misoperation occurred or cannot rule out a Misoperation; and

2.3 The BES interrupting device owner determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.

~~**Rationale for R2**: A formal CAP is a proven tool for resolving operational problems. Based on industry experience and operational coordination timeframes, the SDT believes 60 calendar days is reasonable for considering such things as alternative solutions, coordination of resources, or development of a schedule for a CAP. When the cause of a Misoperation is determined from implementing an action plan in accordance with Requirement R4, a CAP must be developed in accordance with Requirement R2.~~

~~In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, documenting the reasons for taking no corrective actions is essential for justifying the close of the Misoperation investigation process and for future reference.~~

M2. Acceptable evidence for Requirement R2, including Parts 2.1, 2.2, and 2.3 may include, but is not limited to, the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

Rationale for R2: This requirement ensures that the BES interrupting device owner notifies the other owners of the Composite Protection System when the criteria in all three Parts (2.1, 2.2, and 2.3) are met, within the same 120 calendar day period as R1. This ensures other entities are notified to review their Protection System components. The expectation is that entities will communicate accordingly and when it is clear that the three conditions are met, the entity would make the notification. It is not intended for entities to automatically and unnecessarily notify other entities before adequate detail is known.

R3. Each Transmission Owner, Generator Owner, ~~or~~and Distribution Provider that receives notification, pursuant to Requirement R2, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, shall identify whether its Protection System component(s) caused a Misoperation. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

M3. Acceptable evidence for Requirement R3 may include, but is not limited to, the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

~~**Rationale for R3**: Where a Misoperation cause is not determined during the initial investigation; implementing an action plan of additional investigation/monitoring may determine a cause and lead to the development of a CAP in accordance with Requirement R2. The 180 calendar day period is the sum of 120 calendar days (investigative period in Requirement R1) and a 60 calendar day period (similar timeframe as in Requirement R2 for developing a CAP.)~~

~~If the action plan completion does not provide direction for identifying the cause, then pursuing further action is not warranted. In these cases, documenting the reasons is essential for justifying the close of the Misoperation investigation process and for future reference.~~

Rationale for R3: When an entity receives notification of a Protection System operation by the BES interrupting device owner, the Protection System owner is allotted at least 60 calendar days to identify whether it was a Misoperation. A shorter time period is allotted on the basis that the BES interrupting device owner has already performed preliminary work, collaborated with the other owners, and that other owners generally have fewer associated Protection System components.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation identified in accordance with Requirement R1 or R3 shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: *[Violation Risk Factor: Medium] [Time Horizon: Operations Assessment, Operations Planning]*

- The identification of the cause(s) of the Misoperation; or
- A declaration that no cause was identified.

M4. Acceptable evidence for Requirement R4 may include, but is not limited to, the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R4: If a Misoperation cause is not identified within the time period established by Requirements R1 or R3 (120 calendar days), the Protection System component owner must demonstrate investigative actions toward identifying the cause(s). Performing at least one action every two full calendar quarters from first identifying the Misoperation encourages periodic focus on finding the cause of the Misoperation.

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying ~~the~~a cause of ~~each~~the Misoperation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s~~) that includes~~), and an evaluation of the CAP's applicability to the entity's other Protection Systems ~~at~~including other locations, or
- Explain in a declaration why corrective actions are beyond the entity's control or would ~~reduce~~not improve BES reliability, and that no further corrective actions will be taken.

~~**M2**~~**M5.** Acceptable evidence for Requirement R5 may include, but is not limited to, the following documentation (electronic or hardcopy format): a dated CAP or a dated declaration.

Rationale for R5: A formal CAP is a proven tool for resolving and reducing the possibility of reoccurrence of operational problems. A time period of 60 calendar days is based on industry experience and operational coordination time needed for considering such things as alternative solutions, coordination of resources, or development of a schedule. When the cause of a Misoperation is identified, a CAP will generally be developed. In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, a statement documenting the reasons for taking no corrective actions is essential for justifying the close of the Misoperation in lieu of a CAP and for future reference.

R6. Each Transmission Owner, Generator Owner, and Distribution Provider shall ~~have evidence for Requirement R2 that must include a dated CAP or a dated declaration explaining why there is no need to develop a CAP.~~

~~Each Transmission Owner, Generator Owner, or Distribution Provider shall, within 180 calendar days of the associated BES interrupting device operation, complete for each Misoperation without an identified cause:~~implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. [*Violation Risk Factor: Medium*~~] [~~*][Time Horizon: Operations Planning, Long-Term Planning]*

- ~~Development of an action plan that identifies any additional investigative actions and/or Protection System modifications, including a work timetable, or~~
- ~~A declaration explaining why no further actions will be taken.~~

~~**M3.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R3 that must include a dated action plan or a dated declaration.~~

~~**R1.** Each Transmission Owner, Generator Owner, or Distribution Provider shall implement each CAP or action plan, and revise as needed through completion. [*Violation Risk Factor: High*] [*Time Horizon: Operations Planning, Long-Term Planning*]~~

~~**Rationale for R4**: The CAP or action plan must be completed to accomplish all identified objectives. During the course of implementing a CAP or action plan, revisions may be necessary for a variety of reasons such as scheduling conflicts or resource issues. Documenting the CAP or action plan provides auditable progress and completion confirmation on any plan. When the cause of a Misoperation is determined from implementing an action plan, a CAP must be developed in accordance with Requirement R2.~~

~~**M4.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have~~**M6.** Acceptable evidence for Requirement ~~R4 that must~~R6 may include, but is not limited to, ~~dated~~ the following documentation (electronic or hard copy format): dated records ~~which~~that document the implementation of each CAP and ~~action plan and~~ the completion of actions for each CAP ~~or action plan. The evidence~~. Evidence may also include ~~dated~~ work management program records, ~~dated~~ work orders, ~~or dated~~and maintenance records.

Rationale for R6: The CAP must accomplish all identified objectives to be complete. During the course of implementing a CAP, updates may be necessary for a variety of reasons such as new information, scheduling conflicts, or resource issues. Documenting changes or completion of CAP activities provides measurable progress and confirmation of completion.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority ~~(CEA)~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider ~~that owns a BES Protection System~~ shall keep data or evidence to show compliance ~~with Requirements R1, R2, R3, and R4 and Measures M1, M2, M3, and M4, since the last audit~~as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- The Transmission Owner, Generator Owner, and Distribution Provider ~~that owns a BES Protection System~~ shall retain evidence of Requirements R1, R2, R3, and R4, Measures M1, M2, M3, and M4 for ~~all Misoperations with an open investigation, action plan, or~~ 12 calendar months.
- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R5, Measure M5 for 12 calendar months following completion of each CAP ~~even if the BES interrupting device operation occurred prior to the current audit period~~, evaluation, and declaration.
- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R6, Measure M6 for 12 calendar months following completion of each CAP.

If a Transmission Owner, Generator Owner ~~and~~, or Distribution Provider ~~that owns a BES Protection System~~ is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes~~:~~

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

Periodic Data Submittal

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation. Guidelines and Technical Basis

Introduction

This standard addresses the reliability issues identified in the letter[2] from Gerry Cauley, NERC President and CEO, dated January 7, 2011.

> "Nearly all major system failures, excluding perhaps those caused by severe weather, have misoperations of relays or automatic controls as a factor contributing to the propagation of the failure. …Relays can misoperate, either operate when not needed or fail to operate when needed, for a number of reasons. First, the device could experience an internal failure – but this is rare. Most commonly, relays fail to operate correctly due to incorrect settings, improper coordination (of timing and set points) with other devices, ineffective maintenance and testing, or failure of communications channels or power supplies. Preventable errors can be introduced by field personnel and their supervisors or more programmatically by the organization."

The standard also addresses the findings in the 2011 Risk Assessment of Reliability Performance[3]; July 2011.

> "…a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry."

~~The composite Protection System in the context of this standard is the total complement of protection for a system Element. All protection for a given Element such as primary, secondary, backup, pilot and non-pilot relay schemes are included in the composite Protection System for the Element. These individual schemes or systems may be isolated or function independently, but aggregate as part of one composite Protection System.~~

~~A Protection System~~

Definitions

The Misoperation definition is based on the IEEE/PSRC Working Group I3 "Transmission Protective Relay System Performance Measuring Methodology[4]." Misoperations of a Protection System include failure to operate, slowness in operating, or operating when not required either during a Fault or non-Fault condition.

---

[3] http://www.nerc.com/files/2011_RARPR_FINAL.pdf

[4] "Transmission Protective Relay System Performance Measuring Methodology," Working Group I3 of Power System Relaying Committee of IEEE Power Engineering Society, 1999.

For reference, a "Protection System" is defined in the ~~NERC~~ *Glossary of Terms* ~~as:~~ *used in NERC Reliability Standards* ("NERC Glossary") as:

- ~~•~~Protective relays which respond to electrical quantities,
- ~~•~~Communications systems necessary for correct operation of protective functions,
- ~~•~~Voltage and current sensing devices providing inputs to protective relays,
- ~~•~~Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- ~~•~~Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

~~Circuit breaker and other~~A BES interrupting device is a BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current. Although BES interrupting device mechanisms are not part of a Protection System~~.~~

~~A revised~~ , the standard uses the operation of a BES interrupting device by a Protection System to initiate the review for Misoperation~~ definition is~~ .

The following two definitions are being proposed for ~~industry adoption;~~inclusion in the ~~failure~~ NERC Glossary:

> **Composite Protection System –** *The total complement of* ~~an Element's~~*the Protection System(s) that function collectively to protect a Element, such as any primary, secondary, local backup, and communication-assisted relay systems. Backup protection provided by a remote Protection System is excluded.*

This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the entity must consider the entire Protection System associated with the BES interrupting device that operated. Additionally, the definition accounts for those Protection Systems with multiple levels of protection (e.g., redundant systems), such that if one component fails, but the overall intended performance of the composite protection is met – it would not be identified as a Misoperation under the definition.

> **Misoperation –** *The failure a Composite Protection System to operate as intended.* ~~The definition includes~~*Any of the following* ~~categories~~*is a Misoperation*:
>
> 1. ~~**(1)**~~**Failure to Trip – During Fault –** *A failure of a Composite Protection System to operate for a Fault* ~~**within the zone**~~*condition for which it is designed*~~**to protect.**~~ *. The failure of a Protection System component is not a Misoperation as long as the* ~~**overall**~~ *performance of the Composite Protection System is correct.*

***Failure to Trip – Other Than Fault –** A failure of a Composite Protection System to operate for* ~~**the Element**~~*a non-Fault condition for which it is designed* ~~**to protect is correct.**~~

2. ~~A failure of a transformer's composite Protection System to operate for a transformer Fault is an example of a "~~, *such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure* ~~to trip" Misoperation. This type~~*of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*

3. ***Slow Trip – During Fault*** *– A Composite Protection System operation that is slower than required for a Fault condition for which it is designed. Delayed clearing of a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or resulted in the operation of any other Composite Protection System.*

4. ***Slow Trip – Other Than Fault*** *– A Composite Protection System operation that is slower than required for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. Delayed clearing of a non-Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or resulted in the operation of any other Composite Protection System.*

5. ***Unnecessary Trip – During Fault*** *– An unnecessary Protection System operation for a Fault condition on another Element.*

6. ***Unnecessary Trip – Other Than Fault*** *– An unnecessary Protection System operation for a non-Fault condition for which it is not designed. A Protection System operation that is caused by on-site maintenance, testing, inspection, construction or commissioning activities is not a Misoperation.*

Failure to automatically reclose after a Fault condition is not included as a Misoperation because reclosing equipment is not included within the definition of Protection System.

This proposed definition of Misoperation provides additional clarity over the current version. A Misoperation is the failure of a Composite Protection System to operate as intended. The definition includes six categories which provide further differentiation and examples of what is a Misoperation. These categories are discussed in greater detail in the following sections.

Failure to Trip – During Fault

This category of Misoperation typically results in the Fault condition being cleared by remote backup Protection System operation~~s~~.

> **Example 1a:** A failure of a transformer's Composite Protection System to operate for a transformer Fault is a Misoperation.

> **Example 1b:** A failure of a "primary" transformer relay (or any other component) to operate for a transformer Fault is not a ~~"failure to trip"~~ Misoperation as long as another component of the transformer's ~~c~~Composite Protection System operated to clear the Fault~~. Please see category 3 to see if the "slow trip" classification applies to the operation~~.

Example 1c: A lack of target information~~, e.g. when~~ does not by itself constitute a Misoperation. When a high-speed pilot system does not target because a high-speed zone element trips first~~, does~~ would not ~~by~~in and of itself ~~constitute~~be a Misoperation.

~~**(2) A failure of a Protection System to operate for a non-Fault condition for which**~~In analyzing the Protection System ~~**was intended to operate, such as a power swing, under-voltage, over excitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for the Element it is designed to protect is correct.**~~

~~A failure of a generator's composite Protection System to operate for a loss of field condition is an example of a "failure to trip"~~ for Misoperation~~. This type of Misoperation may require manual operator intervention.~~

~~A failure of a "primary" reverse power relay (or any other component) is not a "failure to trip" Misoperation as long as another component of the generator's composite Protection System operated to shut down the generator. Please see~~, the entity must also consider whether the "Slow Trip – During Fault" category ~~4 to see if the "slow trip" classification~~ applies to the operation.

~~The non-~~

Failure to Trip – Other Than Fault

This category of Misoperation may have resulted in operator intervention. The "Failure to Trip – Other Than Fault" conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

~~**(3) A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high-speed performance has not been identified to meet the dynamic stability performance requirements of the TPL standards nor is it required to ensure coordination with other Protection Systems.**~~

~~A failure of a line's composite Protection System to operate as quickly as intended for a line Fault is an example of a "slow trip"~~ **Example 2a:** A failure of a generator's Composite Protection System to operate for an unintentional loss of field condition is a Misoperation.

Example 2b: A failure of an overexcitation relay (or any other component) is not a "Failure to Trip – Other Than Fault" Misoperation as long as another component of the generator's Composite Protection System operated as intended (e.g., isolating the generator).

In analyzing the Protection System for Misoperation~~. –~~, the entity must also consider whether the "Slow Trip – Other Than Fault" category applies to the operation.

Slow Trip – During Fault

This ~~type~~category of Misoperation typically results in remote backup Protection System operation~~s~~ before the Fault is cleared.

> ~~In many cases,~~**Example 3:** A failure of a line's Composite Protection System to operate as quickly as intended for a line Fault is a Misoperation.

Installing high-speed protection ~~is installed as~~ may be a part of ~~the~~a utility's standard practice without having the need for high-speed protection ~~for meeting TPL requirements. A slow trip of this Protection System~~to prevent voltage or dynamic instability or to maintain relay coordination. For this case, a "Slow Trip – During Fault" of the high-speed protection is not a Misoperation because it would not negatively impact the dynamic ~~performance of the BES; so, it does not need to be reported. However, even if high-speed clearing is not required, the~~BES performance, unless the Composite Protection System operation is slower than previously identified as being necessary to prevent voltage or dynamic instability. The Composite Protection System must also coordinate with other Protection Systems to prevent the trip (e.g., an over-trip) of additional Protection Systems ~~must coordinate to prevent an "unnecessary trip" Misoperation (e.g. an over trip).~~.

The phrase "slower than ~~intended~~required" means the Composite Protection System operated slower than the objective of the owner(s). It would be ~~impossible~~impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should ~~have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent additional harm, and ultimately be able to decide~~understand whether the speed ~~or~~and outcome of its Protection System operation ~~was adequate~~met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and stability by the owner(s) reviewing each Protection System operation.

The ~~reference to the TPL standards is meant to place some bounds on the time to clear a Fault and prevent dynamic instability. The performance requirements~~phrase "resulted in the ~~TPL standards are found in Table 1, and are applicable to all contingencies mentioned for Type A, B and C contingencies.~~

~~Coordination with~~operation of any other Composite Protection System~~s~~" refers to the need to ensure that relaying operates in the proper or planned sequence (i.e~~.~~., the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

~~**(4) A Protection System operation that is slower than intended for a non-Fault condition such as a power swing, under-voltage, over excitation, or loss of excitation for which it was intended to operate.**~~

~~A failure of a generator's composite Protection System to operate as quickly as intended for an over excitation condition is an example of a "slow trip" Misoperation. This type of Misoperation may result in equipment damage.~~

In analyzing the Protection System for Misoperation, the entity must also consider the "Unnecessary Trip – During Fault" category to determine if an "unnecessary trip" applies to the Protection System operation of an Element other than the faulted Element.

Slow Trip – Other Than Fault

The phrase "slower than ~~intended~~required" means the ~~c~~Composite Protection System operated slower than the objective of the owner(s). It would be ~~impossible~~impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should ~~have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent additional harm, and ultimately be able to decide~~understand whether the speed ~~or~~and outcome of its Protection System ~~was adequate~~operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and stability by the owner(s) reviewing each Protection System operation.

> **Example 4:** A failure of a generator's Composite Protection System to operate as quickly as intended for an overexcitation condition is a Misoperation. This category of Misoperation could result in equipment damage.

The ~~non-~~"Slow Trip – Other Than Fault" conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

~~**(5) A Protection System operation for a Fault for which the Protection System is not intended to operate.**~~

~~An operation of a transformer's composite Protection System which over trips for a properly cleared line Fault is an example of an "unnecessary trip" Misoperation. For this type of Misoperation, the Fault is typically cleared properly by the faulted equipment's composite Protection System (line relaying, in this case) without the need for an external Protection System's operation.~~

Unnecessary Trip – During Fault

An operation of a properly coordinated remote Protection System~~s~~ is not in and of itself a Misoperation if the Fault has persisted for a sufficient time to allow the correct operation of the ~~local~~Composite Protection System of the Faulted Element to clear the Fault. ~~An~~A BES interrupting device failure, a "failure to trip" Misoperation, or a "slow trip" Misoperation may result in a proper remote Protection System operation.

~~**(6) A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate, and is unrelated to on-site maintenance, testing, inspection, construction or commissioning activities.**~~

> ~~Non-Fault~~ **Example 5:** An operation of a transformer's Composite Protection System which trips (i.e., over-trips) for a properly cleared line Fault is a Misoperation. The Fault is cleared properly by the faulted equipment's Composite Protection System (i.e., line relaying) without the need for an external Protection System operation resulting in an unnecessary trip of the transformer protection; therefore, the transformer Protection System operation is a Misoperation.

Unnecessary Trip – Other Than Fault

Unnecessary trips for non-Fault conditions include but are not limited to, power swings, ~~over excitation~~overexcitation, loss of excitation, frequency excursions, and normal ~~condi~~operations.

> **Example 6a:** An operation of a line's ~~c~~Composite Protection System due to a relay failure during normal ~~conditions is an example of an "unnecessary trip other than Fault"~~operation is a Misoperation.
>
> ~~In a second example, tripping~~**Example 6b:** Tripping a generator by the operation of the loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation~~. In a third example, an~~ assuming the Composite Protection System was not intended to operate under this condition.
>
> **Example 6c:** An impedance line relay trip for a power swing that entered the relay's characteristic is a Misoperation if the power swing was stable and the relay operated because ~~it was set with an excessive reach that unnecessarily restricted the line's load carrying capability~~power swing blocking was enabled and should have prevented the trip, but did not.

~~An~~Additionally, an operation that occurs during a non-~~f~~Fault condition but was initiated directly by on-site (i.e., real-time) maintenance, testing, inspection, construction, or commissioning is not a Misoperation.~~ However~~

> **Example 6d:** A BES interrupting device operation that occurs at the remote end of a line during a non-Fault condition because a direct transfer trip was initiated by system maintenance and testing activities at the local end of the line is not a Misoperation.

The "on-site" activities at one location that initiates a trip to another location are included in this exemption; however, once the maintenance, testing, inspection, construction, or commissioning ~~has been completed~~is complete, the "on-site" Misoperation exclusion no longer applies, regardless of the presence of ~~the technical~~on-site personnel.

Special Cases

Protection System operations for these cases would not be a Misoperation.

> **Example 7a:** A generator Protection System operation prior to closing the unit breaker(s) is not a Misoperation provided no in-service Elements are tripped.

This type of operation is not a Misoperation because the generating unit is not synchronized and is isolated from the BES. Protection System operations which occur with the protected Element out of service, that do not trip any in-service Elements, are not Misoperations.

In some cases where zones of protection overlap, the owner(s) of Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element.

Example 7b: The high-side of a transformer connected to a line may be within the zone of protection of the supplying line's relaying. In this case, the line relaying is planned to protect the area of the high side of the transformer and into its primary winding. ~~This definition is based on the established IEEE/PSRC I3 Working Group on 'Transmission Protective Relay System~~

~~Performance Measuring Methodology' categories (excluding Failure to Reclose) of Relay System Misoperation. The phrase abnormal condition has been replaced with "non-fault condition" to remove ambiguity.~~

~~The exclusion of a component failure, as long as the composite Protection System operates correctly, was based on recommendations by the NERC SPCS. Entities still need to review each Protection System operation. Covering these types of component failures within the standard constitutes additional administrative burden for types of failures that have no immediate reliability impacts.~~

~~Failure to automatically reclose after a Fault is not included as a Misoperation because reclosing equipment is not included under the definition of Protection Systems.~~

> In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for Faults on the high-side of the connected transformer. Therefore, the operation of the line relaying for a high-side transformer Fault operated as intended and would not be a Misoperation.

The above are examples only, and do not constitute an all-inclusive list of conditions that would not be a Misoperation.

Non-Protective Functions

BES interrupting device operations which are initiated by non-protective functions, such as those associated with generator controls, excitation controls, or turbine/boiler controls, ~~Static VAR Compensators (SVCs), Flexible AC Transmission Systems~~static voltampere-reactive compensators (SVC), flexible ac transmission systems (FACTS), ~~High-Voltage DC (HVDC~~high-voltage dc (HVdc) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. ~~Additionally, operations initiated by control functions within protective relays are not considered Protection System operations. For example, in cases where a component of the Protection System or a function of a component within the Protection System is used for control of a generator, such as when a reverse power relay is used to trip a breaker during generator shutdown, the operation of the control component or the function when not providing protection is not included in the definition of Misoperation and its operation would not be reviewed under this standard. Automation (e.g. data collection) is also not a protective function and is not subject to this standard~~ The standard is not applicable to non-protective functions such as automation (e.g., data collection) or control functions that are embedded within a Protection System.

~~A generator Protection System operation prior to closing the unit breaker(s) is not considered a Misoperation provided no in-service BES Elements are tripped. These types of operations are excluded when the generating unit is not synchronized and is isolated from the BES. Protection System operations which occur with the protected Element out of service, that do not trip any in-service Elements are not Misoperations. Protection System operations unrelated to on-site maintenance, testing, inspection, construction or commissioning activities which occur with the protected Element out of service, that trip any in-service Elements are Misoperations.~~

~~In some cases where zones of protection overlap, the owner of BES Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System~~

~~performance for an Element. For example, the high side of a transformer connected to a line may be within the zone of protection of the supplying line's relaying. In this case, the line relaying is planned to protect the area of the high side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for Faults on the high side of the connected transformer. Therefore, the operation of the line relaying for a high side transformer Fault would not be considered a Misoperation.~~

> ~~This standard addresses the reliability issues identified in the letter[5] from Gerry Cauley, NERC President and CEO, dated January 7, 2011. "Nearly all major system failures include misoperation of relays as a factor contributing to the propagation of the events…….. Reducing the risk to reliability from relay Misoperations requires consistent collection of misoperation information by regional entities, along with systematic analysis and correction of the underlying causes of preventable Misoperations." The standard also addresses the findings in the 2011 Risk Assessment of Reliability Performance[6]; July 2011 "….a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry."~~

Control Functions

The entity must make a determination as to whether the standard is applicable to its Protection System in accordance with the provided exclusions in the standard's Applicability, see Section 4.2.1. The subject matter experts (SME) developing this standard recognize that entities use Protection Systems as part of a routine practice to control BES Elements. This standard is not applicable to protective functions within a Protection System when intended for controlling a BES Element as a part of an entity's process or planned switching sequence. The following are examples of conditions to which this standard is not applicable:

> **Example 8a:** The reverse power protective function that operates to remove a generating unit from service using the entity's normal or routine process.
>
> **Example 8b:** The reverse power relay enables a permissive trip and the generator operator trips the unit.

In the example above, the standard is not applicable; however, the standard remains applicable to the reverse power relay as a part of the generator Protection System when intended to provide generator anti-motoring protection. For example, reverse power relays are typically installed as the primary protection for a generating unit to guard against motoring. Though, operators often take advantage of this functionality and use the Protection System's reverse power protective function as a normal procedure to shutdown a generating unit.

~~[5] http://www.nerc.com/news_pr.php?npr=723~~[5] ~~http://www.nerc.com/pa/Stand/Project%202010005%20Protection%20System%20Misoperations%20DL/20110209130708-Cauley%20letter.pdf~~

~~[6] http://www.nerc.com/files/2011_RARPR_FINAL.pdf~~

The following is another example of a condition to which this standard is not applicable:

> **Example 8c:** Operation of a capacitor bank interrupting device for voltage control using functions embedded within a microprocessor based relay that is part of a Protection System.

The above are examples only, and do not constitute an all-inclusive list to which the standard is not applicable.

Extenuating Circumstances

In the event of a natural disaster~~, note that the~~ or other extenuating circumstances, the December 20, 2012 Sanction Guidelines of the North American Electric Reliability Corporation ~~effective January 15, 2008 provides that the Compliance Monitor~~, Section 2.8, Extenuating Circumstances, says: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." The Regional Entities to whom NERC has delegated authority will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

~~**Requirement R1**~~

~~This requirement promotes the prudent evaluation of each Protection System operation to determine if the operation was correct or a Misoperation, even those Misoperations difficult to detect. Unless all BES Protection System operations and Faults that challenge them are reviewed, it cannot be determined with certainty that all Misoperations are identified. For example, if you only reviewed operations resulting in an overtrip, you would not necessarily identify Misoperations caused by slow trips.~~

~~Requirement R1 places the responsibility on~~ The volume of Protection System operations tend to be sporadic. If a high rate of Protection System operations is not sustained, utilities will have an opportunity to catch up within the 120 day period.

Requirement R1

This requirement initiates a review of each BES interrupting device operation to identify whether or not a Misoperation may have occurred. Since the BES interrupting device owner ~~to investigate~~ typically monitors and tracks device operations ~~initiated by a Protection System. The drafting team believes,~~ the owner is the logical starting point for identifying Misoperations of ~~the~~Protection Systems for BES ~~interrupting device that operated would be in the best position to analyze the Protection System operation, determine if a Misoperation occurred, and perform the initial investigation to determine the cause of the Misoperation. If the~~ Elements. A review is required when (1) a BES interrupting device ~~owner does not own all of the~~ operates that is caused by a Protection System ~~and cannot determine that the~~or by manual intervention in response to a Protection System ~~operation was correct, then notify~~failure to operate, (2) regardless of whether the ~~other~~ owner~~(s)~~ owns all or part of the Protection System component(s), and (3) the owner identified that its Protection System component(s) ~~and provide~~as causing the BES interrupting device operation.

Since most Misoperations result in the operation of one or more BES interrupting devices, these operations initiate a review to identify any ~~requested investigative information. In this case, it is expected that both entities will work together to investigate the cause of the operation~~Misoperation. If an Element is manually isolated in response to a failure to operate, the manual isolation of the Element triggers a review for Misoperation.

> **Example R1a:** The failure of a loss of field relay on a generating unit where an operator takes action to isolate the unit.

Manual intervention may indicate a Misoperation has occurred, thus requiring the initiation of an investigation by the BES interrupting device owner.

Protection Systems are made of many components. These components may be owned by ~~more than one entity.~~different entities. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner's differential relay. All of these components and many more are part of a Protection System. It is expected that all of the owners will communicate with each other, sharing ~~any~~ information freely, so that Protection System operations can be analyzed, Misoperations identified, and corrective actions taken~~. If an entity feels it cannot get the level of cooperation it needs to adequately address a Misoperation, the entity should appeal to its Regional Entity for help in resolving the situation~~.

~~Determining~~Each entity is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation regardless of the level of ownership. A combination of available information from resources such as counters, relay targets, Supervisory Control and Data Acquisition (SCADA) systems, or Disturbance Monitoring Equipment (DME) would typically be used to determine whether or not a Misoperation occurred. The entity is allotted 120 calendar days from the date of its BES interrupting device operation to identify whether or not a Misoperation of its Protection System component(s) occurred.

The Protection System operation may be documented in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System.

Requirement R2

For Requirement R2 (i.e., case of multi-entity ownership), the entity that owns the BES interrupting device that operated is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation under Requirement R1; however, if the entity that owns a BES interrupting device determines that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation, it must notify the other Protection System owner(s) when the criteria in Requirement R2 is met.

This requirement does not preclude the Protection System owners from initially communicating and working together to determine whether a Misoperation occurred and, if so, the cause. The BES interrupting device owner is only required to officially notify the other owners when it: (1) shares the Composite Protection System ownership with other entity(ies), (2) determines that a Misoperation occurred or cannot rule out a Misoperation, and (3) determines its Protection System component(s) did not cause a Misoperation or is unsure. Officially notifying the other owners without performing a preliminary review may unnecessarily burden the other owners with compliance obligations, redirect valuable resources, and add little benefit to reliability. The BES interrupting device owner should officially notify other owners when appropriate within the established time period.

The following is an example of a notification to another Protection System owner:

> **Example R2a:** Circuit breakers A and B at the Charlie station tripped from directional comparison blocking or DCB relaying on 03/03/2014 at 15:43 UTC during an external fault. As discussed last week, the fault records indicate that a problem with your equipment (failure to transmit) caused the operation.

Requirement R3

For Requirement R3 (i.e., notification received), the entity that also owns a portion of the Composite Protection System is expected to use judgment to identify whether the Protection System operation is a Misoperation. A combination of available information from resources such as counters, relay targets, SCADA, DME, and information from the other owner(s) would typically be used to determine whether or not a Misoperation occurred.

The entity that is notified by the BES interrupting device owner is allotted the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation date to determine if its portion of the Composite Protection System caused the Protection System operation. It is expected that in most cases of a jointly owned Protection System, the entity making notification would have been in communication with the other owner(s) early in the process. This means that the shorter 60 calendar days only comes into play if the notification occurs in the latter half of the 120 calendar days allotted to the BES interrupting device owner.

The Protection System review may be organized in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System. The BES interrupting device owner's notification received may be documented in a variety of ways such an email or a facsimile.

Requirement R4

The entity in Requirement R4 (i.e., cause identification), whether it is the entity that owns the BES interrupting device or an entity that was notified, the entity is expected to use due diligence in taking investigative action(s) to determine the cause(s) of an identified Misoperation for its portion of the Composite Protection System. The SMEs developing this standard recognize there will be cases where the cause(s) of a Misoperation will not be revealed during the allotted time periods in Requirements R1 or R3; therefore, Requirement R4 provides the entity a mechanism to continue its investigative work to determine the cause(s) of the Misoperation when the cause is not known.

A combination of available information from resources such as counters, relay targets, SCADA, DME, test results, and studies would typically be used to determine the cause of the Misoperation. At least one investigative action must be performed every two full calendar quarters until the investigation is completed.

The following is an example of investigative actions taken to determine the cause of an identified Misoperation:

> **Example R4a**: A Misoperation was identified on 03/18/2014. A line outage to test the Protection System was scheduled on 03/24/2014 for 12/15/2014 (i.e., beyond the next two full calendar quarters) due to summer peak conditions. The protection engineer contacted the manufacturer on 04/10/2014 (i.e., within two full calendar quarters) to obtain any known issues. The engineer reviewed manufacturer's documents on 05/27/2014. The outage schedule was confirmed on 08/29/2014 and was taken on 12/15/2014. Testing was completed on 12/16/2014 (i.e., in the second two full quarters) revealing the microprocessor relay as the cause of the Misoperation. A CAP is being developed to replace the relay.

Periodic action minimizes compliance burdens and focuses the entity's effort on determining the cause(s) of the Misoperation while providing measurable evidence. The SMEs recognize that certain planned investigative actions may require months to schedule and complete; therefore, the entity is only required to perform at least one investigative action every two full calendar quarters. Investigative actions may include a variety of actions, such as reviewing DME records, performing or reviewing studies, completing relay calibration or testing, requesting manufacturer review, or requesting a necessary outage.

The entity's investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for identifying the Misoperation cause.

Although the entity only has to document its specific investigative actions taken to determine the cause(s) of an identified Misoperation, the entity should consider the benefits of formally organizing (e.g., in a report or database) its actions and findings. Well documented investigative actions and findings may be helpful in future investigations of a similar event or circumstances. A thorough report or database may contain a detailed description of the event, information gathered, investigative actions, findings, possible causes, identified causes, and conclusions. Multiple owners of a Composite Protection System might consider working together to produce a common report for their mutual benefit.

The following are examples of a declaration where no cause was determined:

> **Example R4b**: All relays at station A and B functioned properly during testing on 08/26/2014. The carrier system functioned properly during testing on 08/27/2014. The carrier coupling equipment functioned properly during testing on 08/28/2014. A settings review completed on 09/03/2014 indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be correct, and the equipment at station A and station B is already monitored. The investigation is being closed because no cause was found.

> **Example R4c:** The protection scheme was replaced before the cause was identified. The power line carrier or PLC based protection was replaced with fiber-optic based protection with an in service date of 04/16/2014. The new system will be monitored for recurrence of the Misoperation.

Requirement R5

Resolving the causes of Protection System Misoperations ~~is essential in developing an effective remedy to avoid future Misoperations. The drafting team recognizes that~~benefits BES reliability by preventing recurrence. The Corrective Action Plan or CAP is an established tool for resolving operational problems. The NERC Glossary defines a Corrective Action Plan as, *"A list of actions and an associated timetable for implementation to remedy a specific problem."* When the Misoperation cause is identified in Requirement R1, R3 or R4, Requirement R5 requires Protection System owner(s) to develop a CAP or explain why corrective actions are beyond the entity's control or would not improve BES reliability. The entity must create the CAP or make a declaration why additional actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken within 60 calendar days of first determining a cause.

The SMEs developing this standard recognize there may be multiple causes for a Misoperation; in these circumstances, the CAP would include a remedy for the identified causes. The ~~60 day clock for developing the CAP will be associated with the determination of the first cause. A CAP can~~CAP may be revised if additional causes are found~~. The drafting team believes 120 calendar days is a reasonable period of time to investigate operations, determine the cause for most Misoperations and document findings in a Misoperation investigation report. This time frame takes into account the seasonal nature of Protection System operations. Both the volume of Protection System operations as well as outage constraints for investigative purposes can be seasonal.~~

~~Regardless of whether a cause is identified, the BES interrupting device owner must document the investigation as a potential aid in possible future Misoperation investigations. If a~~ ; therefore, the entity has the option to create a single ~~Protection System causes~~or multiple ~~BES interrupting device owners to be affected, the entities may work together to produce a common Misoperation investigation report. Similarly, if the BES interrupting device owner and the Protection System component owner that caused a Misoperation are different entities, they may work together to produce a common report.~~

~~A Misoperation investigation report or documented findings may include the following information: 1) initial evidence, 2) probable causes, 3) tests and studies, and 4) conclusions. A brief description of the event surrounding the Misoperation may be included if not separately documented. The initial evidence, which may also be documented separately, contains the sequence of events, relay targets and a summary of Disturbance Monitoring Equipment (DME) records as appropriate. Probable causes are those causes which are most likely to have contributed to the Misoperation and could be considered for further testing. The test and studies documented in the report would describe and provide findings of those tests if the entity was able to perform them during the initial investigation phase (e.g. relay calibration and simulation tests, communication noise and attenuation tests, CT/VT ratio tests, DC continuity checks and functional tests) and studies (e.g. short circuit and coordination studies) performed in the attempt to determine the cause. The conclusions should summarize the cause(s) substantiated by the evidence and findings of the tests and studies.~~

~~Requirement R2~~

~~If the Misoperation cause is identified within 120 days of the event, Requirement R2 requires Protection System owners to develop a CAP or to make a declaration of no additional action within 60 calendar days of determining the cause. The drafting team recognizes there may be~~ CAPs to correct multiple causes ~~for~~of a Misoperation~~; in these circumstances the CAP would include a remedy for the identified causes~~. The 60 calendar day ~~clock~~period for developing ~~the CAP will be associated with the determination of the first cause. A~~ a CAP ~~can be revised if additional causes are found. Based on~~ (or declaration) is established on the basis of industry experience ~~and~~ which includes operational coordination timeframes, ~~the drafting team believes 60 calendar days is reasonable for considering such things as~~time to consider alternative solutions, coordination of resources, ~~or~~and development of a schedule ~~for a CAP, or to prepare a declaration justifying the lack of a CAP~~.

~~The 120 day time period and the 60 day~~The time periods within Requirement R1, R3 and Requirement R5 are distinct and separate. If a cause of a Misoperation is identified quickly, the time period ~~are distinct and within the context of~~in Requirement R1 ~~and Requirement R2 respectively, need~~or R3 ends and the 60 calendar day period to ~~remain separate. With~~develop the CAP becomes applicable. The ultimate goal ~~of keeping the implementation~~is to keep all time ~~of a CAP~~periods as short as possible, ~~if a cause of a Misoperation is determined quickly the CAP creation timeframe (60 days) becomes applicable and requires the CAP implementation be less than 180 days. Also, if the interrupting device owner is tardy in informing another Protection System component owner and using up much of the 120 day period, it still leaves a considerable amount of time (at least 60 days) to develop an action plan for further investigation by the Protection System component owner, or if a cause is determined the creation of the CAP.~~

including the correction of the cause(s) of the Misoperation. Where there are multiple Protection System owners involved in a Misoperation, ~~the one or more owners~~ each owner whose Protection System component(s) contributed to the Misoperation ~~will create a CAP or declaration as required by Requirement R2. Owners whose Protection System components operated correctly do not need to create a CAP~~is subject to Requirement R5.

~~Resolving Misoperations benefits the Protection System owner and the BES by maintaining reliability and security. The CAP is an established tool for resolving operational problems. The NERC Glossary of Terms defines a Corrective Action Plan as "A list of actions and an associated timetable for implementation to remedy a specific problem".~~

~~Protection System owners are expected to exercise due diligence in the~~The development ~~and implementation~~ of a CAP~~. Typically included would be any~~ is intended to document the specific corrective actions needed to be taken to prevent Misoperation recurrence ~~(along with~~, the ~~date performed), any corrective~~timetable for executing such actions ~~planned to be taken to prevent recurrence (along with the planned date),~~, and an evaluation of the CAP's applicability to the entity's other Protection Systems ~~owned by the entity.~~

including other locations. The evaluation of ~~the CAP's applicability to~~ these other Protection Systems ~~owned by~~aims to reduce the ~~entity is intended to encourage diligence in preventing~~risk and likelihood of similar Misoperations~~.~~ in other Protection Systems. The Protection System owner is responsible for determining the ~~scope of the problem, and for including appropriate actions in the CAP.~~ extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in ~~adding preemptive actions to the CAP. The CAP is complete when~~

~~all specified actions are completed~~the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP must include an evaluation of other Protection Systems including other locations to be complete.

The following ~~are examples~~is an example of ~~Corrective Action Plans (CAPs):~~

a CAP ~~Example 1 – Corrective actions~~ for a ~~failed~~ relay ~~only:~~

~~The impedance relay was removed from service on 6/2/12 because it~~Misoperation that was applying a standing trip~~. Relay testing was performed on 6/4/12. A~~ due to a failed capacitor ~~was found within the impedance relay. The~~ and the evaluation of the cause at similar locations which determined capacitor ~~was replaced on 6/5/12. The impedance relay functioned properly during testing after the~~replacement was not necessary.

> **Example R5a:** Actions: Remove the relay from service. Replace capacitor~~ was replaced. The impedance~~. Test the relay~~ was returned~~. Return to service ~~on 6/5/12~~or replace by 07/01/2014.
>
> Applicability to other Protection Systems: ~~Undesired trips of this~~ This type of impedance relay ~~due to capacitor failures have occurred only occasionally within our system. This type of impedance relay is gradually~~has not been experiencing problems and is systematically being replaced with microprocessor relays as Protection Systems are modernized.~~ It is therefore our assessment~~ Therefore, it was assessed that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for ~~our~~the system.

~~CAP Example 2 - Corrective actions for a failed relay, and a program for preemptive actions at similar installations:~~

~~The impedance~~The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

> **Example R5b:** Actions: Remove the relay ~~was removed~~ from service~~ on 6/2/12 because it was applying a standing trip. Relay testing was performed on 6/4/12. A failed capacitor was found within the impedance relay. The~~. Replace capacitor~~ was replaced on 6/5/12. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned~~. Test the relay. Return to service ~~on 6/5/12~~or replace by 07/01/2014.
>
> Applicability to other Protection Systems: ~~Undesired trips of this~~This type of impedance relay ~~due~~is suspected to~~ capacitor failures~~ have ~~occurred frequently. It is therefore our assessment that~~ previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, a program should be established by 12/~~1/12~~01/2014 for wholesale preemptive replacement of capacitors in this type of impedance relay.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

Example R5c: Actions: Remove the relay from service. Replace capacitor. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, the preemptive replacement of capacitors in this type of impedance relay should be pursued for the identified stations A through I by 04/30/2015.

A plan is being developed to replace the impedance relay capacitors at stations A, B, and C by 09/01/2014. A second plan is being developed to replace the impedance relay capacitors at stations D, E, and F by 11/01/2014. The last plan will replace the impedance relay capacitors at stations G, H, and I by 02/01/2015.

The following is an example of a CAP for a relay Misoperation that was due to a version 2 firmware problem and the evaluation of the cause at similar locations which determined the firmware needs preemptive correction action.

Example R5d: Actions: Provide the manufacturer Fault records. Install new firmware pending manufacturer results by 10/01/2014.

Applicability to other Protection Systems: Based on the evaluation of other locations and a risk assessment, the newer firmware version 3 should be installed at all installations that are identified to be version 2. Twelve relays were identified across the system. Proposed completion date is 12/31/2014.

The following are examples of a declaration made where corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken.

Example R5e: The cause of the Misoperation was due to a non-registered entity communications provider problem.

Example R5f: The cause of the Misoperation was due to a transmission transformer tapped industrial customer who initiated a direct transfer trip to a registered entity's transmission breaker.

In situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity's control.

The following in an example of a declaration made why corrective actions would not improve BES reliability.

Example R5g: The investigation showed that the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations.

Example R5h: As a result of an operation that left a portion of the power system in an electrical island condition, circuit XYZ within that island tripped, resulting in loss of load within the island. Subsequent investigation showed an overfrequency condition persisted after the formation of that island and the XYZ line protective relay operated. Since this relay was operating outside of its designed frequency range and would not be subject to this condition when line XYZ is operated normally connected to the BES, no corrective action will be taken because BES reliability would not be improved.

Example R5i: During a major ice storm, four of six circuits were lost at Station A. Subsequent to the loss of these circuits, a skywire (i.e., shield wire) broke near station A on line AB (between Station A and B) resulting in a phase-phase fault. The protection scheme utilized for both protection groups is a POTT. The Line AB protection at Station B tripped timed for this event (i.e., Slow Trip – During Fault) even though this line had been identified as requiring high speed clearing. A weak infeed condition was created at Station A due to the loss of 4 transmission circuits resulting in the absence of a permissive signal on Line AB from Station A during this fault. No corrective action will be taken for this Misoperation as even under N-1 conditions, there is normally enough infeed at Station A to send a proper permissive signal to station B. Any changes to the protection scheme to account for this would not improve BES reliability.

A declaration why corrective actions are beyond the entity's control or would not improve BES reliability should include the Misoperation cause and the justification for taking no corrective action. Furthermore, a declaration that no further corrective actions will be taken is expected to be used sparingly.

Requirement R6

To achieve the stated purpose of this standard, which is to identify and correct the causes of Misoperations of Protection Systems for BES Elements, the responsible entity is required to implement a CAP that addresses the specific problem (i.e., cause(s) of the Misoperation) through completion. Protection System owners are required in the implementation of a CAP to update it when actions or timetable change, until completed. Accomplishing this objective is intended to reduce the occurrence of future Misoperations of a similar nature, thereby improving reliability and minimizing risk to the BES.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip (See also, Example R5a).

Example R6a: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. The failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

CAP completed on 06/25/2014.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip that resulted in the correction and the establishment of a program for further replacements (See also, Example R5b).

Example R6b: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. The failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

A program for wholesale preemptive replacement of capacitors in this type of impedance relay was established on 10/28/~~12~~2014.

CAP ~~Example 3 – Corrective~~completed on 10/28/2014.

The following is an example of a completed CAP of corrective actions with a timetable that required updating for a failed relay; and preemptive actions for similar installations~~:~~ (See also, Example R5c).

Example R6c: Actions: The impedance relay was removed from service on ~~6/2/12~~06/02/2014 because it was applying a standing trip. ~~Relay testing was performed on 6/4/12. A~~The failed capacitor was found within the impedance relay~~. The capacitor was~~ and replaced~~on 6/5/12.~~. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on ~~6/5/12~~06/05/2014.

~~Applicability to other Protection Systems: Undesired trips of this type of~~The impedance relay ~~due to~~ capacitor ~~failures have occurred frequently. It is therefore our assessment that preemptive~~ replacement ~~of capacitors in this type of impedance relay should be pursued.~~

~~It is planned to replace the impedance relay capacitors~~was completed at stations A, B, and C ~~by 9/1/12. It is planned to replace the~~on 08/16/2014. The impedance relay ~~capacitors~~capacitor replacement was completed at stations D, E, and F ~~by 11/1/12. It is planned to replace the~~on 10/24/2014. The impedance relay ~~capacitors at~~capacitor replacement for stations G, H, and I ~~by 2/1/13.~~

~~The impedance relay~~were postponed due resource rescheduling from 02/01/15 to 03/01/2015. Following the timetable change, capacitor replacement was completed ~~at stations A, B, and C on 8/16/12. The impedance relay capacitor replacement was completed at stations D, E, and F on 10/26/12. The impedance relay capacitor replacement was completed at stations~~ on 03/09/2015 at stations G, H, and I~~on 1/9/13~~. All stations identified in the evaluation have been completed.

CAP ~~Example 4 – Corrective~~completed on 03/09/2015.

The following is an example of a completed CAP for corrective actions with updated actions for a firmware problem; and preemptive actions for similar installations~~:~~. (See also, Example R5d).

Example R6d: Actions: Fault records were provided to the manufacturer on ~~6/4/12. On 6/11/12, the~~06/04/2014. The manufacturer responded that the ~~m~~Misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on ~~6~~08/12/~~12~~2014.

~~Applicability~~Nine of the twelve relays were updated to ~~other Protection Systems: Based on our risk assessment, we plan to install firmware~~ version 3 ~~at all of our installations that are~~ firmware on 09/23/2014. The manufacturer provided a subsequent update which was determined to be beneficial for the remaining relays. The remaining three of twelve relays identified as having the version 2~~. Proposed completion date is 12/31/12.~~

~~The~~ firmware ~~replacements were~~ were updated to version 3.01 firmware on 11/10/2014.

CAP completed on ~~12/4/12~~11/10/2014.

~~If~~The CAP is complete when all the documented actions to resolve the specific problem (i.e., Misoperation ~~cause is identified within 120 days, and no corrective action has been or is intended to be taken, Protection System owners~~) are ~~required to make a declaration to this effect. A "no CAP declaration" would typically~~ completed which may include ~~the Misoperation cause and justification for taking no corrective action.~~

~~An example~~those actions resulting from the entity's evaluation of other locations, if not addressed through a separate CAP.

Process Flow Chart: Below is a ~~"no CAP declaration" due to BES reliability might be: "The investigation showed the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Our studies show that de-sensitizing~~ graphical representation of the ~~relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations." A "no CAP declaration" due to BES reliability is~~ expected ~~to be used sparingly.~~

~~There are some cases where a Misoperation cause is outside of an entity's control and would result in a "no CAP declaration." Items that may be considered outside of an entity's control could be a non-registered entity communications provider problem or a transmission transformer tapped industrial customer who initiates a direct transfer trip to a registered entity's transmission breaker. Generally, situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity's control. The "outside an entity's control" declaration is expected to be used sparingly.~~

~~**Requirement R3**~~

~~If the Misoperation cause is not identified within 120 days, and reasonable investigative actions have not been exhausted, Protection System owners are expected to exercise due diligence in the development and implementation of an action plan for additional investigation. This action plan would typically include any investigative actions taken to determine the cause (along with the date performed), and any investigative actions planned to be taken to determine the cause (along with the planned date).~~

~~At the end of 180 days, the Protection System owner must have an action plan or a declaration why no further actions will be taken. The action plan does not need to have been implemented within the 180 days, but it must have been developed within this time frame. The 180 calendar days are the sum of 120 calendar days (investigative period in Requirement R1) and a 60 calendar day period (similar timeframe as in Requirement R2 for developing a CAP.)~~

~~Where there are multiple Protection System owners involved in a Misoperation and no cause has been determined, then each Protection System owner must either develop an action plan or declare why no further actions will be taken.~~

~~An example of an investigative action plan for more testing might be: "All relays at station A functioned properly during testing on xx/xx/xx. An outage is required to test the relays at station B. The outage is scheduled for xx/xx/xx."~~

~~An example of an action plan for adding monitoring might be: "All relays at station A and B functioned properly during testing on xx/xx/xx. It is planned to install a temporary DFR at station A on xx/xx/xx and to monitor the currents for at least 3 months."~~

~~An example of an action plan for reviewing relay settings might be: "All relays at station A functioned properly during testing on xx/xx/xx. All relays at station B functioned properly during testing on xx/xx/xx. The carrier system functioned properly during testing on xx/xx/xx. It is planned to complete a relay settings review~~ process created by ~~xx/xx/xx."~~

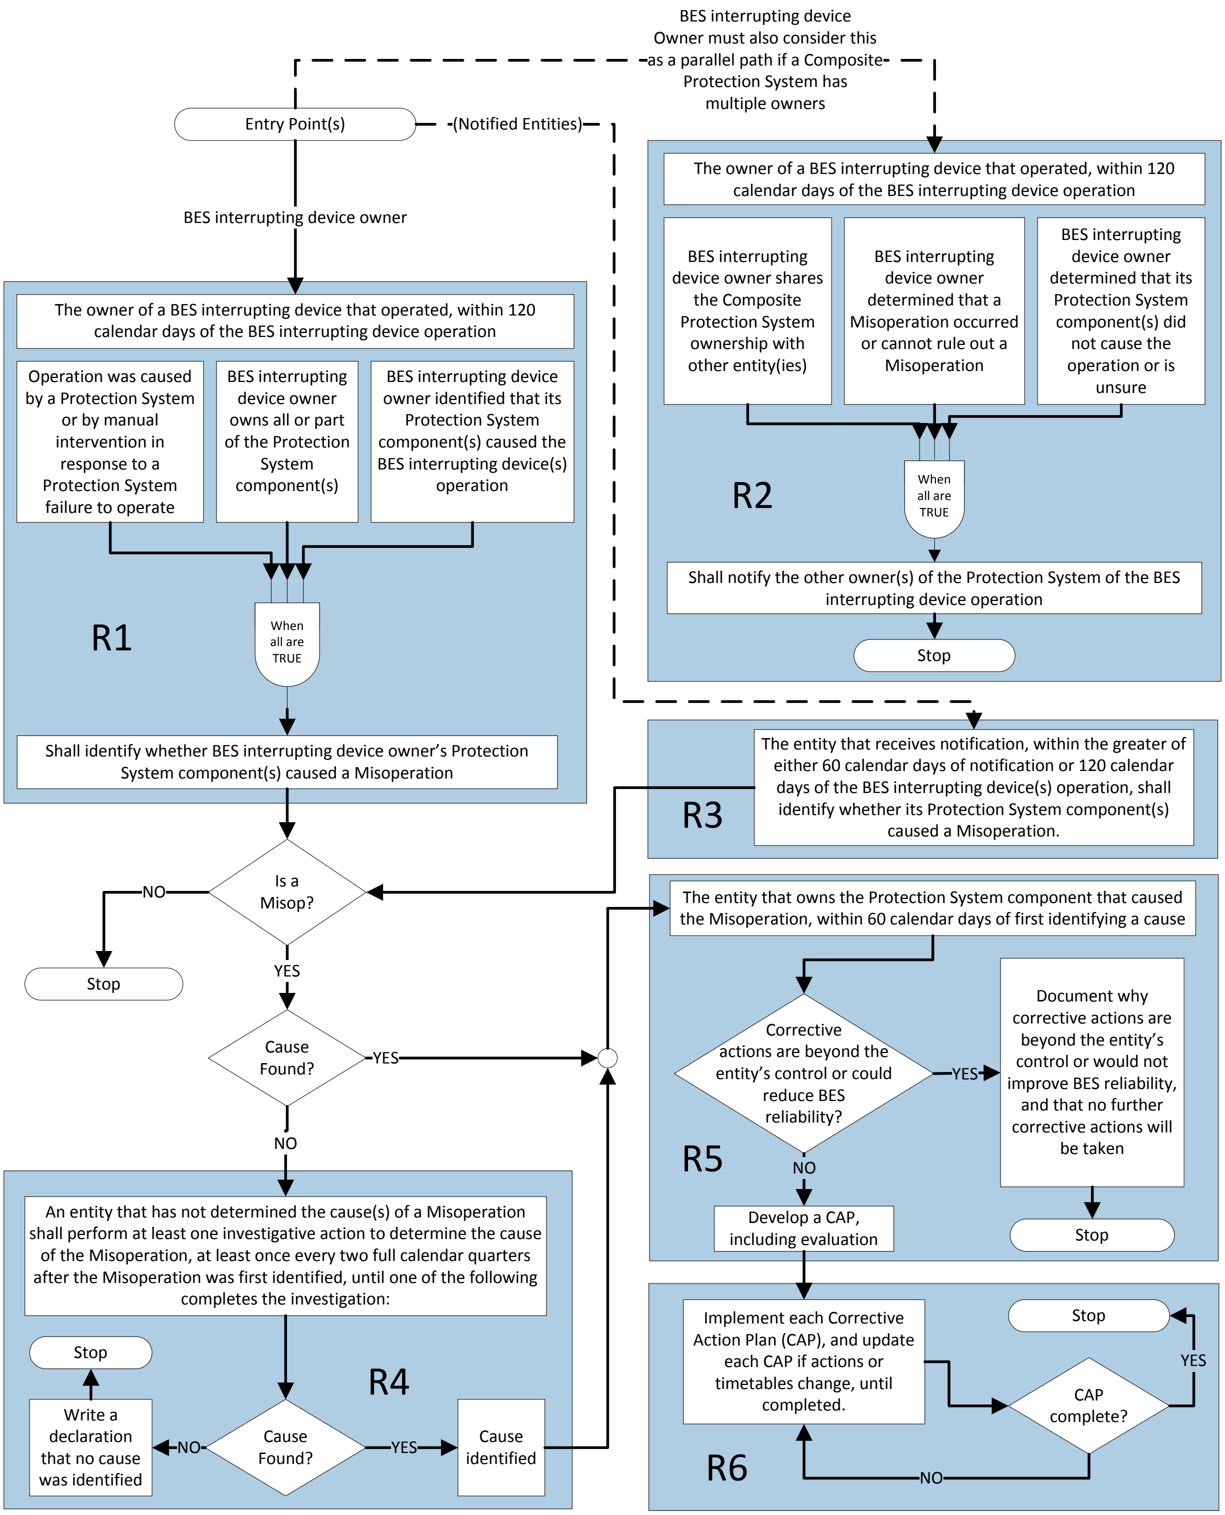
~~If the Misoperation cause is not identified and reasonable investigative actions have been exhausted within 180 days, Protection System owners are required to make a declaration to this~~

~~effect. A "no action plan" declaration would typically include any investigative actions taken to determine the cause (along with the date performed), and justification for taking no additional investigative actions.~~

~~An example of a "no action plan" declaration might be: "All relays at station A and B functioned properly during testing on xx/xx/xx. The carrier system functioned properly during testing on xx/xx/xx. The carrier coupling equipment functioned properly during testing on xx/xx/xx. A settings review completed on xx/xx/xx indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be proper, and the equipment at station A and station B is already monitored, we have decided to close this investigation."~~

~~Requirement R4~~

~~The goal of~~ the standard ~~has not been met unless CAPs or action plans are actually implemented, as is required in Requirement R4. The responsible entity is required to implement and complete a CAP or action plan to accomplish the purpose of this standard, which is to prevent future Misoperations, thereby minimizing risk to the BES. The responsible entity is also required to complete the CAP or action plan, document the plan implementation, and retain the appropriate evidence to demonstrate implementation and completion.~~, including the relationships between requirements:



~~The goal of an action plan created in Requirement R3 is to determine a cause so a CAP can be created to ultimately remedy the cause of the Misoperation. If the cause is determined as a result of the action plan, the entity must develop a CAP or a declaration within 60 days of determination of cause per Requirement R2. This requirement sets the expectation that the work identified in the CAP or action plan will be completed on schedule as planned. Deferrals or~~

~~other relevant changes to the CAP or action plan need to be documented so that the record includes not only what was planned, but what was implemented. Depending on the planning and documentation format used by the responsible entity, evidence of successful CAP or action plan execution could consist of signed-off work orders, printouts from work management systems, spreadsheets of planned versus completed work, timesheets, work inspection reports, paid invoices, photographs, walk-through reports or other evidence.~~

~~Documentation of a CAP or action plan provides an auditable progress and completion confirmation for specific Misoperations. In addition, the investigative documentation may aid the responsible entity in remedying future Misoperations of a similar nature.~~

Implementation Plan

Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)

Requested Approvals

- PRC-004-3 – Protection System Misoperation Identification and Correction

Requested Retirements

- PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection System
- PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

Prerequisite Approvals

- None

Revisions to Defined Terms in the NERC Glossary

The standard drafting team proposes the following new definition:

Composite Protection System:

The total complement of the Protection System(s) that function collectively to protect an Element, such as any primary, secondary, local backup, and communication-assisted relay systems. Backup protection provided by a remote Protection System is excluded.

The standard drafting team proposes the following revised definition:

Misoperation:

The failure of a Composite Protection System to operate as intended. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage,

overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.

3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition for which it is designed. Delayed clearing of a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or resulted in the operation of any other Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. Delayed clearing of a non-Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or resulted in the operation of any other Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Protection System operation for a Fault condition on another Element.
6. **Unnecessary Trip – Other Than Fault** – An unnecessary Protection System operation for a non-Fault condition for which it is not designed. A Protection System operation that is caused by on-site maintenance, testing, inspection, construction or commissioning activities is not a Misoperation.

General Considerations

The implementation period allows adequate time for applicable entities to develop or modify its procedures and processes for reviewing Protection System operations. The obligation for reporting Misoperations has been removed from PRC-004 and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information. The development and implementation of a Corrective Action Plan remains within the scope of PRC-004; therefore, little additional time and resources should be needed to account for the increased detail in the required performance identified in the proposed PRC-004-3 Reliability Standard.

Applicability

This standard applies to the following functional entities:

- Transmission Owner
- Generator Owner
- Distribution Provider

This standard applies to the following Facilities:

- Protection Systems for BES Elements. Non-protective functions that are embedded within a Protection System are excluded. Protective functions intended to operate as a control function during switching are excluded.
- Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

Effective Dates of New or Revised Standards and Definitions

Except in the Western Interconnection, the standard and definitions shall become effective on the first day of the first calendar quarter that is twelve months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Except in the Western Interconnection, where approval by an applicable governmental authority is not required, the standard and definitions shall become effective on the first day of the first calendar quarter that is twelve months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

In the Western Interconnection, the standard and definitions shall become effective on the first day of the first calendar quarter that is twenty-four months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. In the Western Interconnection, where approval by an applicable governmental authority is not required, the standard and definitions shall become effective on the first day of the first calendar quarter that is twenty-four months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-004-3, All Requirements

Each Transmission Owner, Generator Owner, and Distribution Provider applicable to this standard shall be 100% compliant upon the effective date of the standard.

The extended implementation for the Western Interconnection is provided to allow an opportunity to make the necessary changes to the PRC-004-WECC-1 Regional Reliability Standard. An overlap in performance between the regional and proposed continent-wide standard was identified during the development of the proposed PRC-004-3 Reliability Standard.

Implementation Plan for definitions

The revised definition of Misoperation and the new definition of Composite Protection System shall be implemented concurrently with the standard upon the effective dates noted above. Note that the Western Interconnection has an extended implementation.

Retirement of Existing Standards

Except in the Western Interconnection, the existing standards PRC-003-1 and PRC-004-2.1a shall be retired at midnight of the day immediately prior to the effective date of PRC-004-3. In the Western Interconnection, the existing standards PRC-003-1 and PRC-004-2.1a shall be retired at midnight of the day immediately prior to the effective date of PRC-004-3 for the Western Interconnection.

Revisions to Defined Terms in the NERC Glossary

The standard~~s~~ drafting team proposes ~~modifying~~ the following ~~approved~~new definition:

Composite Protection System:

> The total complement of the Protection System(s) that function collectively to protect an Element, such as any primary, secondary, local backup, and communication-assisted relay systems. Backup protection provided by a remote Protection System is excluded.

The standard drafting team proposes the following revised definition:

Misoperation:

> The failure of ~~an Element's composite~~a Composite Protection System to operate as intended. Any of the following is ~~considered~~ a Misoperation:
>
> 1. **Failure to Trip ~~-~~– During Fault ~~-~~–** A failure of a Composite Protection System to operate for a Fault ~~within the zone~~ condition for which it is designed~~ to protect~~. The failure of a Protection System component is not a Misoperation as long as the ~~overall~~ performance of the Composite Protection System ~~for the Element it is designed to protect~~ is correct.
> 2. **Failure to Trip ~~-~~– Other Than Fault ~~-~~–** A failure of a Composite Protection System to operate for a non-Fault condition for which ~~the Protection System was intended to operate~~it is

designed, such as a power swing, ~~under-voltage, over excitation~~undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the ~~overall~~ performance of the Composite Protection System ~~for the Element it is designed to protect~~ is correct.

3. **Slow Trip ~~-~~– During Fault ~~-~~–** A Composite Protection System operation that is slower than ~~intended~~required for a Fault ~~within the zone~~ condition for which it is designed ~~to protect~~. Delayed ~~Fault~~ clearing ~~associated with an installed high-speed protection scheme is not~~ of a Fault condition is a Misoperation if ~~the~~ high-speed performance ~~has not been~~was previously identified ~~to meet the~~ as being necessary to prevent voltage or dynamic ~~stability performance requirements of the TPL standards nor is it required to ensure coordination with~~instability, or resulted in the operation of any other Composite Protection System~~s~~.

4. **Slow Trip ~~-~~– Other Than Fault ~~-~~–** A Composite Protection System operation that is slower than ~~intended~~required for a non-Fault condition for which it is designed, such as a power swing, ~~under-voltage, over excitation~~undervoltage, overexcitation, or loss of excitation ~~for which the Protection System was intended to operate~~. Delayed clearing of a non-Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or resulted in the operation of any other Composite Protection System.

5. **Unnecessary Trip ~~-~~– During Fault** ~~- A~~– An unnecessary Protection System operation for a Fault ~~for which the Protection System is not intended to operate~~condition on another Element.

6. **Unnecessary Trip ~~-~~– Other Than Fault** ~~-~~– An unnecessary Protection System operation for a non-Fault condition for which it is not designed. A Protection System operation ~~for a non-Fault condition for which the Protection System is not intended to operate, and~~ that is ~~unrelated to~~caused by on-site maintenance, testing, inspection, construction or commissioning activities~~.~~

~~**Background**~~

~~PRC-004-3 Protection System Misoperation Identification and Correction~~ is ~~a revision of PRC-004-2a Analysis and Mitigation of Transmission and Generation Protection System Misoperations with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated. PRC-003-1 Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems required the Regions to establish procedures for analysis of Misoperations. In FERC Order No. 693, the Commission identified PRC-003-0 as a fill-in-the-blank standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2a. This is~~ not a ~~potential~~

~~reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2a~~Misoperation.

General Considerations

~~PRC-004-WECC-1 – This regional standard is related to reporting of Misoperations for a limited set of WECC Paths and Remedial Action Schemes. In those cases where PRC-004-WECC-1 overlaps with the Continent-wide standard, entities are expected to comply with the more stringent standard.~~

The implementation period allows adequate time for applicable entities to develop or modify its procedures and processes for reviewing Protection System operations. The obligation for reporting Misoperations has been removed from PRC-004 and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information. The development and implementation of a Corrective Action Plan remains within the scope of PRC-004; therefore, little additional time and resources should be needed to account for the increased detail in the required performance identified in the proposed PRC-004-3 Reliability Standard.

Applicability

This standard applies to the following functional entities:

- Transmission Owner
- Generator Owner
- Distribution Provider

This standard applies to the following Facilities:

- Protection Systems for BES Elements.
- ~~Underfrequency Load Shedding (UFLS) that trips a BES Element~~
- ~~Special Protection Systems (SPS), Remedial Action Schemes (RAS), and Undervoltage Load Shedding (UVLS) are excluded~~
- Non-protective functions that ~~may be imbedded~~are embedded within a Protection System are excluded. Protective functions intended to operate as a control function during switching are excluded.
- Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

Effective Dates of New or Revised Standards and Definitions

~~First day of~~Except in the Western Interconnection, the standard and definitions shall become effective on the first day of the first calendar quarter that is twelve months ~~beyond~~after the date that ~~PRC-004-3~~the standard is approved by an applicable ~~regulatory authorities, or in those jurisdictions~~governmental authority or as otherwise provided for in a jurisdiction where ~~regulatory~~ approval by an applicable governmental authority is required for a standard to go into effect. Except in the Western Interconnection, where approval by an applicable governmental authority is not required, the standard ~~becomes~~and definitions shall become effective on the first day of the first calendar quarter that is twelve months ~~beyond~~after the date ~~this~~the standard is ~~approved~~adopted by the NERC Board of Trustees~~,~~ or as otherwise ~~made effective pursuant to the laws applicable to such ERO governmental authorities~~provided for in that jurisdiction.

~~The proposed definition of Misoperation~~ In the Western Interconnection, the standard and definitions shall become effective on the ~~same date as PRC-004-3. Entities shall use this definition when implementing any portions of Requirements R1, R2 R3 and R4 that use this defined term.~~

~~Implementation Plan for~~ Requirements R1, R2, R3 and R4

~~Entities shall be 100% compliant for any new Protection System Operation on the~~ first day of the first calendar quarter ~~twelve~~that is twenty-four months ~~following~~after the date that the standard is approved by an applicable ~~regulatory approvals,~~governmental authority or as otherwise provided for in ~~those jurisdictions~~a jurisdiction where ~~no regulatory~~ approval by an applicable governmental authority is required~~,~~ for a standard to go into effect. In the Western Interconnection, where approval by an applicable governmental authority is not required, the standard and definitions shall become effective on the first day of the first calendar quarter ~~twelve~~that is twenty-four months ~~following~~after the date the standard is adopted by the NERC Board of Trustees ~~adoption. Protection System operations that occur before the compliance date shall comply with the previous version of the Standard~~or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-004-3, All Requirements

Each Transmission Owner, Generator Owner, and Distribution Provider applicable to this standard shall be 100% compliant upon the effective date of the standard.

The extended implementation for the Western Interconnection is provided to allow an opportunity to make the necessary changes to the PRC-004-WECC-1 Regional Reliability Standard. An overlap in performance between the regional and proposed continent-wide standard was identified during the development of the proposed PRC-004-3 Reliability Standard.

Implementation Plan for definitions

The revised definition of Misoperation and the new definition of Composite Protection System shall be implemented concurrently with the standard upon the effective dates noted above. Note that the Western Interconnection has an extended implementation.

Retirement of Existing Standards

~~The~~ Except in the Western Interconnection, the existing standards PRC-003-1 and PRC-004-~~2a~~2.1a shall be retired at midnight of the day immediately prior to the effective date of PRC-004-3. In the Western Interconnection, the existing standards PRC-003-1 and PRC-004-2.1a shall be retired at midnight of the day immediately prior to the effective date of PRC-004-3 for the Western Interconnection.

Unofficial Comment Form

Project 2010-05.1 Protection System Misoperations

Please **DO NOT** use this form for submitting comments. Please use the electronic form to submit comments on the PRC-004-3 Standard. The comment form must be completed by **March 3, 2014**.

If you have questions please contact Scott Barfield-McGinnis or by telephone at 404-446-9689.

http://www.nerc.com/pa/Stand/Pages/Project2010-05_Protection_System_Misoperations.aspx

Background Information

This posting is soliciting formal comment.

The third draft of PRC-004-3 was posted for a 30-day formal comment period from January 22 – February 20, 2013 with a successive ballot in the last ten days of the comment period. Stakeholders from approximately 132 companies representing all ten Industry Segments provided feedback. The Protection System Misoperation Standard Drafting Team (PSMSDT) has responded to all commenters and developed a fourth draft of the standard for Protection System Misoperation Identification and Correction based on stakeholder input. Changes to the standard include:

Summary of Changes

The PSMSDT made substantive revisions to the previous draft 3 of PRC-004-3 – Protection System Misoperation Identification and Correction Reliability Standard following its previous 30-day formal comment posting of the standard and successive ballot which received 50.60% stakeholder approval. The following narrative is a summary of the substantive revisions made to the proposed draft 4 of the PRC-004-3 standard.

Definitions

Composite Protection System: The SDT is proposing a new definition to support the revisions to the definition of Misoperation.

Misoperation: The SDT made updated occurrences of “composite Protection System” with the newly proposed term of Composite Protection System. Other revisions include removing the uses of “zone,” and most notably updated the category of “Slow Trip – During Fault” to address high-speed performance. The last category of “Unnecessary Trip – Other Than Fault” was modified to be clear that a Protection System operation due to on-site personnel is not a Misoperation.

Purpose

The purpose statement was reorganized to clarify that the standard applies to those Protection Systems for Bulk Electric System Elements

Facilities

The SDT revised the Facilities section of the Applicability to remove exclusions for Special Protection Systems (SPS) and Remedial Action Schemes (RAS). As a general rule, Reliability Standards should address what is applicable, not what is excluded; therefore, SPS and RAS are not referenced in the Applicability. Exclusions concerning non-protective functions embedded within a Protection System and protective functions intended to operate as a control function (e.g., reverse power when removing a generator from service) have been moved to the main Applicability for Facilities to add clarity that these are not applicable as Protection Systems for Bulk Electric System (BES) Elements.

Effective Dates

The effective dates have not materially changed even though the language shows significant modification. This language change is being applied to Reliability Standards that are currently under development. The change is an outcome of NERC working with Canadian authorities to address their specific circumstances. Also, the Effective Date language now incorporates a provision for the Western Interconnection due to identified overlap between the Regional Reliability Standard PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation and the proposed continent-wide Reliability Standard PRC-004-3 – Protection System Misoperation Identification and Correction. The provision is to allot time for the Western Interconnection to modify the Regional Reliability Standard.

Requirement R1

The SDT reorganized Requirement R1 to improve clarity of the required performance, allotted time periods, and a single reliability objective in a Requirement. The main part of the Requirement begins with defining what starts the review of a Misoperation, which is the operation of a BES interrupting device. In replacing the earlier Part 1.1 and its sub-bullets, the responsible entity will perform a review when the criteria (i.e., 1.1, 1.2, and 1.3) are met. The three criteria include when: the BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; the BES interrupting device owner owns all or part of the Protection System component(s); and the BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation. Part 1.2 is now represented in Requirement R4 to investigate the identified Misoperation to determine a cause, if not previously revealed during the initial review of a Misoperation.

There were a significant number of comments from stakeholders about the confusion between the proposed “action plan” and the “Corrective Action Plan” found in previous Requirement R3. To address these comments, the SDT created Requirement R4 to allow an entity to continue its investigation, as needed, only requiring the entity to demonstrate actions taken at least once in every two calendar quarters toward determining the cause of an identified Misoperation.

Requirement R2

This requirement is essentially unchanged and is now represented in Requirement R5, the development of a Corrective Action Plan (CAP) to address the cause(s) of an identified Misoperation. The SDT made clarifying revisions to pinpoint the Protection System component that caused the Misoperation as being subject to the (CAP). Also, the word “first” was added before “…identifying the cause…” to improve clarity that upon identifying the “first cause” starts the 60 calendar day time period for developing the CAP. Last, the SDT added the clause “…and that no further corrective actions will be taken” to require entities to clearly state that no additional actions are planned to be taken to provide a measurable close to the performance in the declaration. Also, the phrase “would reduce BES reliability” was replaced with “would not improve BES reliability” to align with those conditions where corrective action may not be practical.

Requirement R3

This requirement was removed by the SDT in the current draft as comments revealed the use of “action plan” along with Corrective Action Plan created unnecessary confusion. The proposed Requirement R4 fills this performance by requiring entities to continue its investigative actions in determining a cause of an identified Misoperation.

Requirement R4

This requirement is now Requirement R6 and is essentially the same as the previous Requirement R4, except that “action plan” was removed. Implementation is further clarified that the CAP must be updated when actions or timetables change through completion of the CAP.”

Compliance

The SDT corrected this section to comport with the standard language NERC uses in Reliability Standards. Also, the Evidence Retention section was changed to reduce the minimum time periods that were previously proposed at six years (i.e., the last audit) for all Requirements to 12 calendar months for all Requirements according to the Standard Drafting Guidelines for evidence retention.

VRFs and VSLs

After further review, the SDT lowered the earlier Requirement R4 (implement the CAP) Violation Risk Level (VRF) from High to Medium. This comports with the VRF found in PRC-016-0.1 – Special Protection System Misoperation, Requirement R2 and PRC-022-1 - Under-Voltage Load Shedding Program Performance, Requirement R1.2. See the VRF and VSL Justifications document for additional information.

The Violation Severity Levels were completely rewritten due to the substantive changes made in restructuring the Requirements to meet a single reliability objective in a requirement. The SDT notes that it applied the VSL Guidelines in establishing the VSLs including the incremental differences between each level.

Application Guidelines

The SDT substantially reorganized the Guidelines and Technical Basis section of the Application Guidelines for organization and flow. Section headers were added and reordered as well as creating additional examples for guidance. For instance, the examples for Requirement R5 and R6 mirror one another to demonstrate an example of Corrective Action Plan (CAP) development (R5) and its implementation (R6).

Questions

You do not have to answer all questions. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

1. Based on stakeholder input, the drafting team created a new definition for **Composite Protection System** to support the definition of **Misoperation**. The Slow Trip categories of Misoperation were also clarified. Do you agree with the new and revised definitions? If not, please provide specific suggestions for improvement.

   ☐ Yes
   ☐ No
   Comments:

2. Based on stakeholder input, the drafting team modified the previous Requirement R1 to clarify responsibilities where two or more entities share ownership of a Protection System. The proposed Requirement R2 determines when other entities are notified and Requirement R3 now clarifies that the notified entity has the greater of 60 calendar days from notification or 120 calendar days from the BES interrupting device operation. Do you agree this modification clarified the performance for notification (R2) and the notified (R3)? If not, please provide specific suggestions for improvement.

   ☐ Yes
   ☐ No
   Comments:

3. Based on stakeholder input, the drafting team removed the previous Requirement R3 (action plan) and proposed a new Requirement R4 which provides entities time to investigate the Misoperation to determine its cause(s). Do you agree this modification clarified performance and removed ambiguity regarding the action plan? If not, please provide specific suggestions for improvement.

   ☐ Yes
   ☐ No
   Comments:

4. The drafting team modified the Application Guidelines to improve examples and clarify the team's intent on various topics. Do you agree the Application Guidelines provide sufficient examples and clarity? If not, please provide specific suggestions for improvement.

   ☐ Yes
   ☐ No
   Comments:

5. If you have any other comments on this Standard that you haven't already mentioned above, please provide them here:

   Comments:

Mapping Document

Project 2010-05.1 Protection Systems: Phase 1 (Misoperations)

Revisions or Retirements to Already Approved Standards

This mapping document shows the translation of PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems and PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations into the proposed PRC-004-3 – Protection System Misoperation Identification and Correction Reliability Standard. The following table identifies the sections of the approved standard that shall be added, retired, or revised when this standard is implemented. If the drafting team is recommending revisions to the standard, those changes are identified in the "Proposed Replacement" column.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
4. Applicability: **4.1.** Regional Reliability Organization	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider	The proposed standard properly assigns responsibility to the registered functions that are responsible for Protection System Misoperation identification and correction. The Transmission Owner, Generator Owner, and Distribution Provider, by function, are Protection System asset owners and are in the best position be aware of and apply resources to review Protection System operations.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
R1. Each Regional Reliability Organization shall establish, document and maintain its procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations. These procedures shall include the following elements:		The Requirements in the proposed PRC-004-3 standard by their results-based construction requires performance that is implicit of having procedures for the analysis of Protection System operations (R1, R2, R3, and R4) and mitigation of identified Misoperations (R5 and R6). The proposed requirements also direct focus to areas most important to reliability. For example, Requirement R1 requires the applicable entity to initiate a review upon a Bulk Electric System (BES) interrupting device operation and identify any Misoperation. Requirement R2 requires the applicable entity to notify all other owners of the Composite Protection System when it determines (or is unsure) its Protection System components did not cause the BES interrupting device operation or it cannot rule out a Misoperation. Requirement R3 requires the notified entity to identify any Misoperation of its Protection System component(s) similar to Requirement R1. Requirement R4 directs the applicable entity to continue its investigative work to determine the cause(s) of an identified Misoperation until the cause is determined or

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		the entity concludes that it is unable to determine the cause. Requirements R5 and R6 for developing and implementing a Corrective Action Plan (CAP) are also implicit of having a documented procedure. The implicit performance required by Requirements R1 through R6 necessitate that an entity have procedures to accomplish the objectives of the proposed standard. Requiring the applicable entities to have procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.
R1.1. The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**4.2.** **Facilities:** **4.2.1** Protection Systems for BES Elements. Non-protective functions that are embedded within a Protection System are excluded. Protective functions intended to operate as a control function during switching are excluded. **4.2.2** Underfrequency load shedding	The previous PRC-003-1, Requirement R1.1 required the Regional Reliability Organization (RRO) to identify the Protection Systems to be reviewed and analyzed for Misoperation. The applicable Facilities have been clarified in the proposed PRC-004-3 to include Protection Systems for BES Elements. Additional language is provided for clarity that non-protective functions are not applicable and

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	(UFLS) that is intended to trip one or more BES Elements.	those protective functions that are intended to operate as a control function (e.g., a reverse power relay operated to remove a generating unit from service). The Applicability is further clarified to include underfrequency load shedding (UFLS) to be more precise. Protection Systems associated with Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are addressed in phase two of this project.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation when: **1.1** The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to	The applicable entities will be required to identify whether a Misoperation occurred for each BES interrupting device operation which meet criteria 1.1 through 1.3. Requirement R1 is most clearly the direct carryover from the PRC-003-1 Reliability Standard which involves the "owner" of the Protection System. The previous standard was silent on the responsibilities of other Protection System owners and had no provision for ensuring that other owners had a responsibility to be involved in the review and analysis.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	operate; and **1.2** The BES interrupting device owner owns all or part of the Composite Protection System; and **1.3** The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.	
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R2.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, notify the other owner(s) of the Protection System of the operation when: **2.1** The BES interrupting device owner shares the Composite Protection System ownership with any other entity; and	Requirement R2 now asserts a responsibility on the initiating entity (i.e., BES interrupting device owner) to notify other owners of the Composite Protection System when the cause of a Protection System operation was not caused (or is undetermined) by the BES interrupting device owner and a Misoperation occurred (or cannot be ruled out) in accordance with criteria 2.1 through 2.3.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	2.2 The BES interrupting device owner determined that a Misoperation occurred or cannot rule out a Misoperation; and **2.3** The BES interrupting device owner determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.	
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, shall identify whether its Protection System component(s) caused a Misoperation.	Requirement R3 places responsibility on the applicable entity that receives notification to review its Protection System component(s) for Misoperations similar to Requirement R1. It is common practice for the BES interrupting device owner that initiates the review to be in communication and collaboration with other Protection System component owners during its review with the 120 calendar day period. The shorter 60 calendar day period for the notified entity assures that in

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		the rare case where the notifying entity takes the majority of its allotted time (120 days) to review an operation, the receiving entity will always have a minimum and reasonable time (60 days) to conduct its review.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation identified in accordance with Requirement R1 or R3 shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: • The identification of the cause(s) of the Misoperation; or • A declaration that no cause was identified.	Requirement R4 is essentially a new requirement to determine the cause(s) of a Misoperation where the previous requirements (i.e., R1 or R3) failed to reveal the cause of a Misoperation. In most cases, the cause of a Misoperation will be revealed during the course of review and when a cause is not readily apparent, the applicable entity is required in Requirement R4 to conduct at least one investigative action every two calendar quarters until the entity determines the cause or declares that it has taken reasonable action and could not determine the cause.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
R1.2. Data reporting requirements (periodicity and format) for Misoperations.	None.	NERC Rules of Procedure, Section 1600 Request for Information or Data will replace the reporting obligations of applicable entities. As such, Regional reporting will end and continent-wide single reporting to the Electric Reliability Organization (ERO) will be required. The ERO will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. Metrics will be shared with each Region. The removal of the data collection from the standard does not result in a reduction of reliability.
R1.3. Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	**R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: • Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an	The proposed PRC-004-3, Requirement R5 provides a step not apparent in the previous PRC-003-1 which is the development of a Corrective Action Plan (CAP) within 60 calendar days of first identifying the Misoperation cause. Requirement R5 also requires each applicable entity to perform an evaluation of the CAP's applicability to the entity's other Protection Systems, including those at other locations.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	evaluation of the CAP's applicability to the entity's other Protection Systems including other locations, or • Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.	Furthermore, Requirement R5 accounts for those cases why corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken. This could be a result of a cause created by a non-registered third party, such as a communication provider. Also, should implementing the changes not improve BES reliability, the entity may document this as well. In cases where the entity, in its judgment, determines that a CAP is not practical for improving BES reliability, the entity must explain in a declaration its conclusions why no further action will be taken.
(Continued) **R1.3.** Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	**R6.** Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed.	Requirement R6 requires the implementation of the CAP. The applicable entity must update the CAP if actions or timetables change until the CAP is completed.
R1.4. Identification of the Regional Reliability	None.	The proposed PRC-004-3 now requires the applicable entities (GO, DP, and TO) to individually address

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
Organization group responsible for the procedures and the process for approval of the procedures.		Misoperations of its Protection System without regard to the Region or Regions in which it owns Protection Systems for BES Elements. The proposed PRC-004-3 Reliability Standard and revised definition of Misoperation provide sufficient clarity to entities; therefore, there is no reliability benefit to obtain the Regional Entity's (formerly Regional Reliability Organization or RRO) approval. Each applicable entity will be measured on its performance with the proposed PRC-004-3 requirements.
R2. Each Regional Reliability Organization shall maintain and periodically update documentation of its procedures for review, analysis, reporting, and mitigation of transmission and generation Protection System Misoperations.	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider	The proposed PRC-004-3 implicitly requires each applicable entity to have its own procedures and processes; therefore, there is no need to have a specific requirement for dictating the updating of such procedures or processes by the previous Regional Reliability Organization or applicable entities. Requiring the applicable entities to update procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.
R3. Each Regional Reliability	None.	The proposed PRC-004-3 implicitly requires each

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
Organization shall distribute procedures in Requirement 1 and any changes to those procedures, to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners within 30 calendar days of approval of those procedures.		applicable entity to have its own procedures and processes; therefore, there is no longer a need to distribute such procedures or processes by the previous Regional Reliability Organization or applicable entities. Requiring the applicable entities to distribute procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
4. Applicability: **4.1.** Transmission Owner **4.2.** Distribution Provider that owns a transmission Protection System **4.3.** Generator Owner	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider **4.2 Facilities:** **4.2.1** Protection Systems for BES Elements. Non-protective functions that are embedded within a Protection System are excluded. Protective functions intended to operate as a control function during switching are excluded. **4.2.2** Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.	The same applicable entities will transition to the new standard. The clause about the Distribution Provider "*that owns a transmission Protection System*" has been removed because it was ambiguous. This clause is replaced by "*Protection Systems for BES Elements*" found in Section 4.2, Facilities and applies to all the applicable entities. Having the Applicability section address Facilities specifically removes the ambiguity of what a "*transmission Protection System*" includes. The proposed PRC-004-3 standard is specific that it includes those Protection Systems for BES Elements, including UFLS that is intended to trip one or more BES Elements. Additional language is provided for clarity that non-protective functions are not applicable and those protective functions that are intended to operate as a control function (e.g., a reverse power relay operated to remove a generating unit from service). Protection Systems associated with Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are addressed in phase two of this project.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures. **R2.** The Generator Owner shall analyze its generator and generator interconnection Facility Protection System Misoperations, and shall develop and implement a	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation when: **1.1** The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and **1.2** The BES interrupting device owner owns all or part of the Composite Protection System; and **1.3** The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation. **R2.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns	The already approved standard PRC-004-2.1a, Requirements R1 and R2 include three levels of performance which is analyze (Protection System operations), develop (CAP), and implement (CAP). The proposed standard, which includes the same three applicable entities (DP, GO, and TO), divides the three levels of performance into six discrete Requirements. Requirement R1 provides the "analyze" portion, requiring the initiating BES interrupting device owner to review its Protection System for each BES interrupting device operation that meets the three criteria (i.e., 1.1 thorough 1.3). The "analyze" portion is further clarified in the proposed Requirement R2 by ensuring that any other owners of the Composite Protection System are notified when the cause of a Protection System operation was not caused (or is undetermined) by the BES interrupting device owner and a Misoperation occurred (or cannot be ruled out) in accordance with criteria 2.1 through 2.3.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.	a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, notify the other owner(s) of the Protection System of the operation when: **2.1** The BES interrupting device owner shares the Composite Protection System ownership with any other entity; and **2.2** The BES interrupting device owner determined that a Misoperation occurred or cannot rule out a Misoperation; and **2.3** The BES interrupting device owner determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.	Requirement R3 provides the necessary performance for the notified Protection System owner to review its component(s) for Misoperation. Last, Requirement R4 requires the applicable entity to conduct investigative actions until is determines the cause(s) or declares that it has been unable to determine the cause(s). Requirement R5 addresses the "develop" a Corrective Action Plan (CAP)" portion, and Requirement R6 addresses the "implement" portion of the CAP.

Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed.	
R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.	None.	Since the NERC Rules of Procedure, Section 1600 Request for Information or Data will replace the reporting obligations. NERC will receive the data on a periodic basis, analyze, establish metrics, and share results accordingly with the Regional Entities as well as industry. Having reporting obligations as a Requirement is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.

Mapping Document

~~Mapping Document Showing Translation~~Project 2010-05.1 Protection Systems: Phase 1 (Misoperations)

Revisions or Retirements to Already Approved Standards

This mapping document shows the translation of PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems~~,~~ and PRC-004-~~2a~~2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations into the proposed PRC-004-3 ~~—~~ – Protection System Misoperation Identification and Correction Reliability Standard. The following table identifies the sections of the approved standard that shall be added, retired, or revised when this standard is implemented. If the drafting team is recommending revisions to the standard, those changes are identified in the "Proposed Replacement" column.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
~~**Requirement in Approved Standard**~~**4. Applicability:** **4.1.** Regional Reliability Organization	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider~~**Translation to New Standard or Other Action**~~	~~**Proposed Language in PRC-004-3 – Protection System Misoperation Identification and Correction Or Comment**~~The proposed standard properly assigns responsibility to the registered functions that are responsible for Protection System Misoperation identification and correction. The Transmission Owner,

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
		Generator Owner, and Distribution Provider, by function, are Protection System asset owners and are in the best position be aware of and apply resources to review Protection System operations.
R1. Each Regional Reliability Organization shall establish, document and maintain its procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations. These procedures shall include the following elements:	~~PRC-004-3~~ ~~Applicability Section 4.1 Functional Entities - assigns the Transmission Owner, Generator Owner, and Distribution Provider as the responsible entity(s) replacing the Regional Reliability Organization.~~ ~~PRC-004-3 replaces the RRO procedures.~~	The Requirements in the proposed PRC-004-3 standard by their results-based construction requires performance that is implicit of having procedures for the analysis of Protection System operations (R1, R2, R3, and R4) and mitigation of identified Misoperations (R5 and R6). The proposed requirements also direct focus to areas most important to reliability. For example, Requirement R1 requires the applicable entity to initiate a review upon a Bulk Electric System (BES) interrupting device operation and identify any Misoperation. Requirement R2 requires the applicable entity to notify all other owners of the Composite Protection System when it determines (or is unsure) its Protection System components did not cause the BES interrupting device operation or it cannot rule out a Misoperation. Requirement R3 requires the notified

procedures.		anything, to benefit or protect the reliable operation of the BES.

Violation Risk Factors and Violation Severity Level Justifications

PRC-004-3 – Protection System Misoperation Identification and Correction
Project 2010-05.1 – Protection System (Misoperations)

Violation Risk Factor and Violation Severity Level Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in: PRC-004-3 — Protection System Misoperations.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Protection System Misoperations Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project.

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.

However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

The standard drafting team (SDT) also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System: [2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").

[2] Id. at footnote 15.

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

VRF Discussion

The following discussion addresses how the SDT considered FERC's VRF Guidelines 1 through 5. PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. " The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In FERC Order No. 693, the Commission identified PRC-003-0 as a "fill-in-the-blank" standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

The proposed PRC-004-3 Reliability Standard has six (6) discrete requirements that incorporate and enhance the intent of the requirements of PRC-004-2.1a and PRC-003-1. First, the revised standard requires the Transmission Owner, Generator Owner, and Distribution Provider to review each BES interrupting device operation meeting the criteria in Requirement R1, which includes: when caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate and identify each that is a Misoperation; regardless of whether the BES interrupting device owner owns all or part of the Composite Protection

System; and when BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

Second, the BES interrupting device owner is required to notify the other Protection System component owner(s) when the criteria in Requirement R2 are met, which includes: Composite Protection System ownership is shared with another entity; the BES interrupting device owner determined that a Misoperation occurred or cannot rule out a Misoperation; and the BES interrupting device owner determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or is unsure.

Third, if a Transmission Owner, Generator Owner, or Distribution Provider is notified by a BES interrupting device owner that the Composite Protection System operated, it must review the operation according to Requirement R3. In most cases, Requirement R1 or R3 will reveal the cause of the Misoperation. If not, Requirement R4 mandates the entity perform investigative action(s) to determine the cause as the fourth discrete requirement. If a cause is not identified, the entity either may continue its investigation until a cause is identified or the entity may write a declaration that no cause was identified. If a cause is identified, the entity advances to the fifth requirement.

In Requirement R5, the entity whose Protection System component was identified as the cause of the Misoperation must either develop a Corrective Action Plan (CAP) or explain in a declaration why it cannot correct the cause of the Misoperation. In developing a Corrective Action Plan (CAP) for the identified Protection System component(s), the entity must perform an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. If the entity determines that corrective actions are beyond the entity's control or would not improve BES reliability, the entity must make a declaration why and that no further corrective actions will be taken.

In the last of the requirements, Requirement R6, the entity must implement and complete the CAP. The entity must update the CAP during implementation when actions or timetables change.

The requirements of the proposed PRC-004-3 do not map, one-to-one, with the requirements of the two legacy standards, PRC-003-1 and PRC-004-2.1a. The new requirements comingle various reliability attributes of the legacy standards with precise reliability objectives, thus a requirement-to-requirement comparison of VRFs is not possible. In developing the new VRFs for the requirements of PRC-004-3, the Standard Drafting Team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. The VRFs of the FERC approved PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations, PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation, PRC-016-0.1 – Special Protection System Misoperation, and PRC-022-1 – Under-

Voltage Load Shedding Program Performance, R1 influenced (citing FERC VRF Guideline 3) the drafting team's VRF decisions, as such, the VRFs for PRC-004-3 Requirements R1 through R6 are assigned a VRF of Medium.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.
Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF and VSL Justifications – PRC-004-3, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Protection System operations reviewed for proper operation by their owner(s) is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection System for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The requirement single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2

VRF and VSL Justifications – PRC-004-3, R1	
	(GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which have a VRF of High. This proposed Requirement R1, to "review" (similar to "analyze"), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 ("…shall analyze its SPS operations and maintain a record of all misoperations…") and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 ("…shall analyze and document all UVLS operations and Misoperations.") which both have a VRF of Medium. The proposed VRF of Medium is not inadvertently lowering the identified VRF of High in the former Requirements R1 and R2 because the proposed Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Protection System operations reviewed for proper operation by their owner(s) is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to identify whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.		

VRF and VSL Justifications – PRC-004-3, R1	
of Compliance	The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed VSLs appropriately assess the severity of the violation with the failure to perform a review for Misoperation as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R1	
Violations	

VRF and VSL Justifications – PRC-004-3, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to notify a joint owner of a Protection System when the initiating owner determined its components did not cause a Misoperation or it did not rule out a Misoperation, could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Unresolved Misoperations of jointly owned equipment or operations that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: This is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. A lack of coordination on system protection was one of eight factors common to substantive outages prior to and including the August 14, 2003 Blackout. The initiating entity in the planning time frame is required to notify the other owner(s) of Protection System components when it determines that (or is unsure whether)its components did not cause a Misoperation or when it is unable to rule out a Misoperation of the jointly owned Protection System. This ensures that all parties review

VRF and VSL Justifications – PRC-004-3, R2	
	their equipment for proper operation which may include checking for proper coordination depending on the circumstances.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The requirement single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which as a VRF of High. The requirement and VRF of Medium is consistent with Reliability Standards FAC-008-3 – Facility Ratings, R7 ("…shall provide Facility Ratings (for its solely and jointly owned Facilities…") and MOD-012-0 – Dynamics Data for Modeling and Simulation of the Interconnected Transmission System, R2 ("…shall provide appropriate equipment characteristics and system data…") which both have a VRF of Medium. Other protection systems based Reliability Standards such as PRC-005-1b – Transmission and Generation Protection System Maintenance and Testing, R2 ("…shall provide documentation…"), PRC-016-0.1 – Special Protection System Misoperations, R3 ("…that owns an SPS shall provide documentation of the misoperation analyses…"), and PRC-017-0 – Special Protection System Maintenance and Testing, R2 ("…SPS shall provide documentation of the program…) all have a VRF of Lower; however, these requirements involve the administrative reporting to either the Regional Reliability Organization (now Regional Entity) or NERC and not a reliability function like the previously mentioned FAC-008-3 and MOD-012-0 Reliability Standards.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to notify other entities to review each Protection System operation, identify Misoperations, and determine the cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of

VRF and VSL Justifications – PRC-004-3, R2			
	the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Unresolved Misoperations of jointly owned equipment or operations that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with

VRF and VSL Justifications – PRC-004-3, R2			
			Requirement R2.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement is new to the standard and had no previous level of compliance. Other Reliability Standards use a variety of VSLs ranging from a single severe level (i.e., binary), two levels, to four VSL levels. Some use a percentage as the failure of the number entities not notified; however, this would not be practical for this requirement as joint ownership is generally limited to one or two owners. The incremental increase in violation is consistent with the NERC Guidelines and is reasonable in consideration of the time periods provided by the Requirement.		
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.		
FERC VSL G3	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore		

VRF and VSL Justifications – PRC-004-3, R2	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R3	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure of a joint Protection System owner to review its components for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation upon notification could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Protection System operations reviewed for proper operation by other owner(s) is an important step in

VRF and VSL Justifications – PRC-004-3, R3	
	preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection System for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The requirement single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which as a VRF of High. This proposed Requirement R1, to “review” (similar to “analyze”), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“…shall analyze its SPS operations and maintain a record of all misoperations…”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“…shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium. The proposed VRF of Medium is not inadvertently lowering the identified VRF of High in the former Requirements R1 and R2 because the proposed Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs:

VRF and VSL Justifications – PRC-004-3, R3			
	Failure of a joint Protection System owner to review its components for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation upon notification could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Protection System operations reviewed for proper operation by other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

less than or equal to 30 calendar days late.	greater than 30 calendar days and less than or equal to 45 calendar days late.	than or equal to 60 calendar days late.	OR The responsible entity failed to identify whether or not a Misoperation its Protection System component(s) occurred in accordance with Requirement R3.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (DP) and R2 (GO & TO) for the notified Protection System owner. The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.		
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.		

VRF and VSL Justifications – PRC-004-3, R3	
Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R4	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to identify the cause(s) of a Misoperation could in the planning time frame, under emergency, abnormal, or restorative

VRF and VSL Justifications – PRC-004-3, R4	
	conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Unidentified causes of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. The applicable entity must conduct investigative action(s) to determine the cause(s) of a Misoperation, if not determined during the course of a review as proposed in Requirements R1 and R3.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The requirement single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which as a VRF of High. This proposed Requirement R4, to perform at least one “investigative action” (similar to “analyze”), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“…shall analyze its SPS operations and maintain a record of all misoperations…”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“…shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium.

VRF and VSL Justifications – PRC-004-3, R4			
	The proposed VRF of Medium is not inadvertently lowering the identified VRF of High in the former Requirement because the proposed Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.		
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to identify the cause(s) of a Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Unidentified causes of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**

NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.		
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.		

VRF and VSL Justifications – PRC-004-3, R4	
"Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R5	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to develop a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An unresolved cause of a Misoperation or failing to consider other locations with similar Protection System components could contribute the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the development of a Corrective Action Plan (CAP) associated with Protection Systems.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The requirement single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.

VRF and VSL Justifications – PRC-004-3, R5	
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which have varying VSLs. The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The former Requirement for the CAP was limited to a High VSL; however, the proposed Requirement R5 is now expanded to the Severe VSL. The lesser VSLs are based on tardiness and are practical and reasonable for the amount of time allotted for completion.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to develop a CAP for a Misoperation with an identified cause or failing to consider other locations with similar components could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An unresolved cause of a Misoperation could contribute the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justifications – PRC-004-3, R5			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop a CAP or explain in a declaration in accordance with Requirement R5. OR The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop an evaluation in accordance with Requirement R5.

VRF and VSL Justifications – PRC-004-3, R5	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. Varying VSLs are provided for the omission of the evaluation when developing the Corrective Action Plan and for failure to develop the evaluation.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which have varying VSLs. The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed Requirement is a Severe VSL for failure to develop the CAP with the Lower VSL being based on tardiness of the development.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-004-3, R5	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justification – PRC-004-3, R6	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to implement a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An uncorrected cause of a Misoperation, through not implementing a Corrective Action Plan, could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the implementation of a Corrective Action Plan (CAP) associated with Protection Systems.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The requirement single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.

VRF and VSL Justification – PRC-004-3, R6	
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which as a VRF of High. The requirement is consistent with Reliability Standards PRC-016-0.1, R2 (“…shall take corrective actions to avoid future misoperations.”) and PRC-022-1, R1.5 (“For any Misoperation, a Corrective Action Plan…”) which both have a VRF of Medium. The proposed VRF of Medium is not inadvertently lowering the identified VRF of High in the former Requirement because the proposed Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to implement a Corrective Action Plan for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An uncorrected cause of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justification – PRC-004-3, R6			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity implemented, but failed to update a CAP, when actions or timetables changed, in accordance with Requirement R6.	N/A	N/A	The responsible entity failed to implement a CAP in accordance with Requirement R6.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—The VSLs cover aspects of the requirement that are not equal in importance and performance.		

VRF and VSL Justification – PRC-004-3, R6	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed Requirement is a Severe VSL for failure to implement the CAP with the Lower VSL being based the failure of updating the CAP when actions or timetables change which is administrative in nature.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justification – PRC-004-3, R6	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

~~Project 2010-05.1 –~~ Violation Risk Factors and Violation Severity Level Justifications

PRC-004-3~~:~~
– Protection System Misoperation Identification and Correction
Project 2010-05.1 – Protection System (Misoperations)

Violation Risk Factor and Violation Severity Level Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in: PRC-004-3 — Protection System Misoperations.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Protection System Misoperations Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project~~:~~.

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system.

However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

The standard drafting team (SDT) also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").

[2] Id. at footnote 15.

- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

VRF Discussion

The following discussion addresses how the SDT considered FERC's VRF Guidelines ~~2~~1 through 5. ~~The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.~~

PRC-004-3 – Protection System ~~Misoperations~~Misoperation Identification and Correction is a revision of PRC-004-~~2a~~2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations~~ with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated.~~ . " The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems ~~required the Regions~~requires Regional Entities to establish procedures for analysis of Misoperations. In ~~the NOPR~~FERC Order No. 693, the Commission identified PRC-003-0 as a "fill-in-the-blank" standard. The ~~NOPR~~Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the requirements of PRC-004-~~2a.~~ 2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-~~2a~~2.1a.

The proposed PRC-004-3 Reliability Standard has ~~four (4)~~six (6) discrete requirements that incorporate and enhance the intent of the requirements of PRC-004-2.1a and PRC-003-1. ~~The~~First, the revised standard requires ~~entities to identify~~ the Transmission Owner, Generator Owner, and Distribution Provider to review each BES interrupting device operation meeting the criteria in Requirement R1, which includes: when caused by a Protection System ~~operations and designate each~~ operation or by manual intervention in response to a Protection System failure to operate and identify each that is a Misoperation; ~~then investigate each~~ regardless of whether the BES interrupting device owner owns all or part of the Composite Protection System; and when BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

Second, the BES interrupting device owner is required to notify the other Protection System component owner(s) when the criteria in Requirement R2 are met, which includes: Composite Protection System ownership is shared with another entity; the BES interrupting device owner determined that a Misoperation ~~and document the findings. If a~~ occurred or cannot rule out a Misoperation; and the BES interrupting device owner determined that its Protection System component(s) did not cause ~~is identified, the entity either creates~~the BES interrupting device(s) operation or is unsure.

Third, if a Transmission Owner, Generator Owner, or Distribution Provider is notified by a BES interrupting device owner that the Composite Protection System operated, it must review the operation according to Requirement R3. In most cases, Requirement R1 or R3 will reveal the cause of the Misoperation. If not, Requirement R4 mandates the entity perform investigative action(s) to determine the cause as the fourth discrete requirement. If a cause is not identified, the entity either may continue its investigation until a cause is identified or the entity may write a declaration that no cause was identified. If a cause is identified, the entity advances to the fifth requirement.

In Requirement R5, the entity whose Protection System component was identified as the cause of the Misoperation must either develop a Corrective Action Plan (CAP) or ~~writes~~explain in a declaration ~~that they~~why it cannot correct the ~~misoperating device(s). If a cause is not identified, the entity either creates an action plan~~ cause of the Misoperation. In developing a Corrective Action Plan (CAP) for ~~additional investigation or a writes a declaration~~ the identified Protection System component(s), the entity must perform an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. If the entity determines that corrective actions are beyond the entity's control or would not improve BES reliability, the entity must make a declaration why and that no further ~~work~~corrective actions will be ~~done. The next step is to~~taken.

In the last of the requirements, Requirement R6, the entity must implement and complete the CAP ~~or action plan. If the action plan leads to the determination of a cause, then the entity would either create a Corrective Action Plan (CAP) or write a declaration. The requirements recognize and encompass the possibility that components of a Protection System can be owned by different entities.~~. The entity must update the CAP during implementation when actions or timetables change.

The requirements of the proposed PRC-004-3 do not map, one-to-one, with the requirements of the two legacy standards~~.~~, PRC-003-1 and PRC-004-2.1a. The new requirements comingle various reliability attributes of the legacy standards with ~~new~~precise reliability objectives, thus a requirement-to-requirement comparison of VRFs is not possible. In developing the new VRFs for the requirements of PRC-004-3, the Standard Drafting Team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. ~~The VRFs of the FERC approved PRC-004-WECC-1, EOP-008-1, PRC-004-2a and of TPL-001-2~~The VRFs of the FERC approved PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations, PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation, PRC-016-0.1 – Special Protection System Misoperation, and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 influenced (citing FERC VRF Guideline 3) the drafting team's VRF decisions, as such, the VRFs for PRC-004-3 Requirements R1~~, R2 and R3~~ through R6 are assigned a VRF of Medium~~, while Requirement R4 is assigned a VRF of High~~.

~~PRC-004-3 Requirements R1, R2 and R3 are related to identifying Protection System operations, designating Misoperations, investigating Misoperations and developing Corrective Action Plans (CAP) or action plans. The SDT determined that the assignment of a VRF of Medium was consistent with the NERC criterion that states "A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures…"~~

~~PRC-004-3 Requirement R4 relates to implementing and completing CAPs or action plans. The SDT determined that the assignment of a VRF of High was consistent with the NERC criterion that states "A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures…"~~

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF and VSL Justifications – PRC-004-3, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to ~~identify and~~ review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to ~~designate Misoperations, investigate each~~a Protection System failure to operate for Misoperation ~~and document the findings~~ could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or ~~the~~ capability of the bulk electric system, or the ability to effectively monitor ~~and~~, control, or restore the bulk electric system. ~~Unresolved Misoperations could contribute to more severe~~However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Protection System operations reviewed for proper operation by their owner(s) is the first step in preventing the future severity of disturbances affecting a wider area, or ~~result in~~potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. ~~The applicable entities are always responsible for maintaining the reliability of the bulk electric system regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.~~
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: ~~N/A~~ The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection System for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The requirement ~~has Parts that all support~~single reliability activity associated with the reliability objective ~~so only one~~and no sub-Requirement(s) which allows a single VRF ~~was~~to be assigned; therefore no

VRF and VSL Justifications – PRC-004-3, R1	
	conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: ~~The SDT has assigned a Medium VRF which is consistent with EOP-008-1 Requirement R8 (which is similar in nature to PRC-004-3 Requirement R1.)~~This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which have a VRF of High. This proposed Requirement R1, to "review" (similar to "analyze"), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 ("…shall analyze its SPS operations and maintain a record of all misoperations…") and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 ("…shall analyze and document all UVLS operations and Misoperations.") which both have a VRF of Medium. The proposed VRF of Medium is not inadvertently lowering the identified VRF of High in the former Requirements R1 and R2 because the proposed Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to ~~identify and~~ review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to ~~designate Misoperations, investigate each~~ a Protection System failure to operate for Misoperation ~~and document the findings~~ could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or ~~the~~ capability of the bulk electric system, or the ability to effectively monitor ~~and~~, control, or restore the bulk electric system. ~~Unresolved Misoperations could contribute to more severe~~ However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Protection System operations reviewed for proper operation by their owner(s) is the first step in preventing the future severity of disturbances affecting a wider area, or ~~result in~~potential equipment damage. However,

VRF and VSL Justifications – PRC-004-3, R1			
	violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.~~ The applicable entities are always responsible for maintaining the reliability of the bulk electric system regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.~~		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent~~ throughout the requirement~~.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity ~~performed the actions~~identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, ~~Parts 1.1 and 1.2 ~~but in more than 120 calendar days ~~but~~and less than or equal to 150 calendar days of the ~~operation's occurrence.~~ ~~OR~~ ~~The responsible entity identified a Protection System operation that operated one of its ~~BES interrupting ~~devices but failed to review the operation in~~	The responsible entity ~~performed the actions~~identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, ~~Parts 1.1 and 1.2 ~~but in more than 150 calendar days ~~but~~and less than or equal to ~~160~~165 calendar days of the ~~operation's occurrence~~BES interrupting device operation.	The responsible entity ~~performed the actions~~identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, ~~Parts 1.1 and 1.2~~ but in more than ~~160~~165 calendar days ~~but~~and less than or equal to ~~170~~180 calendar days of the ~~operation's occurrence.~~BES interrupting device operation. Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to notify a joint owner of a Protection System when the initiating owner determined its components did not cause a Misoperation or it did not rule out a Misoperation, could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Unresolved Misoperations of jointly owned equipment or operations that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.

VRF and VSL Justifications – PRC-004-3, R2	
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: This is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. A lack of coordination on system protection was one of eight factors common to substantive outages prior to and including the August 14, 2003 Blackout. The initiating entity in the planning time frame is required to notify the other owner(s) of Protection System components when it determines that (or is unsure whether)its components did not cause a Misoperation or when it is unable to rule out a Misoperation of the jointly owned Protection System. This ensures that all parties review their equipment for proper operation which may include checking for proper coordination depending on the circumstances.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The requirement single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which as a VRF of High. The requirement and VRF of Medium is consistent with Reliability Standards FAC-008-3 – Facility Ratings, R7 (“…shall provide Facility Ratings (for its solely and jointly owned Facilities…”) and MOD-012-0 – Dynamics Data for Modeling and Simulation of the Interconnected Transmission System, R2 (“…shall provide appropriate equipment characteristics and system data…”) which both have a VRF of Medium. Other protection systems based Reliability Standards such as PRC-005-1b – Transmission and Generation Protection System Maintenance and Testing, R2 (“…shall provide documentation…”), PRC-016-0.1 – Special Protection System Misoperations, R3 (“…that owns an SPS shall provide documentation of the misoperation analyses…”), and PRC-017-0 – Special Protection System Maintenance and Testing, R2 (“…SPS shall provide documentation of the program…) all have a VRF of Lower; however, these requirements involve the administrative reporting to either the Regional Reliability Organization (now

VRF and VSL Justifications – PRC-004-3, R2	
	Regional Entity) or NERC and not a reliability function like the previously mentioned FAC-008-3 and MOD-012-0 Reliability Standards.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to notify other entities to review each Protection System operation, identify Misoperations, and determine the cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Unresolved Misoperations of jointly owned equipment or operations that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device

VRF and VSL Justifications – PRC-004-3, R2			
and less than or equal to 150 calendar days of the BES interrupting device operation.	and less than or equal to 165 calendar days of the BES interrupting device operation.	calendar days of the BES interrupting device operation.	operation. OR The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.

NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement is new to the standard and had no previous level of compliance. Other Reliability Standards use a variety of VSLs ranging from a single severe level (i.e., binary), two levels, to four VSL levels. Some use a percentage as the failure of the number entities not notified; however, this would not be practical for this requirement as joint ownership is generally limited to one or two owners. The incremental increase in violation is consistent with the NERC Guidelines and is reasonable in consideration of the time periods provided by the Requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-004-3, R2	
"Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R3	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure of a joint Protection System owner to ~~develop an action plan~~review its components for ~~a~~ each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation ~~without an identified cause~~upon notification could in the

VRF and VSL Justifications – PRC-004-3, R3	
	planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or ~~the~~ capability of the bulk electric system, or the ability to effectively monitor ~~and~~, control, or restore the bulk electric system. ~~Unresolved Misoperations could contribute to more severe~~However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Protection System operations reviewed for proper operation by other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or ~~result in~~potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. ~~The applicable entities are always responsible for maintaining the reliability of the bulk electric system regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.~~
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: ~~N/A~~ The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection System for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The requirement ~~has~~single reliability activity associated with the reliability objective and no ~~Parts so only one~~sub-Requirement(s) which allows a single VRF ~~was~~to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: ~~The requirement is similar to EOP-008-1 Requirement R8 which has an approved VRF of Medium.~~This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations,"

VRF and VSL Justifications – PRC-004-3, R3	
	"develop a Correction Action Plan," and "implement a Corrective Action Plan" which as a VRF of High. This proposed Requirement R1, to "review" (similar to "analyze"), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 ("…shall analyze its SPS operations and maintain a record of all misoperations…") and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 ("…shall analyze and document all UVLS operations and Misoperations.") which both have a VRF of Medium. The proposed VRF of Medium is not inadvertently lowering the identified VRF of High in the former Requirements R1 and R2 because the proposed Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure of a joint Protection System owner to ~~develop an action plan~~review its components for ~~a~~ each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation ~~without an identified cause~~upon notification could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or ~~the~~ capability of the bulk electric system, or the ability to effectively monitor ~~and~~, control, or restore the bulk electric system. ~~Unresolved Misoperations could contribute to more severe~~However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Protection System operations reviewed for proper operation by other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or ~~result in~~potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. ~~The applicable entities are always responsible for maintaining the reliability of the bulk electric system regardless of the situation. This requirement meets NERC's criterion~~

VRF and VSL Justifications – PRC-004-3, R3	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This ~~VSL is consistent with the current VSL associated with the existing~~ requirement replaces one of the three performance components of PRC-004-2a, R1 (DP) and R2 (GO & TO) for the notified Protection System owner. The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard ~~being replaced.~~ . The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: ~~N/A~~ This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-004-3, R3	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R4	
Proposed VRF	~~High~~**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to ~~implement~~identify the cause(s) of a ~~CAP or action plan to address an identified~~ Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly ~~cause~~and adversely affect the electrical state or ~~contribute~~capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or ~~a~~ cascading ~~sequence of~~ failures~~. Unresolved Misoperations~~, nor to hinder restoration to a normal condition. Unidentified causes of a Misoperation could contribute to ~~more severe~~the severity of future disturbances

VRF and VSL Justifications – PRC-004-3, R4	
	affecting a wider area, or ~~result in~~potential equipment damage.~~ This is a planning requirement that meets the NERC criterion for a High VRF~~ However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report:~~ N/A~~ This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. The applicable entity must conduct investigative action(s) to determine the cause(s) of a Misoperation, if not determined during the course of a review as proposed in Requirements R1 and R3.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The requirement ~~has~~single reliability activity associated with the reliability objective and no ~~Parts so only one~~sub-Requirement(s) which allows a single VRF ~~was~~to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: ~~The requirement is consistent with PRC-004-2a, Requirements R1 and R2, PRC-004-WECC-1 Requirement R2.1, and TPL-001-2 Requirement R2 Part 2.7 which have approved VRFs of High.~~This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which as a VRF of High. This proposed Requirement R4, to perform at least one "investigative action" (similar to "analyze"), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 ("…shall analyze its SPS operations and maintain a record of all misoperations…") and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 ("…shall analyze and document all UVLS operations and Misoperations.") which both have a VRF of Medium. The proposed VRF of Medium is not inadvertently lowering the identified VRF of High in the former Requirement because the proposed Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.

VRF and VSL Justifications – PRC-004-3, R4	
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to ~~implement~~ identify the cause(s) of a ~~CAP or action plan to address an identified~~ Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly ~~cause~~and adversely affect the electrical state or ~~contribute~~capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or ~~a~~ cascading ~~sequence of~~ failures~~. Unresolved Misoperations~~, nor to hinder restoration to a normal condition. Unidentified causes of a Misoperation could contribute to ~~more severe~~the severity of future disturbances affecting a wider area, or ~~result in~~potential equipment damage. ~~This is a planning requirement that meets the NERC criterion for a High VRF~~However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does ~~contain obligations that are administrative in nature but they support the high risk~~not co-mingle reliability ~~objective;~~objectives of differing risk; therefore, the assigned VRF of ~~High~~Medium is ~~appropriate for the requirement~~consistent.

Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity ~~failed to revise a CAP or~~ performed at least one investigative action ~~plan as needed~~ in accordance with Requirement R4, but was less than or equal to one	~~N/A~~The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than	~~N/A~~The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late.

calendar quarter late.	or equal to two calendar quarters late.	three calendar quarters late.	OR The responsible entity failed to ~~implement a CAP or~~perform investigative action ~~plan~~(s) in accordance with Requirement R4.

NERC VSL Guidelines	Meets NERC's VSL Guidelines—~~The VSLs cover aspects of~~There is an incremental aspect to the ~~requirement that are~~VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not ~~equal in importance~~by individual assets.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This ~~VSL is consistent with the previous severity level~~requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. The proposed VSL does not lower the current level of compliance ~~for the similar Requirement~~because the former VSL was comingled with the other activities. The proposed VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single	Guideline 2a: ~~N/A~~ This requirement is not binary; therefore, this criterion does not apply. Guideline 2b:

VRF and VSL Justifications – PRC-004-3, R4	
Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R5	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to develop a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An unresolved cause of a Misoperation or failing to consider other locations with similar Protection System components could contribute the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the development of a Corrective Action Plan (CAP) associated with Protection Systems.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The requirement single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.

VRF and VSL Justifications – PRC-004-3, R5	
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which have varying VSLs. The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The former Requirement for the CAP was limited to a High VSL; however, the proposed Requirement R5 is now expanded to the Severe VSL. The lesser VSLs are based on tardiness and are practical and reasonable for the amount of time allotted for completion.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to develop a CAP for a Misoperation with an identified cause or failing to consider other locations with similar components could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An unresolved cause of a Misoperation could contribute the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justifications – PRC-004-3, R5			
Proposed VSL

OR The responsible entity failed to develop a CAP or explain in a declaration in accordance with Requirement R5. OR The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop an evaluation in accordance with Requirement R5.

VRF and VSL Justifications – PRC-004-3, R5	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. Varying VSLs are provided for the omission of the evaluation when developing the Corrective Action Plan and for failure to develop the evaluation.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which have varying VSLs. The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed Requirement is a Severe VSL for failure to develop the CAP with the Lower VSL being based on tardiness of the development.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-004-3, R5	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justification – PRC-004-3, R6	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to implement a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An uncorrected cause of a Misoperation, through not implementing a Corrective Action Plan, could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the implementation of a Corrective Action Plan (CAP) associated with Protection Systems.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The requirement single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.

VRF and VSL Justification – PRC-004-3, R6	
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which as a VRF of High. The requirement is consistent with Reliability Standards PRC-016-0.1, R2 (“…shall take corrective actions to avoid future misoperations.”) and PRC-022-1, R1.5 (“For any Misoperation, a Corrective Action Plan…”) which both have a VRF of Medium. The proposed VRF of Medium is not inadvertently lowering the identified VRF of High in the former Requirement because the proposed Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to implement a Corrective Action Plan for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An uncorrected cause of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justification – PRC-004-3, R6			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity implemented, but failed to update a CAP, when actions or timetables changed, in accordance with Requirement R6.	N/A	N/A	The responsible entity failed to implement a CAP in accordance with Requirement R6.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—The VSLs cover aspects of the requirement that are not equal in importance and performance.		

VRF and VSL Justification – PRC-004-3, R6	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed Requirement is a Severe VSL for failure to implement the CAP with the Lower VSL being based the failure of updating the CAP when actions or timetables change which is administrative in nature.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justification – PRC-004-3, R6	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

A. Introduction

1. **Title:** **Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems**

2. **Number:** PRC-003-1

3. **Purpose:** To ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated.

4. **Applicability**

   4.1. Regional Reliability Organization

5. **Effective Date:** May 1, 2006.

B. Requirements

R1. Each Regional Reliability Organization shall establish, document and maintain its procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations. These procedures shall include the following elements:

R1.1. The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).

R1.2. Data reporting requirements (periodicity and format) for Misoperations.

R1.3. Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.

R1.4. Identification of the Regional Reliability Organization group responsible for the procedures and the process for approval of the procedures.

R2. Each Regional Reliability Organization shall maintain and periodically update documentation of its procedures for review, analysis, reporting, and mitigation of transmission and generation Protection System Misoperations.

R3. Each Regional Reliability Organization shall distribute procedures in Requirement 1 and any changes to those procedures, to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners within 30 calendar days of approval of those procedures.

C. Measures

M1. The Regional Reliability Organization shall have procedures for the review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations as defined in R1.

M2. The Regional Reliability Organization shall have evidence it maintained and periodically updated its procedures for review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations as defined in Requirement 2.

M3. The Regional Reliability Organization shall have evidence it provided its procedures for the review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners as defined in Requirement 3.

D. Compliance

1. **Compliance Monitoring Process**

1.1. Compliance Monitoring Responsibility

NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The Regional Reliability Organization shall retain documentation of its procedures for analysis of transmission and generation Protection System Misoperations and any changes to those procedures for three years.

The Compliance Monitor shall retain any audit data for three years.

1.4. Additional Compliance Information

The Regional Reliability Organization shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Levels of Non-Compliance

2.1. Level 1: Procedures were not reviewed and updated within the review cycle period as required in R2.

2.2. Level 2: Procedures did not include one of the elements defined in R1.1 through R1.4.

2.3. Level 3: Procedures did not include two or more of the elements defined in R1.1 through R1.4.

2.4. Level 4: There shall be a level four non-compliance if either of the following conditions exist:

2.4.1 No evidence of Procedures.

2.4.2 Procedures were not provided to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners as defined in R3.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to “en dash” (–) and “em dash (—).” 2. Added “periods” to items where appropriate. 3. Changed “Timeframe” to “Time Frame” in item D, 1.2.	01/20/06

A. Introduction

1. **Title:** Analysis and Mitigation of Transmission and Generation Protection System Misoperations
2. **Number:** PRC-004-2.1a
3. **Purpose:** Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated.
4. **Applicability**
   - **4.1.** Transmission Owner.
   - **4.2.** Distribution Provider that owns a transmission Protection System.
   - **4.3.** Generator Owner.
5. **(Proposed) Effective Date:** In those jurisdictions where regulatory approval is required, all requirements become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements become effective upon Board of Trustees' adoption.

B. Requirements

R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.

R2. The Generator Owner shall analyze its generator and generator interconnection Facility Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.

R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.

C. Measures

M1. The Transmission Owner, and any Distribution Provider that owns a transmission Protection System shall each have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.

M2. The Generator Owner shall have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.

M3. Each Transmission Owner, and any Distribution Provider that owns a transmission Protection System, and each Generator Owner shall have evidence it provided documentation of its Protection System Misoperations, analyses and Corrective Action Plans according to the Regional Entity's procedures.

D. Compliance

1. **Compliance Monitoring Process**
   - **1.1. Compliance Enforcement Authority**

     Regional Entity.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

The Transmission Owner, and Distribution Provider that own a transmission Protection System and the Generator Owner that owns a generation or generator interconnection Facility Protection System shall each retain data on its Protection System Misoperations and each accompanying Corrective Action Plan until the Corrective Action Plan has been executed or for 12 months, whichever is later.

The Compliance Monitor shall retain any audit data for three years.

1.5. Additional Compliance Information

The Transmission Owner, and any Distribution Provider that owns a transmission Protection System and the Generator Owner shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Violation Severity Levels (no changes)

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to “en dash” (–) and “em dash (—).” 2. Added “periods” to items where appropriate. Changed “Timeframe” to “Time Frame” in item D, 1.2.	01/20/06
2		Modified to address Order No. 693 Directives contained in paragraph 1469.	Revised
2	August 5, 2010	Adopted by NERC Board of Trustees	

1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by the Board of Trustees	
1a	September 26, 2011	FERC Order issued approving the interpretation of R1 and R3 (FERC's Order is effective as of September 26, 2011)	
2a	September 26, 2011	Appended FERC-approved interpretation of R1 and R3 to version 2	
2.1a		Errata change: Edited R2 to add "…and generator interconnection Facility…"	Revision under Project 2010-07
2.1a	February 9, 2012	Errata change adopted by the Board of Trustees	
2.1a	September 19, 2013	FERC Order issued approving PRC-004-2.1a (approval becomes effective November 25, 2013).	

Appendix 1[1]

Requirement Number and Text of Requirement
R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's procedures developed for Reliability Standard PRC-003 Requirement 1. **R3**. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Reliability Organization, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Reliability Organization's procedures developed for PRC-003 R1.
Question:
Is protection for a radially-connected transformer protection system energized from the BES considered a transmission Protection System subject to this standard?
Response:
The request for interpretation of PRC-004-1 Requirements R1 and R3 focuses on the applicability of the term "transmission Protection System." The NERC Glossary of Terms Used in Reliability Standards contains a definition of "Protection System" but does not contain a definition of transmission Protection System. In these two standards, use of the phrase transmission Protection System indicates that the requirements using this phrase are applicable to any Protection System that is installed for the purpose of detecting faults on transmission elements (lines, buses, transformers, etc.) identified as being included in the Bulk Electric System (BES) and trips an interrupting device that interrupts current supplied directly from the BES. A Protection System for a radially connected transformer energized from the BES would be considered a transmission Protection System and subject to these standards only if the protection trips an interrupting device that interrupts current supplied directly from the BES and the transformer is a BES element.

[1] When the request for interpretation was made, it was for a previous version of the standard. Although the interpretation references a previous version of the standard, because it is still applicable in this case, it is appended to this version of the standard.

Standards Announcement

Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)
PRC-004-3

Formal Comment Period Open: January 17, 2014 – March 3, 2014

Upcoming:
Additional Ballot and Non-Binding Poll: February 21, 2014 - March 3, 2014

Now Available

A formal comment period for **PRC-004-3 – Protection System Misoperation Identification and Correction** is now open through 8 p.m. Eastern on **Monday, March 3, 2014**.

Background information for this project can be found on the project page.

Instructions

A formal comment period for **PRC-004-3** is open through **8 p.m. Eastern on Monday, March 3, 2014.** Please use the electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment forms are posted on the project page.

Next Steps

An additional ballot of **PRC-004-3** and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted **February 21, 2014 through 8 p.m. Eastern on Monday, March 3, 2014**.

Standards Development Process

The Standards Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Wendy Muller,
Standards Development Administrator, or at 404-446-2560.

Standards Announcement

Project 2010-05.1 Protection Systems: Misoperations
PRC-004-3

Additional Ballot and Non-Binding Poll Results

Now Available

An additional ballot of **PRC-004-3 – Protection System Misoperation Identification and Correction** and a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels concluded at **8 p.m. Eastern on Tuesday, March, 11 and Wednesday, March 12, 2014** respectively.

This standard achieved a quorum but did not receive sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballot.

Ballot	Non-Binding Poll
Quorum /Approval	Quorum/Supportive Opinions
75.06% / 62.63%	75.00% / 69.06%

Background information for this project can be found on the project page.

Next Steps

The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a final ballot.

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller,
Standards Development Administrator, or at 404-446-2560.

Yes
Yes
We agree with the requirements as revised, but do not agree with Measures M2 and M3. a. Measure M2: The performance target is that the responsible entity notified the other owner(s) of the Protection System of the operation of the BES interrupting device when the conditions in Parts 2.1 to 2.3 are met. b. Measure M3: The performance target is that the responsible entity undertook actions to identify whether its Protection System component(s) caused a Misoperation when notified by the other owner of the Protection System of the BES interrupting device that operated.
No
We agree with the requirements as revised, but do not agree with the Measures. Measures: The performance target is that the responsible entity performed investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, and the identification of the cause(s) of the Misoperation or a declaration that no cause was identified. The term “investigative

action(s)" is ambiguous even given the example cited in the Application Guidelines. Since this is an auditable measure, this term should be defined in the standard.
a. The "Effective Dates" section of the standard is confusing as it suggests no regulatory (i.e. FERC) approval is required in Western Interconnection and offers both twelve and twenty-four month timeframes. b. Applicability Section – Facilities: We agree with removing references to RAS and SPS, but question the omission of UVLS when UFLS that is intended to trip one or more BES Elements is included. There might well be UVLS that performs a similar function when initiated by abnormal voltage conditions. The draft standard does not provide any rationale for the omission. Please review and provide the rationale, or add UVLS to the list of applicable facilities. c. Measure M1: M1 as presented only indicates the kind of evidence that can be provided to demonstrate compliance by the responsible entity, but M1 does not specify the performance targets to illustrate compliance, e.g. "that the responsible entity undertook actions to identify whether its Protection System component(s) caused a Misoperation when the conditions in Part 1.1 to Part 1.3 are met". Suggest M1 be revised to provide the performance target. d. VSL for R1: The second condition under SEVERE is not proper or needed. Requirement R1 asks for the identification of whether or not a responsible entity's Protection System component(s) caused a Misoperation but R4 has a provision that if the responsible entity has not determined the cause(s) of a Misoperation identified in accordance with Requirement R1 (or R3), then it shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters. Therefore, the second condition under SEVERE is either premature or inappropriate. We suggest to remove the second condition, or to revise it to read: The responsible entity did not take action to identify whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1. e. VSL for R3: Second condition under SEVERE - similar comment as for the VSL for R1 preceding. f. The SDT should reconsider the need for the defined term "Composite Protection System". By definition, a Protection System is already a composite system whose components need to function collectively to protect an Element. The proposed term is redundant. The comment report indicated that 4 commenters representing 24 individuals requested clarification of the term "composite Protection System". This represents a very low percentage of the total number of commenters and individuals, which should not be the basis for proposing the redundant new term.

No
a) Misoperation Definition #3 (Slow Trip – During Fault) would require the running of system studies to test for possible system instability. This (and/or other expectations) should be spelled out in the Application Guidelines. b) Misoperation Definition #4 (Slow Trip – Other Than Fault) would also require the running of system studies to test for possible system

instability. This (and/or other expectations) should be spelled out in the Application Guidelines. c) For #2 & #4 sections of the Misoperation Definition as well as under Facilities (4.2.2) - UFLS/UVLS both should specifically be mentioned together. d) It should be clarified that non-fault tripping protection schemes as described in PRC-004-3 do not include RAS/SPS (and that RAS/SPS will be covered in PRC-016). e) It should be clarified in PRC-004-3 that UFLS/UVLS are not specifically part of the RAS/SPS definition (even though this is spelled out in the NERC glossary). Otherwise, it all can be quite confusing. f) In all six parts of the Misoperation Definition, the phrase "…where tripping for protection purposes is involved" could be included for clarity.
Yes
Yes
No
a) Application Guidelines could have more specificity, in addition to examples. For example, in #4 (Slow Trip – Other than Fault), it should be spelled out that each possible Misoperation should be studied to test for possible effects on system stability. Other specific expectations, if any, should also be spelled out. b) In addition, "Other than Fault" should be clarified and explained together with the definition of SPS/RAS, which are excluded from PRC-004. (SPS/RAS are defined as non fault protection schemes). c) UFLS/UVLS should always be mentioned together in PRC-004-3 (unless both are not included). d) Should sync check and breaker failure be considered in the Application Guidelines – what category do these fall into? e) In all six parts of the Misoperation Definition, the phrase "…where tripping for protection purposes is involved" could be included for clarity.
a) Under Facilities on p.5, UFLS /UVLS should both be listed, if intended. The order of facilities (specifically content of 4.2.1 and 4.2.2) should be swapped – so that everything INcluded comes before everything EXcluded. b) There should be a whole section clarifying exclusion of SPS/RAS (but inclusion of UFLS/UVLS). Or….the definition of SPS/RAS should be changed to include UFLS/UVLS. c) A Misoperation Process Benchmark table of reporting functions and dates should be provided to entities. This would greatly facilitate retention of misoperation timeline evidence (for audits, self-cert, data requests). The Misoperation Process Benchmark table structure could be provided by the Regional Entities such as WECC in an updated misoperation Criterion as an Appendix. A suggested list of Benchmark dates is as follows: 1. date of Interrupting device operation, 2. date of identification of misoperation, 3. date other owners of Protection System (of BES interrupting device operation) notified, 4. date of identification by notified entity whether its device caused a misoperation, 5. date the cause of misoperation investigated/found, 6. date of further investigation (if cause not found) 7. date of Corrective Action Plan (CAP) development 8. target CAP completion date(s), actual CAP completion date d) Finally, it is recommended that Quarterly Misoperation Reporting be changed over to a "Data Request" sooner than the effective date of PRC-004-3. It is stated on page 5 of the proposed PRC-004-3, that the currently reporting system is "not optimal to establish consistent metrics for measuring Protection System

performance”. Perhaps the ERO Reliabililty Assessment and Performance Analysis Group could release an updated recommendation letter for Misoperation Reporting. It is also recommended that the Misoperation “Data Request” occur once per year.

No
The Bureau of Reclamation (Reclamation) requests that the drafting team clarify the bounds of the Composite Protection Systems definition. Reclamation suggests that the drafting team update the Application Guidelines to provide an example of a Composite Protection System for a generator, a transformer, and a transmission line so that industry will have guidance on the scope of typical Composite Protection Systems.
Yes
Yes
No
Reclamation suggests that the drafting team update the Application Guidelines to provide an example of a Composite Protection System for a generator, a transformer, and a transmission line so that industry will have guidance on the scope of typical Composite Protection Systems.
Reclamation thanks the drafting team for their efforts refining the standard and providing the examples in the Application Guidelines.
Individual
William H. Chambliss, Member, Operating Committee
Virginia State Corporation Commisison
No
Minor suggestion in Parts 1 and 2 "Faliure to Trip." I suggest changing the phrase "failure of a Protection System component" to "failure of any Protection System component." Although it may be a remote possibility, more than a single component may fail, while the Composite Protection System as a whole acts correctly.
No
R1 remains very unclear to me. The text requires a TO, GO or distribution provider to "identify whether" its component caused a misoperation, but Subparagraph 1.3 requires, as a necessary condition to such identification that the "BES interrupting device owner [has] identified" that its component caused the failure. This is circular.
Yes

I have one wording suggestion for R3. I suggest moving the words "shall identify" from their present location to follow immediately after "Requirement R2." The sentence would then read "Each TO, GO and Distribution Provider that receives notification pursuant to Requirement R2, shall identify within the later of 60 days.....device(s) operation, whether its Protection System component(s) caused a Misoperation."
Yes
Under R5, the owner of a Protection System component that causes a Misoperation shall either develop a CAP or "Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability....." I wonder whether the Requirement should identify to whom and by what manner any such "declaration" should be made?
Group
JEA
Tom McElhinney
Yes
Yes
R1 & R3 both need an exclusion for any declared natural disasters. We also believe that the 60 day timeframe identified in R5 to develop a Corrective Action Plan and evaluate applicability is not sufficient to consider applicability to other PS, different options and their cost/benefit scenarios, coordinate resources, develop schedules, and procure funding. We recommend this be changed to 180 days.
Individual
Michelle R. D'Antuono
Ingleside Cogeneration, L.P./Occidental Chemical Corporation
No
Ingleside Cogeneration, L.P. (“ICLP”) agrees that the definition of “Composite Protection System” properly captures the concept proposed by the project team. It reflects an intent that a Misoperation is determined by evaluating the actual performance of the primary, secondary, and pilot systems in totality against the expected performance. Evaluations of individual schema failures are of little value when built-in redundancy takes over to protect the local system – exactly as the designers intended. There is still discomfort with the definitions of “Slow Trip – During Fault” and “Slow Trip – Other Than Fault” – particularly in those cases where the design responsibility is out of our hands. For example, when PRC-024-1 takes effect, Generator Owners will have little control over the expected performance of

voltage and frequency-responsive Protection Systems – provided the relays are set in accordance with the standard. This means that the definitions need to include a statement that any composite Protection System operation that reacts consistently with the parameters (settings) established in any other NERC standard cannot be a Misoperation. Secondly, unless notified by the Transmission Planner or Planning Coordinator, ICLP will not know that the Misoperation of one of our Protection Systems will lead to BES "voltage or dynamic instability." The two definitions seem to recognize that the GO may not be in a position to be identify such critical Protection Systems, but can be read otherwise. Similar to the previous issue, we believe that as long as we correctly supply modeling data to the TP and PC in accordance with other NERC standards, the responsibility to identify susceptible Protection Systems remains with the planning entities.
Yes
ICLP believes that the latest draft of PRC-004-3 corrects a gap where a delayed investigation by one entity could lead to a finding of a violation on the other. Requirements R2 and R3 address this potentially unfair scenario.
Yes
ICLP appreciates the precise language used in Requirement R4 – which allows sufficient time to investigate a Misoperation, while limiting it to within reasonable bounds. We agree that if a cause cannot be found through good faith investigation within two calendar quarters, there is little benefit to pursuing the case further.
Yes
ICLP is concerned that Compliance Enforcement Entities' interpretation of PRC-004-3 will evolve over time – particularly as new Protection System vulnerabilities are found through the evaluation of Misoperations. In addition, the need for greater numbers of measuring points and the increased granularity of Disturbance data will naturally grow as relay schemes become more and more complex. This means that a clear expectation of the requirements for Disturbance Monitoring Equipment (DME) must be established up front in a binding fashion. We accept the project team's assertion that PRC-002-2 (presently under development) is the proper vehicle for the identification of required DME locations, but would like to see a clear tie to PRC-004-3. Otherwise it is easy to see that CEAs may decide at a future date that Misoperations' reporting needs are the driving factor for DME, not PRC-002-2.

ReliabilityFirst
No
Throughout the draft standard (and definition of Misoperation), the term “Composite Protection System” is used while in other portions only the term Protection System is referenced. For example, within the definition of “Misoperation”, items one through four use the term “Composite Protection System” while items five and six use the term “Protection System”. Another example is Requirement R1, Part 1.1 references the term “Protection System” while Part 1.2 references “Composite Protection System”. ReliabilityFirst request the SDT’s rationale on the appropriateness of the use of these terms.
No
The term “BES interrupting device” is used throughout Requirements R1, R2 and R3 though it is only defined within the Application Guidelines section. In order to provide clarity and avoid potential interpretations of what constitutes a “BES interrupting device”; ReliabilityFirst recommends the SDT propose this as a new definition which would be added to the NERC Glossary of Terms. ReliabilityFirst recommends the following definition from the Application Guidelines for consideration: “BES Interrupting Device - A BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current.”
No
ReliabilityFirst has a number of concerns with Requirement R4. First, from compliance/enforcement perspective, Requirement R4 is not sufficiently distinct from Requirements R1 and R3 (it creates a “double jeopardy situation”). For example, Requirement R3 requires the responsible entity to “…identify whether its Protection System component(s) caused a Misoperation”. As written, if the responsible entity fails to “…identify whether its Protection System component(s) caused a Misoperation” this could be grounds for a possible violation of Requirement R3. This is evident in the associated Violation Severity Levels where failing “…to identify whether or not a Misoperation its Protection System component(s) occurred” is a Severe Violation. This is in direct conflict with Requirement R4, which gives the responsible entity additional time to perform investigation actions to determine the cause of the Misoperation. ReliabilityFirst agrees with the intent of what Requirement R4 is trying to accomplish but from a compliance/enforcement standpoint it will cause issues. Second, as already noted, ReliabilityFirst agrees with the intent of what Requirement R4 is trying to accomplish, but notes that there is no ending time period associated with how long the responsible entity has to complete the investigation. As

written, a responsible entity can hypothetically drag out the investigations and never officially complete the investigation. ReliabilityFirst believes in order to close the loop, the responsible entity should be limited to four calendar quarters to complete the investigation (i.e., either identification of the cause(s) of the Misoperation or declaration that no cause can be identified). To address the two concerns, ReliabilityFirst recommends including similar language as noted in Requirement R4 as sub parts in Requirement R1 and R3 along with including an ending completion timeframe as well. The following is an example for consideration for Requirement R3: R3. Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, shall identify whether its Protection System component(s) caused a Misoperation. If the cause(s) of the Misoperation cannot be determined, the Transmission Owner, Generator Owner, and Distribution Provider shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters, but for no more than four calendar quarters after the Misoperation was first identified, until one of the following actions completes the investigation: • The identification of the cause(s) of the Misoperation; or • A declaration that no cause was identified.

We suggest revising #6 Unnecessary Trip –Other Than Fault: replace the 2nd sentence as follows: Current wording: “A Protection System operation that is caused by on-site maintenance, testing, …is not a Misoperation” Suggested wording: “A Protection System operation that is related to on-site maintenance, testing, … is not a Misoperation”. This provides some flexibility to exclude operations not directly caused by on-site activity, but is a consequence of such activity.
No
There appears to be a gap between R1 and R2 for the case when an interrupting device operates, but the interrupting device owner does not own any part of the Protection System(s) that tripped or may have tripped the device. The assumption in the draft is that the interrupting device owner also owns a portion of the Protection System, but this may not always be true.
Yes
No
The examples 8a and 8b under Control Functions should be clarified to help entities make proper distinctions between control functions and protective functions of reverse power

relays. We suggest the wording in the paragraph following Example 8b be revised as follows: Current wording: In the example above, the standard is not applicable; however, the standard remains applicable to the reverse power relay as a part of the generator Protection System when intended to provide generator anti-motoring protection. For example, reverse power relays are typically installed as the primary protection for a generating unit to guard against motoring. Though, operators often take advantage of this functionality and use the Protection System’s reverse power protective function as a normal procedure to shutdown a generating unit. Suggested wording: In the examples above, the standard is not applicable because the reverse power elements are performing control functions only. Reverse power relay elements are typically installed as part of the generator Protection System to protect turbine-generators from motoring. Entities often take advantage of this functionality and use the Protection System’s reverse power function as a part of a normal procedure to shutdown a generating unit. However, the standard is applicable when the reverse power relaying provides the anti-motoring protective function for the generating unit. For example, if unintended motoring occurs, the reverse power relaying is designed to protect the turbine by tripping the unit.

(1) Manitoba Hydro believes that the definition of Misoperation needs to be re-written for the following reasons: a. It is not clear whether the six categories of Misoperations is exhaustive. The definition should be revised to clarify this. b. Under category 3, it is not clear if the cited example is the only type of Misoperations. c. Use of the phrase “slower than required” in category 3 and 4 of the definition is unclear and does not capture the intended meaning identified in the Application Guidelines. The Guidelines state that “required” actually means as intended by the owner. Thus, this terminology should be used. d. Based on the numerous examples in the Guidelines of what is and is not a “Misoperation”, as well as references in the Guidelines to the effect that SMEs recognize that judgment must be used, the definition itself should clearly incorporate the notion of judgment by the owner. While the first sentence of the definition refers to intention, it does not specify whose intention (manufacturer, designer, operator..?) e. The sentences about component failure are out of place given that the definition of Composite Protection System is the total system, not individual components, and given that the first sentence of the definition refers specifically to failure of the Composite Protection System. f. The word “intended” has been replaced with “required” even though the Application Guideline states that the term “required” is intended to refer to the objective of the owner. If this is the intended meaning, then the standard should use the wording “as intended by the owner”. The words “as required” are too vague and may be interpreted to mean as required to ensure the reliability of the BES. (Could it also mean as required by the designer / manufacturer or some other entity?) (2)

Revise the definition of Composite Protection System to “The total complements of the Protection System(s) that function collectively to protect an Element, such as A and B system, any primary, secondary, local backup, and communication-assisted relay systems. Backup protection provided by a remote Protection System is excluded.”
Yes
No
(1) For R4, Manitoba Hydro does not think that there is a need to perform investigative actions to determine the cause of the Misoperation at least once every two full quarters. Repeated investigative actions would not be productive in identifying the cause. We propose this requirement to read as follows: “Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation identified in accordance with Requirement R1 or R3 shall perform investigative action(s) to determine the cause of the Misoperation, until one of the following is completed: • The identification of the cause(s) of the Misoperation; or • A declaration that no cause was identified.”
Yes
(1) PRC-004-3, Application Guidelines, Extenuating Circumstances - for clarity, replace the word “says” with the word “reads”.
(1) R4, second bullet - for consistency with the previous bullet, rephrase to read “A declaration that no cause(s) were identified.” (2) R5, second bullet - because it’s possible that a single corrective action can be taken, add brackets around the “s” in the word “actions”. (3) R6 and M6 - for consistency with other requirements in the standard, replace the word “actions” with “corrective action(s)”. (4) R1 and R2 a. Use of the past tense (i.e. "that operated") is inappropriate for statutory / regulatory standards. The wording should be: "Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device shall, within 120 calendar days of the operation of the BES interrupting device...". b. Similarly, in R2.2 and 2.3 , the word "determined" should be replaced with "has determined". c. Use of the word "when" implies a time frame. Given the intent, it would be clearer to use the phrase "under the following circumstances". (5) R5 - for the reasons identified above, the use of past tense should be changed to:" Each Transmission Owner, Generator Owner and Distribution Provider that owns a Protection System Component that causes a Misoperation ...". (6) The wording of R6 makes the compliance obligation unclear. Part of the requirement requires implementation of a CAP. However, another part of the requirement allows updating and changing the CAP. Accordingly, it can be inferred that some deviation from the CAP, and thus failure to implement the CAP, will still be considered compliance. A review of the Application Guidelines also confirms that rescheduling actions under the CAP is permitted in at least some cases. The criteria for acceptable revisions should be clarified in R6 (ex.- do they need to be beyond the reasonable control of the Responsible Entity?).

The standard should require that the Connection Agreement(s) among owners must address the procedures and potential dispute resolution for the case of 2 or more owners involved in the Misoperation investigation and CAP.
As written, the draft standard leaves a void that should be filled. A mechanism must be provided to allow for verifying that the conclusions of the investigation are correct, the CAP is appropriate and overseeing its completion within the planned time. Typically, this would be a responsibility that could be assigned to the Reliability Assurer (RA) as defined in the BoT approved Functional Model. The FM definition of RA fits this role well. However, since no entities are registered as RA at this time and it is unlikely there will be in the future, a second choice would be assigning such responsibility to the Planning Coordinator (PC). Suggest adding an additional requirement assigning such responsibility to the RA (or the PC if the SDT decides so): Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall submit its investigation report and CAP documentation to the Reliability Assurer (or Planning Coordinator) that has responsibility for the area in which the associated devices are located, within 21 calendar days of their completion. The RA (or PC) shall review and either approve or provide comments within 60 calendar days of the submission.

We strongly believe that the drafting teams need to understand how the standards they are developing will interact with other NERC standards and documents. There may be unintended consequences when the relationships between two standards or other NERC documents are not foreseen. Regrettably, the SDT for the new BES Definition failed to take into account the substantial impact of its product on the various standards that would be applied to the new BES elements. Therefore it is critical for the PRC-004-3 SDT to take a step back and anticipate the effect of the new BES definition on this standard. The case in point is the addition of dispersed generators to the BES. We remain very concerned with the effort that will be required to comply with this standard in light of the new BES facilities that are included in the new BES definition, especially dispersed generation. It is wind that especially troubles us. We have about 200 wind turbine generators in our fleet, all less than 2 MW in size. Wind makes up less than 5 % of our generation capacity. Yet, in terms of the sheer number of generators, the number of wind units is roughly 5 times the number of other larger generators in our fleet. Of these 200 wind generators, 90% will soon become BES generators due to being aggregated in facilities above 75 MVA. It is the outsized impact of these wind turbines that will have a huge effect when we are required to analyze in depth each protection system operation of these wind generators in order to comply with PRC-004-3. This effort will be enormous, and yet the reliability benefit is negligible. The valuable technical resources available at my company, and at many other companies with even larger amounts of dispersed generators, are not best utilized by applying this standard at the level

of individual wind generators, and other similar small dispersed generators. To allow entities to focus limited technical resources on efforts that truly enhance reliability, the SDT should revise the Applicability to specifically exclude small dispersed generators, and only apply it where the aggregated generation exceeds 75 MVA, that is, to the collector bus and transformer (with the high-side winding operated at or above 100 kv) used to connect to the transmission system. We believe the extra time it takes to think this through will be worthwhile to the industry, and may prevent inadvertent outcomes that may not serve the overall reliability of the bulk power system.

To support the movement away from zero tolerance standards and towards the Reliability Assurance Initiative which recognizes appropriate risks to the Bulk Electric System, MP&W proposes the 60 and 120 calendar day time frames be removed. Entities can be assessed to determine if they are identifying misoperations and correcting issues without daily timeframes. Writing in daily timeframes forces the audit of timeframes placing a documentation burden on entities that does nothing to support reliability. Administrative accounting for timeframes shifts the focus of the reliability activity away from identifying and correcting reliability issues to accounting. As one alternative, the drafting team could go back to the fundamental position of reporting progress quarterly similar to the current PRC-004 standard. Another alternative is, if the drafting team must impose daily timeframes, daily timeframes would be implemented only after the development of a nationwide database similar to the TADs database that includes internal controls (such as reminders) similar to the RAPA database that allows entities to enter and track all of the required information necessary to meet the PRC-004-3 standard within the database, thus reducing the some of the administrative burden. Please note that the PRC-005-2 drafting team recognized the trap of writing a standard that imposes accounting for timeframes understanding that schedules change and events occur which could cause an entity to miss its schedule by days or weeks. See below: Excerpt from PRC-005-2 supplemental reference: Also of note is the Table's use of the term "Calendar" in the column for "Maximum Maintenance Interval." The PSMT SDT deemed it necessary to include the term "Calendar" to facilitate annual maintenance planning, scheduling and implementation. This need is the result of known occurrences of system requirements that could cause maintenance schedules to be missed by a few days or weeks. The PSMT SDT chose the term "Calendar" to preclude the need to have schedules be met to the day. The reliability benefit of the NERC standard is to identify misoperations and to take corrective actions. This can be achieved without the daily accounting burden imposed by the current writing of the standard.

No
MP&W believes that there are many potential forms of “owners” and that “owners” needs to be modified to read, “other NERC registered applicable entities” to avoid a paragraph 81 administrative issue that has no bearing on reliability. Exclusions must be identified in R1, R2, R3, and R4 for joint protection system owners that actually don’t have any impact on the operation of the protection systems.
Yes
MP&W is concerned about the potential inadvertent inclusion of individual wind turbines in this standard where the inclusion of thousands of individual wind turbine protection systems will add significant burden without corresponding reliability benefits. MP&W also recognizes the NERC dispersed generation SAR and SAR team are best equipped to address this issue.

ATC agrees with the new and revised definitions, but recommends additional clarification around Slow Trip. Would a study be needed to indicate where high-speed performance was previously identified for a Slow Trip? The Slow Trip definitions infer that in order to correctly or incorrectly declare a Misoperation, a study would need to occur. Such study would need to pre-date the operation.
Yes
No
ATC’s experience has been that the cause of a Misoperation is determined within the first couple months following its occurrence. If the cause is not found in that time, it is unlikely to be found. Relative to R4, the parameters around investigative actions are not very productive, as revisiting the same information after an extended period of time does not typically lead to determining a cause. ATC recommends removing the language in R4 that speaks to investigative steps “at least once every two full calendar quarters after the Misoperation was first identified.”

LCRA TSC recommends the SDT address the topic of temporal aggregation within the Application Guidelines. For example, if a transmission line over-trips for an out-of-section fault three times in a 2-hour interval, perhaps due to persistent storm activity before a relay setting adjustment can be made, does this count as three misoperations, or can the three events of a similar nature and cause be “collapsed” into a single misoperation? Some guidance in this area would be helpful in order to allow entities to be consistent in reporting. LCRA TSC recommends some way to collapse/combine misoperation events of a similar nature within a short, defined timeframe.

There are a lot of protective relays that protect one element that sense the same parameter. For example, the Generator has a Generator differential relay, an overall differential relay, an overcurrent relay. If the Generator differential fails to actuate but the overall differential relay or the overcurrent actuates, does that mean the Composite Protection System did not misoperate? The definition of Composite Protection System is still vague to this. Suggest the below definition: The total complement of the Protection System(s), with respect to the protective relay of interest, that function collectively to protect an Element, such as any primary, secondary, local backup, and communication-assisted relay systems. Backup protection provided by a remote Protection System is excluded.
Yes
Yes
Yes

Look at response to question one.
Required Protection System Misoperation identification and evidence in support of R1 could be interpreted to include all scheduled or manual interrupting device operations, which we believe is not and should not be the intention. Either way, suggest rewording R1 to include the applicable Protection System governing criteria by integrating R1.1 (revised) into requirement R1 as follows: “Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated due to a Protection System operation or a Protection System failure to operate as designed shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation when:”

AEP recommends replacing “high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability” with “the lack of high-speed performance resulted in voltage or dynamic instability”. The draft does not specify who is responsible to perform the identification, and adding “Planning Authority” would create a de facto TPL requirement.
No
1) AEP recommends revising R1 section 1.2 as follows to recognize that a BES interrupting device may be part of multiple Composite Protection Systems: “The BES interrupting device owner owns all or part of the Composite Protection System(s); and”. 2) AEP recommends revising R2 section 2.1 as follows: “The BES interrupting device owner shares the Composite Protection System(s) ownership with any other entity; and”. 3) AEP recommends adding the

following footnote to the "entity" reference in R2 section 2.1: "In this context, "entity" denotes functional entity. A Composite Protection System owned by different functional entities within the same registered entity satisfies the R2 section 2.1 criteria." 4) AEP recommends adding the following footnote to the "entity's" reference in the first bullet of R5: "In this context, "entity" denotes functional entity". 5) AEP recommends adding the following footnote to the "120 calendar days" reference in R2 and R3: "This timeframe may be extended, for operations occurring within a specified time period, by the Regional Entity if it determines that extenuating circumstances such as a natural disaster make it impractical to complete R1 or R2 within the allotted timeframe".
Yes
AEP recommends replacing "at least once every two full calendar quarters after the Misoperation was first identified" with "at least once every six month period after the Misoperation was first identified".
No
1) AEP recommends adding an example to the applications guideline to illustrate whether repeated operations/misoperations which occur during the same automatic reclosing sequence need a separate identification under R1. 2) AEP recommends adding an example to the applications guideline to illustrate that a properly coordinated breaker failure operation does not equate to a "slow trip" type misoperation. 3) AEP recommends adding an example to illustrate how breaker failure fits into composite protection system. 4) AEP recommends adding an example where a misoperation is initially identified, but subsequent investigation (after 120 days) reveals a misoperation did not occur.
AEP believes the draft is very close to being ready for final ballot. AEP supports the overall efforts of the drafting team in the fundamental approach taken in the proposed standard. Our negative vote does not reflect disagreement on the direction or intent of the standard. Rather, it is driven by a number of smaller issues that, in total, would prove problematic in consistently applying the standard.

Please clarify the following; the composite protection system also includes the potential transformers, current transformers, battery bank and charger?
Yes
Yes
No

The application guidelines state: “The CAP is complete when all the documented actions to resolve the specific problem (i.e.,Misoperation) are completed which may include those actions resulting from the entity’s evaluation of other locations, if not addressed through a separate CAP.” In the example R6b it appears the CAP is completed and a program was established for corrections at other locations. Please clarify if a program to address other locations is or is not required to be tracked as part of PRC-004 evidence. In the example, it appears the program for other locations does not need to be tracked for PRC-004 evidence. Is this up to the entity to determine?
It seems like the scope for the CAP that must include an evaluation of other Protection Systems including other locations to be completed is very open ended. The concern is what an audit team’s latitude will be with reviewing and accepting or not accepting the subjective nature or these evaluations for other locations. Can the SDT comment how an evaluation that was completed for other locations as part of a misoperation might be addressed in an audit? For example, if a misoperation occurs due to a setting error and an entity decides not to review every relay setting on their system is it possible for an audit team to disagree with this evaluation and create any potential violations? It is recommended the section 1600 Misoperation Draft Template language should match PRC-004-3. It would be quite odd to have the evaluations requirements and a data submissions request use different language. The portion of R6 that states “and update each CAP if actions or time tables change, until completed” seems excessive and granular in nature and adds a lot of detail tracking and difficulty in auditing. It is enough to require a corrective action plan be implemented and close the plan when the final objectives are completed. R4 provides the long term tracking and scheduling. This portion of R6 should be removed. Another option would be to use similar language as in R4.
Individual
Chris Scanlon
Exelon
Yes
We support the definition for Composite Protection System.
No
Please address who takes lead responsibility for R1 when the associated BES interrupting device has multiple owners (i.e. single breaker that has multiple owners, two breakers associated with a line or generator on a ring bus with a different owner for each breaker, a three-terminal line with different owners for each terminal). Perhaps some additional examples in the Application Guidelines focusing on this situation would be helpful in reducing this confusion. Otherwise we have no concerns with R1. For R2 and R3, the date timeframes for a shared responsibility Protection System to a common interrupting device short cycles the non-owner of the interrupting device. A suggestion for shared responsibly; With R2 - the BES device owner should notify the Other Protection System owners within 30 calendar days of the operation and the device owner has 120 days calendar days to identify

if it’s Protection System caused a misoperation. For R3, the notified Protection owner should then have 120 from notification to identify if its Protection System misoperated. This time frame for R3 would provide the non-owner sufficient time for any scheduled outages to make a determination.
No
How soon after a misoperation can a declaration of no cause be submitted? Exelon agrees that a prompt investigation of the event should occur and prudent corrective action be initiated as detailed in the new Requirement R4; however, if the Standard is allowing a provision for continued investigations then the other requirements in the Standard should align. Requirement R4 needs to be modified or R1 needs to be modified to align with each other. The current wording in R4 provides a requirement that cannot be met unless the entity is not in compliance with R1. R3 provides the wording such as "cannot rule out" and "or cannot determine". This wording needs to also be added to R1 for completeness. In addition, the wording in the VRFs and VSLs needs to be adjusted to accommodate those events where the cause of the interrupting device operation has not yet been determined.
Yes
The concept of the Application Guideline (AG) is an excellent tool to retain the thought process behind the development of the standard. Use of an AG in this and future standards will help greatly with the understanding, application, and consistency of the standards. Generally, the applications are sufficient for the purpose. Specific comments for clarification include: In “Unnecessary Trip – Other Than Fault”, in the paragraph after Example 6d, the “on-site” maintenance activities section needs more clarity. Is the intent of that paragraph trying to say, if the BES Protection System equipment clearly misoperated and personnel had nothing to do with it, then it’s a PRC-004 misoperation. If the BES Protection System equipment appeared to misoperate, but it’s clear that personnel had something to do with that operation, it’s not a PRC-004 misoperation? For a Communication System, does the “on-site” activities exemption apply to anywhere along the communication path were personnel caused what would otherwise look to be a BES Protection System misoperation?
This draft is a significant improvement over the last draft, specifically because of the addition of the “Composite Protection System”. We also endorse the use of the rationale boxes within the standard; they lend additional clarity to the requirements of the standard. However, consistent with our comments above, the standard is too prescriptive. For example, there is far too much emphasis on documenting dates. Additionally, most of the VSL’s should be eliminated and labeled “N/A”, e.g., on R3, does 30 calendar days really matter? Lower VSL should be up to 60 days late, Moderate is N/A, High is N/A, Severe is more than 60 days late which equals failed to identify. ComEd also disagrees with the VSL tables because they disproportionately propose to punish a larger utility with more operations (and misoperations). There also needs to be a distinction between analyzing automatic operations for misoperations but failing to identify a misoperation in, as an example, 1 out of 100 operations verses taking no effort to identify any misoperations. For these reasons we think the current revision to PRC-004-3 is overly prescriptive and complicated. Suggest that the SDT should evaluate simplifying the Standard to the basic

purpose which is to "identify and correct the causes of Misoperation of Protection Systems for BES elements" without introducing hard timelines, overly prescriptive communication requirements, and documentation of the level of corrective actions performed. Guidelines and Technical Basis: (1) A failure of a Protection System to operate for a Fault within the zone it is designed to protect. Can the drafting team provide an example for generator protection similar to the one provided for the transmission line protection? (2) A failure of a Protection System to operate for a non-Fault condition for which the Protection System was intended to operate, such as a power swing, under-voltage, over excitation, or loss of excitation. For example, failure to trip the generator by loss of field protection for a loss of field condition on that generator is a Misoperation. If the generator is tripped by another relay say out of step, should it still be called misoperations?

Composite Protection System as a new definition is unclear within the context of a Generating Unit as a BES Asset. Protection System, by definition, is already a composite of the five identified components, as applicable. We do not understand the intent of adding the word Composite, or how it changes the current definition of a Protection System for a Generating Unit.
No
R1 and R2 refer to identification and notification "… within 120 calendar days of the BES interrupting device operation …". Currently, submittals to the Regional Entity are due 60 days following the end of a quarter, which could conceivably place it up to 150 days following an event. Besides having to move up the review of Protection System operations, what Evidence will be required to prove the 120 day identification and notification?
No
Does NERC intend to be prescriptive with respect to a template for a Corrective Action Plan, or will the Regional Entities accept whatever format and tracking documentation is provided by the Registered Entities, even though they may be varied among the Entities? The measures identified in M6 seem as though they could be subject to interpretation by an Auditor.
No
None of the Requirements address notifying the Regional Entity on a periodic basis, as is done now (quarterly for RFC). Is it going to be up to the Regional Entity to identify: a. Whether periodic data submittals will be required? b. If so, the periodicity and the template / format for those data submittals?
For FirstEnergy, the "BES interrupting device" (GCB or Generator Circuit Breaker) is typically owned by the TO, due to the location of the POI (Point of Interconnection). However, the Protection System devices which operate the GCBs are owned by the GO. Regardless the

ownership, the GO certainly knows when the “BES interrupting device” (GCB) operates. It appears that a significant emphasis of this revision is to ensure the owner of the BES interrupting device and the owner of the Protection System devices which operate the BES interrupting device are communicating and collaborating in the evaluation. It would seem that the detailed effort to ensure this provides more confusion than clarification for the GO.

We do not see the need to create a defined term “Composite Protection System”. By definition, a Protection System is already a composite system whose components need to function collectively to protect an Element. The proposed term is redundant. In the comment report, it is indicated that 4 commenters representing about 24 individuals requesting clarification of the term “composite Protection System”. This represents a very low percentage of the total number of commenters and individuals, which should not be the basis for proposing a new term which is redundant. We suggest to remove this defined term.
Yes
Yes
a. Applicability Section – Facilities: We agree with removing references to RAS and SPS, but question the omission of UVLS when UFLS that is intended to trip one or more BES Elements is included. There might well be UVLS that performs similar function when initiated by voltage conditions. The draft standard does not provide any rationale for the omission. Please review and provide the rationale, or add UVLS to the list of applicable facilities. b. Measure M1: M1 as presented only indicates the kind of evidence that can be provided to demonstrate compliance by the responsible entity, but M1 does not specify the performance targets to illustrate compliance, e.g. “that the responsible entity undertook actions to identify whether its Protection System component(s) caused a Misoperation when the conditions in Part 1.1 to Part 1.3 are met”. Suggest M1 be revised to provide the performance target. c. Measure M2: Similar comment as for M1, above. The performance target is that the responsible entity notified the other owner(s) of the Protection System of the operation of the BES interrupting device when the conditions in Parts 2.1 to 2.3 are met. d. Measure M3: Similar comment as for M1, above. The performance target is that the responsible entity undertook actions to identify whether its Protection System component(s) caused a Misoperation when notified by the other owner of the Protection System of the BES interrupting device that operated. e. Measure M4: Similar comment as for M3, above. The performance target is that the responsible entity performed investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after

the Misoperation was first identified, and the identification of the cause(s) of the Misoperation or a declaration that no cause was identified. f. VSL for R1: The second condition under SEVERE is not proper or needed. Requirement R1 asks for the identification of whether or not a responsible entity's Protection System component(s) caused a Misoperation but R4 has a provision that if the responsible entity has not determined the cause(s) of a Misoperation identified in accordance with Requirement R1 (or R3), then it shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters. Therefore, the second condition under SEVERE is either premature or inappropriate. We suggest to remove the second condition, or to revise it to read: The responsible entity did not take action to identify whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1. g. VSL for R3: Second condition under SEVERE - similar comment as for VSL for R1, above.

The inclusion of the following phrase is ambiguous. "….. shall perform investigative actions to determine the cause of the misoperation at least once every two full calendar quarters after the misoperation was first identified, until one of the following completes the investigation: The identification of the cause of the misoperation; or A declaration that no cause was identified." I would remove "at least once every two full calendar quarters after the misoperation was first identified." If the drafting team wants to set a time limit on the investigation, then state a not-to-exceed time period. A declaration should be available once an entity has completed all of its diagnostic tests, even if the declaration comes in the first calendar quarter after the misoperation. During the NERC webinar, one of the drafting team members indicated that the declaration could be made at any time, but I can envision a Compliance Enforcement Authority reading the language of R4 and asking why you didn't fulfill the requirement to test in the second full calendar quarter.

Yes
No comments on the modified “Composite Protection System” definition. However, confusion may result in trying to determine whether an item fits into Misoperation Category 1 “Failure to Trip-During Fault” or into the Category 3 “Slow Trip-During Fault” definition. In both cases, the fault is likely be isolated by remote backup protection schemes. Consider combining Categories 1 and 3. Also, regarding Category 6 “Unnecessary Trip-Other that Fault,” the included wording is somewhat confusing. Consider revising to: “Spurious operation of a protection system in the absence of a fault condition on the power system it is designed to protect.”
Yes
Yes
Yes
The examples are an excellent idea. It would also be advantageous and practical to include supporting information on the scope of Misoperation reporting. Example to consider adding: The boundary of Misoperation reporting extends from protective relay input devices to circuit breaker trip coil(s). More examples should be provided in relation to Power Generation events.

No
These comments are submitted on behalf of the following PPL NERC Registered Affiliates (“PPL”): Louisville Gas and Electric Company and Kentucky Utilities Company; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; PPL Generation, LLC; PPL Susquehanna, LLC and PPL Montana, LLC. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. Comments: The definition for ‘Slow Trips’ has been improved in the current draft of PRC-004-3, but still requires some revision. The first means by which slow tripping can be manifested, instability, is believed to pertain only to Transmission Systems. The second effect of slow tripping, bringing backup relays into play, does not pertain to generation plants. That is, opening the breaker via a backup relay of a generation plant means not that the primary device acted slowly, but that it did not function at all. This would be a Failure-to-Trip type of Misoperation of the primary relay. We understand that variation-of-tripping is an issue of great importance for Transmission Owners (TOs), but it does not apply for generation plants (such as in the case of high speed tripping to limit system instability). Generator Owners (GOs) additionally do not necessarily have the installed equipment needed to analyze trip speed. Generation plants are not

presently required to have high-speed disturbance monitoring equipment, and many plants still have electromechanical relays (i.e. no oscillograph function). Also, GOs often lack the design-level protection relay staff necessary to perform the activities described on pp. 23-24 of the Application Guidelines.
No
The expression, “identify whether its Protection System component(s) caused a Misoperation when,” in R1 should be changed to, “identify whether (a) its Protection System component(s) caused a Misoperation, (b) functioned correctly or (c) a Misoperation cannot be ruled-out, when.” NERC acknowledges in R4 that many months or even more than a year may be needed to authoritatively classify a relay operation, and this possibility is noted also in R2.2, but R1 requires passing Misoperation-vs.-no Misoperation determination within 120 days. It was stated in the 2/20/2014 Protection Systems Misoperation Webinar that such situations should be addressed by initially assuming a Misoperation, and later ask that the coding be changed if this proves not to be the case. The PPL NERC Registered Affiliates submit (per the guidelines issued by RFC) that in the absence of evidence, a Misoperation should not be assumed.
No
The expression, “or that decided a Misoperation cannot be ruled-out,” should be added in R4 after, “has not determined the cause(s) of a Misoperation identified in accordance with Requirement R1 or R3,” per the rationale in our comment above for R1. The outcomes listed under R4 should be expanded as shown below; since, if there are Misoperations for which no cause can ever be identified, there can also be possible-Misoperations for which a yes-or-no determination can never be made. • The identification of the cause(s) of the Misoperation; or • A declaration that no cause of the Misoperation was identified; or • A declaration for an event for which a Misoperation cannot be ruled-out that no Misoperation can be proven
No
PPL NERC Registered Affiliates comments above for the Slow Trip portion of the Applications Guidelines. A statement should be added, “A Misoperation should not be assumed when the cause of a relay operation cannot be authoritatively established,” (reference response to question #3) The discussion of reverse power relays on pg. 26 would be clearer if it included some of the topics and points made in the 2/20/2014 Protection Systems Misoperations Webinar. We propose stating that “The control-vs.-protective demarcation of reverse power relays is based on the operation at hand and not programming”. Failure of a reverse power relay to open the breaker at the established time after commencement of motoring is not a Misoperation if using the relay to trip a unit as part of a normal stop sequence. The same failure would be a Misoperation if some unintended event caused the unit to import power. The statement on pg. 27, “The entity is allotted 120 calendar days from the date of its BES interrupting device operation to identify whether or not a Misoperation of its Protection System component(s) occurred,” should be amended per our comments above for R4. That is, NERC has stated in R4 that determining the cause of a relay operation may take a very long time, and a Misoperation yes-or-no decision may not be possible if the cause for the

trip is not known. Correction is also needed for the flowchart on pg. 35. “A known or possible Misoperation,” should be substituted for, “the Misoperation,” at the top of pg. 29, and elsewhere that this expression is used, because undetermined cause for tripping can make a Misoperation yes-or-no decision impossible. The statement on p.29, “certain planned investigative actions may require months to schedule and complete,” should be changed to, “certain planned investigative actions may require months or even years to schedule and complete,” in recognition that generation units are intended to operate for years between planned outages and frequently must be returned to service as soon as possible in the event of a forced outage. The following statement should be added at the end of the same paragraph, “Taking equipment out of service for the sake of furthering the investigation is not required, and forced outages need not be prolonged for troubleshooting. However, planned outages should include any testing or other actions for which downtime is necessary.” The discussion on pg. 30 should include the point that a CAP must be developed within 60 days, but implementing the CAP may take much longer if requiring a downtime opportunity. An example should be included for multiple CAPs under the circumstance of extended troubleshooting, (e.g. taking action for the apparent cause of a Misoperation), developing a new theory and taking different action when the event occurs again several months later and making a final and successful corrective action when the problem occurs a third time.
The expression, “the Misoperation,” in R5 should be changed to, “a determined Misoperation,” in recognition of the fact that some events can be classified only after full investigation, as described above.

(1) Duke Energy suggests rewording Slow Trip – Other Than Fault as follows: “A Composite Protection System operation that is slower than required for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. Delayed operation for a non-Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or resulted in the operation of any other Composite Protection System.” By replacing “clearing of a non-Fault” with “operation for a non-Fault”, we feel this better describes the intent of a slow trip that is not a fault.

The Extenuating Circumstances process, as outlined on page 32 of the Application Guidelines, relies too heavily on a subjective review by Enforcement to determine whether penalties will be imposed. In alignment with the RAI project, Oncor recommends the evaluation of an Extenuating Circumstance be removed from the back end Enforcement phase and up to the Compliance Monitoring phase where the evaluation is done within a risk and controls framework. Furthermore, Oncor recommends the Registered Entity be allowed to request a formal "state of extenuating circumstance" and coordinate an extension to the 120 day deadline with the Regional Entity.

Ameren
Yes

Yes
(1) Ameren adopts all the SERC PCS comments by reference. (2) A primary reason for our negative ballot on this draft 4 is the proposed clarification (included with SERC PCS comments) to allow a System Protection group of one company's TO, GO, and DP to document R2 and R3 notifications within its database or PRC-004 software, rather than exchange emails or Faxes.
Yes
No
(1) We request the drafting team add another example to clarify the paragraph on page 26, following Example 8b, which includes "…however, the standard remains applicable to the reverse power relay as a part of the generator Protection System when intended to provide generator anti-motoring protection." (a) Units in our GO's fleet shut down thousands of times each year, in our opinion Example 8a are applicable. Does the SDT intend to include these as correct operations if indeed the same reverse power relay also provides anti-motoring protection? (b) Our protection scheme in some cases will have separate Device 32 elements, with one short and one longer timer; does the SDT intend in these cases that only trips by the longer timer are within PRC-004 scope? GO will need to know as either of these differ from our understanding of NERC SPCS / RAPA guidance for reporting of total operations under the presently applicable PRC-004-2a. (c) Based on the number of reverse power questions on your 2/20/2014 Webinar, it appears to us that many GO's are unclear on your intent. [Generator reverse power reporting clarity is another primary reason for our negative ballot.] (2) At the end of Example R4a on page 29, please add "Each of 3/24, 4/10, 5/27, and 8/29 actions are valid investigative actions." If the SDT intends otherwise, please state which ones are valid.
(1) Delete from R1 1.1 "or by manual intervention in response to a Protection System failure to operate;" and remove from Rationale for R1, and Process Flow Chart. This is an extremely rare occurrence not warranting special inclusion in the requirements. In our view, manual intervention is already included in that Failure to Trip is a Misoperations and a BES interrupting device did operate, albeit manually. It is acceptable to retain some mention or explanation of it in the Application Guidance to keep it from falling out of the consciousness. Unnecessary Trip – During Fault on page 24 already points out the correct remote clearing that would occur for a Fault. [Unwarranted inclusion of 'manual intervention' in a Requirement is another primary reason for our negative ballot.] (2) Please add "Note: Historically, the cause of about of 10% NERC-wide Misoperations have an unknown cause" at the end declaration paragraph (2nd last paragraph) on page 29. (3) On page 31, please add "For completion of the CAPs in examples R5a through R5d see examples R6a through R6d on pages 33 and 34." (4) We understand R1 to apply to the aggregate set of BES interrupting device operations associated with the same BES event (e.g., fault, abnormal condition, etc.) For example, under present NERC SPSC guidance the entity count all trips in the automatic reclose cycle and reports them as a single event. (5) The NERC PSMTF Final Report recommended grouping all like events involving the same Protection System within a 24

hour period, recognizing that the response time limitations to altering the Protection System. SERC PCS advocated the 24 hour grouping in our comments to NERC on the Section 1600 Data Reporting draft. The resulting metrics more clearly indicate dominant causes, rather than being distorted by repetitive like events on the same Element and Protection System. (6) If the SDT intends that each and every BES interrupting device operations be separately tracked, the TO, GO, and DP certainly need to know this. Although every breaker operation is almost always available within the SCADA log attached in our PRC-004 software database, we group them into a single event record in accordance with applicable NERC guidance. We are concerned that if R1 intends we have a separate event record for each breaker operation, the administrative overhead is unwarranted and burdensome.

We agree with the definition of Composite Protection System, but we believe that the categories definition of Misoperation could be improved. The standard does not address situations where one cannot determine whether the Protection System operated correctly or whether a Misoperation occurred. • Without evidence of a Fault associated with a trip, it is possible that Normal Clearing occurred, although there may be no evidence to support or reject that conclusion. • Without evidence of a Fault associated with a trip, it is also possible that a category 5 (Unnecessary Trip – During Fault) or category 6 (Unnecessary Trip – Other Than Fault) Misoperation occurred; however, there may be no evidence to support or reject either reporting category. In order to address a situation when the operation of a Protection System cannot be determined to be a correct operation or a Misoperation, we believe a seventh Misoperation category should be considered: “Unclassified Trip: Any trip that (a) cannot be confirmed as the correct operation of the Protection System and (b) for which the evidence is not sufficient to place the trip into another Misoperation category.” This will cause all such trips to be consistently investigated as Misoperations. We understand that many of these Misoperations may result in an undetermined cause.
Yes
No
In R4, we find the phrase “two calendar quarters” unclear since it is referenced from the date when the Misoperation was identified. For simplicity, that phrase should be replaced with “180 days.” Also, there may be a need to extend the time. For example, if an investigation required removing a transmission line from service, one may not be able to obtain a clearance to do so within 180 days, so an investigation action could not be performed, resulting is a violation of R4. Therefore, the 180 day time frame should be allowed to be extended for good cause if the owner documents the cause of an extension. Our recommendation is to replace R4 with this language: “Each Transmission Owner,

Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation identified in accordance with Requirement R1 or R3 shall perform investigative action(s) to determine the cause of the Misoperation at least once every 180 days after the Misoperation was first identified (which 180 days may be extended by the Transmission Owner, Generation Owner, or Distribution Provider for a documented good cause), until one of the following completes the investigation:" Finally, in the "Rationale" text box, the phrase "(120 calendar days)" should be stricken since it does not apply to R3. If notice per R2 is given on day 120, the entity under R3 has 60 day time period, while if notice is given on day 1, it has a 119 day time period.
No
The Application Guide is unclear as to the reporting of reverse power relays. A reverse power relay is typically used to remove a generator from service (a control function) AND to prevent generator motoring (a protection function). The two are not separable. On p. 26, example 8a removes the operation of a generator's reverse power relay to open a breaker during routine shutdown from being subject to the standard because it is performing a control function, while the guideline then states "; however, the standard remains applicable to the reverse power relay as a part of the generator Protection System when intended to provide generator anti-motoring protection." If the reverse power relay failed to open the generator's breaker during shutdown, the generator would motor and the breaker would need to be opened by manual intervention. As the SDT may know, reverse power relays have a documented "blind spot" that causes them to fail to operate during low power factor operation of the generator. (We can provide such documentation if desired). For this reason, generator operators normally have procedures with a step that states that the operator is to manually open the generator output breaker if generator the breaker does not open after a predetermined time period. If this occurred, would the failure of the reverse power relay be reported as a Misoperation? Finally, per the NERC document "Questions and Answers about Consistent Protection System Misoperation Reporting" dated February 5, 2013, reporting a reverse power relay Misoperation and not reporting a successful operation is inconsistent with the principle stated in paragraph #1 that "if an operation would not count as a misoperation, it should not be included as an operation." Therefore, to avoid further confusion, we recommend that reverse power relays used for equipment shutdown be explicitly eliminated from the scope of this standard.
There is no requirement in the standard for the cause of a Misoperation to be determined by the appropriate Protection System owner. Neither R1 nor R3 obligates the owner to attempt to determine the cause of a Misoperation. We note that R4 presumes the owner could not "determine the cause(s) of a Misoperation in accordance with R1 and R3" when those requirements contain no such obligation. R5 and R6 apply to an owner that has determined the cause(s) of a Misoperation. Therefore, we recommend that R1 and R3 be modified as follows with the following additional capitalized language: ".... shall identify whether its Protection System component(s) caused a Misoperation OR NOT, AND IF SUCH A MISOPERATION OCCURRED, SHALL DETERMINE, IF POSSIBLE, THE CAUSE(S) OF SUCH MISOPERATION. " As R1 and R2 are written, one could interpret the language as requiring

ALL interruption device operations be evaluated. However, this is not the intent based upon the draft RSAW that's posted. It states that the evidence required in R1 is "A list of BES interrupting device operations within audit period meeting the criteria of Requirement R1 Parts 1.1 through 1.3." Therefore, we recommend that R1 and R2 be changed so that it is clear that the only interruption device operations that need to be examined are those that are the unexpected. Expected operations for, as an example, switching would be eliminated from any requirement to review the interrupting device operation. This would greatly simplify the data required to demonstrate compliance. We offer the following additional capitalized language in R1 and R2: "Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated UNEXPECTEDLY shall,…."

Generally I agree with the proposed new definition of a Misoperation, but have one hypothetical circumstance where it might be unclear and could perhaps benefit from another example in the guidelines section. Under the category "Unnecessary Trip – Other Than Fault," the guidelines state that an operation that was initiated directly by on-site maintenance…is not a Misoperation. Are there circumstances where on-site maintenance could indirectly cause a Misoperation? We had a situation where a technician was conducting testing on a breaker failure (BF) relay, and accidently initiated the wrong BF relay in an adjacent panel that was still in service and not part of the testing plan for the day, resulting in tripping of the BES bus. Our initial thoughts were that the BF relay should have issued a 'retrip' function to its corresponding breaker after being initiated, thereby only tripping the one breaker instead of the entire bus. Investigation showed the relay was indeed designed to trip the bus and acted properly. BUT if the relay HAD operated improperly after being inadvertently initiated by on-site personnel, would that be a Misoperation? Does the presence alone of on-site personnel create an exemption in all cases? If that is the case, I think it should be explicitly stated, or another example added to clarify technician-induced operations.

In the definition of Misoperation, Unnecessary Trip – Other Than Fault, change "…caused by…" to "…related to…" In the definition of Misoperation, there may be some ambiguity/overlap in determining if some Misoperations are due to a Slow Trip or an Unnecessary Trip when Protection Systems are found not to have been adequately coordinated. It is suggested that something like the following change be made to Slow Trip – During Fault and Slow Trip – Other Than Fault: Change "…or resulted in the operation of any other Composite Protection System…" to something like "…or a Protection System component failure resulted in the operation of any other Composite Protection System…" Inadequately coordinated relay settings would then more clearly fall under either Unnecessary Trip – During Fault or Unnecessary Trip – Other Than Fault. The only other remedy would be to categorize the Misoperation based upon the corrective action taken. (It should be noted that this ambiguity/overlap is only an issue if Misoperations must later be coded during a NERC data request.) In the definition of Misoperation, Slow Trip – Other Than Fault, consider removing the reference to "…voltage or dynamic instability…" It seems that these issues may be more related to Fault conditions.
Yes
Yes
No
On page 24 of the redlined Application Guidelines, remove the following verbiage: "This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the entity must consider the entire Protection System associated with the BES interrupting device that operated. Additionally," This portion does not add value and seems to have a conflicting emphasis with the reminder of the paragraph. Regarding Example 4 in the Application Guidelines, Slow Trip – Other Than Fault, equipment damage is not explicitly identified in the definition of a Misoperation. Either the definition should be revised to clearly identify equipment damage or another example should be used that better fits the proposed definition.
Since Protection System operations that are related to (or caused by, if this verbiage is retained) on-site maintenance, testing, inspection, construction, or commissioning activities are by definition not Misoperations, is it necessary under Requirement R1 to document that the entity identified "whether its Protection System component(s) caused a Misoperation" for these cases of Protection System operations? BES interrupting devices may be operated many times during on-site activities from a Protection System, or part of a Protection System, and it would be very burdensome to document actions taken surrounding this activity for purposes of compliance with PRC-004-3 Requirement R1. Consideration should be given to an additional part under Requirement R1 such as the following: "The BES interrupting device operation was not related to [or caused by, if this verbiage is retained] on-site maintenance, testing, inspection, construction, or commissioning activities." Regarding the Severe VSL for Requirement R3, change "…whether or not a Misoperation

its…” to “…whether or not a Misoperation of its…” (This also needs to be updated in the VRF/VSL Justification.) Regarding the Moderate VSL for Requirement R5, change the two instances of “…calendar days first…” to “…calendar days of first…” (This also needs to be updated in the VRF/VSL Justification.) On page 32 of the redlined VRF/VSL Justification, in the FERC VRF G3 Discussion, change references to ‘VSL’ or ‘VSLs’ to references to ‘VRF’ or ‘VRFs’ respectively. On page 39 of the redlined VRF/VSL Justification, in the discussion of FERC VSL G1, change “…being based the…” to “…being based on the…” On page 2 of the redlined Mapping Document, in the Comments column, change “…a review upon a Bulk Electric System (BES) interrupting device operation…” to something like “…a review upon a Bulk Electric System (BES) interrupting device operation initiated by a Protection System and not related to [or caused by, if this verbiage is retained] on-site maintenance, testing, inspection, construction, or commissioning activities…” Explicitly reviewing and (more to the point) documenting each BES interrupting device operation is overly burdensome, as this would include control operations, including those associated with switching, as well as operations caused during on-site activities. On pages 4 and 19 of the redlined Mapping Document, in the Comments column, change “…a reverse power relay operated to remove a generating unit from service…” to something like “…a reverse power relay operated to remove a generating unit from service as opposed to providing anti-motoring protection…” Whether it is for a protective or control function, the reverse power relay will still remove the generating unit from service; the distinction is why the generating unit is being removed from service. On page 5 of the redlined Mapping Document, in the Comments column, change “…underfrequency load shedding (UFLS)…” to “…underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements…” The Applicability does not include UFLS that trips non-BES Elements (e.g., medium voltage distribution feeders). On page 21 of the redlined Mapping Document, in the Comments column, change “…until is…” to “…until it…”

The calendar day time keeping requirements create additional burden on entities to track and maintain additional records for each entities timeline dates; especially R3 where the allotted time to identify the misoperation is dependent on when someone else notifies them. The 60 calendar day time frame is reasonable, but creates potential for non-compliance just because of an arbitrary date.
Yes
No

a). During the webinar there were a number of questions about reverse power protection when used as protection or used as control. This indicates that there is still confusion with current examples given in the Guidelines. Recommend expanding examples to include: 1. A gas turbine generator has a single reverse power relay which is used to trip the generator breaker during a normal controlled shutdown. This function is considered a control function and not counted as an operation or a Misoperation. 2. The reverse power relay (mentioned in example 1) does not operate to trip the generator breaker and the unit continues to motor until the operator intervenes and opens the breaker manually. Is this a Misoperation? If so what protection system misoperated? Is this considered a Misoperation due to lack of protection? 3. The gas turbine generator mentioned in example 1 and 2 also has a separate reverse power relay that directly trips the generator lockout relay. Is this function considered part of the Protection System? With the unit operating at normal load, this relay incorrectly trips the unit due to an internal relay problem. Is this a Misoperation? 4. A steam turbine generator has a reverse power relay (sometimes referred to as a Sequential trip relay) used in conjunction with valve position switches to trip the generator following a turbine trip. This function is considered a control function and not counted as an operation or a Misoperation. 5. The reverse power relay mentioned in example 4 (sometimes referred to as an Anti-motoring relay) does not operate during a turbine trip and after thirty seconds a second reverse power relay operates as designed to directly trip the generator lockout. Is this second reverse power relay considered part of the Protection System? If so is this counted as one operation that needs to be evaluated? b). Mechanical type breaker trip examples should be expanded to show that air pressure, gas pressure and pole disagreement trips (and their associated auxiliary relays) are control functions and therefore not part of the protection System and thus not subject to this standard. In addition, gas and oil type fault pressure relays on transformers are excluded from Protection System. The example should clarify whether the transformer auxiliary tripping relays (sometimes referred to as 63X relays) are part of the Protection System. Examples could be extremely helpful here since no examples are included in the definition of Protection System. c). Additional Application Guideline examples are needed and the following are specific examples that should be considered: 1. A generating unit GSU transformer trips when the unit is off line (lowside gen breaker was open) due to a Misoperation of the generation Protection System owned by the G.O. The switchyard generator breaker trips but is owned by the T.O. Application Guidelines examples should be added to show if this is an operation where the T.O should notify the G.O., identify who is responsible for CAP, clarify is this a reportable generation Misoperation and who should report, T.O. or G.O.? 2. A generating unit trips out immediately upon synchronizing to the grid due to a Misoperation of its Startup Overcurrent protection. The T.O. owns the 230KV generator breaker that was closed and tripped. Application Guidelines examples should be added to show if this is an operation where the T.O should notify the G.O., identify if the G.O. is responsible to identify the cause of the Misoperation and who is responsible for CAP, clarify is this a reportable generation Misoperation and who should report, T.O. or G.O.? 3. A 230-115 KV network transformer trips out when being re-energized following maintenance due to a Misoperation of the transformer differential relay. The operation trips only the highside breaker that was closed

to energize the transformer (transformer was not feeding the grid at the time). Application Guidelines should be added to clarify if this is a Misoperation and if this a reportable transmission Protection System Misoperation per the current or proposed reporting guidelines? 4. A 230 KV shunt capacitor bank trips out when being placed in service due to a Misoperation of the capacitor bank differential relay. The operation trips only the capacitor bank breaker that was closed to energize the bank. Application examples should be added to clarify if this is a Misoperation and if this a reportable transmission Protection System Misoperation per the current or proposed reporting guidelines? 5. A 230KV line trips at one terminal via its carrier ground relay during closing of a line switch to re-network the line. There was no fault, but the relay operated during typical phase current imbalance created by the poles of the switch closing at different times. Is this a Misoperation?

Currently, there is not a clear indication of regulatory relief for an entity following a major natural disaster. When recovering from major events such as Hurricane Sandy, the first priority is to get lights on and rebuild the system. Because a large natural event produces an influx of unique system configurations that may not have been planned for by system planners or relay setters, analyzing and investigating all the operations and misoperations that occur takes months and is not the top priority for a utility that endures such an event. We respectfully request that the standard drafting committee add wording to allow additional time when a utility endures a natural disaster.
Yes
The Severity Level wording (re CAP development) is too stringent and very confusing. Adding roughly 5 days (from the timeframe stated in the previous draft) is negligible. The current requirement allows 12 months for CAP development, and changing this to 120 days will not, in some cases, give a utility adequate time to investigate/determine actions going forth.

WECC Extended Implementation Period - The Standard as proposed allows entities in the WECC Region an additional 12-months to comply with the Requirements of PRC-004-3. Seminole requests that entities in all other NERC Regions have the same amount of time to comply. Correlating every Region's effective date to that of WECC would be just, reasonable, and less preferential. Evidence Retention - Bullet 2 under section C.1.2. of the Standard deals with evidence retention. Bullet 2 specifically requires retention of evidence 12 months from the date of "completion of each CAP, evaluation, and declaration." It does not appear that Requirement R5 covers the completion of the CAP; it appears that specific requirement is covered in Requirement R6 and bullet #3 of the evidence retention section. Seminole reasons that the drafting team meant Bullet 2 to state that the retention period is from the date of completion of the "development" of a CAP, not the completion of remedies stated in a CAP. In addition, there are three possible dates for completion of a CAP, evaluation, and declaration. Seminole requests that the drafting team clarify which date, and time period, specific evidence is required.

Yes
Yes, provided that it is made plain that, for the purposes of reportability, the failure or misoperation of an individual component of the Composite Protection System is not to be considered a reportable Misoperation when the Composite Protection System taken collectively functionally did not misoperate. Without this clarification, it is still confusing to state that the failure (misoperation) of an individual component of a Composite Protection System is not a misoperation. We suggest adding "reportable" to all occurances of the phrase "is not a misoperation" to read "is not a reportable Misoperation" where the phrase occurs in the draft standard (12 occurances). The definition of Misoperation, items 5 and 6 need to have the word Composite inserted between unnecessary and Protection
Yes
If the drafting team feels that this issue needs to be specifically stated in the Standard then the approach is acceptable. However, since there is no evidence that separate entities have not been doing due diligence in investigating and correcting misoperations, the addition of the various timelines serve only to generate additional paperwork and administrative burden.If the drafting team feels that this issue needs to be specifically stated in the Standard then the approach is acceptable. However, since there is no evidence that separate entities have not been doing due diligence in investigating and correcting misoperations, the addition of the various timelines serve only to generate additional paperwork and administrative burden.
Yes
On page 28 of the clean draft #4, in the first sentence of the R4 section, the words "the entity" appearing after the comma are redundant and are not needed.
Yes
1. The removal from R1 of the qualifier of an operation ‘device operation caused by a Protection System operation’ has some consequences that were not likely intended by the drafting team in that, as presently written, every operation on a BES interrupting device comes into scope of this standard. It includes both automatic and manual operations. It is also noted that this description would also exclude those cases that may be a failure to trip. 2. Related to the observation in #1 above, this would also bring the TOP and GOP into the scope of this standard since the TOP and GOP would need to provide the TO every operation of a BES interrupting device and indicate which were manual vs. automatic in nature. As such the Applicability would need to be modified to include the TOP and GOP. The added change of including ‘or by manual intervention in response to a Protection System failure to operate’ additionally is data needed from the TOP and GOP. Although not necessarily a common occurrence by the TOP, this may happen by the Plant Operator on a more common basis. As such there would be the need for each TOP and GOP/ Plant Operator by polled quarterly to provide this information. This addition is not necessary since the initiating event for such action would be a failure to operate. However, if this part of the Requirement remains, the Applicability would need to be modified to include the TOP and GOP. Note: related to above 3 comments: Although the recently posted RSAW mitigates some of these concerns, we feel

the Standard itself should be modified to go back to the concept of ‘BES interrupting device operation in its Facility caused by a Protection System operation, identify and review each Protection System operation’ thus removing the need to include the TOP in the applicability. 3. The various timetables introduced in the Standard result in many compliance milestones to be tracked for minimal if any overall increase in reliability. There is no evidence that entities have not been doing due diligence in investigating and correcting misoperations, therefore, the addition of the various timelines serve only to generate additional paperwork. 4. We also observe that the Standard does not require any closure on a specific event. As noted in R6: implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. Therefore, an acceptable CAP could be ‘we plan on upgrading the protection systems in 15 years which will solve the problem’. Since the neither proposed actions nor timetable may change, no update is required. This seems to contradict the statement in the Rational box for R6 which states: Documenting changes or completion of CAP activities provides measurable progress and confirmation of completion. 5. Related to comment#4 above, which notes that there is no requirement for closure: Recognizing that there has been considerable work by various NERC teams (SPCS, RAPA, and the PSMTF) to implement consistent reporting utilizing the misoperation template and that one of the recommendation was that the Regional entities need to become closely engaged in reviewing submittals and following up on action plans/ corrective actions; we would encourage the SDT to consider revamping the Standard to require the quarterly submittal of misoperation data utilizing the approved template and NERC and the Regions to agree on some standard methodology for Regional review and follow-up if progress is not being made.

Yes
The definition of Misoperation is much improved. We thank the drafting team for proposing a definition for Composite Protection System. It adds clarity to the standard.
Yes
(1) While we agree the revisions to these requirements clarify what is required, we feel that R2 meets P81 criteria. First, R2 meets P81 criterion A because the requirement of notifying another owner does little to support reliability. Second, R2 meets P81 criterion B1 because it is clearly administrative, and it meets P81 criterion B4 because it requires reporting to another party. Without significant justification for how this administrative, reporting requirement materially and substantially supports reliability, we cannot support it. We suggest that requirement R2 should be removed and an explanation of the desired reporting would be appropriate in the Application Guidelines. The Application Guidelines on page 28 in the first paragraph acknowledges that “notifying the other owners… may unnecessarily burden the other owners with compliance obligations, redirect valuable resources, and add little benefit to reliability.” (2) If Requirement R2 persists, we cannot support a medium VRF

for R2. This requirement simply does not rise to the level of having an "impact on the electric state or capability of the bulk electric system" which is what is required to meet the Medium VRF criteria. The requirement is an administrative requirement and does not have any impact on the electric state or capability. (3) While we believe that R2 meets P81 criteria and should be removed, if the requirement persists, we recommend removing the Distribution Provider from the applicability section. By definition, the Distribution Provider cannot own a "BES interrupting device" since it is a BES Element as explained on page 21 in the Application Guidelines. The Distribution Provider provides the wires between the BES and the end-use customer. It is the TO/TOP that owns/operates an integrated transmission Element that is 100 kV or higher. This is consistent with statement of registry criteria and the BES definition. If a Distribution Provider does own a BES interrupting device, then they will also be registered as a TO. If they are not, then NERC/regional entity has made a determination per Note 1 in the statement of compliance registry criteria that the BES interrupting device does not have a material impact on the reliability of the bulk electric system and has not registered them. Furthermore, the Application Guidelines state that the BES interrupting device is not part of the Protection System so there is no reason for the requirement to apply to the Distribution Provider. (4) Requirement R3 needs to be further clarified for the situation when an entity is not able to identify if a Protection System operation was a correct operation or a Misoperation. This is particularly true for older technology such as electromechanical relays which may lack the necessary information to make such a determination. As the requirement is literally written, it requires the responsible entity "to identify whether its Protection System component(s) caused a Misoperation." If a responsible entity is unable to determine a whether the relay operated as designed, then the requirement would be technically violated. The VSL for R3 results in a severe violation if the responsible entity failed to identify a Protection System Misoperation. There should be some flexibility for instances where the operation is unknown.
No
(1) This requirement should be modified to simply state that the applicable entity is required to identify the cause of the Misoperation or document that a cause could not be found. It is too prescriptive that an applicable entity must identify investigative actions each successive two calendar quarters. This makes the requirement inflexible and needs to be simplified. Consider an example where an applicable entity that should be performing more investigative actions every two successive calendar quarters can be compliant by simply identifying one and an applicable entity in a unique situation that cannot perform even a single investigative action in the two successive calendar quarters due to extenuating circumstances would be in technical non-compliance. (2) This requirement incorrectly implies that R1 and R3 require the applicable entity to identify the cause of the Misoperation. They do not. Rather, R1 and R3 simply require the applicable entity to identify Misoperations. Thus, R4 should be modified to simply require identification of the cause of the Misoperation subject to reasonable investigative actives or declaration that the cause could not be identified after completing reasonable investigative actions.
Yes

The examples in the Application Guidelines are improved and provide additional clarity.
(1) We are concerned that Part 1.1 may cause an auditor to request an inventory of all BES interrupting device operations. From that list, then the applicable entity would be required to identify which BES interrupting device operations were cause by Protection System actuation and which were operator interventions. Then, the applicable entity may have to prove each BES interrupting device operation initiated by an operator was not necessitated by a Protection System Misoperation. Also, the applicable entity would have to show for each BES interrupting device operation caused by Protection System actuation was evaluated for Protection System Misoperation. While we understand that an applicable entity will have to show it evaluated each BES interrupting device operation caused by a Protection System operation, we do not believe they should be required to identify those operations caused by other means such as a manual operation by the operator. To identify cases where manual intervention was necessary due to a Protection System misoperation, the applicable entity should be able to rely on its operator notifying the protection systems department that such actions were necessary. In other words, Part 1.1 should be evaluated based on this exception with the auditor only requesting the applicable entity to identify the instances where manual intervention was necessary. An explanation in the Application Guidelines for what is required here would be helpful. (2) Requirement R1 needs to be further clarified for the situation when an entity is not able to identify if a Protection System operation was a correct operation or a Misoperation. This is particularly true for older technology such as electromechanical relays which may lack the necessary information to make such a determination. As the requirement is literally written, it requires the entity “to identify whether its Protection System component(s) caused a Misoperation.” If an entity is unable to determine a whether the relay operated as designed, then the requirement would be technically violated. The VSL for R3 results in a severe violation if the responsible entity failed to identify a Protection System Misoperation. There should be some flexibility for instances where the operation is unknown. (3) While we believe that R2 meets P81 criteria and should be removed, if the requirement persists, we recommend removing the Distribution Provider from the requirement. By definition, the Distribution Provider cannot own a “BES interrupting device” since it is a BES Element as explained on page 21 in the Application Guidelines. The Distribution Provider provides the wires between the BES and the end-use customer. It is the TO/TOP that owns/operates an integrated transmission Element that is 100 kV or higher. This is consistent with statement of registry criteria and the BES definition. If a Distribution Provider does own a BES interrupting device, then they will also be registered as a TO. Furthermore, the Application Guidelines state that the BES interrupting device is not part of the Protection System so there is no reason for the Distribution Provider to apply. (4) For the second severe VSL of R3, “a Misoperation its Protection System” should be “a Misoperation in its Protection System.” The “in” is missing. (5) We disagree with the VRFs for R2. It is an administrative requirement and should not even be a requirement since it meets P81 criteria. However, if the requirement persists, the VRF should be no higher than “Low” since it is administrative. (6) Thank you for the opportunity to comment.

FMPA appreciates the response to our comments, but, we do not believe our issues from our past comments have been resolved. Regarding “Slow Trip”: FMPA agrees in concept with providing the ability to apply engineering judgment regarding what tripping “slower than required” may mean but believes there is too much ambiguity. We agree that “It is impractical to provide a precise tolerance ...”; however, If the standard is kept in this format, we support a clarification on the order of “fast enough to prevent harm to the protected equipment, undesired overtripping, or harm to stability.” FMPA believes “BES interrupting device” should be a defined term because it now drives the majority of the compliance activities associated with the standard. Specifically we believe with the way this device is characterized in the Application Guide is deficient. Devices that do not have “fault current interrupting capability” but have load interrupting capability, are often also used for protection functions in “Other than Fault” scenarios. Also, we note that fuses do not qualify as Protection System components although they meet Application Guide description of “BES interrupting device”. Confusion concerning treatment of fuses and the definition of BES Interrupting Device could lead to unintended consequences, such as a proliferation of use of fuses. FMPA still believes that the remaining definitions – Failure to Trip (During and Other than Fault) and Unnecessary Trip (During and Other than Fault) have similar difficulties to “Slow Trip”, wherein the standard provides the leeway for entities to apply judgment but that same leeway affords no way of supporting such judgment with evidence if an auditor disagrees with the interpretation. FMPA also believes that specifically excluding remote backup devices from the definition of Composite Protection System wrongly places a negative connotation on those typically lower voltage (100 – 161 kV) systems in which remote backup for a relay or breaker failure is “as-designed”. We recognize that under the current format it will be difficult to avoid this issue – however if entities were able to develop their own Protection System Design Philosophy documents with this issue specifically addressed (see response to question 5 for more description of this proposed approach) as the criteria against which performance is measured, this problem goes away.
No
FMPA believes there are still ambiguities regarding the responsibility where to or more entities share ownership of a Protection System. Specifically as R1 relates to R2 the language reads in a way that seems to imply entities are required to wait to provide notification of the ongoing investigation to one another, which we believe is not the intent. Furthermore please clarify; where BES interrupting devices are associated with multiple Composite Protection Systems; Does 1.2 refer to the Composite Protection System which is believed to have operated or to all Composite Protection Systems associated with the BES Interrupting device (which may or may not be owned by the same entity)?
No

FMPA believes it would be beneficial to actually lay out specific failures in the examples. For example, “Slow Trip – During Fault” simply says “A failure of a line’s Composite Protection System to operate as quickly as intended for a line fault is a Misoperation.” This is more or less a restatement of the definition but applied with the additional detail of a specific protected component (the transmission line). Rather, consideration should be paid to an actual way a relay could fail – for example “…a line to line fault in a weak portion of the system resulted in positive sequence currents below the overcurrent supervision pickup for a line current differential relay. The relay’s negative sequence differential element operated instead. However, the original relay settings did not account for the additional detection time required for the negative sequence element…” most of the nuance in the application comes from the way the relay failed. Another example might be a line fault with electromechanical relays wherein the relay output contacts stuck initially, resulting in a delayed clear.
In general, FMPA disagrees with the philosophy of the current standard. Protection system design is too complex, too diverse, and requires too much engineering judgment to be conducive to making all system designs and voltage classes of systems fit into one set of criteria. Many of the comments the PSM SDT has been receiving are evidence to that effect. System Protection is just as much an art as it an engineering science (i.e., “The Art and Science of Protective Relaying”, C. Russel Mason, Wiley, 1956). FMPA supports the intent of the statements that the SDT has laid out which seek to provide the individual entities with the ability to provide engineering judgment, but there is no clear cut way to establish measures and allow entities to demonstrate compliance without a set of specific criteria against which the comparison can be made. Thus, FMPA believes entities should have “Protection System Design Philosophies” for their systems as appropriate, analogous to the FAC-008-3 and the prior FAC-008-1 and 009-1 standards and facility Rating Methodologies. Entities can lay out the characteristics of their systems – what is the “intended operation” for the systems, and what, generically, constitutes the constraints around which that entity develops its Composite Protection Systems. We recognize the tremendous amount of work the PSM SDT has put forth in attempting to reach industry consensus on this document but do not believe any form of document that applies criteria without a corresponding philosophy behind that criteria makes the standard too ambiguous. In recognition of the art of protective relaying, we suggest documenting a protection philosophy and intended operation of systems against which to measure whether a protection system operates as intended or not.

1) The definition for Composite Protection System could be clearer. For example, are the relays deployed at all ends of a transmission line for the protection of that line considered a part of one Composite Protection System? Does the presence or absence of a

communications-assisted scheme change which relays would comprise the Composite Protection System? 2) The definition of Composite Protection System should be modified to account for all of the elements that may or may not operate to protect an element, excluding breaker failure protection. Breaker Failure protection should be considered its own zone of protection. Suggested change as follows: The total complement of the Protection System(s) that function collectively to protect an Element, such as any primary, secondary, local backup, and communication-assisted relay systems. Backup protection provided by a remote Protection System is excluded. Breaker failure protection should be considered as protecting its own specific breaker element. 3) We have two issues driving our negative vote. The first issue is that high speed performance requirements for identified Composite Protection Systems are not defined or controlled by a single entity with regional grid performance knowledge, such as Transmission Planning. Without centralized accountability to identify performance requirements for specified systems, settings will be installed according to the PRC-001 coordinated settings implemented by the BA, and TO or GO system owners. These settings have been coordinated with the applicable entities. Transmission Planning is the entity that should be cognizant of settings required to maintain system stability under various fault conditions, and notify TO system owners of these requirements for inclusion in PRC-001 coordination. This coordination needs to be identified, tracked, and proper timelines for implementation identified. 4) The second issue driving our negative vote is the lack of a time requirement tied to when a "previously identified" high-speed performance need has to be implemented. For example, under the Slow Trip – During Fault, the phrase " …if high-speed performance was previously identified…" has no time horizon to make this an effective requirement. If a high speed, 3 cycle fault clearing requirement was identified by e-mail the previous day, and the device was not reset immediately, and a subsequent event caused the device to operate at 30 cycles, a Misoperation would result. Instead, a process by which requirements are identified by the planner, allowing an defined period for implementation, should be required. This could be accomplished by either adding Transmission Planning as an applicable entity with notification requirements defined in the requirement language, or including the GO/TO/Distribution provider as a partner in this process in another standard, such as PRC-001 or the TPL series. Proposed rewording is as follows : Misoperation: The failure of a Composite Protection System to operate as intended and previously coordinated. Any of the following is a Misoperation: Slow Trip – During Fault – A Composite Protection System operation that is slower than for a Fault condition for which it is designed and coordinated. Delayed clearing of a Fault condition is a Misoperation if it resulted in the operation of any other Composite Protection System. Slow Trip – Other Than Fault – A Composite Protection System operation that is slower than required for a non-Fault condition for which it is designed and coordinated, such as a power swing, undervoltage, overexcitation, or loss of excitation. Delayed clearing of a non-Fault condition is a Misoperation if it resulted in the operation of any other Composite Protection System. And similar edits to all other fault definitions in the document, removing the "…previously identified…" language.
No

1) There appears to be a potential gap if a Composite Protection System wholly owned by one entity experiences a Failure to Trip, and only interrupting devices wholly owned by another entity operate. 2) Propose wording change for R1 through R3 as follows: “R1 - Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Associated Composite Protection System component(s) Misoperated when: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]”; “R2 - Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, notify the other owner(s) of the Associated Composite Protection System of the operation when: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]”; and “R3 - Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, shall identify whether its Associated Composite Protection System component(s) caused a Misoperation. [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]”
Yes
No
1) The examples for R6 in the Application Guidelines are not clear. In R6a, it states the CAP completed on 6/25/2014, but no action is referenced for this date. In R6b, it states the CAP completed on 10/28/2014 when a proactive only replacement program was established, but in R6c and R6d, the CAP is open until the proactive replacement program is completed. It seems the difference between these two is only semantic. 2) Please clarify if it was the intent of the drafting team to exclude operations like the following example from being classified as a Misoperation: Assume that a fault occurs in a generator stator, due to either a mechanical or design setting issue the 64S does not operate. However, the 87 does operate and trips the unit. We believe this would not be a Misoperation because of the overall performance of the composite protection system.
Definition for Unnecessary Trip – Other Than Fault: The first sentence of this is unclear (triple-negative) without the expanded language in the Application Guidelines section. Consider omitting the clause “…for which it is not designed” to make this more clear. The analysis of a Failure to Trip situation does not appear to be covered here, except to the extent that another interrupting device trips in a different zone to prevent the event from propagating.

Texas Reliability Entity
Texas Reliability Entity
No
Texas RE is concerned that the revised definition of Misoperation is limited to failure of a Composite Protection System, and that this standard does not require investigation and mitigation of all Protection System operations/failures to operate when they are sub-parts of a Composite Protection System. We submit that any failure to operate as designed should be investigated and mitigated, even if another part of the Composite Protection System covered for the malfunctioning component/system.
No
There are several cases in the ERCOT Region where Company A owns the interrupting device and Company B owns the Protection System. In these cases, subpart 1.2 for R1 and subpart 2.1 for R2 do not apply. The language for Requirements R1 and R2 is written such that all of the subparts (1.1, 1.2, and 1.3 for R1 and 2.1, 2.2, and 2.3 for R2) must apply for the entity to initiate the analysis of the operation or notification. We would suggest modifying the language for R1 and R2 to say that the Requirement applies if one or more of the subparts apply.
No
There should be an end time frame for this requirement. If an entity has not determined if a Misoperation occurred within 120 days of the interrupting device operation, they could conceivably continue to investigate the event for years, as long as they perform an investigative action at least once every 6 months.
(1) For Requirement R5, how does the SDT intend to handle a situation where the CAP involves another registered entity. For example, we've seen several cases where the CAP requires multiple TOs to make setting changes in order to mitigate the cause of the misoperation. In this case, should both TOs involved have their own CAP? The requirement language is not clear. The bullet "Explain in a declaration why corrective actions are beyond the entity's control…" provides no assurance that all the required actions to mitigate the Misoperation are completed in cases where multiple entities are involved in the CAP. (2) Evidence Retention: We recommend changing the evidence retention from 12 months to a minimum of 3 years.

CenterPoint Energy agrees with the new definition for Composite Protection System and believes it is needed to support consistent misoperations reporting. However, we suggest additional clarifications for the two Slow Trip categories of Misoperation definitions that were revised to address high-speed performance. The second sentence of the two Slow Trip categories of Misoperation definitions states: ‘Delayed clearing of a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or resulted in the operation of any other Composite Protection System’. We recommended changing this sentence to state the following: ‘If the Composite Protection System is comprised of two, or more, independent high-speed schemes, delayed clearing of a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or if high-speed performance was previously identified as being necessary for coordination with other Composite Protection Systems.’
No
CenterPoint Energy believes a requirement to perform investigative actions to determine the cause of a Misoperation at least once every two full calendar quarters after the Misoperation was first identified will result in repetitious investigative actions and scheduled outages and would provide little benefit. Also, we do not believe a declaration is needed, since assigning a cause code of Unknown / Unexplainable is part of the misoperation analysis process. The Cause Code and an explanation of the exhaustive investigation and tests conducted should be sufficient. Therefore, we recommend Requirement R4 be deleted.
CenterPoint Energy recommends revising the wording of the second bullet of Requirement R5 to account for situations where corrective action would not be practical. CenterPoint Energy suggests the following wording: ‘Explain in a statement why corrective actions are beyond the entity’s control or would not improve BES reliability or may not be practical, and that no further corrective actions will be taken.’

We see no alternative other than to install SOE equipment and/or Disturbance Monitoring Equipment and/or Digital Fault Recorders to monitor the Composite Protection System during operations/Misoperations of BES interrupting devices. With the current definition of Misoperation, especially the Slow Trip definitions, it will be crucial to the investigation to have exact Protection System parameters and operation times prior to, during, and immediately following any operation on a BES interrupting device. In short any Protection System element (any device subject to PRC-005) must now be logged, recorded, and archived in order for a Registered Entity to be able to go back and show that their Protection System/Composite Protection System operated as designed and did not contribute to a Misoperation on either their own BES interrupting device and/or an adjacent Registered Entity’s BES interrupting device. This will be a considerable expense for smaller GOP’s and DP’s to install, operate, and maintain the equipment and archive the data and records required to meet the burden of these proposed definitions.
No

It is not clear how an entity is to show that an operation of a BES interrupting device happened fast enough and did not fall into one of the two "Slow Trip" categories of a misoperation.
Individual
Sergio Banuelos
Tri-State Generation and Transmission Association, Inc.
No
We believe that the term “local backup” includes breaker failure relaying, but it appeared at the webinar that the drafting team does not intend for breaker failure relaying to be included in the definition of Composite Protection System. We recommend that “local backup” be removed from the definition or changed to “local backup (excluding breaker failure protection).”
No
We generally agree but we have some concerns about multiple entity ownership of different Protection System components compared to joint ownership of individual components.
Yes
Yes
1. The standard is difficult to interpret regarding jointly-owned Composite Protection System components as opposed to multiple entities owning separate components. An interrupting device and all or part of the Composite Protection System may be owned by a contractually-organized group that is not a registered Functional Entity. This makes it unclear which entity is responsible for initial review and potential notification under Requirement R1. Our belief is that it would be the registered entity that is contractually responsible for operating the interrupting device. 2. It is also unclear whether Requirement R2 includes notice to all the other joint-owners of the Protection System or only to the owners of the Protection System components that are not owned by the joint group. Our belief is that notice should only be given to the owners of the Protection System components that are not owned by the joint group. Our proposal to eliminate the uncertainty is to add a statement to the Applicability that addresses how jointly-owned Facilities are to be handled in the standard any time a TO, GO, or DP has a responsibility.
Group
ReliabilityFirst Protection Subcommittee
Bill Crossland
Yes

Yes
There was some confusion on who takes lead responsibility for R1 when the associated BES interrupting device has multiple owners (i.e. single breaker that has multiple owners, two breakers associated with a line or generator on a ring bus with a different owner for each breaker, a three-terminal line with different owners for each terminal). Perhaps some additional examples in the Application Guidelines focusing on this situation would be helpful in reducing this confusion.
No
The direction included in R4 is awkwardly worded. Consider rewording the following “shall perform investigative action(s)… at least once every two full calendar quarters” AS “shall, on a semi-annual basis, continue to show evidence of investigation…”. However, the examples in the Application Guidelines are clear as to what the SDT is looking for.
Yes
Other than our suggestion from Question 2, our group would like to state that the concept of the Application Guideline is an excellent tool to retain the thought process behind the development of the standard. Its use in this and future standards will help greatly with the understanding, application, and consistency of the standards.
We believe that the rationale boxes within the standard should be retained to lend additional clarity to the requirements of the standard.
Group
SPP Standards Review Group
Robert Rhodes
No
With the introduction of the term Composite Protection System, and especially considering the movement from Composite Protection System to Protection System in Requirements R1 and R2, additional confusion may have been incorporated into the standard than existed previously. If there is a way to eliminate the movement from one term to the other or develop a clearer transition from one to the other, it would be helpful to the industry.
Yes
Yes
No
Our preference would be that during a condition of a high number of outages, such as a hurricane or ice storm, we be allowed to request a formal "state of extenuating circumstances" and extend our deadline from 120 days to 270 days. We object to the proposed process where extenuating circumstances can force a utility into a violation and then rely on a nebulous, subjective review to determine whether penalties will be imposed. See additional comments on the Applications Guides contained in Question 5 below.

Exclusions for SPS and RAS are mentioned in the Rationale Box for Applicability. If these exclusions are not incorporated in the RSAW, which was just recently posted and we have not had a chance to review, then the exclusions should be included in the applicability section of the standard. Typos/grammatical/editorial: In the last line of the 4th paragraph on Page 5 under the Background section, insert ‘be’ between ‘to’ and ‘independent’. Insert ‘of’ in both portions of the Moderate VSL of R5 between ‘days’ and ‘first’. Application Guidelines In the definition of Composite Protection System on page 21, change the ‘a’ in front of ‘Element’ to an ‘an’. In the 1st paragraph under Requirement R1 on Page 27, delete the ‘that’ following ‘identified’ in the next to last line of the paragraph. In Example R2a under Requirement R2 on Page 28, set the phrase ‘or DCB relaying’ off with commas. In the last line of the last paragraph under Requirement R3, insert an ‘as’ between ‘such’ and ‘an’. In the 2nd line of the 1st paragraph under Requirement R4 on Page 28, delete ‘the entity’ following ‘notified,’ in the 2nd line. It would be helpful to include the initiating event in Examples R4b and R4c. Hyphenate ‘in-service’ in the 3rd line of Example R4c on Page 30. In the 1st paragraph under Requirement R5 on Page 30, delete the ‘or’ and place parentheses around CAP in the 2nd line. Reword the 1st line of the 3rd paragraph under Requirement R5 on page 30 to read: ‘The time periods within Requirements R1, R3 and R5 are distinct…’ On Page 31 in the introductory paragraph for Examples R5a, R5b and R5c, insert ‘in the relay’ in the 2nd line of the paragraph following ‘capacitor’. Also, in the examples, rewrite the sentence that states ‘Replace capacitor.’ to say ‘Replace the capacitor.’ We suggest the introductory paragraph for Examples R5g, R5h and R5i on Page 32 be rewritten to state: The following are examples of a declaration why corrective actions would not improve BES reliability.’ In Example R5i on Page 32, spell out POTT. In Examples R6a, R6b and R6c on Pages 33 and 34, change the sentence in the 2nd line of both examples from ‘The failed capacitor…’ to ‘A failed capacitor…’ Delete the semicolon in the 2nd line of the last paragraph on Page 33. To eliminate any possible confusion, change the CAP completion date in Example R6c from 03/09/2015 to 03/01/2015. The example gets messy if the completion date is actually after the scheduled completion date.

Yes
Yes
1. Recommend that R1.3 be simplified by rewording to indicate that “The BES interrupting device owner identified that its Protection System component(s) caused the Misoperation.” 2. The calendar day time keeping requirements create additional burden on entities to track and maintain additional records for each entities timeline dates; especially R3 where the allotted time to identify the Misoperation is dependent on when someone else notifies them. The 60 calendar day time frame is reasonable, but creates potential for non-compliance just because of an arbitrary date. 3. Please add an explanation in the R2

Application Guidelines for situations in which one group investigates for multiple registered entities. It's quite common for a single protective relay engineering group to investigate for the TO, GO, and DP that their company owns. We suggest the following note "(Note: In cases where a single group performs an overall investigation for several entities each with some ownership of the Composite Protection System; a single document (or electronic database) is sufficient to meet the R2 and R3 notification requirements for use by both Registered Entities.)" be added to the Rational boxes for R1, R2 and R3 as well as to the Application Guidelines. This reduces the administrative overhead of having to send yourself an email just to prove that R2 and R3 are met. The important action of identifying and correcting Misoperation causes is still done and duly documented. 4. Please augment M2 with 'databases' to more clearly allow for a single group investigating on behalf of multiple entities (e.g., GO, TO, DP) to date the notification within their database. For example, CTs on a GO breaker may be part of an adjacent TO switchyard bus protection, so there are two entity owners regarding the Composite Protection System. If owned by the same corporation, one system protection group investigates on behalf of the GO and TO, and act to identify and correct Misoperation causes.
Yes
No
See #3 in question 2 above. The examples in the Application Guidelines are beneficial, the SERC PCS suggests it would be beneficial to add additional examples and add clarity to who is to report the Misoperation. Some examples are added below. During the recent webinar there were a number of questions about reverse power protection when used as protection or used as control. This indicates that there is still confusion with current examples given in the Guidelines. Recommend expanding examples specific to reverse power. Also, trips should be expanded to show that air or gas system breaker trips or pole disagreement trips are not reportable operations. Additional examples are needed and the following are recommended: 1. A generating unit GSU transformer trips when the unit is off line (lowside gen breaker was open) due to a Misoperation of the generation Protection System owned by the G.O. The switchyard generator breaker trips but is owned by the T.O. Application Guidelines examples should be added to show if this is an operation where the T.O should notify the G.O., identify who is responsible for CAP, clarify is this a reportable generation Misoperation and who should report, T.O. or G.O.? 2. A generating unit trips out immediately upon synchronizing to the grid due to a Misoperation of it's Startup Overcurrent protection. The T.O. owns the 230KV generator breaker that was closed and tripped. Application Guidelines examples should be added to show if this is an operation where the T.O should notify the G.O., identify if the G.O. is responsible to identify the cause of the Misoperation and who is responsible for CAP, clarify is this a reportable generation Misoperation and who should report, T.O. or G.O.? 3. A 230-115 KV network transformer trips out when being re-energized following maintenance due to a Misoperation of the transformer differential relay. The operation trips only the high-side breaker that was closed to energize the transformer (transformer was not feeding the grid at the time). Application

Guidelines should be added to clarify if this is a Misoperation and if this a reportable transmission Protection System Misoperation per the current or proposed reporting guidelines? 4 A 230 KV shunt capacitor bank trips out when being placed in service due to a Misoperation of the capacitor bank differential relay. The operation trips only the capacitor bank breaker that was closed to energize the bank. Application examples should be added to clarify if this is a Misoperation and if this a reportable transmission Protection System Misoperation per the current or proposed reporting
1. The removal from R1 of the qualifier of an operation 'device operation caused by a Protection System operation' has some consequences that were not likely intended by the drafting team in that, as presently written, every operation on a BES interrupting device becomes into scope of this standard. It includes both automatic and manual operations. It is also noted that this description would also exclude those cases that may be a failure to trip. 2. Related to the observation in #1 above, this would also bring the TOP and GOP into the scope of this standard since the TOP and GOP would need to provide the TO every operation of a BES interrupting device and indicate which were manual vs. automatic in nature. As such the Applicability would need to be modified to include the TOP and GOP. 3. The added change of including 'or by manual intervention in response to a Protection System failure to operate' additionally is data needed from the TOP and GOP. Although not necessarily a common occurrence by the TOP, this may happen by the Plant Operator on a more common basis. As such there would be the need for each GOP/ Plant Operator by polled quarterly to provide this information. This addition is not necessary since the initiating event for such action would be a failure to operate. However, if this part of the Requirement remains, the Applicability would need to be modified to include the TOP and GOP. The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Protection and Control Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.

Applicability section 4.2.2 includes UFLS only if it trips a BES element. We believe that UFLS inclusion in this standard should only be applicable to those single UFLS elements that can have an adverse impact to the BES. Limiting applicability to UFLS elements which trip a BES

element will not adequately address all UFLS adverse impact elements. For example, some industrial loads must be shed in a carefully planned sequence, and it may not be possible to link the UFLS trip signal to a BES element. Instead, the trip signal is received within the industrial load (plant) whereby a controlled plant shutdown is automatically initiated. This load shedding can exceed 200 MW, and is significant. In such UFLS schemes, the actual process of the load shed within a non-BES plant should not be subject to standard compliance; however, the misoperation of the associated UFLS relay as a single point of failure should be considered as a significant BES support device. Inclusion of UFLS in this Standard may be duplicative of PRC-006-1, requirements R11, R12, and R13. An underfrequency event is generally a system wide event; conversely, the objective of Protection System action is to isolate an event to prevent it from becoming a system wide impact. UFLS elements must work as a coordinated system which can withstand several UFLS element failures, yet successfully stabilize the BES. Since PRC-004-3 addresses discovery of problems after an event, we propose that at best this Standard would assure UFLS element Unnecessary Trip misoperations would be mitigated. The discovery of a UFLS element Failure to Trip which has an adverse impact on the ability of the UFLS system to stabilize the BES as stated above is addressed by PRC-006-1. Notwithstanding the above, we do not see our concerns as requiring a negative ballot.

ITC
Yes
Yes
ITC Holdings is concerned with the documentation requirements to track communications between the BES interrupting device owner and the protection system owner. An auditor may become more interested in communication dates being more important to them than identifying the cause of the misoperation and implementation of the corrective action plan.

The maintenance exclusion should include failure to trip as well as trip. Take for example a deliberate roll of a lock out relay as a unit comes offline to test the system. Under the definition if the test caused an early trip it would not be an misoperation. But it is unclear if a failure to trip during the test would be a misoperation.

Consideration of Comments

Project 2010-05.1 Protection System (Misoperations)

The Project 2010-05.1 Protection System Misoperation Standard Drafting Team ("drafting team") thanks all commenters who submitted comments on the proposed Reliability Standard PRC-004-3 – Protection System Misoperation Identification and Correction. This standard was posted for a 45-day formal and public comment period from January 17, 2014 through March 11, 2014. Stakeholders were asked to provide comment on the standard and associated documents through a special electronic comment form. There were 63 sets of comments, including comments from approximately 173 different people from approximately 99 companies representing 9 of the 10 industry segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Director of Standards, Valerie Agnew, at 404-446-2566 or at valerie.agnew@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Background Information

The fourth draft of PRC-004-3 – Protection System Misoperation Identification and Correction Reliability Standard was posted for a 45-day formal comment period from January 17 – March 11, 2014 with an additional ballot in the last ten days of the comment period according to the new Standards Process Manual, June 26, 2013. Stakeholders from approximately 99 companies representing nine of ten industry segments provided comment. The Protection System Misoperation Standard Drafting Team (PSMSDT or SDT) has responded to all commenters and developed a fifth draft of the standard based on stakeholder comment. Changes to the standard include, but are not limited to following areas.

Summary of Changes

The PSMSDT made two substantive revisions to the previous draft 4 following the additional 45-day formal comment period of the standard and additional ballot which received 62.63% stakeholder approval. The following narrative is a summary of the two substantive revisions and other minor revisions made to the proposed draft 5 of the standard.

Definitions

The definition of "Composite Protection System" was revised for clarity. The first substantive revision is the definition of "Misoperation" concerning the two categories of "Slow Trip – During Fault." The

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf

revision removes the "a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability" and uses the more clear "…if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System." The last category of "Unnecessary Trip – Other Than Fault" was revised slightly to clarify that a Protection System operation caused by on-site personnel is not a Misoperation and the SDT made other corresponding revisions to insert word "Composite" before "Protection System" for consistency with the proposed definition of "Composite Protection System."

Purpose Statement
No revisions.

Facilities
An exclusion for Remedial Action Schemes (RAS) and Special Protection System (SPS) has been provided to increase clarity that these Protection Systems are not applicable to the standard.

Effective Dates
The extended implementation provision of 24 calendar months previously provided to entities in the Western Electric Coordinating Council (WECC) Region was eliminated. The provision was originally proposed due to a perceived conflict that is no longer valid. The effective date language was inserted into Section 6 of the standard for completeness.

Requirement R1
The SDT made a non-substantive revision to more clearly describe that the BES interrupting device operation that meets the three sub-parts (i.e., 1.1, 1.2, and 1.3) must all be true to have a Protection System operation that is reviewable for Misoperation.

Requirement R2
The requirement is the second substantive revision to address a gap in performance identified through continued review during the formal comment period. The previous draft did not have a provision for the responsible entity to initiate a reliability activity under the standard in the case of a Protection System failure to operate a BES interrupting device which is what initiates the activity to review for Misoperation.

The SDT determined that a failed Protection System would cause backup protection to operate other BES interrupting devices; therefore, it is practical to have the responsible entity that provided backup protection to notify the other entity of the potential failure. It is the notification that eliminates the gap and causes the other entity to review the Protection System for Misoperation under the next Requirement, R3.

Requirement R3
Minor word change.

Requirement R4

Minor clarity revision by adding “for a Misoperation” to more clearly reference the Misoperation identified in either Requirement R1 or R3.

Requirement R5

No change.

Requirement R6

No change.

Measures M1-M6

Each of the six Measures were updated to provide the entity that is required to demonstrate compliance, what is demonstrated, and the reference to the corresponding Requirement. Revisions were based on stakeholder comment and to be consistent with drafting team guidance for developing Measures.

Compliance

The SDT clarified for Requirement R5 that evidence retention relates to the “development” of the Corrective Action Plan (CAP), each evaluation, and each declaration.

VRFs and VSLs

The drafting team made a couple of minor typographical corrections identified by stakeholders.

Application Guidelines

The SDT made a significant number of additions and clarifications to address stakeholder comment. Most notably in the section discussing the definition of Composite Protection System.

Index to Questions, Comments, and Responses

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory, or other Government Entities

10 —Regional Entities

If you support the comments submitted by another entity and would like to indicate you agree with their comments, please select "agree" below and enter the entity's name in the comment section (please provide the name of the organization, trade association, group, or committee, rather than the name of the individual submitter).

Summary Consideration: The drafting team appreciates the entities below supporting the comments of others. Having single sets of comments with documented support greatly improves the efficiency of the standard drafting team (SDT). This format also ensures the drafting team has a clearer picture of the number of stakeholders supporting the same concerns or suggestions as the case may be.

Organization	Agree	Supporting Comments of "Entity Name"
Santee Cooper	Agree	Santee Cooper agrees with the SERC PCS Comments.
DTE Electric	Agree	RFC Protection Subcommittee
South Carolina Electric and Gas	Agree	SERC PCS
Beaches Energy Services	Agree	FMPA - Florida Municipal Power Agency

1. **Based on stakeholder input, the drafting team created a new definition for Composite Protection System to support the definition of Misoperation. The Slow Trip categories of Misoperation were also clarified. Do you agree with the new and revised definitions? If not, please provide specific suggestions for improvement.**

Summary Consideration: Approximately 56 commenters responded to this question about the proposed definitions. More than half agreed with the proposed changes. The majority of commenters responding "no" to the question had concerns that the SDT addressed through either a revision to the definition or a clarification in the Application Guidelines. The following is a summary of the significant issues and whether the concern resulted in a change or not.

There were three majority comment "themes" for this question that resulted in a change. Approximately 15 comments, supported by 43 individuals, had concerns about how to evaluate a "Slow Trip" with regard to the definition of "Misoperation." The SDT modified both "Slow Trip" categories of the definition for clarity. For example, "[a] Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System" would be a "Slow Trip" Misoperation. Second, about nine comments supported by 16 individuals either requested clarification to the definition of "Composite Protection System" and to clarify or add examples to the Application Guidelines concerning the definition. The SDT revised the definition of "Composite Protection System" and added several examples to the Application Guidelines. The last majority theme of comments from five individuals had general questions about the definitions of "Composite Protection System" and "Misoperation." Some questions raised by commenters resulted in a clarification to the definitions and Application Guidelines.

There were no majority comment themes that did not result in a change; however, there were five minority themes in the comments which did not result in a change and a number of other minority comments not summarized here. There were approximately two comments supported by 12 individuals that requested clarity in the use of "Composite Protection System" and "Protection System" in the Requirements. The SDT provided insight in the individual responses below which describe why or why not such changes improve clarity. One comment supported by eight individuals wanted to have an exclusion for dispersed generation resources (DGR) in the standard's Applicability. The SDT provide detail in the individual response that the DGR drafting team would address such an exclusion once this standard reaches industry approval. There were a number of questions about data reporting in one comment. Data reporting is being addressed in a "data request" consistent with the NERC Rules of Procedure, Section 1600, Request for Data or Information. This avoids having a Requirement for the reporting of Misoperations. Another comment requested the phrase "BES interrupting device" to be defined. The SDT did not define the phrase because it is widely understood by industry.

Last, there was a concern about undervoltage load shedding (UVLS) not being included in the standard. This will be addressed by the drafting team working on UVLS once this standard is approved by industry.

Organization	Yes or No	Question 1 Comment
Puget Sound Energy	No	a) Misoperation Definition #3 (Slow Trip - During Fault) would require the running of system studies to test for possible system instability. This (and/or other expectations) should be spelled out in the Application Guidelines. **Response:** The portion "[d]*elayed clearing of a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability…"* has been removed. Change made. b) Misoperation Definition #4 (Slow Trip - Other Than Fault) would also require the running of system studies to test for possible system instability. This (and/or other expectations) should be spelled out in the Application Guidelines. **Response:** The drafting team has modified the Slow Trip portion of the definition of "Misoperation" to address this concern. Change made. c) For #2 & #4 sections of the Misoperation Definition as well as under Facilities (4.2.2) - UFLS/UVLS both should specifically be mentioned together. **Response:** Undervoltage load shedding (UVLS) has not been included in the proposed PRC-004-3 standard's Applicability because Misoperations of UVLS relays are being addressed under Project 2008-02 – Undervoltage Load Shedding when modifying Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance. Since UVLS does not fall under 4.2.1 or 4.2.2, it is not applicable to PRC-004-3. No change made. d) It should be clarified that non-fault tripping protection schemes as described in PRC-004-3 do not include RAS/SPS (and that RAS/SPS will be covered in PRC-016).

Organization	Yes or No	Question 1 Comment
		Response: Remedial Action Schemes (RAS) and Special Protection Systems (SPS) are being addressed by Project 2010-05.2 – Special Protection Systems (Phase 2 of this project). An exclusion for RAS/SPS has been added to the Applicability section. Change made. e) It should be clarified in PRC-004-3 that UFLS/UVLS are not specifically part of the RAS/SPS definition (even though this is spelled out in the NERC glossary). Otherwise, it all can be quite confusing. **Response:** It would be inappropriate for the team to restate what is governed by the *Glossary of Terms used in NERC Reliability Standards* which may change in the future and could potentially require modifying an industry approved standard that contains such a clarification. No change made. f) In all six parts of the Misoperation Definition, the phrase "...where tripping for protection purposes is involved" could be included for clarity. **Response:** The drafting team has modified the definition of "Misoperation" to address this concern. Change made.
US Bureau of Reclamation	No	The Bureau of Reclamation (Reclamation) requests that the drafting team clarify the bounds of the Composite Protection Systems definition. Reclamation suggests that the drafting team update the Application Guidelines to provide an example of a Composite Protection System for a generator, a transformer, and a transmission line so that industry will have guidance on the scope of typical Composite Protection Systems. **Response:** The Application Guidelines section has been revised to add clarity concerning this issue. The examples were moved to the Application Guidelines. Change made.
FirstEnergy Corp	No	Composite Protection System as a new definition is unclear within the context of a Generating Unit as a BES Asset. Protection System, by definition, is already a composite of

Organization	Yes or No	Question 1 Comment
		the five identified components, as applicable. We do not understand the intent of adding the word Composite, or how it changes the current definition of a Protection System for a Generating Unit. **Response:** The Application Guidelines section has been revised to add clarity concerning this issue. The examples were moved to the Application Guidelines. Change made. The Misoperations drafting team understands the concern with the applicability of dispersed generation resources (DGR) to this standard. This drafting team is working with the DGR drafting team addressing standards with this concern under Project 2014-01 – Standards Applicability for Dispersed Generation Resources. In order to keep the sequence of the versions correct, the DGR drafting team will consider the exclusion in this standard once approved by industry. This should not be of great concern due to the implementation time of this standard and the need to bring in alignment with the work of the DGR drafting team. No change at this time.
PPL NERC Registered Affiliates	No	These comments are submitted on behalf of the following PPL NERC Registered Affiliates ("PPL"): Louisville Gas and Electric Company and Kentucky Utilities Company; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; PPL Generation, LLC; PPL Susquehanna, LLC and PPL Montana, LLC. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. Comments: The definition for 'Slow Trips' has been improved in the current draft of PRC-004-3, but still requires some revision. The first means by which slow tripping can be manifested, instability, is believed to pertain only to Transmission Systems. The second effect of slow tripping, bringing backup relays into play, does not pertain to generation plants. That is, opening the breaker via a backup relay of a generation plant means not that the primary device acted slowly, but that it did not function at all. This would be a Failure-to-Trip type of Misoperation of the primary relay. We understand that variation-of-tripping

Organization	Yes or No	Question 1 Comment
		is an issue of great importance for Transmission Owners (TOs), but it does not apply for generation plants (such as in the case of high speed tripping to limit system instability). Generator Owners (GOs) additionally do not necessarily have the installed equipment needed to analyze trip speed. Generation plants are not presently required to have high-speed disturbance monitoring equipment, and many plants still have electromechanical relays (i.e. no oscillograph function). Also, GOs often lack the design-level protection relay staff necessary to perform the activities described on pp. 23-24 of the Application Guidelines. **Response:** The drafting team has modified the Slow Trip portion of the definition of “Misoperation” to address this concern. Change made.
Duke Energy	No	(1) Duke Energy suggests rewording Slow Trip - Other Than Fault as follows: “A Composite Protection System operation that is slower than required for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. Delayed operation for a non-Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or resulted in the operation of any other Composite Protection System.” By replacing “clearing of a non-Fault” with “operation for a non-Fault”, we feel this better describes the intent of a slow trip that is not a fault. **Response:** The drafting team has modified the Slow Trip portion of the definition of “Misoperation” to address this concern. Change made.
Florida Municipal Power Agency	No	FMPA appreciates the response to our comments, but, we do not believe our issues from our past comments have been resolved.

Organization	Yes or No	Question 1 Comment
		Regarding “Slow Trip”: FMPA agrees in concept with providing the ability to apply engineering judgment regarding what tripping “slower than required” may mean but believes there is too much ambiguity. We agree that “It is impractical to provide a precise tolerance ...”; however, If the standard is kept in this format, we support a clarification on the order of “fast enough to prevent harm to the protected equipment, undesired overtripping, or harm to stability.” **Response:** The drafting team has modified the Slow Trip portion of the definition of “Misoperation” to address this concern. Change made. FMPA believes “BES interrupting device” should be a defined term because it now drives the majority of the compliance activities associated with the standard. Specifically we believe with the way this device is characterized in the Application Guide is deficient. Devices that do not have “fault current interrupting capability” but have load interrupting capability, are often also used for protection functions in “Other than Fault” scenarios. Also, we note that fuses do not qualify as Protection System components although they meet Application Guide description of “BES interrupting device”. Confusion concerning treatment of fuses and the definition of BES Interrupting Device could lead to unintended consequences, such as a proliferation of use of fuses. **Response:** The drafting team asserts that the phrase “BES interrupting device” is widely understood by industry through both the absence of comments and the description in the Application Guidelines. No change made. FMPA still believes that the remaining definitions - Failure to Trip (During and Other than Fault) and Unnecessary Trip (During and Other than Fault) have similar difficulties to “Slow Trip”, wherein the standard provides the leeway for entities to apply judgment but that same leeway affords no way of supporting such judgment with evidence if an auditor disagrees with the interpretation.

Organization	Yes or No	Question 1 Comment
		Response: There is no criteria for judgment of accuracy within the Requirements. No change made. FMPA also believes that specifically excluding remote backup devices from the definition of Composite Protection System wrongly places a negative connotation on those typically lower voltage (100 - 161 kV) systems in which remote backup for a relay or breaker failure is “as-designed”. We recognize that under the current format it will be difficult to avoid this issue - however if entities were able to develop their own Protection System Design Philosophy documents with this issue specifically addressed (see response to question 5 for more description of this proposed approach) as the criteria against which performance is measured, this problem goes away. **Response:** The drafting team has modified the definition of “Composite Protection System” and changed the reference to backup protection from an exclusionary statement to an inclusionary statement to address this concern. Change made.
SPP Standards Review Group	No	With the introduction of the term Composite Protection System, and especially considering the movement from Composite Protection System to Protection System in Requirements R1 and R2, additional confusion may have been incorporated into the standard than existed previously. If there is a way to eliminate the movement from one term to the other or develop a clearer transition from one to the other, it would be helpful to the industry. **Response:** The text involving Protection System component(s) (i.e., R1 or R2) is to provide a more granular look at the specific entity’s protection whereas the text of Composite Protection System (i.e., Part 1.2 or 2.1) is referring to the broader condition where two or more entities jointly own a Protection System that makes up a Composite Protection System. No change made.

Organization	Yes or No	Question 1 Comment
Virginia State Corporation Commisison	No	Minor suggestion in Parts 1 and 2 "Faliure to Trip." I suggest changing the phrase "failure of a Protection System component" to "failure of any Protection System component." Although it may be a remote possibility, more than a single component may fail, while the Composite Protection System as a whole acts correctly. **Response:** The definition of Misoperation uses the singular form as only one Protection System component failure is required to be a qualifier in meeting the criteria. The term "any" is implicit in the statement. No change made.
Ingleside Cogeneration, L.P./Occidental Chemical Corporation	No	Ingleside Cogeneration, L.P. ("ICLP") agrees that the definition of "Composite Protection System" properly captures the concept proposed by the project team. It reflects an intent that a Misoperation is determined by evaluating the actual performance of the primary, secondary, and pilot systems in totality against the expected performance. Evaluations of individual schema failures are of little value when built-in redundancy takes over to protect the local system - exactly as the designers intended. **Response:** Thank you for your support of the definition. No change made. There is still discomfort with the definitions of "Slow Trip - During Fault" and "Slow Trip - Other Than Fault" - particularly in those cases where the design responsibility is out of our hands. For example, when PRC-024-1 takes effect, Generator Owners will have little control over the expected performance of voltage and frequency-responsive Protection Systems - provided the relays are set in accordance with the standard. This means that the definitions need to include a statement that any composite Protection System operation that reacts consistently with the parameters (settings) established in any other NERC standard cannot be a Misoperation. **Response:** If the operating time resulted in the operation of at least one other Element's Composite Protection System, then it's a "Slow Trip" Misoperation. If the Misoperation cause is determined to be a settings issue, then corrective action must be taken or a

Organization	Yes or No	Question 1 Comment
		declaration explaining why corrective actions are beyond the entity's control or would not improve BES reliability. No change made. Secondly, unless notified by the Transmission Planner or Planning Coordinator, ICLP will not know that the Misoperation of one of our Protection Systems will lead to BES "voltage or dynamic instability." The two definitions seem to recognize that the GO may not be in a position to be identify such critical Protection Systems, but can be read otherwise. Similar to the previous issue, we believe that as long as we correctly supply modeling data to the TP and PC in accordance with other NERC standards, the responsibility to identify susceptible Protection Systems remains with the planning entities. **Response:** The drafting team has modified the Slow Trip portion of the definition of "Misoperation" to address this concern. Change made.
ReliabilityFirst	No	Throughout the draft standard (and definition of Misoperation), the term "Composite Protection System" is used while in other portions only the term Protection System is referenced. For example, within the definition of "Misoperation", items one through four use the term "Composite Protection System" while items five and six use the term "Protection System". **Response:** The term "Composite" was added to category 5 and 6 in the definition of "Misoperation." Change made. Another example is Requirement R1, Part 1.1 references the term "Protection System" while Part 1.2 references "Composite Protection System". ReliabilityFirst request the SDT's rationale on the appropriateness of the use of these terms. **Response:** The text involving Protection System component(s) (i.e., R1 or R2) is to provide a more granular look at the specific entity's protection whereas the text of Composite Protection System (i.e., Part 1.2 or 2.1) is referring to the broader condition where two or

Organization	Yes or No	Question 1 Comment
		more entities jointly own a Protection System that makes up a Composite Protection System. No change made.
Wisconsin Electric Power Company	No	We suggest revising #6 Unnecessary Trip -Other Than Fault: replace the 2nd sentence as follows: Current wording: "A Protection System operation that is caused by on-site maintenance, testing, ...is not a Misoperation" Suggested wording: "A Protection System operation that is related to on-site maintenance, testing, ... is not a Misoperation". This provides some flexibility to exclude operations not directly caused by on-site activity, but is a consequence of such activity. **Response:** The drafting team intends for this exclusion to apply only if the operation were directly initiated by on-site activities. A clarification was made to category 6.
Manitoba Hydro	No	(1) Manitoba Hydro believes that the definition of Misoperation needs to be re-written for the following reasons: a. It is not clear whether the six categories of Misoperations is exhaustive. The definition should be revised to clarify this. **Response:** The six categories are "exhaustive". The drafting teams contends that any Misoperation would fit within one of the categories. No change made. b. Under category 3, it is not clear if the cited example is the only type of Misoperations. **Response:** The portion "[d]*elayed clearing of a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability…"* has been removed. Change made. More explicit criteria has been provided to add the necessary clarity.

Organization	Yes or No	Question 1 Comment
		c. Use of the phrase “slower than required” in category 3 and 4 of the definition is unclear and does not capture the intended meaning identified in the Application Guidelines. The Guidelines state that “required” actually means as intended by the owner. Thus, this terminology should be used. **Response:** The drafting team has modified the Slow Trip portion of the definition of “Misoperation” to address this concern. Change made. d. Based on the numerous examples in the Guidelines of what is and is not a “Misoperation”, as well as references in the Guidelines to the effect that SMEs recognize that judgment must be used, the definition itself should clearly incorporate the notion of judgment by the owner. While the first sentence of the definition refers to intention, it does not specify whose intention (manufacturer, designer, operator..?) **Response:** The drafting team has modified the definition of “Misoperation” to address this concern. Change made. The proposed definition of “Slow Trip” simplifies the criteria; therefore, simplifying the determination. The Application Guidelines has been updated to clarify the intent of the drafting team in using the word “intended” in the definition of “Misoperation.” e. The sentences about component failure are out of place given that the definition of Composite Protection System is the total system, not individual components, and given that the first sentence of the definition refers specifically to failure of the Composite Protection System. **Response:** The intent is to provide clarity that a single component failure is not a Misoperation so long as the overall performance of the Composite Protection System is correct. No change made.

Organization	Yes or No	Question 1 Comment
		f. The word “intended” has been replaced with “required” even though the Application Guideline states that the term “required” is intended to refer to the objective of the owner. If this is the intended meaning, then the standard should use the wording “as intended by the owner”. The words “as required” are too vague and may be interpreted to mean as required to ensure the reliability of the BES. (Could it also mean as required by the designer / manufacturer or some other entity?) **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made. (2) Revise the definition of Composite Protection System to “The total complements of the Protection System(s) that function collectively to protect an Element, such as A and B system, any primary, secondary, local backup, and communication-assisted relay systems. Backup protection provided by a remote Protection System is excluded.” **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made. A redline of the commenter’s proposal above is provided using **blue with underline** for additions and ~~red with strikethrough~~ for deletions to illustrate the requested revision: “The total complements of the Protection System(s) that function collectively to protect an Element, such as **A and B system,** any primary, secondary, local backup, and communication-assisted relay systems. Backup protection provided by a remote Protection System is excluded.”
Flathead Electric Cooperative, Inc.	No	I do not like adding composite to the definition of protection system. This seems to broaden what is understood as a protection system and may impact testing and maintenance programs unnecessarily. I suggest sticking with the way it was before this redline change. **Response:** The drafting team is not modifying the current defined term Protection System, but defining a newly proposed term. No change made.

Organization	Yes or No	Question 1 Comment
American Electric Power	No	AEP recommends replacing "high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability" with "the lack of high-speed performance resulted in voltage or dynamic instability". The draft does not specify who is responsible to perform the identification, and adding "Planning Authority" would create a de facto TPL requirement. **Response:** The drafting team has modified the Slow Trip portion of the definition of "Misoperation" to address this concern. Change made.
Independent Electricity System Operator	No	We do not see the need to create a defined term "Composite Protection System". By definition, a Protection System is already a composite system whose components need to function collectively to protect an Element. The proposed term is redundant. In the comment report, it is indicated that 4 commenters representing about 24 individuals requesting clarification of the term "composite Protection System". This represents a very low percentage of the total number of commenters and individuals, which should not be the basis for proposing a new term which is redundant. We suggest to remove this defined term. **Response:** The reason for proposing the newly defined term, "Composite Protection System," is found in the Application Guidelines under the heading "Definitions." No change made.
Public Service Enterprise Group	No	We agree with the definition of Composite Protection System, but we believe that the categories definition of Misoperation could be improved. The standard does not address situations where one cannot determine whether the Protection System operated correctly or whether a Misoperation occurred. • Without evidence of a Fault associated with a trip, it is possible that Normal Clearing occurred, although there may be no evidence to support or reject that conclusion.

Organization	Yes or No	Question 1 Comment
		• Without evidence of a Fault associated with a trip, it is also possible that a category 5 (Unnecessary Trip - During Fault) or category 6 (Unnecessary Trip - Other Than Fault) Misoperation occurred; however, there may be no evidence to support or reject either reporting category. In order to address a situation when the operation of a Protection System cannot be determined to be a correct operation or a Misoperation, we believe a seventh Misoperation category should be considered: "Unclassified Trip: Any trip that (a) cannot be confirmed as the correct operation of the Protection System and (b) for which the evidence is not sufficient to place the trip into another Misoperation category." **Response:** The intent of the definition of "Misoperation" and the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. It may decide to identify the operation as a Misoperation and continue its investigation. If the continued investigative actions are inconclusive, the entity may declare no cause can be found and end its investigation. The Application Guidelines section has been updated to address this issue. Change made. See the Application Guidelines under the heading "Requirement R1." This will cause all such trips to be consistently investigated as Misoperations. We understand that many of these Misoperations may result in an undetermined cause.
Tacoma Power	No	In the definition of Misoperation, Unnecessary Trip - Other Than Fault, change "...caused by..." to "...related to..."In the definition of Misoperation, there may be some ambiguity/overlap in determining if some Misoperations are due to a Slow Trip or an Unnecessary Trip when Protection Systems are found not to have been adequately

Organization	Yes or No	Question 1 Comment
		coordinated. It is suggested that something like the following change be made to Slow Trip - During Fault and Slow Trip - Other Than Fault: Change "...or resulted in the operation of any other Composite Protection System..." to something like "...or a Protection System component failure resulted in the operation of any other Composite Protection System..." Inadequately coordinated relay settings would then more clearly fall under either Unnecessary Trip - During Fault or Unnecessary Trip - Other Than Fault. The only other remedy would be to categorize the Misoperation based upon the corrective action taken. (It should be noted that this ambiguity/overlap is only an issue if Misoperations must later be coded during a NERC data request.) **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made. In the definition of Misoperation, Slow Trip - Other Than Fault, consider removing the reference to "...voltage or dynamic instability..." It seems that these issues may be more related to Fault conditions. **Response:** The drafting team has modified the Slow Trip portion of the definition of "Misoperation" to address this concern. Change made.
Southern California Edison Company	No	There continues to be a lack of clarity in the definition. The standards drafting team has created a term that does not provide clear means of compliance for the industry. **Response:** The "Misoperation" definition has been modified to address this issue. Change made.
Xcel Energy	No	1) The definition for Composite Protection System could be clearer. For example, are the relays deployed at all ends of a transmission line for the protection of that line considered a part of one Composite Protection System? Does the presence or

Organization	Yes or No	Question 1 Comment
		absence of a communications-assisted scheme change which relays would comprise the Composite Protection System? **Response:** Yes, relays deployed at all ends of a transmission line, which is an Element, that function collectively to protect that line are considered a part of the line's Composite Protection System. The presence or absence of a communications-assisted scheme does not change the application of the proposed definition. The Application Guidelines section has been updated to address this issue. Change made. 2) The definition of Composite Protection System should be modified to account for all of the elements that may or may not operate to protect an element, excluding breaker failure protection. Breaker Failure protection should be considered its own zone of protection. Suggested change as follows: The total complement of the Protection System(s) that function collectively to protect an Element, such as any primary, secondary, local backup, and communication-assisted relay systems. Backup protection provided by a remote Protection System is excluded. Breaker failure protection should be considered as protecting its own specific breaker element. **Response: This portion of the Application Guidelines has been revised based upon the suggestion. Change made**. A redline of the commenter's proposal above is provided using **blue with underline** for additions and ~~**red with strikethrough**~~ for deletions to illustrate the requested revision: "The total complement of the Protection System(s) that function collectively to protect an Element, such as any primary, secondary, local backup, and communication-assisted relay systems. Backup protection provided by a remote Protection System is excluded. **Breaker failure protection should be considered as protecting its own specific breaker element**." 3) We have two issues driving our negative vote. The first issue is that high speed performance requirements for identified Composite Protection Systems are not defined or

Organization	Yes or No	Question 1 Comment
		controlled by a single entity with regional grid performance knowledge, such as Transmission Planning. Without centralized accountability to identify performance requirements for specified systems, settings will be installed according to the PRC-001 coordinated settings implemented by the BA, and TO or GO system owners. These settings have been coordinated with the applicable entities. Transmission Planning is the entity that should be cognizant of settings required to maintain system stability under various fault conditions, and notify TO system owners of these requirements for inclusion in PRC-001 coordination. This coordination needs to be identified, tracked, and proper timelines for implementation identified. **Response:** The drafting team has modified the Slow Trip portion of the definition of “Misoperation” to address this concern. Change made. 4) The second issue driving our negative vote is the lack of a time requirement tied to when a “previously identified” high-speed performance need has to be implemented. For example, under the Slow Trip - During Fault, the phrase “ ...if high-speed performance was previously identified...” has no time horizon to make this an effective requirement. If a high speed, 3 cycle fault clearing requirement was identified by e-mail the previous day, and the device was not reset immediately, and a subsequent event caused the device to operate at 30 cycles, a Misoperation would result. Instead, a process by which requirements are identified by the planner, allowing an defined period for implementation, should be required. This could be accomplished by either adding Transmission Planning as an applicable entity with notification requirements defined in the requirement language, or including the GO/TO/Distribution provider as a partner in this process in another standard, such as PRC-001 or the TPL series. Proposed rewording is as follows: Misoperation: The failure of a Composite P0rotection System to operate as intended and previously coordinated. Any of the following is a Misoperation:

Organization	Yes or No	Question 1 Comment
		Slow Trip - During Fault - A Composite Protection System operation that is slower than for a Fault condition for which it is designed and coordinated. Delayed clearing of a Fault condition is a Misoperation if it resulted in the operation of any other Composite Protection System. Slow Trip - Other Than Fault - A Composite Protection System operation that is slower than required for a non-Fault condition for which it is designed and coordinated, such as a power swing, undervoltage, overexcitation, or loss of excitation. Delayed clearing of a non-Fault condition is a Misoperation if it resulted in the operation of any other Composite Protection System. And similar edits to all other fault definitions in the document, removing the "...previously identified..." language. **Response:** The drafting team has modified the Slow Trip portion of the definition of "Misoperation" to address this concern. Change made.
Texas Reliability Entity	No	Texas RE is concerned that the revised definition of Misoperation is limited to failure of a Composite Protection System, and that this standard does not require investigation and mitigation of all Protection System operations/failures to operate when they are sub-parts of a Composite Protection System. We submit that any failure to operate as designed should be investigated and mitigated, even if another part of the Composite Protection System covered for the malfunctioning component/system. **Response:** The Composite Protection System definition is based on the principle that an Element's multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element's total complement of protection should be considered while evaluating an operation.

Organization	Yes or No	Question 1 Comment
		The purpose of having the definition of Composite Protection System is to promote reliability and not to penalize entities for implementing redundant protection (e.g., primary and secondary protection). A failure of the primary system when secondary system operates correctly is not a Misoperation because the Composite Protection System operated correctly to protect the given Element. The Application Guidelines section has been updated to address this issue. Change made.
CenterPoint Energy Houston Electric LLC	No	CenterPoint Energy agrees with the new definition for Composite Protection System and believes it is needed to support consistent misoperations reporting. However, we suggest additional clarifications for the two Slow Trip categories of Misoperation definitions that were revised to address high-speed performance. The second sentence of the two Slow Trip categories of Misoperation definitions states: 'Delayed clearing of a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or resulted in the operation of any other Composite Protection System'. We recommended changing this sentence to state the following: 'If the Composite Protection System is comprised of two, or more, independent high-speed schemes, delayed clearing of a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or if high-speed performance was previously identified as being necessary for coordination with other Composite Protection Systems.' **Response:** The drafting team has modified the Slow Trip portion of the definition of "Misoperation" to address this concern. Change made.
Indiana Municipal Power Agency	No	We see no alternative other than to install SOE equipment and/or Disturbance Monitoring Equipment and/or Digital Fault Recorders to monitor the Composite Protection System

Organization	Yes or No	Question 1 Comment
		during operations/Misoperations of BES interrupting devices. With the current definition of Misoperation, especially the Slow Trip definitions, it will be crucial to the investigation to have exact Protection System parameters and operation times prior to, during, and immediately following any operation on a BES interrupting device. **Response:** The drafting team has modified the Slow Trip portion of the definition of “Misoperation” to address this concern. Change made. In short any Protection System element (any device subject to PRC-005) must now be logged, recorded, and archived in order for a Registered Entity to be able to go back and show that their Protection System/Composite Protection System operated as designed and did not contribute to a Misoperation on either their own BES interrupting device and/or an adjacent Registered Entity’s BES interrupting device. This will be a considerable expense for smaller GOP’s and DP’s to install, operate, and maintain the equipment and archive the data and records required to meet the burden of these proposed definitions. **Response:** The proposed standard is not prescriptive and provides the applicable entities flexibility in choosing how they log, record, and archive data and records. No change made.
Tri-State Generation and Transmission Association, Inc.	No	We believe that the term “local backup” includes breaker failure relaying, but it appeared at the webinar that the drafting team does not intend for breaker failure relaying to be included in the definition of Composite Protection System. We recommend that “local backup” be removed from the definition or changed to “local backup (excluding breaker failure protection).” **Response: This portion of the Application Guidelines has been revised based upon the suggestion. Change made.**
Liberty Electric Power LLC	No	The maintenance exclusion should include failure to trip as well as trip. Take for example a deliberate roll of a lock out relay as a unit comes offline to test the system. Under the

Organization	Yes or No	Question 1 Comment
		definition if the test caused an early trip it would not be an misoperation. But it is unclear if a failure to trip during the test would be a misoperation. **Response:** The drafting team has modified the definition of "Misoperation" to address this example. Change made.
Florida Power & Light	Yes	No comments on the modified "Composite Protection System" definition. However, confusion may result in trying to determine whether an item fits into Misoperation Category 1 "Failure to Trip-During Fault" or into the Category 3 "Slow Trip-During Fault" definition. In both cases, the fault is likely be isolated by remote backup protection schemes. Consider combining Categories 1 and 3. **Response:** The drafting team has modified the Slow Trip portion of the definition of "Misoperation" to address this concern. Change made. The Composite Protection System will not have operated for a Failure to Trip; whereas, for a Slow to Trip Composite Protection System operation, an operation would have occurred. Either way both are a Misoperation. Also, regarding Category 6 "Unnecessary Trip-Other that Fault," the included wording is somewhat confusing. Consider revising to: "Spurious operation of a protection system in the absence of a fault condition on the power system it is designed to protect." **Response:** The drafting team declined to use "Spurious…" as suggested, but made other modifications to the Unnecessary Trip – Other Than Fault portion of the definition of "Misoperation." Change made.
Southern Company: Southern Company Service, Inc.; Alabama Power Company;	Yes	Yes, provided that it is made plain that, for the purposes of reportability, the failure or misoperation of an individual component of the Composite Protection System is not to be considered a reportable Misoperation when the Composite Protection System taken collectively functionally did not misoperate. Without this clarification, it is still confusing to

Organization	Yes or No	Question 1 Comment
Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing		state that the failure (misoperation) of an individual component of a Composite Protection System is not a misoperation. We suggest adding "reportable" to all occurances of the phrase "is not a misoperation" to read "is not a reportable Misoperation" where the phrase occurs in the draft standard (12 occurances). **Response:** The intent is to provide clarity that a single component failure is not a Misoperation so long as the overall performance of the Composite Protection System is correct. No change made. Reporting has been removed from the standard; therefore, adding this language would not add clarity. No change made. The data reporting will be addressed by a NERC Rules of Procedure, Section 1600 Request for Data or Information (i.e., data request). See the proposed data request for details regarding periodic data submittals and the associated template.[2] The Section 1600 Data Request will be submitted for approval along with the revised PRC-004 Reliability Standard. No change made. The definition of Misoperation, items 5 and 6 need to have the word Composite inserted between unnecessary and Protection. **Response:** The drafting team has modified the definition of “Misoperation” to address this concern. Change made.
ACES Standards Collaborators	Yes	The definition of Misoperation is much improved. We thank the drafting team for proposing a definition for Composite Protection System. It adds clarity to the standard. **Response:** Thanks you for your support.

[2] http://www.nerc.com/pa/RAPA/Pages/Protection-System-Misoperations-Section-1600-Data-Request.aspx

Organization	Yes or No	Question 1 Comment
American Transmission Company	Yes	ATC agrees with the new and revised definitions, but recommends additional clarification around Slow Trip. Would a study be needed to indicate where high-speed performance was previously identified for a Slow Trip? The Slow Trip definitions infer that in order to correctly or incorrectly declare a Misoperation, a study would need to occur. Such study would need to pre-date the operation. **Response:** The drafting team has modified the Slow Trip portion of the definition of “Misoperation” to address this concern. Change made.
Entergy Services, Inc.	Yes	There are a lot of protective relays that protect one element that sense the same parameter. For example, the Generator has a Generator differential relay, an overall differential relay, an overcurrent relay. If the Generator differential fails to actuate but the overall differential relay or the overcurrent actuates, does that mean the Composite Protection System did not misoperate? **Response:** In the example above, this is not a Misoperation of the Composite Protection System. The Application Guidelines have been revised to add clarity concerning this issue. Change made. The definition of Composite Protection System is still vague to this. Suggest the below definition: The total complement of the Protection System(s), with respect to the protective relay of interest, that function collectively to protect an Element, such as any primary, secondary, local backup, and communication-assisted relay systems. Backup protection provided by a remote Protection System is excluded. **Response:** The definition of Composite Protection System and the associated Application Guidelines section has been modified to improve clarity. Change made.

Organization	Yes or No	Question 1 Comment
Nebraska Public Power District	Yes	Please clarify the following; the composite protection system also includes the potential transformers, current transformers, battery bank and charger? **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made.
Exelon	Yes	We support the definition for Composite Protection System. **Response:** Thank you for your support.

2. **Based on stakeholder input, the drafting team modified the previous Requirement R1 to clarify responsibilities where two or more entities share ownership of a Protection System. The proposed Requirement R2 determines when other entities are notified and Requirement R3 now clarifies that the notified entity has the greater of 60 calendar days from notification or 120 calendar days from the BES interrupting device operation. Do you agree this modification clarified the performance for notification (R2) and the notified (R3)? If not, please provide specific suggestions for improvement.**

Summary Consideration: Of the 53 commenters that responded to this question regarding the first three Requirements in the standard, more than two-thirds support the standard drafting team's (SDT) revisions and approach. The majority of commenters responding "no" to the question had concerns that the SDT addressed with a revision to the standard. The following is a summary of the significant comments and whether the concern resulted in a change or not.

There were approximately two majority comments, both of which resulted in a revision to the standard. Two comments supported by 26 individuals noted that the one or more of the Measures were insufficient. The SDT provided additional detail in the Measures. Second, approximately three comments supported by ten individuals raised concerns about notification of other owners. To address these concerns, the SDT revised Requirement R2, 2.1, to read: "notification of the operation shall be provided to the other owner(s) that share *Misoperation identification responsibility* for the Composite Protection System." This is intended to allow the initiating entity to identify and notify the appropriate owner that needs to review the BES interrupting device operation for Misoperation.

A minority issue identified by two individuals revealed a significant gap in the standard for the case of a BES interrupting device that failed to operate. If this condition occurred, there would have been no specific performance for an entity to initiate the Requirement(s). To address this, the SDT revised Requirement R2 by creating two discrete conditions for notification. For the case of the BES interrupting device failing to operate, a remote BES interrupting device would have operated. It would be this device owner in Requirement R2 that would have an obligation to notify the other owner for which backup protection was provided to close the gap.

There were two significant majority issues that did not result in a change. The first concerns joint owners and there were approximately eight comments supported by 23 individuals that requested either a Requirement to have agreements between joint owners or how to address cases where the equipment is owned by the same entity, but different functions. The SDT provided detailed responses below for each of these comments. In general, if a single entity can meet the standard's objectives and support its compliance under Requirement R1, there is no need to make notifications; however, Requirement R2 is provided to ensure that other owners or entities that share Misoperation identification responsibility for the Composite Protection System are notified.

Other minority comments were too numerous to list in this summary, but are detailed in individual responses, below. Some include confusion about notifications and the time periods. Others revealed confusion between identifying the Misoperation and identifying the cause of the Misoperation. One comment requested special handling for extenuating circumstances and another requested the Distribution Provider to be excluded from the standard's Applicability.

Organization	Yes or No	Question 2 Comment
MRO NERC Standards Review Forum	No	To support the movement away from zero tolerance standards and towards the Reliability Assurance Initiative which recognizes appropriate risks to the Bulk Electric System, the NSRF proposes the 60 and 120 calendar day time frames be removed. Entities can be assessed to determine if they are identifying misoperations and correcting issues without daily timeframes. Writing in daily timeframes forces the audit of timeframes placing a documentation burden on entities that does nothing to support reliability. Administrative accounting for timeframes shifts the focus of the reliability activity away from identifying and correcting reliability issues to accounting. As one alternative, the drafting team could go back to the fundamental position of reporting progress quarterly similar to the current PRC-004 standard. Another alternative is, if the drafting team must impose daily timeframes, daily timeframes would be implemented only after the development of a nationwide database similar to the TADs database that includes internal controls (such as reminders) similar to the RAPA database that allows entities to enter and track all of the required information necessary to meet the PRC-004-3 standard within the database, thus reducing the some of the administrative burden.

Organization	Yes or No	Question 2 Comment
		Please note that the PRC-005-2 drafting team recognized the trap of writing a standard that imposes accounting for timeframes understanding that schedules change and events occur which could cause an entity to miss its schedule by days or weeks. See below: Excerpt from PRC-005-2 supplemental reference: Also of note is the Table's use of the term "Calendar" in the column for "Maximum Maintenance Interval." The PSMT SDT deemed it necessary to include the term "Calendar" to facilitate annual maintenance planning, scheduling and implementation. This need is the result of known occurrences of system requirements that could cause maintenance schedules to be missed by a few days or weeks. The PSMT SDT chose the term "Calendar" to preclude the need to have schedules be met to the day. The reliability benefit of the NERC standard is to identify misoperations and to take corrective actions. This can be achieved without the daily accounting burden imposed by the current writing of the standard. **Response:** The requirements and associated timeframes ensure that the responsible entities are diligent about Misoperation response, CAP creation and completion. The timetables make the requirements measurable. No change made.
FirstEnergy Corp	No	R1 and R2 refer to identification and notification "... within 120 calendar days of the BES interrupting device operation ...". Currently, submittals to the Regional Entity are due 60 days following the end of a quarter, which could conceivably place it up to 150 days following an event. Besides having to move up the review of Protection System operations, what Evidence will be required to prove the 120 day identification and notification? **Response:** The RSAW will provide the audit approach to determining compliance. Acceptable evidence is listed in each Requirement's Measure. No change made.

Organization	Yes or No	Question 2 Comment
PPL NERC Registered Affiliates	No	The expression, "identify whether its Protection System component(s) caused a Misoperation when," in R1 should be changed to, "identify whether (a) its Protection System component(s) caused a Misoperation, (b) functioned correctly or (c) a Misoperation cannot be ruled-out, when." NERC acknowledges in R4 that many months or even more than a year may be needed to authoritatively classify a relay operation, and this possibility is noted also in R2.2, but R1 requires passing Misoperation-vs.-no Misoperation determination within 120 days. It was stated in the 2/20/2014 Protection Systems Misoperation Webinar that such situations should be addressed by initially assuming a Misoperation, and later ask that the coding be changed if this proves not to be the case. The PPL NERC Registered Affiliates submit (per the guidelines issued by RFC) that in the absence of evidence, a Misoperation should not be assumed. **Response:** The intent of the definition of "Misoperation" and the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. It may decide to identify the operation as a Misoperation and continue its investigation. If the continued investigative actions are inconclusive, the entity may declare no cause can be found and end its investigation. The Application Guidelines section has been updated to address this issue. Change made.
Dominion	No	The calendar day time keeping requirements create additional burden on entities to track and maintain additional records for each entities timeline dates; especially R3 where the allotted time to identify the misoperation is dependent on when someone else notifies them. The 60 calendar day time frame is reasonable, but creates potential for non-compliance just because of an arbitrary date. **Response:** The requirements and associated timeframes ensure that the responsible entities are diligent about Misoperation response, CAP creation and completion. The timetables make the requirements measurable. No change made.

Organization	Yes or No	Question 2 Comment
Florida Municipal Power Agency	No	FMPA believes there are still ambiguities regarding the responsibility where to or more entities share ownership of a Protection System. Specifically as R1 relates to R2 the language reads in a way that seems to imply entities are required to wait to provide notification of the ongoing investigation to one another, which we believe is not the intent. **Response:** It is not the intent to require entities to wait to provide notification. A period of 120 calendar days after a BES interrupting device operation is provided for the BES interrupting device owner to perform Requirement R2. If the BES interrupting device owner determines from parts 2.2 and 2.3 that a notification is warranted they have the remainder of the 120 calendar day period to make notification. They do not have to wait for the 120 calendar day period to expire before making notification. No change made. Requirement R2 has been redrafted for clarity but the intent remains the same. Furthermore please clarify; where BES interrupting devices are associated with multiple Composite Protection Systems; Does 1.2 refer to the Composite Protection System which is believed to have operated or to all Composite Protection Systems associated with the BES Interrupting device (which may or may not be owned by the same entity)? **Response:** Requirement R1, Part 1.2 is referring to the Composite Protection System that initiated the BES interrupting device operation. No change made.
Virginia State Corporation Commisison	No	R1 remains very unclear to me. The text requires a TO, GO or distribution provider to "identify whether" its component caused a misoperation, but Subparagraph 1.3 requires, as a necessary condition to such identification that the "BES interrupting device owner [has] identified" that its component caused the failure. This is circular. **Response:** Parts 1.1 through 1.3 are the criteria for which BES interrupting device operations have to be reviewed under R1 within 120 calendar days. Part 1.3 says “caused the BES interrupting device(s) operation” not caused the failure. If all three are true, then the entity must review (i.e., determine) whether its Protection System component(s) caused a

Organization	Yes or No	Question 2 Comment
		Misoperation. Similarly, Requirement R2 uses the same concept, but for determining the notification of others. No change made.
ReliabilityFirst	No	The term “BES interrupting device” is used throughout Requirements R1, R2 and R3 though it is only defined within the Application Guidelines section. In order to provide clarity and avoid potential interpretations of what constitutes a “BES interrupting device”; ReliabilityFirst recommends the SDT propose this as a new definition which would be added to the NERC Glossary of Terms. ReliabilityFirst recommends the following definition from the Application Guidelines for consideration: “BES Interrupting Device - A BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current.” **Response:** The drafting team asserts that the phrase “BES interrupting device” is widely understood by industry through both the absence of comments and the description in the Application Guidelines. No change made.
Wisconsin Electric Power Company	No	There appears to be a gap between R1 and R2 for the case when an interrupting device operates, but the interrupting device owner does not own any part of the Protection System(s) that tripped or may have tripped the device. The assumption in the draft is that the interrupting device owner also owns a portion of the Protection System, but this may not always be true. **Response:** The drafting team asserts that according to definition of Protection System which became effective April 1, 2013, the BES interrupting device owner owns a component of the Protection System, namely the trip coil(s) of that BES interrupting device (at a minimum). No change made. Requirement R2 has been modified to address these concerns. Change made.

Organization	Yes or No	Question 2 Comment
David Kiguel	No	The standard should require that the Connection Agreement(s) among owners must address the procedures and potential dispute resolution for the case of 2 or more owners involved in the Misoperation investigation and CAP. **Response:** The drafting asserts this suggestion is administrative in nature and does not support reliability overall. The proposed standard mandates the necessary obligation for each entity of the jointly owned Protection System. Development and implementation of a Corrective Action Plan (CAP) to correct the Protection System component(s) of an identified Misoperation is incumbent upon the entity that owns the component. No change made.
Muscatine Power and Water	No	To support the movement away from zero tolerance standards and towards the Reliability Assurance Initiative which recognizes appropriate risks to the Bulk Electric System, MP&W proposes the 60 and 120 calendar day time frames be removed. Entities can be assessed to determine if they are identifying misoperations and correcting issues without daily timeframes. Writing in daily timeframes forces the audit of timeframes placing a documentation burden on entities that does nothing to support reliability. Administrative accounting for timeframes shifts the focus of the reliability activity away from identifying and correcting reliability issues to accounting. As one alternative, the drafting team could go back to the fundamental position of reporting progress quarterly similar to the current PRC-004 standard. Another alternative is, if the drafting team must impose daily timeframes, daily timeframes would be implemented only after the development of a nationwide database similar to the TADs database that includes internal controls (such as reminders) similar to the RAPA database that allows entities to enter and track all of the required information necessary to meet the PRC-004-3 standard within the database, thus reducing the some of the administrative burden.

Organization	Yes or No	Question 2 Comment
		Please note that the PRC-005-2 drafting team recognized the trap of writing a standard that imposes accounting for timeframes understanding that schedules change and events occur which could cause an entity to miss its schedule by days or weeks. See below: Excerpt from PRC-005-2 supplemental reference: Also of note is the Table's use of the term "Calendar" in the column for "Maximum Maintenance Interval." The PSMT SDT deemed it necessary to include the term "Calendar" to facilitate annual maintenance planning, scheduling and implementation. This need is the result of known occurrences of system requirements that could cause maintenance schedules to be missed by a few days or weeks. The PSMT SDT chose the term "Calendar" to preclude the need to have schedules be met to the day. The reliability benefit of the NERC standard is to identify misoperations and to take corrective actions. This can be achieved without the daily accounting burden imposed by the current writing of the standard. **Response:** The requirements and associated timeframes ensure that the responsible entities are diligent about Misoperation response, CAP creation and completion. The timetables make the requirements measurable. No change made.
American Electric Power	No	1) AEP recommends revising R1 section 1.2 as follows to recognize that a BES interrupting device may be part of multiple Composite Protection Systems: "The BES interrupting device owner owns all or part of the Composite Protection System(s); and". **Response:** Requirement R1, Part 1.2 is referring to the Composite Protection System that initiated the BES interrupting device operation. No change made. 2) AEP recommends revising R2 section 2.1 as follows: "The BES interrupting device owner shares the Composite Protection System(s) ownership with any other entity; and".

Organization	Yes or No	Question 2 Comment
		Response: Requirement R2, Part 2.1 is referring to the Composite Protection System that initiated the BES interrupting device operation. Requirement R2 has been modified. The previously drafted R2 Part 2.1 is now R2 Part 2.1.2. Change made. 3) AEP recommends adding the following footnote to the "entity" reference in R2 section 2.1: "In this context, "entity" denotes functional entity. A Composite Protection System owned by different functional entities within the same registered entity satisfies the R2 section 2.1 criteria." **Response:** A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the R2 section 2.1 criteria. For example, if the same personnel within a registered entity perform the Misoperation identification for both the GO and TO functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be completely covered in Requirement R1. Part 2.1 of Requirement R2 has been modified to address this concern. Change made. 4) AEP recommends adding the following footnote to the "entity's" reference in the first bullet of R5: "In this context, "entity" denotes functional entity". **Response:** The drafting team does not agree the suggestion provides additional clarity. Entity customarily denotes functional entity. No change made. 5) AEP recommends adding the following footnote to the "120 calendar days" reference in R2 and R3: "This timeframe may be extended, for operations occurring within a specified time period, by the Regional Entity if it determines that extenuating circumstances such as a natural disaster make it impractical to complete R1 or R2 within the allotted timeframe". **Response:** NERC and the Regional Entity do not have the authority to provide flexibility regarding the performance (time frames) of a Reliability Standard in unique extenuating

Organization	Yes or No	Question 2 Comment
		circumstances. However, the Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, says: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." While the drafting team recognizes the concern and that there are other standards which have similar provisions for natural disasters, the sanction guidelines provide sufficient flexibility to address extenuating circumstances in the event that they occur. No change made.
Exelon	No	Please address who takes lead responsibility for R1 when the associated BES interrupting device has multiple owners (i.e. single breaker that has multiple owners, two breakers associated with a line or generator on a ring bus with a different owner for each breaker, a three-terminal line with different owners for each terminal). Perhaps some additional examples in the Application Guidelines focusing on this situation would be helpful in reducing this confusion. Otherwise we have no concerns with R1. **Response:** While a BES interrupting device may be contractually owned by multiple entities that are not jointly registered, all of the entities would ultimately be responsible for the requisite documentation and results. Contractually organized entities may share or designate compliance responsibilities as well as associated documentation. No change made. For R2 and R3, the date timeframes for a shared responsibility Protection System to a common interrupting device short cycles the non-owner of the interrupting device. A suggestion for shared responsibly; With R2 - the BES device owner should notify the Other Protection System owners within 30 calendar days of the operation and the device owner has 120 days calendar days to identify if it's Protection System caused a misoperation. For R3, the notified Protection owner should then have 120 from notification to identify if its Protection System misoperated. This time frame for R3 would provide the non-owner sufficient time for any scheduled outages to make a determination.

Organization	Yes or No	Question 2 Comment
		Response: Notification in Requirement R3 starts the period for the Protection System component owner to begin its investigation. If the BES interrupting device owner officially notifies other Protection System component owners pursuant to Requirement R2 when there may be no need to do so, it will create an unnecessary compliance obligation for the other owners (i.e., upon notification), especially when there is little possibility that another owner's Protection System component(s) caused a Misoperation. The requirements do not preclude the initial entity that is reviewing the operation from working with the other owners and when necessary, make the official notification within 120 calendar days. This is the concept the drafting team is employing in Requirement R3 which considers the informal communication and the exchange of information. Should an entity receive notification, it always has a minimum of 60 calendar days and probably has a good idea of the problem; otherwise, if a notification (i.e., official notification) happens early on, the entity is now subject to compliance under Requirement R3. If the entity has not ruled out a Misoperation, it should assume it is a Misoperation, at which time, Requirement R4 will enable the entity to continue its investigation into the cause or no cause found. No change made.
Xcel Energy	No	1) There appears to be a potential gap if a Composite Protection System wholly owned by one entity experiences a Failure to Trip, and only interrupting devices wholly owned by another entity operate. 2) Propose wording change for R1 through R3 as follows: "R1 - Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Associated Composite Protection System component(s) Misoperated when: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]"; "R2 - Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES

Organization	Yes or No	Question 2 Comment
		interrupting device operation, notify the other owner(s) of the Associated Composite Protection System of the operation when: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]"; and "R3 - Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, shall identify whether its Associated Composite Protection System component(s) caused a Misoperation. [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]" **Response:** Requirement R2 has been modified to address these concerns. Change made. A redline of the commenter's proposal above is provided below using **blue with underline** for additions and ~~red with strikethrough~~ for deletions to illustrate the requested revision: "R1 - Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its **Associated** **Composite** Protection System component(s) ~~caused a Misoperation~~ **Misoperated** when: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]"; "R2 - Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, notify the other owner(s) of the **Associated** **Composite** Protection System of the operation when: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]"; and "R3 - Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, shall identify whether its **Associated** **Composite** Protection System component(s) caused a

Organization	Yes or No	Question 2 Comment
		Misoperation. [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]"
Texas Reliability Entity	No	There are several cases in the ERCOT Region where Company A owns the interrupting device and Company B owns the Protection System. In these cases, subpart 1.2 for R1 and subpart 2.1 for R2 do not apply. The language for Requirements R1 and R2 is written such that all of the subparts (1.1, 1.2, and 1.3 for R1 and 2.1, 2.2, and 2.3 for R2) must apply for the entity to initiate the analysis of the operation or notification. We would suggest modifying the language for R1 and R2 to say that the Requirement applies if one or more of the subparts apply. **Response:** The drafting team asserts that according to definition of Protection System which became effective April 1, 2013, the BES interrupting device owner owns a component of the Protection System, namely the trip coil(s) of that BES interrupting device (at a minimum). No change made.
Hydro-Québec Production	No	For the requirement R1, the other owner of the protection system shall share any information it has that could be used by the owner of the interrupting device to determine the cause of the misoperation of the interrupting device owner's protection system. For the requirement R2, the owner of the interrupting device shall share any information it has that could be used by the other owner of the protection system to determine the cause of the misoperation. **Response:** The drafting team agrees this is a best practice; however, it is not useful having a Requirement for each entity to share information. The way the Requirements are written, it is in the best interest of all parties (i.e., jointly owned Protection Systems) to share or communicate information about operations which meet the criteria for Requirement R1 and R2. Having such a Requirement is administrative and provides little, if any, reliability benefit. No change made.

Organization	Yes or No	Question 2 Comment
Tri-State Generation and Transmission Association, Inc.	No	We generally agree but we have some concerns about multiple entity ownership of different Protection System components compared to joint ownership of individual components. **Response:** While a Protection System may be contractually owned by multiple entities that are not jointly registered, all of the entities would ultimately be responsible for the requisite documentation and results. Contractually organized entities may share or designate compliance responsibilities as well as associated documentation. No change made. A change was made to Requirement R2, 2.1, "notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System" to address this concern. Change made.
Northeast Power Coordinating Council	Yes	We agree with the requirements as revised, but do not agree with Measures M2 and M3. a. Measure M2: The performance target is that the responsible entity notified the other owner(s) of the Protection System of the operation of the BES interrupting device when the conditions in Parts 2.1 to 2.3 are met. **Response:** The Measures have been updated. Change made. b. Measure M3: The performance target is that the responsible entity undertook actions to identify whether its Protection System component(s) caused a Misoperation when notified by the other owner of the Protection System of the BES interrupting device that operated. **Response:** The Measures have been updated. Change made.
Southern Company: Southern Company Service, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power	Yes	If the drafting team feels that this issue needs to be specifically stated in the Standard then the approach is acceptable. However, since there is no evidence that separate entities have not been doing due diligence in investigating and correcting misoperations, the addition of the various timelines serve only to generate additional paperwork and administrative burden.

Organization	Yes or No	Question 2 Comment
Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing		If the drafting team feels that this issue needs to be specifically stated in the Standard then the approach is acceptable. However, since there is no evidence that separate entities have not been doing due diligence in investigating and correcting misoperations, the addition of the various timelines serve only to generate additional paperwork and administrative burden. **Response:** Requirement R2 ensures notification of those who have a role in identifying Misoperations but were not accounted for within Requirement R1. No change made.
ACES Standards Collaborators	Yes	(1) While we agree the revisions to these requirements clarify what is required, we feel that R2 meets P81 criteria. First, R2 meets P81 criterion A because the requirement of notifying another owner does little to support reliability. Second, R2 meets P81 criterion B1 because it is clearly administrative, and it meets P81 criterion B4 because it requires reporting to another party. Without significant justification for how this administrative, reporting requirement materially and substantially supports reliability, we cannot support it. We suggest that requirement R2 should be removed and an explanation of the desired reporting would be appropriate in the Application Guidelines. The Application Guidelines on page 28 in the first paragraph acknowledges that "notifying the other owners... may unnecessarily burden the other owners with compliance obligations, redirect valuable resources, and add little benefit to reliability." **Response:** Requirement R2 ensures notification of those who have a role in identifying Misoperations, but were not accounted for within Requirement R1. No change made. (2) If Requirement R2 persists, we cannot support a medium VRF for R2. This requirement simply does not rise to the level of having an "impact on the electric state or capability of the bulk electric system" which is what is required to meet the Medium VRF criteria. The requirement is an administrative requirement and does not have any impact on the electric state or capability.

Organization	Yes or No	Question 2 Comment
		Response: The drafting team disagrees because a lower Violation Risk Factor (VRF) is a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature. However, any unresolved Misoperations of jointly owned equipment or operations that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. Because of this, the drafting team has selected a VRF of Medium. Please refer to the VRF/VSL Justification document. No change made. (3) While we believe that R2 meets P81 criteria and should be removed, if the requirement persists, we recommend removing the Distribution Provider from the applicability section. By definition, the Distribution Provider cannot own a “BES interrupting device” since it is a BES Element as explained on page 21 in the Application Guidelines. The Distribution Provider provides the wires between the BES and the end-use customer. It is the TO/TOP that owns/operates an integrated transmission Element that is 100 kV or higher. This is consistent with statement of registry criteria and the BES definition. If a Distribution Provider does own a BES interrupting device, then they will also be registered as a TO. If they are not, then NERC/regional entity has made a determination per Note 1 in the statement of compliance registry criteria that the BES interrupting device does not have a material impact on the reliability of the bulk electric system and has not registered them. Furthermore, the Application Guidelines state that the BES interrupting device is not part of the Protection System so there is no reason for the requirement to apply to the Distribution Provider.

Organization	Yes or No	Question 2 Comment
		Response: The Distribution Provider (DP) provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage. In this case, the DP may own a non-BES Protection System which operates a BES interrupting device. This rationale supports including the DP as an applicable entity in the proposed standard. Also, BES interrupting device "mechanisms" are not a part of the Protection System as noted in the Application Guidelines; however, the trip coil(s) is a part of the BES interrupting device and Protection System. No change made. (4) Requirement R3 needs to be further clarified for the situation when an entity is not able to identify if a Protection System operation was a correct operation or a Misoperation. This is particularly true for older technology such as electromechanical relays which may lack the necessary information to make such a determination. As the requirement is literally written, it requires the responsible entity "to identify whether its Protection System component(s) caused a Misoperation." If a responsible entity is unable to determine a whether the relay operated as designed, then the requirement would be technically violated. The VSL for R3 results in a severe violation if the responsible entity failed to identify a Protection System Misoperation. There should be some flexibility for instances where the operation is unknown. **Response:** The intent of the definition of "Misoperation" and the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. It may decide to identify the operation as a Misoperation and continue its investigation. If the continued investigative actions are inconclusive, the entity may declare no cause can be found and end its investigation. The Application Guidelines section has been updated to address this issue. Change made.

Organization	Yes or No	Question 2 Comment
		Response: The drafting team notes the Violation Severity Level of Severe here is for failing to perform the Requirement, not failing to properly identify the operation as a Misoperation. No change made.
ReliabilityFirst Protection Subcommittee	Yes	There was some confusion on who takes lead responsibility for R1 when the associated BES interrupting device has multiple owners (i.e. single breaker that has multiple owners, two breakers associated with a line or generator on a ring bus with a different owner for each breaker, a three-terminal line with different owners for each terminal). Perhaps some additional examples in the Application Guidelines focusing on this situation would be helpful in reducing this confusion. **Response:** While a Protection System may be contractually owned by multiple entities that are not jointly registered, all of the entities would ultimately be responsible for the requisite documentation and results. Contractually organized entities may share or designate compliance responsibilities as well as associated documentation. No change made. A change was made to Requirement R2, 2.1, "notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System" to address this concern. Change made.
SERC Protection and Controls Subcommittee	Yes	1. Recommend that R1.3 be simplified by rewording to indicate that "The BES interrupting device owner identified that its Protection System component(s) caused the Misoperation." **Response:** Although the drafting team understands the reason for the suggestion, it does not meet the intent of the three Parts 1.1 through 1.3. The three Parts are criteria which must be met to determine whether the Protection System operation is a reviewable event by the entity. The Misoperation is determined under the main Requirement R1, if the event meets the three Parts. No change made. A redline of the commenter's proposal above is provided using **blue with underline** for additions and ~~**red with strikethrough**~~ for deletions to illustrate the requested revision: "The

Organization	Yes or No	Question 2 Comment
		BES interrupting device owner identified that its Protection System component(s) caused the Misoperation ~~the BES interrupting device operation~~." 2. The calendar day time keeping requirements create additional burden on entities to track and maintain additional records for each entities timeline dates; especially R3 where the allotted time to identify the Misoperation is dependent on when someone else notifies them. The 60 calendar day time frame is reasonable, but creates potential for non-compliance just because of an arbitrary date. **Response:** The requirements and associated timeframes ensure that the responsible entities are diligent about Misoperation response, CAP creation and completion. The timetables make the requirements measurable. No change made. 3. Please add an explanation in the R2 Application Guidelines for situations in which one group investigates for multiple registered entities. It's quite common for a single protective relay engineering group to investigate for the TO, GO, and DP that their company owns. We suggest the following note "(Note: In cases where a single group performs an overall investigation for several entities each with some ownership of the Composite Protection System; a single document (or electronic database) is sufficient to meet the R2 and R3 notification requirements for use by both Registered Entities.)" be added to the Rational boxes for R1, R2 and R3 as well as to the Application Guidelines. This reduces the administrative overhead of having to send yourself an email just to prove that R2 and R3 are met. The important action of identifying and correcting Misoperation causes is still done and duly documented. **Response:** While a Protection System may be contractually owned by multiple entities that are not jointly registered, all of the entities would ultimately be responsible for the requisite documentation and results. Contractually organized entities may share or designate compliance responsibilities as well as associated documentation. No change made.

Organization	Yes or No	Question 2 Comment
		A change was made to Requirement R2, 2.1, "notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System" to address this concern. Change made. 4. Please augment M2 with 'databases' to more clearly allow for a single group investigating on behalf of multiple entities (e.g., GO, TO, DP) to date the notification within their database. For example, CTs on a GO breaker may be part of an adjacent TO switchyard bus protection, so there are two entity owners regarding the Composite Protection System. If owned by the same corporation, one system protection group investigates on behalf of the GO and TO, and act to identify and correct Misoperation causes. **Response:** The drafting team notes that the Measures for the Requirements above include examples of evidence and are not all inclusive. Other forms of evidence may be used at the entity's discretion. No change made.
Ingleside Cogeneration, L.P./Occidental Chemical Corporation	Yes	ICLP believes that the latest draft of PRC-004-3 corrects a gap where a delayed investigation by one entity could lead to a finding of a violation on the other. Requirements R2 and R3 address this potentially unfair scenario. **Response:** Thank you for your comment and support.
Ameren	Yes	(1) Ameren adopts all the SERC PCS comments by reference. **Response:** Please see the response to the SERC Protection and Controls Subcommittee. (2) A primary reason for our negative ballot on this draft 4 is the proposed clarification (included with SERC PCS comments) to allow a System Protection group of one company's TO, GO, and DP to document R2 and R3 notifications within its database or PRC-004 software, rather than exchange emails or Faxes.

Organization	Yes or No	Question 2 Comment
		Response: The drafting team notes that the Measures for the Requirements above include examples of evidence and are not all inclusive. Other forms of evidence may be used at the entity's discretion. No change made.
ITC	Yes	ITC Holdings is concerned with the documentation requirements to track communications between the BES interrupting device owner and the protection system owner. An auditor may become more interested in communication dates being more important to them than identifying the cause of the misoperation and implementation of the corrective action plan. **Response:** The drafting team asserts that entities may have varying and multiple communications in their efforts to identify potential Misoperations. Evidence must demonstrate that the BES interrupting device owner communicated to other owner(s) (i.e., Requirement R2). For the notified entity, it would demonstrate receipt of notification from the BES interrupting device owner (i.e., Requirement R3). No change made.

3. **Based on stakeholder input, the drafting team removed the previous Requirement R3 (action plan) and proposed a new Requirement R4 which provides entities time to investigate the Misoperation to determine its cause(s). Do you agree this modification clarified performance and removed ambiguity regarding the action plan? If not, please provide specific suggestions for improvement.**

Summary Consideration: Approximately 52 commenters responded to this question about the replacement of the previous "action plan" with "investigative actions." More than half agreed with the proposed change. The majority of commenters responding "no" to the question had concerns that the standard drafting team (SDT) addressed with either a revision to the standard or a clarification in the Application Guidelines. The following is a summary of the significant issues and whether the concern resulted in a change or not.

There were two significant majority comments. First, two comments supported by approximately 33 individuals identified problems with the Measure(s). The SDT corrected the issue by adding the necessary text. Second, two comments supported by about 26 individuals were concerned about how "investigative actions" would be handled by an auditor or what constituted an investigative action to demonstrate compliance. The SDT provided additional information in the Application Guidelines. There was one minority comment by two individuals that requested clarification about the timeframes used in Requirement R4. The SDT made clarifications in the Application Guidelines to note that timeframes are distinct and separate from the other Requirements.

There were no majority comments in this section, but there were a number of minority comments and too many to summarize in a meaningful way in this summary; detailed responses are provided in response to individual comments, below. The following are the most notable. Approximately six individuals had varying concerns about the auditability of Requirement R4, whether or not it is measurable, that the timeframes are either too constrictive or open-ended, or if the times are separate from other Requirements. The SDT contends the timeframes are reasonable given that investigative actions may take several months to complete between actions. For example, scheduling an outage of a transmission line. The timeframes are distinct. Two commenters believe the Requirement R4 should require the entities to determine the cause rather than indirectly assuming the cause would be found in Requirements R1 or R3 which focus on Misoperation identification. Another commenter requested a provision for extenuating circumstances which is better handled through the enforcement space according to the NERC Rules of Procedure.

Organization	Yes or No	Question 3 Comment
Northeast Power Coordinating Council	No	We agree with the requirements as revised, but do not agree with the Measures. Measures: The performance target is that the responsible entity performed investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, and the identification of the cause(s) of the Misoperation or a declaration that no cause was identified. **Response:** The Measures have been updated. Change made. The term "investigative action(s)" is ambiguous even given the example cited in the Application Guidelines. Since this is an auditable measure, this term should be defined in the standard. **Response:** The Application Guidelines has been updated to provide additional guidance on the expectation of investigative actions under the section heading "Requirement R4." Change made.
MRO NERC Standards Review Forum	No	The NSRF believe that there are many potential forms of "owners" and that "owners" needs to be modified to read, "other NERC registered applicable entities" to avoid a paragraph 81 administrative issue that has no bearing on reliability. Exclusions must be identified in R1, R2, R3, and R4 for joint protection system owners that actually don't have any impact on the operation of the protection systems. **Response:** While a Protection System may be contractually owned by multiple entities that are not jointly registered, all of the entities would ultimately be responsible for the requisite documentation and results. Contractually organized entities may share or designate compliance responsibilities as well as associated documentation. No change made. A change was made to Requirement R2, 2.1, "notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System" to address this concern. Change made.

Organization	Yes or No	Question 3 Comment
FirstEnergy Corp	No	Does NERC intend to be prescriptive with respect to a template for a Corrective Action Plan, or will the Regional Entities accept whatever format and tracking documentation is provided by the Registered Entities, even though they may be varied among the Entities? **Response:** There is nothing prescriptive in the Requirements concerning a Corrective Action Plan. The entity may use its discretion to determine how to create it. By definition, a CAP contains actions and a timetable to remedy a specific problem. No change made. The measures identified in M6 seem as though they could be subject to interpretation by an Auditor. **Response:** The Measures have been updated. Change made.
PPL NERC Registered Affiliates	No	The expression, “or that decided a Misoperation cannot be ruled-out,” should be added in R4 after, “has not determined the cause(s) of a Misoperation identified in accordance with Requirement R1 or R3,” per the rationale in our comment above for R1. The outcomes listed under R4 should be expanded as shown below; since, if there are Misoperations for which no cause can ever be identified, there can also be possible-Misoperations for which a yes-or-no determination can never be made. • The identification of the cause(s) of the Misoperation; or • A declaration that no cause of the Misoperation was identified; or • A declaration for an event for which a Misoperation cannot be ruled-out that no Misoperation can be proven. **Response:** The 120 calendar days is to determine whether or not a Misoperation occurred. The intent of the definition of “Misoperation” and the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. It may decide to identify the operation as a Misoperation and continue its investigation. If the

Organization	Yes or No	Question 3 Comment
		continued investigative actions are inconclusive, the entity may declare no cause can be found and end its investigation. The Application Guidelines section has been updated to address this issue. Change made. A redline of the commenter's proposal above is provided below using **blue with underline** for additions and ~~**red with strikethrough**~~ for deletions to illustrate the requested revision: • The identification of the cause(s) of the Misoperation; or • A declaration that no cause of the Misoperation was identified; or • **A declaration for an event for which a Misoperation cannot be ruled-out that no Misoperation can be proven**.
Tennessee Valley Authority	No	Currently, there is not a clear indication of regulatory relief for an entity following a major natural disaster. When recovering from major events such as Hurricane Sandy, the first priority is to get lights on and rebuild the system. Because a large natural event produces an influx of unique system configurations that may not have been planned for by system planners or relay setters, analyzing and investigating all the operations and misoperations that occur takes months and is not the top priority for a utility that endures such an event. We respectfully request that the standard drafting committee add wording to allow additional time when a utility endures a natural disaster. **Response:** NERC and the Regional Entity do not have the authority to provide flexibility regarding the performance (time frames) of a Reliability Standard in unique extenuating circumstances. However, the Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, says: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." While the drafting team recognizes the concern and that there are other standards which have similar provisions for natural disasters, the sanction guidelines provide sufficient flexibility to address extenuating circumstances in the event that they occur. No change made.

Organization	Yes or No	Question 3 Comment
ACES Standards Collaborators	No	(1) This requirement should be modified to simply state that the applicable entity is required to identify the cause of the Misoperation or document that a cause could not be found. It is too prescriptive that an applicable entity must identify investigative actions each successive two calendar quarters. This makes the requirement inflexible and needs to be simplified. Consider an example where an applicable entity that should be performing more investigative actions every two successive calendar quarters can be compliant by simply identifying one and an applicable entity in a unique situation that cannot perform even a single investigative action in the two successive calendar quarters due to extenuating circumstances would be in technical non-compliance. **Response:** The drafting team asserts that Requirement R4 mandates the applicable entity to exercise due diligence to pursue the cause of the Misoperation until the cause is found or document that a cause could not be found. Requirement R4 is structured in such a way to ensure identified Misoperations with no cause are either investigated to identify the cause or that a declaration is made to close the investigative action(s) if no cause is identified. In addition, a requirement needs to be auditable and measureable. No change made. (2) This requirement incorrectly implies that R1 and R3 require the applicable entity to identify the cause of the Misoperation. They do not. Rather, R1 and R3 simply require the applicable entity to identify Misoperations. Thus, R4 should be modified to simply require identification of the cause of the Misoperation subject to reasonable investigative actives or declaration that the cause could not be identified after completing reasonable investigative actions. **Response:** Requirement R4 is not applicable if the “cause” of the Misoperation is known. The “cause” may be found when performing Requirements R1 and R3. If not, Requirement R4 requires the entity to perform at least one investigative action every two calendar quarters following the identification of a Misoperation or make a declaration. No change made.

Organization	Yes or No	Question 3 Comment
ReliabilityFirst Protection Subcommittee	No	The direction included in R4 is awkwardly worded. Consider rewording the following “shall perform investigative action(s)... at least once every two full calendar quarters” AS “shall, on a semi-annual basis, continue to show evidence of investigation...”. However, the examples in the Application Guidelines are clear as to what the SDT is looking for. **Response:** The drafting team appreciates the suggestion and has decided to leave the Requirement as written. No change made.
ReliabilityFirst	No	ReliabilityFirst has a number of concerns with Requirement R4. First, from compliance/enforcement perspective, Requirement R4 is not sufficiently distinct from Requirements R1 and R3 (it creates a “double jeopardy situation”). For example, Requirement R3 requires the responsible entity to “...identify whether its Protection System component(s) caused a Misoperation”. As written, if the responsible entity fails to “...identify whether its Protection System component(s) caused a Misoperation” this could be grounds for a possible violation of Requirement R3. This is evident in the associated Violation Severity Levels where failing “...to identify whether or not a Misoperation its Protection System component(s) occurred” is a Severe Violation. This is in direct conflict with Requirement R4, which gives the responsible entity additional time to perform investigation actions to determine the cause of the Misoperation. ReliabilityFirst agrees with the intent of what Requirement R4 is trying to accomplish but from a compliance/enforcement standpoint it will cause issues. **Response:** Requirements R1 and R3 are for determining whether a Misoperation occurred or not. Requirement R4 is for determining the cause(s), if not determined while performing Requirements R1 or R3. Requirement R4 has been clarified. Change made. Second, as already noted, ReliabilityFirst agrees with the intent of what Requirement R4 is trying to accomplish, but notes that there is no ending time period associated with how long the responsible entity has to complete the investigation. As written, a responsible entity can hypothetically drag out the investigations and never officially complete the investigation.

Organization	Yes or No	Question 3 Comment
		ReliabilityFirst believes in order to close the loop, the responsible entity should be limited to four calendar quarters to complete the investigation (i.e., either identification of the cause(s) of the Misoperation or declaration that no cause can be identified). To address the two concerns, ReliabilityFirst recommends including similar language as noted in Requirement R4 as sub parts in Requirement R1 and R3 along with including an ending completion timeframe as well. The following is an example for consideration for Requirement R3: R3. Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, shall identify whether its Protection System component(s) caused a Misoperation. If the cause(s) of the Misoperation cannot be determined, the Transmission Owner, Generator Owner, and Distribution Provider shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters, but for no more than four calendar quarters after the Misoperation was first identified, until one of the following actions completes the investigation: • The identification of the cause(s) of the Misoperation; or • A declaration that no cause was identified. **Response:** The drafting team asserts that Requirement R4 is intended to allow the entity the time needed for identifying the cause(s) of a Misoperation. Shortening the period would have the unintended consequence of having entities prematurely declaring that the cause was not found. It is up to each entity to determine how long it wants to continue its investigative work to determine the cause(s) of a Misoperation. No change made.
Manitoba Hydro	No	(1) For R4, Manitoba Hydro does not think that there is a need to perform investigative actions to determine the cause of the Misoperation at least once every two full quarters.

Organization	Yes or No	Question 3 Comment
		Repeated investigative actions would not be productive in identifying the cause. We propose this requirement to read as follows: "Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation identified in accordance with Requirement R1 or R3 shall perform investigative action(s) to determine the cause of the Misoperation, until one of the following is completed: • The identification of the cause(s) of the Misoperation; or • A declaration that no cause was identified." **Response:** The requirements and associated timeframes ensure that the responsible entities are diligent about Misoperation response, CAP creation and completion. The timetables make the requirements measurable. No change made. A redline of the commenter's proposal above is provided below using **blue with underline** for additions and ~~**red with strikethrough**~~ for deletions to illustrate the requested revision: "Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation identified in accordance with Requirement R1 or R3 shall perform investigative action(s) to determine the cause of the Misoperation ~~at least once every two full calendar quarters after the Misoperation was first identified~~, until one of the following ~~completes the investigation~~ is completed: • The identification of the cause(s) of the Misoperation; or • A declaration that no cause was identified."
Muscatine Power and Water	No	MP&W believes that there are many potential forms of "owners" and that "owners" needs to be modified to read, "other NERC registered applicable entities" to avoid a paragraph 81 administrative issue that has no bearing on reliability. Exclusions must be identified in R1,

Organization	Yes or No	Question 3 Comment
		R2, R3, and R4 for joint protection system owners that actually don't have any impact on the operation of the protection systems. **Response:** While a Protection System may be contractually owned by multiple entities that are not jointly registered, all of the entities would ultimately be responsible for the requisite documentation and results. Contractually organized entities may share or designate compliance responsibilities as well as associated documentation. No change made. A change was made to Requirement R2, 2.1, "notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System" to address this concern. Change made.
American Transmission Company	No	ATC's experience has been that the cause of a Misoperation is determined within the first couple months following its occurrence. If the cause is not found in that time, it is unlikely to be found. Relative to R4, the parameters around investigative actions are not very productive, as revisiting the same information after an extended period of time does not typically lead to determining a cause. **Response:** The drafting team agrees that most Misoperation cause(s) are determined in the first phase of review and afterward the likelihood of determine the cause diminishes; however, Requirement R4 allows the entity a mechanism to continue the investigation without being out of compliance with Requirements R1 or R3 as the case may be. The drafting team understands that entities may need to schedule additional investigation (i.e., activities) such as taking an outage or sending equipment off to manufactures for testing and inspection. Requirement R4 provides this avenue to promote determining the cause(s) of Misoperations. No change made. ATC recommends removing the language in R4 that speaks to investigative steps "at least once every two full calendar quarters after the Misoperation was first identified."

Organization	Yes or No	Question 3 Comment
		Response: The drafting team originally discussed not having a time period associated with Requirement R4; however, in considering that approach, it was determined that the Requirement would not be measurable or auditable. No change made.
Exelon	No	How soon after a misoperation can a declaration of no cause be submitted? **Response:** The drafting team notes there is no prescribed time period. An entity should reasonably exhaust its efforts to determine the cause(s) of a Misoperation. The Application Guidelines under the heading "Requirement R4" provides additional direction regarding this comment. No change made. Exelon agrees that a prompt investigation of the event should occur and prudent corrective action be initiated as detailed in the new Requirement R4; however, if the Standard is allowing a provision for continued investigations then the other requirements in the Standard should align. Requirement R4 needs to be modified or R1 needs to be modified to align with each other. The current wording in R4 provides a requirement that cannot be met unless the entity is not in compliance with R1. R3 provides the wording such as "cannot rule out" and "or cannot determine". This wording needs to also be added to R1 for completeness. In addition, the wording in the VRFs and VSLs needs to be adjusted to accommodate those events where the cause of the interrupting device operation has not yet been determined. **Response:** Requirement R4 is not applicable if the "cause" of the Misoperation is known. The "cause" may be found when performing Requirements R1 and R3. If not, Requirement R4 requires the entity to perform at least one investigative action every two calendar quarters following the identification of a Misoperation or make a declaration. No change made.
Kansas City Power & Light	No	The inclusion of the following phrase is ambiguous. "..... shall perform investigative actions to determine the cause of the misoperation at least once every two full calendar quarters

Organization	Yes or No	Question 3 Comment
		after the misoperation was first identified, until one of the following completes the investigation: • The identification of the cause of the misoperation; or • A declaration that no cause was identified." I would remove "at least once every two full calendar quarters after the misoperation was first identified." If the drafting team wants to set a time limit on the investigation, then state a not-to-exceed time period. **Response:** The drafting team originally discussed not having a time period associated with Requirement R4; however, in considering that approach, it was determined that the Requirement would not be measurable or auditable. No change made. A declaration should be available once an entity has completed all of its diagnostic tests, even if the declaration comes in the first calendar quarter after the misoperation. During the NERC webinar, one of the drafting team members indicated that the declaration could be made at any time, but I can envision a Compliance Enforcement Authority reading the language of R4 and asking why you didn't fulfill the requirement to test in the second full calendar quarter. **Response:** The drafting team notes there is no prescribed time period. An entity should reasonably exhaust its efforts to determine the cause(s) of a Misoperation. The Application Guidelines under the heading "Requirement R4" provides additional direction regarding this comment. No change made.
City of Tallahassee	No	It can be difficult to perform some investigative actions if you are waiting for particular conditions to repeat in order to further investigate. You may not be able to repeat those conditions during the proposed time period from the standard.

Organization	Yes or No	Question 3 Comment
		Response: Requirement R4 allows the entity to close its investigative actions. Should the particular conditions reoccur, the entity may use the information in the future. No change made.
City of Tallahassee	No	It can be difficult to perform some investigative actions if you are waiting for particular conditions to repeat in order to further investigate. You may not be able to repeat those conditions during the proposed time period from the standard. **Response:** Requirement R4 allows the entity to close its investigative actions. Should the particular conditions reoccur, the entity may use the information in the future. No change made.
City of Tallahassee	No	It can be difficult to perform some investigative actions if you are waiting for particular conditions to repeat in order to further investigate. You may not be able to repeat those conditions during the proposed time period from the standard. **Response:** Requirement R4 allows the entity to close its investigative actions. Should the particular conditions reoccur, the entity may use the information in the future. No change made.
Public Service Enterprise Group	No	In R4, we find the phrase “two calendar quarters” unclear since it is referenced from the date when the Misoperation was identified. For simplicity, that phrase should be replaced with “180 days.” Also, there may be a need to extend the time. For example, if an investigation required removing a transmission line from service, one may not be able to obtain a clearance to do so within 180 days, so an investigation action could not be performed, resulting is a violation of R4. Therefore, the 180 day time frame should be allowed to be extended for good cause if the owner documents the cause of an extension. Our recommendation is to replace R4 with this language:

Organization	Yes or No	Question 3 Comment
		"Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation identified in accordance with Requirement R1 or R3 shall perform investigative action(s) to determine the cause of the Misoperation at least once every 180 days after the Misoperation was first identified (which 180 days may be extended by the Transmission Owner, Generation Owner, or Distribution Provider for a documented good cause), until one of the following completes the investigation:" **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made. A redline of the commenter's proposal above is provided below using **blue with underline** for additions and ~~**red with strikethrough**~~ for deletions to illustrate the requested revision: "Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation identified in accordance with Requirement R1 or R3 shall perform investigative action(s) to determine the cause of the Misoperation at least once every ~~two full calendar quarters after the Misoperation was first identified~~ **180 days after the Misoperation was first identified (which 180 days may be extended by the Transmission Owner, Generation Owner, or Distribution Provider for a documented good cause),** until one of the following completes the investigation:" Finally, in the "Rationale" text box, the phrase "(120 calendar days)" should be stricken since it does not apply to R3. If notice per R2 is given on day 120, the entity under R3 has 60 day time period, while if notice is given on day 1, it has a 119 day time period. **Response:** The drafting team believes the reference above is in error. The "(120 calendar day)" reference is in the rationale box for Requirement R4 to highlight that Requirements R1 and R3 are distinct and separate from the time period in Requirement R4. No change made.

Organization	Yes or No	Question 3 Comment
Northeast Utilities	No	The term "investigative action(s)" used in Requirement 4 is somewhat ambiguous even given the examples cited in the Application Guidelines. Since this is an auditable measure, this term should be defined in the standard. Can simply confirming an outage schedule be enough of an investigative action to satisfy all compliance auditors as suggested in the Application Guidelines? **Response:** The Application Guidelines has been updated to provide additional guidance on the expectation of investigative actions under the section heading "Requirement R4." Change made.
Texas Reliability Entity	No	There should be an end time frame for this requirement. If an entity has not determined if a Misoperation occurred within 120 days of the interrupting device operation, they could conceivably continue to investigate the event for years, as long as they perform an investigative action at least once every 6 months. **Response:** The drafting team asserts that Requirement R4 mandates the applicable entity to exercise due diligence to pursue the cause of the Misoperation until the cause is found or document that a cause could not be found. Requirement R4 is structured in such a way to ensure identified Misoperations with no cause are either investigated to identify the cause or that a declaration is made to close the investigative action(s) if no cause is identified. In addition, a requirement needs to be auditable and measureable. The Application Guidelines under the heading "Requirement R4" provides direction regarding this question. No change made.
CenterPoint Energy Houston Electric LLC	No	CenterPoint Energy believes a requirement to perform investigative actions to determine the cause of a Misoperation at least once every two full calendar quarters after the Misoperation was first identified will result in repetitious investigative actions and scheduled outages and would provide little benefit.

Organization	Yes or No	Question 3 Comment
		Response: The drafting team notes there is no prescribed time period. An entity should reasonably exhaust its efforts to determine the cause(s) of a Misoperation. The Application Guidelines under the heading “Requirement R4” provides additional direction regarding this comment. No change made. Also, we do not believe a declaration is needed, since assigning a cause code of Unknown / Unexplainable is part of the misoperation analysis process. The Cause Code and an explanation of the exhaustive investigation and tests conducted should be sufficient. Therefore, we recommend Requirement R4 be deleted. **Response:** The declaration in Requirement R4 is meant to be distinct and separate from the reporting aspects under the NERC Rules of Procedure, Section 1600, Request for Information or Data for compliance purposes. No change made.
Southern Company: Southern Company Service, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	Yes	On page 28 of the clean draft #4, in the first sentence of the R4 section, the words "the entity" appearing after the comma are redundant and are not needed. **Response:** The drafting team agrees and has removed the additional “the entity” from the sentence. Change made.

Organization	Yes or No	Question 3 Comment
Virginia State Corporation Commisison	Yes	I have one wording suggestion for R3. I suggest moving the words "shall identify" from their present location to follow immediately after "Requirement R2." The sentence would then read "Each TO, GO and Distribution Provider that receives notification pursuant to Requirement R2, shall identify within the later of 60 days.....device(s) operation, whether its Protection System component(s) caused a Misoperation." **Response:** The drafting team appreciates the suggestion and has decided to leave the Requirement as written. No change made.
Ingleside Cogeneration, L.P./Occidental Chemical Corporation	Yes	ICLP appreciates the precise language used in Requirement R4 - which allows sufficient time to investigate a Misoperation, while limiting it to within reasonable bounds. We agree that if a cause cannot be found through good faith investigation within two calendar quarters, there is little benefit to pursuing the case further. **Response:** The drafting team appreciates the comment and support.
American Electric Power	Yes	AEP recommends replacing “at least once every two full calendar quarters after the Misoperation was first identified” with “at least once every six month period after the Misoperation was first identified”. **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made.

4. **The drafting team modified the Application Guidelines to improve examples and clarify the team's intent on various topics. Do you agree the Application Guidelines provide sufficient examples and clarity? If not, please provide specific suggestions for improvement.**

Summary Consideration: Approximately 50 commenters responded to this question about the overall comprehensiveness of the Application Guidelines. Commenters were equally divided as to whether the Application Guidelines were sufficient. The majority of commenters responding "no" to the question had concerns that the SDT addressed with either a revision to the standard or a clarification in the Application Guidelines. The following is a summary of the significant issues and whether the concern resulted in a change or not.

The following is a summary of the comments that resulted in a change. There were four majority comment themes. First, approximately six comments represented by 24 individuals requested additional specificity concerning the definition of "Misoperation" with regard to categories 3 and 4 ("Slow Trip"). The SDT made several changes to the Application Guidelines in addition to revisions to the definition. Second, about seven comments supported by 13 individuals requested clarifications concerning equipment. The SDT made clarifications to the Application Guidelines in reference to sync check relays, breaker failure, reverse power relays, control functions, and mechanical parts of breakers. Third, approximately four comments supported by ten individuals requested clarity regarding who had responsibility for the Corrective Action Plan (CAP), the extent of the evaluation of other Protection Systems, and/or the reporting of Misoperations. The SDT provided clarifications in the Application Guidelines except for reporting which will be handled through the NERC Rules of Procedure, Section 1600, Request for Data or Information. The last majority comments requested various clarifications or examples for the definition of "Composite Protection System." The SDT provided additional narratives and examples for various BES Elements (e.g., transformer, generator, and transmission line). Other additions included improving discussion concerning investigative actions and the definition of "Misoperation" to include on-site personnel.

There were three notable minority comments which resulted in a change. One comment supported by 11 individuals was stating uncertainty whether to identify an operation as a "Misoperation" if unsure or to consider the operation "correct." The SDT provided additional clarification in the Application Guidelines on the approaches an entity could take to continue its investigation. Two comments from individuals requested clarification on how to handle multiple automatic recloses of a BES interrupting device by a Protection System. The SDT provided clarification based on existing NERC System Protection and Control Subcommittee guidance. Last, one commenter requested an exclusion of Remedial Action Schemes (RAS) and Special Protection Systems (SPS). The SDT provided an exclusion in the Applicability section of the standard to make clear this perceived sub-set of a Protection System is not applicable to the standard.

There were two majority comments which did not result in a change to the standard. First, there were approximately five comments supported by 22 individuals that were either concerned the Regional Entities would no longer review CAPs or wanted to know more about the reporting of Misoperations. The SDT provided feedback below in the responses and directed commenters to the data request concerning the reporting of Misoperations. Second, about five comments supported by 11 individuals raised questions as to whether a certain scenarios were a Misoperation. Some scenarios could be determined whether they were Misoperations or not by the information provided by the commenter, others could not. Most notable minority comments which did not result in a change include: a request to add undervoltage load shedding (UVLS), a provision for extenuating circumstances, and a requirement to share information between different owners of Protection Systems. The SDT noted that UVLS would be handled after industry approval, extenuating circumstances are best handled in the enforcement space according to the NERC Rules of Procedure, and the request to share information requirement would not have a reliability benefit.

Organization	Yes or No	Question 4 Comment
Puget Sound Energy	No	a) Application Guidelines could have more specificity, in addition to examples. For example, in #4 (Slow Trip - Other than Fault), it should be spelled out that each possible Misoperation should be studied to test for possible effects on system stability. Other specific expectations, if any, should also be spelled out. **Response:** The drafting team has modified the Slow Trip portion of the definition of “Misoperation” to address this concern. Change made. b) In addition, “Other than Fault” should be clarified and explained together with the definition of SPS/RAS, which are excluded from PRC-004. (SPS/RAS are defined as non fault protection schemes). **Response:** The drafting team contends that “Other than Fault” does not need further clarification.

Organization	Yes or No	Question 4 Comment
		Response: Remedial Action Schemes (RAS) and Special Protection Systems (SPS) are being addressed by Project 2010-05.2 – Special Protection Systems (Phase 2 of this project). An exclusion for RAS/SPS has been added to the Applicability section. Change made. c) UFLS/UVLS should always be mentioned together in PRC-004-3 (unless both are not included). **Response:** Currently, underfrequency load shedding (UFLS) is applicable to the proposed standard to close a gap in reliability. No change made. Undervoltage load shedding (UVLS) has not been included in the proposed PRC-004-3 standard's Applicability because Misoperations of UVLS relays are being addressed under Project 2008-02 – Undervoltage Load Shedding when modifying Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance. Since UVLS does not fall under 4.2.1 or 4.2.2, it is not applicable to PRC-004-3. No change made. d) Should sync check and breaker failure be considered in the Application Guidelines - what category do these fall into? **Response:** Sync check is not included as a part of a Protection System and is not within scope of the proposed standard. Breaker failure has been clarified in the Application Guidelines. Change made. e) In all six parts of the Misoperation Definition, the phrase "...where tripping for protection purposes is involved" could be included for clarity. **Response:** The drafting team has modified the definition of "Misoperation" to address this concern. Change made.
US Bureau of Reclamation	No	Reclamation suggests that the drafting team update the Application Guidelines to provide an example of a Composite Protection System for a generator, a transformer, and a

Organization	Yes or No	Question 4 Comment
		transmission line so that industry will have guidance on the scope of typical Composite Protection Systems. **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made.
FirstEnergy Corp	No	None of the Requirements address notifying the Regional Entity on a periodic basis, as is done now (quarterly for RFC). Is it going to be up to the Regional Entity to identify: a. Whether periodic data submittals will be required? b. If so, the periodicity and the template / format for those data submittals? **Response:** The drafting team does not anticipate that Regions actively involved with Protection System operation reviews to end these activities. The data reporting will be addressed by a NERC Rules of Procedure, Section 1600 Request for Data or Information (i.e., data request). See the proposed data request for details regarding periodic data submittals and the associated template.[3] The Section 1600 Data Request will be submitted for approval along with the revised PRC-004 Reliability Standard. No change made.
PPL NERC Registered Affiliates	No	PPL NERC Registered Affiliates comments above for the Slow Trip portion of the Applications Guidelines. A statement should be added, "A Misoperation should not be assumed when the cause of a relay operation cannot be authoritatively established," (reference response to question #3) **Response:** The intent of the definition of "Misoperation" and the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The

[3] http://www.nerc.com/pa/RAPA/Pages/Protection-System-Misoperations-Section-1600-Data-Request.aspx

Organization	Yes or No	Question 4 Comment
		standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. It may decide to identify the operation as a Misoperation and continue its investigation. If the continued investigative actions are inconclusive, the entity may declare no cause can be found and end its investigation. The Application Guidelines section has been updated to address this issue. Change made. The discussion of reverse power relays on pg. 26 would be clearer if it included some of the topics and points made in the 2/20/2014 Protection Systems Misoperations Webinar. We propose stating that "The control-vs.-protective demarcation of reverse power relays is based on the operation at hand and not programming". Failure of a reverse power relay to open the breaker at the established time after commencement of motoring is not a Misoperation if using the relay to trip a unit as part of a normal stop sequence. The same failure would be a Misoperation if some unintended event caused the unit to import power. **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made. The statement on pg. 27, "The entity is allotted 120 calendar days from the date of its BES interrupting device operation to identify whether or not a Misoperation of its Protection System component(s) occurred," should be amended per our comments above for R4. That is, NERC has stated in R4 that determining the cause of a relay operation may take a very long time, and a Misoperation yes-or-no decision may not be possible if the cause for the trip is not known. **Response:** The 120 calendar days is to determine whether or not a Misoperation occurred. The intent of the definition of "Misoperation" and the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. It may decide to identify the operation as a Misoperation and continue its investigation. If the continued investigative actions are inconclusive, the entity may declare no cause can be

Organization	Yes or No	Question 4 Comment
		found and end its investigation. The Application Guidelines section has been updated to address this issue. Change made. Correction is also needed for the flowchart on pg. 35. “A known or possible Misoperation,” should be substituted for, “the Misoperation,” at the top of pg. 29, and elsewhere that this expression is used, because undetermined cause for tripping can make a Misoperation yes-or-no decision impossible. **Response:** The intent of the definition of “Misoperation” and the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. It may decide to identify the operation as a Misoperation and continue its investigation. If the continued investigative actions are inconclusive, the entity may declare no cause can be found and end its investigation. The Application Guidelines section has been updated to address this issue. Change made. The outcome of Requirement R1 or R3 has to be a determination of whether or not a Misoperation occurred. The suggested phrase does not provide additional clarity. Also, the flowchart is intended to provide entities guidance in the relationship between the Requirements within the proposed standard. No change made. The statement on p.29, “certain planned investigative actions may require months to schedule and complete,” should be changed to, “certain planned investigative actions may require months or even years to schedule and complete,” in recognition that generation units are intended to operate for years between planned outages and frequently must be returned to service as soon as possible in the event of a forced outage. **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made. A redline of the commenter’s proposal above is provided below using **blue with underline** for additions and ~~**red with strikethrough**~~ for deletions to illustrate the requested revision:

Organization	Yes or No	Question 4 Comment
		"certain planned investigative actions may require months **or even years** to schedule and complete," The following statement should be added at the end of the same paragraph, "Taking equipment out of service for the sake of furthering the investigation is not required, and forced outages need not be prolonged for troubleshooting. However, planned outages should include any testing or other actions for which downtime is necessary." The discussion on pg. 30 should include the point that a CAP must be developed within 60 days, but implementing the CAP may take much longer if requiring a downtime opportunity. An example should be included for multiple CAPs under the circumstance of extended troubleshooting, (e.g. taking action for the apparent cause of a Misoperation), developing a new theory and taking different action when the event occurs again several months later and making a final and successful corrective action when the problem occurs a third time. **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made.
Dominion	No	a). During the webinar there were a number of questions about reverse power protection when used as protection or used as control. This indicates that there is still confusion with current examples given in the Guidelines. Recommend expanding examples to include: 1. A gas turbine generator has a single reverse power relay which is used to trip the generator breaker during a normal controlled shutdown. This function is considered a control function and not counted as an operation or a Misoperation. 2. The reverse power relay (mentioned in example 1) does not operate to trip the generator breaker and the unit continues to motor until the operator intervenes and opens the

Organization	Yes or No	Question 4 Comment
		breaker manually. Is this a Misoperation? If so what protection system misoperated? Is this considered a Misoperation due to lack of protection? 3. The gas turbine generator mentioned in example 1 and 2 also has a separate reverse power relay that directly trips the generator lockout relay. Is this function considered part of the Protection System? With the unit operating at normal load, this relay incorrectly trips the unit due to an internal relay problem. Is this a Misoperation? 4. A steam turbine generator has a reverse power relay (sometimes referred to as a Sequential trip relay) used in conjunction with valve position switches to trip the generator following a turbine trip. This function is considered a control function and not counted as an operation or a Misoperation. 5. The reverse power relay mentioned in example 4 (sometimes referred to as an Anti-motoring relay) does not operate during a turbine trip and after thirty seconds a second reverse power relay operates as designed to directly trip the generator lockout. Is this second reverse power relay considered part of the Protection System? If so is this counted as one operation that needs to be evaluated? **Response:** The drafting team provided clarification in the Application Guidelines under the section “Control Functions.” Change made. b). Mechanical type breaker trip examples should be expanded to show that air pressure, gas pressure and pole disagreement trips (and their associated auxiliary relays) are control functions and therefore not part of the protection System and thus not subject to this standard. In addition, gas and oil type fault pressure relays on transformers are excluded from Protection System. The example should clarify whether the transformer auxiliary tripping relays (sometimes referred to as 63X relays) are part of the Protection System. Examples could be extremely helpful here since no examples are included in the definition of Protection System.

Organization	Yes or No	Question 4 Comment
		Response: The definition of "Protection System" does not include these types of equipment. No change made. c). Additional Application Guideline examples are needed and the following are specific examples that should be considered: 1. A generating unit GSU transformer trips when the unit is off line (lowside gen breaker was open) due to a Misoperation of the generation Protection System owned by the G.O. The switchyard generator breaker trips but is owned by the T.O. Application Guidelines examples should be added to show if this is an operation where the T.O should notify the G.O., identify who is responsible for CAP, clarify is this a reportable generation Misoperation and who should report, T.O. or G.O.? **Response:** The drafting team does not have sufficient information about the TO's breaker tripping to provide a response. 2. A generating unit trips out immediately upon synchronizing to the grid due to a Misoperation of its Startup Overcurrent protection. The T.O. owns the 230KV generator breaker that was closed and tripped. Application Guidelines examples should be added to show if this is an operation where the T.O should notify the G.O., identify if the G.O. is responsible to identify the cause of the Misoperation and **who is responsible for CAP**, clarify is this a reportable generation Misoperation and who should report, T.O. or G.O.? **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made. 3. A 230-115 KV network transformer trips out when being re-energized following maintenance due to a Misoperation of the transformer differential relay. The operation trips only the highside breaker that was closed to energize the transformer (transformer was not feeding the grid at the time). Application Guidelines should be added to clarify if this is a

Organization	Yes or No	Question 4 Comment
		Misoperation and if this a reportable transmission Protection System Misoperation per the current or proposed reporting guidelines? **Response:** The drafting team has modified the definition of "Misoperation" to address this concern. Change made. Identified Misoperations are proposed to be reported under the NERC Rules of Procedure, Section 1600, Request for Data or Information. No change made. 4. A 230 KV shunt capacitor bank trips out when being placed in service due to a Misoperation of the capacitor bank differential relay. The operation trips only the capacitor bank breaker that was closed to energize the bank. Application examples should be added to clarify if this is a Misoperation and if this a reportable transmission Protection System Misoperation per the current or proposed reporting guidelines? **Response:** The drafting team has modified the definition of "Misoperation" to address this concern. Change made. Identified Misoperations are proposed to be reported under the NERC Rules of Procedure, Section 1600, Request for Data or Information. No change made. 5. A 230KV line trips at one terminal via its carrier ground relay during closing of a line switch to re-network the line. There was no fault, but the relay operated during typical phase current imbalance created by the poles of the switch closing at different times. Is this a Misoperation? **Response:** This is not a Misoperation based on the information above that the Protection System sensed the prescribed current imbalance and operated correctly. No change made.
Florida Municipal Power Agency	No	FMPA believes it would be beneficial to actually lay out specific failures in the examples. For example, "Slow Trip - During Fault" simply says "A failure of a line's Composite Protection System to operate as quickly as intended for a line fault is a Misoperation." This is more or

Organization	Yes or No	Question 4 Comment
		less a restatement of the definition but applied with the additional detail of a specific protected component (the transmission line). Rather, consideration should be paid to an actual way a relay could fail - for example“...a line to line fault in a weak portion of the system resulted in positive sequence currents below the overcurrent supervision pickup for a line current differential relay. The relay’s negative sequence differential element operated instead. However, the original relay settings did not account for the additional detection time required for the negative sequence element...” most of the nuance in the application comes from the way the relay failed. Another example might be a line fault with electromechanical relays wherein the relay output contacts stuck initially, resulting in a delayed clear. **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made.
SPP Standards Review Group	No	Our preference would be that during a condition of a high number of outages, such as a hurricane or ice storm, we be allowed to request a formal "state of extenuating circumstances" and extend our deadline from 120 days to 270 days. We object to the proposed process where extenuating circumstances can force a utility into a violation and then rely on a nebulous, subjective review to determine whether penalties will be imposed. **Response:** It appears that the comment is objecting to the Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, which have been in place for some time. No change made See additional comments on the Applications Guides contained in Question 5 below.
SERC Protection and Controls Subcommittee	No	See #3 in question 2 above.

Organization	Yes or No	Question 4 Comment
		The examples in the Application Guidelines are beneficial, the SERC PCS suggests it would be beneficial to add additional examples and add clarity to who is to report the Misoperation. Some examples are added below. **Response:** The data reporting will be addressed by a NERC Rules of Procedure, Section 1600 Request for Data or Information (i.e., data request). See the proposed data request for details regarding periodic data submittals and the associated template.[4] The Section 1600 Data Request will be submitted for approval along with the revised PRC-004 Reliability Standard. No change made. During the recent webinar there were a number of questions about reverse power protection when used as protection or used as control. This indicates that there is still confusion with current examples given in the Guidelines. Recommend expanding examples specific to reverse power. **Response:** The drafting team provided clarification in the Application Guidelines under the section “Control Functions.” Change made. Also, trips should be expanded to show that air or gas system breaker trips or pole disagreement trips are not reportable operations. **Response:** Mechanical systems of a breaker are not included in the definition of “Protection System”. No change made. Additional examples are needed and the following are recommended: 1. A generating unit GSU transformer trips when the unit is off line (lowside gen breaker was open) due to a Misoperation of the generation Protection System owned by the G.O. The switchyard generator breaker trips but is owned by the T.O. Application Guidelines examples should be added to show if this is an operation where the T.O should notify the

[4] http://www.nerc.com/pa/RAPA/Pages/Protection-System-Misoperations-Section-1600-Data-Request.aspx

Organization	Yes or No	Question 4 Comment
		G.O., identify who is responsible for CAP, clarify is this a reportable generation Misoperation and who should report, T.O. or G.O.? **Response:** The drafting team does not have sufficient information about the TO's breaker tripping to provide a response. 2. A generating unit trips out immediately upon synchronizing to the grid due to a Misoperation of it's Startup Overcurrent protection. The T.O. owns the 230KV generator breaker that was closed and tripped. Application Guidelines examples should be added to show if this is an operation where the T.O should notify the G.O., identify if the G.O. is responsible to identify the cause of the Misoperation and who is responsible for CAP, clarify is this a reportable generation Misoperation and who should report, T.O. or G.O.? **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made. Identified Misoperations are proposed to be reported under the NERC Rules of Procedure, Section 1600, Request for Data or Information. No change made. 3. A 230-115 KV network transformer trips out when being re-energized following maintenance due to a Misoperation of the transformer differential relay. The operation trips only the high-side breaker that was closed to energize the transformer (transformer was not feeding the grid at the time). Application Guidelines should be added to clarify if this is a Misoperation and if this a reportable transmission Protection System Misoperation per the current or proposed reporting guidelines? **Response:** There is not sufficient information to provide an accurate response. Identified Misoperations are proposed to be reported under the NERC Rules of Procedure, Section 1600, Request for Data or Information. No change made. 4. A 230 KV shunt capacitor bank trips out when being placed in service due to a Misoperation of the capacitor bank differential relay. The operation trips only the capacitor

Organization	Yes or No	Question 4 Comment
		bank breaker that was closed to energize the bank. Application examples should be added to clarify if this is a Misoperation and if this a reportable transmission Protection System Misoperation per the current or proposed reporting guidelines? **Response:** Yes, this is a Misoperation. An example has been added to the Application Guidelines. Change made. Identified Misoperations are proposed to be reported under the NERC Rules of Procedure, Section 1600, Request for Data or Information. No change made.
Wisconsin Electric Power Company	No	The examples 8a and 8b under Control Functions should be clarified to help entities make proper distinctions between control functions and protective functions of reverse power relays. We suggest the wording in the paragraph following Example 8b be revised as follows: **Current wording:** In the example above, the standard is not applicable; however, the standard remains applicable to the reverse power relay as a part of the generator Protection System when intended to provide generator anti-motoring protection. For example, reverse power relays are typically installed as the primary protection for a generating unit to guard against motoring. Though, operators often take advantage of this functionality and use the Protection System's reverse power protective function as a normal procedure to shutdown a generating unit. **Suggested wording:** In the examples above, the standard is not applicable because the reverse power elements are performing control functions only. Reverse power relay elements are typically installed as part of the generator Protection System to protect turbine-generators from motoring. Entities often take advantage of this functionality and use the Protection System's reverse power function as a part of a normal procedure to shutdown a generating unit. However, the standard is applicable when the reverse power relaying provides the anti-motoring protective function for the generating unit. For

Organization	Yes or No	Question 4 Comment
		example, if unintended motoring occurs, the reverse power relaying is designed to protect the turbine by tripping the unit. **Response:** The drafting team provided clarification in the Application Guidelines under the section "Control Functions." Change made. A redline of the commenter's proposal above is provided below using **blue with underline** for additions and ~~red with strikethrough~~ for deletions to illustrate the requested revision: **Suggested wording:** In the example**s** above, the standard is not applicable ~~however, the standard remains applicable to~~ **because** the reverse power elements are performing control functions only. Reverse power relay elements are typically installed as part of the generator Protection System ~~when intended to provide generator anti-motoring protection. For example, reverse power relays are typically installed as the primary protection for a generating unit to guard against motoring. Though, operator~~ **to protect turbine-generators from motoring. Entities** often take advantage of this functionality and use the Protection System's reverse power ~~protective~~ function as a **part of a** normal procedure to shutdown a generating unit. **However, the standard is applicable when the reverse power relaying provides the anti-motoring protective function for the generating unit. For example, if unintended motoring occurs, the reverse power relaying is designed to protect the turbine by tripping the unit**.
Flathead Electric Cooperative, Inc.	No	I do not believe that UFLS equipment should be included under this standard. **Response:** Currently, underfrequency load shedding (UFLS) is applicable to the proposed standard to close a gap in reliability. No change made.

Organization	Yes or No	Question 4 Comment
LCRA Transmission Services Corp	No	LCRA TSC recommends the SDT address the topic of temporal aggregation within the Application Guidelines. For example, if a transmission line over-trips for an out-of-section fault three times in a 2-hour interval, perhaps due to persistent storm activity before a relay setting adjustment can be made, does this count as three misoperations, or can the three events of a similar nature and cause be “collapsed” into a single misoperation? Some guidance in this area would be helpful in order to allow entities to be consistent in reporting. LCRA TSC recommends some way to collapse/combine misoperation events of a similar nature within a short, defined timeframe. **Response:** The Application Guidelines have been updated to clarify this situation. Change made. The data reporting will be addressed by a NERC Rules of Procedure, Section 1600 Request for Data or Information (i.e., data request). See the proposed data request for details regarding periodic data submittals and the associated template. No change made.
American Electric Power	No	1) AEP recommends adding an example to the applications guideline to illustrate whether repeated operations/misoperations which occur during the same automatic reclosing sequence need a separate identification under R1. **Response:** The Application Guidelines have been updated to clarify this situation. Change made. 2) AEP recommends adding an example to the applications guideline to illustrate that a properly coordinated breaker failure operation does not equate to a “slow trip” type misoperation. **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made.

Organization	Yes or No	Question 4 Comment
		3) AEP recommends adding an example to illustrate how breaker failure fits into composite protection system. **Response:** Breaker failure has been clarified in the Application Guidelines under the heading, "Definitions." Change made. 4) AEP recommends adding an example where a misoperation is initially identified, but subsequent investigation (after 120 days) reveals a misoperation did not occur. **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made.
Nebraska Public Power District	No	The application guidelines state: "The CAP is complete when all the documented actions to resolve the specific problem (i.e., Misoperation) are completed which may include those actions resulting from the entity's evaluation of other locations, if not addressed through a separate CAP." In the example R6b it appears the CAP is completed and a program was established for corrections at other locations. Please clarify if a program to address other locations is or is not required to be tracked as part of PRC-004 evidence. In the example, it appears the program for other locations does not need to be tracked for PRC-004 evidence. Is this up to the entity to determine? **Response:** The proposed standard requires that the entity complete a Corrective Action Plan (CAP) for the identified Misoperation. The results of the entity's evaluation of other Protection Systems, including other locations is separate and distinct, and is meant to bring awareness to other areas of potential Misoperation. It is up to the entity's discretion in selecting other locations for evaluation and implementation of any modifications to other Protection Systems. Any action items placed in the CAP (including other locations) are required to be completed. No change made.

Organization	Yes or No	Question 4 Comment
City of Tallahassee	No	It can be difficult to perform some investigative actions if you are waiting for particular conditions to repeat in order to further investigate. You may not be able to repeat those conditions during the proposed time period from the standard. **Response:** Requirement R4 allows the entity to close its investigative actions. Should the particular conditions reoccur, the entity may use the information in the future. No change made.
City of Tallahassee	No	It can be difficult to perform some investigative actions if you are waiting for particular conditions to repeat in order to further investigate. You may not be able to repeat those conditions during the proposed time period from the standard. **Response:** Requirement R4 allows the entity to close its investigative actions. Should the particular conditions reoccur, the entity may use the information in the future. No change made.
City of Tallahassee	No	It can be difficult to perform some investigative actions if you are waiting for particular conditions to repeat in order to further investigate. You may not be able to repeat those conditions during the proposed time period from the standard. **Response:** Requirement R4 allows the entity to close its investigative actions. Should the particular conditions reoccur, the entity may use the information in the future. No change made.
Oncor Electric Delivery Company LLC	No	The Extenuating Circumstances process, as outlined on page 32 of the Application Guidelines, relies too heavily on a subjective review by Enforcement to determine whether penalties will be imposed. In alignment with the RAI project, Oncor recommends the evaluation of an Extenuating Circumstance be removed from the back end Enforcement phase and up to the Compliance Monitoring phase where the evaluation is done within a risk and controls framework. Furthermore, Oncor recommends the Registered Entity be

Organization	Yes or No	Question 4 Comment
		allowed to request a formal "state of extenuating circumstance" and coordinate an extension to the 120 day deadline with the Regional Entity. **Response:** NERC and the Regional Entity do not have the authority to provide flexibility regarding the performance (time frames) of a Reliability Standard in unique extenuating circumstances. However, the Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, says: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." While the drafting team recognizes the concern and that there are other standards which have similar provisions for natural disasters, the sanction guidelines provide sufficient flexibility to address extenuating circumstances in the event that they occur. No change made.
Ameren	No	(1) We request the drafting team add another example to clarify the paragraph on page 26, following Example 8b, which includes "...however, the standard remains applicable to the reverse power relay as a part of the generator Protection System when intended to provide generator anti-motoring protection. **Response:** The drafting team provided clarification in the Application Guidelines under the section "Control Functions." Change made. (a) Units in our GO's fleet shut down thousands of times each year, in our opinion Example 8a are applicable. Does the SDT intend to include these as correct operations if indeed the same reverse power relay also provides anti-motoring protection? **Response:** If the BES interrupting device operation is expected as part of a controlled shutdown, the operation is not included per the Applicability section of the standard. The drafting team provided clarification in the Application Guidelines under the section "Control Functions." Change made.

Organization	Yes or No	Question 4 Comment
		(b) Our protection scheme in some cases will have separate Device 32 elements, with one short and one longer timer; does the SDT intend in these cases that only trips by the longer timer are within PRC-004 scope? GO will need to know as either of these differ from our understanding of NERC SPCS / RAPA guidance for reporting of total operations under the presently applicable PRC-004-2a. **Response:** Both of these 32 devices are part of the generator's Composite Protection System; both are applicable to the standard when operating as a protective function; neither are applicable when operating as a control function. The drafting team provided clarification in the Application Guidelines under the section "Control Functions." Change made. (c) Based on the number of reverse power questions on your 2/20/2014 Webinar, it appears to us that many GO's are unclear on your intent. [Generator reverse power reporting clarity is another primary reason for our negative ballot.] **Response:** The drafting team provided clarification in the Application Guidelines under the section "Control Functions." Change made. (2) At the end of Example R4a on page 29, please add "Each of 3/24, 4/10, 5/27, and 8/29 actions are valid investigative actions." If the SDT intends otherwise, please state which ones are valid. **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made.
Public Service Enterprise Group	No	The Application Guide is unclear as to the reporting of reverse power relays. A reverse power relay is typically used to remove a generator from service (a control function) AND to prevent generator motoring (a protection function). The two are not separable. On p. 26, example 8a removes the operation of a generator's reverse power relay to open a breaker during routine shutdown from being subject to the standard because it is performing a control function, while the guideline then states "; however, the standard remains

Organization	Yes or No	Question 4 Comment
		applicable to the reverse power relay as a part of the generator Protection System when intended to provide generator anti-motoring protection." If the reverse power relay failed to open the generator's breaker during shutdown, the generator would motor and the breaker would need to be opened by manual intervention. As the SDT may know, reverse power relays have a documented "blind spot" that causes them to fail to operate during low power factor operation of the generator. (We can provide such documentation if desired). For this reason, generator operators normally have procedures with a step that states that the operator is to manually open the generator output breaker if generator the breaker does not open after a predetermined time period. If this occurred, would the failure of the reverse power relay be reported as a Misoperation? **Response:** If the GO includes the manual intervention as part of its process for a controlled shutdown, then it is not a Misoperation. In this case, it has clearly shown it is acting as a control function which is backed up by another control function. As noted, the same relay performs two functions – when the device is performing (or fails to perform) its protective function, that is when it is applicable to the standard. No change made. Finally, per the NERC document "Questions and Answers about Consistent Protection System Misoperation Reporting" dated February 5, 2013, reporting a reverse power relay Misoperation and not reporting a successful operation is inconsistent with the principle stated in paragraph #1 that "if an operation would not count as a misoperation, it should not be included as an operation." Therefore, to avoid further confusion, we recommend that reverse power relays used for equipment shutdown be explicitly eliminated from the scope of this standard. **Response:** Because of the inherent differences in the application of reverse power relays on generators continent-wide, the drafting team has provided the means to exclude them from the set of operations that will be reviewed by entities. The proposed standard's Applicability, Section 4.2.1, states: "Protective functions intended to operate as a control

Organization	Yes or No	Question 4 Comment
		function during switching are excluded."[5] Therefore, operations occurring within the entity's normal controlled process do not fall within the purview of the proposed standard. Any operation outside of an entity's shutdown sequence would be a reviewable operation. No change made.
Consumers Energy Company	No	Generally I agree with the proposed new definition of a Misoperation, but have one hypothetical circumstance where it might be unclear and could perhaps benefit from another example in the guidelines section. Under the category "Unnecessary Trip - Other Than Fault," the guidelines state that an operation that was initiated directly by on-site maintenance...is not a Misoperation. Are there circumstances where on-site maintenance could indirectly cause a Misoperation? We had a situation where a technician was conducting testing on a breaker failure (BF) relay, and accidently initiated the wrong BF relay in an adjacent panel that was still in service and not part of the testing plan for the day, resulting in tripping of the BES bus. Our initial thoughts were that the BF relay should have issued a 'retrip' function to its corresponding breaker after being initiated, thereby only tripping the one breaker instead of the entire bus. Investigation showed the relay was indeed designed to trip the bus and acted properly. BUT if the relay HAD operated improperly after being inadvertently initiated by on-site personnel, would that be a Misoperation? **Response:** According to the example presented above, this would not be a Misoperation due to the exemption in category 6 of the proposed definition. No change made. Does the presence alone of on-site personnel create an exemption in all cases? If that is the case, I think it should be explicitly stated, or another example added to clarify technician-induced operations.

[5] For additional information and examples, see the "Non-Protective Functions" and "Control Functions" sections in the Application Guidelines.

Organization	Yes or No	Question 4 Comment
		Response: This portion of the Application Guidelines has been revised based upon the suggestion. Change made.
Tacoma Power	No	On page 24 of the redlined Application Guidelines, remove the following verbiage: "This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the entity must consider the entire Protection System associated with the BES interrupting device that operated. Additionally," This portion does not add value and seems to have a conflicting emphasis with the reminder of the paragraph. **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made. Regarding Example 4 in the Application Guidelines, Slow Trip - Other Than Fault, equipment damage is not explicitly identified in the definition of a Misoperation. Either the definition should be revised to clearly identify equipment damage or another example should be used that better fits the proposed definition. **Response:** The Application Guidelines (Example 4) has been revised to add clarity concerning this issue. The examples were moved to the Application Guidelines. Change made.
Southern California Edison Company	No	There continues to be a lack of clarity in the definition. The standards drafting team has created a term that does not provide clear means of compliance for the industry. **Response:** Thank you for your comment.
Xcel Energy	No	1) The examples for R6 in the Application Guidelines are not clear. In R6a, it states the CAP completed on 6/25/2014, but no action is referenced for this date. In R6b, it states the CAP completed on 10/28/2014 when a proactive only replacement program was established, but

Organization	Yes or No	Question 4 Comment
		in R6c and R6d, the CAP is open until the proactive replacement program is completed. It seems the difference between these two is only semantic. **Response:** The corresponding actions are found in the previous Requirement R5, Example R5a with at date of 07/01/2014. The examples R6c and R6d regarding preemptive replacement have been included in these Corrective Action Plans (CAP) for illustration. An entity may choose to handle other locations either within or separate of the CAP that is remedying the specific Misoperation cause(s). No change made. 2) Please clarify if it was the intent of the drafting team to exclude operations like the following example from being classified as a Misoperation: Assume that a fault occurs in a generator stator, due to either a mechanical or design setting issue the 64S does not operate. However, the 87 does operate and trips the unit. We believe this would not be a Misoperation because of the overall performance of the composite protection system. **Response:** The intent is to provide clarity that a single Protection System component failure is not a Misoperation so long as the overall performance of the Composite Protection System is correct. No change made.
Hydro-Québec Production	No	For the requirement R1, the other owner of the protection system shall share any information it has that could be used by the owner of the interrupting device to determine the cause of the misoperation of the interrupting device owner's protection system. For the requirement R2, the owner of the interrupting device shall share any information it has that could be used by the other owner of the protection system to determine the cause of the misoperation. **Response:** The drafting team agrees this is a best practice; however, it is not useful having a Requirement for each entity to share information. The way the Requirements are written, it is in the best interest of all parties (i.e., jointly owned Protection Systems) to share or communicate information about operations which meet the criteria for Requirement R1 and

Organization	Yes or No	Question 4 Comment
		R2. Having such a Requirement is administrative and provides little, if any, reliability benefit. No change made.
Indiana Municipal Power Agency	No	It is not clear how an entity is to show that an operation of a BES interrupting device happened fast enough and did not fall into one of the two "Slow Trip" categories of a misoperation. **Response:** The drafting team has modified the Slow Trip portion of the definition of "Misoperation" to address this concern. Change made.
Florida Power & Light	Yes	The examples are an excellent idea. It would also be advantageous and practical to include supporting information on the scope of Misoperation reporting. Example to consider adding: The boundary of Misoperation reporting extends from protective relay input devices to circuit breaker trip coil(s). **Response:** The data reporting will be addressed by a NERC Rules of Procedure, Section 1600 Request for Data or Information (i.e., data request). See the proposed data request for details regarding periodic data submittals and the associated template.[6] The Section 1600 Data Request will be submitted for approval along with the revised PRC-004 Reliability Standard. No change made. More examples should be provided in relation to Power Generation events. **Response:** The Application Guidelines has been modified as suggested. Change made.
ACES Standards Collaborators	Yes	The examples in the Application Guidelines are improved and provide additional clarity.

Organization	Yes or No	Question 4 Comment
		Response: Thank you for your comment.
ReliabilityFirst Protection Subcommittee	Yes	Other than our suggestion from Question 2, our group would like to state that the concept of the Application Guideline is an excellent tool to retain the thought process behind the development of the standard. Its use in this and future standards will help greatly with the understanding, application, and consistency of the standards. **Response:** Thank you for your comment.
Manitoba Hydro	Yes	(1) PRC-004-3, Application Guidelines, Extenuating Circumstances - for clarity, replace the word “says” with the word “reads”. **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made.
Entergy Services, Inc.	Yes	Look at response to question one. **Response:** Thank you for your comment.
Exelon	Yes	The concept of the Application Guideline (AG) is an excellent tool to retain the thought process behind the development of the standard. Use of an AG in this and future standards will help greatly with the understanding, application, and consistency of the standards. Generally, the applications are sufficient for the purpose. Specific comments for clarification include: In “Unnecessary Trip - Other Than Fault”, in the paragraph after Example 6d, the “on-site” maintenance activities section needs more clarity. Is the intent of that paragraph trying to say, if the BES Protection System equipment clearly misoperated and personnel had nothing to do with it, then it’s a PRC-004 misoperation. If the BES Protection System equipment appeared to misoperate, but it’s clear that personnel had something to do with that operation, it’s not a PRC-004 misoperation?

Organization	Yes or No	Question 4 Comment
		Response: This is correct and for the example above, both of these points are described in the Application Guidelines in the paragraphs preceding and following Example 6e. No change made. For a Communication System, does the "on-site" activities exemption apply to anywhere along the communication path were personnel caused what would otherwise look to be a BES Protection System misoperation? **Response:** According to the example presented above, this would not be a Misoperation due to the exemption in category 6 of the proposed definition. No change made.

5. **If you have any other comments on this Standard that you haven't already mentioned above, please provide them here:**

Summary Consideration: There were a number of comments that were relevant and consistent with responses found in the previous questions above and will not be summarized here. The most notable majority comment that resulted in a change was the Implementation Plan. The previous allowance of 24 months for the standard to become effective in the Western Interconnection was changed back to 12 months. This was changed because it was determined that a conflict does not exist between the proposed continent-wide PRC-004-3 and regional PRC-004-WECC-1 standards. Also, implementing the standard on the same time basis continent-wide eliminates any perceived preferential treatment. Minority comments included a number of editorial suggestions and edits which the SDT implemented.

The following summarizes comments which did not result in a change. One majority theme came from three comments supported by 22 individuals that had concerns about the population of BES interrupting device operation events that would be audited. The SDT noted that only those operations that meet the Requirement R1 criteria (i.e., 1.1, 1.2, and 1.3) are to be reviewed to identify whether a Misoperation occurred or not. The Reliability Standard Audit Worksheet (RSAW) also supports this approach and intent. Notable minority comments include approximately nine individuals that were concerned about timeframes, milestones, or closure of a CAP. The SDT responded that timeframes are needed to make the Requirement measurable and the CAP is closed by the entity based on its timetable. The commenters were concerned that the Regional Entities will no longer be involved with ensuring entities follow through on completing CAPs. Eight individuals were concerned about the cases where a Generatfaor Owner operates the Transmission Owner's BES interrupting device. The SDT noted that communication would need to occur and does occur today. Most of the BES interrupting device operations would be a result of synchronizing to the BES or a normal shutdown through a control function to remove the generating unit from service, both are not reviewable operations under Requirement R1. Approximately six individuals believed that Requirement R2 (i.e., "notification") is administrative and qualifies under the Paragraph 81 (P81) criteria as having little reliability benefit. The SDT contends that Requirement R2 has a reliability need to involve other owners that may need to review their Protection Systems for possible Misoperation. Approximately two comments supported by seven individuals argued that "manual intervention" in Requirement R1 is unnecessary because it is rare and should be requested by an auditor by exception. The SDT agrees that such situations are probably rare; however, the SDT contends this is a valid condition for which an entity must be required to identify any possible Misoperation of a BES Protection System. Last of the majority comments include four individuals that expressed concern over the Violation Severity Levels (VSL). Commenters were concerned about VSLs being unjust for larger entities. The SDT noted that the NERC VSL Guidelines were adhered to and do not unjustly impact larger entities. VSLs only come into scope during a potential violation, are per event, and not based on the size of an entity; therefore, are size-neutral.

Notable minority comments which did not result in a change include a request to add a field to the data request for reporting Misoperations, being clear the standard is not requiring Disturbance Monitoring Equipment (DME), and underfrequency load shedding (UFLS) only for BES Elements. The SDT provided feedback to NERC staff concerning the additional data request field for reporting. Also, the SDT contends that the standard and Application Guidelines provide the necessary points that DME is not required and that UFLS for BES Elements addresses the reliability concerns adequately.

Organization	Question 5 Comment
TransÉnergie Hydro-Québec	An addition "Field" can be added to improve metric analysis of microprocessor relays malfunction since these are the type of relays that will be installed in the future by every entities. As the number of microprocessor continue to grow, the more frequent will a Misoperation be caused by these type of relays, therefore this added field would greatly improve metric analysis. For example, the Field Value for a microprocessor relay malfunction could include the following: Setting Error - Incorrect Numerical Input Specified Setting Error - Incorrect User-Programmed Custom Logic Incorrect Design - Incorrect User Application Incorrect Design - Wiring Firmware Version Mismatch by User Others. **Response:** The data reporting will be addressed by a NERC Rules of Procedure, Section 1600 Request for Data or Information (i.e., data request). See the proposed data request for details regarding periodic data submittals and the associated template.[7] The Section 1600 Data Request will be submitted for approval along with the revised PRC-004 Reliability Standard. No change made.
Cowlitz PUD	Applicability section 4.2.2 includes UFLS only if it trips a BES element. We believe that UFLS inclusion in this standard should only be applicable to those single UFLS elements that can have an adverse impact to the BES. Limiting applicability to UFLS elements which trip a BES element will not adequately address all UFLS adverse impact elements. For example, some industrial loads must be shed in a carefully planned sequence, and it may not be possible to link the UFLS trip signal to a BES element. Instead, the trip signal is received within the

[7] http://www.nerc.com/pa/RAPA/Pages/Protection-System-Misoperations-Section-1600-Data-Request.aspx

	industrial load (plant) whereby a controlled plant shutdown is automatically initiated. This load shedding can exceed 200 MW, and is significant. In such UFLS schemes, the actual process of the load shed within a non-BES plant should not be subject to standard compliance; however, the misoperation of the associated UFLS relay as a single point of failure should be considered as a significant BES support device. Inclusion of UFLS in this Standard may be duplicative of PRC-006-1, requirements R11, R12, and R13. An underfrequency event is generally a system wide event; conversely, the objective of Protection System action is to isolate an event to prevent it from becoming a system wide impact. UFLS elements must work as a coordinated system which can withstand several UFLS element failures, yet successfully stabilize the BES. Since PRC-004-3 addresses discovery of problems after an event, we propose that at best this Standard would assure UFLS element Unnecessary Trip misoperations would be mitigated. The discovery of a UFLS element Failure to Trip which has an adverse impact on the ability of the UFLS system to stabilize the BES as stated above is addressed by PRC-006-1. Notwithstanding the above, we do not see our concerns as requiring a negative ballot. **Response:** The drafting team contends that addressing underfrequency load shedding (UFLS) for Bulk Electric System (BES) Elements provides the necessary applicability for reliability. A UFLS relay that trips non-BES equipment (i.e., customer load or distribution) is a quality of service issue for the entity's customers and the impact on BES reliability is not measurable. The standard PRC-006-1 addresses UFLS program performance and will reveal potential Misoperations when evaluating the program's performance to a frequency excursion. Only UFLS relay operations directly impacting BES Elements need be included within the applicability of the proposed standard PRC-004-3. No change made.
Ameren	(1) Delete from R1 1.1 "or by manual intervention in response to a Protection System failure to operate;" and remove from Rationale for R1, and Process Flow Chart. This is an extremely rare occurrence not warranting special inclusion in the requirements. In our view, manual intervention is already included in that Failure to Trip is a Misoperations and a BES interrupting device did operate, albeit manually. It is acceptable to retain some mention or explanation of it in the Application Guidance to keep it from falling out of the consciousness. Unnecessary Trip - During Fault on page 24 already points out the correct remote clearing that would occur for a Fault. [Unwarranted inclusion of 'manual intervention' in a Requirement is another primary reason for our negative ballot.]

	Response: The requirement is written so that only manual interventions in response to a Protection System failure are required to be identified in addition to automatic operations of a Protection System. No change made. (2) Please add "Note: Historically, the cause of about of 10% NERC-wide Misoperations have an unknown cause" at the end declaration paragraph (2nd last paragraph) on page 29. **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made. (3) On page 31, please add "For completion of the CAPs in examples R5a through R5d see examples R6a through R6d on pages 33 and 34. **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made. (4) We understand R1 to apply to the aggregate set of BES interrupting device operations associated with the same BES event (e.g., fault, abnormal condition, etc.) For example, under present NERC SPSC guidance the entity count all trips in the automatic reclose cycle and reports them as a single event. **Response:** This portion of the Application Guidelines has been revised based upon the suggestion. Change made. (5) The NERC PSMTF Final Report recommended grouping all like events involving the same Protection System within a 24 hour period, recognizing that the response time limitations to altering the Protection System. SERC PCS advocated the 24 hour grouping in our comments to NERC on the Section 1600 Data Reporting draft. The resulting metrics more clearly indicate dominant causes, rather than being distorted by repetitive like events on the same Element and Protection System. **Response:** Please see the Application Guidelines, on multiple operations/same event/automatic recloses. Change made. (6) If the SDT intends that each and every BES interrupting device operations be separately tracked, the TO, GO, and DP certainly need to know this. Although every breaker operation is almost always available within the SCADA log attached in our PRC-004 software database, we group them into a single event record

	in accordance with applicable NERC guidance. We are concerned that if R1 intends we have a separate event record for each breaker operation, the administrative overhead is unwarranted and burdensome. **Response:** Please see the Application Guide under the heading "Requirement R1." The Protection System operation may be documented in a variety of ways such as in a report, database, spreadsheet, or list." The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System. No change made.
Texas Reliability Entity	(1) For Requirement R5, how does the SDT intend to handle a situation where the CAP involves another registered entity. For example, we've seen several cases where the CAP requires multiple TOs to make setting changes in order to mitigate the cause of the misoperation. In this case, should both TOs involved have their own CAP? **Response:** The entity whose Protection System component caused a Misoperation is required by the proposed standard to develop and implement a Corrective Action Plan (CAP). Part of the action within that CAP may include coordinating work such as settings with other entities. Coordination of settings also falls under the current Reliability Standard PRC-001-1 – Protection System Coordination. No change made. The requirement language is not clear. The bullet "Explain in a declaration why corrective actions are beyond the entity's control..." provides no assurance that all the required actions to mitigate the Misoperation are completed in cases where multiple entities are involved in the CAP. **Response:** Requirement R4 of the proposed standard is providing a mechanism for entities not to make corrective actions when such actions are not practical and will not improve reliability. See Examples R5e and R5f in the Application Guidelines. No change made. (2) Evidence Retention: We recommend changing the evidence retention from 12 months to a minimum of 3 years.

	Response: The drafting team based data retention on guidance provided by NERC staff for writing evidence retention periods. See pages 8 through 14 of the NERC Background Information for Quality Reviews, February 7, 2012 for more information.[8] No change made.
Manitoba Hydro	(1) R4, second bullet - for consistency with the previous bullet, rephrase to read "A declaration that no cause(s) were identified." **Response:** The drafting team does not agree that the suggestion provides additional clarity. No change made. (2) R5, second bullet - because it's possible that a single corrective action can be taken, add brackets around the "s" in the word "actions". **Response:** The drafting team does not agree that the suggestion provides additional clarity. No change made. (3) R6 and M6 - for consistency with other requirements in the standard, replace the word "actions" with "corrective action(s)". **Response:** The drafting team does not agree that the suggestion provides additional clarity. No change made. (4) R1 and R2 a. Use of the past tense (i.e. "that operated") is inappropriate for statutory / regulatory standards. The wording should be: "Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device shall, within 120 calendar days of the operation of the BES interrupting device...". **Response:** Without the phrase "that operated" all BES interrupting device owners would have to investigate every BES interrupting device operation. No change made. b. Similarly, in R2.2 and 2.3, the word "determined" should be replaced with "has determined".

[8] http://www.nerc.com/pa/Stand/Resources/Documents/BackgroundDocument.pdf

	Response: Change made. c. Use of the word "when" implies a time frame. Given the intent, it would be clearer to use the phrase "under the following circumstances". **Response:** Change made. (5) R5 - for the reasons identified above, the use of past tense should be changed to:" Each Transmission Owner, Generator Owner and Distribution Provider that owns a Protection System Component that causes a Misoperation ...". **Response:** The use of "caused" is used to emphasize that the Misoperation has already been identified in the previous requirements. No change made. (6) The wording of R6 makes the compliance obligation unclear. Part of the requirement requires implementation of a CAP. However, another part of the requirement allows updating and changing the CAP. Accordingly, it can be inferred that some deviation from the CAP, and thus failure to implement the CAP, will still be considered compliance. A review of the Application Guidelines also confirms that rescheduling actions under the CAP is permitted in at least some cases. The criteria for acceptable revisions should be clarified in R6 (ex.- do they need to be beyond the reasonable control of the Responsible Entity?). **Response:** The Application Guidelines provide three examples of situations where reliability would not be improved. Requirement R5 addresses two situations where a CAP does not need to be developed and a declaration will be made. The definition of "CAP" limits the scope of the remedy to a specific problem; therefore, the drafting team contends that it is unlikely to be impractical to implement a CAP. No change made. Manitoba Hydro has concerns with the lack of clarity of Misoperation definition. Manitoba Hydro believes that the definition of Misoperation needs to be re-written for various reasons specified in the comments. **Response:** See responses in Question 1. For R4, Manitoba Hydro recommends the removal of the investigation frequency as repeated investigative actions would not be productive in identifying the cause of a Misoperation.

	Response: The proposed Requirement R4 provides the entity discretion on how to handle ongoing efforts. At least one investigative action is required toward determining the cause(s) of an identified Misoperation. Beyond that, the entity may declare it is unable to determine the cause(s). Whether the investigation is held open in anticipation of capturing similar operations, or if closed with a declaration, the entity should have the pertinent information documented both for future reference and compliance with the Requirement(s). No change made.
ACES Standards Collaborators	(1) We are concerned that Part 1.1 may cause an auditor to request an inventory of all BES interrupting device operations. From that list, then the applicable entity would be required to identify which BES interrupting device operations were cause by Protection System actuation and which were operator interventions. Then, the applicable entity may have to prove each BES interrupting device operation initiated by an operator was not necessitated by a Protection System Misoperation. Also, the applicable entity would have to show for each BES interrupting device operation caused by Protection System actuation was evaluated for Protection System Misoperation. **Response:** The drafting team structured the criteria in a manner to be clear that the audit population of BES interrupting device operations is those operations which meet the three criteria 1.1 through 1.3. This is further noted in the accompanying rationale box for this and the previous version of the proposed standard. The posted draft RSAW developed by NERC Compliance supports this approach. No change made. While we understand that an applicable entity will have to show it evaluated each BES interrupting device operation caused by a Protection System operation, we do not believe they should be required to identify those operations caused by other means such as a manual operation by the operator. To identify cases where manual intervention was necessary due to a Protection System misoperation, the applicable entity should be able to rely on its operator notifying the protection systems department that such actions were necessary. In other words, Part 1.1 should be evaluated based on this exception with the auditor only requesting the applicable entity to identify the instances where manual intervention was necessary. An explanation in the Application Guidelines for what is required here would be helpful.

	Response: The requirement is written so that only manual interventions in response to a Protection System failure are required to be identified in addition to automatic operations of a Protection System. No change made. (2) Requirement R1 needs to be further clarified for the situation when an entity is not able to identify if a Protection System operation was a correct operation or a Misoperation. This is particularly true for older technology such as electromechanical relays which may lack the necessary information to make such a determination. As the requirement is literally written, it requires the entity "to identify whether its Protection System component(s) caused a Misoperation." If an entity is unable to determine a whether the relay operated as designed, then the requirement would be technically violated. The VSL for R3 results in a severe violation if the responsible entity failed to identify a Protection System Misoperation. There should be some flexibility for instances where the operation is unknown. **Response:** The intent of the definition of "Misoperation" and the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. It may decide to identify the operation as a Misoperation and continue its investigation. If the continued investigative actions are inconclusive, the entity may declare no cause can be found and end its investigation. The Application Guidelines section has been updated to address this issue. Change made. (3) While we believe that R2 meets P81 criteria and should be removed, if the requirement persists, we recommend removing the Distribution Provider from the requirement. By definition, the Distribution Provider cannot own a "BES interrupting device" since it is a BES Element as explained on page 21 in the Application Guidelines. The Distribution Provider provides the wires between the BES and the end-use customer. It is the TO/TOP that owns/operates an integrated transmission Element that is 100 kV or higher. This is consistent with statement of registry criteria and the BES definition. If a Distribution Provider does own a BES interrupting device, then they will also be registered as a TO. Furthermore, the Application Guidelines state that the BES interrupting device is not part of the Protection System so there is no reason for the Distribution Provider to apply. **Response:** Requirement R2 ensures notification of those who have a role in identifying Misoperations, but were not accounted for within Requirement R1. No change made.

	Response: The drafting team agrees that a Distribution Provider (DP) which owns Bulk Electric System (BES) interrupting device should be registered as a Generation Owner or Transmission Owner (TO) as the case may be. However, in this case, the DP may own a non-BES Protection System which operates a BES interrupting device. This is why the drafting team has included the DP as an applicable entity. No change made. (4) For the second severe VSL of R3, "a Misoperation its Protection System" should be "a Misoperation in its Protection System." The "in" is missing. **Response:** The drafting team does not agree that the suggestion provides additional clarity. No change made. (5) We disagree with the VRFs for R2. It is an administrative requirement and should not even be a requirement since it meets P81 criteria. However, if the requirement persists, the VRF should be no higher than "Low" since it is administrative. **Response:** Requirement R2 is not purely administrative since without a mandatory reporting to other owners as defined in R2, there is no expectation of performance by the other owners as prescribed in Requirement R3. No change made. (6) Thank you for the opportunity to comment.
MRO NERC Standards Review Forum	: The NSRF is concerned about the potential inadvertent inclusion of individual wind turbines in this standard where the inclusion of thousands of individual wind turbine protection systems will add significant burden without corresponding reliability benefits. The NSRF also recognizes the NERC dispersed generation SAR and SAR team are best equipped to address this issue. **Response:** The Misoperations drafting team understands the concern with the applicability of dispersed generation resources (DGR) to this standard. This drafting team is working with the DGR drafting team addressing standards with this concern under Project 2014-01 – Standards Applicability for Dispersed Generation Resources. In order to keep the sequence of the versions correct, the DGR drafting team will consider the exclusion in this standard once approved by industry. This should not be of great concern due

	to the implementation time of this standard and the need to bring in alignment with the work of the DGR drafting team. No change at this time.
SERC Protection and Controls Subcommittee	1. The removal from R1 of the qualifier of an operation 'device operation caused by a Protection System operation' has some consequences that were not likely intended by the drafting team in that, as presently written, every operation on a BES interrupting device becomes into scope of this standard. It includes both automatic and manual operations. It is also noted that this description would also exclude those cases that may be a failure to trip. **Response:** The drafting team agrees with your perception of its intent. The posting retained in Requirement R1, Part 1.1 the concept that the interrupting device operations that need to be evaluated were caused by a Protection System. Only interrupting device operations caused by Protection System operations (except those specifically exempted) and manual operations made in response to a Protection failure are within the scope of Requirement R1 in the Standard. No change made. Requirement R2 was revised to address the case where an entity's BES interrupting device provided backup protection. Part 2.2 of Requirement R2 requires this entity to notify the entity that backup protection was provided which is most likely due to a failure to operate. Change made. 2. Related to the observation in #1 above, this would also bring the TOP and GOP into the scope of this standard since the TOP and GOP would need to provide the TO every operation of a BES interrupting device and indicate which were manual vs. automatic in nature. As such the Applicability would need to be modified to include the TOP and GOP. **Response:** The drafting team agrees adding in the Transmission Operator and Generator Operator provides little to no reliability benefit. The proposed standard's applicable entities should be capable of acquiring this necessary information from others, if necessary. No change made. 3. The added change of including 'or by manual intervention in response to a Protection System failure to operate' additionally is data needed from the TOP and GOP. Although not necessarily a common occurrence by the TOP, this may happen by the Plant Operator on a more common basis. As such there would be the need for each GOP/ Plant Operator by polled quarterly to provide this information. This addition is not necessary since the initiating event for such action would be a failure to operate. However,

	if this part of the Requirement remains, the Applicability would need to be modified to include the TOP and GOP. **Response:** The drafting team agrees adding in the Transmission Operator and Generator Operator provides little to no reliability benefit. The proposed standard's applicable entities should be capable of acquiring this necessary information from others, if necessary. No change made. The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Protection and Control Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.
Southern Company: Southern Company Service, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	1. The removal from R1 of the qualifier of an operation 'device operation caused by a Protection System operation' has some consequences that were not likely intended by the drafting team in that, as presently written, every operation on a BES interrupting device comes into scope of this standard. It includes both automatic and manual operations. It is also noted that this description would also exclude those cases that may be a failure to trip. **Response:** The drafting team agrees with your perception of its intent. The posting retained in Requirement R1, Part 1.1 the concept that the interrupting device operations that need to be evaluated were caused by a Protection System. Only interrupting device operations caused by Protection System operations (except those specifically exempted) and manual operations made in response to a Protection failure are within the scope of Requirement R1 in the Standard. No change made. The drafting team contends that the "failure of a Composite Protection System to operate for a Fault" provides sufficient guidance to determine if a "Failure to Trip" occurred. The operation of other zones to prevent the event from propagating should be considered along with the other available evidence. No change made. 2. Related to the observation in #1 above, this would also bring the TOP and GOP into the scope of this standard since the TOP and GOP would need to provide the TO every operation of a BES interrupting device and indicate which were manual vs. automatic in nature. As such the Applicability would need to be modified to include the TOP and GOP.

	Response: The drafting team agrees adding in the Transmission Operator and Generator Operator provides little to no reliability benefit. The proposed standard's applicable entities should be capable of acquiring this necessary information from others, if necessary. No change made. The added change of including 'or by manual intervention in response to a Protection System failure to operate' additionally is data needed from the TOP and GOP. Although not necessarily a common occurrence by the TOP, this may happen by the Plant Operator on a more common basis. As such there would be the need for each TOP and GOP/ Plant Operator by polled quarterly to provide this information. This addition is not necessary since the initiating event for such action would be a failure to operate. However, if this part of the Requirement remains, the Applicability would need to be modified to include the TOP and GOP. Note: related to above 3 comments: Although the recently posted RSAW mitigates some of these concerns, we feel the Standard itself should be modified to go back to the concept of 'BES interrupting device operation in its Facility caused by a Protection System operation, identify and review each Protection System operation' thus removing the need to include the TOP in the applicability. **Response:** The drafting team agrees adding in the Transmission Operator and Generator Operator provides little to no reliability benefit. The proposed standard's applicable entities should be capable of acquiring this necessary information from others, if necessary. No change made. 3. The various timetables introduced in the Standard result in many compliance milestones to be tracked for minimal if any overall increase in reliability. There is no evidence that entities have not been doing due diligence in investigating and correcting misoperations, therefore, the addition of the various timelines serve only to generate additional paperwork. **Response:** The time periods in the standard are maximums for completing work relative to each Requirement and the drafting teams contends they are reasonable. Dates should be included in the entity's evidence of completion for each Requirement. The only exception to this is demonstrating the investigative actions in Requirement R4 which occur on a periodic basis. This time period is essentially six months and is minimal for the overall number of unidentified causes that go beyond the initial 120 calendar days from the operation of the BES interrupting device. No change made.

	4. We also observe that the Standard does not require any closure on a specific event. As noted in R6: implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. Therefore, an acceptable CAP could be 'we plan on upgrading the protection systems in 15 years which will solve the problem'. Since the neither proposed actions nor timetable may change, no update is required. This seems to contradict the statement in the Rational box for R6 which states: Documenting changes or completion of CAP activities provides measurable progress and confirmation of completion. **Response:** The example provided is not practical nor is it consistent with the definition of Corrective Action Plan (CAP) and the examples provided in the proposed standards' Application Guidelines for both Requirement R5 and R6. No change made. 5. Related to comment #4 above, which notes that there is no requirement for closure: Recognizing that there has been considerable work by various NERC teams (SPCS, RAPA, and the PSMTF) to implement consistent reporting utilizing the misoperation template and that one of the recommendation was that the Regional entities need to become closely engaged in reviewing submittals and following up on action plans/ corrective actions; we would encourage the SDT to consider revamping the Standard to require the quarterly submittal of misoperation data utilizing the approved template and NERC and the Regions to agree on some standard methodology for Regional review and follow-up if progress is not being made. **Response:** The effectiveness of a CAP would be apparent in the number of recurring events of a similar nature. It is expected that entities would seek solutions for Protection System Misoperations that prevent recurrence. The drafting team understands when the patterns of Protection System Events indicate increasing recurring events of a similar nature there is value in having Corrective Action Plans (CAP) reviewed by others and in some cases the Regional Entities are currently performing these activities. Also, a Reliability Standard Requirement cannot be applicable to the Regional Entity; therefore, this entity would not be mandated to do such reviews. The drafting team expects that entities will facilitate reviews of Protection System operations, Misoperations, and/or CAPs this through peer review groups or industry forums. No change made. The data reporting will be addressed by a NERC Rules of Procedure, Section 1600 Request for Data or Information (i.e., data request). See the proposed data request for details regarding periodic data

	submittals and the associated template.[9] The Section 1600 Data Request will be submitted for approval along with the revised PRC-004 Reliability Standard. No change made.
Tri-State Generation and Transmission Association, Inc.	1. The standard is difficult to interpret regarding jointly-owned Composite Protection System components as opposed to multiple entities owning separate components. An interrupting device and all or part of the Composite Protection System may be owned by a contractually-organized group that is not a registered Functional Entity. This makes it unclear which entity is responsible for initial review and potential notification under Requirement R1. Our belief is that it would be the registered entity that is contractually responsible for operating the interrupting device. **Response:** While a Protection System may be contractually owned by multiple entities that are not jointly registered, all of the entities would ultimately be responsible for the requisite documentation and results. Contractually organized entities may share or designate compliance responsibilities as well as associated documentation. No change made. 2. It is also unclear whether Requirement R2 includes notice to all the other joint-owners of the Protection System or only to the owners of the Protection System components that are not owned by the joint group. Our belief is that notice should only be given to the owners of the Protection System components that are not owned by the joint group. Our proposal to eliminate the uncertainty is to add a statement to the Applicability that addresses how jointly-owned Facilities are to be handled in the standard any time a TO, GO, or DP has a responsibility. **Response:** The standard requires notification to the other owner(s) when a Misoperation occurs or cannot rule out a Misoperation and the owner's Protection System component did not cause the Misoperation. There is no exclusion for components that are owned by multiple discrete entities. The challenges of delineating compliance responsibility for contractually joined entities would be extremely difficult and outside the scope of Standard Drafting Team. No change made.

[9] http://www.nerc.com/pa/RAPA/Pages/Protection-System-Misoperations-Section-1600-Data-Request.aspx

Puget Sound Energy	a) Under Facilities on p.5, UFLS /UVLS should both be listed, if intended. The order of facilities (specifically content of 4.2.1 and 4.2.2) should be swapped - so that everything INcluded comes before everything EXcluded. **Response:** Undervoltage load shedding (UVLS) has not been included in the proposed PRC-004-3 standard's Applicability because Misoperations of UVLS relays are being addressed under Project 2008-02 – Undervoltage Load Shedding when modifying Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance. Since UVLS does not fall under 4.2.1 or 4.2.2, it is not applicable to PRC-004-3. No change made. b) There should be a whole section clarifying exclusion of SPS/RAS (but inclusion of UFLS/UVLS). Or....the definition of SPS/RAS should be changed to include UFLS/UVLS. **Response:** The Background section states "Misoperations associated with Special Protection Schemes (SPS) and Remedial Action Schemes (RAS) are not addressed in this standard due to their inherent complexities." Remedial Action Schemes (RAS) and Special Protection Systems (SPS) are being addressed by Project 2010-05.2 – Special Protection Systems (Phase 2 of this project). An exclusion for RAS/SPS has been added to the Applicability section. Change made. c) A Misoperation Process Benchmark table of reporting functions and dates should be provided to entities. This would greatly facilitate retention of misoperation timeline evidence (for audits, self-cert, data requests). The Misoperation Process Benchmark table structure could be provided by the Regional Entities such as WECC in an updated misoperation Criterion as an Appendix. A suggested list of Benchmark dates is as follows: 1. date of Interrupting device operation, 2. date of identification of misoperation, 3. date other owners of Protection System (of BES interrupting device operation) notified, 4. date of identification by notified entity whether its device caused a misoperation, 5. date the cause of misoperation investigated/found,

	6. date of further investigation (if cause not found) 7. date of Corrective Action Plan (CAP) development 8. target CAP completion date(s), actual CAP completion date **Response:** The data reporting will be addressed by a NERC Rules of Procedure, Section 1600 Request for Data or Information (i.e., data request). See the proposed data request for details regarding periodic data submittals and the associated template.[10] The Section 1600 Data Request will be submitted for approval along with the revised PRC-004 Reliability Standard. The drafting team has forwarded your suggestion to the appropriate NERC staff for consideration. No change made. d) Finally, it is recommended that Quarterly Misoperation Reporting be changed over to a "Data Request" sooner than the effective date of PRC-004- **Response:** The drafting team agrees that in theory this sounds like a good idea; however, Regional Entities and NERC may need the allotted implementation period to address changes in data collection and practices that will be effectuated by the proposed standard. This is especially true with NERC developing the systems for collecting data rather than the Regions. No change made. 3. It is stated on page 5 of the proposed PRC-004-3, that the currently reporting system is "not optimal to establish consistent metrics for measuring Protection System performance". Perhaps the ERO Reliabililty Assessment and Performance Analysis Group could release an updated recommendation letter for Misoperation Reporting. It is also recommended that the Misoperation "Data Request" occur once per year. **Response:** The data reporting will be addressed by a NERC Rules of Procedure, Section 1600 Request for Data or Information (i.e., data request). See the proposed data request for details regarding periodic data submittals and the associated template.[11] The Section 1600 Data Request will be submitted for approval along with the revised PRC-004 Reliability Standard. No change made.

[10] http://www.nerc.com/pa/RAPA/Pages/Protection-System-Misoperations-Section-1600-Data-Request.aspx

[11] http://www.nerc.com/pa/RAPA/Pages/Protection-System-Misoperations-Section-1600-Data-Request.aspx

Northeast Power Coordinating Council	a. The "Effective Dates" section of the standard is confusing as it suggests no regulatory (i.e. FERC) approval is required in Western Interconnection and offers both twelve and twenty-four month timeframes. **Response:** After further review and discussion with WECC following the latest changes to the standard, the proposed standard and the existing regional standard do not conflict. Therefore, different implementation timeframes are no longer necessary. However, the language used in the implementation plan is the stock language NERC uses for effective dates of Reliability Standards. In the prior version of the implementation, the effective dates were specified separately for WECC to provide time to eliminate language conflicts between the proposed standard and the regional standard. Since no conflict exists, there will be a single effective date for the standard. Change made. b. Applicability Section - Facilities: We agree with removing references to RAS and SPS, but question the omission of UVLS when UFLS that is intended to trip one or more BES Elements is included. There might well be UVLS that performs a similar function when initiated by abnormal voltage conditions. The draft standard does not provide any rationale for the omission. Please review and provide the rationale, or add UVLS to the list of applicable facilities. **Response:** Undervoltage load shedding (UVLS) has not been included in the proposed PRC-004-3 standard's Applicability because Misoperations of UVLS relays are being addressed under Project 2008-02 – Undervoltage Load Shedding when modifying Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance. Since UVLS does not fall under 4.2.1 or 4.2.2, it is not applicable to PRC-004-3. No change made. c. Measure M1: M1 as presented only indicates the kind of evidence that can be provided to demonstrate compliance by the responsible entity, but M1 does not specify the performance targets to illustrate compliance, e.g. "that the responsible entity undertook actions to identify whether its Protection System component(s) caused a Misoperation when the conditions in Part 1.1 to Part 1.3 are met". Suggest M1 be revised to provide the performance target. **Response:** The Measures have been updated. Change made. d. VSL for R1: The second condition under SEVERE is not proper or needed. Requirement R1 asks for the identification of whether or not a responsible entity's Protection System component(s) caused a

	Misoperation but R4 has a provision that if the responsible entity has not determined the cause(s) of a Misoperation identified in accordance with Requirement R1 (or R3), then it shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters. Therefore, the second condition under SEVERE is either premature or inappropriate. We suggest to remove the second condition, or to revise it to read: The responsible entity did not take action to identify whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1. **Response:** The drafting team followed the VSL guidelines in proposing VSLs. The requirement is binary, either the entity identified the operation as a "Misoperation" or not. Under the VSL guidelines, this condition requires the VSL to be Severe for failure to perform the activity. Additionally, the drafting team has provided gradated VSLs for tardiness in identifying any Misoperation. No change made. e. VSL for R3: Second condition under SEVERE - similar comment as for the VSL for R1 preceding. **Response:** The drafting team followed the VSL guidelines in proposing VSLs. The requirement is binary, either the entity identified the operation as a "Misoperation" or not. Under the VSL guidelines, this condition requires the VSL to be Severe for failure to perform the activity. Additionally, the drafting team has provided gradated VSLs for tardiness in identifying any Misoperation. No change made. f. The SDT should reconsider the need for the defined term "Composite Protection System". By definition, a Protection System is already a composite system whose components need to function collectively to protect an Element. The proposed term is redundant. The comment report indicated that 4 commenters representing 24 individuals requested clarification of the term "composite Protection System". This represents a very low percentage of the total number of commenters and individuals, which should not be the basis for proposing the redundant new term. **Response:** The reason for proposing the newly defined term, "Composite Protection System," is found in the Application Guidelines under the heading "Definitions." No change made.
Independent Electricity System Operator	a. Applicability Section - Facilities: We agree with removing references to RAS and SPS, but question the omission of UVLS when UFLS that is intended to trip one or more BES Elements is included. There might well be UVLS that performs similar function when initiated by voltage conditions. The draft standard does

	not provide any rationale for the omission. Please review and provide the rationale, or add UVLS to the list of applicable facilities. **Response:** Undervoltage load shedding (UVLS) has not been included in the proposed PRC-004-3 standard's Applicability because Misoperations of UVLS relays are being addressed under Project 2008-02 – Undervoltage Load Shedding when modifying Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance. Since UVLS does not fall under 4.2.1 or 4.2.2, it is not applicable to PRC-004-3. No change made. b. Measure M1: M1 as presented only indicates the kind of evidence that can be provided to demonstrate compliance by the responsible entity, but M1 does not specify the performance targets to illustrate compliance, e.g. "that the responsible entity undertook actions to identify whether its Protection System component(s) caused a Misoperation when the conditions in Part 1.1 to Part 1.3 are met". Suggest M1 be revised to provide the performance target. **Response:** The Measures have been updated. Change made. c. Measure M2: Similar comment as for M1, above. The performance target is that the responsible entity notified the other owner(s) of the Protection System of the operation of the BES interrupting device when the conditions in Parts 2.1 to 2.3 are met. **Response:** The Measures have been updated. Change made. d. Measure M3: Similar comment as for M1, above. The performance target is that the responsible entity undertook actions to identify whether its Protection System component(s) caused a Misoperation when notified by the other owner of the Protection System of the BES interrupting device that operated. **Response:** The Measures have been updated. Change made. e. Measure M4: Similar comment as for M3, above. The performance target is that the responsible entity performed investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, and the identification of the cause(s) of the Misoperation or a declaration that no cause was identified. **Response:** The Measures have been updated. Change made.

	f. VSL for R1: The second condition under SEVERE is not proper or needed. Requirement R1 asks for the identification of whether or not a responsible entity's Protection System component(s) caused a Misoperation but R4 has a provision that if the responsible entity has not determined the cause(s) of a Misoperation identified in accordance with Requirement R1 (or R3), then it shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters. Therefore, the second condition under SEVERE is either premature or inappropriate. We suggest to remove the second condition, or to revise it to read: The responsible entity did not take action to identify whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1. **Response:** The drafting team followed the VSL guidelines in proposing VSLs. The requirement is binary, either the entity identified the operation as a "Misoperation" or not. Under the VSL guidelines, this condition requires the VSL to be Severe for failure to perform the activity. Additionally, the drafting team has provided gradated VSLs for tardiness in identifying any Misoperation. No change made. g. VSL for R3: Second condition under SEVERE - similar comment as for VSL for R1, above. **Response:** The drafting team followed the VSL guidelines in proposing VSLs. The requirement is binary, either the entity identified the operation as a "Misoperation" or not. Under the VSL guidelines, this condition requires the VSL to be Severe for failure to perform the activity. Additionally, the drafting team has provided gradated VSLs for tardiness in identifying any Misoperation. No change made.
American Electric Power	AEP believes the draft is very close to being ready for final ballot. AEP supports the overall efforts of the drafting team in the fundamental approach taken in the proposed standard. Our negative vote does not reflect disagreement on the direction or intent of the standard. Rather, it is driven by a number of smaller issues that, in total, would prove problematic in consistently applying the standard. **Response:** Thank you for your comment.
David Kiguel	As written, the draft standard leaves a void that should be filled. A mechanism must be provided to allow for verifying that the conclusions of the investigation are correct, the CAP is appropriate and overseeing its completion within the planned time.

	Typically, this would be a responsibility that could be assigned to the Reliability Assurer (RA) as defined in the BoT approved Functional Model. The FM definition of RA fits this role well. However, since no entities are registered as RA at this time and it is unlikely there will be in the future, a second choice would be assigning such responsibility to the Planning Coordinator (PC). Suggest adding an additional requirement assigning such responsibility to the RA (or the PC if the SDT decides so): Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall submit its investigation report and CAP documentation to the Reliability Assurer (or Planning Coordinator) that has responsibility for the area in which the associated devices are located, within 21 calendar days of their completion. The RA (or PC) shall review and either approve or provide comments within 60 calendar days of the submission. **Response:** The drafting team understands the value of having Corrective Action Plans (CAP) reviewed by others and Regional Entities. However, a Reliability Standard Requirement cannot be applicable to the Regional Entity The Planning Coordinator does not have the expertise to review these CAPs. No change made.
CenterPoint Energy Houston Electric LLC	CenterPoint Energy recommends revising the wording of the second bullet of Requirement R5 to account for situations where corrective action would not be practical. CenterPoint Energy suggests the following wording: 'Explain in a statement why corrective actions are beyond the entity's control or would not improve BES reliability or may not be practical, and that no further corrective actions will be taken.' **Response:** The Application Guidelines provide three examples of situations where reliability would not be improved. Requirement R5 addresses two situations where a CAP does not need to be developed and a declaration will be made. The definition of "CAP" limits the scope of the remedy to a specific problem; therefore, the drafting team contends that it is unlikely to be impractical to implement a CAP. No change made.
Xcel Energy	Definition for Unnecessary Trip - Other Than Fault: The first sentence of this is unclear (triple-negative) without the expanded language in the Application Guidelines section. Consider omitting the clause "...for which it is not designed" to make this more clear.

	Response: The drafting team removed the "for which it is not designed" language. Change made. The analysis of a Failure to Trip situation does not appear to be covered here, except to the extent that another interrupting device trips in a different zone to prevent the event from propagating. **Response:** Requirement R2 has been modified by adding Part 2.2 to address these concerns. Change made. The drafting team contends that the "failure of a Composite Protection System to operate for a Fault" provides sufficient guidance to determine if a "Failure to Trip" occurred. The operation of other zones to prevent the event from propagating should be considered along with the other available evidence. No change made.
SPP Standards Review Group	Exclusions for SPS and RAS are mentioned in the Rationale Box for Applicability. If these exclusions are not incorporated in the RSAW, which was just recently posted and we have not had a chance to review, then the exclusions should be included in the applicability section of the standard. **Response:** Remedial Action Schemes (RAS) and Special Protection Systems (SPS) are being addressed by Project 2010-05.2 – Special Protection Systems (Phase 2 of this project). An exclusion for RAS/SPS has been added to the Applicability section. Change made. Typos/grammatical/editorial: In the last line of the 4th paragraph on Page 5 under the Background section, insert 'be' between 'to' and 'independent'. Insert 'of' in both portions of the Moderate VSL of R5 between 'days' and 'first'. Application Guidelines In the definition of Composite Protection System on page 21, change the 'a' in front of 'Element' to an 'an'. In the 1st paragraph under Requirement R1 on Page 27, delete the 'that' following 'identified' in the next to last line of the paragraph. In Example R2a under Requirement R2 on Page 28, set the phrase 'or DCB relaying' off with commas. In the last line of the last paragraph under Requirement R3, insert an 'as' between 'such' and 'an'.

	In the 2nd line of the 1st paragraph under Requirement R4 on Page 28, delete 'the entity' following 'notified,' in the 2nd line. It would be helpful to include the initiating event in Examples R4b and R4c.Hyphenate 'in-service' in the 3rd line of Example R4c on Page 30. In the 1st paragraph under Requirement R5 on Page 30, delete the 'or' and place parentheses around CAP in the 2nd line. Reword the 1st line of the 3rd paragraph under Requirement R5 on page 30 to read: 'The time periods within Requirements R1, R3 and R5 are distinct...' On Page 31 in the introductory paragraph for Examples R5a, R5b and R5c, insert 'in the relay' in the 2nd line of the paragraph following 'capacitor'. Also, in the examples, rewrite the sentence that states 'Replace capacitor.' to say 'Replace the capacitor.' We suggest the introductory paragraph for Examples R5g, R5h and R5i on Page 32 be rewritten to state: The following are examples of a declaration why corrective actions would not improve BES reliability.' In Example R5i on Page 32, spell out POTT. In Examples R6a, R6b and R6c on Pages 33 and 34, change the sentence in the 2nd line of both examples from 'The failed capacitor...' to 'A failed capacitor...' Delete the semicolon in the 2nd line of the last paragraph on Page 33. To eliminate any possible confusion, change the CAP completion date in Example R6c from 03/09/2015 to 03/01/2015. The example gets messy if the completion date is actually after the scheduled completion date. **Response:** The above suggestions have been addressed. Changes made.
FirstEnergy Corp	For FirstEnergy, the "BES interrupting device" (GCB or Generator Circuit Breaker) is typically owned by the TO, due to the location of the POI (Point of Interconnection). However, the Protection System devices which operate the GCBs are owned by the GO. Regardless the ownership, the GO certainly knows when the "BES interrupting device" (GCB) operates. It appears that a significant emphasis of this revision is to

	ensure the owner of the BES interrupting device and the owner of the Protection System devices which operate the BES interrupting device are communicating and collaborating in the evaluation. It would seem that the detailed effort to ensure this provides more confusion than clarification for the GO. **Response:** While the situation provided is not uncommon, there are far more cases involving TO-TO interconnections where a clear understanding of accountabilities is required. No change made.
Ingleside Cogeneration, L.P./Occidental Chemical Corporation	ICLP is concerned that Compliance Enforcement Entities' interpretation of PRC-004-3 will evolve over time - particularly as new Protection System vulnerabilities are found through the evaluation of Misoperations. In addition, the need for greater numbers of measuring points and the increased granularity of Disturbance data will naturally grow as relay schemes become more and more complex. This means that a clear expectation of the requirements for Disturbance Monitoring Equipment (DME) must be established up front in a binding fashion. We accept the project team's assertion that PRC-002-2 (presently under development) is the proper vehicle for the identification of required DME locations, but would like to see a clear tie to PRC-004-3. Otherwise it is easy to see that CEAs may decide at a future date that Misoperations' reporting needs are the driving factor for DME, not PRC-002-2. **Response:** The standard does not require the use of DME to determine whether a Misoperation has occurred; however, if DME are available, then they can be used to make the determination. The drafting team contends that PRC-004-3 does not require the installation of DME to assess interrupting device operations. No change made.
Florida Municipal Power Agency	In general, FMPA disagrees with the philosophy of the current standard. Protection system design is too complex, too diverse, and requires too much engineering judgment to be conducive to making all system designs and voltage classes of systems fit into one set of criteria. Many of the comments the PSM SDT has been receiving are evidence to that effect. System Protection is just as much an art as it an engineering science (i.e., "The Art and Science of Protective Relaying", C. Russel Mason, Wiley, 1956). FMPA supports the intent of the statements that the SDT has laid out which seek to provide the individual entities with the ability to provide engineering judgment, but there is no clear cut way to establish measures and allow entities to demonstrate compliance without a set of specific criteria against which the comparison can be made. Thus, FMPA believes entities should have "Protection System Design Philosophies" for their systems as appropriate, analogous to the FAC-008-3 and the prior FAC-008-1 and 009-1 standards and facility Rating

	Methodologies. Entities can lay out the characteristics of their systems - what is the “intended operation” for the systems, and what, generically, constitutes the constraints around which that entity develops its Composite Protection Systems. We recognize the tremendous amount of work the PSM SDT has put forth in attempting to reach industry consensus on this document but do not believe any form of document that applies criteria without a corresponding philosophy behind that criteria makes the standard too ambiguous. In recognition of the art of protective relaying, we suggest documenting a protection philosophy and intended operation of systems against which to measure whether a protection system operates as intended or not. **Response:** The drafting team contends “operate as intended" is illustrated by the Misoperation definition. An Element's total complement of protection needs to operate dependably and securely. The Application Guidelines has been revised to add clarity concerning this issue. Change made.
Nebraska Public Power District	It seems like the scope for the CAP that must include an evaluation of other Protection Systems including other locations to be completed is very open ended. The concern is what an audit team’s latitude will be with reviewing and accepting or not accepting the subjective nature or these evaluations for other locations. Can the SDT comment how an evaluation that was completed for other locations as part of a misoperation might be addressed in an audit? For example, if a misoperation occurs due to a setting error and an entity decides not to review every relay setting on their system is it possible for an audit team to disagree with this evaluation and create any potential violations? **Response:** The drafting team is not in a position to state how an audit team may or may not determine compliance; however, the draft RSAW available on the NERC web page for this standard may be helpful in answering these types of concerns. The Application Guidelines provide guidance to the extent of evaluating other locations. No change made. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations.” **Response:** Yes, guidance is provided in the Application Guidelines under section heading “Requirement R4.” No change made.

	It is recommended the section 1600 Misoperation Draft Template language should match PRC-004-3. It would be quite odd to have the evaluations requirements and a data submissions request use different language. **Response:** The data reporting was split off from the standard, in part, to provide flexibility to make changes to the reporting template as needed to further the analysis of Misoperations. Therefore, the drafting team cannot guarantee that the reporting template will match the standard. The portion of R6 that states "and update each CAP if actions or time tables change, until completed" seems excessive and granular in nature and adds a lot of detail tracking and difficulty in auditing. It is enough to require a corrective action plan be implemented and close the plan when the final objectives are completed. R4 provides the long term tracking and scheduling. This portion of R6 should be removed. Another option would be to use similar language as in R4. **Response:** Requirement R4 requires determining the cause of the Misoperation, but does not involve a CAP. Requirement R5 requires developing a CAP. The language you reference in Requirement R6 is included to give an entity leeway to revise their proposed corrective actions or timetables if new developments or unforeseen circumstances warrant. No change made.
Muscatine Power and Water	MP&W is concerned about the potential inadvertent inclusion of individual wind turbines in this standard where the inclusion of thousands of individual wind turbine protection systems will add significant burden without corresponding reliability benefits. MP&W also recognizes the NERC dispersed generation SAR and SAR team are best equipped to address this issue. **Response:** The Misoperations drafting team understands the concern with the applicability of dispersed generation resources (DGR) to this standard. This drafting team is working with the DGR drafting team addressing standards with this concern under Project 2014-01 – Standards Applicability for Dispersed Generation Resources. In order to keep the sequence of the versions correct, the DGR drafting team will consider the exclusion in this standard once approved by industry. This should not be of great concern due to the implementation time of this standard and the need to bring in alignment with the work of the DGR drafting team. No change at this time.

JEA	R1 & R3 both need an exclusion for any declared natural disasters. **Response:** NERC and the Regional Entity do not have the authority to provide flexibility regarding the performance (time frames) of a Reliability Standard in unique extenuating circumstances. However, the Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, says: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." While the drafting team recognizes the concern and that there are other standards which have similar provisions for natural disasters, the sanction guidelines provide sufficient flexibility to address extenuating circumstances in the event that they occur. No change made. We also believe that the 60 day timeframe identified in R5 to develop a Corrective Action Plan and evaluate applicability is not sufficient to consider applicability to other PS, different options and their cost/benefit scenarios, coordinate resources, develop schedules, and procure funding. We recommend this be changed to 180 days. **Response:** The drafting team believes that 60 days is sufficient to develop a CAP including its applicability to other Protection Systems as there is opportunity to update the CAP in Requirement R6 as needed. The drafting team believes that issues such as cost/benefit scenarios, resource coordination, scheduling, and funding procurement can be considered while developing the schedule of the CAP. No change made.
US Bureau of Reclamation	Reclamation thanks the drafting team for their efforts refining the standard and providing the examples in the Application Guidelines. **Response:** The drafting team thanks you for your comment.
Entergy Services, Inc.	Required Protection System Misoperation identification and evidence in support of R1 could be interpreted to include all scheduled or manual interrupting device operations, which we believe is not and should not be the intention. Either way, suggest rewording R1 to include the applicable Protection System governing criteria by integrating R1.1 (revised) into requirement R1 as follows: "Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated due to a Protection System operation or a Protection System failure to operate

	as designed shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation when:" **Response:** The drafting team agrees with your perception of its intent. The posting retained in Requirement R1, Part 1.1 the concept that the interrupting device operations that need to be evaluated were caused by a Protection System. Only interrupting device operations caused by Protection System operations (except those specifically exempted) and manual operations made in response to a Protection failure are within the scope of Requirement R1 in the Standard. No change made.
Tacoma Power	Since Protection System operations that are related to (or caused by, if this verbiage is retained) on-site maintenance, testing, inspection, construction, or commissioning activities are by definition not Misoperations, is it necessary under Requirement R1 to document that the entity identified "whether its Protection System component(s) caused a Misoperation" for these cases of Protection System operations? BES interrupting devices may be operated many times during on-site activities from a Protection System, or part of a Protection System, and it would be very burdensome to document actions taken surrounding this activity for purposes of compliance with PRC-004-3 Requirement R1. Consideration should be given to an additional part under Requirement R1 such as the following: "The BES interrupting device operation was not related to [or caused by, if this verbiage is retained] on-site maintenance, testing, inspection, construction, or commissioning activities." **Response:** The operation of out-of-service equipment is not applicable to the standard. If the operation of the Protection System causes the operation of an in-service BES Element, it must be evaluated irrespective of on-site activity. Additional information is provided in the Application Guide under Requirement R1 (last paragraph). Change made. Regarding the Severe VSL for Requirement R3, change "...whether or not a Misoperation its..." to "...whether or not a Misoperation of its..." (This also needs to be updated in the VRF/VSL Justification.) **Response:** The language has been changed. Regarding the Moderate VSL for Requirement R5, change the two instances of "...calendar days first..." to "...calendar days of first..." (This also needs to be updated in the VRF/VSL Justification.)

	Response: The language has been changed. On page 32 of the redlined VRF/VSL Justification, in the FERC VRF G3 Discussion, change references to 'VSL' or 'VSLs' to references to 'VRF' or 'VRFs' respectively. **Response:** Change made. On page 39 of the redlined VRF/VSL Justification, in the discussion of FERC VSL G1, change "...being based the..." to "...being based on the..."On page 2 of the redlined Mapping Document, in the Comments column, change "...a review upon a Bulk Electric System (BES) interrupting device operation..." to something like "...a review upon a Bulk Electric System (BES) interrupting device operation initiated by a Protection System and not related to [or caused by, if this verbiage is retained] on-site maintenance, testing, inspection, construction, or commissioning activities..." Explicitly reviewing and (more to the point) documenting each BES interrupting device operation is overly burdensome, as this would include control operations, including those associated with switching, as well as operations caused during on-site activities. **Response:** The comment was intended to provide a discussion of how the requirement in PRC-004-3 is better than the requirement in PRC-003. The text does not convey all the details of PRC-004-3 which include the identification of conditions which are not Misoperations. The drafting team does not believe the addition of the clarification requested is needed to justify for the replacement of PRC-003 requirement R1. No change made. On pages 4 and 19 of the redlined Mapping Document, in the Comments column, change "...a reverse power relay operated to remove a generating unit from service..." to something like "...a reverse power relay operated to remove a generating unit from service as opposed to providing anti-motoring protection..." Whether it is for a protective or control function, the reverse power relay will still remove the generating unit from service; the distinction is why the generating unit is being removed from service. **Response:** The language has been changed. On page 5 of the redlined Mapping Document, in the Comments column, change "...underfrequency load shedding (UFLS)..." to "...underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements..." The Applicability does not include UFLS that trips non-BES Elements (e.g., medium voltage distribution feeders).

	Response: The language has been changed. On page 21 of the redlined Mapping Document, in the Comments column, change "...until is..." to "...until it..." **Response:** The language has been changed.
PPL NERC Registered Affiliates	The expression, "the Misoperation," in R5 should be changed to, "a determined Misoperation," in recognition of the fact that some events can be classified only after full investigation, as described above. **Response:** Requirement R5 does not come into the process until the owner of the Protection System component(s) has identified the cause of a Misoperation. Requirement R5 is implicitly pursuant to finding the cause in R1, R3, or R4 as illustrated by: "…first identifying a cause of the Misoperation." No change made.
Hydro-Québec Production	The purpose of the Standard shall be limited only to "Identify and correct the causes of Protection System Misoperations affecting the reliability of the Bulk Electric System (BES)." The Bulk Electric System (BES) Elements or Protection System Misoperations that may affect the reliability of the Bulk Electric System (BES), shall be first identifed by the PC or RC. **Response:** Using the "affecting the reliability of the BES" has the effect of expanding applicability because all BES Elements are already included. Adding "affecting" would include other Protection Systems. The drafting team contends that the proposed Purpose statement does address Protection Systems that affect the BES. No change made.
Tennessee Valley Authority	The Severity Level wording (re CAP development) is too stringent and very confusing. Adding roughly 5 days (from the timeframe stated in the previous draft) is negligible. The current requirement allows 12 months for CAP development, and changing this to 120 days will not, in some cases, give a utility adequate time to investigate/determine actions going forth. **Response:** CAP development (60 days) is performed after the investigation is complete. It is separate from the "120 day" time period for identifying a Misoperation.

	A CAP is "a list of actions and an associated timetable for implementation to remedy a specific problem." Since CAP's address specific problems, the investigation into what went wrong needs to be completed before a CAP is developed. Per requirement R5, the 60 day CAP development time frame begins once the specific problem that caused a Misoperation is identified. The CAP implementation period is determined by the GO, TO, or DP developing the CAP. No change made.
Public Service Enterprise Group	There is no requirement in the standard for the cause of a Misoperation to be determined by the appropriate Protection System owner. Neither R1 nor R3 obligates the owner to attempt to determine the cause of a Misoperation. We note that R4 presumes the owner could not "determine the cause(s) of a Misoperation in accordance with R1 and R3" when those requirements contain no such obligation. R5 and R6 apply to an owner that has determined the cause(s) of a Misoperation. Therefore, we recommend that R1 and R3 be modified as follows with the following additional capitalized language:".... shall identify whether its Protection System component(s) caused a Misoperation OR NOT, AND IF SUCH A MISOPERATION OCCURRED, SHALL DETERMINE, IF POSSIBLE, THE CAUSE(S) OF SUCH MISOPERATION. **Response:** Requirements R1 and R3 are for determining whether a Misoperation occurred or not. Requirement R4 is for determining the cause(s), if not determined while performing Requirements R1 or R3. Requirement R4 has been clarified. Change made. "As R1 and R2 are written, one could interpret the language as requiring ALL interruption device operations be evaluated. However, this is not the intent based upon the draft RSAW that's posted. It states that the evidence required in R1 is "A list of BES interrupting device operations within audit period meeting the criteria of Requirement R1 Parts 1.1 through 1.3." Therefore, we recommend that R1 and R2 be changed so that it is clear that the only interruption device operations that need to be examined are those that are the unexpected. Expected operations for, as an example, switching would be eliminated from any requirement to review the interrupting device operation. This would greatly simplify the data required to demonstrate compliance. We offer the following additional capitalized language in R1 and R2:"Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated UNEXPECTEDLY shall,...."

	Response: Only BES interrupting device operations caused by a Protection System, a Composite Protection System, or by a manual intervention in response to a Protection System failure need to be investigated. This is stated in Requirements R1.1 and R2.1. No change made.
Exelon	This draft is a significant improvement over the last draft, specifically because of the addition of the “Composite Protection System”. We also endorse the use of the rationale boxes within the standard; they lend additional clarity to the requirements of the standard. However, consistent with our comments above, the standard is too prescriptive. For example, there is far too much emphasis on documenting dates. **Response:** The requirements and associated timeframes ensure that the responsible entities are diligent about Misoperation response, CAP creation and completion. The timetables make the requirements measurable. No change made. Additionally, most of the VSL’s should be eliminated and labeled “N/A”, e.g., on R3, does 30 calendar days really matter? Lower VSL should be up to 60 days late, Moderate is N/A, High is N/A, Severe is more than 60 days late which equals failed to identify. **Response:** The drafting team followed NERC Violation Severity Level Guidelines for VSL escalation. No change made. ComEd also disagrees with the VSL tables because they disproportionately propose to punish a larger utility with more operations (and misoperations). **Response:** The drafting team contends that the VSLs follow the NERC Violation Severity Level Guidelines and do not disproportionately burden a larger utility. The VSLs only apply when an entity fails to comply with the Requirements of the standard. A Misoperation is not a violation of the standard. No change made. There also needs to be a distinction between analyzing automatic operations for misoperations but failing to identify a misoperation in, as an example, 1 out of 100 operations verses taking no effort to identify any misoperations. For these reasons we think the current revision to PRC-004-3 is overly prescriptive and complicated. **Response:** The drafting team contends that each operation of a BES interrupting device according to the requirements is a discrete instance; therefore, a violation would be assessed for not reviewing the

	operation for Misoperation. For example, an entity that failed to review 100 operations would have 100 violations whereas an entity that failed to review one operation would have only one violation. No change made. Suggest that the SDT should evaluate simplifying the Standard to the basic purpose which is to "identify and correct the causes of Misoperation of Protection Systems for BES elements" without introducing hard timelines, overly prescriptive communication requirements, and documentation of the level of corrective actions performed. **Response:** The drafting team contends that the proposed version provides additional clarity over the current version. For example, the proposed version identifies who does what under what circumstances. No change made. Guidelines and Technical Basis: (1) A failure of a Protection System to operate for a Fault within the zone it is designed to protect. Can the drafting team provide an example for generator protection similar to the one provided for the transmission line protection? **Response:** The drafting team added Example 1d to address this concern. Change made. (2) A failure of a Protection System to operate for a non-Fault condition for which the Protection System was intended to operate, such as a power swing, under-voltage, over excitation, or loss of excitation. For example, failure to trip the generator by loss of field protection for a loss of field condition on that generator is a Misoperation. If the generator is tripped by another relay say out of step, should it still be called misoperations? **Response:** Based on the information provided, the drafting team believes that the out-of-step relay is part of the generator's Composite Protection System; therefore, as described in this example the operation is not a Misoperation.
Virginia State Corporation Commisison	Under R5, the owner of a Protection System component that causes a Misoperation shall either develop a CAP or "Explain in a declaration why corrective actions are beyond the entity's control or would not

	improve BES reliability....." I wonder whether the Requirement should identify to whom and by what manner any such "declaration" should be made? **Response:** A declaration is documentation retained by the entity to explain why development of a CAP would not improve reliability and that no further corrective actions will be taken. An entity would have a declaration available to provide to its Regional Entity during a compliance monitoring activity. No change made.
ReliabilityFirst Protection Subcommittee	We believe that the rationale boxes within the standard should be retained to lend additional clarity to the requirements of the standard. **Response:** When this standard has received ballot approval, the rationale boxes are retained and will be moved to the Application Guidelines Section of the Standard. No change made.
Wisconsin Electric Power Company	We strongly believe that the drafting teams need to understand how the standards they are developing will interact with other NERC standards and documents. There may be unintended consequences when the relationships between two standards or other NERC documents are not foreseen. Regrettably, the SDT for the new BES Definition failed to take into account the substantial impact of its product on the various standards that would be applied to the new BES elements. Therefore it is critical for the PRC-004-3 SDT to take a step back and anticipate the effect of the new BES definition on this standard. The case in point is the addition of dispersed generators to the BES. We remain very concerned with the effort that will be required to comply with this standard in light of the new BES facilities that are included in the new BES definition, especially dispersed generation. It is wind that especially troubles us. We have about 200 wind turbine generators in our fleet, all less than 2 MW in size. Wind makes up less than 5 % of our generation capacity. Yet, in terms of the sheer number of generators, the number of wind units is roughly 5 times the number of other larger generators in our fleet. Of these 200 wind generators, 90% will soon become BES generators due to being aggregated in facilities above 75 MVA. It is the outsized impact of these wind turbines that will have a huge effect when we are required to analyze in depth each protection system operation of these wind generators in order to comply with PRC-004-3. This effort will be enormous, and yet the reliability benefit is negligible. The valuable technical resources available at my company, and at

	many other companies with even larger amounts of dispersed generators, are not best utilized by applying this standard at the level of individual wind generators, and other similar small dispersed generators. To allow entities to focus limited technical resources on efforts that truly enhance reliability, the SDT should revise the Applicability to specifically exclude small dispersed generators, and only apply it where the aggregated generation exceeds 75 MVA, that is, to the collector bus and transformer (with the high-side winding operated at or above 100 kv) used to connect to the transmission system. We believe the extra time it takes to think this through will be worthwhile to the industry, and may prevent inadvertent outcomes that may not serve the overall reliability of the bulk power system. **Response:** The Misoperations drafting team understands the concern with the applicability of dispersed generation resources (DGR) to this standard. This drafting team is working with the DGR drafting team addressing standards with this concern under Project 2014-01 – Standards Applicability for Dispersed Generation Resources. In order to keep the sequence of the versions correct, the DGR drafting team will consider the exclusion in this standard once approved by industry. This should not be of great concern due to the implementation time of this standard and the need to bring in alignment with the work of the DGR drafting team. No change at this time.
Seminole Electric Cooperative, Inc.	WECC Extended Implementation Period - The Standard as proposed allows entities in the WECC Region an additional 12-months to comply with the Requirements of PRC-004-3. Seminole requests that entities in all other NERC Regions have the same amount of time to comply. Correlating every Region's effective date to that of WECC would be just, reasonable, and less preferential. **Response:** After further review and discussion with WECC following the latest changes to the standard, the proposed standard and the existing regional standard do not conflict. Therefore, different implementation timeframes are no longer necessary. However, the language used in the implementation plan is the stock language NERC uses for effective dates of Reliability Standards. In the prior version of the implementation, the effective dates were specified separately for WECC to provide time to eliminate language conflicts between the proposed standard and the regional standard. Since no conflict exists, there will be a single effective date for the standard. Change made.

	Evidence Retention - Bullet 2 under section C.1.2. of the Standard deals with evidence retention. Bullet 2 specifically requires retention of evidence 12 months from the date of "completion of each CAP, evaluation, and declaration." It does not appear that Requirement R5 covers the completion of the CAP; it appears that specific requirement is covered in Requirement R6 and bullet #3 of the evidence retention section. Seminole reasons that the drafting team meant Bullet 2 to state that the retention period is from the date of completion of the "development" of a CAP, not the completion of remedies stated in a CAP. In addition, there are three possible dates for completion of a CAP, evaluation, and declaration. Seminole requests that the drafting team clarify which date, and time period, specific evidence is required. **Response:** Bullet 2 under Section C.1.2 has been redrafted to indicate the data retained should support the development of the CAP in Requirement R5. Change made. When a CAP is developed in accordance with Requirement R5 there will be two dates. One for the completion of the development of the CAP and a second for the completion of an evaluation of the applicability of the CAP at other locations. In the case where a declaration is made that no further corrective actions will be taken, the date will be when the declaration was made. Measure M5 gives examples of acceptable evidence. When a CAP is completed in accordance with Requirement R6 the dates of the completion of actions within the CAP as well as any modifications to the CAP should be retained. Measure M6 gives examples of acceptable evidence.

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. The SC authorized moving the SAR forward for standard development at their June 9, 2011 meeting.
2. The SAR was posted for informal comment June 10 – July 11, 2011.
3. Draft 1 of PRC-004-3 was posted for a 30-day formal comment period from June 10 – July 11, 2011.
4. Draft 2 of PRC-004-3 was posted for a 45-day formal comment period from July 25 – September 7, 2012 and an initial ballot in the last ten days of the comment period from August 29 – September 7, 2012.
5. Draft 3 of PRC-004-3 was posted for a 30-day formal comment period from January 22 – February 20, 2013 and a successive ballot in the last ten days of the comment period from February 11-20, 2013.
6. Draft 4 of PRC-004-3 was posted for a 45-day additional comment period from January 17 – March 11, 2014 and an additional ballot in the last ten days of the comment period from February 2 – March 11, 2014 under the new Standards Process Manual (Effective: June 26, 2013).

Description of Current Draft

The Protection System Misoperations Standard Drafting Team (PSMSDT) is posting Draft 5 of PRC-004-3 – Protection System Misoperation Identification and Correction for a 45-day additional comment period and additional ballot in the last ten days of the comment period under the new Standards Process Manual (Effective: June 26, 2013).

Anticipated Actions	Anticipated Date
Additional 45-day Formal Comment Period with Parallel Ballot	May 2014
10-day Final Ballot	July 2014
BOT Approval	August 2014

Effective Dates

The standard, the revised definition of “Misoperation” and the new definition of “Composite Protection System” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard, the revised definition of

"Misoperation" and the new definition of "Composite Protection System" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to "en dash" (–) and "em dash (—)." 2. Added "periods" to items where appropriate. Changed "Timeframe" to "Time Frame" in item D, 1.2.	01/20/06
2		Modified to address Order No. 693 Directives contained in paragraph 1469.	Revised
2	August 5, 2010	Adopted by NERC Board of Trustees	
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by the Board of Trustees	
1a	September 26, 2011	FERC Order issued approving the interpretation of R1 and R3 (FERC's Order is effective as of September 26, 2011)	
2a	September 26, 2011	Appended FERC-approved interpretation of R1 and R3 to version 2	
2.1a		Errata change: Edited R2 to add "…and generator interconnection Facility…"	Revision under Project 2010-07
2.1a	February 9, 2012	Errata change adopted by the Board of Trustees	

2.1a	September 19, 2013	FERC Order issued approving PRC-004-2.1a (approval becomes effective November 25, 2013).	
3	TBD	Adopted by Board of Trustees	Revision under Project 2010-05.1

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the *Glossary of Terms used in NERC Reliability Standards* ("NERC Glossary") are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the NERC Glossary.

Composite Protection System:

The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided to a remote Protection System is included.

Misoperation:

The failure of a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.
6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

When this standard has received ballot approval, the rationale boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System Misoperation Identification and Correction**

2. **Number:** PRC-004-3

3. **Purpose:** Identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements.

4. **Applicability:**

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities:

4.2.1 Protection Systems for BES Elements, with the following exclusions:

4.2.1.1 Non-protective functions that are embedded within a Protection System.

4.2.1.2 Protective functions intended to operate as a control function during switching.[1]

4.2.1.3 Special Protection Systems (SPS).

4.2.1.4 Remedial Action Schemes (RAS).

4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

Rationale for Applicability: Protection Systems that protect BES Elements are integral to the operation and reliability of the BES. Some functions of relays are not used as protection but as control functions or for automation; therefore, any operation of the control function portion or the automation portion of relays is excluded from this standard. See the Application Guidelines for detailed examples of non-protective functions. Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are excluded in this standard because they are planned to be handled in the second phase of this project.

5. **Background**:

A key factor for BES reliability is the correct performance of Protection Systems. The monitoring of Protection System events for BES Elements, as well as identifying and

[1] For additional information and examples, see the “Non-Protective Functions” and “Control Functions” sections in the Application Guidelines.

correcting the causes of Misoperations, will improve Protection System performance. This Reliability Standard PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In the FERC Order No. 693, the Commission identified PRC-003-0 as a “fill-in-the-blank” standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

This project includes revising the existing definition of Misoperation, which reads:

Misoperation

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity.

In general, this definition needs more specificity and clarity. The terms “specified time” and “abnormal condition” are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical yet explainable condition is a Misoperation.

The SAR for this project also includes clarifying reporting requirements. Misoperation data, as currently collected and reported, is not optimal to establish consistent metrics for measuring Protection System performance. As such, the data reporting obligation for this standard is being removed and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information (“data request”). As a result of the data request, NERC will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. The removal of the data collection obligation from the standard does not result in a reduction of reliability. The standard and data request have been developed in a manner such that evidence used for compliance with the standard and data request are intended to be independent of each other.

The proposed requirements of the revised Reliability Standard PRC-004-3 meet the following objectives:

- Review all Protection System operations on the BES to identify those that are Misoperations of Protection Systems for Facilities that are part of the BES.
- Analyze Misoperations of Protection Systems for Facilities that are part of the BES to identify the cause(s).
- Develop and implement Corrective Action Plans to address the cause(s) of Misoperations of Protection Systems for Facilities that are part of the BES.

Misoperations associated with Special Protection Schemes (SPS) and Remedial Action Schemes (RAS) are not addressed in this standard due to their inherent complexities. NERC plans to handle SPS and RAS in the second phase of this project.

The Western Electric Coordinating Council (WECC) Regional Reliability Standard PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation relates to the reporting of Misoperations of Protection Systems and RAS for a limited set of WECC Paths. The WECC region plans to conduct work to harmonize the regional standard with this continent-wide proposed standard and the second phase of this project concerning SPS and RAS.

6. Effective Dates:

The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation under the following circumstances: *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and

1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and

1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

M1. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified the Misoperation of its Protection System component(s), if any, that meet the circumstances in Requirement R1, Parts 1.1, 1.2, and 1.3 within the allotted time period. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R1: This requirement ensures that entities review those Protection System operations meeting the circumstances in all three Parts (1.1, 1.2, and 1.3) and identify any that are Misoperations. The BES interrupting device owner is assigned the responsibility to initiate the review because the owner is in the best position to be aware of the operation. Manual intervention is included as a condition that initiates a review. Occasionally, Protection System failures do not yield other Protection System operations and manual intervention is required to isolate the problematic equipment. The 120 calendar day period accounts for the sporadic volumes of Protection System operations, and provides the opportunity to identify any Misoperations which were initially missed.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in 2.1 and 2.2. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

2.1 For a BES interrupting device operation by a Composite Protection System, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:

2.1.1 The BES interrupting device owner shares the Composite Protection System ownership with any other owner; and

2.1.2 The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and

2.1.3 The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.

2.2 For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.

M2. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates notification to the other owner(s), within the allotted time period for either Requirement R2, Part 2.1, including subparts 2.1.1, 2.1.2, and 2.1.3 and Requirement R2, Part 2.2. Acceptable evidence for Requirement R2, including Parts 2.1 and 2.2 may include, but is not limited to the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

Rationale for R2: Part 2.1 ensures that the BES interrupting device owner notifies the other owners of the Composite Protection System. The phrase "owner(s) that share Misoperation identification responsibility" allows entities to notify the specific others that will actually review the operation to determine if a Misoperation occurred. Part 2.2 ensures that the Protection System owner(s) for which that backup protection was provided receives notification, within the same 120 calendar day period as R1. This ensures other entities are notified to review their Protection System components. The expectation is that entities will communicate accordingly and when it is clear that when Part 2.1, 2.2, or both are met, the entity would make the notification. It is not intended for entities to automatically and unnecessarily notify other entities before adequate detail is known.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified whether its Protection System component(s) caused a Misoperation within the allotted time period. Acceptable evidence for Requirement R3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R3: When an entity receives notification of a Protection System operation by the BES interrupting device owner, the Protection System owner is allotted at least 60 calendar days to identify whether it was a Misoperation. A shorter time period is allotted on the basis that the BES interrupting device owner has already performed preliminary work, collaborated with the other owners, and that other owners generally have fewer associated Protection System components.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: *[Violation Risk Factor: Medium] [Time Horizon: Operations Assessment, Operations Planning]*

- The identification of the cause(s) of the Misoperation; or
- A declaration that no cause was identified.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it performed at least one investigative action according to Requirement R4 every two full calendar quarters until a cause is identified or a declaration is made. Acceptable evidence for Requirement R4 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R4: If a Misoperation cause is not identified within the time period established by Requirements R1 or R3 (i.e., 120 calendar days), the Protection System component owner must demonstrate investigative actions toward identifying the cause(s). Performing at least one action every two full calendar quarters from first identifying the Misoperation encourages periodic focus on finding the cause of the Misoperation.

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations; or
- Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP's applicability to other Protection Systems and locations, or a declaration in accordance with Requirement R5. Acceptable evidence for Requirement R5 may include, but is not limited to the following dated documentation (electronic or hardcopy format): CAP and evaluation, or declaration.

Rationale for R5: A formal CAP is a proven tool for resolving and reducing the possibility of reoccurrence of operational problems. A time period of 60 calendar days is based on industry experience and operational coordination time needed for considering such things as alternative solutions, coordination of resources, or development of a schedule. When the cause of a Misoperation is identified, a CAP will generally be developed. An evaluation of the CAP's applicability to the entity's other Protection Systems including other locations helps identify similar problems, potential for Misoperation occurrences in other Protection Systems, common mode failure, design problems, etc. In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, a statement documenting the reasons for taking no corrective actions is essential for future reference and for justifying the absence of a CAP.

R6. Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. *[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Long-Term Planning]*

M6. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it implemented each CAP, including updating actions or timetables. Acceptable evidence for Requirement R6 may include, but is not limited to the following dated documentation (electronic or hard copy format): records that document the implementation of each CAP and the completion of actions for each CAP including revision history of each CAP. Evidence may also include work management program records, work orders, and maintenance records.

Rationale for R6: Each CAP must accomplish all identified objectives to be complete. During the course of implementing a CAP, updates may be necessary for a variety of reasons such as new information, scheduling conflicts, or resource issues. Documenting changes or completion of CAP activities provides measurable progress and confirmation of completion.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirements R1, R2, R3, and R4, Measures M1, M2, M3, and M4 for 12 calendar months.
- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R5, Measure M5 for 12 calendar months following development of each CAP, development of each evaluation, and development of each declaration.
- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R6, Measure M6 for 12 calendar months following completion of each CAP.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

Periodic Data Submittal

1.4. Additional Compliance Information

None.

D. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to identify whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R2	Operations Assessment, Operations Planning	Medium	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R3	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late. OR The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	Operations Assessment, Operations Planning	Medium	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late. OR The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	Operations Planning, Long-Term Planning	Medium	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop a CAP or explain in a declaration in accordance with Requirement R5. OR (See next page)

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	(Continued)		The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop an evaluation in accordance with Requirement R5.
R6	Operations Planning, Long-Term Planning	Medium	The responsible entity implemented, but failed to update a CAP, when actions or timetables changed, in accordance with Requirement R6.	N/A	N/A	The responsible entity failed to implement a CAP in accordance with Requirement R6.

Guidelines and Technical Basis

Introduction

This standard addresses the reliability issues identified in the letter[2] from Gerry Cauley, NERC President and CEO, dated January 7, 2011.

> "Nearly all major system failures, excluding perhaps those caused by severe weather, have misoperations of relays or automatic controls as a factor contributing to the propagation of the failure. …Relays can misoperate, either operate when not needed or fail to operate when needed, for a number of reasons. First, the device could experience an internal failure – but this is rare. Most commonly, relays fail to operate correctly due to incorrect settings, improper coordination (of timing and set points) with other devices, ineffective maintenance and testing, or failure of communications channels or power supplies. Preventable errors can be introduced by field personnel and their supervisors or more programmatically by the organization."

The standard also addresses the findings in the 2011 Risk Assessment of Reliability Performance[3]; July 2011.

> "…a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry."

Definitions

The Misoperation definition is based on the IEEE/PSRC Working Group I3 "Transmission Protective Relay System Performance Measuring Methodology[4]." Misoperations of a Protection System include failure to operate, slowness in operating, or operating when not required either during a fault or non-fault condition.

---

[2] http://www.nerc.com/pa/Stand/Project%20201005%20Protection%20System%20Misoperations%20DL/20110209130708-Cauley%20letter.pdf
[3] http://www.nerc.com/files/2011_RARPR_FINAL.pdf
[4] "Transmission Protective Relay System Performance Measuring Methodology," Working Group I3 of Power System Relaying Committee of IEEE Power Engineering Society, 1999.

For reference, a "Protection System" is defined in the *Glossary of Terms used in NERC Reliability Standards* ("NERC Glossary") as:

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

A BES interrupting device is a BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current. Although BES interrupting device mechanisms are not part of a Protection System, the standard uses the operation of a BES interrupting device by a Protection System to initiate the review for Misoperation.

The following two definitions are being proposed for inclusion in the NERC Glossary:

> **Composite Protection System –** *The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided to a remote Protection System is included.*

The Composite Protection System definition is based on the principle that an Element's multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element's total complement of protection should be considered while evaluating an operation.

Composite Protection System – Line Example

The Composite Protection System of the Alpha-Beta line (Circuit #123) is comprised of current differential, permissive overreaching transfer trip (POTT), step distance (classic zone 1, zone 2, and zone 3), instantaneous-overcurrent, time-overcurrent, out-of-step, and overvoltage protection. The protection is housed at the Alpha and Beta substations, and includes the associated relays, communications systems, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Transformer Example

The Composite Protection System of the Alpha transformer (#2) is comprised of internal differential, overall differential, instantaneous-overcurrent, and time-overcurrent protection. The protection is housed at the Alpha substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Generator Example

The Composite Protection System of the Beta generator (#3) is comprised of generator differential, overall differential, overcurrent, stator ground, reverse power, volts per hertz, loss-of-field, and undervoltage protection. The protection is housed at the Beta generating plant and at the Beta substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Breaker Failure Example

Breaker failure protection provides backup protection for the breaker, and therefore is part of the breaker's Composite Protection System. Considering breaker failure protection to be part of another Element's Composite Protection System could lead to an incorrect conclusion that a breaker failure operation automatically satisfies the "Slow Trip" criteria of the Misoperation definition.

> **Misoperation –** *The failure a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:*
>
> 1. **Failure to Trip – During Fault** – *A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*
> 2. ***Failure to Trip – Other Than Fault*** – *A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*
> 3. ***Slow Trip – During Fault*** – *A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.*
> 4. ***Slow Trip – Other Than Fault*** – *A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.*
> 5. ***Unnecessary Trip – During Fault*** – *An unnecessary Composite Protection System operation for a Fault condition on another Element.*
> 6. ***Unnecessary Trip – Other Than Fault*** – *An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.*

The Misoperation definition is based on the principle that an Element's total complement of protection is intended to operate dependably and securely.

Failure to automatically reclose after a fault condition is not included as a Misoperation because reclosing equipment is not included within the definition of Protection System.

A breaker failure operation does not, in itself, constitute a Misoperation.

A remote backup operation resulting from a "Failure to Trip" or a "Slow Trip" does not, in itself, constitute a Misoperation.

This proposed definition of Misoperation provides additional clarity over the current version. A Misoperation is the failure of a Composite Protection System to operate as intended. The definition includes six categories which provide further differentiation of what constitutes a Misoperation. These categories are discussed in greater detail in the following sections.

Failure to Trip – During Fault

This category of Misoperation typically results in the fault condition being cleared by remote backup Protection System operation.

> **Example 1a:** A failure of a transformer's Composite Protection System to operate for a transformer fault is a Misoperation.
>
> **Example 1b:** A failure of a "primary" transformer relay (or any other component) to operate for a transformer fault is not a “Failure to Trip – During Fault” Misoperation as long as another component of the transformer's Composite Protection System operated.
>
> **Example 1c:** A lack of target information does not by itself constitute a Misoperation. When a high-speed pilot system does not target because a high-speed zone element trips first, it would not in and of itself be a Misoperation.
>
> **Example 1d:** A failure of an overall differential relay to operate is not a “Failure to Trip – During Fault” Misoperation as long as another component such as a generator differential relay operated.

In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – During Fault” category applies to the operation.

Failure to Trip – Other Than Fault

This category of Misoperation may have resulted in operator intervention. The “Failure to Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

> **Example 2a:** A failure of a generator's Composite Protection System to operate for an unintentional loss of field condition is a Misoperation.
>
> **Example 2b:** A failure of an overexcitation relay (or any other component) is not a "Failure to Trip – Other Than Fault" Misoperation as long as the generator's Composite Protection System operated as intended isolating the generator from the BES.

In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – Other Than Fault” category applies to the operation.

Slow Trip – During Fault

This category of Misoperation typically results in remote backup Protection System operation before the fault is cleared.

> **Example 3:** A failure of a line's Composite Protection System to operate as quickly as intended for a line fault is a Misoperation. The current differential element of a multiple function relay failed to operate for a line fault. The same relay's time-overcurrent element operated after a time delay. However, an adjacent line also operated from a time-overcurrent element. The faulted line's time-overcurrent element was found to be set to trip too slowly.

Installing high-speed protection may be a part of a utility's standard practice without having the need for high-speed protection to prevent voltage or dynamic instability or to maintain relay coordination. For this case, a "Slow Trip – During Fault" of the high-speed protection is not a Misoperation because it would not negatively impact the dynamic BES performance, unless the Composite Protection System operation is slower than previously identified as being necessary to prevent voltage or dynamic instability. The Composite Protection System must also coordinate with other Protection Systems to prevent the trip (e.g., an over-trip) of additional Protection Systems.

The phrase "slower than required" means the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and stability by the owner(s) reviewing each Protection System operation.

The phrase "resulted in the operation of any other Composite Protection System" refers to the need to ensure that relaying operates in the proper or planned sequence (i.e., the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

In analyzing the Protection System for Misoperation, the entity must also consider the "Unnecessary Trip – During Fault" category to determine if an "unnecessary trip" applies to the Protection System operation of an Element other than the faulted Element.

If a coordination error was at the local terminal (i.e., set too slow), then it was a "Slow Trip," category of Misoperation at the local terminal.

Slow Trip – Other Than Fault

The phrase "slower than required" means the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and stability by the owner(s) reviewing each Protection System operation.

> **Example 4:** A failure of a generator's Composite Protection System to operate as quickly as intended for an overexcitation condition is a Misoperation.

The "Slow Trip – Other Than Fault" conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

Unnecessary Trip – During Fault

An operation of a properly coordinated remote Protection System is not in and of itself a Misoperation if the fault has persisted for a sufficient time to allow the correct operation of the Composite Protection System of the faulted Element to clear the fault. A BES interrupting device failure, a "failure to trip" Misoperation, or a "slow trip" Misoperation may result in a proper remote Protection System operation.

> **Example 5:** An operation of a transformer's Composite Protection System which trips (i.e., over-trips) for a properly cleared line fault is a Misoperation. The fault is cleared properly by the faulted equipment's Composite Protection System (i.e., line relaying) without the need for an external Protection System operation resulting in an unnecessary trip of the transformer protection; therefore, the transformer Protection System operation is a Misoperation.

Unnecessary Trip – Other Than Fault

Unnecessary trips for non-fault conditions include but are not limited to, power swings, overexcitation, loss of excitation, frequency excursions, and normal operations.

> **Example 6a:** An operation of a line's Composite Protection System due to a relay failure during normal operation is a Misoperation.
>
> **Example 6b:** Tripping a generator by the operation of the loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation assuming the Composite Protection System was not intended to operate under this condition.
>
> **Example 6c:** An impedance line relay trip for a power swing that entered the relay's characteristic is a Misoperation if the power swing was stable and the relay operated because power swing blocking was enabled and should have prevented the trip, but did not.
>
> **Example 6d:** Tripping a generator operating at normal load by the operation of a reverse power protection relay due to a relay failure is a Misoperation.

Additionally, an operation that occurs during a non-fault condition but was initiated directly by on-site (i.e., real-time) maintenance, testing, inspection, construction, or commissioning is not a Misoperation.

> **Example 6e:** A BES interrupting device operation that occurs at the remote end of a line during a non-fault condition because a direct transfer trip was initiated by system maintenance and testing activities at the local end of the line is not a Misoperation.

The "on-site" activities at one location that initiates a trip to another location are included in this exemption; however, once the maintenance, testing, inspection, construction, or commissioning is complete, the "on-site" Misoperation exclusion no longer applies, regardless of the presence of on-site personnel.

If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip," category of Misoperation at the remote terminal.

Special Cases

Protection System operations for these cases would not be a Misoperation.

> **Example 7a:** A generator Protection System operation prior to closing the unit breaker(s) is not a Misoperation provided no in-service Elements are tripped.

This type of operation is not a Misoperation because the generating unit is not synchronized and is isolated from the BES. Protection System operations which occur with the protected Element out of service, that do not trip any in-service Elements, are not Misoperations.

In some cases where zones of protection overlap, the owner(s) of Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element.

> **Example 7b:** The high-side of a transformer connected to a line may be within the zone of protection of the supplying line's relaying. In this case, the line relaying is planned to protect the area of the high side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for faults on the high-side of the connected transformer. Therefore, the operation of the line relaying for a high-side transformer fault operated as intended and would not be a Misoperation.

Below are examples of conditions that would be a Misoperation.

> **Example7c:** A 230 kV shunt capacitor bank trips due to a settings error in the capacitor bank differential relay upon energization. The operation trips only the capacitor bank breaker that was closed to energize the bank. Since closing the breaker put the capacitor bank into service, this is a Misoperation.

> **Example 7d:** A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush following a maintenance outage. Only the high-side breaker opens since the low-side breaker had not yet been closed. Since closing the breaker put the transformer bank into service, this is a Misoperation.

Non-Protective Functions

BES interrupting device operations which are initiated by non-protective functions, such as those associated with generator controls, excitation controls, or turbine/boiler controls, static voltampere-reactive compensators (SVC), flexible ac transmission systems (FACTS), high-voltage dc (HVdc) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. The standard is not applicable to non-protective functions such as automation (e.g., data collection) or control functions that are embedded within a Protection System.

Control Functions

The entity must make a determination as to whether the standard is applicable to each operation of its Protection System in accordance with the provided exclusions in the standard's Applicability, see Section 4.2.1. The subject matter experts (SME) developing this standard recognize that entities use Protection Systems as part of a routine practice to control BES Elements. This standard is not applicable to operation of protective functions within a Protection System when intended for controlling a BES Element as a part of an entity's process or planned switching sequence. The following are examples of conditions to which this standard is not applicable:

> **Example 8a:** The reverse power protective function that operates to remove a generating unit from service using the entity's normal or routine process.
>
> **Example 8b:** The reverse power relay enables a permissive trip and the generator operator trips the unit.

The standard is not applicable to operation of the protective relay because its operation is intended as a control function as part of a controlled shutdown sequence for the generator. However, the standard remains applicable to operation of the reverse power relay when it operates for conditions not associated with the controlled shutdown sequence, such as a motoring condition caused by a trip of the prime mover.

The following is another example of a condition to which this standard is not applicable:

> **Example 8c:** Operation of a capacitor bank interrupting device for voltage control using functions embedded within a microprocessor based relay that is part of a Protection System.

The above are examples only, and do not constitute an all-inclusive list to which the standard is not applicable.

Extenuating Circumstances

In the event of a natural disaster or other extenuating circumstances, the December 20, 2012 Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, reads: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." The Regional Entities to whom NERC has delegated authority will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

The volume of Protection System operations tend to be sporadic. If a high rate of Protection System operations is not sustained, utilities will have an opportunity to catch up within the 120 day period.

Requirement R1

This requirement initiates a review of each BES interrupting device operation to identify whether or not a Misoperation may have occurred. Since the BES interrupting device owner typically monitors and tracks device operations, the owner is the logical starting point for identifying Misoperations of Protection Systems for BES Elements. A review is required when (1) a BES interrupting device operates that is caused by a Protection System or by manual intervention in response to a Protection System failure to operate, (2) regardless of whether the owner owns all or part of the Protection System component(s), and (3) the owner identified its Protection System component(s) as causing the BES interrupting device operation.

Since most Misoperations result in the operation of one or more BES interrupting devices, these operations initiate a review to identify any Misoperation. If an Element is manually isolated in response to a failure to operate, the manual isolation of the Element triggers a review for Misoperation.

> **Example R1a:** The failure of a loss of field relay on a generating unit where an operator takes action to isolate the unit.

Manual intervention may indicate a Misoperation has occurred, thus requiring the initiation of an investigation by the BES interrupting device owner.

For the case, BES interrupting device did not operate and remote clearing occurs due to the failure of a Composite Protection System to operate, Requirement R2, Part 2.2 requires the entity that had the BES interrupting device operation to notify the other owner(s) to review its portion of Composite Protection System for Misoperation.

Protection Systems are made of many components. These components may be owned by different entities. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner’s differential relay. All of these components and many more are part of a Protection System. It is expected that all of the owners will communicate with each other, sharing information freely, so that Protection System operations can be analyzed, Misoperations identified, and corrective actions taken.

Each entity is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation regardless of the level of ownership. A combination of available information from resources such as counters, relay targets, Supervisory Control and Data Acquisition (SCADA) systems, or Disturbance Monitoring Equipment (DME) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure, it may decide to identify the operation as a Misoperation and continue its investigation until the entity determines otherwise. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation. The entity is allotted 120 calendar days from the date of its BES interrupting device operation to identify whether or not a Misoperation of its Protection System component(s) occurred.

The Protection System operation may be documented in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System.

Repeated operations which occur during the same automatic reclosing sequence do not need a separate identification under requirement R1. This is consistent with NERC SPCS guidance.

Repeated Misoperations which occur during the same 24 hour period do not need a separate identification under requirement R1. This is consistent with NERC PSMTF guidance.

When Elements are isolated from the BES and undergoing maintenance, they are not subject to the standard, provided they do not result in the operation of any interrupting devices that are part of the BES.

Requirement R2

Requirement R2 ensures notification of those who have a role in identifying Misoperations, but were not accounted for within Requirement R1. In the case of multi-entity ownership, the entity that owns the BES interrupting device that operated is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation under Requirement R1; however, if the entity that owns a BES interrupting device determines that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation, it must notify the other Protection System owner(s) that share Misoperation identification responsibility when the criteria in Requirement R2 is met.

This requirement does not preclude the Protection System owners from initially communicating and working together to determine whether a Misoperation occurred and, if so, the cause. The BES interrupting device owner is only required to officially notify the other owners when it: (1) shares the Composite Protection System ownership with other entity(ies), (2) determines that a Misoperation occurred or cannot rule out a Misoperation, and (3) determines its Protection System component(s) did not cause a Misoperation or is unsure. Officially notifying the other owners without performing a preliminary review may unnecessarily burden the other owners with compliance obligations, redirect valuable resources, and add little benefit to reliability. The BES interrupting device owner should officially notify other owners when appropriate within the established time period.

The following is an example of a notification to another Protection System owner:

> **Example R2a:** Circuit breakers A and B at the Charlie station tripped from directional comparison blocking (DCB) relaying on 03/03/2014 at 15:43 UTC during an external fault. As discussed last week, the fault records indicate that a problem with your equipment (failure to transmit) caused the operation.
>
> **Example R2b:** A generator unit tripped out immediately upon synchronizing to the grid due to a Misoperation of its overcurrent protection. The Transmission Owner owns the 230 kV generator breaker that operated. The Transmission Owner, as the owner of the BES interrupting device after determining that its Protection System components did not cause the Misoperation, was required to notify the Generator Owner of the operation. The Generator Owner investigated to determine if its Protection System components caused the Misoperation. In this example, the Generator Owner's Protection System components did cause the Misoperation. As the owner of the Protection System components that caused the Misoperation, the Generator Owner is responsible for creating and implementing the CAP.

A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the GO and TO functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.

Requirement R3

For Requirement R3 (i.e., notification received), the entity that also owns a portion of the Composite Protection System is expected to use judgment to identify whether the Protection System operation is a Misoperation. A combination of available information from resources such as counters, relay targets, SCADA, DME, and information from the other owner(s) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure, it may decide to identify the operation as a Misoperation and continue its investigation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation.

The entity that is notified by the BES interrupting device owner is allotted the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation date to determine if its portion of the Composite Protection System caused the Protection System operation. It is expected that in most cases of a jointly owned Protection System, the entity making notification would have been in communication with the other owner(s) early in the process. This means that the shorter 60 calendar days only comes into play if the notification occurs in the latter half of the 120 calendar days allotted to the BES interrupting device owner.

The Protection System review may be organized in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System. The BES interrupting device owner's notification received may be documented in a variety of ways such as an email or a facsimile.

Requirement R4

The entity in Requirement R4 (i.e., cause identification), whether it is the entity that owns the BES interrupting device or an entity that was notified, is expected to use due diligence in taking investigative action(s) to determine the cause(s) of an identified Misoperation for its portion of the Composite Protection System. The SMEs developing this standard recognize there will be cases where the cause(s) of a Misoperation will not be revealed during the allotted time periods in Requirements R1 or R3; therefore, Requirement R4 provides the entity a mechanism to continue its investigative work to determine the cause(s) of the Misoperation when the cause is not known.

A combination of available information from resources such as counters, relay targets, SCADA, DME, test results, and studies would typically be used to determine the cause of the Misoperation. At least one investigative action must be performed every two full calendar quarters until the investigation is completed.

The following is an example of investigative actions taken to determine the cause of an identified Misoperation:

> **Example R4a**: A Misoperation was identified on 03/18/2014. A line outage to test the Protection System was scheduled on 03/24/2014 for 12/15/2014 (i.e., beyond the next two full calendar quarters) due to summer peak conditions. The protection engineer contacted the manufacturer on 04/10/2014 (i.e., within two full calendar quarters) to obtain any known issues. The engineer reviewed manufacturer's documents on 05/27/2014. The outage schedule was confirmed on 08/29/2014 and was taken on 12/15/2014. Testing was completed on 12/16/2014 (i.e., in the second two full quarters) revealing the microprocessor relay as the cause of the Misoperation. A CAP is being developed to replace the relay.

Periodic action minimizes compliance burdens and focuses the entity's effort on determining the cause(s) of the Misoperation while providing measurable evidence. The SMEs recognize that certain planned investigative actions may require months or years to schedule and complete; therefore, the entity is only required to perform at least one investigative action every two full calendar quarters. If an investigative action is performed in the first quarter of a calendar year, the next investigative action would need to be performed by the end of the third calendar quarter. If an investigative action is performed in the last quarter of a calendar year, the next investigative action would need to be performed by the end of the second calendar quarter of the following calendar year. Investigative actions may include a variety of actions, such as reviewing DME records, performing or reviewing studies, completing relay calibration or testing, requesting manufacturer review, requesting an outage, or confirming a schedule.

The entity's investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for identifying the Misoperation cause. Historically, approximately 12% of Misoperations are unknown or unexplainable.[5]

Although the entity only has to document its specific investigative actions taken to determine the cause(s) of an identified Misoperation, the entity should consider the benefits of formally organizing (e.g., in a report or database) its actions and findings. Well documented investigative actions and findings may be helpful in future investigations of a similar event or circumstances. A thorough report or database may contain a detailed description of the event, information gathered, investigative actions, findings, possible causes, identified causes, and conclusions. Multiple owners of a Composite Protection System might consider working together to produce a common report for their mutual benefit.

The following are examples of a declaration where no cause was determined:

[5] NERC System Protection and Control Subcommittee. Misoperations Report. April 1, 2013: http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf, Figure 15: NERC Wide Misoperations by Cause Code, pg. 22 of 40.

Example R4b: A Misoperation was identified on 04/11/2014. All relays at station A and B functioned properly during testing on 08/26/2014. The carrier system functioned properly during testing on 08/27/2014. The carrier coupling equipment functioned properly during testing on 08/28/2014. A settings review completed on 09/03/2014 indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be correct, and the equipment at station A and station B is already monitored. The investigation is being closed because no cause was found.

Example R4c: A Misoperation was identified on 03/22/2014. The protection scheme was replaced before the cause was identified. The power line carrier or PLC based protection was replaced with fiber-optic based protection with an in-service date of 04/16/2014. The new system will be monitored for recurrence of the Misoperation.

Requirement R5

Resolving the causes of Protection System Misoperations benefits BES reliability by preventing recurrence. The Corrective Action Plan (CAP) is an established tool for resolving operational problems. The NERC Glossary defines a Corrective Action Plan as, *"A list of actions and an associated timetable for implementation to remedy a specific problem."* Since a CAP addresses specific problems, the determination of what went wrong needs to be completed before developing a CAP. When the Misoperation cause is identified in Requirement R1, R3 or R4, Requirement R5 requires Protection System owner(s) to develop a CAP, or explain why corrective actions are beyond the entity's control or would not improve BES reliability. The entity must create the CAP or make a declaration why additional actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken within 60 calendar days of first determining a cause.

The SMEs developing this standard recognize there may be multiple causes for a Misoperation; in these circumstances, the CAP would include a remedy for the identified causes. The CAP may be revised if additional causes are found; therefore, the entity has the option to create a single or multiple CAPs to correct multiple causes of a Misoperation. The 60 calendar day period for developing a CAP (or declaration) is established on the basis of industry experience which includes operational coordination timeframes, time to consider alternative solutions, coordination of resources, and development of a schedule.

The time periods within Requirement R1, R3 and R5 are distinct and separate. If a cause of a Misoperation is identified quickly, the time period in Requirement R1 or R3 ends and the 60 calendar day period to develop the CAP becomes applicable. The ultimate goal is to keep all time periods as short as possible, including the correction of the cause(s) of the Misoperation. See Requirement R6 for CAP implementation. Where there are multiple Protection System owners involved in a Misoperation, each owner whose Protection System component(s) contributed to the Misoperation is subject to Requirement R5.

The development of a CAP is intended to document the specific corrective actions needed to be taken to prevent Misoperation recurrence, the timetable for executing such actions, and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. The evaluation of these other Protection Systems aims to reduce the risk and likelihood of similar Misoperations in other Protection Systems. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP and an evaluation of other Protection Systems including other locations must be developed to complete Requirement R5.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor and the evaluation of the cause at similar locations which determined capacitor replacement was not necessary.

For completion of the CAPs in examples R5a through R5d, please see examples R6a through R6d.

> **Example R5a:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay has not been experiencing problems and is systematically being replaced with microprocessor relays as Protection Systems are modernized. Therefore, it was assessed that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for the system.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

> **Example R5b:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, a program should be established by 12/01/2014 for wholesale preemptive replacement of capacitors in this type of impedance relay.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

> **Example R5c:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, the preemptive replacement of capacitors in this type of impedance relay should be pursued for the identified stations A through I by 04/30/2015.
>
> A plan is being developed to replace the impedance relay capacitors at stations A, B, and C by 09/01/2014. A second plan is being developed to replace the impedance relay capacitors at stations D, E, and F by 11/01/2014. The last plan will replace the impedance relay capacitors at stations G, H, and I by 02/01/2015.

The following is an example of a CAP for a relay Misoperation that was due to a version 2 firmware problem and the evaluation of the cause at similar locations which determined the firmware needs preemptive correction action.

> **Example R5d:** Actions: Provide the manufacturer fault records. Install new firmware pending manufacturer results by 10/01/2014.
>
> Applicability to other Protection Systems: Based on the evaluation of other locations and a risk assessment, the newer firmware version 3 should be installed at all installations that are identified to be version 2. Twelve relays were identified across the system. Proposed completion date is 12/31/2014.

The following are examples of a declaration made where corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken.

> **Example R5e:** The cause of the Misoperation was due to a non-registered entity communications provider problem.
>
> **Example R5f:** The cause of the Misoperation was due to a transmission transformer tapped industrial customer who initiated a direct transfer trip to a registered entity's transmission breaker.

In situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity's control.

The following are examples of declarations made why corrective actions would not improve BES reliability.

> **Example R5g:** The investigation showed that the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations.
>
> **Example R5h:** As a result of an operation that left a portion of the power system in an electrical island condition, circuit XYZ within that island tripped, resulting in loss of load within the island. Subsequent investigation showed an overfrequency condition persisted after the formation of that island and the XYZ line protective relay operated. Since this relay was operating outside of its designed frequency range and would not be subject to this condition when line XYZ is operated normally connected to the BES, no corrective action will be taken because BES reliability would not be improved.

Example R5i: During a major ice storm, four of six circuits were lost at Station A. Subsequent to the loss of these circuits, a skywire (i.e., shield wire) broke near station A on line AB (between Station A and B) resulting in a phase-phase fault. The protection scheme utilized for both protection groups is a permissive overreaching transfer trip (POTT). The Line AB protection at Station B tripped timed for this event (i.e., Slow Trip – During Fault) even though this line had been identified as requiring high speed clearing. A weak infeed condition was created at Station A due to the loss of 4 transmission circuits resulting in the absence of a permissive signal on Line AB from Station A during this fault. No corrective action will be taken for this Misoperation as even under N-1 conditions, there is normally enough infeed at Station A to send a proper permissive signal to station B. Any changes to the protection scheme to account for this would not improve BES reliability.

A declaration why corrective actions are beyond the entity's control or would not improve BES reliability should include the Misoperation cause and the justification for taking no corrective action. Furthermore, a declaration that no further corrective actions will be taken is expected to be used sparingly.

Requirement R6

To achieve the stated purpose of this standard, which is to identify and correct the causes of Misoperations of Protection Systems for BES Elements, the responsible entity is required to implement a CAP that addresses the specific problem (i.e., cause(s) of the Misoperation) through completion. Protection System owners are required in the implementation of a CAP to update it when actions or timetable change, until completed. Accomplishing this objective is intended to reduce the occurrence of future Misoperations of a similar nature, thereby improving reliability and minimizing risk to the BES.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip (See also, Example R5a).

Example R6a: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

CAP completed on 06/25/2014.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip that resulted in the correction and the establishment of a program for further replacements (See also, Example R5b).

Example R6b: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

A program for wholesale preemptive replacement of capacitors in this type of impedance relay was established on 10/28/2014.

CAP completed on 10/28/2014.

The following is an example of a completed CAP of corrective actions with a timetable that required updating for a failed relay and preemptive actions for similar installations (See also, Example R5c).

Example R6c: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

The impedance relay capacitor replacement was completed at stations A, B, and C on 08/16/2014. The impedance relay capacitor replacement was completed at stations D, E, and F on 10/24/2014. The impedance relay capacitor replacement for stations G, H, and I were postponed due resource rescheduling from a scheduled 02/01/15 completion to 04/01/2015 completion. Capacitor replacement was completed on 03/09/2015 at stations G, H, and I. All stations identified in the evaluation have been completed.

CAP completed on 03/09/2015.

The following is an example of a completed CAP for corrective actions with updated actions for a firmware problem and preemptive actions for similar installations. (See also, Example R5d).

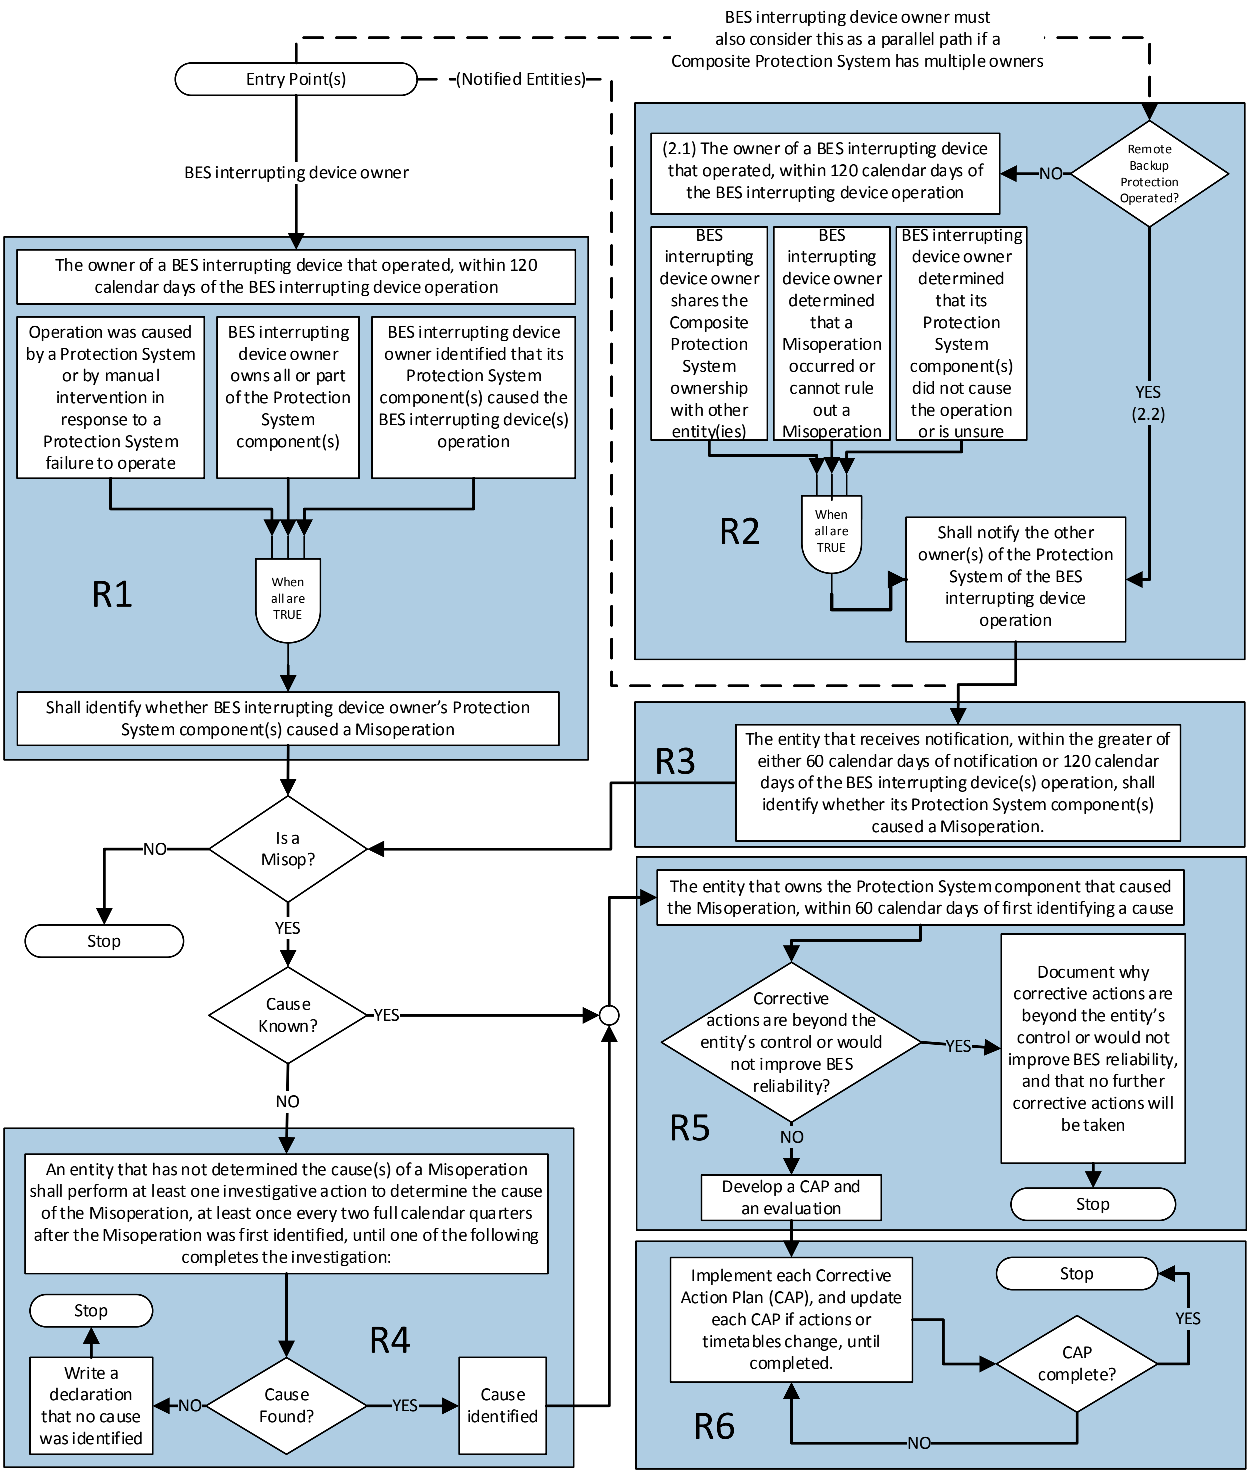
Example R6d: Actions: fault records were provided to the manufacturer on 06/04/2014. The manufacturer responded that the Misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 08/12/2014.

Nine of the twelve relays were updated to version 3 firmware on 09/23/2014. The manufacturer provided a subsequent update which was determined to be beneficial for the remaining relays. The remaining three of twelve relays identified as having the version 2 firmware were updated to version 3.01 firmware on 11/10/2014.

CAP completed on 11/10/2014.

The CAP is complete when all of the actions identified within the CAP have been completed.

Process Flow Chart: Below is a graphical representation demonstrating the relationships between requirements:



Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. The SC authorized moving the SAR forward for standard development at their June 9, 2011 meeting.
2. The SAR was posted for informal comment June 10 – July 11, 2011.
3. Draft 1 of PRC-004-3 was posted for a 30-day formal comment period from June 10 – July 11, 2011.
4. Draft 2 of PRC-004-3 was posted for a 45-day formal comment period from July 25 – September 7, 2012 and an initial ballot in the last ten days of the comment period from August 29 – September 7, 2012.
5. Draft 3 of PRC-004-3 was posted for a 30-day formal comment period from January 22 – February 20, 2013 and a successive ballot in the last ten days of the comment period from February 11-20, 2013.
6. Draft 4 of PRC-004-3 was posted for a 45-day additional comment period from January 17 – March 11, 2014 and an additional ballot in the last ten days of the comment period from February 2 – March 11, 2014 under the new Standards Process Manual (Effective: June 26, 2013).

Description of Current Draft

The Protection System Misoperations Standard Drafting Team (PSMSDT) is posting Draft ~~4~~5 of PRC-004-3 – Protection System Misoperation Identification and Correction for a 45-day additional comment period and additional ballot in the last ten days of the comment period under the new Standards Process Manual (Effective: June 26, 2013).

Anticipated Actions	Anticipated Date
Additional 45-day Formal Comment Period with Parallel Ballot	~~January~~May 2014
10-day Final Ballot	~~March~~July 2014
BOT Approval	~~May~~August 2014

Effective Dates

~~Except in the Western Interconnection, the~~ The standard, the revised definition of "Misoperation" and ~~definitions~~the new definition of "Composite Protection System" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. ~~Except in the Western Interconnection, where~~Where approval by an applicable governmental authority is not required, the standard, the revised definition of "Misoperation" and ~~definitions~~the new definition of "Composite Protection System" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

~~In the Western Interconnection, the standard and definitions shall become effective on the first day of the first calendar quarter that is twenty-four months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. In the Western Interconnection, where approval by an applicable governmental authority is not required, the standard and definitions shall become effective on the first day of the first calendar quarter that is twenty-four months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to "en dash" (–) and "em dash (—)." 2. Added "periods" to items where appropriate. Changed "Timeframe" to "Time Frame" in item D, 1.2.	01/20/06
2		Modified to address Order No. 693 Directives contained in paragraph 1469.	Revised
2	August 5, 2010	Adopted by NERC Board of Trustees	
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by the Board of Trustees	
1a	September 26, 2011	FERC Order issued approving the interpretation of R1 and R3 (FERC's	

		Order is effective as of September 26, 2011)	
2a	September 26, 2011	Appended FERC-approved interpretation of R1 and R3 to version 2	
2.1a		Errata change: Edited R2 to add "…and generator interconnection Facility…"	Revision under Project 2010-07
2.1a	February 9, 2012	Errata change adopted by the Board of Trustees	
2.1a	September 19, 2013	FERC Order issued approving PRC-004-2.1a (approval becomes effective November 25, 2013).	
~~1~~3	TBD	~~Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)~~Adopted by Board of Trustees	~~New~~Revision under Project 2010-05.1

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the *Glossary of Terms used in NERC Reliability Standards* ("NERC Glossary") are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the ~~glossary~~NERC Glossary.

Composite Protection System:

The total complement of ~~the~~ Protection System(s) that function collectively to protect an Element~~, such as any primary, secondary, local backup, and communication-assisted relay systems.~~. Backup protection provided ~~by~~to a remote Protection System is ~~excluded~~included.

Misoperation:

The failure of a Composite Protection System to operate as intended~~.~~ for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition ~~for which it is designed. Delayed clearing~~if the duration of ~~a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or~~its operating time resulted in the operation of ~~any~~at least one other Element's Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition ~~for which it is designed~~, such as a power swing, undervoltage, overexcitation, or loss of excitation~~. Delayed clearing~~, if the duration of ~~a non-Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or~~its operating time resulted in the operation of ~~any~~at least one other Element's Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.
6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition ~~for which it is not designed. A~~. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

When this standard has received ballot approval, the ~~text~~rationale boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System Misoperation Identification and Correction**
2. **Number:** PRC-004-3
3. **Purpose:** Identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements.
4. **Applicability:**

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities:

4.2.1 Protection Systems for BES Elements~~. Non-protective functions that are embedded within a Protection System are excluded. Protective functions intended to operate as a control function during switching are excluded.[1]~~, with the following exclusions:

4.2.1.1 Non-protective functions that are embedded within a Protection System.

4.2.1.2 Protective functions intended to operate as a control function during switching.[2]

4.2.1.3 Special Protection Systems (SPS).

4.2.1.4 Remedial Action Schemes (RAS).

4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

Rationale for Applicability: Protection Systems that protect BES Elements are integral to the operation and reliability of the BES. Some functions of relays are not used as protection but as control functions or for automation; therefore, any operation of the control function portion or the automation portion of relays is excluded from this standard. See the Application Guidelines for detailed examples of non-protective functions. Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are ~~not included~~excluded in this standard because they are planned to be handled in the second phase of this project.

~~[1] For additional information and examples, see the "Non-Protective Functions" and "Control Functions" sections in the Application Guidelines.~~

[2] For additional information and examples, see the "Non-Protective Functions" and "Control Functions" sections in the Application Guidelines.

5. Background:

A key ~~element~~factor for BES reliability is the correct performance of Protection Systems. The monitoring of Protection System events for BES Elements, as well as identifying and correcting the causes of Misoperations, will improve Protection System performance. This Reliability Standard PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In the FERC Order No. 693, the Commission identified PRC-003-0 as a "fill-in-the-blank" standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

This project includes revising the existing definition of Misoperation, which reads:

Misoperation

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity.

In general, this definition needs more specificity and clarity. The terms "specified time" and "abnormal condition" are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical yet explainable condition is a Misoperation.

The SAR for this project also includes clarifying reporting requirements. Misoperation data, as currently collected and reported, is not optimal to establish consistent metrics for measuring Protection System performance. As such, the data reporting obligation for this standard is being removed and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information ("data request"). As a result of the data request, NERC will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. The removal of the data collection obligation from the standard does not result in a reduction of reliability. The standard and data request have been developed in a manner such that evidence used for compliance with the standard and data request are intended to be independent of each other.

The proposed requirements of the revised Reliability Standard PRC-004-3 meet the following objectives:

- Review all Protection System operations on the BES to identify those that are Misoperations of Protection Systems for Facilities that are part of the BES.
- Analyze Misoperations of Protection Systems for Facilities that are part of the BES to identify the cause(s).
- Develop and implement Corrective Action Plans to address the cause(s) of Misoperations of Protection Systems for Facilities that are part of the BES.

Misoperations associated with Special Protection Schemes (SPS) and Remedial Action Schemes (RAS) are not addressed in this standard due to their inherent complexities. NERC plans to handle SPS and RAS in the second phase of this project.

The Western Electric Coordinating Council (WECC) Regional Reliability Standard PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation relates to the reporting of Misoperations of Protection Systems and RAS for a limited set of WECC Paths. The WECC region plans to conduct work to harmonize the regional standard with this continent-wide proposed standard and the second phase of this project concerning SPS and RAS.

6. Effective Dates: ~~See Implementation Plan~~

The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation ~~when~~under the following circumstances: *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and

1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and

1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

~~**M1.**~~ **M1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified the Misoperation of its Protection System component(s), if any, that meet the circumstances in Requirement R1, Parts 1.1, 1.2, and 1.3 within the allotted time period. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to~~,~~ the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R1: This requirement ensures that entities review those Protection System operations meeting the ~~criteria~~circumstances in all three Parts (1.1, 1.2, and 1.3) and identify any that are Misoperations. The BES interrupting device owner ~~has~~is assigned the responsibility to initiate the review because the owner is in the best position to be aware of the operation. Manual intervention is included as a condition that initiates a review. Occasionally, Protection System failures do not yield other Protection System operations and manual intervention is required to isolate the problematic equipment. The 120 calendar day period accounts for the sporadic volumes of Protection System operations, and provides the opportunity to identify any Misoperations which were initially missed.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, ~~notify the other owner(s) of the Protection System of the operation when:~~provide notification as described in 2.1 and 2.2. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

~~2~~**2.1** For a BES interrupting device operation by a Composite Protection System, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:

2.1.1 The BES interrupting device owner shares the Composite Protection System ownership with any other ~~entity~~owner; and

2.1.2 The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and

2.1.3 The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.

2.2 For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.

M2. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates notification to the other owner(s), within the allotted time period for either Requirement R2, Part 2.1, including subparts 2.1.1, 2.1.2, and 2.1.3 and Requirement R2, Part 2.2. Acceptable evidence for Requirement R2, including Parts 2.1~~, 2.2,~~ and 2.~~3~~2 may include, but is not limited to~~,~~ the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

Rationale for R2: ~~This requirement~~Part 2.1 ensures that the BES interrupting device owner notifies the other owners of the Composite Protection System~~ when the criteria in all three Parts (2.1, 2.2, and 2.3) are met~~. The phrase "owner(s) that share Misoperation identification responsibility" allows entities to notify the specific others that will actually review the operation to determine if a Misoperation occurred. Part 2.2 ensures that the Protection System owner(s) for which that backup protection was provided receives notification, within the same 120 calendar day period as R1. This ensures other entities are notified to review their Protection System components. The expectation is that entities will communicate accordingly and when it is clear that ~~the three conditions~~when Part 2.1, 2.2, or both are met, the entity would make the notification. It is not intended for entities to automatically and unnecessarily notify other entities before adequate detail is known.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, ~~shall~~ identify whether its Protection System component(s) caused a Misoperation. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified whether its Protection System component(s) caused a Misoperation within the allotted time period. Acceptable evidence for Requirement R3 may include, but is not limited to~~,~~ the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R3: When an entity receives notification of a Protection System operation by the BES interrupting device owner, the Protection System owner is allotted at least 60 calendar days to identify whether it was a Misoperation. A shorter time period is allotted on the basis that the BES interrupting device owner has already performed preliminary work, collaborated with the other owners, and that other owners generally have fewer associated Protection System components.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: *[Violation Risk Factor: Medium] [Time Horizon: Operations Assessment, Operations Planning]*

- The identification of the cause(s) of the Misoperation; or
- A declaration that no cause was identified.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it performed at least one investigative action according to Requirement R4 every two full calendar quarters until a cause is identified or a declaration is made. Acceptable evidence for Requirement R4 may include, but is not limited to~~,~~ the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R4: If a Misoperation cause is not identified within the time period established by Requirements R1 or R3 (i.e., 120 calendar days), the Protection System component owner must demonstrate investigative actions toward identifying the cause(s). Performing at least one action every two full calendar quarters from first identifying the Misoperation encourages periodic focus on finding the cause of the Misoperation.

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations~~,~~; or
- Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP's applicability to other Protection Systems and locations, or a declaration in accordance with Requirement R5. Acceptable evidence for Requirement R5 may include, but is not limited to~~,~~ the following dated documentation (electronic or hardcopy format): ~~a dated~~ CAP and evaluation, or ~~a dated~~ declaration.

Rationale for R5: A formal CAP is a proven tool for resolving and reducing the possibility of reoccurrence of operational problems. A time period of 60 calendar days is based on industry experience and operational coordination time needed for considering such things as alternative solutions, coordination of resources, or development of a schedule. When the cause of a Misoperation is identified, a CAP will generally be developed. An evaluation of the CAP's applicability to the entity's other Protection Systems including other locations helps identify similar problems, potential for Misoperation occurrences in other Protection Systems, common mode failure, design problems, etc. In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, a statement documenting the reasons for taking no corrective actions is essential for future reference and for justifying the ~~close of the Misoperation in lieu~~absence of a CAP~~ and for future reference~~.

R6. Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. *[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Long-Term Planning]*

M6. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it implemented each CAP, including updating actions or timetables. Acceptable evidence for Requirement R6 may include, but is not limited to~~,~~ the following dated documentation (electronic or hard copy format): ~~dated~~ records that document the implementation of each CAP and the completion of actions for each CAP including revision history of each CAP. Evidence may also include work management program records, work orders, and maintenance records.

Rationale for R6: ~~The~~Each CAP must accomplish all identified objectives to be complete. During the course of implementing a CAP, updates may be necessary for a variety of reasons such as new information, scheduling conflicts, or resource issues. Documenting changes or completion of CAP tivities provides measurable progress and confirmation of completion.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirements R1, R2, R3, and R4, Measures M1, M2, M3, and M4 for 12 calendar months.
- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R5, Measure M5 for 12 calendar months following ~~completion~~development of each CAP, development of each evaluation, and development of each declaration.
- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R6, Measure M6 for 12 calendar months following completion of each CAP.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

Periodic Data Submittal

1.4. Additional Compliance Information

None**.**

D. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to identify whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R2	Operations Assessment, Operations Planning	Medium	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late. OR The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.

Guidelines and Technical Basis

Introduction

This standard addresses the reliability issues identified in the letter[3] from Gerry Cauley, NERC President and CEO, dated January 7, 2011.

> "Nearly all major system failures, excluding perhaps those caused by severe weather, have misoperations of relays or automatic controls as a factor contributing to the propagation of the failure. …Relays can misoperate, either operate when not needed or fail to operate when needed, for a number of reasons. First, the device could experience an internal failure – but this is rare. Most commonly, relays fail to operate correctly due to incorrect settings, improper coordination (of timing and set points) with other devices, ineffective maintenance and testing, or failure of communications channels or power supplies. Preventable errors can be introduced by field personnel and their supervisors or more programmatically by the organization."

The standard also addresses the findings in the 2011 Risk Assessment of Reliability Performance[4]; July 2011.

> "…a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry."

Definitions

The Misoperation definition is based on the IEEE/PSRC Working Group I3 "Transmission Protective Relay System Performance Measuring Methodology[5]." Misoperations of a Protection System include failure to operate, slowness in operating, or operating when not required either during a ~~Fault~~fault or non-~~Fault~~fault condition.

[3] http://www.nerc.com/pa/Stand/Project%20201005%20Protection%20System%20Misoperations%20DL/20110209130708-Cauley%20letter.pdf
[4] http://www.nerc.com/files/2011_RARPR_FINAL.pdf
[5] "Transmission Protective Relay System Performance Measuring Methodology," Working Group I3 of Power System Relaying Committee of IEEE Power Engineering Society, 1999.

For reference, a "Protection System" is defined in the *Glossary of Terms used in NERC Reliability Standards* ("NERC Glossary") as:

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

A BES interrupting device is a BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current. Although BES interrupting device mechanisms are not part of a Protection System, the standard uses the operation of a BES interrupting device by a Protection System to initiate the review for Misoperation.

The following two definitions are being proposed for inclusion in the NERC Glossary:

> **Composite Protection System –** *The total complement of ~~the~~ Protection System(s) that function collectively to protect ~~a~~an Element~~, such as any primary, secondary, local backup, and communication-assisted relay systems.~~. Backup protection provided ~~by~~to a remote Protection System is ~~excluded~~included.*

The Composite Protection System definition is based on the principle that an Element's multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the ~~entity must consider the entire Protection System associated with the BES interrupting device that operated. Additionally, the definition accounts for those Protection Systems with multiple levels of protection (e.g., redundant systems), such that if one component fails, but the overall intended performance of the composite protection is met – it would not be identified as a Misoperation under the definition~~overall performance of an Element's total complement of protection should be considered while evaluating an operation.

Composite Protection System – Line Example

The Composite Protection System of the Alpha-Beta line (Circuit #123) is comprised of current differential, permissive overreaching transfer trip (POTT), step distance (classic zone 1, zone 2, and zone 3), instantaneous-overcurrent, time-overcurrent, out-of-step, and overvoltage protection. The protection is housed at the Alpha and Beta substations, and includes the associated relays, communications systems, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Transformer Example

The Composite Protection System of the Alpha transformer (#2) is comprised of internal differential, overall differential, instantaneous-overcurrent, and time-overcurrent protection. The protection is housed at the Alpha substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Generator Example

The Composite Protection System of the Beta generator (#3) is comprised of generator differential, overall differential, overcurrent, stator ground, reverse power, volts per hertz, loss-of-field, and undervoltage protection. The protection is housed at the Beta generating plant and at the Beta substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Breaker Failure Example

Breaker failure protection provides backup protection for the breaker, and therefore is part of the breaker's Composite Protection System. Considering breaker failure protection to be part of another Element's Composite Protection System could lead to an incorrect conclusion that a breaker failure operation automatically satisfies the "Slow Trip" criteria of the Misoperation definition.

Misoperation – *The failure a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:*

1. **Failure to Trip – During Fault** – *A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*
2. ***Failure to Trip – Other Than Fault*** – *A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*
3. ***Slow Trip – During Fault*** – *A Composite Protection System operation that is slower than required for a Fault condition ~~for which it is designed. Delayed clearing~~if the duration of ~~a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or~~its operating time resulted in the operation of ~~any~~at least one* other *Element's* Composite Protection *System.*
4. ***Slow Trip – Other Than Fault*** – *A Composite Protection System operation that is slower than required for a non-Fault condition ~~for which it is designed~~, such as a power swing, undervoltage, overexcitation, or loss of excitation~~. Delayed clearing~~, if the duration of ~~a non-Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability, or~~its operating time resulted in the operation of ~~any~~at least one* other *Element's* Composite Protection *System.*
5. ***Unnecessary Trip – During Fault*** – *An unnecessary Composite Protection System operation for a Fault condition on another Element.*

6. ***Unnecessary Trip – Other Than Fault*** *– An unnecessary Composite Protection System operation for a non-Fault condition ~~for which it is not designed. A~~. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.*

The Misoperation definition is based on the principle that an Element's total complement of protection is intended to operate dependably and securely.

Failure to automatically reclose after a ~~Fault~~fault condition is not included as a Misoperation because reclosing equipment is not included within the definition of Protection System.

A breaker failure operation does not, in itself, constitute a Misoperation.

A remote backup operation resulting from a "Failure to Trip" or a "Slow Trip" does not, in itself, constitute a Misoperation.

This proposed definition of Misoperation provides additional clarity over the current version. A Misoperation is the failure of a Composite Protection System to operate as intended. The definition includes six categories which provide further differentiation ~~and examples~~ of what ~~is~~constitutes a Misoperation. These categories are discussed in greater detail in the following sections.

Failure to Trip – During Fault

This category of Misoperation typically results in the ~~Fault~~fault condition being cleared by remote backup Protection System operation.

Example 1a: A failure of a transformer's Composite Protection System to operate for a transformer ~~Fault~~fault is a Misoperation.

Example 1b: A failure of a "primary" transformer relay (or any other component) to operate for a transformer ~~Fault~~fault is not a "Failure to Trip – During Fault" Misoperation as long as another component of the transformer's Composite Protection System operated ~~to clear the Fault~~.

Example 1c: A lack of target information does not by itself constitute a Misoperation. When a high-speed pilot system does not target because a high-speed zone element trips first, it would not in and of itself be a Misoperation.

Example 1d: A failure of an overall differential relay to operate is not a "Failure to Trip – During Fault" Misoperation as long as another component such as a generator differential relay operated.

In analyzing the Protection System for Misoperation, the entity must also consider whether the "Slow Trip – During Fault" category applies to the operation.

Failure to Trip – Other Than Fault

This category of Misoperation may have resulted in operator intervention. The "Failure to Trip – Other Than Fault" conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

> **Example 2a:** A failure of a generator's Composite Protection System to operate for an unintentional loss of field condition is a Misoperation.
>
> **Example 2b:** A failure of an overexcitation relay (or any other component) is not a "Failure to Trip – Other Than Fault" Misoperation as long as ~~another component of~~ the generator's Composite Protection System operated as intended ~~(e.g.,~~ isolating the generator~~).~~ from the BES.

In analyzing the Protection System for Misoperation, the entity must also consider whether the "Slow Trip – Other Than Fault" category applies to the operation.

Slow Trip – During Fault

This category of Misoperation typically results in remote backup Protection System operation before the ~~Fault~~fault is cleared.

> **Example 3:** A failure of a line's Composite Protection System to operate as quickly as intended for a line ~~Fault is a Misoperation~~fault is a Misoperation. The current differential element of a multiple function relay failed to operate for a line fault. The same relay's time-overcurrent element operated after a time delay. However, an adjacent line also operated from a time-overcurrent element. The faulted line's time-overcurrent element was found to be set to trip too slowly.

Installing high-speed protection may be a part of a utility's standard practice without having the need for high-speed protection to prevent voltage or dynamic instability or to maintain relay coordination. For this case, a "Slow Trip – During Fault" of the high-speed protection is not a Misoperation because it would not negatively impact the dynamic BES performance, unless the Composite Protection System operation is slower than previously identified as being necessary to prevent voltage or dynamic instability. The Composite Protection System must also coordinate with other Protection Systems to prevent the trip (e.g., an over-trip) of additional Protection Systems.

The phrase "slower than required" means the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System ~~operated slower than the objective of the owner(s).~~. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and stability by the owner(s) reviewing each Protection System operation.

The phrase "resulted in the operation of any other Composite Protection System" refers to the need to ensure that relaying operates in the proper or planned sequence (i.e., the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

In analyzing the Protection System for Misoperation, the entity must also consider the "Unnecessary Trip – During Fault" category to determine if an "unnecessary trip" applies to the Protection System operation of an Element other than the faulted Element.

If a coordination error was at the local terminal (i.e., set too slow), then it was a "Slow Trip," category of Misoperation at the local terminal.

Slow Trip – Other Than Fault

The phrase "slower than required" means the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System ~~operated slower than the objective of the owner(s).~~. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and stability by the owner(s) reviewing each Protection System operation.

> **Example 4:** A failure of a generator's Composite Protection System to operate as quickly as intended for an overexcitation condition is a Misoperation. ~~This category of Misoperation could result in equipment damage.~~

The "Slow Trip – Other Than Fault" conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

Unnecessary Trip – During Fault

An operation of a properly coordinated remote Protection System is not in and of itself a Misoperation if the ~~Fault~~fault has persisted for a sufficient time to allow the correct operation of the Composite Protection System of the ~~Faulted~~faulted Element to clear the ~~Fault~~fault. A BES interrupting device failure, a "failure to trip" Misoperation, or a "slow trip" Misoperation may result in a proper remote Protection System operation.

> **Example 5:** An operation of a transformer's Composite Protection System which trips (i.e., over-trips) for a properly cleared line ~~Fault~~fault is a Misoperation. The ~~Fault~~fault is cleared properly by the faulted equipment's Composite Protection System (i.e., line relaying) without the need for an external Protection System operation resulting in an unnecessary trip of the transformer protection; therefore, the transformer Protection System operation is a Misoperation.

Unnecessary Trip – Other Than Fault

Unnecessary trips for non-~~Fault~~fault conditions include but are not limited to, power swings, overexcitation, loss of excitation, frequency excursions, and normal operations.

> **Example 6a:** An operation of a line's Composite Protection System due to a relay failure during normal operation is a Misoperation.

> **Example 6b:** Tripping a generator by the operation of the loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation assuming the Composite Protection System was not intended to operate under this condition.

Example 6c: An impedance line relay trip for a power swing that entered the relay's characteristic is a Misoperation if the power swing was stable and the relay operated because power swing blocking was enabled and should have prevented the trip, but did not.

Example 6d: Tripping a generator operating at normal load by the operation of a reverse power protection relay due to a relay failure is a Misoperation.

Additionally, an operation that occurs during a non-~~Fault~~fault condition but was initiated directly by on-site (i.e., real-time) maintenance, testing, inspection, construction, or commissioning is not a Misoperation.

Example ~~6d~~6e: A BES interrupting device operation that occurs at the remote end of a line during a non-~~Fault~~fault condition because a direct transfer trip was initiated by system maintenance and testing activities at the local end of the line is not a Misoperation.

The "on-site" activities at one location that initiates a trip to another location are included in this exemption; however, once the maintenance, testing, inspection, construction, or commissioning is complete, the "on-site" Misoperation exclusion no longer applies, regardless of the presence of on-site personnel.

If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip," category of Misoperation at the remote terminal.

Special Cases

Protection System operations for these cases would not be a Misoperation.

Example 7a: A generator Protection System operation prior to closing the unit breaker(s) is not a Misoperation provided no in-service Elements are tripped.

This type of operation is not a Misoperation because the generating unit is not synchronized and is isolated from the BES. Protection System operations which occur with the protected Element out of service, that do not trip any in-service Elements, are not Misoperations.

In some cases where zones of protection overlap, the owner(s) of Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element.

Example 7b: The high-side of a transformer connected to a line may be within the zone of protection of the supplying line's relaying. In this case, the line relaying is planned to protect the area of the high side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for ~~Faults~~faults on the high-side of the connected transformer. Therefore, the operation of the line relaying for a high-side transformer ~~Fault~~fault operated as intended and would not be a Misoperation.

~~The above~~Below are examples ~~only, and do not constitute an all-inclusive list~~ of conditions that would ~~not~~ be a Misoperation.

> **Example7c:** A 230 kV shunt capacitor bank trips due to a settings error in the capacitor bank differential relay upon energization. The operation trips only the capacitor bank breaker that was closed to energize the bank. Since closing the breaker put the capacitor bank into service, this is a Misoperation.
>
> **Example 7d:** A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush following a maintenance outage. Only the high-side breaker opens since the low-side breaker had not yet been closed. Since closing the breaker put the transformer bank into service, this is a Misoperation.

Non-Protective Functions

BES interrupting device operations which are initiated by non-protective functions, such as those associated with generator controls, excitation controls, or turbine/boiler controls, static voltampere-reactive compensators (SVC), flexible ac transmission systems (FACTS), high-voltage dc (HVdc) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. The standard is not applicable to non-protective functions such as automation (e.g., data collection) or control functions that are embedded within a Protection System.

Control Functions

The entity must make a determination as to whether the standard is applicable to each operation of its Protection System in accordance with the provided exclusions in the standard's Applicability, see Section 4.2.1. The subject matter experts (SME) developing this standard recognize that entities use Protection Systems as part of a routine practice to control BES Elements. This standard is not applicable to operation of protective functions within a Protection System when intended for controlling a BES Element as a part of an entity's process or planned switching sequence. The following are examples of conditions to which this standard is not applicable:

> **Example 8a:** The reverse power protective function that operates to remove a generating unit from service using the entity's normal or routine process.
>
> **Example 8b:** The reverse power relay enables a permissive trip and the generator operator trips the unit.
>
> ~~In the example above, the~~

The standard is not applicable~~; however~~ to operation of the protective relay because its operation is intended as a control function as part of a controlled shutdown sequence for the generator. However, the standard remains applicable to operation of the reverse power relay ~~as a part of the generator Protection System~~ when ~~intended to provide generator anti-~~it operates for conditions not associated with the controlled shutdown sequence, such as a motoring ~~protection. For example, reverse power relays are typically installed as~~condition caused by a trip of the ~~primary protection for a generating unit to guard against motoring. Though, operators often take advantage of this functionality and use the Protection System's reverse power protective function as a normal procedure to shutdown a generating unit~~prime mover.

The following is another example of a condition to which this standard is not applicable:

> **Example 8c:** Operation of a capacitor bank interrupting device for voltage control using functions embedded within a microprocessor based relay that is part of a Protection System.

The above are examples only, and do not constitute an all-inclusive list to which the standard is not applicable.

Extenuating Circumstances

In the event of a natural disaster or other extenuating circumstances, the December 20, 2012 Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, ~~says~~reads: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." The Regional Entities to whom NERC has delegated authority will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

The volume of Protection System operations tend to be sporadic. If a high rate of Protection System operations is not sustained, utilities will have an opportunity to catch up within the 120 day period.

Requirement R1

This requirement initiates a review of each BES interrupting device operation to identify whether or not a Misoperation may have occurred. Since the BES interrupting device owner typically monitors and tracks device operations, the owner is the logical starting point for identifying Misoperations of Protection Systems for BES Elements. A review is required when (1) a BES interrupting device operates that is caused by a Protection System or by manual intervention in response to a Protection System failure to operate, (2) regardless of whether the owner owns all or part of the Protection System component(s), and (3) the owner identified ~~that~~ its Protection System component(s) as causing the BES interrupting device operation.

Since most Misoperations result in the operation of one or more BES interrupting devices, these operations initiate a review to identify any Misoperation. If an Element is manually isolated in response to a failure to operate, the manual isolation of the Element triggers a review for Misoperation.

> **Example R1a:** The failure of a loss of field relay on a generating unit where an operator takes action to isolate the unit.

Manual intervention may indicate a Misoperation has occurred, thus requiring the initiation of an investigation by the BES interrupting device owner.

For the case, BES interrupting device did not operate and remote clearing occurs due to the failure of a Composite Protection System to operate, Requirement R2, Part 2.2 requires the entity that had the BES interrupting device operation to notify the other owner(s) to review its portion of Composite Protection System for Misoperation.

Protection Systems are made of many components. These components may be owned by different entities. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner's differential relay. All of these components and many more are part of a Protection System. It is expected that all of the owners will communicate with each other, sharing information freely, so that Protection System operations can be analyzed, Misoperations identified, and corrective actions taken.

Each entity is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation regardless of the level of ownership. A combination of available information from resources such as counters, relay targets, Supervisory Control and Data Acquisition (SCADA) systems, or Disturbance Monitoring Equipment (DME) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure, it may decide to identify the operation as a Misoperation and continue its investigation until the entity determines otherwise. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation. The entity is allotted 120 calendar days from the date of its BES interrupting device operation to identify whether or not a Misoperation of its Protection System component(s) occurred.

The Protection System operation may be documented in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System.

Repeated operations which occur during the same automatic reclosing sequence do not need a separate identification under requirement R1. This is consistent with NERC SPCS guidance.

Repeated Misoperations which occur during the same 24 hour period do not need a separate identification under requirement R1. This is consistent with NERC PSMTF guidance.

When Elements are isolated from the BES and undergoing maintenance, they are not subject to the standard, provided they do not result in the operation of any interrupting devices that are part of the BES.

Requirement R2

~~For~~ Requirement R2 ~~(i.e.,~~ensures notification of those who have a role in identifying Misoperations, but were not accounted for within Requirement R1. In the case of multi-entity ownership~~),~~, the entity that owns the BES interrupting device that operated is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation under Requirement R1; however, if the entity that owns a BES interrupting device determines that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation, it must notify the other Protection System owner(s) that share Misoperation identification responsibility when the criteria in Requirement R2 is met.

This requirement does not preclude the Protection System owners from initially communicating and working together to determine whether a Misoperation occurred and, if so, the cause. The BES interrupting device owner is only required to officially notify the other owners when it: (1) shares the Composite Protection System ownership with other entity(ies), (2) determines that a

Misoperation occurred or cannot rule out a Misoperation, and (3) determines its Protection System component(s) did not cause a Misoperation or is unsure. Officially notifying the other owners without performing a preliminary review may unnecessarily burden the other owners with compliance obligations, redirect valuable resources, and add little benefit to reliability. The BES interrupting device owner should officially notify other owners when appropriate within the established time period.

The following is an example of a notification to another Protection System owner:

> **Example R2a:** Circuit breakers A and B at the Charlie station tripped from directional comparison blocking ~~or~~ (DCB) relaying on 03/03/2014 at 15:43 UTC during an external fault. As discussed last week, the fault records indicate that a problem with your equipment (failure to transmit) caused the operation.

> **Example R2b:** A generator unit tripped out immediately upon synchronizing to the grid due to a Misoperation of its overcurrent protection. The Transmission Owner owns the 230 kV generator breaker that operated. The Transmission Owner, as the owner of the BES interrupting device after determining that its Protection System components did not cause the Misoperation, was required to notify the Generator Owner of the operation. The Generator Owner investigated to determine if its Protection System components caused the Misoperation. In this example, the Generator Owner's Protection System components did cause the Misoperation. As the owner of the Protection System components that caused the Misoperation, the Generator Owner is responsible for creating and implementing the CAP.

A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the GO and TO functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.

Requirement R3

For Requirement R3 (i.e., notification received), the entity that also owns a portion of the Composite Protection System is expected to use judgment to identify whether the Protection System operation is a Misoperation. A combination of available information from resources such as counters, relay targets, SCADA, DME, and information from the other owner(s) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure, it may decide to identify the operation as a Misoperation and continue its investigation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation.

The entity that is notified by the BES interrupting device owner is allotted the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation date to determine if its portion of the Composite Protection System caused the

Protection System operation. It is expected that in most cases of a jointly owned Protection System, the entity making notification would have been in communication with the other owner(s) early in the process. This means that the shorter 60 calendar days only comes into play if the notification occurs in the latter half of the 120 calendar days allotted to the BES interrupting device owner.

The Protection System review may be organized in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System. The BES interrupting device owner's notification received may be documented in a variety of ways such as an email or a facsimile.

Requirement R4

The entity in Requirement R4 (i.e., cause identification), whether it is the entity that owns the BES interrupting device or an entity that was notified, ~~the entity~~ is expected to use due diligence in taking investigative action(s) to determine the cause(s) of an identified Misoperation for its portion of the Composite Protection System. The SMEs developing this standard recognize there will be cases where the cause(s) of a Misoperation will not be revealed during the allotted time periods in Requirements R1 or R3; therefore, Requirement R4 provides the entity a mechanism to continue its investigative work to determine the cause(s) of the Misoperation when the cause is not known.

A combination of available information from resources such as counters, relay targets, SCADA, DME, test results, and studies would typically be used to determine the cause of the Misoperation. At least one investigative action must be performed every two full calendar quarters until the investigation is completed.

The following is an example of investigative actions taken to determine the cause of an identified Misoperation:

> **Example R4a**: A Misoperation was identified on 03/18/2014. A line outage to test the Protection System was scheduled on 03/24/2014 for 12/15/2014 (i.e., beyond the next two full calendar quarters) due to summer peak conditions. The protection engineer contacted the manufacturer on 04/10/2014 (i.e., within two full calendar quarters) to obtain any known issues. The engineer reviewed manufacturer's documents on 05/27/2014. The outage schedule was confirmed on 08/29/2014 and was taken on 12/15/2014. Testing was completed on 12/16/2014 (i.e., in the second two full quarters) revealing the microprocessor relay as the cause of the Misoperation. A CAP is being developed to replace the relay.

Periodic action minimizes compliance burdens and focuses the entity's effort on determining the cause(s) of the Misoperation while providing measurable evidence. The SMEs recognize that certain planned investigative actions may require months or years to schedule and complete; therefore, the entity is only required to perform at least one investigative action every two full calendar quarters. If an investigative action is performed in the first quarter of a calendar year, the next investigative action would need to be performed by the end of the third calendar quarter. If an investigative action is performed in the last quarter of a calendar year, the next investigative action would need to be performed by the end of the second calendar quarter of the following calendar year. Investigative actions may include a variety of actions, such as reviewing DME records, performing or reviewing studies, completing relay calibration or testing, requesting manufacturer review, ~~or~~ requesting ~~a necessary~~an outage, or confirming a schedule.

The entity's investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for identifying the Misoperation cause. Historically, approximately 12% of Misoperations are unknown or unexplainable.[6]

Although the entity only has to document its specific investigative actions taken to determine the cause(s) of an identified Misoperation, the entity should consider the benefits of formally organizing (e.g., in a report or database) its actions and findings. Well documented investigative actions and findings may be helpful in future investigations of a similar event or circumstances. A thorough report or database may contain a detailed description of the event, information gathered, investigative actions, findings, possible causes, identified causes, and conclusions. Multiple owners of a Composite Protection System might consider working together to produce a common report for their mutual benefit.

The following are examples of a declaration where no cause was determined:

> **Example R4b**: A Misoperation was identified on 04/11/2014. All relays at station A and B functioned properly during testing on 08/26/2014. The carrier system functioned properly during testing on 08/27/2014. The carrier coupling equipment functioned properly during testing on 08/28/2014. A settings review completed on 09/03/2014 indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be correct, and the equipment at station A and station B is already monitored. The investigation is being closed because no cause was found.

> **Example R4c:** A Misoperation was identified on 03/22/2014. The protection scheme was replaced before the cause was identified. The power line carrier or PLC based protection was replaced with fiber-optic based protection with an in-service date of 04/16/2014. The new system will be monitored for recurrence of the Misoperation.

Requirement R5

Resolving the causes of Protection System Misoperations benefits BES reliability by preventing recurrence. The Corrective Action Plan ~~or~~ (CAP) is an established tool for resolving operational problems. The NERC Glossary defines a Corrective Action Plan as, *"A list of actions and an associated timetable for implementation to remedy a specific problem."* Since a CAP addresses specific problems, the determination of what went wrong needs to be completed before developing a CAP. When the Misoperation cause is identified in Requirement R1, R3 or R4, Requirement R5 requires Protection System owner(s) to develop a CAP, or explain why corrective actions are beyond the entity's control or would not improve BES reliability. The entity must create the CAP or make a declaration why additional actions are beyond the entity's

[6] NERC System Protection and Control Subcommittee. Misoperations Report. April 1, 2013: http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf, Figure 15: NERC Wide Misoperations by Cause Code, pg. 22 of 40.

control or would not improve BES reliability and that no further corrective actions will be taken within 60 calendar days of first determining a cause.

The SMEs developing this standard recognize there may be multiple causes for a Misoperation; in these circumstances, the CAP would include a remedy for the identified causes. The CAP may be revised if additional causes are found; therefore, the entity has the option to create a single or multiple CAPs to correct multiple causes of a Misoperation. The 60 calendar day period for developing a CAP (or declaration) is established on the basis of industry experience which includes operational coordination timeframes, time to consider alternative solutions, coordination of resources, and development of a schedule.

The time periods within Requirement R1, R3 and ~~Requirement~~ R5 are distinct and separate. If a cause of a Misoperation is identified quickly, the time period in Requirement R1 or R3 ends and the 60 calendar day period to develop the CAP becomes applicable. The ultimate goal is to keep all time periods as short as possible, including the correction of the cause(s) of the Misoperation. See Requirement R6 for CAP implementation. Where there are multiple Protection System owners involved in a Misoperation, each owner whose Protection System component(s) contributed to the Misoperation is subject to Requirement R5.

The development of a CAP is intended to document the specific corrective actions needed to be taken to prevent Misoperation recurrence, the timetable for executing such actions, and an evaluation of the CAP's applicability to the entity’s other Protection Systems including other locations. The evaluation of these other Protection Systems aims to reduce the risk and likelihood of similar Misoperations in other Protection Systems. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP ~~must include~~and an evaluation of other Protection Systems including other locations ~~to~~must be developed to complete Requirement R5.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor and the evaluation of the cause at similar locations which determined capacitor replacement was not necessary.

For completion of the CAPs in examples R5a through R5d, please see examples R6a through R6d.

> **Example R5a:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay has not been experiencing problems and is systematically being replaced with microprocessor relays as Protection Systems are modernized. Therefore, it was assessed that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for the system.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

Example R5b: Actions: Remove the relay from service. Replace capacitor~~.~~ in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, a program should be established by 12/01/2014 for wholesale preemptive replacement of capacitors in this type of impedance relay.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

Example R5c: Actions: Remove the relay from service. Replace capacitor~~.~~ in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, the preemptive replacement of capacitors in this type of impedance relay should be pursued for the identified stations A through I by 04/30/2015.

A plan is being developed to replace the impedance relay capacitors at stations A, B, and C by 09/01/2014. A second plan is being developed to replace the impedance relay capacitors at stations D, E, and F by 11/01/2014. The last plan will replace the impedance relay capacitors at stations G, H, and I by 02/01/2015.

The following is an example of a CAP for a relay Misoperation that was due to a version 2 firmware problem and the evaluation of the cause at similar locations which determined the firmware needs preemptive correction action.

Example R5d: Actions: Provide the manufacturer ~~Fault~~fault records. Install new firmware pending manufacturer results by 10/01/2014.

Applicability to other Protection Systems: Based on the evaluation of other locations and a risk assessment, the newer firmware version 3 should be installed at all installations that are identified to be version 2. Twelve relays were identified across the system. Proposed completion date is 12/31/2014.

The following are examples of a declaration made where corrective actions are beyond the entity’s control or would not improve BES reliability and that no further corrective actions will be taken.

Example R5e: The cause of the Misoperation was due to a non-registered entity communications provider problem.

Example R5f: The cause of the Misoperation was due to a transmission transformer tapped industrial customer who initiated a direct transfer trip to a registered entity’s transmission breaker.

In situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity’s control.

The following ~~in an example~~are examples of ~~a declaration~~declarations made why corrective actions would not improve BES reliability.

Example R5g: The investigation showed that the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations.

Example R5h: As a result of an operation that left a portion of the power system in an electrical island condition, circuit XYZ within that island tripped, resulting in loss of load within the island. Subsequent investigation showed an overfrequency condition persisted after the formation of that island and the XYZ line protective relay operated. Since this relay was operating outside of its designed frequency range and would not be subject to this condition when line XYZ is operated normally connected to the BES, no corrective action will be taken because BES reliability would not be improved.

Example R5i: During a major ice storm, four of six circuits were lost at Station A. Subsequent to the loss of these circuits, a skywire (i.e., shield wire) broke near station A on line AB (between Station A and B) resulting in a phase-phase fault. The protection scheme utilized for both protection groups is a ~~POTT.~~permissive overreaching transfer trip (POTT). The Line AB protection at Station B tripped timed for this event (i.e., Slow Trip – During Fault) even though this line had been identified as requiring high speed clearing. A weak infeed condition was created at Station A due to the loss of 4 transmission circuits resulting in the absence of a permissive signal on Line AB from Station A during this fault. No corrective action will be taken for this Misoperation as even under N-1 conditions, there is normally enough infeed at Station A to send a proper permissive signal to station B. Any changes to the protection scheme to account for this would not improve BES reliability.

A declaration why corrective actions are beyond the entity's control or would not improve BES reliability should include the Misoperation cause and the justification for taking no corrective action. Furthermore, a declaration that no further corrective actions will be taken is expected to be used sparingly.

Requirement R6

To achieve the stated purpose of this standard, which is to identify and correct the causes of Misoperations of Protection Systems for BES Elements, the responsible entity is required to implement a CAP that addresses the specific problem (i.e., cause(s) of the Misoperation) through completion. Protection System owners are required in the implementation of a CAP to update it when actions or timetable change, until completed. Accomplishing this objective is intended to reduce the occurrence of future Misoperations of a similar nature, thereby improving reliability and minimizing risk to the BES.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip (See also, Example R5a).

Example R6a: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. ~~The~~A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

CAP completed on 06/25/2014.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip that resulted in the correction and the establishment of a program for further replacements (See also, Example R5b).

Example R6b: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. ~~The~~A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

A program for wholesale preemptive replacement of capacitors in this type of impedance relay was established on 10/28/2014.

CAP completed on 10/28/2014.

The following is an example of a completed CAP of corrective actions with a timetable that required updating for a failed relay~~;~~ and preemptive actions for similar installations (See also, Example R5c).

Example R6c: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. ~~The~~A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

The impedance relay capacitor replacement was completed at stations A, B, and C on 08/16/2014. The impedance relay capacitor replacement was completed at stations D, E, and F on 10/24/2014. The impedance relay capacitor replacement for stations G, H, and I were postponed due resource rescheduling from a scheduled 02/01/15 completion to ~~03~~04/01/2015~~. Following the timetable change, capacitor~~ completion. Capacitor replacement was completed on 03/09/2015 at stations G, H, and I. All stations identified in the evaluation have been completed.

CAP completed on 03/09/2015.

The following is an example of a completed CAP for corrective actions with updated actions for a firmware problem~~;~~ and preemptive actions for similar installations. (See also, Example R5d).

Example R6d: Actions: ~~Fault~~fault records were provided to the manufacturer on 06/04/2014. The manufacturer responded that the Misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 08/12/2014.

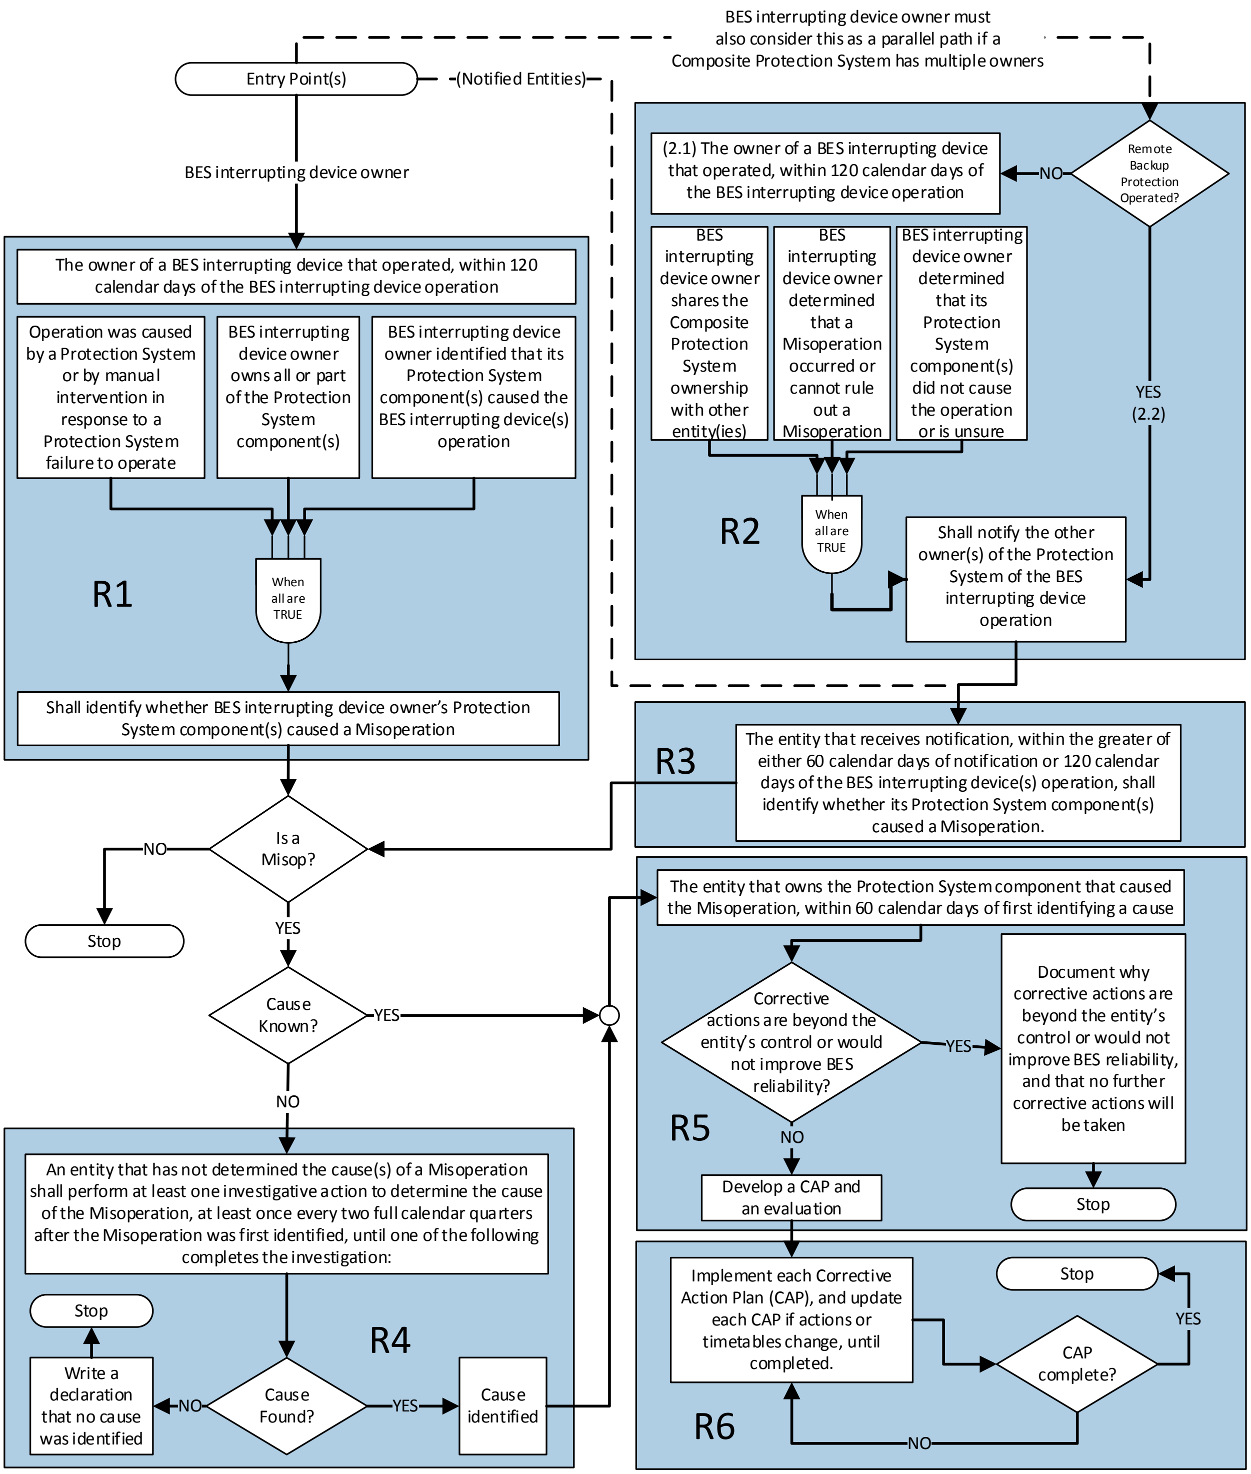
Nine of the twelve relays were updated to version 3 firmware on 09/23/2014. The manufacturer provided a subsequent update which was determined to be beneficial for the remaining relays. The remaining three of twelve relays identified as having the version 2 firmware were updated to version 3.01 firmware on 11/10/2014.

CAP completed on 11/10/2014.

The CAP is complete when all of the ~~documented~~ actions ~~to resolve~~identified within the ~~specific problem (i.e., Misoperation) are~~CAP have been completed~~ which may include those actions~~

~~resulting from the entity's evaluation of other locations, if not addressed through a separate CAP.~~.

Process Flow Chart: Below is a graphical representation ~~of the expected process created by the standard, including~~demonstrating the relationships between requirements:



NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Implementation Plan

Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)

Requested Approvals

- PRC-004-3 – Protection System Misoperation Identification and Correction
- Definitions of "Composite Protection System" and "Misoperation"

Requested Retirements

- PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection System
- PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

Prerequisite Approvals

- None

Revisions to Defined Terms in the NERC Glossary

The standard drafting team proposes the following new definition:

Composite Protection System:

The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided to a remote Protection System is excluded.

The standard drafting team proposes the following revised definition:

Misoperation:

The failure of a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.

3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.
6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction or commissioning activities is not a Misoperation.

General Considerations

The implementation period allows adequate time for applicable entities to develop or modify its procedures and processes for reviewing Protection System operations. The development and implementation of a Corrective Action Plan remains within the scope of PRC-004; therefore, little additional time and resources should be needed to account for the increased detail in the required performance identified in the proposed PRC-004-3 Reliability Standard. The obligation for reporting Misoperations has been removed from PRC-004 and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information.

Applicability

This standard applies to the following functional entities:

- Transmission Owner
- Generator Owner
- Distribution Provider

This standard applies to the following Facilities:

- Protection Systems for BES Elements. Non-protective functions that are embedded within a Protection System are excluded. Protective functions intended to operate as a control function during switching are excluded.
- Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

Effective Dates of New or Revised Standards and Definitions

The standard, the revised definition of "Misoperation" and the new definition of "Composite Protection System" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard, the revised definition of "Misoperation" and the new definition of "Composite Protection System" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Retirement of Existing Standards

The existing standards, PRC-003-1 and PRC-004-2.1a, shall be retired at midnight of the day immediately prior to the Effective Date of PRC-004-3.

Implementation Plan

Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)

Requested Approvals

Background Information

The fourth draft of PRC-004-3 – Protection System Misoperation Identification and Correction Reliability Standard was posted for a 45-day formal comment period from January 17 – March 11, 2014 with an additional ballot in the last ten days of the comment period according to the new Standards Process Manual, June 26, 2013. Stakeholders from approximately 99 companies representing nine of ten industry segments provided comment. The Protection System Misoperation Standard Drafting Team (PSMSDT or SDT) has responded to all commenters and developed a fifth draft of the standard based on stakeholder comment. Changes to the standard include, but are not limited to following areas.

Summary of Changes

The PSMSDT made two substantive revisions to the previous draft 4 following the additional 45-day formal comment period of the standard and additional ballot which received 62.63% stakeholder approval. The following narrative is a summary of the two substantive revisions and other minor revisions made to the proposed draft 5 of the standard.

Definitions

The definition of "Composite Protection System" was revised for clarity. The first substantive revision is the definition of "Misoperation" concerning the two categories of "Slow Trip – During Fault." The revision removes the "a Fault condition is a Misoperation if high-speed performance was previously identified as being necessary to prevent voltage or dynamic instability" and uses the more clear "…if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System." The last category of "Unnecessary Trip – Other Than Fault" was revised slightly to clarify that a Protection System operation caused by on-site personnel is not a Misoperation and the SDT made other corresponding revisions to insert word "Composite" before "Protection System" for consistency with the proposed definition of "Composite Protection System."

Purpose Statement

No revisions.

Facilities
An exclusion for Remedial Action Schemes (RAS) and Special Protection System (SPS) has been provided to increase clarity that these Protection Systems are not applicable to the standard.

Effective Dates
The extended implementation provision of 24 calendar months previously provided to entities in the Western Electric Coordinating Council (WECC) Region was eliminated. The provision was originally proposed due to a perceived conflict that is no longer valid. The effective date language was inserted into Section 6 of the standard for completeness.

Requirement R1
The SDT made a non-substantive revision to more clearly describe that the BES interrupting device operation that meets the three sub-parts (i.e., 1.1, 1.2, and 1.3) must all be true to have a Protection System operation that is reviewable for Misoperation.

Requirement R2
The requirement is the second substantive revision to address a gap in performance identified through continued review during the formal comment period. The previous draft did not have a provision for the responsible entity to initiate a reliability activity under the standard in the case of a Protection System failure to operate a BES interrupting device which is what initiates the activity to review for Misoperation.

The SDT determined that a failed Protection System would cause backup protection to operate other BES interrupting devices; therefore, it is practical to have the responsible entity that provided backup protection to notify the other entity of the potential failure. It is the notification that eliminates the gap and causes the other entity to review the Protection System for Misoperation under the next Requirement, R3.

Requirement R3
Minor word change.

Requirement R4
Minor clarity revision by adding “for a Misoperation” to more clearly reference the Misoperation identified in either Requirement R1 or R3.

Requirement R5
No change.

Requirement R6
No change.

Measures M1-M6
Each of the six Measures were updated to provide the entity that is required to demonstrate compliance, what is demonstrated, and the reference to the corresponding Requirement. Revisions were based on stakeholder comment and to be consistent with drafting team guidance for developing Measures.

Compliance
The SDT clarified for Requirement R5 that evidence retention relates to the "development" of the Corrective Action Plan (CAP), each evaluation, and each declaration.

VRFs and VSLs
The drafting team made a couple of minor typographical corrections identified by stakeholders.

Application Guidelines
The SDT made a significant number of additions and clarifications to address stakeholder comment. Most notably in the section discussing the definition of Composite Protection System.

Questions

Entities are encouraged to answer all questions and provide comment as requested in the questions. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained in this system.

1. Based on stakeholder input, the drafting team revised the proposed definition of "**Misoperation**." Concerning the two categories of "Slow Trip." The drafting team also clarified the proposed definition of "Composite Protection System." Do you agree the revisions provided clarity? If not, please provide specific suggestions for improvement.

   ☐ Yes
   ☐ No
   Comments:

2. Based on stakeholder input, the drafting team revised Requirement R2 to clarify responsibilities when local protection is responsible for the interrupting device operation and when backup protection is responsible. This also addresses the notifications that must occur to eliminate a gap in the previous draft. The gap was a condition where an entity's BES interrupting device did not operate because of a failed Protection System; therefore, would not have been applicable to the standard. Do you agree that the gap has been eliminated with the change to Requirement R2? If not, please provide specific suggestions for improvement.

   ☐ Yes
   ☐ No
   Comments:

3. The drafting team modified the Application Guidelines to improve examples and clarify the team's intent on various topics. Do you agree the Application Guidelines provide sufficient examples and clarity? If not, please provide specific suggestions for improvement.

   ☐ Yes
   ☐ No
   Comments:

4. If you have any other comments on this Standard that were not provided in response to the previous questions, please provide them here:

   Comments:

Mapping Document

Project 2010-05.1 Protection Systems: Phase 1 (Misoperations)

Revisions or Retirements to Already Approved Standards

This mapping document shows the translation of PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems and PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations into the proposed PRC-004-3 – Protection System Misoperation Identification and Correction Reliability Standard. The following table identifies the sections of the approved standard that shall be added, retired, or revised when this standard is implemented. If the standard drafting team is recommending revisions to the standard, those changes are identified in the “Translation to PRC-004-3 or Other Action” column.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
4. Applicability: **4.1.** Regional Reliability Organization	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider	The proposed standard properly assigns responsibility to the registered entity functions that are responsible for Protection System Misoperation identification and correction. The Transmission Owner, Generator Owner, and Distribution Provider, by function, are Protection System asset owners and are in the best position be aware of and apply resources to review Protection System operations.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
R1. Each Regional Reliability Organization shall establish, document and maintain its procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations. These procedures shall include the following elements:		The Requirements in the proposed PRC-004-3 standard by their results-based standard (RBS) construction requires performance that is implicit of having procedures for the analysis of Protection System operations (R1, R2, R3, and R4) and mitigation of identified Misoperations (R5 and R6). The proposed requirements also directs focus to areas most important to reliability. For example, Requirement R1 requires the applicable entity to initiate a review upon a Bulk Electric System (BES) interrupting device operation and identify any Misoperation. Requirement R2 requires the applicable entity to notify all other owners that share a Misoperation identification responsibility of the Composite Protection System when it determines (or is unsure) its Protection System component(s) did not cause the BES interrupting device operation or it cannot rule out a Misoperation. Requirement R3 requires the notified entity to identify any Misoperation of its Protection System component(s) similar to Requirement R1. Requirement R4 directs the applicable entity to

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		continue its investigative work to determine the cause(s) of an identified Misoperation, if not determined in R1 or R3, until the cause(s) is determined or the entity declares that it is unable to determine the cause. Requirements R5 and R6 for developing and implementing a Corrective Action Plan (CAP) are also implicit of having a documented procedure. The implicit performance required by Requirements R1 through R6 necessitate that an entity have procedures to accomplish the objectives of the proposed standard. Requiring the applicable entities to have procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.
R1.1. The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**4.2.** Facilities: **4.2.1** Protection Systems for BES Elements, with the following exclusions: **4.2.1.1** Non-protective functions that are embedded	The previous PRC-003-1, Requirement R1.1 required the Regional Reliability Organization (RRO) to identify the Protection Systems to be reviewed and analyzed for Misoperation. The applicable Facilities have been clarified in the proposed PRC-004-3 to include Protection Systems for

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	within a Protection System. **4.2.1.2** Protective functions intended to operate as a control function during switching. **4.2.1.3** Special Protection Systems (SPS). **4.2.1.4** Remedial Action Schemes (RAS). **4.2.2** Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.	BES Elements. Additional language is provided for clarity that non-protective functions and those protective functions that are intended to operate as a control function (e.g., a reverse power relay operated to remove a generating unit from service as opposed to providing anti-motoring protection) are not applicable. The standard's Applicability is further clarified to include underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements to be more precise. Protection Systems associated with Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are excluded and will be addressed in phase two of this project and have been excluded in the Applicability.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation under the following circumstances:	The applicable entities will be required to identify whether a Misoperation occurred for each BES interrupting device operation which meet criteria 1.1 through 1.3. Requirement R1 is most clearly the direct carryover from the PRC-003-1 Reliability Standard which involves the "owner" of the Protection System. The previous standard was silent on the responsibilities of other Protection System owners and had no provision for

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and **1.2** The BES interrupting device owner owns all or part of the Composite Protection System; and **1.3** The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.	ensuring that other owners had a responsibility to be involved in the review and analysis.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R2.** Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in 2.1 and 2.2.	Requirement R2 asserts a responsibility on the initiating entity (i.e., BES interrupting device owner) to notify other owners of the Composite Protection System when the cause of a Protection System operation was not caused (or is undetermined) by the BES interrupting device owner and a Misoperation occurred (or cannot be

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	2.1 When a BES interrupting device operation by a Composite Protection System, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances: **2.1.1** The BES interrupting device owner shares the Composite Protection System ownership with any other entity; and **2.1.2** The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and **2.1.3** The BES interrupting device owner has determined that its Protection System	ruled out) in accordance with Part 2.1, including sub-parts 2.1.1 through 2.1.3.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation. **2.2** For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.	(Part 2.2) Since Requirement R1 initiates the reliability activity upon the operation of a BES interrupting device, Requirement R1 does not address the case of a Protection System failure where a remote BES interrupting device operates. The second Part 2.2 of Requirement R2 is a provision to require notification to the other owners when a remote BES interrupting device owner in performing Requirement R1 determines that it's Protection System operated as backup for another BES interrupting device which has most likely failed to operate. Part 2.2 requires the other owner for which backup protection was provided to be notified, thus initiating the reliability activity to identify a possible Misoperation under Requirement R3 for the other owner.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation.	Requirement R3 places responsibility on the applicable entity that receives notification to review its Protection System component(s) for Misoperations similar to Requirement R1. It is common practice for the BES interrupting device owner that initiates the review to be in communication and collaboration with other Protection System component(s) owners during its review within the 120 calendar day period. The shorter 60 calendar day period for the notified entity assures that in the rare case where the notifying entity takes the majority of its allotted time (120 days) to review an operation, the receiving entity will always have a minimum and reasonable time (60 days) to conduct its review.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the	Requirement R4 is essentially a new requirement to determine the cause(s) of a Misoperation where the previous requirements (i.e., R1 or R3) failed to reveal the cause(s) of a Misoperation. In most cases, the cause(s) of a Misoperation will be revealed during the course of review and when the cause(s) is not readily apparent, the applicable entity is required in Requirement R4 to

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: • The identification of the cause(s) of the Misoperation; or • A declaration that no cause was identified.	conduct at least one investigative action every two full calendar quarters until the entity determines the cause(s) or declares that it could not determine the cause.
R1.2. Data reporting requirements (periodicity and format) for Misoperations.	None.	NERC Rules of Procedure, Section 1600 Request for Information or Data will replace the reporting obligations of applicable entities. As such, Regional reporting will end and continent-wide single reporting to the Electric Reliability Organization (ERO) will be required. The ERO will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. Metrics will be shared with each Region. The removal of the data collection from the standard does not result in a reduction of reliability.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
R1.3. Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	**R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: • Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations, or • Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.	The proposed PRC-004-3, Requirement R5 provides a step not apparent in the previous PRC-003-1 which is the development of a Corrective Action Plan (CAP) within 60 calendar days of first identifying the Misoperation cause. Requirement R5 also requires each applicable entity to perform an evaluation of the CAP's applicability to the entity's other Protection Systems, including those at other locations. Furthermore, Requirement R5 accounts for those cases why corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken. This could be a result of a cause created by a non-registered third party, such as a communication provider. Also, should implementing the changes not improve BES reliability, the entity may document this as well and not make a change. In cases where the entity, in its judgment, determines that a CAP is not practical for improving BES reliability, the entity must explain in a declaration its conclusions why no further action will be taken.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
(Continued) **R1.3.** Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	**R6.** Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed.	Requirement R6 requires the implementation of the CAP. The applicable entity must update the CAP if actions or timetables change until the CAP is completed.
R1.4. Identification of the Regional Reliability Organization group responsible for the procedures and the process for approval of the procedures.	None.	The proposed PRC-004-3 now requires the applicable entities (GO, DP, and TO) to individually address Misoperations of its Protection Systems for BES Elements without regard to the Region or Regions in which it owns Protection Systems for BES Elements. The proposed PRC-004-3 Reliability Standard, revised definition of “Misoperation,” and new definition of “Composite Protection System” provide sufficient clarity to entities; therefore, there is no reliability benefit to obtain the Regional Entity’s (formerly Regional Reliability Organization or RRO) approval. Each applicable entity will be measured on its performance with the proposed PRC-004-3 requirements.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
R2. Each Regional Reliability Organization shall maintain and periodically update documentation of its procedures for review, analysis, reporting, and mitigation of transmission and generation Protection System Misoperations.	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider	The proposed PRC-004-3 implicitly requires each applicable entity to have its own procedures and processes; therefore, there is no need to have a specific requirement for dictating the updating of such procedures or processes by the previous Regional Reliability Organization (now Regional Entity) or applicable entities. Requiring the applicable entities to update procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.
R3. Each Regional Reliability Organization shall distribute procedures in Requirement 1 and any changes to those procedures, to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator	None.	The proposed PRC-004-3 implicitly requires each applicable entity to have its own procedures and processes; therefore, there is no longer a need to distribute such procedures or processes by the previous Regional Reliability Organization (now Regional Entity) or applicable entities. Requiring the applicable entities to distribute procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
Owners within 30 calendar days of approval of those procedures.		

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
4. Applicability: **4.1.** Transmission Owner **4.2.** Distribution Provider that owns a transmission Protection System **4.3.** Generator Owner	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider **4.2.** Facilities: **4.2.1** Protection Systems for BES Elements, with the following exclusions: **4.2.1.1** Non-protective functions that are embedded within a Protection System. **4.2.1.2** Protective functions intended to operate as a control function during switching. **4.2.1.3** Special Protection Systems (SPS). **4.2.1.4** Remedial Action Schemes (RAS).	The same applicable entities will transition to the new PRC-004-3 standard. The clause about the Distribution Provider "*that owns a transmission Protection System*" has been removed because it was ambiguous. This clause is replaced by "*Protection Systems for BES Elements*" found in Section 4.2, Facilities and applies to all the applicable entities. Having the Applicability section address Facilities specifically removes the ambiguity of what a "*transmission Protection System*" includes. The proposed PRC-004-3 standard is specific that it includes those Protection Systems for BES Elements, including UFLS that is intended to trip one or more BES Elements. Additional language is provided for clarity that non-protective functions and those protective functions that are intended to operate as a control function (e.g., a reverse power relay operated to remove a generating unit from service) are not applicable. Protection Systems associated with Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are

Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.	addressed in phase two of this project and have been excluded in the Applicability.
R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures. **R2.** The Generator Owner shall analyze its generator and generator	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation under the following circumstances: **1.1** The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and **1.2** The BES interrupting device owner owns all or part of the Composite Protection System; and The BES interrupting device owner identified that its Protection System component(s)	The currently approved standard PRC-004-2.1a, Requirements R1 and R2 include three levels of performance which is analyze (Protection System operations), develop (CAP), and implement (CAP). The proposed standard, which includes the same three applicable entities (DP, GO, and TO), divides the three levels of performance into six discrete Requirements. Requirement R1 provides the "analyze" portion, requiring the initiating BES interrupting device owner to review its Protection System for each BES interrupting device operation that meets the three criteria (i.e., 1.1 thorough 1.3). The "analyze" portion is further clarified in the proposed Requirement R2 by ensuring that any other owners of the Composite Protection System are notified when the cause of a Protection System operation was not caused (or is undetermined) by the

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
interconnection Facility Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.	caused the BES interrupting device(s) operation. **R2.** Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in 2.1 and 2.2. **2.1** When a BES interrupting device operation by a Composite Protection System, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances: **2.1.1** The BES interrupting device owner shares the Composite Protection System ownership with any other entity; and	BES interrupting device owner and a Misoperation occurred (or cannot be ruled out) in accordance with criteria 2.1 through 2.3. Requirement R3 provides the necessary performance for the notified Protection System owner to review its component(s) for Misoperation. Last, Requirement R4 requires the applicable entity to conduct investigative actions until it determines the cause(s) or declares that it has been unable to determine the cause(s). Requirement R5 addresses the "develop" a Corrective Action Plan (CAP)" portion, and Requirement R6 addresses the "implement" portion of the CAP.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	2.1.2 The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and **2.1.3** The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation. **2.2** For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's Element, notification of the operation shall be provided to the other Protection

Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	System owner(s) for which that backup protection was provided. **R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation. **R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation:	

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	• The identification of the cause(s) of the Misoperation; or • A declaration that no cause was identified. **R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: • Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations, or • Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.	

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	R6. Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed.	
R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.	None.	Since the NERC Rules of Procedure, Section 1600 Request for Data or Information will replace the reporting obligations, NERC will receive the data on a periodic basis, analyze, establish metrics, and share results accordingly with the Regional Entities as well as industry. Having reporting obligations as a Requirement is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.

Mapping Document

Project 2010-05.1 Protection Systems: Phase 1 (Misoperations)

Revisions or Retirements to Already Approved Standards

This mapping document shows the translation of PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems and PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations into the proposed PRC-004-3 – Protection System Misoperation Identification and Correction Reliability Standard. The following table identifies the sections of the approved standard that shall be added, retired, or revised when this standard is implemented. If the standard drafting team is recommending revisions to the standard, those changes are identified in the "~~Proposed Replacement~~Translation to PRC-004-3 or Other Action" column.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
for Misoperations (due to their potential impact on BES reliability).	operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation ~~when~~under the following circumstances: **1.1** The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and **1.2** The BES interrupting device owner owns all or part of the Composite Protection System; and **1.3** The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.	through 1.3. Requirement R1 is most clearly the direct carryover from the PRC-003-1 Reliability Standard which involves the "owner" of the Protection System. The previous standard was silent on the responsibilities of other Protection System owners and had no provision for ensuring that other owners had a responsibility to be involved in the review and analysis.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R2.** ~~Each~~ Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, ~~notify the other owner(s) of the Protection System of the operation when:~~provide notification as described in 2.1 and 2.2. **2.1** When a BES interrupting device operation by a Composite Protection System, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances: **2.1.1** The BES interrupting device owner shares the Composite Protection	Requirement R2 ~~now~~ asserts a responsibility on the initiating entity (i.e., BES interrupting device owner) to notify other owners of the Composite Protection System when the cause of a Protection System operation was not caused (or is undetermined) by the BES interrupting device owner and a Misoperation occurred (or cannot be ruled out) in accordance with ~~criteria~~Part 2.1, including sub-parts 2.1.1 through 2.1.3.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	System ownership with any other entity; and **2.1.2** The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and **2.1.3** ~~2.3~~ The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation. **2.2** For a BES interrupting device operation by a Protection System	(Part 2.2) Since Requirement R1 initiates the reliability activity upon the operation of a BES interrupting device, Requirement R1 does not address the case of a Protection System failure where a remote BES interrupting device operates. The second Part 2.2 of Requirement R2 is a provision to require notification to the other owners when a remote BES interrupting device owner in performing Requirement R1 determines that it's Protection System

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	component intended to operate as backup protection for a condition on another entity's Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.	operated as backup for another BES interrupting device which has most likely failed to operate. Part 2.2 requires the other owner for which backup protection was provided to be notified, thus initiating the reliability activity to identify a possible Misoperation under Requirement R3 for the other owner.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, ~~shall~~ identify whether its Protection System component(s) caused a Misoperation.	Requirement R3 places responsibility on the applicable entity that receives notification to review its Protection System component(s) for Misoperations similar to Requirement R1. It is common practice for the BES interrupting device owner that initiates the review to be in communication and collaboration with other Protection System component(s) owners during its review ~~with~~within the 120 calendar day period. The shorter 60 calendar day period for the notified entity assures that in the rare case where the notifying entity takes the majority of its allotted time (120 days) to review an operation, the receiving entity will always have

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		a minimum and reasonable time (60 days) to conduct its review.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: • The identification of the cause(s) of the Misoperation; or • A declaration that no cause was identified.	Requirement R4 is essentially a new requirement to determine the cause(s) of a Misoperation where the previous requirements (i.e., R1 or R3) failed to reveal the cause(s) of a Misoperation. In most cases, the cause(s) of a Misoperation will be revealed during the course of review and when ~~a~~the cause(s) is not readily apparent, the applicable entity is required in Requirement R4 to conduct at least one investigative action every two full calendar quarters until the entity determines the cause(s) or declares that it ~~has taken reasonable action and~~ could not determine the cause.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
R1.2. Data reporting requirements (periodicity and format) for Misoperations.	None.	NERC Rules of Procedure, Section 1600 Request for Information or Data will replace the reporting obligations of applicable entities. As such, Regional reporting will end and continent-wide single reporting to the Electric Reliability Organization (ERO) will be required. The ERO will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. Metrics will be shared with each Region. The removal of the data collection from the standard does not result in a reduction of reliability.
R1.3. Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	**R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation:	The proposed PRC-004-3, Requirement R5 provides a step not apparent in the previous PRC-003-1 which is the development of a Corrective Action Plan (CAP) within 60 calendar days of first identifying the Misoperation cause. Requirement R5 also requires each applicable entity to perform an evaluation of the CAP's applicability to the entity's other Protection Systems, including those at other locations.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	• Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations, or • Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.	Furthermore, Requirement R5 accounts for those cases why corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken. This could be a result of a cause created by a non-registered third party, such as a communication provider. Also, should implementing the changes not improve BES reliability, the entity may document this as well~~.~~ and not make a change. In cases where the entity, in its judgment, determines that a CAP is not practical for improving BES reliability, the entity must explain in a declaration its conclusions why no further action will be taken.
(Continued) **R1.3.** Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	**R6.** Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed.	Requirement R6 requires the implementation of the CAP. The applicable entity must update the CAP if actions or timetables change until the CAP is completed.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
R1.4. Identification of the Regional Reliability Organization group responsible for the procedures and the process for approval of the procedures.	None.	The proposed PRC-004-3 now requires the applicable entities (GO, DP, and TO) to individually address Misoperations of its Protection ~~System~~Systems for BES Elements without regard to the Region or Regions in which it owns Protection Systems for BES Elements. The proposed PRC-004-3 Reliability Standard ~~and~~, revised definition of "Misoperation," and new definition of "Composite Protection System" provide sufficient clarity to entities; therefore, there is no reliability benefit to obtain the Regional Entity's (formerly Regional Reliability Organization or RRO) approval. Each applicable entity will be measured on its performance with the proposed PRC-004-3 requirements.
R2. Each Regional Reliability Organization shall maintain and periodically update documentation of its procedures for review, analysis, reporting, and mitigation of transmission	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider	The proposed PRC-004-3 implicitly requires each applicable entity to have its own procedures and processes; therefore, there is no need to have a specific requirement for dictating the updating of such procedures or processes by the previous Regional Reliability Organization (now Regional Entity) or applicable entities. Requiring the applicable entities to

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
and generation Protection System Misoperations.		update procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.
R3. Each Regional Reliability Organization shall distribute procedures in Requirement 1 and any changes to those procedures, to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners within 30 calendar days of approval of those procedures.	None.	The proposed PRC-004-3 implicitly requires each applicable entity to have its own procedures and processes; therefore, there is no longer a need to distribute such procedures or processes by the previous Regional Reliability Organization (now Regional Entity) or applicable entities. Requiring the applicable entities to distribute procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
4. Applicability: **4.1.** Transmission Owner **4.2.** Distribution Provider that owns a transmission Protection System **4.3.** Generator Owner	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider **4.2.** Facilities: **4.2.1** Protection Systems for BES Elements~~.~~, with the following exclusions: **4.2.1.1** Non-protective functions that are embedded within a Protection System ~~are excluded.~~ . **4.2.1.2** Protective functions intended to operate as a control function during switching ~~are excluded.~~. **4.2.1.3** Special Protection Systems (SPS).	The same applicable entities will transition to the new PRC-004-3 standard. The clause about the Distribution Provider "*that owns a transmission Protection System*" has been removed because it was ambiguous. This clause is replaced by "*Protection Systems for BES Elements*" found in Section 4.2, Facilities and applies to all the applicable entities. Having the Applicability section address Facilities specifically removes the ambiguity of what a "*transmission Protection System*" includes. The proposed PRC-004-3 standard is specific that it includes those Protection Systems for BES Elements, including UFLS that is intended to trip one or more BES Elements. Additional language is provided for clarity that non-protective functions ~~are not applicable~~ and those protective functions that are intended to operate as a control function (e.g., a reverse power relay operated to remove a generating unit from service~~).~~) are not applicable. Protection Systems associated with Special Protection Systems (SPS) and Remedial Action

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	4.2.1.4 Remedial Action Schemes (RAS). **4.2.2** Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.	Schemes (RAS) are addressed in phase two of this project~~.~~ and have been excluded in the Applicability.
R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation ~~when~~under the following circumstances: **1.1** The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and **1.2** The BES interrupting device owner owns all or part of the Composite Protection System; and	The ~~already~~currently approved standard PRC-004-2.1a, Requirements R1 and R2 include three levels of performance which is analyze (Protection System operations), develop (CAP), and implement (CAP). The proposed standard, which includes the same three applicable entities (DP, GO, and TO), divides the three levels of performance into six discrete Requirements. Requirement R1 provides the "analyze" portion, requiring the initiating BES interrupting device owner to review its Protection System for each BES interrupting device operation that meets the three criteria (i.e., 1.1 thorough 1.3). The "analyze" portion is further clarified in the proposed Requirement R2 by ensuring that any other owners of the Composite Protection System are

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
R2. The Generator Owner shall analyze its generator and generator interconnection Facility Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.	The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation. **R2.** ~~Each~~ Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, ~~notify the other owner(s) of the Protection System of the operation when:~~provide notification as described in 2.1 and 2.2. **2.1** When a BES interrupting device operation by a Composite Protection System, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:	notified when the cause of a Protection System operation was not caused (or is undetermined) by the BES interrupting device owner and a Misoperation occurred (or cannot be ruled out) in accordance with criteria 2.1 through 2.3. Requirement R3 provides the necessary performance for the notified Protection System owner to review its component(s) for Misoperation. Last, Requirement R4 requires the applicable entity to conduct investigative actions until ~~is~~it determines the cause(s) or declares that it has been unable to determine the cause(s). Requirement R5 addresses the "develop" a Corrective Action Plan (CAP)" portion, and Requirement R6 addresses the "implement" portion of the CAP.

Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.		Requirement is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.

Violation Risk Factors and Violation Severity Level Justifications

PRC-004-3 – Protection System Misoperation Identification and Correction

Project 2010-05.1 – Protection System (Misoperations)

Violation Risk Factor and Violation Severity Level Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in: PRC-004-3 — Protection System Misoperations.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Protection System Misoperations Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project.

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if

violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

The standard drafting team (SDT) also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System: [2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

VRF Discussion

The following discussion addresses how the SDT considered FERC's VRF Guidelines 1 through 5. PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-

004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. ” The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In FERC Order No. 693, the Commission identified PRC-003-0 as a “fill-in-the-blank” standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

The proposed PRC-004-3 Reliability Standard has six (6) discrete requirements that incorporate and enhance the intent of the requirements of PRC-004-2.1a and PRC-003-1. First, the revised standard requires the Transmission Owner, Generator Owner, and Distribution Provider to review each BES interrupting device operation meeting the criteria in Requirement R1, which includes: when caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate and identify each that is a Misoperation; regardless of whether the BES interrupting device owner owns all or part of the Composite Protection System; and when BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

Second, the BES interrupting device owner is required to notify the other Composite Protection System component owner(s) when the criteria in Requirement R2 are met, which includes: Composite Protection System ownership is shared with another owner; the BES interrupting device owner determined that a Misoperation occurred or cannot rule out a Misoperation; and the BES interrupting device owner determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or is unsure.

Third, if a Transmission Owner, Generator Owner, or Distribution Provider is notified by a BES interrupting device owner that the Composite Protection System operated, it must review the operation according to Requirement R3. In most cases, Requirement R1 or R3 will reveal the cause of the Misoperation. If not, Requirement R4 mandates the entity perform investigative action(s) to determine the cause(s) as the fourth discrete Requirement. If a cause is not identified, the entity either may continue its investigation until a cause is identified or the entity may write a declaration that no cause was identified. If a cause is identified, the entity advances to the fifth Requirement.

In Requirement R5, the entity whose Protection System component was identified as the cause of the Misoperation must either develop a Corrective Action Plan (CAP) or explain in a declaration why it cannot correct the cause of the Misoperation. In developing a Corrective Action Plan (CAP) for the identified Protection System component(s), the entity must perform an evaluation of the CAP’s applicability to the entity’s other Protection Systems including other locations. If the entity determines that corrective actions are beyond the entity’s control or would not improve BES reliability, it must explain this in a declaration why no further corrective actions will be taken.

In the last Requirement R6, the entity must implement and complete the CAP. The entity must update the CAP during implementation when actions or timetables change.

The requirements of the proposed PRC-004-3 do not map, one-to-one, with the Requirements of the two legacy standards, PRC-003-1 and PRC-004-2.1a. The new Requirements comingle various reliability attributes of the legacy standards with precise reliability objectives, thus a Requirement-to-Requirement comparison of VRFs is not possible. In developing the new VRFs for the Requirements of PRC-004-3, the Standard Drafting Team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. The VRFs of the FERC approved PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations (R1 & R2 – High VRF), PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation (R1 – Lower VRF), PRC-016-0.1 – Special Protection System Misoperation (R2 – Medium VRF), and PRC-022-1 – Under-Voltage Load Shedding Program Performance (R1 & R1.5 – Medium VRF), all influenced (citing FERC VRF Guideline 3) the drafting team's VRF decisions, as such, the VRFs for PRC-004-3 Requirements R1 through R6 are assigned a VRF of Medium.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered

	intent of the requirement.	intent of the requirement.	cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF and VSL Justifications – PRC-004-3, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Composite Protection System operations reviewed for proper operation by an owner is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.

VRF and VSL Justifications – PRC-004-3, R1	
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which both have a VRF of High. This Requirement R1, to “review” (similar to “analyze”), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“…shall analyze its SPS operations and maintain a record of all misoperations…”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“…shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium. A VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous. The VRF assignment also comports with the currently effective standards PRC-016-0.1 and PRC-022-1.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

VRF and VSL Justifications – PRC-004-3, R1			
	Protection System operations reviewed for proper operation by their owner(s) is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to identify whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1.

VRF and VSL Justifications – PRC-004-3, R1	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The VSLs appropriately assess the severity of the violation with the failure to perform a review for Misoperation as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-004-3, R1	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to notify the other owner(s) of a Composite Protection System when the initiating owner determined its Protection System components did not cause a Misoperation or it did not rule out a Misoperation, could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Unresolved Misoperations of Composite Protection Systems owned by others that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: This is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. A lack of coordination on system protection was one of eight factors common to substantive outages prior to and including the August 14, 2003 Blackout. The initiating entity in the planning time frame is required to notify the other owner(s) of the Composite Protection System component(s) when it determines that (or is unsure whether)its component(s) did not cause a Misoperation or when it is unable to rule out a Misoperation of the Composite Protection System owned by others. This ensures that all owners review their equipment for proper operation which may include checking for proper coordination depending on the circumstances.

VRF and VSL Justifications – PRC-004-3, R2	
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which both have a VRF of High. This requirement and VRF of Medium is consistent with Reliability Standards FAC-008-3 – Facility Ratings, R7 ("…shall provide Facility Ratings (for its solely and jointly owned Facilities…"),MOD-012-0 – Dynamics Data for Modeling and Simulation of the Interconnected Transmission System, R2 ("…shall provide appropriate equipment characteristics and system data…"), and IRO-015-1 – NAME, R1.1 ("…shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas.") which all have a VRF of Medium. Other Protection Systems based Reliability Standards such as PRC-005-1b – Transmission and Generation Protection System Maintenance and Testing, R2 ("…shall provide documentation…"), PRC-016-0.1 – Special Protection System Misoperations, R3 ("…that owns an SPS shall provide documentation of the misoperation analyses…"), and PRC-017-0 – Special Protection System Maintenance and Testing, R2 ("…SPS shall provide documentation of the program…) all have a VRF of Lower; however, these requirements involve the administrative reporting to either the Regional Reliability Organization (now Regional Entity) or NERC and not a reliability function like the previously mentioned FAC-008-3 and MOD-012-0 Reliability Standards. As such, this Requirement R2 is assigned a VRF of Medium because it has a reliability need to be communicated to other owners.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs:

VRF and VSL Justifications – PRC-004-3, R2	
	Failure to notify other entities to review each Protection System operation, identify Misoperations, and determine the cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Unresolved Misoperations of Composite Protection Systems owned by others that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justifications – PRC-004-3, R2			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement is new to the standard and had no previous level of compliance. Other Reliability Standards use a variety of VSLs ranging from a single severe level (i.e., binary), two levels, to four VSL levels. Some use a percentage as the failure of the number entities not notified; however, this would not be practical for this requirement as Composite Protection Systems that are owned by multiple entities is generally limited to one or two owners. The incremental increase in violation is consistent with the NERC Guidelines and is reasonable in consideration of the time periods provided by the Requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.

VRF and VSL Justifications – PRC-004-3, R2	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R3	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure of another Composite Protection System owner to review its component(s) for Misoperation, upon notification, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Composite Protection System operations reviewed for proper operation by the other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.

VRF and VSL Justifications – PRC-004-3, R3	
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which both have a VRF of High. This Requirement R3, to "review" (similar to "analyze"), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 ("…shall analyze its SPS operations and maintain a record of all misoperations…") and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 ("…shall analyze and document all UVLS operations and Misoperations.") which both have a VRF of Medium. A VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.

VRF and VSL Justifications – PRC-004-3, R3	
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure of another Composite Protection System owner to review its component(s) for Misoperation, upon notification, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Composite Protection System operations reviewed for proper operation by the other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justifications – PRC-004-3, R3			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late. OR The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (DP) and R2 (GO & TO) for the notified Protection System owner. The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. A VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.

VRF and VSL Justifications – PRC-004-3, R3	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R4	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to identify the cause(s) of a Misoperation (if not determined in Requirements R1 or R3) could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An Unidentified cause(s) of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. The applicable entity must conduct investigative action(s) to determine the cause(s) of a Misoperation, if not determined during the course of a review as proposed in Requirements R1 and R3.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.

VRF and VSL Justifications – PRC-004-3, R4	
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which have a VRF of High. This Requirement R4, to perform at least one “investigative action” (similar to “analyze”), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“…shall analyze its SPS operations and maintain a record of all misoperations…”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“…shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium. A VRF of Medium is not inadvertently lowering the current VRF of High in the former PRC-004-2.1a, Requirements R1 or R3, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous. This VRF of Medium comports with the VRF assignment of Medium for PRC-004-3, Requirements R1 and R3, which will generally reveal the cause(s) of an identified Misoperation.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to identify the cause(s) of a Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Unidentified causes of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.

VRF and VSL Justifications – PRC-004-3, R4			
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late. OR The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R4	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.

VRF and VSL Justifications – PRC-004-3, R4	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R5	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to develop a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

VRF and VSL Justifications – PRC-004-3, R5	
	An unresolved cause of a Misoperation or failing to consider other locations with similar Protection System components could contribute the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the development of a Corrective Action Plan (CAP) associated with Protection Systems.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which have a VRF of High. This requirement is consistent with Reliability Standards PRC-016-0.1, R2 (“…shall take corrective actions to avoid future Misoperations”), PRC-022-1, R1.5 (“For any Misoperation, a Corrective Action Plan…”), FAC-003, R5 (“…Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management”) all three of which have a VRF of Medium.

VRF and VSL Justifications – PRC-004-3, R5	
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to develop a CAP for a Misoperation with an identified cause or failing to consider other locations with similar components could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An unresolved cause of a Misoperation could contribute the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justifications – PRC-004-3, R5			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation. OR The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation. OR The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation. The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop a CAP or explain in a declaration in accordance with Requirement R5. OR The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR

VRF and VSL Justifications – PRC-004-3, R5			
			The responsible entity failed to develop an evaluation in accordance with Requirement R5.

NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. Varying VSLs are provided for the omission of the evaluation when developing the Corrective Action Plan and for failure to develop the evaluation.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which have varying VSLs. This VSL does not lower the current level of compliance because the former VSL in PRC-004-2.1a was comingled with the other activities. This Requirement has a Severe VSL for failure to develop the CAP with the other VSLs being based on tardiness of the development.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-004-3, R5	
Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justification – PRC-004-3, R6	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to implement a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An uncorrected cause of a Misoperation as a result of not implementing a Corrective Action Plan, could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the implementation of a Corrective Action Plan (CAP) associated with Protection Systems.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.

VRF and VSL Justification – PRC-004-3, R6	
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2.1a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which both have a VRF of High. This requirement is consistent with Reliability Standards PRC-016-0.1, R2 (“…shall take corrective actions to avoid future misoperations.”) and PRC-022-1, R1.5 (“For any Misoperation, a Corrective Action Plan…”) which both have a VRF of Medium. The proposed VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to implement a Corrective Action Plan for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An uncorrected cause of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.

VRF and VSL Justification – PRC-004-3, R6	
Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed Requirement is a Severe VSL for failure to implement the CAP with the Lower VSL being based on the failure of updating the CAP when actions or timetables change which is administrative in nature.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.

VRF and VSL Justification – PRC-004-3, R6	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

Violation Risk Factors and Violation Severity Level Justifications

PRC-004-3 – Protection System Misoperation Identification and Correction

Project 2010-05.1 – Protection System (Misoperations)

Violation Risk Factor and Violation Severity Level Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in: PRC-004-3 — Protection System Misoperations.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Protection System Misoperations Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project.

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

The standard drafting team (SDT) also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System: [2]

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").

[2] Id. at footnote 15.

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

VRF Discussion

The following discussion addresses how the SDT considered FERC's VRF Guidelines 1 through 5. PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. " The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In FERC Order No. 693, the Commission identified PRC-003-0 as a "fill-in-the-blank" standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

The proposed PRC-004-3 Reliability Standard has six (6) discrete requirements that incorporate and enhance the intent of the requirements of PRC-004-2.1a and PRC-003-1. First, the revised standard requires the Transmission Owner, Generator Owner, and Distribution Provider to review each BES interrupting device operation meeting the criteria in Requirement R1, which includes: when caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate and identify each that is a Misoperation; regardless of whether the BES interrupting device owner owns all or part of the Composite Protection System; and when BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

Second, the BES interrupting device owner is required to notify the other Composite Protection System component owner(s) when the criteria in Requirement R2 are met, which includes: Composite Protection System ownership is shared with another ~~entity~~owner; the BES interrupting device owner determined that a Misoperation occurred or cannot rule out a Misoperation; and the BES interrupting device owner determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or is unsure.

Third, if a Transmission Owner, Generator Owner, or Distribution Provider is notified by a BES interrupting device owner that the Composite Protection System operated, it must review the operation according to Requirement R3. In most cases, Requirement R1 or R3 will reveal the cause of the Misoperation. If not, Requirement R4 mandates the entity perform investigative action(s) to determine the cause(s) as the fourth discrete ~~requirement~~Requirement. If a cause is not identified, the entity either may continue its investigation until a cause is identified or the entity may write a declaration that no cause was identified. If a cause is identified, the entity advances to the fifth ~~requirement~~Requirement.

In Requirement R5, the entity whose Protection System component was identified as the cause of the Misoperation must either develop a Corrective Action Plan (CAP) or explain in a declaration why it cannot correct the cause of the Misoperation. In developing a Corrective Action Plan (CAP) for the identified Protection System component(s), the entity must perform an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. If the entity determines that corrective actions are beyond the entity's control or would not improve BES reliability, ~~the entity~~it must ~~make~~explain this in a declaration why ~~and that~~ no further corrective actions will be taken.

In the last ~~of the requirements,~~ Requirement R6, the entity must implement and complete the CAP. The entity must update the CAP during implementation when actions or timetables change.

The requirements of the proposed PRC-004-3 do not map, one-to-one, with the ~~requirements~~Requirements of the two legacy standards, PRC-003-1 and PRC-004-2.1a. The new ~~requirements~~Requirements comingle various reliability attributes of the legacy standards with precise reliability objectives, thus a ~~requirement~~Requirement-to-~~requirement~~Requirement comparison of VRFs is not possible. In developing the new VRFs for the ~~requirements~~Requirements of PRC-004-3, the Standard Drafting Team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. The VRFs of the FERC approved PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations~~,~~ (R1 & R2 – High VRF), PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation~~,~~ (R1 – Lower VRF), PRC-016-0.1 – Special Protection System Misoperation~~,~~ (R2 – Medium VRF), and PRC-022-1 – Under-Voltage Load Shedding Program Performance~~, R1~~ (R1 & R1.5 – Medium VRF), all influenced (citing FERC VRF Guideline 3) the drafting team's VRF decisions, as such, the VRFs for PRC-004-3 Requirements R1 through R6 are assigned a VRF of Medium.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF and VSL Justifications – PRC-004-3, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Composite Protection System operations reviewed for proper operation by ~~their~~an owner~~(s)~~ is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection ~~System~~Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard:

VRF and VSL Justifications – PRC-004-3, R1	
	~~The~~This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which both have a VRF of High. This ~~proposed~~ Requirement R1, to "review" (similar to "analyze"), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 ("…shall analyze its SPS operations and maintain a record of all misoperations…") and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 ("…shall analyze and document all UVLS operations and Misoperations.") which both have a VRF of Medium. ~~The proposed~~A VRF of Medium ~~is~~does not inadvertently ~~lowering~~lower the ~~identified~~current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because ~~the proposed~~this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous. The VRF assignment also comports with the currently effective standards PRC-016-0.1 and PRC-022-1.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs:

VRF and VSL Justifications – PRC-004-3, R1	
	Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Protection System operations reviewed for proper operation by their owner(s) is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justifications – PRC-004-3, R1			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to identify whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. ~~The proposed~~This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The ~~proposed~~ VSLs appropriately assess the severity of the violation with the failure to perform a review for Misoperation as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: ~~The proposed~~This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-004-3, R1	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	~~The proposed~~This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with ~~the requirement.~~this Requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to notify ~~a joint~~the other owner(s) of a Composite Protection System when the initiating owner determined its Protection System components did not cause a Misoperation or it did not rule out a Misoperation, could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Unresolved Misoperations of ~~jointly~~Composite Protection Systems owned ~~equipment or operations~~by others that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report:

VRF and VSL Justifications – PRC-004-3, R2	
	This is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. A lack of coordination on system protection was one of eight factors common to substantive outages prior to and including the August 14, 2003 Blackout. The initiating entity in the planning time frame is required to notify the other owner(s) of the Composite Protection System ~~components~~component(s) when it determines that (or is unsure whether)its ~~components~~component(s) did not cause a Misoperation or when it is unable to rule out a Misoperation of the ~~jointly owned~~ Composite Protection System~~.~~ owned by others. This ensures that all ~~parties~~owners review their equipment for proper operation which may include checking for proper coordination depending on the circumstances.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: ~~The~~This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which ~~as~~both have a VRF of High. ~~The~~This requirement and VRF of Medium is consistent with Reliability Standards FAC-008-3 – Facility Ratings, R7 (“…shall provide Facility Ratings (for its solely and jointly owned Facilities~~…”) and~~ …”),MOD-012-0 – Dynamics Data for Modeling and Simulation of the Interconnected Transmission System, R2 (“…shall provide appropriate equipment characteristics and system data~~…”) which both~~…”), and IRO-015-1 – NAME, R1.1 (“…shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas.”) which all have a VRF of Medium.

VRF and VSL Justifications – PRC-004-3, R2	
	Other ~~protection systems~~Protection Systems based Reliability Standards such as PRC-005-1b – Transmission and Generation Protection System Maintenance and Testing, R2 ("…shall provide documentation…"), PRC-016-0.1 – Special Protection System Misoperations, R3 ("…that owns an SPS shall provide documentation of the misoperation analyses…"), and PRC-017-0 – Special Protection System Maintenance and Testing, R2 ("…SPS shall provide documentation of the program…) all have a VRF of Lower; however, these requirements involve the administrative reporting to either the Regional Reliability Organization (now Regional Entity) or NERC and not a reliability function like the previously mentioned FAC-008-3 and MOD-012-0 Reliability Standards. As such, this Requirement R2 is assigned a VRF of Medium because it has a reliability need to be communicated to other owners.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to notify other entities to review each Protection System operation, identify Misoperations, and determine the cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Unresolved Misoperations of ~~jointly~~Composite Protection Systems owned ~~equipment or operations~~by others that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:

VRF and VSL Justifications – PRC-004-3, R2			
	This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement is new to the standard and had no previous level of compliance. Other Reliability Standards use a variety of VSLs ranging from a single severe level (i.e., binary), two levels, to four VSL levels. Some use a percentage as the failure of the number entities not notified; however, this would not be practical for this requirement as ~~joint ownership~~Composite Protection Systems that are owned by multiple entities is generally limited to one or two owners. The incremental increase in violation is consistent with the NERC Guidelines and is reasonable in consideration of the time periods provided by the Requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: ~~The proposed~~This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	~~The proposed~~This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with ~~the requirement.~~this Requirement.

VRF and VSL Justifications – PRC-004-3, R2	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R3	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure of ~~a joint~~another Composite Protection System owner to review its ~~components~~component(s) for Misoperation, upon notification, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate ~~for Misoperation upon notification~~ could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Composite Protection System operations reviewed for proper operation by the other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection ~~System~~Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.

VRF and VSL Justifications – PRC-004-3, R3	
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: ~~The~~This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which ~~as~~both have a VRF of High. This ~~proposed~~ Requirement ~~R1,~~ R3, to "review" (similar to "analyze"), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 ("…shall analyze its SPS operations and maintain a record of all misoperations…") and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 ("…shall analyze and document all UVLS operations and Misoperations.") which both have a VRF of Medium. ~~The proposed~~A VRF of Medium ~~is~~does not inadvertently ~~lowering~~lower the ~~identified~~current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because ~~the proposed~~this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.

VRF and VSL Justifications – PRC-004-3, R3	
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure of ~~a joint~~another Composite Protection System owner to review its ~~components~~component(s) for Misoperation, upon notification, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate ~~for Misoperation upon notification~~ could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Composite Protection System operations reviewed for proper operation by the other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justifications – PRC-004-3, R3			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late. OR The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (DP) and R2 (GO & TO) for the notified Protection System owner. The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. ~~The proposed~~A VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. ~~The proposed~~This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: ~~The proposed~~This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-004-3, R3	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	~~The proposed~~This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with ~~the requirement.~~this Requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R4	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to identify the cause(s) of a Misoperation (if not determined in Requirements R1 or R3) could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An Unidentified ~~causes~~cause(s) of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. The applicable entity must conduct investigative action(s) to determine the cause(s) of a Misoperation, if not determined during the course of a review as proposed in Requirements R1 and R3.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: ~~The~~This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.

VRF and VSL Justifications – PRC-004-3, R4	
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which ~~as~~have a VRF of High. This~~ proposed~~ Requirement R4, to perform at least one “investigative action” (similar to “analyze”), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“…shall analyze its SPS operations and maintain a record of all misoperations…”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“…shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium. ~~The proposed~~A VRF of Medium is not inadvertently lowering the ~~identified~~current VRF of High in the former ~~Requirement~~PRC-004-2.1a, Requirements R1 or R3, because ~~the proposed~~this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous. This VRF of Medium comports with the VRF assignment of Medium for PRC-004-3, Requirements R1 and R3, which will generally reveal the cause(s) of an identified Misoperation.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to identify the cause(s) of a Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

VRF and VSL Justifications – PRC-004-3, R4			
	Unidentified causes of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late. OR The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.

VRF and VSL Justifications – PRC-004-3, R4	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. ~~The proposed~~This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. ~~The proposed~~This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: ~~The proposed~~This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-004-3, R4	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	~~The proposed~~This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with ~~the requirement.~~this Requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R5	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to develop a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An unresolved cause of a Misoperation or failing to consider other locations with similar Protection System components could contribute the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the development of a Corrective Action Plan (CAP) associated with Protection Systems.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: ~~The~~This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.

VRF and VSL Justifications – PRC-004-3, R5	
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which have ~~varying VSLs.~~ ~~The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The former Requirement for the CAP was limited to a High VSL; however, the proposed Requirement R5 is now expanded to the Severe VSL. The lesser VSLs are based on tardiness and are practical and reasonable for the amount of time allotted for completion.~~a VRF of High. This requirement is consistent with Reliability Standards PRC-016-0.1, R2 (“…shall take corrective actions to avoid future Misoperations”), PRC-022-1, R1.5 (“For any Misoperation, a Corrective Action Plan…”), FAC-003, R5 (“…Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management”) all three of which have a VRF of Medium.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to develop a CAP for a Misoperation with an identified cause or failing to consider other locations with similar components could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An unresolved cause of a Misoperation could contribute the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.

VRF and VSL Justifications – PRC-004-3, R5			
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation. OR The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation. OR The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop a CAP or explain in a declaration in accordance with Requirement R5. OR

VRF and VSL Justifications – PRC-004-3, R5			
			The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop an evaluation in accordance with Requirement R5.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. Varying VSLs are provided for the omission of the evaluation when developing the Corrective Action Plan and for failure to develop the evaluation.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which have varying VSLs. ~~The proposed~~This VSL does not lower the current level of compliance because the former VSL in PRC-004-2.1a was comingled with the other activities. ~~The proposed~~This Requirement ~~is~~has a Severe VSL for failure to develop the CAP with the ~~Lower VSL~~other VSLs being based on tardiness of the development.		

VRF and VSL Justifications – PRC-004-3, R5	
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: ~~The proposed~~This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	~~The proposed~~This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with ~~the requirement.~~this Requirement.
FERC VSL G4	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R5	
Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	

VRF and VSL Justification – PRC-004-3, R6	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to implement a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An uncorrected cause of a Misoperation~~, through~~ as a result of not implementing a Corrective Action Plan, could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.

VRF and VSL Justification – PRC-004-3, R6	
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the implementation of a Corrective Action Plan (CAP) associated with Protection Systems.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: ~~The~~This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-~~2a~~2.1a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which ~~as~~both have a VRF of High. ~~The~~This requirement is consistent with Reliability Standards PRC-016-0.1, R2 ("…shall take corrective actions to avoid future misoperations.") and PRC-022-1, R1.5 ("For any Misoperation, a Corrective Action Plan…") which both have a VRF of Medium. The proposed VRF of Medium ~~is~~does not inadvertently ~~lowering~~lower the ~~identified~~current VRF of High in the former ~~Requirement~~PRC-004-2.1a, Requirements R1 and R2, because ~~the proposed~~this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.

VRF and VSL Justification – PRC-004-3, R6	
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to implement a Corrective Action Plan for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. An uncorrected cause of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justification – PRC-004-3, R6			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity implemented, but failed to update a CAP, when actions or timetables changed, in accordance with Requirement R6.	N/A	N/A	The responsible entity failed to implement a CAP in accordance with Requirement R6.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—The VSLs cover aspects of ~~the requirement~~this Requirement that are not equal in importance and performance.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed Requirement is a Severe VSL for failure to implement the CAP with the Lower VSL being based on the failure of updating the CAP when actions or timetables change which is administrative in nature.		

VRF and VSL Justification – PRC-004-3, R6	
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with ~~the requirement.~~this Requirement.
FERC VSL G4	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justification – PRC-004-3, R6	
Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	

Table of Issues and Directives

Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)

Table of Issues and Directives Associated with PRC-003-1			
Source	**Issue or Directive Language (including Para. #)**	**Section and/or Requirement(s)**	**Consideration of Issue or Directive**
FERC Order No. 693, P 1460.	For the reasons stated in the NOPR, the Commission will not approve or remand PRC-003-1. (For reference) P 1458. In the NOPR, the Commission identified PRC-003-1 as a fill-in-the-blank standard. The NOPR stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-1 until the ERO submitted the additional information.	PRC-004-3	PRC-003-1 will be retired and replaced by PRC-004-3.
FERC Order No. 693, P 1461.	We agree with APPA that the ERO should consider whether greater consistency can be achieved in this Reliability Standard. In Order No.	NERC Rules of Procedure, Section 1600 Request for	PRC-003-1 will be retired and replaced by PRC-004-3. The responsibility to address all aspects of a Protection System Misoperation is assigned to the

Table of Issues and Directives Associated with PRC-003-1			
Source	**Issue or Directive Language (including Para. #)**	**Section and/or Requirement(s)**	**Consideration of Issue or Directive**
	672, the Commission also encouraged greater uniformity in the development of Reliability Standards. Consistent with that goal, the Commission directs the ERO to consider APPA's suggestions in the Reliability Standards development process as it modifies PRC-003-1 to provide missing information needed for the Commission to act on this Reliability Standard (For reference) P 1459. APPA agrees with the Commission's proposed course of action. It states that there are significant and substantive differences between regional procedures due to the characteristics of various regional grids and industry structures. Further it suggests that NERC and the Regional Entities consider whether they can attain greater consistency on an Interconnection-wide basis in completing this Reliability Standard.	Data or Information.	owner(s) of the Protection System(s) - the Transmission Owner, Generation Owner, and Distribution Provider. Additionally, further consistency has been achieved by specifying the data reporting requirements for periodic Misoperations reporting based on a continent-wide template. All reporting of Misoperations will be done through a data request according to the NERC Rules of Procedures, Section 1600, Request for Data or Information instead of having PRC-004-3 specify an administrative reporting requirement.

Table of Issues and Directives Associated with PRC-004-2.1a			
Source	**Issues or Directive Language (including Para. #)**	**Section and/or Requirement(s)**	**Consideration of Issue or Directive**
FERC Order No. 693, P 1469 (first directive only)	We direct the ERO to consider ISO-NE's suggestion that LSEs and transmission operators should be included in the applicability section, in the Reliability Standards development process as it modifies PRC-004-1. (For reference) P 1466. ISO-NE further requests the Commission to direct NERC to modify PRC-004-1 to include LSEs and transmission operators in the applicability section. It states that based on current practice in the ISO-NE balancing area, transmission operators, transmission owners, LSEs and distribution providers may individually or jointly own and operate a protection system. It therefore suggests that transmission operators and LSEs should also be included in the applicability section. ISO-NE provides the same suggestion with regard to PRC-005-1, PRC-008-0, PRC-011-0, PRC-015-0, PRC-016-0, PRC-017-0 and PRC-021-1.	PRC-004-3 all Requirements.	PRC-004-2.1a will be retired and replaced by PRC-004-3.The Transmission Owner, Generator Owner, and Distribution Provider own the BES Protection Systems. The owners of BES Protection Systems have been assigned responsibility for this standard.

Standards Announcement Reminder

Project 2010-05.1 Protection System (Misoperations)

Additional Ballot and Non-Binding Poll
Now Open from June 20, 2014 through June 30, 2014

Now Available

An additional ballot and non-binding Poll for **PRC-004-3 – Protection System Misoperation Identification and Correction** is open from June 20, 2014 through June 30, 2014.

Background information for this project can be found on the project page.

Instructions for Balloting

Members of the ballot pools associated with this project may log in and submit their vote for the standard and non-binding poll of the associated VRFs and VSLs by clicking here.

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a final ballot.

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Scott Barfield-McGinnis.

Standards Announcement

Project 2010-05.1 Protection System (Misoperations)
PRC-004-3

A Formal Comment Period Now Open through June 30, 2014

Upcoming:
Additional Ballot and Non-Binding Poll: June 20-30, 2014

Now Available

A 45-day formal comment period for **PRC-004-3 – Protection System Misoperation Identification and Correction** is open through **8 p.m. Eastern on Monday, June 30, 2014**.

Instructions for Commenting
Please use the electronic form to submit comments on the standard. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps
An additional ballot and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted **June 20-30, 2014**.

For information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller (via email), Standards Development Administrator, or at 404-446-2560.

Standards Announcement

Project 2010-05.1 Protection System: Misoperations PRC-004-3

Additional Ballot and Non-Binding Poll Results

Now Available

An additional ballot of **PRC-004-3 – Protection System Misoperation Identification and Correction** and a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels concluded at **8 p.m. Eastern on Wednesday, July 9, 2014**.

This standard achieved a quorum and sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballot.

Ballot	Non-Binding Poll
Quorum /Approval	Quorum/Supportive Opinions
76.98% / 74.53%	75.52% / 77.59%

Background information for this project can be found on the project page.

Next Steps

The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard and post it for an additional ballot. If the comments do not show the need for significant revisions, the standard will proceed to a final ballot.

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

In the Composite Protection System definition “Backup protection provided to a remote Protection System is included.” is not clear because it directs the focus from the local protected Element to a remote protection system. Suggest revising this sentence to read “Backup protection provided by a remote protection system by design is included.”
No
The case where manual intervention is required to open a BES interrupting device, but the cause of the Misoperation is located on a Protection System component owned by another Transmission Owner is not addressed in R2. In R1 a special mention to manual intervention is included. Why isn’t a process of notification included in R2 for manual intervention caused by Misoperation of another owner’s protection system?
Regarding Section 5: Background (page 6), additional justification to explain the application of the standard would be beneficial. As indicated in our previous comments, we disagreed with the omission of UVLS while UFLS is included. The SDT’s response indicates that UVLS has not been included in the proposed standard’s Applicability because Misoperations of UVLS relays are being addressed under Project 2008-02 – Undervoltage Load Shedding when modifying Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance. This rationale is not sufficient to justify the inclusion of UFLS but exclusion of UVLS since both need to be assessed and treated the same. Note that the SAR for PRC-022-1 is being revised to include UFLS. We suggest the PRC-004 SDT coordinate with the PRC-022 SDT to apply a consistent approach to addressing Misoperations of UFLS and UVLS. Requirement R1 does not work for the case where manual intervention to operate the BES device was required. Parts 1.1 thru 1.3 are all ANDS. Part 1.3 requires the Interrupting Device to be operated by the Protection System. This conflicts with the idea in Part 1.1 of MANUAL intervention. If an operator manually opens a breaker because the Composite Protection System does not clear a fault then the Protection System could not have operated the interrupting device. Therefore the threshold R1 would not be met and no identification is required even though the Composite Protection System may have failed-to-trip. Suggest Part 1.3 be revised to read: The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation; or manual intervention was required to operate the BES interrupting device because its Protection System failed to operate. Requirement R1 can be rephrased to provide clarity to the relationship of Parts 1.1 thru 1.3 to R1. Present phrasing has the added phrase, under the following circumstances, following Misoperation where it can ambiguously modify Misoperation. Clearly the intent is to describe the circumstances that a BES device owner has to embark on a process to identify a Misoperation. There are two inputs prior to beginning the process of identification; first the operation of a BES interrupting device occurs and second that the attributes of Parts 1.1 thru 1.3 are met. It would be clearer to place the reference to

Parts 1.1 thru 1.3 prior to the word identify. Suggest Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated, and where such operation conforms to Parts 1.1 thru 1.3, shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation.

We disagree witht he 60 day limit in R5 to develop a CAP and think it should be 180 days.
Individual
Chris Scanlon
Exelon Companies
Yes
Yes
Yes
Paraphrasing many commenters from draft 4, Exelon agrees emphasis on due dates from the time of an operation be reconsidered. There is a significant administrative burden imposed by the proposed approach not commensurate with gains in reliable operations. The drafting team can review previous comments to this effect as well as references to the use of “calendar” as used in the PRC-005 supplemental reference to preclude the need to have reviews done by a specific date. We disagree with the SDT response that timeframes as proposed are required to force entities to be diligent about identifying and correcting misoperations.

The most recent draft of the proposed standard added a definition for a composite protection system which satisfies our previous concerns.
Yes

We are in agreement that this revision eliminates the identified gap. However, we are still not in agreement that the owner of the interrupting device be responsible for demonstrating compliance with the requirements in the proposed standard, as has been previously stated. This is of particular interest at interface terminals with generator owners.

AEP recommends adding an example to the applications guideline to illustrate that a properly coordinated breaker failure operation does not equate to a “slow trip” type misoperation. AEP recommends adding a backup protection example to the application guidelines to illustrate how R2.2 would be applied. AEP recommends adding an example of a breaker failure misoperation to the application guidelines.
As currently written, R5 may be interpreted as requiring the entity to both develop a CAP and complete the evaluation of the CAP’s applicability to other Protection Systems within 60 days. For large entities, or in cases where the evaluation requires equipment outages, completing the evaluation of applicability within 60 days could be impossible. R5 should be revised to clearly state that the entity is only required to develop a CAP within 60 days. There should be an option to include the evaluation within the CAP. This would enable entities to complete the evaluation as part of the CAP and within a time window that is tailored to the scope of the corrective action and quantity of potentially applicable Protection Systems. AEP supports the concept of evaluating a corrective action’s applicability to other Protection Systems. However, the standard requirements provide no means of measuring what is an adequate evaluation. Without this, an auditor could question the adequacy of an entity’s evaluation, decide that the entity’s actions were not an evaluation and subsequently find the entity non-compliant with R5. We believe that the SDT’s Application Guide examples were an effort to demonstrate what would be acceptable. However, the examples are not exhaustive and therefore do not eliminate the audit risk. AEP believes that subject matter experts are in the best position to determine evaluation scope and content. AEP recommends that in lieu of adding additional examples in the Application Guideline, the drafting team should consider the possibility of an auditor invalidating an evaluation. The requirement should be revised so that it places bounds on this scenario and provide entities with certainty in how R5 might be reviewed by an auditor. AEP supports the overall efforts of the drafting team in the fundamental approach taken in the proposed standard. AEP has chosen to vote in the affirmative despite our concerns regarding the CAP and evaluation within R5, and how their compliance would ultimately be determined by an auditor.

The 2nd sentence in the definition of Composite Protection System is “Backup protection provided to a remote Protection System is included.” The meaning and intention of this phrase is not readily understood. We suggest that the phrase from previous Draft 4: “Backup protection provided by a remote Protection System is excluded“, is clearer and should be re-instated.
Yes
Yes
Facilities, Section 4.2.1, should have an exclusion for individual dispersed generators, or have its applicability limited to the point where the generators are aggregated to greater than 75 MVA. It is critical for the PRC-004-3 SDT to coordinate with the SDT for Project 2014-01, Standards Applicability for Dispersed Generation Resources, to assure that the new standard will have appropriate applicability consistent with BES reliability.

We agree with the Slow Trip changes. However, the revised definition of Composite Protection System caused much discussion. In the end, we would accept it provided that “a remote” in the second sentence is changed to “another.” With this change, the second sentence would read “Backup protection provided to another Protection System is included.” The backup Protection System need not be “remote” physically; it could be located in the same substation. The phrase “a remote Protection System” would require that the backup Protection System be at a different physical location, which may not be the case as we have just described.
Yes
No

In comments for the prior posting, we addressed a “consistency” reporting issue. See our comments and the SDT’s response in the Consideration of Comments document on pp 27-28 and the SDT’s response which is incorporated into the standard in various places. See the Application Guideline change on p. 31 of the redline version, which included this addition: “The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure, it may decide to identify the operation as a Misoperation and continue its investigation until the entity determines otherwise. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation.” The SDT’s language above still allows entities too much latitude in the classification of an operation as a correct Operation or a Misoperation. The classification of an operation as a correct operation or a Misoperation is step 1 in the process. Only if the operation is determined to be a Misoperation is the cause of the Misoperation investigated (step 2). We suggest this guidance: “If the available evidence IS INSUFFICIENT to classify the operation as a Misoperation PRIOR TO THE INVESTIGATION OF THE CAUSE OF A POSSIBLE MISOPERATION, DO NOT CLASSIFY THE OPERATION AS A MISOPERATION.” • A Misoperation with “no cause found” is not equivalent to a correct operation, which is how an unreported Misoperation is interpreted. If an entity classifies an operation as a Misoperation and goes down that path to investigate the cause, it may well conclude that no Misoperation occurred; however, unless its original Misoperation classification is changed to reflect that result, the reported Misoperations will be overstated. Another entity with an identical operation may decide not to classify it as a Misoperation based upon the data available to it absent an investigation of the cause. For the sake of consistent reporting, the classification decision (correct operation or Misoperation) must be reached without a causal investigation, which only takes place if an operation is classified as a Misoperation.
See the Consideration of Comments document, pp. 76-77. We interpreted that the SDT agreed to our proposed changes to R3; however it was not reflected in this draft.

Requirements R1 and R2 place the burden on the owner of a BES interrupting device to initiating a review on the operation of the device. This responsibility should fall on the owner of the components of the Composite Protection System that initiated the BES interrupting device to operate. The owner of these components should be just as aware as the owner of the device regarding its operation. In addition, for those entities that are interconnected and who utilize the same BES interrupting device, those entities should have equal awareness of the BES interrupting device status. Therefore, Seminole recommends that the SDT revise Requirements R1 and R2 to require the entity whose components of the Composite Protection System initiated the BES interrupting device to activate.

Definitions for “Failure to Trip – During Fault” and “Failure to Trip – Other Than Fault” state that “The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct”. However, requirement R1 asks to identify if “Protection System component(s) caused a Misoperation”. These statements seem to contradict each other. Definition for “Unnecessary Trip – Other Than Fault” provides examples for what it is not. It should also provide examples for what it is, similarly with other definitions.
Yes
Yes
Second part of sub-requirement R1.1 “The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate” seems to contradict with sub-requirement R1.3 “The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation”. R1.1 and R1.3 cannot be met at the same time. An entity which receives notification of the BES interrupting device(s) operation in requirement R3 is allotted between 60 and 120 calendar days. However, the BES interrupting device(s) owner(s) are allotted 120 calendar days. Receiving entity also should be allotted full 120 calendar days counting from the day it receives notification. Requirements R1, R2, and R3 are assuming that an entity will make an attempt to determine the cause(s) of a Misoperation. However, an entity can choose to make no effort until requirement R4 becomes applicable. It is suggested to expand requirements R1, R2, and R3 with the obligation for an entity to make an effort to determine the cause(s) of a Misoperation before requirement R4 takes place.

The purpose of the Standard shall be limited only to "Identify and correct the causes of Misoperations of Protection Systems affecting the reliability of the Bulk Electric System (BES)." The Bulk Electric System (BES) Elements or Protection System Misoperations that may affect the reliability of the Bulk Electric System (BES), shall be first identifed by the PC or RC. Requirement R2 The owner of the interrupting device shall share any information he has, that could be used by the other owner of the protection system to determine the cause of the misoperation.
Individual
Don Schmit
Nebraska Public Power District
Yes
No
R2 2.2 states: For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided." Perhaps it would be clearer to state: For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's Element, notification of the operation shall be provided to the other Protection System owner(s) from the backup protection system owner(s) for which that backup protection was provided." A concern with the gap fix is that the backup protection system owner will not be tracking this as a misoperation because the owner of the interrupting device is the one who had the misoperation yet the backup protection owner must store this notification as part of a misoperation on another entities system which creates an odd and risky compliance tracking situation. It would be unfortunate to get fined for not tracking this even though a misoperation did not occur on your system. This is a difficult situation to address. For a backup protection system owner who operates in back up for a fault on a non BES or non-registered entities system is the notification not required?
No
See suggestion below in 4)
The 1.2 Evidence Retention section states 12 months is the required evidence retention period for the requirements. It also notes that "the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit." I would recommend that the evidence retention be longer since it will be difficult to reproduce audit period evidence if it has been discarded. Project 2014-01 Dispersed Generation has noted that PRC-004 needs to be reviewed and updated to direct the industry as to the appropriateness of the BES elements that require misoperation analysis and documentation related to dispersed generation. It is recommended to consider adding these changes rather than issuing multiple versions of this standard unless there is a serious reliability risk with the existing PRC-004 standard. The Draft 5 Application Guidelines states "The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP

and an evaluation of other Protection Systems including other locations must be developed to complete Requirement R5." There are concerns that some CAP evaluations including programs for other locations could be open for long periods of time creating significant audit tracking burdens. Is it acceptable in some cases if a CAP for correcting the issue with equipment that misoperated also has an evaluation to only identify other locations that have a similar issue and once other locations are identified the CAP is considered completed and no other audit tracking is required? If this is acceptable this may be beneficial for cases where there is an issue with a large number of similar breakers, relays, communication schemes, potential devices or current transformers that might be widespread on some systems requiring years to replace or update as part of a program or several programs. If the above is not acceptable as the standard is written consider adding a 3rd bullet to R5 to allow a CAP for the specific misoperations and a requirement to identify other locations or allow a declaration that can be used for creating a CAP for other locations that will be considered separately from PRC-004-3. There are still concerns with including manual intervention as part of R1 since most appear to agree it is rare. Can the SDT provide some thoughts on the best way to guarantee that a manual intervention is duly tracked and provided to the protection departments for review? Perhaps dispatch centers need to have a procedure or process that specifically states "any manual intervention for a failed protection system must be reported to the appropriate protection system owner". Would this be considered a reasonable process approach to satisfy the requirements of auditors that the proper misoperation procedures are in place? It may be that the manual intervention requirement is better suited to the SPS, UFSL, UVLS or plant shutdown schemes since those schemes are more likely to allow operators time to react rather than having manual intervention a part of all types of system operations as it is in R1. Perhaps there are cases where an operator has taken action for a transmission line fault or issue that did not clear with primary/secondary/breaker failure or backup remote clearing but I am not aware of any of these cases. It may be better to clarify the types of practical manual interventions that are intended to be covered by the standard or remove it and place it in another standard mentioned above with clarification for the most practical cases where this should be tracked to simplify the misoperation process documents utilities would likely need to have in place. There is concern that an auditor will have the latitude to ask how you guarantee that you are aware and tracked all manual interventions for protection system failures that have taken place on your system in the last audit period and this could be difficult to prove.
Individual
Michelle D'Antuono
Ingleside Cogeneration LP
Yes
Ingleside Cogeneration ("ICLP") agrees that the drafting team has made a change for the better in the definition of "Misoperation". The prior version would perhaps lead to more technically-accurate identifications of slow-trip incidents, but made too many assumptions around our capability as a GO to conduct a performance evaluation of the Composite Protection System. We simply do not have the tools or training to determine if high-speed performance is necessary to prevent voltage or dynamic instability. In fact, we may not be aware that a slow trip took place if a secondary or back-up Protection System acts in a manner that masks the condition. We believe that improper operation of a nearby Protection System may be an indication that a slow trip occurred. From that point on, an investigation can ensue that has a chance of success – as our investigative capabilities are designed to address such events. In addition, the bright-line definition leaves no room for a violation assessment based upon a CEA's interpretation that the GO should have deployed sophisticated recorders (DME) or situational analysis tools to prepare for a Misoperation of the type.
Yes
ICLP agrees that there are situations where a relay owned by an external entity may trip a circuit breaker protecting an Element owned by another entity. The interrupting device and relay owners will need to coordinate their investigations in order to resolve the issue – and R2 now ensures that the process will be initiated.
Yes
ICLP found the examples provided in the Applications Guidelines to be helpful. In addition, there is a sufficient diversity in scope that will act as a useful reference in the event that we suspect a Misoperation of one of our Composite Protection Systems may have taken place.

Individual
Jonathan Meyer
Idaho Power
Yes
No
Protection Systems regularly provide backup to the next Element. These backup features are not intended to operate under normal conditions and would not be included as part of an Element's Composite Protection System as we interpret it. The phrase “intended to operate” in 2.2 should be modified to account for operations of another Element’s Composite Protection System that could operate as backup to the normal Composite Protection System for an extreme event.
Yes
Group
Tennessee Valley Authority
Dennis Chastain
Currently, there is not a clear indication of regulatory relief for an entity following a major natural disaster. When recovering from major events such as Hurricane Sandy, the first priority is to get lights on and rebuild the system. Because a large natural event produces an influx of unique system configurations that may not have been planned for by system planners or relay setters, analyzing and investigating all the operations and misoperations that occur takes months and is not the top priority for a utility that endures such an event. We respectfully request that the standard drafting committee add wording that states something similar to the following. In the event that the reporting entity is the victim of a weather related Category 4 or 5 event, 90 days are added to each of the required deadlines for misoperations caused by the weather related event.
Individual
Chris Mattson
Tacoma Power
Yes
No
In the Application Guidelines for Unnecessary Trip – Other Than Fault, the following paragraph seems out of place: “If a coordination error was at the remote terminal (i.e., set too fast), then it was an ’Unnecessary Trip,’ category of Misoperation at the remote terminal.” This paragraph seems to focus on a scenario involving a fault. There is concern that, for a very small number of BES interrupting device operations, an entity could fail to identify (formally document) whether or not its Protection System component(s) caused a Misoperation. If this were to occur, it would likely be associated with apparently benign operations, so the likelihood that a misoperation would have occurred is low. Generally, misoperations garner a lot of attention within an entity, so they are generally hard to miss. Even if no misoperation occurred, an entity could be fined up to the maximum allowable for a Medium VRF and Severe VSL for failing to identify that its Protection System component(s) did not cause a Misoperation. The possibility for fines of this magnitude could drive potentially costly measures to ensure zero defects, even though BES reliability would not be impacted by failing to formally identify that an entity’s Protection System component(s) did not cause a Misoperation. Tacoma Power agrees with the spirit of Requirement R1 but believes that compliance and enforcement should be assessed with failure (or tardiness in) identifying that its Protection System component(s) caused a Misoperation. Basically, if an entity does not determine whether or not a Misoperation occurred, they would be implicitly (by default) saying that a

Misoperation did not occur. During an audit, if a BES interrupting device operation caused by a Protection System is uncovered for which no formal (explicit) identification according to Requirement R1 was made, the entity should only be found non-compliant (or penalized) if the CEA believes that a Misoperation did indeed occur. The purpose of the standard is to “identify and correct the causes of Misoperations of Protection Systems...” Perhaps this issue could be addressed in the Application Guidelines. Even though Requirement R1, Part 1.1, stipulates that “the BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate,” to what extent will entities be required to prove that BES interrupting device operations were not caused by a Protection System operation? The potential risk of failing to satisfy Requirement R1 seems high enough that entities may take costly measures to ensure zero defects, out of an abundance of caution, by excessively reviewing BES interrupting device operations. This additional cost could be better served in other areas to support BES reliability. Perhaps this issue could be addressed in the Application Guidelines. In the Application Guidelines for Requirement R1, change “For the case,...” to “For the case in which a...” Furthermore, should this paragraph be included under the Requirement R2 portion of the Application Guidelines? In the Application Guidelines for Requirements R1 and R3, change “The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion” to something like “The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred.” The concern is that the CEA could require an entity to leverage all available data before determining that a Misoperation did not occur. Tacoma Power appreciates the following paragraph in the Application Guidelines for Requirement R2: “A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the GO and TO functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.” In the Application Guidelines for Requirement R4, Example R4a, was the scheduling activity on 03/24/2014 considered to be the first investigative action pursuant to Requirement R4, or did the first investigative action pursuant to Requirement R4 occur on 4/10/2014? Regarding Requirements R1, R3, and R4, is the date when an entity identifies that its Protection System component(s) caused a Misoperation the date that they officially make the identification? As long as an entity is compliant with Requirement R1 or R3, as applicable, are they afforded some discretion as to the identification date? It seems like the timeline for Requirement R4 should be based on 120 calendar days of the BES interrupting device operation, for Misoperations identified pursuant to Requirement R1, or the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, for Misoperations identified pursuant to Requirement R3. As written now, those entities who quickly identify Misoperations will have compliance obligations under Requirement R4 sooner. On the other hand, an entity that delays officially identifying a Misoperation could be looking for causes ahead of time such that they effectively bypass Requirement R4. Perhaps this issue could be addressed in the Application Guidelines. The objective here is not to make the standard more complicated but to avoid misunderstanding that might surface during an audit. Similarly, regarding Requirement R4 and R5, is the date when an entity determines the cause(s) of a Misoperation the date that they officially make the determination? Perhaps this issue could be addressed in the Application Guidelines. Again, the objective here is not to make the standard more complicated but to avoid misunderstanding that might surface during an audit. In the Application Guidelines for Requirement R6, change “...were postponed due resource...” to “...were postponed due to resource...” If manual intervention in response to a Protection System failure to operate is required, this could imply that both the primary Composite Protection System and remote backup Composite Protection System(s) failed to operate, assuming that remote backup could be configured reliably to detect the fault under the pre-fault power system conditions. Would this condition automatically mean that multiple Composite Protection Systems, potentially at multiple locations (both primary and remote backup), misoperated? Perhaps this issue could be addressed in the Application Guidelines.
Although the term is discussed in the Application Guidelines, consider formally defining the term ”interrupting device.” In Requirement R3, should “BES interrupting device(s)” be “BES interrupting

device”? In Requirement R4, should “the cause” be “the cause(s)”? In Requirement R5, should “a cause” be “the cause” or “the cause(s)”? In the Rationale for R6, change “tivities” to “activities.”

We generally agree with the changes to the proposed definition of Misoperation, but do not agree with the proposed addition of the term Composite Protection System. In our previous comments, we expressed our disagreement with the need to create a defined term “Composite Protection System”. By definition, a Protection System is already a composite system whose components need to function collectively to protect an Element. The proposed term is therefore redundant. In the comment report, the SDT’s response indicates that the reason for proposing the newly defined term, “Composite Protection System,” is found in the Application Guidelines under the heading “Definitions.”, and therefore no change was made. In the Application Guideline, the rationale provided for introducing this new term is that: [The Composite Protection System definition is based on the principle that an Element’s multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element’s total complement of protection should be considered while evaluating an operation.] We find this rationale insufficient to justify the introduction of the new term since by having the defined term “Misoperation” which covers any failure a Protection System to operate as intended for protection purposes would suffice to include the effect of multiple levels of protection (e.g. redundant systems). In other words, if a Protection System failed to operate as intended or operated unnecessarily, then regardless of the level of protection and which component caused the Protection System to operate, the action/inaction of the Protection System – Composite or otherwise, would constitute a Misoperation. We therefore continue to disagree with the proposed addition of this new term, and suggest that it be removed.

Yes
No
We do not agree with the part on Composite Protection System, for the reasons indicated under Q1, above.
As indicated in our previous comments, we disagreed with the omission of UVLS while UFLS is included. The SDT's response indicates that UVLS has not been included in the proposed standard's Applicability because Misoperations of UVLS relays are being addressed under Project 2008-02 – Undervoltage Load Shedding when modifying Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance. We do not find this rationale sufficient to justify the inclusion of UFLS but exclusion of UVLS since both need to be assessed and treated under the same light. Note that the SAR for Project PRC-022-1 is being revised to include UFLS. We suggest the PRC-004 SDT to coordinate with the PRC-022 SDT to apply a consistent approach to addressing Misoperations of UFLS and UVLS.

Oncor Electric Delivery LLC
Yes
Yes
No
Since the last Standard draft, the SDT has added a new example on page 29 of the Application Guideline which states "Example 7d: A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush following a maintenance outage. Only the high-side breaker opens since the low-side breaker had not yet been closed. Since closing the breaker put the transformer bank into service, this is a Misoperation." Although this scenario would be an undesired trip, without the low side breaker closed the transformer will not feed load. With that said, tripping of the high side will not compromise reliability of the BES although it is undesirable. Oncor has not seen a perfect relay that will respond ideally during the reenergization of a transformer with magnetizing current. For the reason just described, the possibility of tripping a transformer unnecessarily during energization (with no load connected) is preferable to desensitizing the protection further such that it might not operate when necessary.
Oncor initially balloted affirmative; however, based on the changes in the Application Guide, Oncor's ballot position has changed. Oncor's comments have been provided for the SDT's consideration (response to Question #3) Oncor requests the SDT please consider the additional comment below: In "R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation under the following circumstances: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning] 1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and 1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and 1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation." The circumstances mentioned in 1.1 and 1.3 cause confusion when you do not have a protection system component cause the BES interrupting device operation in the event a BES device is operated by manual intervention. Oncor recommends that 1.3 be written to state: The BES interrupting device owner identified that its Protection System component(s) were designed to cause the BES interrupting device(s) operation. The request below is an outstanding request from Oncor's previous comment period: The Extenuating Circumstances process, as outlined on page 30 of the Application Guidelines, relies too heavily on a subjective review by Enforcement to determine whether penalties will be imposed. In alignment with the Reliability Assurance Initiative Oncor recommends the evaluation of an Extenuating Circumstance be initially reviewed by Compliance Operations in accordance with the system-wide and regional risk framework, an entity's inherent risk assessment and controls to ensure extenuating circumstances are not evaluated as a

“one size fits all” and findings are determined in accordance with RAI versus an automatic Enforcement path. Furthermore, Oncor recommends the Registered Entity be allowed to request a formal "state of extenuating circumstance" and coordinate an extension to the 120 day deadline with the Regional Entity.

No
These comments are submitted on behalf of the following PPL NERC Registered Affiliates: LG&E and KU Energy, LLC; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; PPL Generation, LLC; PPL Susquehanna, LLC; and PPL Montana, LLC. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. It is helpful that the Definitions section on p.3 of the standard now says that a Slow Trip classification applies only if the Protection System of another Element was made to operate, but the term “slower than required” should be revised for clarity to read, “slower than the setting specified in the test/calibration instructions.” That is, a Slow Trip should be declared only if the timer is found to be mis-adjusted. Otherwise there’s no way of knowing whether the device at fault was slow or simply failed to function. Uncertainty on this subject is increased by Example 4 on p.25 having been left in its previous (draft 3) wording, “A failure of a generator's Composite Protection System to operate as quickly as intended for an overexcitation condition is a Misoperation.” This puts us back in the situation of having to decide if a relay acted in, say, ten cycles when five cycles was intended. Having to make such determinations ranges from being unduly burdensome to (for electromechanical relays) impossible, and was the principal reason for our having voted against draft 3 of the standard. It would be better still to state that Slow Trips apply only for TOs, because the issues of concern for this category of Misoperation (e.g. system instability, sequence of tripping) do not apply for generation plants. The description on p.25 of the standard of, “…owner(s) reviewing each Protection System operation,” to determine whether or not, “the speed and outcome…met their objective,” is not typical or appropriate for GOs, and they should not be required to add monitoring systems and design-level personnel to perform a no-value-added function.
No
See our comments above for Example #4. The Application Guidelines should clarify Misoperation analysis scope and purpose differences between TOs (preserve stability and enforce orderly isolation of circuits on a still-live system) and GOs (trip the unit).
We continue to disagree that stating whether or not a Misoperation occurred (per R1) and (under some circumstances) what the cause was (per R3) should be due within 120 days even though identifying the cause may take much longer or may even prove impossible (per R4). That is, the SDT apparently prefers where uncertainty exists to classify events as Misoperations and retract the declaration if later findings show otherwise, while we prefer the present approach of not assuming a Misoperation if evidence to support such a conclusion is lacking. The difficulty foreseen regarding the SDT’s approach is that dated evidence is required in M1 that an entity, “identified the Misoperation… within the allotted time period,” and in M3 that it, “identified whether its protection System component(s) caused a Misoperation within the allotted time period,” while all we may be able to say after 120 days is that we don’t know why an event happened. R4 describes what to do in such a situation, but it does not retract the obligation to provide impossible-to-obtain evidence satisfying M1 and M3.

The composite protection definition involving backup to remote protection does not completely make sense when coupled with the "slow trip" definition. The "total compliment" description in the

Composite Protection System definition indicates that remote backup protection is included in the "total compliment". If the remote backup protection operates instead of the local, primary protection for an element, the "total compliment" collectively functioned to protect the element. Calling this situation a "misoperation of the Composite Protection System" is contradictory to stating that the total compliment collectively functioned as intended. Also, how does this make sense for the protection systems at generating facilities? What does 'backup protection provided by a remote protection system' mean for generating facilities? The slow trip definitions are still confusing. Are there multiple Composite Protection Systems that need to be considered when determining if a trip is a slow trip? The "its operating time" references are indefinite in the definition. Consider making the slow trip definition either one of the following or a combination of the following OR statements: "a composite protection system operation that is slower than required or slower than designed or slower than desired or slower than the intended design". There is a fundamental flaw in the definition of misoperation. A misoperation is recognizable any time any part of a protection system design fails to operate as intended by the design, regardless of the existence of a redundant, remote, or back up protection scheme. The fact that something did not operate properly should indicate that a misoperation has occurred. The addition of the adjective “reportable” simply classifies the types of misoperations that are to be reported. The comment above does not address a requirement governing the actual reporting.
No
There is a problem with R2.2. One entity does not necessarily know whether or not another entities' Element has an abnormal condition. This notification of other entities for an explained operation of my interrupting device and my protection system should not be required. It is acknowledged that this was an attempt to eliminate the gap described above, but it is contrary to the Composite Protection System collectively functioning as intended to protect an element.
Yes
Application Guidelines: Overall, this document is very good in addressing the process.
a) The multiple timing process periods are an added burden and still unclear in the standard. However, the application notes do provide some guidance {R3}; b) The wording in R3 of the Process Flow Chart on the last page of the draft standard should match that of the requirement R6 (change "greater" to "later" in the chart). There is no evidence that entities have not been doing due diligence in investigating and correcting misoperations, therefore, the addition of the various timelines serve only to generate additional paperwork.

SCE disagrees with the explanation of and rationale for the "Composite Protection System" for the following reasons: 1. If an interrupting device is tripped due to misoperation of another device not owned by the owner of the interrupting device, then the owner of the interrupting device will be unaware of this issue until the formal notification of the event to all the owners of the composite protection system is made. One of the reasons for the misoperation of the other device could be a failure to trip. 2. In the case above, the owner of the interrupting device would not be able to validate Requirement 1.3: “The BES interrupting device owner identified that its Protection System Component caused the BES interrupting device(s) operation.” Therefore the owner would not be able to and may not be required to notify other entities owning the composite protection system. The root cause would either not be analyzed or the analysis would be delayed.
No
In the case where a non-performing protection system has caused a tripping device to operate, the non-tripping device could be ignored, resulting in the problem not being mitigated and eventually posing a greater risk to the composite protection system. Assuming that the owner of the system notifies the other entities owning the composite protection system, the time window of 120 days to notify would be too long in order to promote effective and efficient resolution of the problem. Notification should be within a week of the occurrence of event in order to allow the other impacted entities to review, analyze, and communicate with each other in order to perform a root cause analysis and determine a corrective action plan.

Yes
With respect to Requirement 5 on the Corrective Action Plan requirements, we are concerned that an entity's declaration that no corrective action will be taken without supporting evidence, could leave a system problem unresolved. The decision that a Corrective Action Plan is unnecessary, or the development of a Corrective Action Plan, are both complex actions that should be done jointly by respective owners of the composite protection system in a consensus-building manner. The failure to reach consensus on Correction Action Plans can leave the problem unresolved.

Yes
We agree with the changes.
No
(1) We continue to believe that this standard has been overly complicated by including administrative elements such as reporting information to third parties. The reporting does little to nothing to support reliability. The real value is in analyzing the Protection System operations and correcting any errors. Is there any indication that registered entities are not communicating to co-owners of the Composite Protection System that a potential misoperation occurred? If not, (and we have seen no such evidence) why does this administrative requirement that clearly meets multiple P81 criteria (administrative and reporting) rise to level of needing to be enforced with financial penalties? Barring such evidence, we simply do not see how we can support such a requirement. Clearly, the application guidelines spell out what is necessary. We recommend that the drafting team perform a study to determine if there is a true reliability need for communicating with co-owners of Composite Protection Systems. If the drafting team cannot provide data or statistics indicating a gap in reliability, then we recommend striking the administrative tasks from the requirement. (2) The existing standard was fairly simple and coupled with the new definition of Misoperation largely addresses the scope of the SAR. All that is really is needed for this standard is a requirement to evaluate Protection System operations, identify if the Protection System operation was a misoperation and then to develop a Corrective Action Plan to prevent future misoperations. Six requirements create more complication than what is necessary.
Yes
(1) We agree that the Application Guidelines include improved examples and did clarify the intent of the drafting team. Furthermore, we support the intent in the application guidelines. However, in some cases, the intent of the drafting team and the language of the requirements simply do not align. For example, language was inserted into the Requirement R3 discussion on page 31 to clarify that a registered entity is "to classify an operation as Misoperation if the available information leads to that conclusion" and "allows an entity to classify an operation as a Misoperation if an entity is not sure." Neither Requirement R3 nor Requirement R1 language provide this flexibility and is thus inconsistent with the language in the application guidelines. R1 and R3 are both very clear that the responsible entity has 120 days (for R3 or the later of 60 days after notification) to identify whether its Protection System operations were a Misoperation. This language is definitive. We do not see how this language allows an entity to classify an operation as Misoperation if it is not sure. Again, the requirement language states clearly that the responsible entity has to identify whether its Protection System components result in a Misoperation. There is no room in the language of the requirement for uncertainty. This further leads to a problem with R4 because R4 would require R1 and R3 to be violated since both require determination of whether a Misoperation occurred and R4 identifies a situation that can only occur after a violation of R1 or R3. Even the last Severe VSL for both R1 and R3 supports our argument. Failure to identify a whether or not a Protection System operation is a Misoperation is a Severe VSL. We suggest the drafting further refine Requirements R1, R3, and R4 collectively to match the intent demonstrated in the application guidelines.
(1) Example 3 on page 25 should be updated. The first sentence is inconsistent with the proposed definition of Misoperation. A failure of a line's Composite Protection System to operate as quickly as intended is only a Misoperation if another Element's Composite Protection System operation. Please append the following clause to the first sentence: "if another Element's Composite Protection System operated." (2) The VSLs for R3 rely only on the 120 day portion of the language in the requirement.

They do not include the "later of" language relying on 60 days if more than 60 days has passed since the original Protection System Operation. We suggest the VSLs should be updated accordingly reflect the requirement in totality. (3) To avoid requiring a registered entity from providing all BES interrupting device operations, the Compliance Assessment Approach for R1 in the RSAW needs to be modified to be consistent with the requirement and the evidence request section. The auditor should only sample BES interrupting device operations that meet the criteria Requirement R1 Part 1.1 through 1.3 and is provided as evidence in the evidence requested section. Please add "that meet criteria Requirement R1 Part 1.1 through 1.3" after "interrupting device operations" in the first and second rows of the RSAW's Compliance Assessment Approach for R1. (4) Please update the RSAW's Note to Auditor section to review the Application Guidelines section for Requirement R2 for small entities as well as vertically integrated utilities. The Application Guidelines make clear that small entities with a single protection engineer are not expected to provide notification requirements between the GO, TO and DP because they would already be aware since they evaluate all Protection System operations including transmission and generation. (5) Thank you for the opportunity to comment.
Individual
Mahmood Safi
Omaha Public Power District
Yes
Yes
Yes
The Omaha Public Power District (OPPD) is still concern with the 60-day requirement to develop a Corrective Action Plan (CAP) for an identified misoperation. This timing is not practical, and depending on the time of the year, budget cycle, scope of work, 60 days is not sufficient to obtain funding for CAPs. Also, the first bullet under R5 would require evaluation of the applicability of all CAPs to all BES locations which, depending on the CAP, could be overly burdensome. As worded, a wiring or setting error would require that all wiring and all settings at all BES locations be checked. The evaluation should be limited to CAPs related to scheme logic or relay design deficiencies. OPPD proposes that 180 days (6 months) is a sufficient timeframe to practically develop a CAP addressing both operational and budgetary coordination.

Florida Municipal Power Agency
Carol Chinn
Yes
FMPA's primary concern with the previous version of this definition centered around the ability to accurately classify the events and show evidence as appropriate. FMPA agrees the revised versions of "Slow Trip – During Fault" and "Slow Trip – Other than Fault" are more specific and thus easier to consistently apply. However, we do not believe the revised versions are going to result in events being classified the way the SDT desires. We are voting yes for this item because our primary concern is addressed. The SDT should reconsider these revisions, though, in light of the following – the revised versions have nothing to do with the designed, set, or normal operating time as specified by the relay manufacturer/settings. We believe the intent of these two categorizations is to identify relay misoperations for which a relay, interrupting device, or relay setting which was intended to operate at a particular speed, instead operated at a slower speed / in a longer time. Just because a relay from a different Element's Composite Protection System operates does not necessarily mean this event was undesired, unnecessary, or unintended. As stated in our last comments we refer back to the core issue that the protection system performance should be measured against a company's relay setting philosophy. We also note that the Application Guide still refers to this event in "Example 3" as "A failure of a line's Composite Protection System to operate as quickly as intended…". The application guide also still includes language regarding "slower than previously identified as being necessary to prevent voltage or dynamic instability".

1. FMPA does not feel our previous comment regarding notification to affected entities was properly understood. This comment was offered to R2 in the previous round of comments. We understand the way the document is intended to flow, but our main concern is the relay event records are preserved by all entities indefinitely – for many Utilities a special trip must be made to the substation to download the event records. What prevents the Owner of a BES interrupting device that operated from taking the full 120 days to conduct their review without saying anything to the other affected owners, only to find upon request of further evaluation that those entities no longer have the relay event records necessary for the evaluation? At minimum the entity Owning the BES interrupting device should advise the other affected Protection System owners that the investigation is under way at the earliest time they determine those entities are affected, to allow the entities to be prepared with data should they be notified in accord with R2. FMPA does not see how the gap regarding a case where an interrupting device did not operate has been addressed. Reading R1 and R2 again, it still appears that all triggers for activity are based on interrupting device operation, and we see no mention of a case where an interrupting device did not operate. While we can see that requiring actions in the standard based on relay targets, for example, would be challenging to enforce, we would have expected at least a statement, something to the effect of “Or if the entity otherwise becomes aware that a Composite Protection System it owns operated without an associated interrupting device action”.
Yes
FMPA appreciates the changes to the Application Guide and does feel the additional specificity was beneficial. We do, however, feel some sections are inconsistent with the revised Requirements and definitions in the standard. See our comments on the definition of “Misoperation” above. There may be some additional changes that are needed to the Application Guide to ensure it fully supports the revised Standard.
2. FMPA does not feel our previous comment regarding the inherent problems with the concept of comparing Protection System performance to a single set of generic categories as tied to compliance was addressed. We feel many of the issues and challenges in this revised standard would easily be addressed by allowing entities to compare the performance of their relays with their Protection System Design Philosophy. In the absence of a mandatory electric reliability standard, this is how Utilities would determine “mis-operations” – did the Protection System/component perform according to the intended design? 3. In the Facilities section – what is the reason PRC-004-3 cannot use the same description of “Protection System” as PRC-005-2? Would these two standards not inherently be designed to cover the very same Facilities? 4. FMPA accepts the SDT’s revised definition of Composite Protection system which no longer singles out step-distance/intentional remote backup schemes. However, we in general do not agree with the use of Composite Protection System in the standard. This term is being used to reduce what is considered a “Misoperation”. While FMPA supports more relaxed Requirements for mitigating/remediating a Misoperation when another part of the Composite Protection System successfully prevents any negative impact to the BES, a Misoperation is still a Misoperation. If the goal is to keep statistics on how we are doing as an industry, we need to tie those statistics to basic characteristics that are less subject to interpretation and change. Misoperation should still be tied to the failure of equipment. The fact that a different part of the Composite system properly functioned is additional information. Again, we support the idea that a properly designed Composite Protection system should mean an entity does not necessarily need to make changes, but the Misoperation should still be tracked. 5. What is the reason the defined Glossary term “Fault” has been replaced with “fault” throughout the document?

Cleco
Yes
Yes
Yes

Cleco will continue to vote "Negative" as long as the SDT continues to support in R1 and R2 the deadline of 120 days to determine if an operation is a misoperation. There should be exceptions built into the standard when there are circumstances that create numerous outages such as ice storms or hurricanes. For example; In FAC-003, a footnote allows for circumstances that are beyond the control of the Registered Entity. Also, the standard should apply to all protection systems and the SDT should not exclude SPS or RAS.
Individual
Karin Schweitzer
Texas Reliability Entity
Yes
No comments
No comments.
Texas Reliability Entity is voting Negative on this standard due to the concern that the reliable operation of the BES is not ensured by this standard (as written) because the allowable time periods for investigating and correcting are too long and investigative actions are not required before R4. Please consider the following comments and recommendations. 1) Recommend changing the allowable time for identification of a Misoperation to 60 days for R1 and R2. The 120 identification period (in R1 and R2) coupled with the additional allowance in R3 of 60 days means a Misoperation may not be determined up to 179 days after the interrupting device operation. The risk to the BES is still undetermined during this time period and actions should be taken to identify if a Misoperation occurred more expeditiously. 2) Suggest revising language in Requirements 1 and 3 to include investigative actions: [each entity] “shall perform investigative actions to identify whether its Protection System component(s) caused a Misoperation” The proposed language would clarify the expectation that investigations are on-going prior to R4. As written, the standard conceivably allows for a period of up to 120 days before investigative actions are performed. Although the application guidelines for R4 states that an entity “is expected to use due diligence in taking investigative action(s) to determine the cause(s)…” and that R4 “provides the entity a mechanism to continue its investigative work…” the standard does not require an entity to do investigative work before R4. 3) Recommend changing the performance of investigative actions to at least once every calendar quarter in R4. If a Misoperation is confirmed (through steps taken in R1 – R3) then the risk to the BES continues until such time as a cause is found and can be corrected. The application guidelines state that periodic investigative action minimizes compliance burden and focuses the entity’s efforts on determining cause, Texas Reliability Entity asserts that the time period of at least one investigative action every two full calendar quarters (180 days) is not adequate to protect reliability. 4) In order for R4 to be measurable there should be a stated time horizon (per NERC’s Acceptance of a Reliability Standard, Item 7, first bullet). The investigation may end either by identification of the cause of the Misoperation or a declaration that no cause was found. Suggest adding requirement to either determine the cause or make the no cause found declaration within 365 days after interrupting device operation. 5) The investigation and CAP timelines (as written) exceed 12 months so the evidence retention period of 12 months is insufficient. Evidence of investigative actions may be disposed of before corrective action is completed; meaning that a full record of an interrupting device operation may not be available for review by the CEA. In addition, the 12 month evidence retention schedules for R5 and R6 mean that an entity may not have any evidence to prove compliance to a CEA during an audit (which can be several years after a Misoperation).

Bill Temple
Northeast Utilities
No
The part of the Composite Protection System definition “Backup protection provided to a remote protection is included” is not clear because it switches focus from the local protected element to a remote protection system. We suggest revising this part to say “Backup protection of the element provided by a remote protection by design is included.”
Yes

Yes
The examples provided in the application guideline should be clarified when talking about unnecessary trips. It should be made clear that if any portion of a Composite Protection System designed to protect one Element operates for a problem on another Element is considered a Misoperation.
The Unnecessary Trip definitions as written are unclear and seem to indicate that the total compliment of the Composite Protection System. Suggest the following clarifications; Unnecessary Trip – During Fault – An unnecessary operation of any Protection System of a Composite Protection System for a Fault condition on another Element. Unnecessary Trip – Other Than Fault – An unnecessary operation of any Protection System of a Composite Protection System for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.
Individual
John Brockhan
CenterPoint Energy
No
CenterPoint Energy recommends adding wording to the definition to address the direct interrelationships between Misoperation categories, especially the “Slow Trip – During Fault” and the “Unnecessary Trip – During Fault” categories. For these two categories, an operation of an un-faulted Element’s Composite Protection System occurs. This interrelationship is detailed in the Application Guidelines which states the following for the “Slow Trip – During Fault” category: “In analyzing the Protection System for Misoperation, the entity must also consider the “Unnecessary Trip – During Fault” category to determine if an “unnecessary trip” applies to the Protection System operation of an Element other than the faulted Element. If a coordination error was at the local terminal (i.e., set too slow), then it was a "Slow Trip – During Fault” category of Misoperation at the local terminal.” In addition, the Application Guidelines states the following for the Unnecessary Trip – During Fault: “If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip – During Fault” category of Misoperation at the remote terminal.” CenterPoint Energy suggests adding clarifying wording at the end of the “Slow Trip – During Fault” and the “Unnecessary Trip – During Fault” categories: 3. Slow Trip – During Fault – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System, providing it is not determined to be an Unnecessary Trip – During Fault. 5. Unnecessary Trip – During Fault – An unnecessary Composite Protection System operation for a Fault condition on another Element, providing it is not determined to be a Slow Trip – During Fault.
CenterPoint Energy recommends deleting the proposed Requirement R2.2. Based upon the changes made to the Composite Protection System definition and the proposed wording of Requirement R2.1, CenterPoint Energy believes the proposed wording of Requirement R2.2 related to backup protection is unnecessary. The Composite Protection System definition now states that “Backup protection provided to a remote Protection System is included.” This, along with Requirement R2.1 stating “notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances” and Requirement R2.1.2 stating “The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation”, provides for the notification intended by Requirement R2.2.
No
CenterPoint Energy recommends adding additional examples to help provide consistent reporting of Misoperations. Examples for Breaker failure events (stuck breaker) and additional examples of the more common “Unnecessary Trip – During Fault” category would be helpful. Additional examples would help clarify the interrelationship between the “Slow Trip – During Fault” and the “Unnecessary Trip – During Fault” categories. The following comments and additional examples are provided for consideration: Example 1e: The Composite Protection System for a bus does not operate during a bus fault which results in the operation of all local transformer Protection Systems connected to that bus and all remote line Protection Systems connected to that bus isolating the faulted bus from the grid. The operation of the local transformer Protection Systems and the operation of all remote line Protection Systems correctly provided backup protection. There is one “Failure to Trip – During

Fault” Misoperation of the bus Composite Protection System. Example 3b: A failure of a breaker's Composite Protection System to operate as quickly as intended to meet the expected critical fault clearing time for a line fault in conjunction with a breaker failure (stuck breaker) is a Misoperation if it resulted in an unintended operation of at least one other Element’s Composite Protection System. If a generating unit’s Composite Protection System operates due to instability caused by failure of a breaker's Composite Protection System, it is not an “Unnecessary Trip – During Fault” Misoperation of the generating unit’s Composite Protection System. This event would be a “Slow Trip – During Fault” Misoperation of the breaker's Composite Protection System. Example 3c: A line connected to a generation interconnection station is protected with two independent high-speed pilot systems due to dynamic stability reasons. The Composite Protection Scheme for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. During a fault on this line, the two pilot systems fail to operate; and, the time-overcurrent scheme operates clearing the fault with no generating units or other Elements tripping (no over-trips). This event is not a Misoperation. Example 3d: A line connected to a switching station is protected with two independent high-speed pilot systems for reasons other than voltage or dynamic stability (e.g., short line length or to reduce backup clearing times for service reliability). The Composite Protection Scheme for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. The step distance and time-overcurrent schemes and Protection Systems of other line terminals are intentionally not coordinated with the step distance and time-overcurrent schemes of this line because high-speed tripping is expected on the line with the two independent high-speed pilot systems. During a fault on the line with the two independent high-speed pilot systems, the two pilot systems fail to operate; however, the time-overcurrent scheme operates clearing the fault however, another line in the system trips (over-trips). The trip of the other line in the system is not an “Unnecessary Trip – During Fault” Misoperation as miscoordination was expected for the conditions that occurred. The event on the line with the two pilot systems is a “Slow Trip – During Fault” Misoperation, although the analysis and Corrective Action Plan would address the two pilot schemes failure to trip. Example 5b: An operation of a line's Composite Protection System which trips (i.e., over-trips) for a properly cleared fault on a different line is a Misoperation. The fault is cleared properly by the faulted line's Composite Protection System (i.e., line relaying); however, elsewhere in the system, a carrier blocking signal is not transmitted (e.g., carrier ON/OFF switch found in OFF position) resulting in the operation of a remote Protection System, single-end trip of a non-faulted line. The operation of the Protection System for the non-faulted line is an unnecessary trip of the line protection; therefore, the non-faulted line Protection System operation is an “Unnecessary Trip – During Fault” Misoperation. Example 5c: A line connected to a switching station is protected with two independent high-speed pilot systems for reasons other than voltage or dynamic stability (e.g., short line length or to reduce backup clearing times for service reliability). The Composite Protection Scheme also includes step distance and time-overcurrent schemes in addition to the two pilot systems. The step distance and time-overcurrent schemes and Protection Systems of other line terminals are intentionally not coordinated with the step distance and time-overcurrent schemes of this line because high-speed tripping is expected on the line with two independent high-speed pilot systems. During a fault on the line with two independent high-speed pilot systems, the two pilot systems fail to operate; however, the time-overcurrent scheme operates clearing the fault and, in conjunction, another line in the system trips (over-trips). The trip of the other line is not an “Unnecessary Trip – During Fault” Misoperation as miscoordination was expected for the conditions that occurred. The event on the line with the two pilot systems is a “Slow Trip – During Fault” Misoperation, although the analysis and Corrective Action Plan would address the schemes failure to trip. Additionally, in the Application Guidelines, it appears the following paragraph at the end of the “Unnecessary Trip – Other Than Fault” examples is misplaced and could be deleted: “If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip," category of Misoperation at the remote terminal.” CenterPoint Energy recommends adding the following wording as the last two paragraphs at the end of the examples for “Unnecessary Trip – During Fault” examples to parallel the wording for the “Slow Trip – During Fault” category: In analyzing the Protection System for Misoperation, the entity must also consider the “Slow Trip – During Fault” category to determine if an “slow trip” applies to the Protection System operation of an Element other than the faulted Element. If a coordination error was at the remote terminal (i.e., set too fast), then it was an " Unnecessary Trip – During Fault" category of Misoperation at the remote terminal.

(a) In the Application Guidelines, CenterPoint Energy recommends changes to account for high-speed tripping for internal transformer faults by other types of protection systems (e.g., sudden pressure) that are not specifically included in the proposed definition of Composite Protection System. The following additional wording at the end of Examples 1a and 1b is suggested: Example 1a: A failure of a transformer's Composite Protection System to operate for a transformer fault is a Misoperation unless other protection schemes (e.g., sudden pressure) operated. Example 1b: A failure of a "primary" transformer relay (or any other component) to operate for a transformer fault is not a “Failure to Trip – During Fault” Misoperation as long as another component of the transformer's Composite Protection System or other protection schemes (e.g., sudden pressure) operated. (b) The proposed Requirement R4 wording currently includes the following: “…shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes…”. CenterPoint Energy understands this wording is to provide a mechanism to continue investigative work to determine the cause of a Misoperation when the cause cannot be determined during the allotted time periods in Requirements R1 or R3. CenterPoint Energy recommends additional wording to allow the investigation to be completed in the quarter that the misoperation occurs (“partial quarter”) for cases where the investigation and tests, including any needed outages< can be completed in the partial quarter and suggests the following wording: “…shall perform investigative action(s) to determine the cause of the Misoperation at least once during the partial quarter when the misoperation occurs or every two full calendar quarters after the Misoperation was first identified, until one of the following completes…”.

Yes
No
Tri-State remains concerned with situations where individual components are jointly owned. The SDT’s response “While a Protection System may be contractually owned by multiple entities that are not jointly registered, all of the entities would ultimately be responsible for the requisite documentation and results” appears to require all entities to report the operation giving double jeopardy to each misoperation on jointly-owned Composite Protection System components, unless a contract speaks to the designated “Compliance Entity”. Typically compliance contracts take some time to come to fruition. Is it the drafting team’s intent that misoperations be reported by multiple entities in this situation until a contract is finalized?
Yes
In response to Tri-State’s previous concern to the review and reporting of operations of jointly-owned Composite Protection System components as opposed to multiple entities owning separate components. The SDT stated “While a Protection System may be contractually owned by multiple entities that are not jointly registered, all of the entities would ultimately be responsible for the requisite documentation and results” appears to require all entities to report the operation giving double jeopardy to each misoperation on jointly-owned Composite Protection System components, unless a contract speaks to the designated “Compliance Entity”. Typically compliance contracts take some time to come to fruition. Is it the drafting team’s intent that misoperations be reported by multiple entities in this situation until a contract is finalized?

Yes

Yes
Formatting in recent standards has tended toward using bullets in lieu of subparts. The drafting team is encouraged to follow this practice in Requirement R2. Note that there are bullets in Requirement R5. Delete the 2nd 'when' in the 6th line (clean copy) of the Rationale Box for Requirement R2.
No
We note that the drafting team included several additional examples in this version of the standard and we certainly appreciate that. We would however suggest that the following examples would provide further clarification: 1) an example which illustrates that a properly coordinated breaker failure operation does not equate to a slow-trip operation, 2) a backup protection example to provide clarity on how Requirement 2, Part 2.2 would be applied and 3) an example of a breaker failure Misoperation. We noted that the drafting team reverted to the non-capitalized 'fault' throughout most of the Application Guidelines. Yet in the listing of items that characterize a Misoperation on Page 23 (clean copy), the drafting team maintained the capitalization from the previous draft. Can the drafting team provided clarification on the proper use of the term? In the 1st line under Unnecessary Trip – Other Than Fault on Page 26 (clean copy), delete the comma between 'to' and 'power'. Hyphenate 'out-of-service' in the paragraph following Example 7a on Page 27 (clean copy). Hyphenate 'high-side' in the 3rd line of Example 7b on Page 27 (clean copy). Replace 'voltampere-reactive' with 'VAr' in the 3rd line of the paragraph under Non-Protective Functions on Page 27 (clean copy). We appreciate the explanation provided in the Extenuating Circumstances section. However, we believe that the standard should go beyond what is provided in the Sanction Guidelines. Why should an entity be held in violation in the event of multiple operations on its system during a natural disaster? There may not be an actual Misoperation but because an entity simply doesn't meet the purely administrative requirement of getting the evaluation done within a prescribed number of days, a violation has occurred. Recognition should be given in the standard for such events which withhold declaration of any potential violation until the entity has had sufficient time to 1) deal with the crisis at hand of rebuilding its system and 2) then performing the evaluations to determine if Misoperations occurred. This flies in the face of being innocent until proven guilty. In the 2nd paragraph below Example R1a, insert 'where a' such that the 1st line reads: 'For the case, where a BES interrupting device…' In the 4th paragraph below Example R1a, insert 'the' in the 7th line between 'if' and 'entity'. In the 1st paragraph below Requirement R3, break the two sentences in the 7th-9th lines (clean copy) into two separate sentences such that it reads: 'The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. The entity may decide to identify the operation as a Misoperation and continue its investigation under Requirement R4.' Bracket the 's' in 'CAP(s)' in the 4th line of the 2nd paragraph below Requirement R5 on Page 33 (clean copy). Insert a 'to' between 'due' and 'resource' in the 4th line of the 2nd paragraph of Example R6c. Regardless of the outcome of the capitalization of 'fault', it should be capitalized in the 1st sentence of Example R6d just like the 1st words of all the other examples given.
UFLS is mentioned in 4.2.2 of the Applicability Section but there is no mention of UVLS. Should it be included here? We would suggest that the drafting team consider incorporating the evaluation of the CAP's applicability mentioned in the first bullet under Requirement R5 into the CAP itself. This falls in line with the second bullet in the Requirement which is included in the CAP and gets the burden of making the evaluation concurrently with the development of the CAP out of the way. The evaluation could delay the completion of the CAP. References to days should be calendar days and they should be hyphenated; for example 30-, 45-, 60-, or 120-calendar days. Similarly, references to months should be treated in the same manner; for example 12-calendar months.

Electric Reliability Council of Texas, Inc.
Yes
Yes

ERCOT is concerned about Requirement 1 that allows entities 120 days to identify a misoperation. ERCOT believes this might negatively impact the reliability of the grid. Currently, entities have the responsibility to analyze disturbances to identify misoperations. A misoperation could indicate a greater threat to reliability and that threat could exist, unknown, for several months while entities make determinations if operations are truly a misoperation. The responsible entity under the new Standard will track misoperations and develop Corrective Action Plans (CAPs). There is no responsibility for the entity to share that information with Reliability Coordinators who have the responsibility for the wide area view of their Reliability Coordinator area. ERCOT is also concerned that while the responsible entity may develop CAPs, there is no responsibility of coordination of the CAP with other potentially affected entities. ERCOT is therefore recommending the following: R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 24 hours, identify whether its Protection System component(s) caused a Misoperation on an element that is part of an Interconnection Reliability Operating Limit under the following circumstances: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning] 1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and 1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and 1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation. R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 2 business days, identify whether its Protection System component(s) caused a Misoperation on an element at 200 kV or more under the following circumstances: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning] 2.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and 2.2 The BES interrupting device owner owns all or part of the Composite Protection System; and 2.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation. R3. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 5 business days, identify whether its Protection System component(s) caused a Misoperation on an element that is a BES element under the following circumstances: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning] 3.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and 3.2 The BES interrupting device owner owns all or part of the Composite Protection System; and 3.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation. R7. Each Transmission Owner, Generator Owner, and Distribution Provider shall provide the CAP developed in R5, to the Reliability Coordinator with the expected date of completion, how the Composite Protection System will operate until the CAP is completed and detailed information of how the entity will coordinate the CAP with other affected entities if applicable.

Yes
BPA believes that there is one other gap that has not been identified. This is the case where a TO, GO, or DP owns a BES interrupting device that operates, but does not own any of the Composite Protection System. This is a real scenario. In this situation, the owner of the BES interrupting device is not subject to R1 because R1.2 is not true, i.e. the owner of the BES interrupting device does not own all or part of the Composite Protection System. Likewise, the owner of the BES interrupting device is not subject to R2 because R2.1.1 is not true, i.e. the owner of the BES interrupting device does not share ownership of the Composite Protection System -- they don’t have any ownership of the Composite Protection System. With the owner of the BES interrupting device not subject to R1 or

R2, the operation of the BES interrupting device would not be investigated. BPA suggests that this problem could be remedied with a slight change in language to R2.1.1 as follows: “The BES interrupting device owner does not own any of the Composite Protection System or shares the Composite Protection System ownership with any other owner.” This change would require an owner of a BES interrupting device that does not own any of the Composite Protection System to provide notification of the operation to the owners of the Composite Protection System within 120 days per R2.1 so that they could then investigate the operation.

A. The Application Guidelines provide some clarity on the difference between "Slow Trip - During Fault" and "Unnnecessary Trip - During Fault". However, these definitions may still not be entirely clear. B. Quoting Requirement R1...p.31 of Application Guidelines "When Elements are isolated from the BES and undergoing maintenance.....not subject to the standard....provided they do not result in the operation of...part of the BES." This statement and Example 6e (#6 of Misoperation definition), p.28 (at first glance anyways) may be at odds.

Generally do not like the phrase "composite", would prefer that Protection System just have a solid definition. I appreciate that is the dilemma here and my specific suggestion be to delete the word composite throughout.
No
The way the M2 is written is overly prescriptive and limiting on what might be acceptable way to show the coordination between entities. The measure seems to written like a requirements. Prefer the previous language.
Yes
still have trouble with how the word composite is being used, but do agree that the guidelines provide clarity on the drafting teams intent, unsure the compliance impact on the requirements
Generally feel that the requirements should be the sole place where the actual compliance requirements appear. Lot of information in measures, application guidelines, definitional changes that are not technically requirements but may be treated as such depending upon the audience.
Individual
Michelle Clements
Wolverine Power Supply Cooperative, Inc.
Yes
Yes
Yes

Wolverine's position is that the PRC-005 standard sufficiently covers the maintenance and testing requirements for protection systems. Because of this maintenance performed, it is not necessary to perform a detailed engineering analysis of every BES protection system operation. Wolverine's position is to only perform an engineering review of protection system operations if there is an apparent misoperation, for example, an over reach condition, failure to trip, etc. These are easily identified by transmission operators if only the correct facility cleared. To use a protection system operation to verify if a primary and backup protection system work properly seems to conflict with the requirement in PRC-005, which is written to ensure protection systems are maintained so they work properly.

Consideration of Comments

Project 2010-05.1 Protection System (Misoperations)

The Project 2010-05.1 standard drafting team ("SDT" or "drafting team") thanks all commenters who submitted comments on the draft 5 of PRC-004-3 Reliability Standard. This draft Reliability Standard was posted for a 45-day public comment period from June 20, 2014 through July 9, 2014. Stakeholders were asked to provide feedback on the draft Reliability Standard and associated documents through a special electronic comment form. There were 47 sets of comments, including comments from approximately 136 different people from approximately 101 companies representing all 10 industry segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the NERC Standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Director of Standards, Valerie Agnew, at 404-446-2566 or at valerie.agnew@nerc.net . In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary of Changes

The drafting team determined certain non-substantive changes should be made in response to comments. The summary below provides an overview of the clarifications made to the draft PRC-004-3 Reliability Standard.

Definitions

The second sentence of the definition of "Composite Protection System" was clarified by changing the wording from an "inclusionary" to an "exclusionary" statement.

> "The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element's Protection System(s) is excluded."

The drafting team contends that this change is non-substantive because it is a clarifying rewording of the intent of the definition that was requested by commenters. The phrase for backup protection provided "to a remote Protection System" - "is included" is better described "by a different Element's Protection System" - "is excluded". Backup protection that is a part of the Protection System under study is "included." however, it is not intended that the "backup protection provided by a different

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf

Element's Protection System(s) to be" included. If this were the case, by definition, there would be very few identified Misoperations.

Requirements

Requirement R1

Requirement R1 was clarified based on comments. The drafting team moved the clause "under the following circumstances" (referring to Parts 1.1, 1.2, and 1.3) and added the clause with the clarifying reference to the Parts "under the circumstances in Parts 1.1 through 1.3" before the "shall" statement. The reason for moving the clause is based on comments noting that with the placement at the end of the requirement grammatically modified "Misoperation" and not the "BES interrupting device." The drafting team agreed that moving the text would grammatically modify "BES interrupting device" without changing the meaning of the Requirement.

Requirement R1, Part 1.3 was clarified based on a comment revealing an unintentional omission in the circumstances in which an entity is required to review a BES interrupting device operation. The Requirement has three conditions for which the applicable entities must initiate a review of its Protection System to identify whether its Protection System component(s) caused a Misoperation. Part 1.1 has two conditions:

1. A BES interrupting device operation caused by a Protection System; or
2. A BES interrupting device operation caused by "manual intervention" in response to a Protection System failure to operate.

The comment revealed that in Part 1.3 that there was no circumstance for "manual intervention" that is included in Part 1.1. This unintentionally means that all three Parts (i.e., 1.1-1.3) could not be properly satisfied for the "manual intervention" circumstance ("was true") in Part 1.1. Because of this, an applicable entity could reason that the "manual intervention" circumstance was not caused by an actual Protection System component per se. Since the BES interrupting device operation did not satisfy all the circumstances ("were true") of the three Parts, the entity could reasonably justify that the operation does not need to be reviewed because Part 1.3 would not be true. The drafting team did not intend for Part 1.3 to create this circumstance. The drafting team agreed that this circumstance omission technically created an unintended condition in Requirement R1 where it is obvious that Part 1.3 should have included the "manual intervention" circumstance. Therefore, the drafting team inserted the phrase "or was caused by manual intervention in response to its Protection System failure to operate" to accurately account for the "manual intervention" condition specified in Requirement R1, Part 1.1 to make the intention clear to industry.

Requirement R2

Requirement R2, Part 2.1 received the same clarification to include "manual intervention" as Requirement R1, Part 1.3 based on comments. The intention is to notify other Protection System owners when either the BES interrupting device operation is caused by a Composite Protection System or "by manual intervention in response to a Protection System failure to operate."

Additionally, the drafting team inserted the term "BES" in Requirement R2, Part 2.2 before "Element" to clarify that backup protection was provided for a condition on another entity's "BES Element" and not on another entity's non-BES Element. This is consistent with the objectives listed in Section 5, Background of the draft PRC-004-3 Reliability Standard.

Requirement R3

No changes were made to Requirement R3.

Requirement R4

Requirement R4 was clarified by adding a parenthetical "(s)" to the second occurrence of "cause" for consistency with a previous occurrence in the Requirement.

Requirements R5 and R6

No changes were made to Requirements R5 and R6.

Measures M1 through M6

No changes were made to Measures M1 through M6.

Compliance

The clause "a minimum of" was added to the paragraphs pertaining to Requirements R1 through R6 to clarify that the evidence retention periods stated in the Compliance section are minimum retention periods. The drafting team made another clarification based on a comment about how the evidence retention period is applied to Requirements R1, R2, R3, and R4. To clarify that the minimum retention period applies to each Requirement, the drafting team added the clause "following the completion of each Requirement." Last, the drafting team clarified that evidence from R1 through R4 must be retained with the Corrective Action Plan.

Violation Risk Factors and Violation Severity Levels

There were no changes to Violation Risk Factors. The drafting team deleted "or not" from each of the Requirement R1 Violation Severity Levels. Requirement R1 does not mandate that an entity make a determination of whether "or not" an operation is a Misoperation. The reliability activity in Requirement R1 is to "identify whether its Protection System component(s) caused a Misoperation." The VSL could be construed as an expansion of the standard; therefore, the drafting team deleted "or not" based on a comment.

Guidelines and Technical Basis

The drafting team made grammatical corrections to text in the Rationale boxes associated with several Requirements. Rationale boxes will be moved to the end of the Guidelines upon adoption. The drafting team added a number of examples requested throughout comments. Also, the drafting team reconsidered the lowercase use of the term "fault" throughout the Guidelines and Technical Basis. The team changed a number of instances back to the *Glossary of Terms Used in NERC Reliability Standards* capitalized term "Fault" for increased clarity. The use of the term throughout the Guidelines and Technical Basis does not change any meanings and is only intended to provide the reader a more specific understanding of the guidance. Some instances were not changed because they are lowercase (e.g., use of "fault" in the current definition of "Misoperation").

Due to continued questions about the time periods in each of the Requirements, the drafting team consolidated text about time periods into its own section, "Requirement Time Periods." This section explains what other sections already addressed in one concise location for all Requirements. Last, minor corrections were made to the flowchart text to more closely align with the text in the Requirements based on a comment.

Implementation Plan

The drafting team corrected the Implementation Plan to align the definition of "Misoperation," category 2 and Applicability section concerning Facilities with the draft PRC-004-3 Reliability Standard. These revisions occurred in the previous posting and were not aligned with the text presented in the draft 5 of the PRC-004-3 Reliability Standard.

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

If you support the comments submitted by another entity and would like to indicate you agree with their comments, please select "agree" below and enter the entity's name in the comment section (please provide the name of the organization, trade association, group, or committee, rather than the name of the individual submitter).

Summary Consideration: The drafting team appreciates the entities below supporting the comments of others. Having single sets of comments with documented support greatly improves the efficiency of the drafting team in responding to comments. This format also ensures the drafting team has a clearer picture of the number of stakeholders supporting the same concerns or suggestions as the case may be.

Organization	Agree	Supporting Comments of "Entity Name"
Ameren	Agree	Ameren supports and adopts by reference the SERC PCS comments.
Beaches Energy Services	Agree	FMPA - Florida Municipal Power Agency
Occidental Chemical Corporation	Agree	Ingleside Cogeneration LP

1. Based on stakeholder input, the drafting team revised the proposed definition of "Misoperation." Concerning the two categories of "Slow Trip." The drafting team also clarified the proposed definition of "Composite Protection System." Do you agree the revisions provided clarity? If not, please provide specific suggestions for improvement

Summary Consideration: The numerical values are approximate and are intended to provide a gauge of the concerns raised by industry stakeholders. The number of comments noted is analogous to the number of entities (e.g., five comments means five entities provided a comment). More than 60 percent of individual stakeholders that commented in support of the drafting team's revised the proposed definition of "Misoperation," the two categories of "Slow Trip," and clarifications to the proposed definition of "Composite Protection System." There were 12 comments by 49 individuals that were not supportive of the revisions and there were 29 entities represented by 80 individuals that did not comment and only provided a "yes" response to the question in support of the drafting team's revisions.

There was one common issue raised in this section that resulted in a clarifying revision to the proposed definition of "Composite Protection System." Six comments by 34 individuals requested the drafting team to clarify the intent of the definition of "Composite Protection System" to eliminate the confusion of whether "remote" was local or away from the initiating Protection System. To clarify, the drafting team changed the last sentence from an "inclusionary" statement to an "exclusionary" statement. The phrase "[b]ackup protection provided to a remote Protection System is included" was clarified to "[b]ackup protection provided by a different Element's Protection System(s) is excluded."

There were three common issues that were raised by commenters that did not result in revisions. Three comments by 18 individuals requested changes to the definitions of "Composite Protection System" and "Misoperation." Another three comments by individuals noted a lack of clarity on the differences in either the categories of the definition of "Misoperation," the cited examples in the Guidelines, and/or the case where backup protection was provided for a failed Protection System of another owner. Two comments note that the definition of "Composite Protection System" is unnecessary and should not include, for example, redundant systems because in their opinion any failure in the Protection System should be identified as a Misoperation. The drafting team concluded that the suggested changes did not provide additional clarity.

Organization	Yes or No	Question 1 Comment
Northeast Power Coordinating Council	No	In the Composite Protection System definition “Backup protection provided to a remote Protection System is included.” is not clear because it directs the focus from the local protected Element to a remote protection system. Suggest revising this sentence to read “Backup protection provided by a remote protection system by design is included.” **Response:** The drafting team clarified the intent of the definition of “Composite Protection System” to eliminate the confusion of whether “remote” was local or away from the initiating Protection System. The phrase “a remote Protection System” was clarified to “a different Element’s Protection System.” Change made.
National Grid	No	Definitions for “Failure to Trip - During Fault” and “Failure to Trip - Other Than Fault” state that “The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct”. However, requirement R1 asks to identify if “Protection System component(s) caused a Misoperation”. These statements seem to contradict each other. **Response:** The drafting team asserts that every Protection System Misoperation will include the failure of a component to act properly for an identified Misoperation. If the Composite Protection System operates as intended, it is not a Misoperation. No change made. Definition for “Unnecessary Trip - Other Than Fault” provides examples for what it is not. It should also provide examples for what it is, similarly with other definitions. **Response:** The current draft includes what “is a Misoperation” (Examples 6a-6d) and what “is not a Misoperation” (Example 6e). No change made.

Organization	Yes or No	Question 1 Comment
PPL NERC Registered Affiliates	No	These comments are submitted on behalf of the following PPL NERC Registered Affiliates: LG&E and KU Energy, LLC; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; PPL Generation, LLC; PPL Susquehanna, LLC; and PPL Montana, LLC. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. It is helpful that the Definitions section on p.3 of the standard now says that a Slow Trip classification applies only if the Protection System of another Element was made to operate, but the term "slower than required" should be revised for clarity to read, "slower than the setting specified in the test/calibration instructions." That is, a Slow Trip should be declared only if the timer is found to be mis-adjusted. Otherwise there's no way of knowing whether the device at fault was slow or simply failed to function. Uncertainty on this subject is increased by Example 4 on p.25 having been left in its previous (draft 3) wording, "A failure of a generator's Composite Protection System to operate as quickly as intended for an overexcitation condition is a Misoperation." This puts us back in the situation of having to decide if a relay acted in, say, ten cycles when five cycles was intended. Having to make such determinations ranges from being unduly burdensome to (for electromechanical relays) impossible, and was the principal reason for our having voted against draft 3 of the standard. It would be better still to state that Slow Trips apply only for TOs, because the issues of concern for this category of Misoperation (e.g. system instability, sequence of tripping) do not apply for generation plants. The description on p.25 of the standard of, "...owner(s) reviewing each Protection System operation," to determine whether or not, "the speed and

Organization	Yes or No	Question 1 Comment
		outcome...met their objective," is not typical or appropriate for GOs, and they should not be required to add monitoring systems and design-level personnel to perform a no-value-added function. **Response:** The modifications to the category of "Slow Trip" were previously made to simplify the identification and improve the measurability. The identification is based on the reliability impact. It is appropriate to include Generator Owners in the standard's Applicability. No change made.
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	No	The composite protection definition involving backup to remote protection does not completely make sense when coupled with the "slow trip" definition. The "total compliment" description in the Composite Protection System definition indicates that remote backup protection is included in the "total compliment". If the remote backup protection operates instead of the local, primary protection for an element, the "total compliment" collectively functioned to protect the element. Calling this situation a "misoperation of the Composite Protection System" is contradictory to stating that the total compliment collectively functioned as intended. Also, how does this make sense for the protection systems at generating facilities? What does 'backup protection provided by a remote protection system' mean for generating facilities? **Response:** The definition of "Composite Protection System," has been clarified to address the intent of backup protection. Clarification made. The slow trip definitions are still confusing. Are there multiple Composite Protection Systems that need to be considered when determining if a trip is a slow trip?

Organization	Yes or No	Question 1 Comment
		The "its operating time" references are indefinite in the definition. Consider making the slow trip definition either one of the following or a combination of the following OR statements: "a composite protection system operation that is slower than required or slower than designed or slower than desired or slower than the intended design". **Response:** The modifications to the category of "Slow Trip" were previously made to simplify the identification and improve the measurability. The identification is based on the reliability impact. No change made. There is a fundamental flaw in the definition of misoperation. A misoperation is recognizable any time any part of a protection system design fails to operate as intended by the design, regardless of the existence of a redundant, remote, or back up protection scheme. The fact that something did not operate properly should indicate that a misoperation has occurred. The addition of the adjective "reportable" simply classifies the types of misoperations that are to be reported. The comment above does not address a requirement governing the actual reporting. **Response:** The Composite Protection System definition is based on the principle that an Element's multiple layers of protection are intended to function collectively. This new definition has been introduced in this draft PRC-004-3 Reliability Standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element's total complement of protection should be considered while evaluating an operation. No change made.

Organization	Yes or No	Question 1 Comment
Operational Compliance	No	A. The Application Guidelines provide some clarity on the difference between "Slow Trip - During Fault" and "Unnnecessary Trip - During Fault". However, these definitions may still not be entirely clear. **Response:** The drafting team asserts that the Guidelines and Technical Basis is the appropriate place for clarification rather than the definition of “Misoperation.” No change made. B. Quoting Requirement R1...p.31 of Application Guidelines "When Elements are isolated from the BES and undergoing maintenance.....not subject to the standard....provided they do not result in the operation of...part of the BES." This statement and Example 6e (#6 of Misoperation definition), p.28 (at first glance anyways) may be at odds. **Response:** The text referenced on page 31 has been removed because maintenance cannot change the applicability of the standard. Example 6e is not a Misoperation of an in-service Element because of the maintenance exclusion; however, the owner of the BES interrupting device that operates will review the operation when the operation meets the circumstances in Requirement R1, Parts 1.1 through 1.3. Clarification made.
Wisconsin Electric Power Company	No	The 2nd sentence in the definition of Composite Protection System is “Backup protection provided to a remote Protection System is included.” The meaning and intention of this phrase is not readily understood. We suggest that the phrase from previous Draft 4: “Backup protection provided by a remote Protection System is excluded”, is clearer and should be re-instated. **Response:** The definition of “Composite Protection System,” has been clarified to address the intent of backup protection by providing an

Organization	Yes or No	Question 1 Comment
		"exclusionary" condition rather than an "inclusionary" condition. Clarification made.
Public Service Enterprise Group	No	We agree with the Slow Trip changes. However, the revised definition of Composite Protection System caused much discussion. In the end, we would accept it provided that "a remote" in the second sentence is changed to "another." With this change, the second sentence would read "Backup protection provided to another Protection System is included." The backup Protection System need not be "remote" physically; it could be located in the same substation. The phrase "a remote Protection System" would require that the backup Protection System be at a different physical location, which may not be the case as we have just described. **Response:** The drafting team clarified the intent of the definition of "Composite Protection System" to eliminate the confusion of whether "remote" was local or away from the initiating Protection System. The phrase "a remote Protection System" was clarified to "a different Element's Protection System." Clarification made.
Independent Electricity System Operator	No	We generally agree with the changes to the proposed definition of Misoperation, but do not agree with the proposed addition of the term Composite Protection System. In our previous comments, we expressed our disagreement with the need to create a defined term "Composite Protection System". By definition, a Protection System is already a composite system whose components need to function collectively to protect an Element. The proposed term is therefore redundant. In the comment report, the SDT's response indicates that the reason for proposing the newly defined term, "Composite Protection

Organization	Yes or No	Question 1 Comment
		System," is found in the Application Guidelines under the heading "Definitions.", and therefore no change was made. In the Application Guideline, the rationale provided for introducing this new term is that: [The Composite Protection System definition is based on the principle that an Element's multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element's total complement of protection should be considered while evaluating an operation.]We find this rationale insufficient to justify the introduction of the new term since by having the defined term "Misoperation" which covers any failure a Protection System to operate as intended for protection purposes would suffice to include the effect of multiple levels of protection (e.g. redundant systems). In other words, if a Protection System failed to operate as intended or operated unnecessarily, then regardless of the level of protection and which component caused the Protection System to operate, the action/inaction of the Protection System - Composite or otherwise, would constitute a Misoperation. We therefore continue to disagree with the proposed addition of this new term, and suggest that it be removed. **Response:** Not all entities consider a Protection System to include all associated components to protect an Element. The Composite Protection System definition is based on the principle that an Element's multiple layers of protection are intended to function collectively. This new definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element's total complement of protection should be considered while evaluating an operation. Also, the new definition supports consistent

Organization	Yes or No	Question 1 Comment
		reporting of Misoperations under the Section 1600 data request because all entities, under the new definition, will be evaluating its Composite Protection Systems in the same manner. No change made.
Southern California Edison Company	No	SCE disagrees with the explanation of and rationale for the "Composite Protection System" for the following reasons: 1. If an interrupting device is tripped due to misoperation of another device not owned by the owner of the interrupting device, then the owner of the interrupting device will be unaware of this issue until the formal notification of the event to all the owners of the composite protection system is made. One of the reasons for the misoperation of the other device could be a failure to trip. **Response:** The drafting team contends that this concern is addressed by Requirement R2. The new definition of "Composite Protection System," has been clarified to address the intent of backup protection. Clarification made. 2. In the case above, the owner of the interrupting device would not be able to validate Requirement 1.3: "The BES interrupting device owner identified that its Protection System Component caused the BES interrupting device(s) operation." Therefore the owner would not be able to and may not be required to notify other entities owning the composite protection system. The root cause would either not be analyzed or the analysis would be delayed. **Response:** Requirement R1 is for the BES interrupting device owner to initiate the review for identifying any Misoperations caused by its components. Requirement R2 addresses the circumstances in which the initiating BES interrupting device owner in Requirement R1 must make

Organization	Yes or No	Question 1 Comment
		notification to other owners. The notified Protection System component owner(s) in R3 must review its portion of the Composite Protection System for any Misoperation. No change made.
Northeast Utilities	No	The part of the Composite Protection System definition "Backup protection provided to a remote protection is included" is not clear because it switches focus from the local protected element to a remote protection system. We suggest revising this part to say "Backup protection of the element provided by a remote protection by design is included." **Response:** The drafting team clarified the intent of the definition of "Composite Protection System" to eliminate the confusion of whether "remote" was local or away from the initiating Protection System. The phrase "a remote Protection System" was clarified to "a different Element's Protection System." Clarification made.
CenterPoint Energy	No	CenterPoint Energy recommends adding wording to the definition to address the direct interrelationships between Misoperation categories, especially the "Slow Trip - During Fault" and the "Unnecessary Trip - During Fault" categories. For these two categories, an operation of an un-faulted Element's Composite Protection System occurs. This interrelationship is detailed in the Application Guidelines which states the following for the "Slow Trip - During Fault" category: "In analyzing the Protection System for Misoperation, the entity must also consider the "Unnecessary Trip - During Fault" category to determine if an "unnecessary trip" applies to the Protection System operation of an Element other than the faulted Element. If a coordination error was at the local terminal (i.e., set too slow), then it was a "Slow Trip - During Fault" category of Misoperation at the local terminal." In addition, the Application Guidelines states the following for the Unnecessary Trip - During

Organization	Yes or No	Question 1 Comment
		Fault: “If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip - During Fault” category of Misoperation at the remote terminal.” CenterPoint Energy suggests adding clarifying wording at the end of the “Slow Trip - During Fault” and the “Unnecessary Trip - During Fault” categories: 3. Slow Trip - During Fault - A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System, providing it is not determined to be an Unnecessary Trip - During Fault. 5. Unnecessary Trip - During Fault - An unnecessary Composite Protection System operation for a Fault condition on another Element, providing it is not determined to be a Slow Trip - During Fault. **Response:** The drafting team asserts that the Guidelines and Technical Basis is the appropriate place for additional explanation rather than within the definition of “Misoperation.” No change made.
Flathead Electric Cooperative, Inc.	No	Generally do not like the phrase "composite", would prefer that Protection System just have a solid definition. I appreciate that is the dilemma here and my specific suggestion be to delete the word composite throughout. **Response:** The drafting team contends that modifying the Protection System definition in the *Glossary of Terms Used in NERC Reliability Standards* impacts all Reliability Standards using the term. No change made.
JEA	Yes	

Organization	Yes or No	Question 1 Comment
Arizona Public Service Company	Yes	
MRO NERC Standards Review Forum	Yes	
Dominion	Yes	
Duke Energy	Yes	
SERC Protection and Controls Subcommittee	Yes	
ACES Standards Collaborators	Yes	We agree with the changes. **Response:** Thank you for your comment.
Florida Municipal Power Agency	Yes	FMPA's primary concern with the previous version of this definition centered around the ability to accurately classify the events and show evidence as appropriate. FMPA agrees the revised versions of "Slow Trip - During Fault" and "Slow Trip - Other than Fault" are more specific and thus easier to consistently apply. However, we do not believe the revised versions are going to result in events being classified the way the SDT desires. We are voting yes for this item because our primary concern is addressed. The SDT should reconsider these revisions, though, in light of the following - the revised versions have nothing to do with the designed, set, or normal operating time as specified by the relay manufacturer/settings. We believe the intent of these two categorizations is to identify relay misoperations for which a relay, interrupting device, or relay setting which was intended to operate at a particular speed, instead operated at a slower speed / in a

Organization	Yes or No	Question 1 Comment
		longer time. Just because a relay from a different Element's Composite Protection System operates does not necessarily mean this event was undesired, unnecessary, or unintended. As stated in our last comments we refer back to the core issue that the protection system performance should be measured against a company's relay setting philosophy. We also note that the Application Guide still refers to this event in "Example 3" as "A failure of a line's Composite Protection System to operate as quickly as intended...". **Response:** The modifications to the category of "Slow Trip" were previously made to simplify the identification and improve the measurability. The identification is based on the reliability impact. Example 3 in the Guidelines and Technical Basis have been clarified to remove the "quickly" wording. The drafting team contends that design philosophies inherently include the principles of dependability and security. Each entity using its particular design philosophy would lead to less consistent classification of Misoperations. No change made. The application guide also still includes language regarding "slower than previously identified as being necessary to prevent voltage or dynamic instability". **Response:** The Guidelines and Technical Basis have been updated to remove this reference. Correction made.
SPP Standards Review Group	Yes	
Bonneville Power Administration	Yes	

Organization	Yes or No	Question 1 Comment
Exelon Companies	Yes	
Manitoba Hydro	Yes	
Pepco Holdings Inc	Yes	The most recent draft of the proposed standard added a definition for a composite protection system which satisfies our previous concerns. **Response:** Thank you for your comment.
American Electric Power	Yes	
Xcel Energy	Yes	
Entergy Services, Inc.	Yes	
American Transmission Company	Yes	
Kansas City Power & Light	Yes	
Hydro-Québec	Yes	
Nebraska Public Power District	Yes	
Ingleside Cogeneration LP	Yes	Ingleside Cogeneration ("ICLP") agrees that the drafting team has made a change for the better in the definition of "Misoperation". The prior version would perhaps lead to more technically-accurate identifications of slow-trip incidents, but made too many assumptions around our capability as a GO to conduct a performance evaluation of the Composite Protection System. We simply do not have the tools or training to determine if high-speed

Organization	Yes or No	Question 1 Comment
		performance is necessary to prevent voltage or dynamic instability. In fact, we may not be aware that a slow trip took place if a secondary or back-up Protection System acts in a manner that masks the condition. We believe that improper operation of a nearby Protection System may be an indication that a slow trip occurred. From that point on, an investigation can ensue that has a chance of success - as our investigative capabilities are designed to address such events. In addition, the bright-line definition leaves no room for a violation assessment based upon a CEA's interpretation that the GO should have deployed sophisticated recorders (DME) or situational analysis tools to prepare for a Misoperation of the type. **Response:** Thank you for your comment.

2. Based on stakeholder input, the drafting team revised Requirement R2 to clarify responsibilities when local protection is responsible for the interrupting device operation and when backup protection is responsible. This also addresses the notifications that must occur to eliminate a gap in the previous draft. The gap was a condition where an entity's BES interrupting device did not operate because of a failed Protection System; therefore, would not have been applicable to the standard. Do you agree that the gap has been eliminated with the change to Requirement R2? If not, please provide specific suggestions for improvement.

Summary Consideration: The numerical values are approximate and are intended to provide a gauge of the concerns raised by industry stakeholders. The number of comments noted is analogous to the number of entities (e.g., five comments means five entities provided a comment). More than 62 percent of individual stakeholders agreed with the approach used by the drafting team in Requirement R2 to clarify responsibilities when local protection is responsible for the interrupting device operation and when backup protection is responsible. This also addresses the notifications that must occur to eliminate a gap in the previous draft 5.

There were two common comment themes that required a clarification in the standard. First, a single comment by 23 individuals raised concern that the drafting team failed to make it obvious that an entity should also have to notify other owner(s) of Protection Systems under the same circumstances in Requirement R1 for a BES interrupting device operation by manual intervention in response to a Protection System failure. The drafting team agreed with the lack of clarity and inserted the appropriate phrase to highlight that this circumstance is intended to be covered by Requirement R2. Second, two comments by individuals disagreed with the way Requirement R2, Part 2.2 was constructed when compared with the definition of "Composite Protection System." The drafting team did not make a change to Part 2.2 based on the comment, but provided additional explanation in the response how the clarification to the definition of "Composite Protection System" should address the concern.

There were six varying comment themes that did not require the drafting team to clarify the standard. Of those, two comments by nine individuals believed that requirements for providing notifications overly complicate the standard. The drafting team contends that requiring notifications is important to ensuring all Protection System owners become aware of when they need to review their Protection Systems, and when notified, that they have a responsibility to perform the necessary requirements. A single comment expressed concerned about the entity that provided remote backup protection having to track operations. The drafting team noted that a BES interrupting device operation meeting the circumstances in Requirement R1 dictate that a review of the operation be performed. Requirement R2, Part 2.2 requires that entity to notify the other owner(s) for which backup protection was provided. Two comments by 12 individuals were concerned that 120 calendar days is too long of a period and would not promote effective and efficient resolution of the problem. The drafting team contends that most Protection System reviews would occur soon after a

BES interrupting device operation. The 120 calendar days is a maximum time allowance and provides for seasonal variations in operations and work load.

The last three comments were provided by an individual commenter. One comment raised concern that Measure M2 limited an entity's ways to demonstrate coordination of evidence. The drafting team contended that Measure M2 specifically notes that evidence "may include, but is not limited to." A second comment disagreed that the BES interrupting device owner should be responsible for demonstrating compliance with the requirements in the proposed standard. The drafting team contends that the trip coil(s) of a BES interrupting device are, by definition, included in what is considered a Protection System. Last, one comment pointed out that the entity did not see how the gap regarding a case where an interrupting device did not operate has been addressed. The drafting team is confident that a BES interrupting device will operate, somewhere in the system to clear the abnormal condition, thus the entity that owns the BES interrupting device that clears the abnormal condition will notify the other owner(s).

Organization	Yes or No	Question 2 Comment
Northeast Power Coordinating Council	No	The case where manual intervention is required to open a BES interrupting device, but the cause of the Misoperation is located on a Protection System component owned by another Transmission Owner is not addressed in R2. In R1 a special mention to manual intervention is included. Why isn't a process of notification included in R2 for manual intervention caused by Misoperation of another owner's protection system? **Response:** The drafting team intended in Requirement R2 that a BES interrupting device operation due to a Protection System operation or by manual intervention in response to a Protection System failure would be considered in whether or not notifications to other owners would be required. The drafting team added the appropriate clarification for "by manual intervention in response to a Protection System failure to operate." Clarification made.
Southern Company: Southern Company Services, Inc.;	No	There is a problem with R2.2. One entity does not necessarily know whether or not another entities' Element has an abnormal condition. This notification of other entities

Organization	Yes or No	Question 2 Comment
Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing		for an explained operation of my interrupting device and my protection system should not be required. It is acknowledged that this was an attempt to eliminate the gap described above, but it is contrary to the Composite Protection System collectively functioning as intended to protect an element. **Response:** Requirement R2 provides the circumstances where the initiating entity either determines that the operation was not caused by its Composite Protection System components or the initiating entity is unable to rule out a Misoperation. The drafting team contends that the initiating entity will be in the position to determine its Protection System operated correctly. If not, Requirement R2 requires notification to other owners if the initiating entity is unable to rule out a Misoperation. No change made. Also, the drafting team clarified the intent of the definition of "Composite Protection System" to eliminate the confusion of whether "remote" was local or away from the initiating Protection System. The phrase "a remote Protection System" was clarified to "a different Element's Protection System." Clarification made.
ACES Standards Collaborators	No	(1) We continue to believe that this standard has been overly complicated by including administrative elements such as reporting information to third parties. The reporting does little to nothing to support reliability. The real value is in analyzing the Protection System operations and correcting any errors. Is there any indication that registered entities are not communicating to co-owners of the Composite Protection System that a potential misoperation occurred? If not, (and we have seen no such evidence) why does this administrative requirement that clearly meets multiple P81 criteria (administrative and reporting) rise to level of needing to be enforced with financial penalties? Barring such evidence, we simply do not see how we can support such a requirement. Clearly, the application guidelines spell out what is necessary. We recommend that the drafting team perform a study to determine if there is a true

Organization	Yes or No	Question 2 Comment
		reliability need for communicating with co-owners of Composite Protection Systems. If the drafting team cannot provide data or statistics indicating a gap in reliability, then we recommend striking the administrative tasks from the requirement. **Response:** Requirement R2 requires notification to other owners of the Composite Protection System who have a reliability role in identifying Misoperations, but were not accounted for within Requirement R1. Requirement R2, under the circumstances in Part 2.1 and Part 2.2 determine when the notification to other owners must occur. No change made. (2) The existing standard was fairly simple and coupled with the new definition of Misoperation largely addresses the scope of the SAR. All that is really is needed for this standard is a requirement to evaluate Protection System operations, identify if the Protection System operation was a misoperation and then to develop a Corrective Action Plan to prevent future misoperations. Six requirements create more complication than what is necessary. **Response:** The Requirements provide additional clarity over the current version two PRC-004-2.1a Reliability Standard that has three activities in a Requirement. This draft version three PRC-004-3 Reliability Standard has one reliability activity per Requirement and those Requirements provide the essential actions to ensure each and all entities are informed. No change made.
Seminole Electric Cooperative, Inc.	No	Requirements R1 and R2 place the burden on the owner of a BES interrupting device to initiating a review on the operation of the device. This responsibility should fall on the owner of the components of the Composite Protection System that initiated the BES interrupting device to operate. The owner of these components should be just as aware as the owner of the device regarding its operation. In addition, for those entities that are interconnected and who utilize the same BES interrupting device, those entities should have equal awareness of the BES interrupting device status.

Organization	Yes or No	Question 2 Comment
		Therefore, Seminole recommends that the SDT revise Requirements R1 and R2 to require the entity whose components of the Composite Protection System initiated the BES interrupting device to activate. **Response:** According to definition of Protection System which became effective April 1, 2013, the BES interrupting device owner owns a component of the Protection System, namely the trip coil(s) of that BES interrupting device (at a minimum). The BES interrupting device owner is in the best position to be aware of the operation and to initiate the identification of any Misoperation. In the case where the relays or other Protection System component(s) are owned by another entity, that owner may not know of the operation until it receives notification from the BES interrupting device owner. No change made.
Nebraska Public Power District	No	R2 2.2 states: "For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided." Perhaps it would be clearer to state: "For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's Element, notification of the operation shall be provided to the other Protection System owner(s) from the backup protection system owner(s) for which that backup protection was provided." **Response:** The drafting team disagrees that the suggestion provides additional clarity. No change made.

Organization	Yes or No	Question 2 Comment
		A concern with the gap fix is that the backup protection system owner will not be tracking this as a misoperation because the owner of the interrupting device is the one who had the misoperation yet the backup protection owner must store this notification as part of a misoperation on another entities system which creates an odd and risky compliance tracking situation. It would be unfortunate to get fined for not tracking this even though a misoperation did not occur on your system. This is a difficult situation to address. **Response:** Regardless of fixing the gap (i.e., R2, Part 2.2), the entity that experienced a BES interrupting device operation is required to review the operation according to the circumstances in Requirement R1. For example, if the operation was "correct" it would not be identified as a "Misoperation;" however, Requirement R2, Part 2.2 requires that the entity provide notification to the other Protection System owner(s) if the operation was a result of providing backup protection for a condition on another entity's Element. No change made. For a backup protection system owner who operates in back up for a fault on a non BES or non-registered entities system is the notification not required? **Response:** Requirement R2, Part 2.2 has been clarified that the "other entity's Element" is a "BES Element." The Guidelines and Technical Basis have been supplemented for this condition. Clarification made.
Idaho Power	No	Protection Systems regularly provide backup to the next Element. These backup features are not intended to operate under normal conditions and would not be included as part of an Element's Composite Protection System as we interpret it. The phrase "intended to operate" in 2.2 should be modified to account for operations of another Element's Composite Protection System that could operate as backup to the normal Composite Protection System for an extreme event.

Organization	Yes or No	Question 2 Comment
		Response: The drafting team clarified the definition of "Composite Protection System." Back up protection provided by a different Element's Protection System(s) is excluded. The intent of Requirement R2, Part 2.2 is for the condition where an entity provides backup protection for a different Element's Protection System, such as, the case of a failed protection system of another BES Element. Part 2.2 requires that the entity that provided the backup protection (i.e., a correct operation) is required to notify the other Protection System owners to close the reliability gap for a BES interrupting device that did not operate. A clarification was made to the definition of "Composite Protection System."
Southern California Edison Company	No	In the case where a non-performing protection system has caused a tripping device to operate, the non-tripping device could be ignored, resulting in the problem not being mitigated and eventually posing a greater risk to the composite protection system. Assuming that the owner of the system notifies the other entities owning the composite protection system, the time window of 120 days to notify would be too long in order to promote effective and efficient resolution of the problem. Notification should be within a week of the occurrence of event in order to allow the other impacted entities to review, analyze, and communicate with each other in order to perform a root cause analysis and determine a corrective action plan. **Response:** The drafting team concluded that most Protection System reviews would occur soon after a BES interrupting device operation. The 120 calendar days is a maximum time allowance and provides for seasonal variations in operations and work load. Also, requiring automatic notifications to other owners of the Composite Protection System would create an unnecessary compliance burden on entities (i.e., Requirement R3) if the initiating entity did not perform a cursory review of the Protection System operation first. No change made.

Organization	Yes or No	Question 2 Comment
		Requirement R2 provides the circumstances where the initiating entity either determines that the operation was not caused by its Composite Protection System components or the initiating entity is unable to rule out a Misoperation. No change made.
Tri-State Generation and Transmission Association, Inc.	No	Tri-State remains concerned with situations where individual components are jointly owned. The SDT's response "While a Protection System may be contractually owned by multiple entities that are not jointly registered, all of the entities would ultimately be responsible for the requisite documentation and results" appears to require all entities to report the operation giving double jeopardy to each misoperation on jointly-owned Composite Protection System components, unless a contract speaks to the designated "Compliance Entity". Typically compliance contracts take some time to come to fruition. Is it the drafting team's intent that misoperations be reported by multiple entities in this situation until a contract is finalized? **Response:** The reporting of Misoperations is outside the scope of the draft PRC-004-3 Reliability Standard and is being addressed by the NERC Rules of Procedure, Section 1600 Request for Data or Information (i.e., "data request"). Absent an agreement, all owners of a Protection System will have a compliance responsibility. No change made.
Flathead Electric Cooperative, Inc.	No	The way the M2 is written is overly prescriptive and limiting on what might be acceptable way to show the coordination between entities. The measure seems to written like a requirements. Prefer the previous language.

Organization	Yes or No	Question 2 Comment
		Response: The drafting team notes the Measure is worded "may include, but is not limited to," thus allowing other forms of evidence. The wording of the Measure follows NERC guidance. No change made.
Arizona Public Service Company	Yes	
MRO NERC Standards Review Forum	Yes	
National Grid	Yes	
Dominion	Yes	
Duke Energy	Yes	
SERC Protection and Controls Subcommittee	Yes	
SPP Standards Review Group	Yes	Formatting in recent standards has tended toward using bullets in lieu of subparts. The drafting team is encouraged to follow this practice in Requirement R2. Note that there are bullets in Requirement R5. **Response:** The drafting team followed the NERC convention for numbering and bulleting. Numbered items mean "and" which requires all of the items to be considered or performed. Bullets mean "or" and generally mean one or more are required depending on the Requirement text. No change made.

Organization	Yes or No	Question 2 Comment
		Delete the 2nd ‘when’ in the 6th line (clean copy) of the Rationale Box for Requirement R2. **Response:** The drafting team removed the second occurrence of “when.” Change made.
Bonneville Power Administration	Yes	
Operational Compliance	Yes	
Exelon Companies	Yes	
Manitoba Hydro	Yes	
Pepco Holdings Inc	Yes	We are in agreement that this revision eliminates the identified gap. However, we are still not in agreement that the owner of the interrupting device be responsible for demonstrating compliance with the requirements in the proposed standard, as has been previously stated. This is of particular interest at interface terminals with generator owners. **Response:** The drafting team thanks you for your comment. The drafting team contends that the BES interrupting device owner is in the best position to be aware of the operation and to initiate the identification of any Misoperation. No change made.
American Electric Power	Yes	
Xcel Energy	Yes	

Organization	Yes or No	Question 2 Comment
Wisconsin Electric Power Company	Yes	
Public Service Enterprise Group	Yes	
Entergy Services, Inc.	Yes

Omaha Public Power District	Yes	
Cleco	Yes	
Northeast Utilities	Yes	
Electric Reliability Council of Texas, Inc.	Yes	
Wolverine Power Supply Cooperative, Inc.	Yes	
Florida Municipal Power Agency		1. FMPA does not feel our previous comment regarding notification to affected entities was properly understood. This comment was offered to R2 in the previous round of comments. We understand the way the document is intended to flow, but our main concern is the relay event records are preserved by all entities indefinitely - for many Utilities a special trip must be made to the substation to download the event records. What prevents the Owner of a BES interrupting device that operated from taking the full 120 days to conduct their review without saying anything to the other affected owners, only to find upon request of further evaluation that those entities no longer have the relay event records necessary for the evaluation? At minimum the entity Owning the BES interrupting device should advise the other affected Protection System owners that the investigation is under way at the earliest time they determine those entities are affected, to allow the entities to be prepared with data should they be notified in accord with R2. **Response:** The drafting team concluded that most Protection System reviews would occur soon after a BES interrupting device operation. The 120 calendar days is a maximum time allowance and provides for seasonal variations in operations and work

Organization	Yes or No	Question 2 Comment
		load. Also, requiring automatic notifications to other owners of the Composite Protection System would create an unnecessary compliance burden on entities (i.e., Requirement R3) if the initiating entity did not perform a cursory review of the Protection System operation first. No change made. FMPA does not see how the gap regarding a case where an interrupting device did not operate has been addressed. Reading R1 and R2 again, it still appears that all triggers for activity are based on interrupting device operation, and we see no mention of a case where an interrupting device did not operate. While we can see that requiring actions in the standard based on relay targets, for example, would be challenging to enforce, we would have expected at least a statement, something to the effect of "Or if the entity otherwise becomes aware that a Composite Protection System it owns operated without an associated interrupting device action". **Response:** The drafting team is confident that a BES interrupting device will operate, somewhere in the system to clear the abnormal condition. The draft PRC-004-3 Reliability Standard is initiated on the operation of a BES interrupting device. Requirement R2 addresses this perceived gap for a device not operating because an entity that provided backup protection is required to notify the entity for which it provided backup protection. The other entity is then required under Requirement R3 to review its Protection System for Misoperation. No change made.
Texas Reliability Entity		No comments
CenterPoint Energy		CenterPoint Energy recommends deleting the proposed Requirement R2.2. Based upon the changes made to the Composite Protection System definition and the proposed wording of Requirement R2.1, CenterPoint Energy believes the proposed wording of Requirement R2.2 related to backup protection is unnecessary. The Composite Protection System definition now states that "Backup protection provided

Organization	Yes or No	Question 2 Comment
		to a remote Protection System is included.” This, along with Requirement R2.1 stating “notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances” and Requirement R2.1.2 stating “The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation”, provides for the notification intended by Requirement R2.2. **Response:** The drafting team clarified the definition of “Composite Protection System.” Back up protection provided by a different Element’s Protection System(s) is excluded. The intent of Requirement R2, Part 2.2 is for the condition where an entity provides backup protection for a different Element’s Protection System, such as, the case of a failed protection system of another Element. Part 2.2 requires that the entity that provided the backup protection (i.e., a correct operation) is required to notify the other Protection System owners to close the reliability gap for a BES interrupting device that did not operate. A clarification was made to the definition of “Composite Protection System.”

3. The drafting team modified the Application Guidelines to improve examples and clarify the team's intent on various topics. Do you agree the Application Guidelines provide sufficient examples and clarity? If not, please provide specific suggestions for improvement.

Summary Consideration: The numerical values are approximate and are intended to provide a gauge of the concerns raised by industry stakeholders. The number of comments noted is analogous to the number of entities (e.g., five comments means five entities provided a comment). More than 70 percent of individual stakeholders agreed that the Guidelines and Technical Basis was improved by the numerous examples and that it clarified the team's intent on various topics.

There were three themes in the comments that resulted in revisions to the standard's Guidelines. Five comments by 16 individuals requested additional examples in the Guidelines. Among the requests, examples included breaker failure, "Failure to Trip – During Fault," "Slow Trip – During Fault," "Slow Trip – Other Than Fault," "Unnecessary Trip – During Fault," and Requirements R1 and R2. The drafting team supplemented the Guidelines with most of the examples suggested by stakeholders. Four comments by 14 individuals suggested minor word clarifications, punctuation improvements, and grammar corrections needed in the Guidelines. The drafting team concurred with many of the suggestions and implemented the clarifications, improvements, and corrections. A single comment by 11 individuals noted minor issues with wording in the Guidelines that was not updated during previous revisions of the definitions. The drafting team addressed these issues.

The following five comments did not result in revisions or clarifications in the draft PRC-004-3 Reliability Standard or related documents. First, four comments by 21 individuals remained concerned with the "Slow Trip" category of the Misoperation definition. The drafting team noted that it may take a detailed investigation to distinguish between a "Slow Trip" and "Failure to Trip" category of Misoperation. However, making a distinction is not relevant to the Requirements because the entity is required to identify whether a Misoperation of its Protection System components occurred. Second, one comment by 11 individuals expressed concern that an entity does not have any flexibility in the timeframes of the Requirements for extenuating circumstances if the entity did not meet the timeframes due to an event such as a natural disaster. The drafting team responded that NERC and the Regional Entity do not have the authority to provide flexibility regarding the performance (i.e., "timeframes") of a Reliability Standard in unique extenuating circumstances. However, the Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances allow the Compliance Enforcement Authority this flexibility based on the entity's unique circumstances. Third, a single commenter believed that Bulk Electric System (BES) Elements or Protection System Misoperations that may affect the reliability of the Bulk Electric System (BES) should be first identified by the Planning Coordinator or Reliability Coordinator. The drafting team noted that the current version of the draft Reliability Standard (PRC-004-2.1a) applies to all BES Protection Systems; therefore, the Planning Coordinator or Reliability Coordinator do not need to identify specific BES Elements that affect reliability, only the owners of Protection Systems. Fourth, an individual commenter suggested adding a Requirement to require the BES interrupting device owner to share any information it has regarding the operation of the Composite Protection System. The drafting team finds such a requirement to be administrative and a compliance burden when information is already being communicated. Last, a single commenter questioned about how the timeframes relate between the Requirements. The drafting team appended a new section, “Requirement Time Periods” to the Guidelines to provide clarity regarding timeframes.

Organization	Yes or No	Question 3 Comment
PPL NERC Registered Affiliates	No	See our comments above for Example #4. The Application Guidelines should clarify Misoperation analysis scope and purpose differences between TOs (preserve stability and enforce orderly isolation of circuits on a still-live system) and GOs (trip the unit). **The following text was provided to the drafting team by the group’s submitter after the drafting team requested clarification to the above comment:** *The following response was developed by a PPL SME. Please contact me if you have additional questions.* *The issue has to do with our objections regarding slow trips. Previous versions of the standard could be interpreted as requiring us to identify the time delay associated with every relay action, to see if the device functioned as quickly as intended. We (and probably most GOs) don’t have equipment allowing such a determination. The SDT sought to address this concern by revising the definitions to state that a slow trip occurs only if another, backup relay was made to operate.* *Two shortcomings remain, however. One doesn’t know whether the primary device that didn’t get the job done was slow or it was utterly non-functional. The classification of a slow trip should then apply only if the timer was found to be mis-programmed.*

Organization	Yes or No	Question 3 Comment
		Response: Since the symptoms are similar, it may take a detailed investigation to distinguish between a "Slow Trip" and "Failure to Trip" category of Misoperation. However, this is not relevant to the Requirements. The entity is required to identify, within 120 days, whether a Misoperation occurred. The definition's wording change simplifies the identification process by allowing entities to use an operational evaluation to identify whether a Misoperation occurred. In the cited example, it should become clear during subsequent investigation whether a "Slow Trip" or "Failure to Trip" type Misoperation occurred. No change made. Secondly, the SDT forgot to revise the wording for Example 4 on p.25 of the Application Guidelines. It still talks about, "A failure of a generator's Composite Protection System to operate as quickly as intended," contradicting the revised definition. **Response:** Example 4 has been updated.
SPP Standards Review Group	No	We note that the drafting team included several additional examples in this version of the standard and we certainly appreciate that. We would however suggest that the following examples would provide further clarification: 1) an example which illustrates that a properly coordinated breaker failure operation does not equate to a slow-trip operation, **Response:** The drafting team has provided an example in the Guidelines and Technical Basis under "Composite Protection System – Breaker Failure Example" section, second bullet. Clarification made. 2) a backup protection example to provide clarity on how Requirement 2, Part 2.2 would be applied and

Organization	Yes or No	Question 3 Comment
		Response: The drafting team has provided Example 1e in the Guidelines and Technical Basis. Clarification made. 3) an example of a breaker failure Misoperation. **Response:** The drafting team has provided an example in the Guidelines and Technical Basis under "Composite Protection System – Breaker Failure Example" section, third bullet. Clarification made. We noted that the drafting team reverted to the non-capitalized 'fault' throughout most of the Application Guidelines. Yet in the listing of items that characterize a Misoperation on Page 23 (clean copy), the drafting team maintained the capitalization from the previous draft. Can the drafting team provided clarification on the proper use of the term? **Response:** The drafting team re-evaluated the general use of "fault" and the *Glossary of Terms Used in NERC Reliability Standards* definition of "Fault." The evaluation resulted in reverting certain occurrences that should refer to the glossary definition. Clarification made. In the 1st line under Unnecessary Trip - Other Than Fault on Page 26 (clean copy), delete the comma between 'to' and 'power'. **Response:** Punctuation correction made. Hyphenate 'out-of-service' in the paragraph following Example 7a on Page 27 (clean copy). **Response:** Punctuation correction made. Hyphenate 'high-side' in the 3rd line of Example 7b on Page 27 (clean copy). **Response:** Punctuation correction made.

Organization	Yes or No	Question 3 Comment
		Replace 'voltampere-reactive' with 'VAr' in the 3rd line of the paragraph under Non-Protective Functions on Page 27 (clean copy). **Response:** The usage of "static voltampere-reactive compensator" is consistent with the NERC style guide and IEEE usage for an SVC. No change made. We appreciate the explanation provided in the Extenuating Circumstances section. However, we believe that the standard should go beyond what is provided in the Sanction Guidelines. Why should an entity be held in violation in the event of multiple operations on its system during a natural disaster? There may not be an actual Misoperation but because an entity simply doesn't meet the purely administrative requirement of getting the evaluation done within a prescribed number of days, a violation has occurred. Recognition should be given in the standard for such events which withhold declaration of any potential violation until the entity has had sufficient time to 1) deal with the crisis at hand of rebuilding its system and 2) then performing the evaluations to determine if Misoperations occurred. This flies in the face of being innocent until proven guilty. **Response:** NERC and the Regional Entity do not have the authority to provide flexibility regarding the performance (timeframes) of a Reliability Standard in unique extenuating circumstances. However, the Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, says: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." While the drafting team recognizes the concern and that there are other standards which have similar provisions for natural disasters, the sanction guidelines provide sufficient flexibility to address extenuating circumstances in the event that they occur. No change made.

Organization	Yes or No	Question 3 Comment
		In the 2nd paragraph below Example R1a, insert 'where a' such that the 1st line reads: 'For the case, where a BES interrupting device...'In the 4th paragraph below Example R1a, insert 'the' in the 7th line between 'if' and 'entity'. **Response:** Punctuation correction and clarification made. In the 1st paragraph below Requirement R3, break the two sentences in the 7th-9th lines (clean copy) into two separate sentences such that it reads: 'The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. The entity may decide to identify the operation as a Misoperation and continue its investigation under Requirement R4.' **Response:** Corrections made. Bracket the 's' in 'CAP(s)' in the 4th line of the 2nd paragraph below Requirement R5 on Page 33 (clean copy). **Response:** Corrections made. Insert a 'to' between 'due' and 'resource' in the 4th line of the 2nd paragraph of Example R6c. **Response:** Corrections made. Regardless of the outcome of the capitalization of 'fault', it should be capitalized in the 1st sentence of Example R6d just like the 1st words of all the other examples given. **Response:** Corrections made.
American Electric Power	No	AEP recommends adding an example to the applications guideline to illustrate that a properly coordinated breaker failure operation does not equate to a "slow trip" type misoperation.

Organization	Yes or No	Question 3 Comment
		Response: The drafting team notes this is described in the first paragraph of the Guidelines and Technical Basis under the heading "Composite Protection System – Breaker Failure Example." No change made. AEP recommends adding a backup protection example to the application guidelines to illustrate how R2.2 would be applied. **Response:** The drafting team has provided an example(s) in the Guidelines and Technical Basis under the heading "Composite Protection System – Breaker Failure Example." Clarification made. AEP recommends adding an example of a breaker failure misoperation to the application guidelines. **Response:** The drafting team has provided an example(s) in the Guidelines and Technical Basis under the heading "Composite Protection System – Breaker Failure Example." Clarification made.
Public Service Enterprise Group	No	In comments for the prior posting, we addressed a "consistency" reporting issue. See our comments and the SDT's response in the Consideration of Comments document on pp 27-28 and the SDT's response which is incorporated into the standard in various places. See the Application Guideline change on p. 31 of the redline version, which included this addition: "The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure, it may decide to identify the operation as a Misoperation and continue its investigation until the entity determines otherwise. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation."

Organization	Yes or No	Question 3 Comment
		The SDT's language above still allows entities too much latitude in the classification of an operation as a correct Operation or a Misoperation. The classification of an operation as a correct operation or a Misoperation is step 1 in the process. Only if the operation is determined to be a Misoperation is the cause of the Misoperation investigated (step 2). We suggest this guidance: "If the available evidence IS INSUFFICIENT to classify the operation as a Misoperation PRIOR TO THE INVESTIGATION OF THE CAUSE OF A POSSIBLE MISOPERATION, DO NOT CLASSIFY THE OPERATION AS A MISOPERATION." A Misoperation with "no cause found" is not equivalent to a correct operation, which is how an unreported Misoperation is interpreted. If an entity classifies an operation as a Misoperation and goes down that path to investigate the cause, it may well conclude that no Misoperation occurred; however, unless its original Misoperation classification is changed to reflect that result, the reported Misoperations will be overstated. Another entity with an identical operation may decide not to classify it as a Misoperation based upon the data available to it absent an investigation of the cause. For the sake of consistent reporting, the classification decision (correct operation or Misoperation) must be reached without a causal investigation, which only takes place if an operation is classified as a Misoperation. **Response:** The performance under Requirement R1 is that the entity identify Protection System operations that are Misoperations. The requirement does not preclude the entity from using judgment in the classification of the operation if the available evidence is inconclusive. No change made.
Hydro-Québec	No	The purpose of the Standard shall be limited only to "Identify and correct the causes of Misoperations of Protection Systems affecting the reliability of the Bulk Electric System (BES)." The Bulk Electric System (BES) Elements or Protection System

Organization	Yes or No	Question 3 Comment
		Misoperations that may affect the reliability of the Bulk Electric System (BES), shall be first identifed by the PC or RC. **Response:** The scope of the current PRC-004-2.1a Reliability Standard applied to all BES Protection Systems; therefore, the Planning Coordinator or Reliability Coordinator do not need to identify specific BES Elements that affect reliability. No change made. Requirement R2 The owner of the interrupting device shall share any information he has, that could be used by the other owner of the protection system to determine the cause of the misoperation. **Response:** The drafting team contends that Requirement R2 only needs to require notification to the other owner(s) of the Composite Protection System. Creating Requirements for sharing information does little to improve reliability where information is already being communicated because the Requirements would have to prescribe what is shared and within what timeframes. No change made.
Nebraska Public Power District	No	See suggestion below in 4) **Response:** Please see response in Question #4.
Tacoma Power	No	In the Application Guidelines for Unnecessary Trip – Other Than Fault, the following paragraph seems out of place: “If a coordination error was at the remote terminal (i.e., set too fast), then it was an ‘Unnecessary Trip,’ category of Misoperation at the remote terminal.” This paragraph seems to focus on a scenario involving a fault. **Response:** The text was moved to “Unnecessary Trip – During Fault.” Correction made.

Organization	Yes or No	Question 3 Comment
		There is concern that, for a very small number of BES interrupting device operations, an entity could fail to identify (formally document) whether or not its Protection System component(s) caused a Misoperation. If this were to occur, it would likely be associated with apparently benign operations, so the likelihood that a misoperation would have occurred is low. Generally, misoperations garner a lot of attention within an entity, so they are generally hard to miss. Even if no misoperation occurred, an entity could be fined up to the maximum allowable for a Medium VRF and Severe VSL for failing to identify that its Protection System component(s) did not cause a Misoperation. The possibility for fines of this magnitude could drive potentially costly measures to ensure zero defects, even though BES reliability would not be impacted by failing to formally identify that an entity's Protection System component(s) did not cause a Misoperation. Tacoma Power agrees with the spirit of Requirement R1 but believes that compliance and enforcement should be assessed with failure (or tardiness in) identifying that its Protection System component(s) caused a Misoperation. Basically, if an entity does not determine whether or not a Misoperation occurred, they would be implicitly (by default) saying that a Misoperation did not occur. During an audit, if a BES interrupting device operation caused by a Protection System is uncovered for which no formal (explicit) identification according to Requirement R1 was made, the entity should only be found non-compliant (or penalized) if the CEA believes that a Misoperation did indeed occur. The purpose of the standard is to "identify and correct the causes of Misoperations of Protection Systems..." Perhaps this issue could be addressed in the Application Guidelines. **Response:** The performance under Requirement R1 is that the entity identify Protection System operations that are Misoperations. The requirement does not preclude the entity from using judgment in the classification of the operation if the

Organization	Yes or No	Question 3 Comment
		available evidence is inconclusive. The phrases "or not" have been removed from the VSLs to align with the Requirement. Even though Requirement R1, Part 1.1, stipulates that "the BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate," to what extent will entities be required to prove that BES interrupting device operations were not caused by a Protection System operation? The potential risk of failing to satisfy Requirement R1 seems high enough that entities may take costly measures to ensure zero defects, out of an abundance of caution, by excessively reviewing BES interrupting device operations. This additional cost could be better served in other areas to support BES reliability. Perhaps this issue could be addressed in the Application Guidelines. **Response:** The Requirement is written so that only Protection System operations that occur "under the circumstances Parts 1.1 through 1.3" be evaluated for Misoperation. No change made. In the Application Guidelines for Requirement R1, change "For the case,..." to "For the case in which a..." Furthermore, should this paragraph be included under the Requirement R2 portion of the Application Guidelines? **Response:** The drafting team provided an alternative clarification "For the case where a BES interrupting device…" Clarification made. The drafting team disagrees that this text needs to be included in the Guidelines and Technical Basis under Requirement R2. In the Application Guidelines for Requirements R1 and R3, change "The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion" to something like

Organization	Yes or No	Question 3 Comment
		“The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred.” The concern is that the CEA could require an entity to leverage all available data before determining that a Misoperation did not occur. **Response:** The drafting team added the clarification “In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred.” Clarification made. Tacoma Power appreciates the following paragraph in the Application Guidelines for Requirement R2: “A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the GO and TO functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.” **Response:** Thank you for your comment. In the Application Guidelines for Requirement R4, Example R4a, was the scheduling activity on 03/24/2014 considered to be the first investigative action pursuant to Requirement R4, or did the first investigative action pursuant to Requirement R4 occur on 4/10/2014?

Organization	Yes or No	Question 3 Comment
		Response: The drafting team added a clarification “as the first investigative” action to Examples R4b and R4b. Regarding Requirements R1, R3, and R4, is the date when an entity identifies that its Protection System component(s) caused a Misoperation the date that they officially make the identification? **Response:** Yes. As long as an entity is compliant with Requirement R1 or R3, as applicable, are they afforded some discretion as to the identification date? **Response:** The date a Misoperation is identified by the owner of the Protection System component(s) that caused a Misoperation would become the “official date” from which the Compliance Enforcement Authority would measure compliance with in Requirement R1 (or R3 for the notified entity). Note that if the “cause” of an identified Misoperation was not identified in Requirements R1 (or R3 for the notified entity), the entity is obligated under Requirement R4 to perform at least one investigative action at least once every two full calendar quarters after the Misoperation was first identified. No change made. It seems like the timeline for Requirement R4 should be based on 120 calendar days of the BES interrupting device operation, for Misoperations identified pursuant to Requirement R1, or the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, for Misoperations identified pursuant to Requirement R3. As written now, those entities who quickly identify Misoperations will have compliance obligations under Requirement R4 sooner. On the other hand, an entity that delays officially identifying a Misoperation could be looking for causes ahead of time such that they effectively bypass Requirement R4. Perhaps this issue could be addressed in the Application Guidelines. The objective here is not to make

Organization	Yes or No	Question 3 Comment
		the standard more complicated but to avoid misunderstanding that might surface during an audit. **Response:** Each of the time periods in the Requirements is discreet. Once a Misoperation is identified, the entity must either go to Requirement R4 (Misoperation without a cause) or Requirement R5 (develop a CAP because the cause is known). The drafting team added the “Requirement Time Periods” section to the Guidelines to provide additional clarity. Similarly, regarding Requirement R4 and R5, is the date when an entity determines the cause(s) of a Misoperation the date that they officially make the determination? **Response:** Yes. Perhaps this issue could be addressed in the Application Guidelines. Again, the objective here is not to make the standard more complicated but to avoid misunderstanding that might surface during an audit. **Response:** The drafting team provided clarification in the Guidelines and Technical Basis under the heading “Requirement Time Periods.” Clarification made. In the Application Guidelines for Requirement R6, change “...were postponed due resource...” to “...were postponed due to resource...” **Response:** The drafting team corrected the grammar. If manual intervention in response to a Protection System failure to operate is required, this could imply that both the primary Composite Protection System and remote backup Composite Protection System(s) failed to operate, assuming that remote backup could be configured reliably to detect the fault under the pre-fault power system conditions. Would this condition automatically mean that multiple Composite Protection Systems, potentially at multiple locations (both primary and

Organization	Yes or No	Question 3 Comment
		remote backup), misoperated? Perhaps this issue could be addressed in the Application Guidelines. **Response:** Under the scenario described above, multiple "Failure to Trip" Misoperations and would been likely to have occurred. No change made.
Independent Electricity System Operator	No	We do not agree with the part on Composite Protection System, for the reasons indicated under Q1, above. **Response:** Please see the response under Question #1.
Oncor Electric Delivery LLC	No	Since the last Standard draft, the SDT has added a new example on page 29 of the Application Guideline which states "Example 7d: A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush following a maintenance outage. Only the high-side breaker opens since the low-side breaker had not yet been closed. Since closing the breaker put the transformer bank into service, this is a Misoperation." Although this scenario would be an undesired trip, without the low side breaker closed the transformer will not feed load. With that said, tripping of the high side will not compromise reliability of the BES although it is undesirable. Oncor has not seen a perfect relay that will respond ideally during the reenergization of a transformer with magnetizing current. For the reason just described, the possibility of tripping a transformer unnecessarily during energization (with no load connected) is preferable to desensitizing the protection further such that it might not operate when necessary. **Response:** The drafting team recognizes this situation; however, the scenario should be classified as a Misoperation. If so, the entity may address not making any changes to the Protection System under Requirement R5 by making a declaration why

Organization	Yes or No	Question 3 Comment
		corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken. No change made.
CenterPoint Energy	No	CenterPoint Energy recommends adding additional examples to help provide consistent reporting of Misoperations. Examples for Breaker failure events (stuck breaker) and additional examples of the more common "Unnecessary Trip – During Fault" category would be helpful. Additional examples would help clarify the interrelationship between the "Slow Trip – During Fault" and the "Unnecessary Trip – During Fault" categories. The following comments and additional examples are provided for consideration: **Response:** The drafting team has provided examples (see Examples 3b, 5b, and the 3rd bullet under the section "Composite Protection System – Breaker Failure Example") in the Guidelines and Technical Basis. Clarification made. Example 1e: The Composite Protection System for a bus does not operate during a bus fault which results in the operation of all local transformer Protection Systems connected to that bus and all remote line Protection Systems connected to that bus isolating the faulted bus from the grid. The operation of the local transformer Protection Systems and the operation of all remote line Protection Systems correctly provided backup protection. There is one "Failure to Trip – During Fault" Misoperation of the bus Composite Protection System. **Response:** The drafting team has provided an Example 1e in the Guidelines and Technical Basis. Clarification made. Example 3b: A failure of a breaker's Composite Protection System to operate as quickly as intended to meet the expected critical fault clearing time for a line fault in conjunction with a breaker failure (stuck breaker) is a Misoperation if it resulted in an unintended operation of at least one other Element's Composite Protection System. If

Organization	Yes or No	Question 3 Comment
		a generating unit's Composite Protection System operates due to instability caused by failure of a breaker's Composite Protection System, it is not an "Unnecessary Trip – During Fault" Misoperation of the generating unit's Composite Protection System. This event would be a "Slow Trip – During Fault" Misoperation of the breaker's Composite Protection System. **Response:** The drafting team has provided this Example 3b, almost verbatim, in the Guidelines and Technical Basis. Clarification made. Example 3c: A line connected to a generation interconnection station is protected with two independent high-speed pilot systems due to dynamic stability reasons. The Composite Protection Scheme for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. During a fault on this line, the two pilot systems fail to operate; and, the time-overcurrent scheme operates clearing the fault with no generating units or other Elements tripping (no over-trips). This event is not a Misoperation. **Response:** The drafting team has provided an Example 3c in the Guidelines and Technical Basis. Clarification made. Example 3d: A line connected to a switching station is protected with two independent high-speed pilot systems for reasons other than voltage or dynamic stability (e.g., short line length or to reduce backup clearing times for service reliability). The Composite Protection Scheme for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. The step distance and time-overcurrent schemes and Protection Systems of other line terminals are intentionally not coordinated with the step distance and time-overcurrent schemes of this line because high-speed tripping is expected on the line with the two independent high-speed pilot systems. During a fault on the line with the two independent high-speed pilot systems, the two pilot systems fail to operate; however, the time-

Organization	Yes or No	Question 3 Comment
		overcurrent scheme operates clearing the fault however, another line in the system trips (over-trips). The trip of the other line in the system is not an "Unnecessary Trip – During Fault" Misoperation as miscoordination was expected for the conditions that occurred. The event on the line with the two pilot systems is a "Slow Trip – During Fault" Misoperation, although the analysis and Corrective Action Plan would address the two pilot schemes failure to trip. **Response:** The drafting team notes this example is unnecessary due to its complexity therefore it has not been included in the Guidelines and Technical Basis. No change made. Example 5b: An operation of a line's Composite Protection System which trips (i.e., over-trips) for a properly cleared fault on a different line is a Misoperation. The fault is cleared properly by the faulted line's Composite Protection System (i.e., line relaying); however, elsewhere in the system, a carrier blocking signal is not transmitted (e.g., carrier ON/OFF switch found in OFF position) resulting in the operation of a remote Protection System, single-end trip of a non-faulted line. The operation of the Protection System for the non-faulted line is an unnecessary trip of the line protection; therefore, the non-faulted line Protection System operation is an "Unnecessary Trip – During Fault" Misoperation. **Response:** The drafting team has provided an Example 5b in the Guidelines and Technical Basis. Clarification made. Example 5c: A line connected to a switching station is protected with two independent high-speed pilot systems for reasons other than voltage or dynamic stability (e.g., short line length or to reduce backup clearing times for service reliability). The Composite Protection Scheme also includes step distance and time-overcurrent schemes in addition to the two pilot systems. The step distance and time-overcurrent schemes and Protection Systems of other line terminals are intentionally not

Organization	Yes or No	Question 3 Comment
		coordinated with the step distance and time-overcurrent schemes of this line because high-speed tripping is expected on the line with two independent high-speed pilot systems. During a fault on the line with two independent high-speed pilot systems, the two pilot systems fail to operate; however, the time-overcurrent scheme operates clearing the fault and, in conjunction, another line in the system trips (over-trips). The trip of the other line is not an "Unnecessary Trip – During Fault" Misoperation as miscoordination was expected for the conditions that occurred. The event on the line with the two pilot systems is a "Slow Trip – During Fault" Misoperation, although the analysis and Corrective Action Plan would address the schemes failure to trip. **Response:** The drafting team notes this example is unnecessary due to its complexity therefore it has not been included in the Guidelines and Technical Basis. No change made. Additionally, in the Application Guidelines, it appears the following paragraph at the end of the "Unnecessary Trip – Other Than Fault" examples is misplaced and could be deleted: "If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip," category of Misoperation at the remote terminal." **Response:** The drafting team has relocated the text in the Guidelines and Technical Basis. Clarification made. CenterPoint Energy recommends adding the following wording as the last two paragraphs at the end of the examples for "Unnecessary Trip – During Fault" examples to parallel the wording for the "Slow Trip – During Fault" category: In analyzing the Protection System for Misoperation, the entity must also consider the "Slow Trip – During Fault" category to determine if an "slow trip" applies to the Protection System operation of an Element other than the faulted Element.

Organization	Yes or No	Question 3 Comment
		Response: The drafting team disagrees that the suggestion "In analyzing…" provides additional clarity. No change made. If a coordination error was at the remote terminal (i.e., set too fast), then it was an " Unnecessary Trip – During Fault" category of Misoperation at the remote terminal. **Response:** The drafting team has provided an Example 5c in the Guidelines and Technical Basis. Clarification made.
Arizona Public Service Company	Yes	
MRO NERC Standards Review Forum	Yes	The clarifications and additions to the Application Guide are helpful to the understanding of the standard. We recommend these type of guides be with all proposed Standards in the future. **Response:** Thank you for your comment. Results-based Standards (RBS) are designed to have an Application Guideline section to be retained with the adopted PRC-004-3 Reliability Standard upon approval.
National Grid	Yes	
Dominion	Yes	
Duke Energy	Yes	
SERC Protection and Controls Subcommittee	Yes	(1) It would be beneficial if examples in the Application Guidelines had different solutions other than just 'fixed capacitor'. **Response:** The drafting team contends that the examples illustrate different Corrective Action Plan approaches within the Requirement. Replacing the capacitor

Organization	Yes or No	Question 3 Comment
		simplifies the example to highlight the differences in what corrective actions are being taken. No change made. (2) It would be beneficial and we recommend the Application Guidelines remain with the Standard when published to provide easy reference for users. To provide clarity about the authority of the guidelines, the following note should be included similarly as written in other Standards that include Application Guidelines: "Note: These Application Guidelines for PRC-004-3 are neither mandatory nor enforceable." **Response:** Thank you for your comment. Results-based Standards (RBS) are designed to have a Guideline and Technical Basis section to be retained with the adopted PRC-004-3 Reliability Standard upon approval. Only the Requirements are mandatory and enforceable. No change made.
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	Yes	Application Guidelines: Overall, this document is very good in addressing the process. **Response:** Thank you for your comment.
ACES Standards Collaborators	Yes	(1) We agree that the Application Guidelines include improved examples and did clarify the intent of the drafting team. Furthermore, we support the intent in the

Organization	Yes or No	Question 3 Comment
		application guidelines. However, in some cases, the intent of the drafting team and the language of the requirements simply do not align. For example, language was inserted into the Requirement R3 discussion on page 31 to clarify that a registered entity is "to classify an operation as Misoperation if the available information leads to that conclusion" and "allows an entity to classify an operation as a Misoperation if an entity is not sure." Neither Requirement R3 nor Requirement R1 language provide this flexibility and is thus inconsistent with the language in the application guidelines. R1 and R3 are both very clear that the responsible entity has 120 days (for R3 or the later of 60 days after notification) to identify whether its Protection System operations were a Misoperation. This language is definitive. We do not see how this language allows an entity to classify an operation as Misoperation if it is not sure. Again, the requirement language states clearly that the responsible entity has to identify whether its Protection System components result in a Misoperation. There is no room in the language of the requirement for uncertainty. This further leads to a problem with R4 because R4 would require R1 and R3 to be violated since both require determination of whether a Misoperation occurred and R4 identifies a situation that can only occur after a violation of R1 or R3. Even the last Severe VSL for both R1 and R3 supports our argument. Failure to identify a whether or not a Protection System operation is a Misoperation is a Severe VSL. We suggest the drafting further refine Requirements R1, R3, and R4 collectively to match the intent demonstrated in the application guidelines. **Response:** The performance under Requirement R1 is that the entity identify Protection System operations that are Misoperations. The requirement does not preclude the entity from using judgment in the classification of the operation if the available evidence is inconclusive. The drafting team contends that the language in the

Organization	Yes or No	Question 3 Comment
		Guidelines and Technical Basis provides clarity on the intent of the Requirements (i.e., R1 and R3), and is consistent with requirement language. No change made.
Florida Municipal Power Agency	Yes	FMPA appreciates the changes to the Application Guide and does feel the additional specificity was beneficial. We do, however, feel some sections are inconsistent with the revised Requirements and definitions in the standard. See our comments on the definition of "Misoperation" above. There may be some additional changes that are needed to the Application Guide to ensure it fully supports the revised Standard. **Response:** Please see our previous responses to FMPA comments. No change made.
Bonneville Power Administration	Yes	
Operational Compliance	Yes	
Exelon Companies	Yes	
Manitoba Hydro	Yes	
Pepco Holdings Inc	Yes	
Xcel Energy	Yes	
Wisconsin Electric Power Company	Yes	

Organization	Yes or No	Question 3 Comment
Entergy Services, Inc.	Yes	Entergy agrees with the SERC PCS comments to add Application Guideline examples other than "fixed capacitors", and that the Application Guideline should remain with the standard as a reference. **Response:** Please see response to SERC PCS comments. The Guidelines and Technical Basis remains with the standard. No change made.
American Transmission Company	Yes	
Kansas City Power & Light	Yes	
Ingleside Cogeneration LP	Yes	ICLP found the examples provided in the Applications Guidelines to be helpful. In addition, there is a sufficient diversity in scope that will act as a useful reference in the event that we suspect a Misoperation of one of our Composite Protection Systems may have taken place. **Response:** Thank you for your comment.
Idaho Power	Yes	
Southern California Edison Company	Yes	
Omaha Public Power District	Yes	
Cleco	Yes	
Northeast Utilities	Yes	The examples provided in the application guideline should be clarified when talking about unnecessary trips. It should be made clear that if any portion of a Composite

Organization	Yes or No	Question 3 Comment
		Protection System designed to protect one Element operates for a problem on another Element is considered a Misoperation. **Response:** The drafting team added a number of examples to clarify "unnecessary trips" in the Guidelines and Technical Basis. A Composite Protection System designed to protect one Element that operates for a problem on another Element is not necessarily a Misoperation. It could be a correct operation for a "Failure to Trip" elsewhere. Clarifications made to the Guidelines and Technical Basis.
Tri-State Generation and Transmission Association, Inc.	Yes	
Flathead Electric Cooperative, Inc.	Yes	still have trouble with how the word composite is being used, but do agree that the guidelines provide clarity on the drafting teams intent, unsure the compliance impact on the requirements **Response:** Thank you for your comment.
Wolverine Power Supply Cooperative, Inc.	Yes	
Texas Reliability Entity		No comments.

4. If you have any other comments on this Standard that were not provided in response to the previous questions, please provide them here:

Summary Consideration: The numerical values are approximate and are intended to provide a gauge of the concerns raised by industry stakeholders. The number of comments noted is analogous to the number of entities (e.g., five comments means five entities provided a comment). The following summary does not include items addressed in the previous summaries.

This section contained two individual comments that were different from previous summaries above. The comment suggested updating the flowchart wording based on clarifications made to the standard. The drafting team updated the draft PRC-004-3 Reliability Standard, its flowchart, and other related project documents for alignment such as the Implementation Plan which earlier posting revisions to the Misoperation definition failed to include.

Second, an entity pointed out that Evidence Retention section states 12 months is the required evidence retention period for the Requirements. The commenter also noted that the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit. The drafting team clarified the evidence retention periods are “a minimum of” time an entity is required to retain specific evidence to demonstrate compliance. The drafting team used NERC guidance in determining the appropriate minimum evidence retention periods.

The following multiple minority comments did not result in a clarification or revision to the draft PRC-004-3 Reliability Standard or other related project documents. Five comments by 15 individual presented general questions to the drafting team. The drafting team provided responses to these questions; for example, responses included as to whether the scenario was a Misoperation, not a Misoperation, or other response applicable to the rationale of certain Requirements. Three comments by 35 individuals requested either information on why topics like undervoltage load shedding (UVLS), and dispersed generation resources (DGR) concerning the new BES definition implementation, were not addressed in this version. The drafting team noted that it cannot base criteria or applicability in the proposed draft PRC-004-3 Reliability Standard based on projects that are in active development. Completing this version three will enable other drafting teams to address UVLS and DGR topics. Two comments represented by four individuals were concerned about the amount of time to develop a Corrective Action Plan (CAP) in Requirement R5. The drafting team contends that 60 calendar days is an adequate amount of time to develop a high level evaluation and plan. Timeframes associated with any actions taken as a part of the evaluation of other Protection Systems are outside the scope of the standard. Two individual comments suggested significant changes to the standard. The drafting team contends that the draft PRC-004-3 Reliability Standard as written achieves the stated Purpose and therefore declines to make wholesale modifications to the Requirements. For example, there is no requirement to provide a CAP to the Reliability Coordinator in the current version PRC-004-2.1a Reliability Standard, although Regional procedures may have dictated the entity to do so.

The following are comments from single entities and individuals. There was a comment concerning the review and reporting of operations of jointly-owned Composite Protection System components as opposed to multiple entities owning separate components. The drafting team contends that the reporting of Misoperations is outside the scope of the draft PRC-004-3 Reliability Standard and is being addressed by the NERC Rules of Procedure, Section 1600 Request for Data or Information (i.e., “data request”). Absent an agreement, all owners of a Protection System will have a compliance responsibility. Also, one comment asked when is a change to a CAP considered failure to implement. The drafting team noted that modifying a CAP does not constitute a failure to implement a CAP. According to Requirement R6, the audit approach to determining a failure to implement a CAP is addressed by the previously posted draft Reliability Standard Audit Worksheet (RSAW). As the entity completes the actions within a CAP, the entity will update the CAP periodically, thus the CAP will demonstrate implementation.

Another single entity commented that an entity in Requirement R3 should be afforded a full 120 calendar days to review its Protection System similar to entities that initiate reviews under Requirement R1. The drafting team responded that when an entity receives notification of a Protection System operation by the BES interrupting device owner, the Protection System owner is allotted a minimum of 60 calendar days to identify whether it was a Misoperation and could be as much a 120 calendar days from the date the BES interrupting device operated depending on when notification occurs. A minimum time period that is less than 120 calendar days is provided on the basis that the BES interrupting device owner has already performed preliminary work, collaborated with the other owners, and that other owners generally have fewer associated Protection System components.

Another entity commented that an entity could forego performing Requirement R1 or R3 and conduct its review under Requirement R4. The drafting team contends that Requirements R1 and R3 do not preclude an entity from determining the cause of an identified Misoperation (Note: Requirement R2 is for notification to others.); however, Requirement R4 becomes applicable only after a Protection System operation is “identified as a Misoperation” under Requirement R1 or R3 and does not have an identified cause. Requirement R4 is an exception-based Requirement and is only performed when the entity did not identify the cause(s) of the Misoperation in its performance in either Requirement R1 or R3.

Last, a single commenter suggested shortening the performance time periods in Requirement R4 for performing investigative action. The drafting team contends that the periodic action balances the compliance burdens and focuses the entity’s effort on determining the cause(s) of the Misoperation while providing measurable evidence. In addition, certain planned investigative actions may require months or years to schedule and complete due to outages and other factors. Additionally, the drafting team contends that listing a defined time limit to complete the Requirement would actually decrease reliability. Shortening time limits would have the unintended consequence of causing an entity to discontinue its investigation. The Requirement allows the entity to either determine the cause or conclude its investigation when it is confident that a cause cannot be determined.

Organization	Question 4 Comment
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	a) The multiple timing process periods are an added burden and still unclear in the standard. However, the application notes do provide some guidance {R3}; **Response:** The drafting team provided clarification in the Guidelines and Technical Basis under the heading "Requirement Time Periods." Clarification made. b) The wording in R3 of the Process Flow Chart on the last page of the draft standard should match that of the requirement R6 (change "greater" to "later" in the chart). There is no evidence that entities have not been doing due diligence in investigating and correcting misoperations, therefore, the addition of the various timelines serve only to generate additional paperwork. **Response:** The drafting team has corrected the wording in the flowchart. Correction made.
ACES Standards Collaborators	(1) Example 3 on page 25 should be updated. The first sentence is inconsistent with the proposed definition of Misoperation. A failure of a line's Composite Protection System to operate as quickly as intended is only a Misoperation if another Element's Composite Protection System operation. Please append the following clause to the first sentence: "if another Element's Composite Protection System operated." **Response:** Clarification made. (2) The VSLs for R3 rely only on the 120 day portion of the language in the requirement. They do not include the "later of" language relying on 60 days if more than 60 days has passed since the original Protection System Operation. We suggest the VSLs should be updated accordingly reflect the requirement in totality.

Organization	Question 4 Comment
	Response: The VSL is based on tardiness regardless of whether the entity is afforded 120 calendar days from the operation of the BES interrupting device or 60 calendar days of notification by the initiating entity pursuant to Requirement R2. No change made. (3) To avoid requiring a registered entity from providing all BES interrupting device operations, the Compliance Assessment Approach for R1 in the RSAW needs to be modified to be consistent with the requirement and the evidence request section. The auditor should only sample BES interrupting device operations that meet the criteria Requirement R1 Part 1.1 through 1.3 and is provided as evidence in the evidence requested section. Please add “that meet criteria Requirement R1 Part 1.1 through 1.3” after “interrupting device operations” in the first and second rows of the RSAW’s Compliance Assessment Approach for R1. **Response:** The drafting team has provided the RSAW comment to NERC Compliance for consideration and modification. (4) Please update the RSAW’s Note to Auditor section to review the Application Guidelines section for Requirement R2 for small entities as well as vertically integrated utilities. The Application Guidelines make clear that small entities with a single protection engineer are not expected to provide notification requirements between the GO, TO and DP because they would already be aware since they evaluate all Protection System operations including transmission and generation. **Response:** This concern is addressed in the paragraph following Example R2b in the Guidelines and Technical Basis under the heading “Requirement R2.” The drafting team has provided the RSAW comment to NERC Compliance for consideration and modification. (5) Thank you for the opportunity to comment.
CenterPoint Energy	(a) In the Application Guidelines, CenterPoint Energy recommends changes to account for high-speed tripping for internal transformer faults by other types of protection systems (e.g., sudden pressure) that are not specifically included in the proposed definition of Composite Protection System. The following additional wording at the end of Examples 1a and 1b is suggested:

Organization	Question 4 Comment
	Example 1a: A failure of a transformer's Composite Protection System to operate for a transformer fault is a Misoperation unless other protection schemes (e.g., sudden pressure) operated. Example 1b: A failure of a "primary" transformer relay (or any other component) to operate for a transformer fault is not a “Failure to Trip – During Fault” Misoperation as long as another component of the transformer's Composite Protection System or other protection schemes (e.g., sudden pressure) operated. **Response:** The drafting team contends that the scenario that is described does not meet the definition of “Misoperation.” For a high impedance transformer Fault, the non-operation of a differential relay due to low Fault current levels is not a failure to operate as intended for protection purposes. A similar example (R1b) has been added to the Guidelines and Technical Basis. Clarification made. (b) The proposed Requirement R4 wording currently includes the following: “...shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes...”. CenterPoint Energy understands this wording is to provide a mechanism to continue investigative work to determine the cause of a Misoperation when the cause cannot be determined during the allotted time periods in Requirements R1 or R3. CenterPoint Energy recommends additional wording to allow the investigation to be completed in the quarter that the misoperation occurs (“partial quarter”) for cases where the investigation and tests, including any needed outages< can be completed in the partial quarter and suggests the following wording: “...shall perform investigative action(s) to determine the cause of the Misoperation at least once during the partial quarter when the misoperation occurs or every two full calendar quarters after the Misoperation was first identified, until one of the following completes...”.

Organization	Question 4 Comment
	Response: The drafting team contends that the suggestion does not provide any additional benefit over the current wording and may have the unintended consequence of shortening the time period for performance and being in compliance. See Example R4a in the Guidelines and Technical Basis for additional detail. No change made.
Florida Municipal Power Agency	2. FMPA does not feel our previous comment regarding the inherent problems with the concept of comparing Protection System performance to a single set of generic categories as tied to compliance was addressed. We feel many of the issues and challenges in this revised standard would easily be addressed by allowing entities to compare the performance of their relays with their Protection System Design Philosophy. In the absence of a mandatory electric reliability standard, this is how Utilities would determine “mis-operations” – did the Protection System/component perform according to the intended design? **Response:** The drafting team contends that design philosophies inherently include the principles of dependability and security. Each entity using its particular design philosophy would lead to less consistent classification of Misoperations. No change made. 3. In the Facilities section – what is the reason PRC-004-3 cannot use the same description of “Protection System” as PRC-005-2? Would these two standards not inherently be designed to cover the very same Facilities? **Response:** The draft PRC-004-3 Reliability Standard uses the defined term in the *Glossary of Terms Used in NERC Reliability Standards* without the additional level of specificity provided in PRC-005-2. The reasoning was to avoid a subsequent change to the draft PRC-004-3 Reliability Standard if additional equipment changed in the future. No change made. 4. FMPA accepts the SDT’s revised definition of Composite Protection system which no longer singles out step-distance/intentional remote backup schemes. However, we in general do not agree with the use of Composite Protection System in the standard. This term is being used to reduce what is considered a “Misoperation”. While FMPA supports more relaxed Requirements for

Organization	Question 4 Comment
	mitigating/remediating a Misoperation when another part of the Composite Protection System successfully prevents any negative impact to the BES, a Misoperation is still a Misoperation. If the goal is to keep statistics on how we are doing as an industry, we need to tie those statistics to basic characteristics that are less subject to interpretation and change. Misoperation should still be tied to the failure of equipment. The fact that a different part of the Composite system properly functioned is additional information. Again, we support the idea that a properly designed Composite Protection system should mean an entity does not necessarily need to make changes, but the Misoperation should still be tracked. **Response:** The drafting team contends that "Composite Protection System" should be based on the principle that an Element's multiple layers of protection are intended to function collectively. Also, the new definition supports consistent reporting of Misoperations under the Section 1600 data request because all entities, under the new definition, will be evaluating their Composite Protection Systems in the same manner. No change made. 5. What is the reason the defined Glossary term "Fault" has been replaced with "fault" throughout the document? **Response:** The drafting team re-evaluated the general use of "fault" and the *Glossary of Terms Used in NERC Reliability Standards* definition of "Fault." The evaluation resulted in reverting certain occurrences that should refer to the glossary definition. Clarification made.
Tacoma Power	Although the term is discussed in the Application Guidelines, consider formally defining the term "interrupting device." **Response:** The drafting team asserts that the phrase "BES interrupting device" is widely understood by industry and is described in the Guidelines and Technical Basis under the heading "Definitions." No change made. In Requirement R3, should "BES interrupting device(s)" be "BES interrupting device"?

Organization	Question 4 Comment
	Response: The parenthetical "s" is added here because the Protection System may have tripped more than one BES interrupting device. No change made. In Requirement R4, should "the cause" be "the cause(s)"? **Response:** Parenthetical "s" added. In Requirement R5, should "a cause" be "the cause" or "the cause(s)"? **Response:** This use of "cause" is singular because the Corrective Action Plan timing is triggered off of the "first" identified cause. No change made. In the Rationale for R6, change "tivities" to "activities." **Response:** Correction made.
American Electric Power	As currently written, R5 may be interpreted as requiring the entity to both develop a CAP and complete the evaluation of the CAP's applicability to other Protection Systems within 60 days. **Response:** Yes, that is correct. For large entities, or in cases where the evaluation requires equipment outages, completing the evaluation of applicability within 60 days could be impossible. R5 should be revised to clearly state that the entity is only required to develop a CAP within 60 days. There should be an option to include the evaluation within the CAP. This would enable entities to complete the evaluation as part of the CAP and within a time window that is tailored to the scope of the corrective action and quantity of potentially applicable Protection Systems. AEP supports the concept of evaluating a corrective action's applicability to other Protection Systems. **Response:** The drafting team contends that 60 calendar days is an adequate amount of time to develop a high level evaluation. Timeframes associated with the execution of the evaluation are outside the scope of the standard. No change made.

Organization	Question 4 Comment
	However, the standard requirements provide no means of measuring what is an adequate evaluation. Without this, an auditor could question the adequacy of an entity's evaluation, decide that the entity's actions were not an evaluation and subsequently find the entity non-compliant with R5. We believe that the SDT's Application Guide examples were an effort to demonstrate what would be acceptable. However, the examples are not exhaustive and therefore do not eliminate the audit risk. AEP believes that subject matter experts are in the best position to determine evaluation scope and content. AEP recommends that in lieu of adding additional examples in the Application Guideline, the drafting team should consider the possibility of an auditor invalidating an evaluation. The requirement should be revised so that it places bounds on this scenario and provide entities with certainty in how R5 might be reviewed by an auditor. **Response:** The drafting team contends that there are no provisions within the draft PRC-004-3 Reliability Standard directing an auditor to determine the adequacy of an evaluation. No change made. AEP supports the overall efforts of the drafting team in the fundamental approach taken in the proposed standard. AEP has chosen to vote in the affirmative despite our concerns regarding the CAP and evaluation within R5, and how their compliance would ultimately be determined by an auditor. **Response:** Thank you for your comment and support.
Independent Electricity System Operator	As indicated in our previous comments, we disagreed with the omission of UVLS while UFLS is included. The SDT's response indicates that UVLS has not been included in the proposed standard's Applicability because Misoperations of UVLS relays are being addressed under Project 2008-02 - Undervoltage Load Shedding when modifying Reliability Standard PRC-022-1 - Under-Voltage Load Shedding Program Performance. We do not find this rationale sufficient to justify the inclusion of UFLS but exclusion of UVLS since both need to be assessed and treated under the same light. Note that the SAR for Project PRC-022-1 is being revised to include UFLS. We suggest the PRC-004 SDT to

Organization	Question 4 Comment
	coordinate with the PRC-022 SDT to apply a consistent approach to addressing Misoperations of UFLS and UVLS. **Response:** Undervoltage load shedding (UVLS) has not been included in the draft PRC-004-3 Reliability Standard's Applicability because Misoperations of UVLS relays are currently addressed by Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance, Requirement R1.5. Adding UVLS in PRC-004-3 at this point would create unforeseen issues with having Requirements in two different Reliability Standards address the same activity. The purpose of the UFLS project is to address an outstanding FERC directive and review PRC-006-1 to determine if any steady state modifications are appropriate (i.e., Paragraph 81 criteria and recommendations of the Independent Expert Review Panel). Specifically, the other project's standard drafting team will revise PRC-006-1 to address the directive included in FERC Order No. 763 and to provide for clear, unambiguous design and documentation requirements for automatic UFLS programs. Underfrequency load shedding (UFLS) was added to PRC-004-3 to close a gap in reliability as Misoperations of UFLS relays are not covered by a Reliability Standard. The drafting team added additional text to the background to explain both UVLS and UFLS. Clarification made.
Bonneville Power Administration	BPA believes that there is one other gap that has not been identified. This is the case where a TO, GO, or DP owns a BES interrupting device that operates, but does not own any of the Composite Protection System. This is a real scenario. In this situation, the owner of the BES interrupting device is not subject to R1 because R1.2 is not true, i.e. the owner of the BES interrupting device does not own all or part of the Composite Protection System. Likewise, the owner of the BES interrupting device is not subject to R2 because R2.1.1 is not true, i.e. the owner of the BES interrupting device does not share ownership of the Composite Protection System -- they don't have any ownership of the Composite Protection System. With the owner of the BES interrupting device not subject to R1 or R2, the operation of the BES interrupting device would not be investigated. BPA suggests that this problem could be remedied with a slight change in language to R2.1.1 as follows: "The BES interrupting device owner does not own any of the Composite Protection System or shares the

Organization	Question 4 Comment
	Composite Protection System ownership with any other owner." This change would require an owner of a BES interrupting device that does not own any of the Composite Protection System to provide notification of the operation to the owners of the Composite Protection System within 120 days per R2.1 so that they could then investigate the operation. **Response:** The drafting team asserts that according to definition of Protection System which became effective April 1, 2013, the BES interrupting device owner owns a component of the Protection System, namely the trip coil(s) of that BES interrupting device (at a minimum). No change made.
Cleco	Cleco will continue to vote "Negative" as long as the SDT continues to support in R1 and R2 the deadline of 120 days to determine if an operation is a misoperation. There should be exceptions built into the standard when there are circumstances that create numerous outages such as ice storms or hurricanes. For example; In FAC-003, a footnote allows for circumstances that are beyond the control of the Registered Entity. Also, the standard should apply to all protection systems and the SDT should not exclude SPS or RAS. **Response:** We understand your concern, however, the Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, says: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." While the drafting team recognizes the concern and that there are other standards which have similar provisions for natural disasters, the sanction guidelines provide sufficient flexibility to address extenuating circumstances in the event that they occur. Remedial Action Schemes (RAS) and Special Protection Systems (SPS) are being addressed by Project 2010-05.2 – Special Protection Systems (Phase 2 of this project). No change made.
Tennessee Valley Authority	Currently, there is not a clear indication of regulatory relief for an entity following a major natural disaster. When recovering from major events such as Hurricane Sandy, the first priority is to get lights on and rebuild the system. Because a large natural event produces an influx of unique system

Organization	Question 4 Comment
	configurations that may not have been planned for by system planners or relay setters, analyzing and investigating all the operations and misoperations that occur takes months and is not the top priority for a utility that endures such an event. We respectfully request that the standard drafting committee add wording that states something similar to the following. In the event that the reporting entity is the victim of a weather related Category 4 or 5 event, 90 days are added to each of the required deadlines for misoperations caused by the weather related event. **Response:** NERC and the Regional Entity do not have the authority to provide flexibility regarding the performance (timeframes) of a Reliability Standard in unique extenuating circumstances. However, the Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, says: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." While the drafting team recognizes the concern and that there are other standards which have similar provisions for natural disasters, the sanction guidelines provide sufficient flexibility to address extenuating circumstances in the event that they occur. No change made.
Electric Reliability Council of Texas, Inc.	ERCOT is concerned about Requirement 1 that allows entities 120 days to identify a misoperation. ERCOT believes this might negatively impact the reliability of the grid. Currently, entities have the responsibility to analyze disturbances to identify misoperations. A misoperation could indicate a greater threat to reliability and that threat could exist, unknown, for several months while entities make determinations if operations are truly a misoperation. **Response:** The drafting team concluded that most Protection System reviews would occur soon after a BES interrupting device operation. The 120 calendar days is a maximum time allowance and provides for seasonal variations in operations and work load and the opportunity to identify any Misoperations which were initially missed. No change made.

Organization	Question 4 Comment
	The responsible entity under the new Standard will track misoperations and develop Corrective Action Plans (CAPs). There is no responsibility for the entity to share that information with Reliability Coordinators who have the responsibility for the wide area view of their Reliability Coordinator area. ERCOT is also concerned that while the responsible entity may develop CAPs, there is no responsibility of coordination of the CAP with other potentially affected entities. **Response:** If a CAP results in a modification to a Protection System, PRC-001 – System Protection Coordination requires coordination with other owners. No change made. ERCOT is therefore recommending the following: R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 24 hours, identify whether its Protection System component(s) caused a Misoperation on an element that is part of an Interconnection Reliability Operating Limit under the following circumstances: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning] 1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and 1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and 1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation. R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 2 business days, identify whether its Protection System component(s) caused a Misoperation on an element at 200 kV or more under the following circumstances: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]

Organization	Question 4 Comment
	2.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and 2.2 The BES interrupting device owner owns all or part of the Composite Protection System; and 2.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation. R3. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 5 business days, identify whether its Protection System component(s) caused a Misoperation on an element that is a BES element under the following circumstances: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning] 3.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and 3.2 The BES interrupting device owner owns all or part of the Composite Protection System; and 3.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation. R7. Each Transmission Owner, Generator Owner, and Distribution Provider shall provide the CAP developed in R5, to the Reliability Coordinator with the expected date of completion, how the Composite Protection System will operate until the CAP is completed and detailed information of how the entity will coordinate the CAP with other affected entities if applicable. **Response:** The drafting team contends that the draft PRC-004-3 Reliability Standard as written achieves the stated Purpose and therefore declines to make wholesale modifications to the Requirements. There is no requirement to provide a Corrective Action Plan to the Reliability Coordinator in the current version (i.e., PRC-004-2.1a) of the standard, although Regional procedures may have dictated the entity to do so. No change made.

Organization	Question 4 Comment
Wisconsin Electric Power Company	Facilities, Section 4.2.1, should have an exclusion for individual dispersed generators, or have its applicability limited to the point where the generators are aggregated to greater than 75 MVA. It is critical for the PRC-004-3 SDT to coordinate with the SDT for Project 2014-01, Standards Applicability for Dispersed Generation Resources, to assure that the new standard will have appropriate applicability consistent with BES reliability. **Response:** It is not practical to implement changes to the draft PRC-004-3 Reliability Standard based on another project that is in active development. The standard drafting team for Project 2014-01 is aware of this concern and will be addressing the topic following adoption of the draft PRC-004-3 Reliability Standard. No change made.
Flathead Electric Cooperative, Inc.	Generally feel that the requirements should be the sole place where the actual compliance requirements appear. Lot of information in measures, application guidelines, definitional changes that are not technically requirements but may be treated as such depending upon the audience. **Response:** The Requirements of the draft PRC-004-3 Reliability Standard are the only requirements an entity must follow to be compliant. Other information such as Measures and Guidelines and Technical Basis support measurement, provide clarity, and intent of the standard. No change made.
Tri-State Generation and Transmission Association, Inc.	In response to Tri-State's previous concern to the review and reporting of operations of jointly-owned Composite Protection System components as opposed to multiple entities owning separate components. The SDT stated "While a Protection System may be contractually owned by multiple entities that are not jointly registered, all of the entities would ultimately be responsible for the requisite documentation and results" appears to require all entities to report the operation giving double jeopardy to each misoperation on jointly-owned Composite Protection System components, unless a contract speaks to the designated "Compliance Entity". Typically compliance contracts take some time to come to fruition.

Organization	Question 4 Comment
	Is it the drafting team's intent that misoperations be reported by multiple entities in this situation until a contract is finalized? **Response:** The reporting of Misoperations is outside the scope of the draft PRC-004-3 Reliability Standard and is being addressed by the NERC Rules of Procedure, Section 1600 Request for Data or Information (i.e., "data request"). Absent an agreement, all owners of a Protection System will have a compliance responsibility. No change made.
Pepco Holdings Inc	None
Oncor Electric Delivery LLC	Oncor initially balloted affirmative; however, based on the changes in the Application Guide, Oncor's ballot position has changed. Oncor's comments have been provided for the SDT's consideration (response to Question #3) Oncor requests the SDT please consider the additional comment below: In "R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation under the following circumstances: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning] 1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and 1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and 1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation."

Organization	Question 4 Comment
	The circumstances mentioned in 1.1 and 1.3 cause confusion when you do not have a protection system component cause the BES interrupting device operation in the event a BES device is operated by manual intervention. Oncor recommends that 1.3 be written to state: The BES interrupting device owner identified that its Protection System component(s) were designed to cause the BES interrupting device(s) operation. **Response:** The drafting team made a clarification to Requirement R1, Part 1.3 to address this oversight. Part 1.3, as intended, now includes “manual intervention” as a circumstance. Clarification made. The request below is an outstanding request from Oncor’s previous comment period: The Extenuating Circumstances process, as outlined on page 30 of the Application Guidelines, relies too heavily on a subjective review by Enforcement to determine whether penalties will be imposed. In alignment with the Reliability Assurance Initiative Oncor recommends the evaluation of an Extenuating Circumstance be initially reviewed by Compliance Operations in accordance with the system-wide and regional risk framework, an entity’s inherent risk assessment and controls to ensure extenuating circumstances are not evaluated as a “one size fits all” and findings are determined in accordance with RAI versus an automatic Enforcement path. Furthermore, Oncor recommends the Registered Entity be allowed to request a formal "state of extenuating circumstance" and coordinate an extension to the 120 day deadline with the Regional Entity. **Response:** The drafting team does not have the ability to make modifications to the Rules of Procedure. No change made.
Exelon Companies	Paraphrasing many commenters from draft 4, Exelon agrees emphasis on due dates from the time of an operation be reconsidered. There is a significant administrative burden imposed by the proposed approach not commensurate with gains in reliable operations. The drafting team can review previous comments to this effect as well as references to the use of “calendar” as used in the PRC-005

Organization	Question 4 Comment
	supplemental reference to preclude the need to have reviews done by a specific date. We disagree with the SDT response that timeframes as proposed are required to force entities to be diligent about identifying and correcting misoperations. **Response:** The drafting team contends that the timeframes should be measured from the operation date of the BES interrupting device which makes the use of calendar months or quarters difficult. The drafting team concluded that most Protection System reviews would occur soon after a BES interrupting device operation. The 120 calendar days is a maximum time allowance and provides for seasonal variations in operations and work load. The Protection System Maintenance and Testing Reliability Standard (i.e., PRC-005) is based on recurring activities over longer periods than the draft PRC-004-3 Reliability Standard, which is event driven. No change made.
Manitoba Hydro	R6 -when is a change to a CAP considered failure to implement and therefore a violation of R6 (since R6 both requires implementation of a CAP and allows changes to the CAP) **Response:** The drafting team contends that modifying a CAP does not constitute a failure to implement a CAP. According to Requirement R6, a failure to update the CAP when actions or timetables change until completed is a failure to implement the CAP. No change made.
Northeast Power Coordinating Council	Regarding Section 5: Background (page 6), additional justification to explain the application of the standard would be beneficial. As indicated in our previous comments, we disagreed with the omission of UVLS while UFLS is included. The SDT's response indicates that UVLS has not been included in the proposed standard's Applicability because Misoperations of UVLS relays are being addressed under Project 2008-02 – Undervoltage Load Shedding when modifying Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance. This rationale is not sufficient to justify the inclusion of UFLS but exclusion of UVLS since both need to be assessed and treated the same. Note that the SAR for PRC-022-1 is being revised to include UFLS. We suggest the PRC-004 SDT coordinate with the PRC-022 SDT to apply a consistent approach to addressing Misoperations of UFLS and UVLS.

Organization	Question 4 Comment
	Response: Undervoltage load shedding (UVLS) has not been included in the draft PRC-004-3 Reliability Standard's Applicability because Misoperations of UVLS relays are currently addressed by Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance, Requirement R1.5. Adding UVLS in PRC-004-3 at this point would create unforeseen issues with having Requirements in two different Reliability Standards address the same activity. The purpose of the UFLS project is to address an outstanding FERC directive and review PRC-006-1 to determine if any steady state modifications are appropriate (i.e., Paragraph 81 criteria and recommendations of the Independent Expert Review Panel). Specifically, the other project's standard drafting team will revise PRC-006-1 to address the directive included in FERC Order No. 763 and to provide for clear, unambiguous design and documentation requirements for automatic UFLS programs. Underfrequency load shedding (UFLS) was added to PRC-004-3 to close a gap in reliability as Misoperations of UFLS relays are not covered by a Reliability Standard. The drafting team added additional text to the background to explain both UVLS and UFLS. Clarification made. Requirement R1 does not work for the case where manual intervention to operate the BES device was required. Parts 1.1 thru 1.3 are all ANDS. Part 1.3 requires the Interrupting Device to be operated by the Protection System. This conflicts with the idea in Part 1.1 of MANUAL intervention. If an operator manually opens a breaker because the Composite Protection System does not clear a fault then the Protection System could not have operated the interrupting device. Therefore the threshold R1 would not be met and no identification is required even though the Composite Protection System may have failed-to-trip. Suggest Part 1.3 be revised to read: The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation; or manual intervention was required to operate the BES interrupting device because its Protection System failed to operate. **Response:** The drafting team made a clarification to Requirement R1, Part 1.3 that it includes manual intervention. Clarification made.

Organization	Question 4 Comment
	Requirement R1 can be rephrased to provide clarity to the relationship of Parts 1.1 thru 1.3 to R1. Present phrasing has the added phrase, under the following circumstances, following Misoperation where it can ambiguously modify Misoperation. Clearly the intent is to describe the circumstances that a BES device owner has to embark on a process to identify a Misoperation. There are two inputs prior to beginning the process of identification; first the operation of a BES interrupting device occurs and second that the attributes of Parts 1.1 thru 1.3 are met. It would be clearer to place the reference to Parts 1.1 thru 1.3 prior to the word identify. Suggest Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated, and where such operation conforms to Parts 1.1 thru 1.3, shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation. **Response:** The drafting team made the clarification in Requirement R1.
National Grid	Second part of sub-requirement R1.1 “The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate” seems to contradict with sub-requirement R1.3 “The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation”. R1.1 and R1.3 cannot be met at the same time. **Response:** The drafting team made a clarification to Requirement R1, Part 1.3 that it includes manual intervention. Clarification made. An entity which receives notification of the BES interrupting device(s) operation in requirement R3 is allotted between 60 and 120 calendar days. However, the BES interrupting device(s) owner(s) are allotted 120 calendar days. Receiving entity also should be allotted full 120 calendar days counting from the day it receives notification. **Response:** When an entity receives notification of a Protection System operation by the BES interrupting device owner, the Protection System owner is allotted at least 60 calendar days to

Organization	Question 4 Comment
	identify whether it was a Misoperation. A shorter time period is allotted on the basis that the BES interrupting device owner has already performed preliminary work, collaborated with the other owners, and that other owners generally have fewer associated Protection System components. No change made. Requirements R1, R2, and R3 are assuming that an entity will make an attempt to determine the cause(s) of a Misoperation. However, an entity can choose to make no effort until requirement R4 becomes applicable. It is suggested to expand requirements R1, R2, and R3 with the obligation for an entity to make an effort to determine the cause(s) of a Misoperation before requirement R4 takes place. **Response:** Requirements R1 and R3 do not preclude an entity from determining the cause of an identified Misoperation. (Note: Requirement R2 is for notification to others.) Requirement R4 becomes applicable only after a Protection System operation is “identified as a Misoperation” and does not have an identified cause. Requirement R4 is an exception-based Requirement and is only performed when the entity did not identify the cause(s) upon the identification of the Misoperation in either Requirement R1 or R3. No change made.
Public Service Enterprise Group	See the Consideration of Comments document, pp. 76-77. We interpreted that the SDT agreed to our proposed changes to R3; however it was not reflected in this draft. **Response:** The drafting team meant to explain that it revised the Guidelines and Technical Basis to provide a more detailed explanation of the “two full calendar quarters” rather than change the Requirement R4 language to “180 calendar days.” No change made.
Texas Reliability Entity	Texas Reliability Entity is voting Negative on this standard due to the concern that the reliable operation of the BES is not ensured by this standard (as written) because the allowable time periods for investigating and correcting are too long and investigative actions are not required before R4. Please consider the following comments and recommendations.

Organization	Question 4 Comment
	1) Recommend changing the allowable time for identification of a Misoperation to 60 days for R1 and R2. The 120 identification period (in R1 and R2) coupled with the additional allowance in R3 of 60 days means a Misoperation may not be determined up to 179 days after the interrupting device operation. The risk to the BES is still undetermined during this time period and actions should be taken to identify if a Misoperation occurred more expeditiously. **Response:** The drafting team concluded that most Protection System reviews would occur soon after a BES interrupting device operation. The 120 calendar days is a maximum time allowance and provides for seasonal variations in operations and work load and the opportunity to identify any Misoperations which were initially missed. No change made. 2) Suggest revising language in Requirements 1 and 3 to include investigative actions: [each entity] "shall perform investigative actions to identify whether its Protection System component(s) caused a Misoperation" The proposed language would clarify the expectation that investigations are on-going prior to R4. As written, the standard conceivably allows for a period of up to 120 days before investigative actions are performed. Although the application guidelines for R4 states that an entity "is expected to use due diligence in taking investigative action(s) to determine the cause(s)..." and that R4 "provides the entity a mechanism to continue its investigative work..." the standard does not require an entity to do investigative work before R4. **Response:** The drafting team contends that some level of investigation will be necessary to identify a Misoperation. Once a Misoperation is identified (without a cause), Requirement R4 becomes in effect. No change made. 3) Recommend changing the performance of investigative actions to at least once every calendar quarter in R4. If a Misoperation is confirmed (through steps taken in R1 – R3) then the risk to the BES continues until such time as a cause is found and can be corrected. The application guidelines state that periodic investigative action minimizes compliance burden and focuses the entity's efforts on determining cause, Texas Reliability Entity asserts that the time period of at least one investigative action every two full calendar quarters (180 days) is not adequate to protect reliability.

Organization	Question 4 Comment
	Response: The drafting team contends that the periodic action balances the compliance burdens and focuses the entity's effort on determining the cause(s) of the Misoperation while providing measurable evidence. In addition, certain planned investigative actions may require months or years to schedule and complete due to outages and other factors. No change made. 4) In order for R4 to be measurable there should be a stated time horizon (per NERC's Acceptance of a Reliability Standard, Item 7, first bullet). The investigation may end either by identification of the cause of the Misoperation or a declaration that no cause was found. Suggest adding requirement to either determine the cause or make the no cause found declaration within 365 days after interrupting device operation. **Response:** The drafting team contends that listing a defined time limit to complete the requirement would actually decease reliability. It would have the unintended consequence of causing entity to discontinue its investigation. The requirement allows the entity to either determine the cause or conclude its investigation when it is confident that a cause cannot be determined. The Time Horizons are used by Compliance Enforcement Authority in determining penalties and does not impact the timing or measurability of the requirement. No change made. 5) The investigation and CAP timelines (as written) exceed 12 months so the evidence retention period of 12 months is insufficient. Evidence of investigative actions may be disposed of before corrective action is completed; meaning that a full record of an interrupting device operation may not be available for review by the CEA. In addition, the 12 month evidence retention schedules for R5 and R6 mean that an entity may not have any evidence to prove compliance to a CEA during an audit (which can be several years after a Misoperation). **Response:** The drafting team clarified the time periods for retaining evidence is "a minimum of" and also added for Requirements R1-R4. The "development" was revised to "completion" to reflect the intended retention period. Clarification made.

Organization	Question 4 Comment
MRO NERC Standards Review Forum	Thank you for the opportunity to comment.
Nebraska Public Power District	The 1.2 Evidence Retention section states 12 months is the required evidence retention period for the requirements. It also notes that "the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit." I would recommend that the evidence retention be longer since it will be difficult to reproduce audit period evidence if it has been discarded. **Response:** Evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit. The drafting team used NERC guidance in determining the appropriate evidence retention periods. See the document *Background Information on Quality Reviews*, February 7, 2012 (http://www.nerc.com/files/Background_Document_20120207.pdf). No change made. Project 2014-01 Dispersed Generation has noted that PRC-004 needs to be reviewed and updated to direct the industry as to the appropriateness of the BES elements that require misoperation analysis and documentation related to dispersed generation. It is recommended to consider adding these changes rather than issuing multiple versions of this standard unless there is a serious reliability risk with the existing PRC-004 standard. **Response:** The drafting team recognizes that having multiple versions of a Reliability Standard is not ideal; Additionally, it is not practical to implement changes to the draft PRC-004-3 Reliability Standard based on another project when it is in active development. Because of this, the draft PRC-004-3 Reliability Standard must move forward for approval so that other projects can use a final version as a basis for any proposed inclusions or revisions.

Organization	Question 4 Comment
	The Draft 5 Application Guidelines states "The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP and an evaluation of other Protection Systems including other locations must be developed to complete Requirement R5." There are concerns that some CAP evaluations including programs for other locations could be open for long periods of time creating significant audit tracking burdens. Is it acceptable in some cases if a CAP for correcting the issue with equipment that misoperated also has an evaluation to only identify other locations that have a similar issue and once other locations are identified the CAP is considered completed and no other audit tracking is required? If this is acceptable this may be beneficial for cases where there is an issue with a large number of similar breakers, relays, communication schemes, potential devices or current transformers that might be widespread on some systems requiring years to replace or update as part of a program or several programs. If the above is not acceptable as the standard is written consider adding a 3rd bullet to R5 to allow a CAP for the specific misoperations and a requirement to identify other locations or allow a declaration that can be used for creating a CAP for other locations that will be considered separately from PRC-004-3. **Response:** Yes, the drafting team believes your approach meets the intent of Requirement R5. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP and an evaluation of other Protection Systems including other locations must be developed to complete Requirement R5. Timeframes and actions associated with the execution of the evaluation are outside the scope of the standard. No change made.

Organization	Question 4 Comment
	There are still concerns with including manual intervention as part of R1 since most appear to agree it is rare. Can the SDT provide some thoughts on the best way to guarantee that a manual intervention is duly tracked and provided to the protection departments for review? Perhaps dispatch centers need to have a procedure or process that specifically states “any manual intervention for a failed protection system must be reported to the appropriate protection system owner”. Would this be considered a reasonable process approach to satisfy the requirements of auditors that the proper misoperation procedures are in place? It may be that the manual intervention requirement is better suited to the SPS, UFSL, UVLS or plant shutdown schemes since those schemes are more likely to allow operators time to react rather than having manual intervention a part of all types of system operations as it is in R1. Perhaps there are cases where an operator has taken action for a transmission line fault or issue that did not clear with primary/secondary/breaker failure or backup remote clearing but I am not aware of any of these cases. It may be better to clarify the types of practical manual interventions that are intended to be covered by the standard or remove it and place it in another standard mentioned above with clarification for the most practical cases where this should be tracked to simplify the misoperation process documents utilities would likely need to have in place. There is concern that an auditor will have the latitude to ask how you guarantee that you are aware and tracked all manual interventions for protection system failures that have taken place on your system in the last audit period and this could be difficult to prove. **Response:** The drafting team asserts that manual interventions do not necessarily need to be tracked, but they are a condition for which a Protection System must be reviewed for Misoperation. Since it is such an unusual occurrence, the drafting team would expect the entity to be informed of such an operation. An example of manual intervention is a Generator Owner intervening to trip a unit where the operator believes a Protection System failure to operate has occurred. No change made.

Organization	Question 4 Comment
SERC Protection and Controls Subcommittee	The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Protection and Control Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers. **Response:** Thank you for your comment.
Omaha Public Power District	The Omaha Public Power District (OPPD) is still concern with the 60-day requirement to develop a Corrective Action Plan (CAP) for an identified misoperation. This timing is not practical, and depending on the time of the year, budget cycle, scope of work, 60 days is not sufficient to obtain funding for CAPs. Also, the first bullet under R5 would require evaluation of the applicability of all CAPs to all BES locations which, depending on the CAP, could be overly burdensome. As worded, a wiring or setting error would require that all wiring and all settings at all BES locations be checked. The evaluation should be limited to CAPs related to scheme logic or relay design deficiencies. OPPD proposes that 180 days (6 months) is a sufficient timeframe to practically develop a CAP addressing both operational and budgetary coordination. **Response:** The drafting team contends that 60 calendar days is an adequate amount of time to develop a high level evaluation. Timeframes associated with the execution of the evaluation are outside the scope of the standard. No change made.
Northeast Utilities	The Unnecessary Trip definitions as written are unclear and seem to indicate that the total compliment of the Composite Protection System. Suggest the following clarifications; Unnecessary Trip - During Fault - An unnecessary operation of any Protection System of a Composite Protection System for a Fault condition on another Element. Unnecessary Trip - Other Than Fault - An unnecessary operation of any Protection System of a Composite Protection System for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

Organization	Question 4 Comment
	Response: The drafting team added "Composite" to the definition of "Misoperation" for categories 5 and 6 based on comments during the draft 4 posting (e.g., see RFC – Question 1). This was done for consistency within the definition of "Misoperation." No change made.
SPP Standards Review Group	UFLS is mentioned in 4.2.2 of the Applicability Section but there is no mention of UVLS. Should it be included here? **Response:** Undervoltage load shedding (UVLS) has not been included in the proposed PRC-004-3 standard's Applicability because Misoperations of UVLS relays are currently addressed by Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance, Requirement R1.5. Adding UVLS in PRC-004-3 at this point would create unforeseen issues with having Requirements in two different standards address the same activity. The purpose of the UFLS project is to address an outstanding FERC directive and review PRC-006-1 to determine if any steady state modifications are appropriate (i.e., Paragraph 81 criteria and recommendations of the Independent Expert Review Panel). Specifically, the other project's standard drafting team will revise PRC-006-1 to address the directive included in FERC Order No. 763 and to provide for clear, unambiguous design and documentation requirements for automatic UFLS programs. Underfrequency load shedding (UFLS) was added to PRC-004-3 to close a gap in reliability as Misoperations of UFLS relays are not covered by a Reliability Standard. The drafting team added additional text to the background to explain both UVLS and UFLS. Clarification made. We would suggest that the drafting team consider incorporating the evaluation of the CAP's applicability mentioned in the first bullet under Requirement R5 into the CAP itself. This falls in line with the second bullet in the Requirement which is included in the CAP and gets the burden of making the evaluation concurrently with the development of the CAP out of the way. The evaluation could delay the completion of the CAP.

Organization	Question 4 Comment
	Response: By definition the CAP consists of actions to remedy a specific problem (i.e., the Protection System Misoperation). Because the CAP is a specific plan, the evaluation is structured as a separate activity. No change made. References to days should be calendar days and they should be hyphenated; for example 30-, 45-, 60-, or 120-calendar days. Similarly, references to months should be treated in the same manner; for example 12-calendar months. **Response:** The use of a hyphen as suggested is not consistent with the NERC style guide. No change made.
PPL NERC Registered Affiliates	We continue to disagree that stating whether or not a Misoperation occurred (per R1) and (under some circumstances) what the cause was (per R3) should be due within 120 days even though identifying the cause may take much longer or may even prove impossible (per R4). That is, the SDT apparently prefers where uncertainty exists to classify events as Misoperations and retract the declaration if later findings show otherwise, while we prefer the present approach of not assuming a Misoperation if evidence to support such a conclusion is lacking. The difficulty foreseen regarding the SDT's approach is that dated evidence is required in M1 that an entity, "identified the Misoperation... within the allotted time period," and in M3 that it, "identified whether its protection System component(s) caused a Misoperation within the allotted time period," while all we may be able to say after 120 days is that we don't know why an event happened. R4 describes what to do in such a situation, but it does not retract the obligation to provide impossible-to-obtain evidence satisfying M1 and M3. **Response:** Requirements R1 and R3 do not require, but do not preclude an entity from determining the cause of an identified Misoperation. (Note: Requirement R2 is for notification to others.) Requirement R4 becomes applicable only after a Protection System operation is "identified as a Misoperation" and has not identified the cause(s). Requirement R4 is an exception and is only

Organization	Question 4 Comment
	performed when the entity did not identify the cause(s) upon the identification of the Misoperation in either Requirement R1 or R3. No change made. **Response:** The requirement does not preclude the entity from using judgment in the classification of the operation if the available evidence is inconclusive. No change made.
JEA	We disagree with the 60 day limit in R5 to develop a CAP and think it should be 180 days. **Response:** The drafting team believes that 60 days is sufficient to develop a CAP including its applicability to other Protection Systems as there is opportunity to update the CAP in Requirement R6 as needed. The drafting team believes that issues such as cost/benefit scenarios, resource coordination, scheduling, and funding procurement can be considered while developing the schedule of the CAP. No change made.
Southern California Edison Company	With respect to Requirement 5 on the Corrective Action Plan requirements, we are concerned that an entity's declaration that no corrective action will be taken without supporting evidence, could leave a system problem unresolved. **Response:** The drafting team contends that each entity when making a declaration will have to explain "why corrective actions are beyond the entity's control or would not improve BES reliability." This is consistent with the Requirement and Measure. No change made. The decision that a Corrective Action Plan is unnecessary, or the development of a Corrective Action Plan, are both complex actions that should be done jointly by respective owners of the composite protection system in a consensus-building manner. The failure to reach consensus on Correction Action Plans can leave the problem unresolved. **Response:** The drafting team contends that the requirements are structured in a manner that each entity that has identified a cause of a Misoperation of its Protection System components must develop a CAP according to Requirement R5. Other entities are required to develop a CAP if they

Organization	Question 4 Comment
	identified that their components caused a Misoperation, unless corrective actions would not improve BES reliability or are beyond the entity's control. If a CAP results in a modification to a Protection System, PRC-001 – System Protection Coordination requires coordination with other owners.
Wolverine Power Supply Cooperative, Inc.	Wolverine's position is that the PRC-005 standard sufficiently covers the maintenance and testing requirements for protection systems. Because of this maintenance performed, it is not necessary to perform a detailed engineering analysis of every BES protection system operation. Wolverine's position is to only perform an engineering review of protection system operations if there is an apparent misoperation, for example, an over reach condition, failure to trip, etc. These are easily identified by transmission operators if only the correct facility cleared. To use a protection system operation to verify if a primary and backup protection system work properly seems to conflict with the requirement in PRC-005, which is written to ensure protection systems are maintained so they work properly. **Response:** The drafting team notes that the NERC State of Reliability, May 2013 states, "Key Finding 4: Protection System Misoperations are a significant contributor to disturbance events and automatic transmission outage severity. Incorrect settings/logic/design errors, relay failures/malfunctions, and communication failures are the three primary factors that result in such Misoperations." No change made.

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. The SC authorized moving the SAR forward for standard development at their June 9, 2011 meeting.
2. The SAR was posted for informal comment June 10 – July 11, 2011.
3. Draft 1 of PRC-004-3 was posted for a 30-day formal comment period from June 10 – July 11, 2011.
4. Draft 2 of PRC-004-3 was posted for a 45-day formal comment period from July 25 – September 7, 2012 and an initial ballot in the last ten days of the comment period from August 29 – September 7, 2012.
5. Draft 3 of PRC-004-3 was posted for a 30-day formal comment period from January 22 – February 20, 2013 and a successive ballot in the last ten days of the comment period from February 11-20, 2013.
6. Draft 4 of PRC-004-3 was posted for a 45-day additional comment period from January 17 – March 11, 2014 and an additional ballot in the last ten days of the comment period from February 2 – March 11, 2014 under the new Standards Process Manual (Effective: June 26, 2013).
7. Draft 5 of PRC-004-3 was posted for a 45-day additional comment period from May 16 – July 9, 2014 and an additional ballot in the last ten days of the comment period from June 20 – July 9, 2014.

Description of Current Draft

The Protection System Misoperations Standard Drafting Team (PSMSDT) is posting Draft 6 of PRC-004-3 – Protection System Misoperation Identification and Correction for a 10-day final ballot.

Anticipated Actions	Anticipated Date
10-day Final Ballot	July 2014
BOT Approval	August 2014

Effective Dates

The standard, the revised definition of “Misoperation,” and the new definition of “Composite Protection System” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard, the revised definition of "Misoperation," and the new definition of "Composite Protection System" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to "en dash" (–) and "em dash (—)." 2. Added "periods" to items where appropriate. Changed "Timeframe" to "Time Frame" in item D, 1.2.	01/20/06
2		Modified to address Order No. 693 Directives contained in paragraph 1469.	Revised
2	August 5, 2010	Adopted by NERC Board of Trustees	
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by the Board of Trustees	
1a	September 26, 2011	FERC Order issued approving the interpretation of R1 and R3 (FERC's Order is effective as of September 26, 2011)	
2a	September 26, 2011	Appended FERC-approved interpretation of R1 and R3 to version 2	
2.1a		Errata change: Edited R2 to add "…and generator interconnection Facility…"	Revision under Project 2010-07
2.1a	February 9, 2012	Errata change adopted by the Board of Trustees	

2.1a	September 19, 2013	FERC Order issued approving PRC-004-2.1a (approval becomes effective November 25, 2013).	
3	TBD	Adopted by Board of Trustees	Revision under Project 2010-05.1

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the *Glossary of Terms Used in NERC Reliability Standards* ("NERC Glossary") are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the NERC Glossary.

Composite Protection System:

The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element's Protection System(s) is excluded.

Misoperation:

The failure of a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.

6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

When this standard has received ballot approval, the rationale boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System Misoperation Identification and Correction**
2. **Number:** PRC-004-3
3. **Purpose:** Identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements.
4. **Applicability:**

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities:

4.2.1 Protection Systems for BES Elements, with the following exclusions:

4.2.1.1 Non-protective functions that are embedded within a Protection System.

4.2.1.2 Protective functions intended to operate as a control function during switching.[1]

4.2.1.3 Special Protection Systems (SPS).

4.2.1.4 Remedial Action Schemes (RAS).

4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

Rationale for Applicability: Protection Systems that protect BES Elements are integral to the operation and reliability of the BES. Some functions of relays are not used as protection but as control functions or for automation; therefore, any operation of the control function portion or the automation portion of relays is excluded from this standard. See the Application Guidelines for detailed examples of non-protective functions. Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are excluded in this standard because they are planned to be handled in the second phase of this project.

5. **Background**:

A key factor for BES reliability is the correct performance of Protection Systems. The monitoring of Protection System events for BES Elements, as well as identifying and

[1] For additional information and examples, see the “Non-Protective Functions” and “Control Functions” sections in the Application Guidelines.

correcting the causes of Misoperations, will improve Protection System performance. This Reliability Standard PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In the FERC Order No. 693, the Commission identified PRC-003-0 as a “fill-in-the-blank” standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the Requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

This project includes revising the existing definition of Misoperation, which reads:

Misoperation

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity.

In general, this definition needed more specificity and clarity. The terms “specified time” and “abnormal condition” are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical, yet explainable, condition is a Misoperation.

The SAR for this project also included clarifying reporting requirements. Misoperation data, as currently collected and reported, is not optimal to establish consistent metrics for measuring Protection System performance. As such, the data reporting obligation for this standard is being removed and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information (“data request”). As a result of the data request, NERC will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. The removal of the data collection obligation from the standard does not result in a reduction of reliability. The standard and data request have been developed in a manner such that evidence used for compliance with the standard and data request are intended to be independent of each other.

The proposed Requirements of the revised Reliability Standard PRC-004-3 meet the following objectives:

- Review all Protection System operations on the BES to identify those that are Misoperations of Protection Systems for Facilities that are part of the BES.
- Analyze Misoperations of Protection Systems for Facilities that are part of the BES to identify the cause(s).
- Develop and implement Corrective Action Plans to address the cause(s) of Misoperations of Protection Systems for Facilities that are part of the BES.

Misoperations associated with Special Protection Schemes (SPS) and Remedial Action Schemes (RAS) are not addressed in this standard due to their inherent complexities. NERC plans to handle SPS and RAS in the second phase of this project.

The Western Electric Coordinating Council (WECC) Regional Reliability Standard PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation relates to the reporting of Misoperations of Protection Systems and RAS for a limited set of WECC Paths. The WECC region plans to conduct work to harmonize the regional standard with this continent-wide proposed standard and the second phase of this project concerning SPS and RAS.

Undervoltage load shedding (UVLS) has not been included in this standard’s applicability because Misoperations of UVLS relays are currently addressed by Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance, Requirement R1.5. Underfrequency load shedding (UFLS) was added to PRC-004-3 to close a gap in reliability as Misoperations of UFLS relays are not covered by a Reliability Standard currently.

6. Effective Dates:

The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated under the circumstances in Parts 1.1 through 1.3 shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation: *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and

1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and

1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation or was caused by manual intervention in response to its Protection System failure to operate.

M1. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified the Misoperation of its Protection System component(s), if any, that meet the circumstances in Requirement R1, Parts 1.1, 1.2, and 1.3 within the allotted time period. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R1: This Requirement ensures that entities review those Protection System operations meeting the circumstances in all three Parts (1.1, 1.2, and 1.3) and identify any that are Misoperations. The BES interrupting device owner is assigned the responsibility to initiate the review because the owner is in the best position to be aware of the operation. Manual intervention is included as a condition that initiates a review. Occasionally, Protection System failures do not yield other Protection System operations and manual intervention is required to isolate the problematic equipment. The 120 calendar day period accounts for the sporadic volumes of Protection System operations, and provides the opportunity to identify any Misoperations which were initially missed.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in Parts 2.1 and 2.2. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

2.1 For a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:

2.1.1 The BES interrupting device owner shares the Composite Protection System ownership with any other owner; and

2.1.2 The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and

2.1.3 The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.

2.2 For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's BES Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.

M2. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates notification to the other owner(s), within the allotted time period for either Requirement R2, Part 2.1, including subparts 2.1.1, 2.1.2, and 2.1.3 and Requirement R2, Part 2.2. Acceptable evidence for Requirement R2, including Parts 2.1 and 2.2 may include, but is not limited to the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

Rationale for R2: Part 2.1 ensures that the BES interrupting device owner notifies the other owners of the Composite Protection System. The phrase "owner(s) that share Misoperation identification responsibility" allows entities to notify the specific other owners that will actually review the operation to determine if a Misoperation occurred. Part 2.2 ensures that the Protection System owner(s) for which backup protection was provided receives notification, within the same 120 calendar day period as R1. This ensures other entities are notified to review their Protection System components. The expectation is that entities will communicate accordingly and when it is clear that Part 2.1, 2.2, or both are met, the entity would make the notification. It is not intended for entities to automatically and unnecessarily notify other entities before adequate detail is known.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified whether its Protection System component(s) caused a Misoperation within the allotted time period. Acceptable evidence for Requirement R3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R3: When an entity receives notification of a Protection System operation by the BES interrupting device owner, the other Protection System owner is allotted at least 60 calendar days to identify whether it was a Misoperation. A shorter time period is allotted on the basis that the BES interrupting device owner has already performed preliminary work, collaborated with the other owners, and that other owners generally have fewer associated Protection System components.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: *[Violation Risk Factor: Medium] [Time Horizon: Operations Assessment, Operations Planning]*

- The identification of the cause(s) of the Misoperation; or
- A declaration that no cause was identified.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it performed at least one investigative action according to Requirement R4 every two full calendar quarters until a cause is identified or a declaration is made. Acceptable evidence for Requirement R4 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R4: If a Misoperation cause is not identified within the time period established by Requirements R1 or R3 (i.e., 120 calendar days), the Protection System component owner must demonstrate investigative actions toward identifying the cause(s). Performing at least one action every two full calendar quarters from first identifying the Misoperation encourages periodic focus on finding the cause of the Misoperation.

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations; or
- Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP's applicability to other Protection Systems and locations, or a declaration in accordance with Requirement R5. Acceptable evidence for Requirement R5 may include, but is not limited to the following dated documentation (electronic or hardcopy format): CAP and evaluation, or declaration.

Rationale for R5: A formal CAP is a proven tool for resolving and reducing the possibility of reoccurrence of operational problems. A time period of 60 calendar days is based on industry experience and operational coordination time needed for considering such things as alternative solutions, coordination of resources, or development of a schedule. When the cause of a Misoperation is identified, a CAP will generally be developed. An evaluation of the CAP's applicability to the entity's other Protection Systems including other locations helps identify similar problems, the potential for Misoperation occurrences in other Protection Systems, common mode failure, design problems, etc.

In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, a statement documenting the reasons for taking no corrective actions is essential for future reference and for justifying the absence of a CAP.

R6. Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. *[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Long-Term Planning]*

M6. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it implemented each CAP, including updating actions or timetables. Acceptable evidence for Requirement R6 may include, but is not limited to the following dated documentation (electronic or hardcopy format): records that document the implementation of each CAP and the completion of actions for each CAP including revision history of each CAP. Evidence may also include work management program records, work orders, and maintenance records.

Rationale for R6: Each CAP must accomplish all identified objectives to be complete. During the course of implementing a CAP, updates may be necessary for a variety of reasons such as new information, scheduling conflicts, or resource issues. Documenting changes or completion of CAP activities provides measurable progress and confirmation of completion.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

> The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirements R1, R2, R3, and R4, Measures M1, M2, M3, and M4 for a minimum of 12 calendar months following the completion of each Requirement.
>
> The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R5, Measure M5, including any supporting analysis per Requirements R1, R2, R3, and R4, for a minimum of 12 calendar months following completion of each CAP, completion of each evaluation, and completion of each declaration.
>
> The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R6, Measure M6 for a minimum of 12 calendar months following completion of each CAP.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None**.**

D. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to identify whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R2	Operations Assessment, Operations Planning	Medium	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late. OR The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	Operations Assessment, Operations Planning	Medium	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late. OR The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	Operations Planning, Long-Term Planning	Medium	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop a CAP or explain in a declaration in accordance with Requirement R5. OR (See next page)

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	(Continued)		The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop an evaluation in accordance with Requirement R5.
R6	Operations Planning, Long-Term Planning	Medium	The responsible entity implemented, but failed to update a CAP, when actions or timetables changed, in accordance with Requirement R6.	N/A	N/A	The responsible entity failed to implement a CAP in accordance with Requirement R6.

Guidelines and Technical Basis

Introduction

This standard addresses the reliability issues identified in the letter[3] from Gerry Cauley, NERC President and CEO, dated January 7, 2011.

> "Nearly all major system failures, excluding perhaps those caused by severe weather, have misoperations of relays or automatic controls as a factor contributing to the propagation of the failure. …Relays can misoperate, either operate when not needed or fail to operate when needed, for a number of reasons. First, the device could experience an internal failure – but this is rare. Most commonly, relays fail to operate correctly due to incorrect settings, improper coordination (of timing and set points) with other devices, ineffective maintenance and testing, or failure of communications channels or power supplies. Preventable errors can be introduced by field personnel and their supervisors or more programmatically by the organization."

The standard also addresses the findings in the *2011 Risk Assessment of Reliability Performance*[4]; July 2011.

> "…a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry."

The *State of Reliability 2014*[5] report continued to identify Protection System Misoperations as a significant contributor to automatic transmission outage severity. The report recommended completion of the development of PRC-004-3 as part of the solution to address Protection System Misoperations.

Definitions

The Misoperation definition is based on the IEEE/PSRC Working Group I3 "Transmission Protective Relay System Performance Measuring Methodology[6]." Misoperations of a Protection System include failure to operate, slowness in operating, or operating when not required either during a Fault or non-Fault condition.

[6] "Transmission Protective Relay System Performance Measuring Methodology." Working Group I3 of Power System Relaying Committee of IEEE Power Engineering Society. 1999.

For reference, a "Protection System" is defined in the *Glossary of Terms Used in NERC Reliability Standards* ("NERC Glossary") as:

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

A BES interrupting device is a BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current. Although BES interrupting device mechanisms are not part of a Protection System, the standard uses the operation of a BES interrupting device by a Protection System to initiate the review for Misoperation.

The following two definitions are being proposed for inclusion in the NERC Glossary:

> **Composite Protection System –** *The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element's Protection System(s) is excluded.*

The Composite Protection System definition is based on the principle that an Element's multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element's total complement of protection should be considered while evaluating an operation.

Composite Protection System – Line Example

The Composite Protection System of the Alpha-Beta line (Circuit #123) is comprised of current differential, permissive overreaching transfer trip (POTT), step distance (classic zone 1, zone 2, and zone 3), instantaneous-overcurrent, time-overcurrent, out-of-step, and overvoltage protection. The protection is housed at the Alpha and Beta substations, and includes the associated relays, communications systems, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Transformer Example

The Composite Protection System of the Alpha transformer (#2) is comprised of internal differential, overall differential, instantaneous-overcurrent, and time-overcurrent protection. The protection is housed at the Alpha substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Generator Example

The Composite Protection System of the Beta generator (#3) is comprised of generator differential, overall differential, overcurrent, stator ground, reverse power, volts per hertz, loss-of-field, and undervoltage protection. The protection is housed at the Beta generating plant and at the Beta substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Breaker Failure Example

Breaker failure protection provides backup protection for the breaker, and therefore is part of the breaker's Composite Protection System. Considering breaker failure protection to be part of another Element's Composite Protection System could lead to an incorrect conclusion that a breaker failure operation automatically satisfies the "Slow Trip" criteria of the Misoperation definition.

- An example of a correct operation of the breaker's Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. The breaker failure relaying operated because of a failed trip coil. The failed trip coil caused a Misoperation of the line's Composite Protection System.
- An example of a correct operation of the breaker's Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. Only the breaker failure relaying operated because of a failed breaker mechanism. This was not a Misoperation because the breaker mechanism is not part of the breaker's Composite Protection System.
- An example of an "Unnecessary Trip – During Fault" is when the breaker failure relaying tripped at the same time as the line relaying during a Fault. The Misoperation was due to the breaker failure timer being set to zero.

Misoperation – *The failure a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:*

1. **Failure to Trip – During Fault** – *A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*
2. ***Failure to Trip – Other Than Fault*** – *A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*

3. ***Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.*
4. ***Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.*
5. ***Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.*
6. ***Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.*

The Misoperation definition is based on the principle that an Element's total complement of protection is intended to operate dependably and securely.

- Failure to automatically reclose after a Fault condition is not included as a Misoperation because reclosing equipment is not included within the definition of Protection System.
- A breaker failure operation does not, in itself, constitute a Misoperation.
- A remote backup operation resulting from a "Failure to Trip" or a "Slow Trip" does not, in itself, constitute a Misoperation.

This proposed definition of Misoperation provides additional clarity over the current version. A Misoperation is the failure of a Composite Protection System to operate as intended for protection purposes. The definition includes six categories which provide further differentiation of what constitutes a Misoperation. These categories are discussed in greater detail in the following sections.

Failure to Trip – During Fault

This category of Misoperation typically results in the Fault condition being cleared by remote backup Protection System operation.

> **Example 1a:** A failure of a transformer's Composite Protection System to operate for a transformer Fault is a Misoperation.
>
> **Example 1b:** A failure of a "primary" transformer relay (or any other component) to operate for a transformer Fault is not a "Failure to Trip – During Fault" Misoperation as long as another component of the transformer's Composite Protection System operated.
>
> **Example 1c:** A lack of target information does not by itself constitute a Misoperation. When a high-speed pilot system does not target because a high-speed zone element trips first, it would not in and of itself be a Misoperation.
>
> **Example 1d:** A failure of an overall differential relay to operate is not a "Failure to Trip – During Fault" Misoperation as long as another component such as a generator differential relay operated.

Example 1e: The Composite Protection System for a bus does not operate during a bus Fault which results in the operation of all local transformer Protection Systems connected to that bus and all remote line Protection Systems connected to that bus isolating the faulted bus from the grid. The operation of the local transformer Protection Systems and the operation of all remote line Protection Systems correctly provided backup protection. There is one “Failure to Trip – During Fault” Misoperation of the bus Composite Protection System.

In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – During Fault” category applies to the operation.

Failure to Trip – Other Than Fault

This category of Misoperation may have resulted in operator intervention. The “Failure to Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

Example 2a: A failure of a generator's Composite Protection System to operate for an unintentional loss of field condition is a Misoperation.

Example 2b: A failure of an overexcitation relay (or any other component) is not a "Failure to Trip – Other Than Fault" Misoperation as long as the generator's Composite Protection System operated as intended isolating the generator from the BES.

In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – Other Than Fault” category applies to the operation.

Slow Trip – During Fault

This category of Misoperation typically results in remote backup Protection System operation before the Fault is cleared.

Example 3a: A Composite Protection System that is slower than required for a Fault condition is a Misoperation if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. The current differential element of a multiple function relay failed to operate for a line Fault. The same relay's time-overcurrent element operated after a time delay. However, an adjacent line also operated from a time-overcurrent element. The faulted line's time-overcurrent element was found to be set to trip too slowly.

Example 3b: A failure of a breaker's Composite Protection System to operate as quickly as intended to meet the expected critical Fault clearing time for a line Fault in conjunction with a breaker failure (i.e., stuck breaker) is a Misoperation if it resulted in an unintended operation of at least one other Element’s Composite Protection System. If a generating unit’s Composite Protection System operates due to instability caused by the slow trip of the breaker's Composite Protection System, it is not an “Unnecessary Trip – During Fault” Misoperation of the generating unit’s Composite Protection System. This event would be a “Slow Trip – During Fault” Misoperation of the breaker's Composite Protection System.

Example 3c: A line connected to a generation interconnection station is protected with two independent high-speed pilot systems. The Composite Protection System for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. During a Fault on this line, the two pilot systems fail to operate and the time-overcurrent scheme operates clearing the Fault with no generating units or other Elements tripping (i.e., no over-trips). This event is not a Misoperation.

The phrase “slower than required” means the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

The phrase “resulted in the operation of any other Composite Protection System” refers to the need to ensure that relaying operates in the proper or planned sequence (i.e., the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

In analyzing the Protection System for Misoperation, the entity must also consider the “Unnecessary Trip – During Fault” category to determine if an “unnecessary trip” applies to the Protection System operation of an Element other than the faulted Element.

If a coordination error was at the local terminal (i.e., set too slow), then it was a "Slow Trip," category of Misoperation at the local terminal.

Slow Trip – Other Than Fault

The phrase “slower than required” means the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

Example 4: A phase to phase fault occurred on the terminals of a generator. The generator's Composite Protection System and a transmission line's Composite Protection System both operated in response to the fault. It was found during subsequent investigation that the generator protection contained an inappropriate time delay. This caused the transmission line's correctly set overreaching zone of protection to operate. This was a Misoperation of the generator’s Composite Protection System, but not of the transmission line’s Composite Protection System.

The “Slow Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

Unnecessary Trip – During Fault

An operation of a properly coordinated remote Protection System is not in and of itself a Misoperation if the Fault has persisted for a sufficient time to allow the correct operation of the Composite Protection System of the faulted Element to clear the Fault. A BES interrupting device failure, a “failure to trip” Misoperation, or a “slow trip” Misoperation may result in a proper remote Protection System operation.

> **Example 5:** An operation of a transformer's Composite Protection System which trips (i.e., over-trips) for a properly cleared line Fault is a Misoperation. The Fault is cleared properly by the faulted equipment's Composite Protection System (i.e., line relaying) without the need for an external Protection System operation resulting in an unnecessary trip of the transformer protection; therefore, the transformer Protection System operation is a Misoperation.
>
> **Example 5b:** An operation of a line's Composite Protection System which trips (i.e., over-trips) for a properly cleared Fault on a different line is a Misoperation. The Fault is cleared properly by the faulted line's Composite Protection System (i.e., line relaying); however, elsewhere in the system, a carrier blocking signal is not transmitted (e.g., carrier ON/OFF switch found in OFF position) resulting in the operation of a remote Protection System, single-end trip of a non-faulted line. The operation of the Protection System for the non-faulted line is an unnecessary trip during a Fault. Therefore, the non-faulted line Protection System operation is an “Unnecessary Trip – During Fault” Misoperation.
>
> **Example 5c:** If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip – During Fault" category of Misoperation at the remote terminal.

Unnecessary Trip – Other Than Fault

Unnecessary trips for non-Fault conditions include but are not limited to: power swings, overexcitation, loss of excitation, frequency excursions, and normal operations.

> **Example 6a:** An operation of a line's Composite Protection System due to a relay failure during normal operation is a Misoperation.
>
> **Example 6b:** Tripping a generator by the operation of the loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation assuming the Composite Protection System was not intended to operate under this condition.
>
> **Example 6c:** An impedance line relay trip for a power swing that entered the relay’s characteristic is a Misoperation if the power swing was stable and the relay operated because power swing blocking was enabled and should have prevented the trip, but did not.
>
> **Example 6d:** Tripping a generator operating at normal load by the operation of a reverse power protection relay due to a relay failure is a Misoperation.

Additionally, an operation that occurs during a non-Fault condition but was initiated directly by on-site (i.e., real-time) maintenance, testing, inspection, construction, or commissioning is not a Misoperation.

Example 6e: A BES interrupting device operation that occurs at the remote end of a line during a non-Fault condition because a direct transfer trip was initiated by system maintenance and testing activities at the local end of the line is not a Misoperation because of the maintenance exclusion in category 6 of the definition of “Misoperation.”

The “on-site” activities at one location that initiates a trip to another location are included in this exemption. This includes operation of a Protection System when energizing equipment to facilitate measurements, such as verification of current circuits as a part of performing commissioning; however, once the maintenance, testing, inspection, construction, or commissioning activity associated with the Protection System is complete, the "on-site" Misoperation exclusion no longer applies, regardless of the presence of on-site personnel.

Special Cases

Protection System operations for these cases would not be a Misoperation.

Example 7a: A generator Protection System operation prior to closing the unit breaker(s) is not a Misoperation provided no in-service Elements are tripped.

This type of operation is not a Misoperation because the generating unit is not synchronized and is isolated from the BES. Protection System operations that occur when the protected Element is out of service and that do not trip any in-service Elements are not Misoperations.

In some cases where zones of protection overlap, the owner(s) of Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element.

Example 7b: The high-side of a transformer connected to a line may be within the zone of protection of the supplying line’s relaying. In this case, the line relaying is planned to protect the area of the high-side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for Faults on the high-side of the connected transformer. Therefore, the operation of the line relaying for a high-side transformer Fault operated as intended and would not be a Misoperation.

Below are examples of conditions that would be a Misoperation.

Example7c: A 230 kV shunt capacitor bank was released for operational service. The capacitor bank trips due to a settings error in the capacitor bank differential relay upon energization.

Example 7d: A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush after being released for operational service. Only the high-side breaker opens since the low-side breaker had not yet been closed.

Non-Protective Functions

BES interrupting device operations which are initiated by non-protective functions, such as those associated with generator controls, excitation controls, or turbine/boiler controls, static voltampere-reactive compensators (SVC), flexible ac transmission systems (FACTS), high-voltage dc (HVdc) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. The standard is not applicable to non-protective functions such as automation (e.g., data collection) or control functions that are embedded within a Protection System.

Control Functions

The entity must make a determination as to whether the standard is applicable to each operation of its Protection System in accordance with the provided exclusions in the standard's Applicability, see Section 4.2.1. The subject matter experts (SME) developing this standard recognize that entities use Protection Systems as part of a routine practice to control BES Elements. This standard is not applicable to operation of protective functions within a Protection System when intended for controlling a BES Element as a part of an entity's process or planned switching sequence. The following are examples of conditions to which this standard is not applicable:

> **Example 8a:** The reverse power protective function that operates to remove a generating unit from service using the entity's normal or routine process.
>
> **Example 8b:** The reverse power relay enables a permissive trip and the generator operator trips the unit.

The standard is not applicable to operation of the protective relay because its operation is intended as a control function as part of a controlled shutdown sequence for the generator. However, the standard remains applicable to operation of the reverse power relay when it operates for conditions not associated with the controlled shutdown sequence, such as a motoring condition caused by a trip of the prime mover.

The following is another example of a condition to which this standard is not applicable:

> **Example 8c:** Operation of a capacitor bank interrupting device for voltage control using functions embedded within a microprocessor based relay that is part of a Protection System.

The above are examples only, and do not constitute an all-inclusive list to which the standard is not applicable.

Extenuating Circumstances

In the event of a natural disaster or other extenuating circumstances, the December 20, 2012 Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, reads: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." The Regional Entities to whom NERC has delegated authority will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

The volume of Protection System operations tend to be sporadic. If a high rate of Protection System operations is not sustained, utilities will have an opportunity to catch up within the 120 day period.

Requirement Time Periods

The time periods within all the Requirements are distinct and separate. The applicable entity in Requirement R1 has 120 calendar days to identify whether a BES interrupting device operation is a Misoperation. Once the applicable entity has identified a Misoperation, it has completed its performance under Requirement R1. Identified Misoperations without an identified cause become subject to Requirement R4 and any subsequent Requirements as necessary. Identified Misoperations with an identified cause become subject to Requirement R5 and any subsequent Requirements as necessary.

In Requirement R2, the applicable entity has 120 calendar days, based on the date of the BES interrupting device operation, to provide notification to the other Protection System owners that meet the circumstances in Parts 2.1 and 2.2. For the case of an applicable entity that was notified (R3), it has the later of 120 calendar days from the date of the BES interrupting device operation or 60 calendar days of notification to identify whether its Protection System components caused a Misoperation.

Once a Misoperation is identified in either Requirement R1 or R3, and the applicable entity did not identify the cause(s) of the Misoperation, the time period for performing at least one investigative action every two full calendar quarters begins. The time period(s) in Requirement R4 resets upon each period. When the applicable entity’s investigative actions identify the cause of the identified Misoperation or the applicable entity declares that no cause was found, the applicable entity has completed its performance in Requirement R4.

The time period in Requirement R5 begins when the Misoperation cause is first identified. The applicable entity is allotted 60 calendar days to perform one of the two activities listed in Requirement R5 (e.g., CAP or declaration) to complete its performance under Requirement R5.

Requirement R6 time period is determined by the actions and the associated timetable to complete those actions identified in the CAP. The time periods contained in the CAP may change from time to time and the applicable entity is required to update the timetable when it changes.

Time periods provided in the Requirements are intended to provide a reasonable amount of time to perform each Requirement. Performing activities in the least amount of time facilitates prompt identification of Misoperations, notification to other Protection System owners, identification of the cause(s), correction of the cause(s), and that important information is retained that may be lost due to time.

Requirement R1

This Requirement initiates a review of each BES interrupting device operation to identify whether or not a Misoperation may have occurred. Since the BES interrupting device owner typically monitors and tracks device operations, the owner is the logical starting point for identifying Misoperations of Protection Systems for BES Elements. A review is required when (1) a BES interrupting device operates that is caused by a Protection System or by manual intervention in response to a Protection System failure to operate, (2) regardless of whether the owner owns all or part of the Protection System component(s), and (3) the owner identified its Protection System component(s) as causing the BES interrupting device operation or was caused by manual intervention in response to its Protection System failure to operate.

Since most Misoperations result in the operation of one or more BES interrupting devices, these operations initiate a review to identify any Misoperation. If an Element is manually isolated in response to a failure to operate, the manual isolation of the Element triggers a review for Misoperation.

> **Example R1a:** The failure of a loss of field relay on a generating unit where an operator takes action to isolate the unit.

Manual intervention may indicate a Misoperation has occurred, thus requiring the initiation of an investigation by the BES interrupting device owner.

For the case where a BES interrupting device did not operate and remote clearing occurs due to the failure of a Composite Protection System to operate, the BES interrupting device owner would still review the operation under Requirement R1. However, if the BES interrupting device owner determines that its Protection System component operated as backup protection for a condition on another entity's BES Element, the owner would provide notification of the operation to the other Protection System owner(s) under Requirement R2, Part 2.2.

Protection Systems are made of many components. These components may be owned by different entities. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner's differential relay. All of these components and many more are part of a Protection System. It is expected that all of the owners will communicate with each other, sharing information freely, so that Protection System operations can be analyzed, Misoperations identified, and corrective actions taken.

Each entity is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation regardless of the level of ownership. A combination of available information from resources such as counters, relay targets, Supervisory Control and Data Acquisition (SCADA) systems, or Disturbance Monitoring Equipment (DME) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a cause of the Misoperation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation. The entity is allotted 120 calendar days from the date of its BES interrupting device operation to identify whether its Protection System component(s) caused a Misoperation.

The Protection System operation may be documented in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System.

Repeated operations which occur during the same automatic reclosing sequence do not need a separate identification under Requirement R1. Repeated Misoperations which occur during the same 24-hour period do not need a separate identification under Requirement R1. This is consistent with the NERC *Misoperations Report*[7] which states:

> "In order to avoid skewing the data with these repeated events, the NERC SPCS should clarify, in the next annual update of the misoperation template, that all misoperations due to the same equipment and cause within a 24 hour period be recorded as one misoperation."

The following is an example of a condition that is not a Misoperation.

> **Example R1b:** A high impedance Fault occurs within a transformer. The sudden pressure relaying detects and operates for the Fault, but the differential relaying did not operate due to the low Fault current levels. This is not a Misoperation because the Composite Protection System was not required to operate because the Fault was cleared by the sudden pressure relay.

Requirement R2

Requirement R2 ensures notification of those who have a role in identifying Misoperations, but were not accounted for within Requirement R1. In the case of multi-entity ownership, the entity that owns the BES interrupting device that operated is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation under Requirement R1; however, if the entity that owns a BES interrupting device determines that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation, it must notify the other Protection System owner(s) that share Misoperation identification responsibility when the criteria in Requirement R2 is met.

This Requirement does not preclude the Protection System owners from initially communicating and working together to determine whether a Misoperation occurred and, if so, the cause. The BES interrupting device owner is only required to officially notify the other owners when it: (1) shares the Composite Protection System ownership with other entity(ies), (2) determines that a Misoperation occurred or cannot rule out a Misoperation, and (3) determines its Protection System component(s) did not cause a Misoperation or is unsure. Officially notifying the other owners without performing a preliminary review may unnecessarily burden the other owners with compliance obligations under Requirement R3, redirect valuable resources, and add little

[7] "Misoperations Report." Reporting Multiple Occurrences. NERC Protection System Misoperations Task Force. http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf. April 1, 2013. pg. 37 of 40.

benefit to reliability. The BES interrupting device owner should officially notify other owners when appropriate within the established time period.

The following is an example of a notification to another Protection System owner:

> **Example R2a:** Circuit breakers A and B at the Charlie station tripped from directional comparison blocking (DCB) relaying on 03/03/2014 at 15:43 UTC during an external Fault. As discussed last week, the fault records indicate that a problem with your equipment (failure to transmit) caused the operation.

> **Example R2b:** A generator unit tripped out immediately upon synchronizing to the grid due to a Misoperation of its overcurrent protection. The Transmission Owner owns the 230 kV generator breaker that operated. The Transmission Owner, as the owner of the BES interrupting device after determining that its Protection System components did not cause the Misoperation, notified the Generator Owner of the operation. The Generator Owner investigated and determined that its Protection System components caused the Misoperation. In this example, the Generator Owner's Protection System components did cause the Misoperation. As the owner of the Protection System components that caused the Misoperation, the Generator Owner is responsible for creating and implementing the CAP.

A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in Part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the Generator Owner and Transmission Owner functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.

> **Example R2c:** Line A Composite Protection System (owned by entity 1) failed to operate for an internal Fault. As a result, the zone 3 portion of Line B's Composite Protection System (owned by entity 2) and zone 3 portion of Line C's Composite Protection System (owned by entity 3) operated to clear the Fault. Entity 2 and 3 notified entity 1 of the remote zone 3 operation.

For the case where a BES interrupting device operates to provide backup protection for a non-BES Element, the entity reviewing the operation is not required to notify the other owners of Protection Systems for non-BES Elements. No notification is required because this Reliability Standard is not applicable to Protection Systems for non-BES Elements.

Requirement R3

For Requirement R3 (i.e., notification received), the entity that also owns a portion of the Composite Protection System is expected to use judgment to identify whether the Protection System operation is a Misoperation. A combination of available information from resources such as counters, relay targets, SCADA, DME, and information from the other owner(s) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a cause of the Misoperation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation.

The entity that is notified by the BES interrupting device owner is allotted the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation date to determine if its portion of the Composite Protection System caused the Protection System operation. It is expected that in most cases of a jointly owned Protection System, the entity making notification would have been in communication with the other owner(s) early in the process. This means that the shorter 60 calendar days only comes into play if the notification occurs in the second half of the 120 calendar days allotted to the BES interrupting device owner in Requirement R1.

The Protection System review may be organized in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System. The BES interrupting device owner's notification received may be documented in a variety of ways such as an email or a facsimile.

Requirement R4

The entity in Requirement R4 (i.e., cause identification), whether it is the entity that owns the BES interrupting device or an entity that was notified, is expected to use due diligence in taking investigative action(s) to determine the cause(s) of an identified Misoperation for its portion of the Composite Protection System. The SMEs developing this standard recognize there will be cases where the cause(s) of a Misoperation will not be revealed during the allotted time periods in Requirements R1 or R3; therefore, Requirement R4 provides the entity a mechanism to continue its investigative work to determine the cause(s) of the Misoperation when the cause is not known.

A combination of available information from resources such as counters, relay targets, SCADA, DME, test results, and studies would typically be used to determine the cause of the Misoperation. At least one investigative action must be performed every two full calendar quarters until the investigation is completed.

The following is an example of investigative actions taken to determine the cause of an identified Misoperation:

> **Example R4a**: A Misoperation was identified on 03/18/2014. A line outage to test the Protection System was scheduled on 03/24/2014 for 12/15/2014 as the first investigative action (i.e., beyond the next two full calendar quarters) due to summer peak conditions. The protection engineer contacted the manufacturer on 04/10/2014 (i.e., within two full calendar quarters) to obtain any known issues. The engineer reviewed manufacturer's documents on 05/27/2014. The outage schedule was confirmed on 08/29/2014 and was taken on 12/15/2014. Testing was completed on 12/16/2014 (i.e., in the second two full quarters) revealing the microprocessor relay as the cause of the Misoperation. A CAP is being developed to replace the relay.

Periodic action minimizes compliance burdens and focuses the entity's effort on determining the cause(s) of the Misoperation while providing measurable evidence. The SMEs recognize that certain planned investigative actions may require months or years to schedule and complete; therefore, the entity is only required to perform at least one investigative action every two full calendar quarters. If an investigative action is performed in the first quarter of a calendar year, the next investigative action would need to be performed by the end of the third calendar quarter. If an investigative action is performed in the last quarter of a calendar year, the next investigative action would need to be performed by the end of the second calendar quarter of the following calendar year. Investigative actions may include a variety of actions, such as reviewing DME records, performing or reviewing studies, completing relay calibration or testing, requesting manufacturer review, requesting an outage, or confirming a schedule.

The entity's investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for identifying the Misoperation cause. Historically, approximately 12% of Misoperations are unknown or unexplainable.[8]

Although the entity only has to document its specific investigative actions taken to determine the cause(s) of an identified Misoperation, the entity should consider the benefits of formally organizing (e.g., in a report or database) its actions and findings. Well documented investigative actions and findings may be helpful in future investigations of a similar event or circumstances. A thorough report or database may contain a detailed description of the event, information gathered, investigative actions, findings, possible causes, identified causes, and conclusions. Multiple owners of a Composite Protection System might consider working together to produce a common report for their mutual benefit.

The following are examples of a declaration where no cause was determined:

> **Example R4b**: A Misoperation was identified on 04/11/2014. All relays at station A and B functioned properly during testing on 08/26/2014 as the first investigative action. The carrier system functioned properly during testing on 08/27/2014. The carrier coupling equipment functioned properly during testing on 08/28/2014. A settings review completed on 09/03/2014 indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be correct, and the equipment at station A and station B is already monitored. The investigation is being closed because no cause was found.
>
> **Example R4c:** A Misoperation was identified on 03/22/2014. The protection scheme was replaced before the cause was identified. The power line carrier or PLC based protection was replaced with fiber-optic based protection with an in-service date of 04/16/2014. The new system will be monitored for recurrence of the Misoperation.

[8] NERC System Protection and Control Subcommittee. Misoperations Report. April 1, 2013: http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf. Figure 15: NERC Wide Misoperations by Cause Code. pg. 22 of 40.

Requirement R5

Resolving the causes of Protection System Misoperations benefits BES reliability by preventing recurrence. The Corrective Action Plan (CAP) is an established tool for resolving operational problems. The NERC Glossary defines a Corrective Action Plan as, *"A list of actions and an associated timetable for implementation to remedy a specific problem."* Since a CAP addresses specific problems, the determination of what went wrong needs to be completed before developing a CAP. When the Misoperation cause is identified in Requirement R1, R3 or R4, Requirement R5 requires Protection System owner(s) to develop a CAP, or explain why corrective actions are beyond the entity's control or would not improve BES reliability. The entity must develop the CAP or make a declaration why additional actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken within 60 calendar days of first determining a cause.

The SMEs developing this standard recognize there may be multiple causes for a Misoperation. In these circumstances, the CAP would include a remedy for the identified causes. The CAP may be revised if additional causes are found; therefore, the entity has the option to create a single or multiple CAP(s) to correct multiple causes of a Misoperation. The 60 calendar day period for developing a CAP (or declaration) is established on the basis of industry experience which includes operational coordination timeframes, time to consider alternative solutions, coordination of resources, and development of a schedule.

The development of a CAP is intended to document the specific corrective actions needed to be taken to prevent Misoperation recurrence, the timetable for executing such actions, and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. The evaluation of these other Protection Systems aims to reduce the risk and likelihood of similar Misoperations in other Protection Systems. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP and an evaluation of other Protection Systems including other locations must be developed to complete Requirement R5.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined capacitor replacement was not necessary.

For completion of each CAP in Examples R5a through R5d, please see Examples R6a through R6d.

> **Example R5a:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay has not been experiencing problems and is systematically being replaced with microprocessor relays as Protection Systems are modernized. Therefore, it was assessed that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for the system.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

> **Example R5b:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, a program should be established by 12/01/2014 for wholesale preemptive replacement of capacitors in this type of impedance relay.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

> **Example R5c:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, the preemptive replacement of capacitors in this type of impedance relay should be pursued for the identified stations A through I by 04/30/2015.
>
> A plan is being developed to replace the impedance relay capacitors at stations A, B, and C by 09/01/2014. A second plan is being developed to replace the impedance relay capacitors at stations D, E, and F by 11/01/2014. The last plan will replace the impedance relay capacitors at stations G, H, and I by 02/01/2015.

The following is an example of a CAP for a relay Misoperation that was due to a version 2 firmware problem and the evaluation of the cause at similar locations which determined the firmware needs preemptive correction action.

> **Example R5d:** Actions: Provide the manufacturer fault records. Install new firmware pending manufacturer results by 10/01/2014.
>
> Applicability to other Protection Systems: Based on the evaluation of other locations and a risk assessment, the newer firmware version 3 should be installed at all installations that are identified to be version 2. Twelve relays were identified across the system. Proposed completion date is 12/31/2014.

The following are examples of a declaration made where corrective actions are beyond the entity’s control or would not improve BES reliability and that no further corrective actions will be taken.

> **Example R5e:** The cause of the Misoperation was due to a non-registered entity communications provider problem.
>
> **Example R5f:** The cause of the Misoperation was due to a transmission transformer tapped industrial customer who initiated a direct transfer trip to a registered entity’s transmission breaker.

In situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity's control.

The following are examples of declarations made why corrective actions would not improve BES reliability.

> **Example R5g:** The investigation showed that the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations.

> **Example R5h:** As a result of an operation that left a portion of the power system in an electrical island condition, circuit XYZ within that island tripped, resulting in loss of load within the island. Subsequent investigation showed an overfrequency condition persisted after the formation of that island and the XYZ line protective relay operated. Since this relay was operating outside of its designed frequency range and would not be subject to this condition when line XYZ is operated normally connected to the BES, no corrective action will be taken because BES reliability would not be improved.

> **Example R5i:** During a major ice storm, four of six circuits were lost at Station A. Subsequent to the loss of these circuits, a skywire (i.e., shield wire) broke near station A on line AB (between Station A and B) resulting in a phase-phase Fault. The protection scheme utilized for both protection groups is a permissive overreaching transfer trip (POTT). The Line AB protection at Station B tripped timed for this event (i.e., Slow Trip – During Fault) even though this line had been identified as requiring high speed clearing. A weak infeed condition was created at Station A due to the loss of 4 transmission circuits resulting in the absence of a permissive signal on Line AB from Station A during this Fault. No corrective action will be taken for this Misoperation as even under N-1 conditions, there is normally enough infeed at Station A to send a proper permissive signal to station B. Any changes to the protection scheme to account for this would not improve BES reliability.

A declaration why corrective actions are beyond the entity's control or would not improve BES reliability should include the Misoperation cause and the justification for taking no corrective action. Furthermore, a declaration that no further corrective actions will be taken is expected to be used sparingly.

Requirement R6

To achieve the stated purpose of this standard, which is to identify and correct the causes of Misoperations of Protection Systems for BES Elements, the responsible entity is required to implement a CAP that addresses the specific problem (i.e., cause(s) of the Misoperation) through completion. Protection System owners are required in the implementation of a CAP to update it when actions or timetable change, until completed. Accomplishing this objective is intended to reduce the occurrence of future Misoperations of a similar nature, thereby improving reliability and minimizing risk to the BES.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip (See also, Example R5a).

> **Example R6a:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.
>
> CAP completed on 06/25/2014.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip that resulted in the correction and the establishment of a program for further replacements (See also, Example R5b).

> **Example R6b:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.
>
> A program for wholesale preemptive replacement of capacitors in this type of impedance relay was established on 10/28/2014.
>
> CAP completed on 10/28/2014.

The following is an example of a completed CAP of corrective actions with a timetable that required updating for a failed relay and preemptive actions for similar installations (See also, Example R5c).

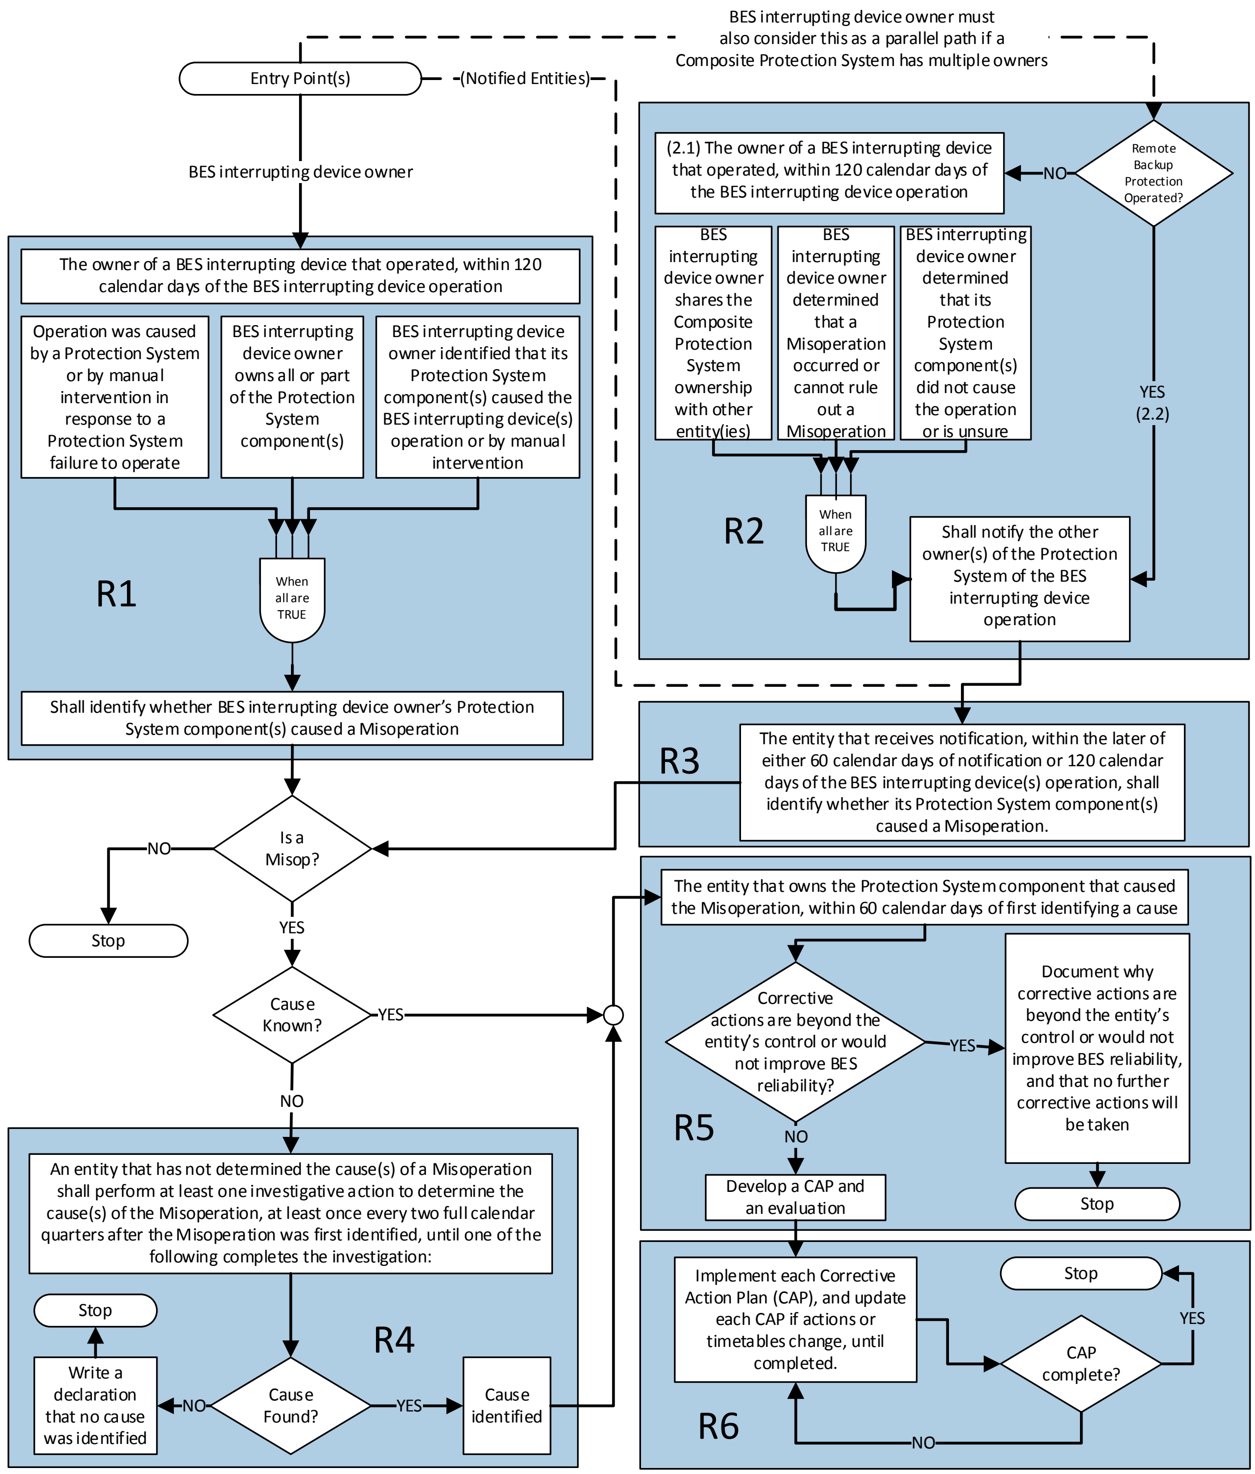
> **Example R6c:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.
>
> The impedance relay capacitor replacement was completed at stations A, B, and C on 08/16/2014. The impedance relay capacitor replacement was completed at stations D, E, and F on 10/24/2014. The impedance relay capacitor replacement for stations G, H, and I were postponed due to resource rescheduling from a scheduled 02/01/15 completion to 04/01/2015 completion. Capacitor replacement was completed on 03/09/2015 at stations G, H, and I. All stations identified in the evaluation have been completed.
>
> CAP completed on 03/09/2015.

The following is an example of a completed CAP for corrective actions with updated actions for a firmware problem and preemptive actions for similar installations. (See also, Example R5d).

> **Example R6d:** Actions: fault records were provided to the manufacturer on 06/04/2014. The manufacturer responded that the Misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 08/12/2014.
>
> Nine of the twelve relays were updated to version 3 firmware on 09/23/2014. The manufacturer provided a subsequent update which was determined to be beneficial for the remaining relays. The remaining three of twelve relays identified as having the version 2 firmware were updated to version 3.01 firmware on 11/10/2014.
>
> CAP completed on 11/10/2014.

The CAP is complete when all of the actions identified within the CAP have been completed.

Process Flow Chart: Below is a graphical representation demonstrating the relationships between Requirements:



Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. The SC authorized moving the SAR forward for standard development at their June 9, 2011 meeting.
2. The SAR was posted for informal comment June 10 – July 11, 2011.
3. Draft 1 of PRC-004-3 was posted for a 30-day formal comment period from June 10 – July 11, 2011.
4. Draft 2 of PRC-004-3 was posted for a 45-day formal comment period from July 25 – September 7, 2012 and an initial ballot in the last ten days of the comment period from August 29 – September 7, 2012.
5. Draft 3 of PRC-004-3 was posted for a 30-day formal comment period from January 22 – February 20, 2013 and a successive ballot in the last ten days of the comment period from February 11-20, 2013.
6. Draft 4 of PRC-004-3 was posted for a 45-day additional comment period from January 17 – March 11, 2014 and an additional ballot in the last ten days of the comment period from February 2 – March 11, 2014 under the new Standards Process Manual (Effective: June 26, 2013).
7. Draft 5 of PRC-004-3 was posted for a 45-day additional comment period from May 16 – July 9, 2014 and an additional ballot in the last ten days of the comment period from June 20 – July 9, 2014.

Description of Current Draft

The Protection System Misoperations Standard Drafting Team (PSMSDT) is posting Draft ~~5~~6 of PRC-004-3 – Protection System Misoperation Identification and Correction for a ~~45~~10-day ~~additional comment period and additional~~final ballot~~ in the last ten days of the comment period under the new Standards Process Manual (Effective: June 26, 2013).~~.

Anticipated Actions	Anticipated Date
~~Additional 45-day Formal Comment Period with Parallel Ballot~~	~~May 2014~~
10-day Final Ballot	July 2014
BOT Approval	August 2014

Effective Dates

The standard, the revised definition of “Misoperation~~”~~,” and the new definition of “Composite Protection System” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard, the revised definition of “Misoperation~~”~~,” and the new definition of “Composite Protection System” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to “en dash” (–) and “em dash (—).” 2. Added “periods” to items where appropriate. Changed “Timeframe” to “Time Frame” in item D, 1.2.	01/20/06
2		Modified to address Order No. 693 Directives contained in paragraph 1469.	Revised
2	August 5, 2010	Adopted by NERC Board of Trustees	
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by the Board of Trustees	
1a	September 26, 2011	FERC Order issued approving the interpretation of R1 and R3 (FERC’s Order is effective as of September 26, 2011)	
2a	September 26, 2011	Appended FERC-approved interpretation of R1 and R3 to version 2	
2.1a		Errata change: Edited R2 to add “…and generator interconnection Facility…”	Revision under Project 2010-07

2.1a	February 9, 2012	Errata change adopted by the Board of Trustees	
2.1a	September 19, 2013	FERC Order issued approving PRC-004-2.1a (approval becomes effective November 25, 2013).	
3	TBD	Adopted by Board of Trustees	Revision under Project 2010-05.1

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the *Glossary of Terms ~~used~~Used in NERC Reliability Standards* ("NERC Glossary") are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the NERC Glossary.

Composite Protection System:

The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided ~~to~~by a ~~remote~~different Element's Protection System(s) is ~~included~~excluded.

Misoperation:

The failure of a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.

6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

When this standard has received ballot approval, the rationale boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System Misoperation Identification and Correction**

2. **Number:** PRC-004-3

3. **Purpose:** Identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements.

4. **Applicability:**

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities:

4.2.1 Protection Systems for BES Elements, with the following exclusions:

4.2.1.1 Non-protective functions that are embedded within a Protection System.

4.2.1.2 Protective functions intended to operate as a control function during switching.[1]

4.2.1.3 Special Protection Systems (SPS).

4.2.1.4 Remedial Action Schemes (RAS).

4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

Rationale for Applicability: Protection Systems that protect BES Elements are integral to the operation and reliability of the BES. Some functions of relays are not used as protection but as control functions or for automation; therefore, any operation of the control function portion or the automation portion of relays is excluded from this standard. See the Application Guidelines for detailed examples of non-protective functions. Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are excluded in this standard because they are planned to be handled in the second phase of this project.

5. **Background**:

A key factor for BES reliability is the correct performance of Protection Systems. The monitoring of Protection System events for BES Elements, as well as identifying and

[1] For additional information and examples, see the "Non-Protective Functions" and "Control Functions" sections in the Application Guidelines.

correcting the causes of Misoperations, will improve Protection System performance. This Reliability Standard PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In the FERC Order No. 693, the Commission identified PRC-003-0 as a "fill-in-the-blank" standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the ~~requirements~~Requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

This project includes revising the existing definition of Misoperation, which reads:

Misoperation

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity.

In general, this definition ~~needs~~needed more specificity and clarity. The terms "specified time" and "abnormal condition" are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical, yet explainable, condition is a Misoperation.

The SAR for this project also ~~includes~~included clarifying reporting requirements. Misoperation data, as currently collected and reported, is not optimal to establish consistent metrics for measuring Protection System performance. As such, the data reporting obligation for this standard is being removed and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information ("data request"). As a result of the data request, NERC will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. The removal of the data collection obligation from the standard does not result in a reduction of reliability. The standard and data request have been developed in a manner such that evidence used for compliance with the standard and data request are intended to be independent of each other.

The proposed ~~requirements~~Requirements of the revised Reliability Standard PRC-004-3 meet the following objectives:

- Review all Protection System operations on the BES to identify those that are Misoperations of Protection Systems for Facilities that are part of the BES.
- Analyze Misoperations of Protection Systems for Facilities that are part of the BES to identify the cause(s).
- Develop and implement Corrective Action Plans to address the cause(s) of Misoperations of Protection Systems for Facilities that are part of the BES.

Misoperations associated with Special Protection Schemes (SPS) and Remedial Action Schemes (RAS) are not addressed in this standard due to their inherent complexities. NERC plans to handle SPS and RAS in the second phase of this project.

The Western Electric Coordinating Council (WECC) Regional Reliability Standard PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation relates to the reporting of Misoperations of Protection Systems and RAS for a limited set of WECC Paths. The WECC region plans to conduct work to harmonize the regional standard with this continent-wide proposed standard and the second phase of this project concerning SPS and RAS.

Undervoltage load shedding (UVLS) has not been included in this standard's applicability because Misoperations of UVLS relays are currently addressed by Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance, Requirement R1.5. Underfrequency load shedding (UFLS) was added to PRC-004-3 to close a gap in reliability as Misoperations of UFLS relays are not covered by a Reliability Standard currently.

6. Effective Dates:

The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated under the circumstances in Parts 1.1 through 1.3 shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation ~~under the following circumstances~~: *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and

1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and

1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation or was caused by manual intervention in response to its Protection System failure to operate.

M1. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified the Misoperation of its Protection System component(s), if any, that meet the circumstances in Requirement R1, Parts 1.1, 1.2, and 1.3 within the allotted time period. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R1: This ~~requirement~~Requirement ensures that entities review those Protection System operations meeting the circumstances in all three Parts (1.1, 1.2, and 1.3) and identify any that are Misoperations. The BES interrupting device owner is assigned the responsibility to initiate the review because the owner is in the best position to be aware of the operation. Manual intervention is included as a condition that initiates a review. Occasionally, Protection System failures do not yield other Protection System operations and manual intervention is required to isolate the problematic equipment. The 120 calendar day period accounts for the sporadic volumes of Protection System operations, and provides the opportunity to identify any Misoperations which were initially missed.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in Parts 2.1 and 2.2. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

2.1 For a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:

2.1.1 The BES interrupting device owner shares the Composite Protection System ownership with any other owner; and

2.1.2 The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and

2.1.3 The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.

2.2 For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's BES Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.

M2. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates notification to the other owner(s), within the allotted time period for either Requirement R2, Part 2.1, including subparts 2.1.1, 2.1.2, and 2.1.3 and Requirement R2, Part 2.2. Acceptable evidence for Requirement R2, including Parts 2.1 and 2.2 may include, but is not limited to the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

Rationale for R2: Part 2.1 ensures that the BES interrupting device owner notifies the other owners of the Composite Protection System. The phrase "owner(s) that share Misoperation identification responsibility" allows entities to notify the specific ~~others~~other owners that will actually review the operation to determine if a Misoperation occurred. Part 2.2 ensures that the Protection System owner(s) for which ~~that~~ backup protection was provided receives notification, within the same 120 calendar day period as R1. This ensures other entities are notified to review their Protection System components. The expectation is that entities will communicate accordingly and when it is clear that ~~when~~ Part 2.1, 2.2, or both are met, the entity would make the notification. It is not intended for entities to automatically and unnecessarily notify other entities before adequate detail is known.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified whether its Protection System component(s) caused a Misoperation within the allotted time period. Acceptable evidence for Requirement R3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R3: When an entity receives notification of a Protection System operation by the BES interrupting device owner, the other Protection System owner is allotted at least 60 calendar days to identify whether it was a Misoperation. A shorter time period is allotted on the basis that the BES interrupting device owner has already performed preliminary work, collaborated with the other owners, and that other owners generally have fewer associated Protection System components.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: *[Violation Risk Factor: Medium] [Time Horizon: Operations Assessment, Operations Planning]*

- The identification of the cause(s) of the Misoperation; or
- A declaration that no cause was identified.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it performed at least one investigative action according to Requirement R4 every two full calendar quarters until a cause is identified or a declaration is made. Acceptable evidence for Requirement R4 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R4: If a Misoperation cause is not identified within the time period established by Requirements R1 or R3 (i.e., 120 calendar days), the Protection System component owner must demonstrate investigative actions toward identifying the cause(s). Performing at least one action every two full calendar quarters from first identifying the Misoperation encourages periodic focus on finding the cause of the Misoperation.

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations; or
- Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP's applicability to other Protection Systems and locations, or a declaration in accordance with Requirement R5. Acceptable evidence for Requirement R5 may include, but is not limited to the following dated documentation (electronic or hardcopy format): CAP and evaluation, or declaration.

Rationale for R5: A formal CAP is a proven tool for resolving and reducing the possibility of reoccurrence of operational problems. A time period of 60 calendar days is based on industry experience and operational coordination time needed for considering such things as alternative solutions, coordination of resources, or development of a schedule. When the cause of a Misoperation is identified, a CAP will generally be developed. An evaluation of the CAP's applicability to the entity's other Protection Systems including other locations helps identify similar problems, the potential for Misoperation occurrences in other Protection Systems, common mode failure, design problems, etc.
In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, a statement documenting the reasons for taking no corrective actions is essential for future reference and for justifying the absence of a CAP.

R6. Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. *[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Long-Term Planning]*

M6. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it implemented each CAP, including updating actions or timetables. Acceptable evidence for Requirement R6 may include, but is not limited to the following dated documentation (electronic or ~~hard copy~~hardcopy format): records that document the implementation of each CAP and the completion of actions for each CAP including revision history of each CAP. Evidence may also include work management program records, work orders, and maintenance records.

Rationale for R6: Each CAP must accomplish all identified objectives to be complete. During the course of implementing a CAP, updates may be necessary for a variety of reasons such as new information, scheduling conflicts, or resource issues. Documenting changes or completion of CAP activities provides measurable progress and confirmation of completion.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirements R1, R2, R3, and R4, Measures M1, M2, M3, and M4 for a minimum of 12 calendar months following the completion of each Requirement.

The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R5, Measure M5, including any supporting analysis per Requirements R1, R2, R3, and R4, for a minimum of 12 calendar months following ~~development~~completion of each CAP, ~~development~~completion of each evaluation, and ~~development~~completion of each declaration.

The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R6, Measure M6 for a minimum of 12 calendar months following completion of each CAP.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

~~Periodic Data Submittal~~

1.4. Additional Compliance Information

None**.**

D. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether ~~or not~~ its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether ~~or not~~ its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether ~~or not~~ its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether ~~or not~~ its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to identify whether ~~or not~~ its Protection System component(s) caused a Misoperation in accordance with Requirement R1.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R2	Operations Assessment, Operations Planning	Medium	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late. OR The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	Operations Assessment, Operations Planning	Medium	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late. OR The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	Operations Planning, Long-Term Planning	Medium	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop a CAP or explain in a declaration in accordance with Requirement R5. OR (See next page)

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	(Continued)		The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop an evaluation in accordance with Requirement R5.
R6	Operations Planning, Long-Term Planning	Medium	The responsible entity implemented, but failed to update a CAP, when actions or timetables changed, in accordance with Requirement R6.	N/A	N/A	The responsible entity failed to implement a CAP in accordance with Requirement R6.

Guidelines and Technical Basis

Introduction

This standard addresses the reliability issues identified in the letter[3] from Gerry Cauley, NERC President and CEO, dated January 7, 2011.

> "Nearly all major system failures, excluding perhaps those caused by severe weather, have misoperations of relays or automatic controls as a factor contributing to the propagation of the failure. …Relays can misoperate, either operate when not needed or fail to operate when needed, for a number of reasons. First, the device could experience an internal failure – but this is rare. Most commonly, relays fail to operate correctly due to incorrect settings, improper coordination (of timing and set points) with other devices, ineffective maintenance and testing, or failure of communications channels or power supplies. Preventable errors can be introduced by field personnel and their supervisors or more programmatically by the organization."

The standard also addresses the findings in the *2011 Risk Assessment of Reliability Performance*[4]; July 2011.

> "…a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry."

The *State of Reliability 2014*[5] report continued to identify Protection System Misoperations as a significant contributor to automatic transmission outage severity. The report recommended completion of the development of PRC-004-3 as part of the solution to address Protection System Misoperations.

Definitions

The Misoperation definition is based on the IEEE/PSRC Working Group I3 "Transmission Protective Relay System Performance Measuring Methodology[6]." Misoperations of a Protection System include failure to operate, slowness in operating, or operating when not required either during a ~~fault~~Fault or non-~~fault~~Fault condition.

[6] "Transmission Protective Relay System Performance Measuring Methodology~~,"~~." Working Group I3 of Power System Relaying Committee of IEEE Power Engineering Society~~,~~. 1999.

For reference, a "Protection System" is defined in the *Glossary of Terms ~~used~~Used in NERC Reliability Standards* ("NERC Glossary") as:

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

A BES interrupting device is a BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current. Although BES interrupting device mechanisms are not part of a Protection System, the standard uses the operation of a BES interrupting device by a Protection System to initiate the review for Misoperation.

The following two definitions are being proposed for inclusion in the NERC Glossary:

> **Composite Protection System –** *The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided ~~to~~by a ~~remote~~different Element's* Protection System*(s) is ~~included~~excluded*.

The Composite Protection System definition is based on the principle that an Element's multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element's total complement of protection should be considered while evaluating an operation.

Composite Protection System – Line Example

The Composite Protection System of the Alpha-Beta line (Circuit #123) is comprised of current differential, permissive overreaching transfer trip (POTT), step distance (classic zone 1, zone 2, and zone 3), instantaneous-overcurrent, time-overcurrent, out-of-step, and overvoltage protection. The protection is housed at the Alpha and Beta substations, and includes the associated relays, communications systems, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Transformer Example

The Composite Protection System of the Alpha transformer (#2) is comprised of internal differential, overall differential, instantaneous-overcurrent, and time-overcurrent protection. The protection is housed at the Alpha substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Generator Example

The Composite Protection System of the Beta generator (#3) is comprised of generator differential, overall differential, overcurrent, stator ground, reverse power, volts per hertz, loss-of-field, and undervoltage protection. The protection is housed at the Beta generating plant and at the Beta substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Breaker Failure Example

Breaker failure protection provides backup protection for the breaker, and therefore is part of the breaker's Composite Protection System. Considering breaker failure protection to be part of another Element's Composite Protection System could lead to an incorrect conclusion that a breaker failure operation automatically satisfies the "Slow Trip" criteria of the Misoperation definition.

- An example of a correct operation of the breaker's Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. The breaker failure relaying operated because of a failed trip coil. The failed trip coil caused a Misoperation of the line's Composite Protection System.
- An example of a correct operation of the breaker's Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. Only the breaker failure relaying operated because of a failed breaker mechanism. This was not a Misoperation because the breaker mechanism is not part of the breaker's Composite Protection System.
- An example of an "Unnecessary Trip – During Fault" is when the breaker failure relaying tripped at the same time as the line relaying during a Fault. The Misoperation was due to the breaker failure timer being set to zero.

Misoperation – *The failure a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:*

1. **Failure to Trip – During Fault** – *A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*
2. ***Failure to Trip – Other Than Fault*** – *A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*

3. ***Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.*
4. ***Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.*
5. ***Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.*
6. ***Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.*

The Misoperation definition is based on the principle that an Element's total complement of protection is intended to operate dependably and securely.

- Failure to automatically reclose after a ~~fault~~Fault condition is not included as a Misoperation because reclosing equipment is not included within the definition of Protection System.
- A breaker failure operation does not, in itself, constitute a Misoperation.
- A remote backup operation resulting from a "Failure to Trip" or a "Slow Trip" does not, in itself, constitute a Misoperation.

This proposed definition of Misoperation provides additional clarity over the current version. A Misoperation is the failure of a Composite Protection System to operate as intended~~.~~ for protection purposes. The definition includes six categories which provide further differentiation of what constitutes a Misoperation. These categories are discussed in greater detail in the following sections.

Failure to Trip – During Fault

This category of Misoperation typically results in the ~~fault~~Fault condition being cleared by remote backup Protection System operation.

Example 1a: A failure of a transformer's Composite Protection System to operate for a transformer ~~fault~~Fault is a Misoperation.

Example 1b: A failure of a "primary" transformer relay (or any other component) to operate for a transformer ~~fault~~Fault is not a "Failure to Trip – During Fault" Misoperation as long as another component of the transformer's Composite Protection System operated.

Example 1c: A lack of target information does not by itself constitute a Misoperation. When a high-speed pilot system does not target because a high-speed zone element trips first, it would not in and of itself be a Misoperation.

Example 1d: A failure of an overall differential relay to operate is not a "Failure to Trip – During Fault" Misoperation as long as another component such as a generator differential relay operated.

Example 1e: The Composite Protection System for a bus does not operate during a bus Fault which results in the operation of all local transformer Protection Systems connected to that bus and all remote line Protection Systems connected to that bus isolating the faulted bus from the grid. The operation of the local transformer Protection Systems and the operation of all remote line Protection Systems correctly provided backup protection. There is one "Failure to Trip – During Fault" Misoperation of the bus Composite Protection System.

In analyzing the Protection System for Misoperation, the entity must also consider whether the "Slow Trip – During Fault" category applies to the operation.

Failure to Trip – Other Than Fault

This category of Misoperation may have resulted in operator intervention. The "Failure to Trip – Other Than Fault" conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

Example 2a: A failure of a generator's Composite Protection System to operate for an unintentional loss of field condition is a Misoperation.

Example 2b: A failure of an overexcitation relay (or any other component) is not a "Failure to Trip – Other Than Fault" Misoperation as long as the generator's Composite Protection System operated as intended isolating the generator from the BES.

In analyzing the Protection System for Misoperation, the entity must also consider whether the "Slow Trip – Other Than Fault" category applies to the operation.

Slow Trip – During Fault

This category of Misoperation typically results in remote backup Protection System operation before the ~~fault~~Fault is cleared.

Example ~~3~~3a: A ~~failure of a line's~~ Composite Protection System ~~to operate as quickly as intended~~that is slower than required for a ~~line fault~~Fault condition is a Misoperation~~.~~ if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System. The current differential element of a multiple function relay failed to operate for a line ~~fault~~Fault. The same relay's time-overcurrent element operated after a time delay. However, an adjacent line also operated from a time-overcurrent element. The faulted line's time-overcurrent element was found to be set to trip too slowly.

~~Installing high-speed protection may be a part of a utility's standard practice without having the need for high-speed protection to prevent voltage or dynamic instability or to maintain relay coordination. For this case, a "Slow Trip – During Fault" of the high-speed protection is not a Misoperation because it would not negatively impact the dynamic BES performance, unless the Composite Protection System operation is slower than previously identified as being necessary to~~

~~prevent voltage or dynamic instability. The Composite Protection System must also coordinate with other Protection Systems to prevent the trip (e.g., an over-trip) of additional Protection Systems.~~

> **Example 3b:** A failure of a breaker's Composite Protection System to operate as quickly as intended to meet the expected critical Fault clearing time for a line Fault in conjunction with a breaker failure (i.e., stuck breaker) is a Misoperation if it resulted in an unintended operation of at least one other Element's Composite Protection System. If a generating unit's Composite Protection System operates due to instability caused by the slow trip of the breaker's Composite Protection System, it is not an "Unnecessary Trip – During Fault" Misoperation of the generating unit's Composite Protection System. This event would be a "Slow Trip – During Fault" Misoperation of the breaker's Composite Protection System.

> **Example 3c:** A line connected to a generation interconnection station is protected with two independent high-speed pilot systems. The Composite Protection System for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. During a Fault on this line, the two pilot systems fail to operate and the time-overcurrent scheme operates clearing the Fault with no generating units or other Elements tripping (i.e., no over-trips). This event is not a Misoperation.

The phrase "slower than required" means the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

The phrase "resulted in the operation of any other Composite Protection System" refers to the need to ensure that relaying operates in the proper or planned sequence (i.e., the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

In analyzing the Protection System for Misoperation, the entity must also consider the "Unnecessary Trip – During Fault" category to determine if an "unnecessary trip" applies to the Protection System operation of an Element other than the faulted Element.

If a coordination error was at the local terminal (i.e., set too slow), then it was a "Slow Trip," category of Misoperation at the local terminal.

Slow Trip – Other Than Fault

The phrase "slower than required" means the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

> **Example 4:** A ~~failure~~phase to phase fault occurred on the terminals of a generator. The generator's Composite Protection System and a transmission line's Composite Protection System both operated in response to the fault. It was found during subsequent investigation that the generator protection contained an inappropriate time delay. This caused the transmission line's correctly set overreaching zone of protection to operate~~ as quickly as intended for an overexcitation condition is~~. This was a Misoperation of the generator's Composite Protection System, but not of the transmission line's Composite Protection System.

The "Slow Trip – Other Than Fault" conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

Unnecessary Trip – During Fault

An operation of a properly coordinated remote Protection System is not in and of itself a Misoperation if the ~~fault~~Fault has persisted for a sufficient time to allow the correct operation of the Composite Protection System of the faulted Element to clear the ~~fault~~Fault. A BES interrupting device failure, a "failure to trip" Misoperation, or a "slow trip" Misoperation may result in a proper remote Protection System operation.

> **Example 5:** An operation of a transformer's Composite Protection System which trips (i.e., over-trips) for a properly cleared line ~~fault~~Fault is a Misoperation. The ~~fault~~Fault is cleared properly by the faulted equipment's Composite Protection System (i.e., line relaying) without the need for an external Protection System operation resulting in an unnecessary trip of the transformer protection; therefore, the transformer Protection System operation is a Misoperation.

> **Example 5b:** An operation of a line's Composite Protection System which trips (i.e., over-trips) for a properly cleared Fault on a different line is a Misoperation. The Fault is cleared properly by the faulted line's Composite Protection System (i.e., line relaying); however, elsewhere in the system, a carrier blocking signal is not transmitted (e.g., carrier ON/OFF switch found in OFF position) resulting in the operation of a remote Protection System, single-end trip of a non-faulted line. The operation of the Protection System for the non-faulted line is an unnecessary trip during a Fault. Therefore, the non-faulted line Protection System operation is an "Unnecessary Trip – During Fault" Misoperation.

> **Example 5c:** If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip – During Fault" category of Misoperation at the remote terminal.

Unnecessary Trip – Other Than Fault

Unnecessary trips for non-~~fault~~Fault conditions include but are not limited to~~,~~: power swings, overexcitation, loss of excitation, frequency excursions, and normal operations.

> **Example 6a:** An operation of a line's Composite Protection System due to a relay failure during normal operation is a Misoperation.
>
> **Example 6b:** Tripping a generator by the operation of the loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation assuming the Composite Protection System was not intended to operate under this condition.
>
> **Example 6c:** An impedance line relay trip for a power swing that entered the relay's characteristic is a Misoperation if the power swing was stable and the relay operated because power swing blocking was enabled and should have prevented the trip, but did not.
>
> **Example 6d:** Tripping a generator operating at normal load by the operation of a reverse power protection relay due to a relay failure is a Misoperation.

Additionally, an operation that occurs during a non-~~fault~~Fault condition but was initiated directly by on-site (i.e., real-time) maintenance, testing, inspection, construction, or commissioning is not a Misoperation.

> **Example 6e:** A BES interrupting device operation that occurs at the remote end of a line during a non-~~fault~~Fault condition because a direct transfer trip was initiated by system maintenance and testing activities at the local end of the line is not a Misoperation~~.~~ because of the maintenance exclusion in category 6 of the definition of "Misoperation."

The "on-site" activities at one location that initiates a trip to another location are included in this exemption. This includes operation of a Protection System when energizing equipment to facilitate measurements, such as verification of current circuits as a part of performing commissioning; however, once the maintenance, testing, inspection, construction, or commissioning activity associated with the Protection System is complete, the "on-site" Misoperation exclusion no longer applies, regardless of the presence of on-site personnel.

~~If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip," category of Misoperation at the remote terminal.~~

Special Cases

Protection System operations for these cases would not be a Misoperation.

> **Example 7a:** A generator Protection System operation prior to closing the unit breaker(s) is not a Misoperation provided no in-service Elements are tripped.

This type of operation is not a Misoperation because the generating unit is not synchronized and is isolated from the BES. Protection System operations ~~which~~that occur ~~with~~when the protected Element is out of service~~,~~ and that do not trip any in-service Elements~~,~~ are not Misoperations.

In some cases where zones of protection overlap, the owner(s) of Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element.

Example 7b: The high-side of a transformer connected to a line may be within the zone of protection of the supplying line's relaying. In this case, the line relaying is planned to protect the area of the high~~-~~-side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for ~~faults~~Faults on the high-side of the connected transformer. Therefore, the operation of the line relaying for a high-side transformer ~~fault~~Fault operated as intended and would not be a Misoperation.

Below are examples of conditions that would be a Misoperation.

Example7c: A 230 kV shunt capacitor bank was released for operational service. The capacitor bank trips due to a settings error in the capacitor bank differential relay upon energization.~~ The operation trips only the capacitor bank breaker that was closed to energize the bank. Since closing the breaker put the capacitor bank into service, this is a Misoperation.~~

Example 7d: A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush ~~following a maintenance outage.~~after being released for operational service. Only the high-side breaker opens since the low-side breaker had not yet been closed~~. Since closing the breaker put the transformer bank into service, this is a Misoperation~~.

Non-Protective Functions

BES interrupting device operations which are initiated by non-protective functions, such as those associated with generator controls, excitation controls, or turbine/boiler controls, static voltampere-reactive compensators (SVC), flexible ac transmission systems (FACTS), high-voltage dc (HVdc) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. The standard is not applicable to non-protective functions such as automation (e.g., data collection) or control functions that are embedded within a Protection System.

Control Functions

The entity must make a determination as to whether the standard is applicable to each operation of its Protection System in accordance with the provided exclusions in the standard's Applicability, see Section 4.2.1. The subject matter experts (SME) developing this standard recognize that entities use Protection Systems as part of a routine practice to control BES Elements. This standard is not applicable to operation of protective functions within a Protection System when intended for controlling a BES Element as a part of an entity's process or planned switching sequence. The following are examples of conditions to which this standard is not applicable:

Example 8a: The reverse power protective function that operates to remove a generating unit from service using the entity's normal or routine process.

Example 8b: The reverse power relay enables a permissive trip and the generator operator trips the unit.

The standard is not applicable to operation of the protective relay because its operation is intended as a control function as part of a controlled shutdown sequence for the generator. However, the standard remains applicable to operation of the reverse power relay when it operates for conditions not associated with the controlled shutdown sequence, such as a motoring condition caused by a trip of the prime mover.

The following is another example of a condition to which this standard is not applicable:

> **Example 8c:** Operation of a capacitor bank interrupting device for voltage control using functions embedded within a microprocessor based relay that is part of a Protection System.

The above are examples only, and do not constitute an all-inclusive list to which the standard is not applicable.

Extenuating Circumstances

In the event of a natural disaster or other extenuating circumstances, the December 20, 2012 Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, reads: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." The Regional Entities to whom NERC has delegated authority will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

The volume of Protection System operations tend to be sporadic. If a high rate of Protection System operations is not sustained, utilities will have an opportunity to catch up within the 120 day period.

Requirement ~~R1~~Time Periods

The time periods within all the Requirements are distinct and separate. The applicable entity in Requirement R1 has 120 calendar days to identify whether a BES interrupting device operation is a Misoperation. Once the applicable entity has identified a Misoperation, it has completed its performance under Requirement R1. Identified Misoperations without an identified cause become subject to Requirement R4 and any subsequent Requirements as necessary. Identified Misoperations with an identified cause become subject to Requirement R5 and any subsequent Requirements as necessary.

In Requirement R2, the applicable entity has 120 calendar days, based on the date of the BES interrupting device operation, to provide notification to the other Protection System owners that meet the circumstances in Parts 2.1 and 2.2. For the case of an applicable entity that was notified (R3), it has the later of 120 calendar days from the date of the BES interrupting device operation or 60 calendar days of notification to identify whether its Protection System components caused a Misoperation.

Once a Misoperation is identified in either Requirement R1 or R3, and the applicable entity did not identify the cause(s) of the Misoperation, the time period for performing at least one investigative action every two full calendar quarters begins. The time period(s) in Requirement R4 resets upon each period. When the applicable entity's investigative actions identify the cause of the identified Misoperation or the applicable entity declares that no cause was found, the applicable entity has completed its performance in Requirement R4.

The time period in Requirement R5 begins when the Misoperation cause is first identified. The applicable entity is allotted 60 calendar days to perform one of the two activities listed in Requirement R5 (e.g., CAP or declaration) to complete its performance under Requirement R5.

Requirement R6 time period is determined by the actions and the associated timetable to complete those actions identified in the CAP. The time periods contained in the CAP may change from time to time and the applicable entity is required to update the timetable when it changes.

Time periods provided in the Requirements are intended to provide a reasonable amount of time to perform each Requirement. Performing activities in the least amount of time facilitates prompt identification of Misoperations, notification to other Protection System owners, identification of the cause(s), correction of the cause(s), and that important information is retained that may be lost due to time.

Requirement R1

This ~~requirement~~Requirement initiates a review of each BES interrupting device operation to identify whether or not a Misoperation may have occurred. Since the BES interrupting device owner typically monitors and tracks device operations, the owner is the logical starting point for identifying Misoperations of Protection Systems for BES Elements. A review is required when (1) a BES interrupting device operates that is caused by a Protection System or by manual intervention in response to a Protection System failure to operate, (2) regardless of whether the owner owns all or part of the Protection System component(s), and (3) the owner identified its Protection System component(s) as causing the BES interrupting device operation or was caused by manual intervention in response to its Protection System failure to operate.

Since most Misoperations result in the operation of one or more BES interrupting devices, these operations initiate a review to identify any Misoperation. If an Element is manually isolated in response to a failure to operate, the manual isolation of the Element triggers a review for Misoperation.

> **Example R1a:** The failure of a loss of field relay on a generating unit where an operator takes action to isolate the unit.

Manual intervention may indicate a Misoperation has occurred, thus requiring the initiation of an investigation by the BES interrupting device owner.

For the case~~,~~ where a BES interrupting device did not operate and remote clearing occurs due to the failure of a Composite Protection System to operate, ~~Requirement R2, Part 2.2 requires the entity that had~~ the BES interrupting device ~~operation to notify the other owner(s) to~~owner would still review the operation under Requirement R1. However, if the BES interrupting device owner determines that its ~~portion of Composite~~ Protection System component operated as backup protection for ~~Misoperation~~a condition on another entity's BES Element, the owner would provide notification of the operation to the other Protection System owner(s) under Requirement R2, Part 2.2.

Protection Systems are made of many components. These components may be owned by different entities. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner's differential relay. All of these components and many more are part of a Protection System. It is expected that all of the owners will communicate with each other, sharing information freely, so that Protection System operations can be analyzed, Misoperations identified, and corrective actions taken.

Each entity is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation regardless of the level of ownership. A combination of available information from resources such as counters, relay targets, Supervisory Control and Data Acquisition (SCADA) systems, or Disturbance Monitoring Equipment (DME) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure~~, it~~. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation ~~until~~for a cause of the ~~entity determines otherwise~~Misoperation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation. The entity is allotted 120 calendar days from the date of its BES interrupting device operation to identify whether ~~or not a Misoperation of~~ its Protection System component(s) ~~occurred.~~ caused a Misoperation.

The Protection System operation may be documented in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System.

Repeated operations which occur during the same automatic reclosing sequence do not need a separate identification under ~~requirement~~Requirement R1. Repeated Misoperations which occur during the same 24-hour period do not need a separate identification under Requirement R1. This is consistent with the NERC ~~SPCS guidance.~~*Misoperations Report*[7] which states:

~~Repeated Misoperations which occur during the same 24 hour period do not need a separate identification under requirement R1. This is consistent with NERC PSMTF guidance.~~

~~When Elements are isolated from the BES and undergoing maintenance, they are not subject to the standard, provided they do not result in the operation of any interrupting devices that are part of the BES.~~

> "In order to avoid skewing the data with these repeated events, the NERC SPCS should clarify, in the next annual update of the misoperation template, that all misoperations due to the same equipment and cause within a 24 hour period be recorded as one misoperation."

[7] "Misoperations Report." Reporting Multiple Occurrences. NERC Protection System Misoperations Task Force. http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf. April 1, 2013. pg. 37 of 40.

The following is an example of a condition that is not a Misoperation.

> **Example R1b:** A high impedance Fault occurs within a transformer. The sudden pressure relaying detects and operates for the Fault, but the differential relaying did not operate due to the low Fault current levels. This is not a Misoperation because the Composite Protection System was not required to operate because the Fault was cleared by the sudden pressure relay.

Requirement R2

Requirement R2 ensures notification of those who have a role in identifying Misoperations, but were not accounted for within Requirement R1. In the case of multi-entity ownership, the entity that owns the BES interrupting device that operated is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation under Requirement R1; however, if the entity that owns a BES interrupting device determines that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation, it must notify the other Protection System owner(s) that share Misoperation identification responsibility when the criteria in Requirement R2 is met.

This ~~requirement~~Requirement does not preclude the Protection System owners from initially communicating and working together to determine whether a Misoperation occurred and, if so, the cause. The BES interrupting device owner is only required to officially notify the other owners when it: (1) shares the Composite Protection System ownership with other entity(ies), (2) determines that a Misoperation occurred or cannot rule out a Misoperation, and (3) determines its Protection System component(s) did not cause a Misoperation or is unsure. Officially notifying the other owners without performing a preliminary review may unnecessarily burden the other owners with compliance obligations under Requirement R3, redirect valuable resources, and add little benefit to reliability. The BES interrupting device owner should officially notify other owners when appropriate within the established time period.

The following is an example of a notification to another Protection System owner:

> **Example R2a:** Circuit breakers A and B at the Charlie station tripped from directional comparison blocking (DCB) relaying on 03/03/2014 at 15:43 UTC during an external ~~fault~~Fault. As discussed last week, the fault records indicate that a problem with your equipment (failure to transmit) caused the operation.

> **Example R2b:** A generator unit tripped out immediately upon synchronizing to the grid due to a Misoperation of its overcurrent protection. The Transmission Owner owns the 230 kV generator breaker that operated. The Transmission Owner, as the owner of the BES interrupting device after determining that its Protection System components did not cause the Misoperation, ~~was required to notify~~notified the Generator Owner of the operation. The Generator Owner investigated ~~to determine if~~and determined that its Protection System components caused the Misoperation. In this example, the Generator Owner's Protection System components did cause the Misoperation. As the owner of the Protection System components that caused the Misoperation, the Generator Owner is responsible for creating and implementing the CAP.

A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in ~~part~~Part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the ~~GO~~Generator Owner and ~~TO~~Transmission Owner functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.

> **Example R2c:** Line A Composite Protection System (owned by entity 1) failed to operate for an internal Fault. As a result, the zone 3 portion of Line B's Composite Protection System (owned by entity 2) and zone 3 portion of Line C's Composite Protection System (owned by entity 3) operated to clear the Fault. Entity 2 and 3 notified entity 1 of the remote zone 3 operation.

For the case where a BES interrupting device operates to provide backup protection for a non-BES Element, the entity reviewing the operation is not required to notify the other owners of Protection Systems for non-BES Elements. No notification is required because this Reliability Standard is not applicable to Protection Systems for non-BES Elements.

Requirement R3

For Requirement R3 (i.e., notification received), the entity that also owns a portion of the Composite Protection System is expected to use judgment to identify whether the Protection System operation is a Misoperation. A combination of available information from resources such as counters, relay targets, SCADA, DME, and information from the other owner(s) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure~~, it~~. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a cause of the Misoperation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation.

The entity that is notified by the BES interrupting device owner is allotted the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation date to determine if its portion of the Composite Protection System caused the Protection System operation. It is expected that in most cases of a jointly owned Protection System, the entity making notification would have been in communication with the other owner(s) early in the process. This means that the shorter 60 calendar days only comes into play if the notification occurs in the ~~latter~~second half of the 120 calendar days allotted to the BES interrupting device owner in Requirement R1.

The Protection System review may be organized in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System. The BES interrupting device owner's notification received may be documented in a variety of ways such as an email or a facsimile.

Requirement R4

The entity in Requirement R4 (i.e., cause identification), whether it is the entity that owns the BES interrupting device or an entity that was notified, is expected to use due diligence in taking investigative action(s) to determine the cause(s) of an identified Misoperation for its portion of the Composite Protection System. The SMEs developing this standard recognize there will be cases where the cause(s) of a Misoperation will not be revealed during the allotted time periods in Requirements R1 or R3; therefore, Requirement R4 provides the entity a mechanism to continue its investigative work to determine the cause(s) of the Misoperation when the cause is not known.

A combination of available information from resources such as counters, relay targets, SCADA, DME, test results, and studies would typically be used to determine the cause of the Misoperation. At least one investigative action must be performed every two full calendar quarters until the investigation is completed.

The following is an example of investigative actions taken to determine the cause of an identified Misoperation:

> **Example R4a**: A Misoperation was identified on 03/18/2014. A line outage to test the Protection System was scheduled on 03/24/2014 for 12/15/2014 as the first investigative action (i.e., beyond the next two full calendar quarters) due to summer peak conditions. The protection engineer contacted the manufacturer on 04/10/2014 (i.e., within two full calendar quarters) to obtain any known issues. The engineer reviewed manufacturer's documents on 05/27/2014. The outage schedule was confirmed on 08/29/2014 and was taken on 12/15/2014. Testing was completed on 12/16/2014 (i.e., in the second two full quarters) revealing the microprocessor relay as the cause of the Misoperation. A CAP is being developed to replace the relay.

Periodic action minimizes compliance burdens and focuses the entity's effort on determining the cause(s) of the Misoperation while providing measurable evidence. The SMEs recognize that certain planned investigative actions may require months or years to schedule and complete; therefore, the entity is only required to perform at least one investigative action every two full calendar quarters. If an investigative action is performed in the first quarter of a calendar year, the next investigative action would need to be performed by the end of the third calendar quarter. If an investigative action is performed in the last quarter of a calendar year, the next investigative action would need to be performed by the end of the second calendar quarter of the following calendar year. Investigative actions may include a variety of actions, such as reviewing DME records, performing or reviewing studies, completing relay calibration or testing, requesting manufacturer review, requesting an outage, or confirming a schedule.

The entity's investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for identifying the Misoperation cause. Historically, approximately 12% of Misoperations are unknown or unexplainable.[8]

Although the entity only has to document its specific investigative actions taken to determine the cause(s) of an identified Misoperation, the entity should consider the benefits of formally organizing (e.g., in a report or database) its actions and findings. Well documented investigative actions and findings may be helpful in future investigations of a similar event or circumstances. A thorough report or database may contain a detailed description of the event, information gathered, investigative actions, findings, possible causes, identified causes, and conclusions. Multiple owners of a Composite Protection System might consider working together to produce a common report for their mutual benefit.

The following are examples of a declaration where no cause was determined:

> **Example R4b**: A Misoperation was identified on 04/11/2014. All relays at station A and B functioned properly during testing on 08/26/2014~~.~~ as the first investigative action. The carrier system functioned properly during testing on 08/27/2014. The carrier coupling equipment functioned properly during testing on 08/28/2014. A settings review completed on 09/03/2014 indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be correct, and the equipment at station A and station B is already monitored. The investigation is being closed because no cause was found.

> **Example R4c:** A Misoperation was identified on 03/22/2014. The protection scheme was replaced before the cause was identified. The power line carrier or PLC based protection was replaced with fiber-optic based protection with an in-service date of 04/16/2014. The new system will be monitored for recurrence of the Misoperation.

Requirement R5

Resolving the causes of Protection System Misoperations benefits BES reliability by preventing recurrence. The Corrective Action Plan (CAP) is an established tool for resolving operational problems. The NERC Glossary defines a Corrective Action Plan as, *"A list of actions and an associated timetable for implementation to remedy a specific problem."* Since a CAP addresses specific problems, the determination of what went wrong needs to be completed before developing a CAP. When the Misoperation cause is identified in Requirement R1, R3 or R4, Requirement R5 requires Protection System owner(s) to develop a CAP, or explain why corrective actions are beyond the entity's control or would not improve BES reliability. The entity must ~~create~~develop the CAP or make a declaration why additional actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken within 60 calendar days of first determining a cause.

The SMEs developing this standard recognize there may be multiple causes for a Misoperation~~;~~ ~~in~~. In these circumstances, the CAP would include a remedy for the identified causes. The CAP may be revised if additional causes are found; therefore, the entity has the option to create a single or multiple ~~CAPs~~CAP(s) to correct multiple causes of a Misoperation. The 60 calendar

[8] NERC System Protection and Control Subcommittee. Misoperations Report. April 1, 2013: http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf~~,~~. Figure 15: NERC Wide Misoperations by Cause Code~~,~~. pg. 22 of 40.

day period for developing a CAP (or declaration) is established on the basis of industry experience which includes operational coordination timeframes, time to consider alternative solutions, coordination of resources, and development of a schedule.

~~The time periods within Requirement R1, R3 and R5 are distinct and separate. If a cause of a Misoperation is identified quickly, the time period in Requirement R1 or R3 ends and the 60 calendar day period to develop the CAP becomes applicable. The ultimate goal is to keep all time periods as short as possible, including the correction of the cause(s) of the Misoperation. See Requirement R6 for CAP implementation. Where there are multiple Protection System owners involved in a Misoperation, each owner whose Protection System component(s) contributed to the Misoperation is subject to Requirement R5.~~

The development of a CAP is intended to document the specific corrective actions needed to be taken to prevent Misoperation recurrence, the timetable for executing such actions, and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. The evaluation of these other Protection Systems aims to reduce the risk and likelihood of similar Misoperations in other Protection Systems. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP and an evaluation of other Protection Systems including other locations must be developed to complete Requirement R5.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined capacitor replacement was not necessary.

For completion of ~~the CAPs~~each CAP in ~~examples~~Examples R5a through R5d, please see ~~examples~~Examples R6a through R6d.

> **Example R5a:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay has not been experiencing problems and is systematically being replaced with microprocessor relays as Protection Systems are modernized. Therefore, it was assessed that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for the system.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

> **Example R5b:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, a program should be established by 12/01/2014 for wholesale preemptive replacement of capacitors in this type of impedance relay.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

> **Example R5c:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, the preemptive replacement of capacitors in this type of impedance relay should be pursued for the identified stations A through I by 04/30/2015.
>
> A plan is being developed to replace the impedance relay capacitors at stations A, B, and C by 09/01/2014. A second plan is being developed to replace the impedance relay capacitors at stations D, E, and F by 11/01/2014. The last plan will replace the impedance relay capacitors at stations G, H, and I by 02/01/2015.

The following is an example of a CAP for a relay Misoperation that was due to a version 2 firmware problem and the evaluation of the cause at similar locations which determined the firmware needs preemptive correction action.

> **Example R5d:** Actions: Provide the manufacturer fault records. Install new firmware pending manufacturer results by 10/01/2014.
>
> Applicability to other Protection Systems: Based on the evaluation of other locations and a risk assessment, the newer firmware version 3 should be installed at all installations that are identified to be version 2. Twelve relays were identified across the system. Proposed completion date is 12/31/2014.

The following are examples of a declaration made where corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken.

> **Example R5e:** The cause of the Misoperation was due to a non-registered entity communications provider problem.
>
> **Example R5f:** The cause of the Misoperation was due to a transmission transformer tapped industrial customer who initiated a direct transfer trip to a registered entity's transmission breaker.

In situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity's control.

The following are examples of declarations made why corrective actions would not improve BES reliability.

> **Example R5g:** The investigation showed that the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations.

Example R5h: As a result of an operation that left a portion of the power system in an electrical island condition, circuit XYZ within that island tripped, resulting in loss of load within the island. Subsequent investigation showed an overfrequency condition persisted after the formation of that island and the XYZ line protective relay operated. Since this relay was operating outside of its designed frequency range and would not be subject to this condition when line XYZ is operated normally connected to the BES, no corrective action will be taken because BES reliability would not be improved.

Example R5i: During a major ice storm, four of six circuits were lost at Station A. Subsequent to the loss of these circuits, a skywire (i.e., shield wire) broke near station A on line AB (between Station A and B) resulting in a phase-phase ~~fault~~Fault. The protection scheme utilized for both protection groups is a permissive overreaching transfer trip (POTT). The Line AB protection at Station B tripped timed for this event (i.e., Slow Trip – During Fault) even though this line had been identified as requiring high speed clearing. A weak infeed condition was created at Station A due to the loss of 4 transmission circuits resulting in the absence of a permissive signal on Line AB from Station A during this ~~fault~~Fault. No corrective action will be taken for this Misoperation as even under N-1 conditions, there is normally enough infeed at Station A to send a proper permissive signal to station B. Any changes to the protection scheme to account for this would not improve BES reliability.

A declaration why corrective actions are beyond the entity's control or would not improve BES reliability should include the Misoperation cause and the justification for taking no corrective action. Furthermore, a declaration that no further corrective actions will be taken is expected to be used sparingly.

Requirement R6

To achieve the stated purpose of this standard, which is to identify and correct the causes of Misoperations of Protection Systems for BES Elements, the responsible entity is required to implement a CAP that addresses the specific problem (i.e., cause(s) of the Misoperation) through completion. Protection System owners are required in the implementation of a CAP to update it when actions or timetable change, until completed. Accomplishing this objective is intended to reduce the occurrence of future Misoperations of a similar nature, thereby improving reliability and minimizing risk to the BES.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip (See also, Example R5a).

Example R6a: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

CAP completed on 06/25/2014.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip that resulted in the correction and the establishment of a program for further replacements (See also, Example R5b).

> **Example R6b:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.
>
> A program for wholesale preemptive replacement of capacitors in this type of impedance relay was established on 10/28/2014.
>
> CAP completed on 10/28/2014.

The following is an example of a completed CAP of corrective actions with a timetable that required updating for a failed relay and preemptive actions for similar installations (See also, Example R5c).

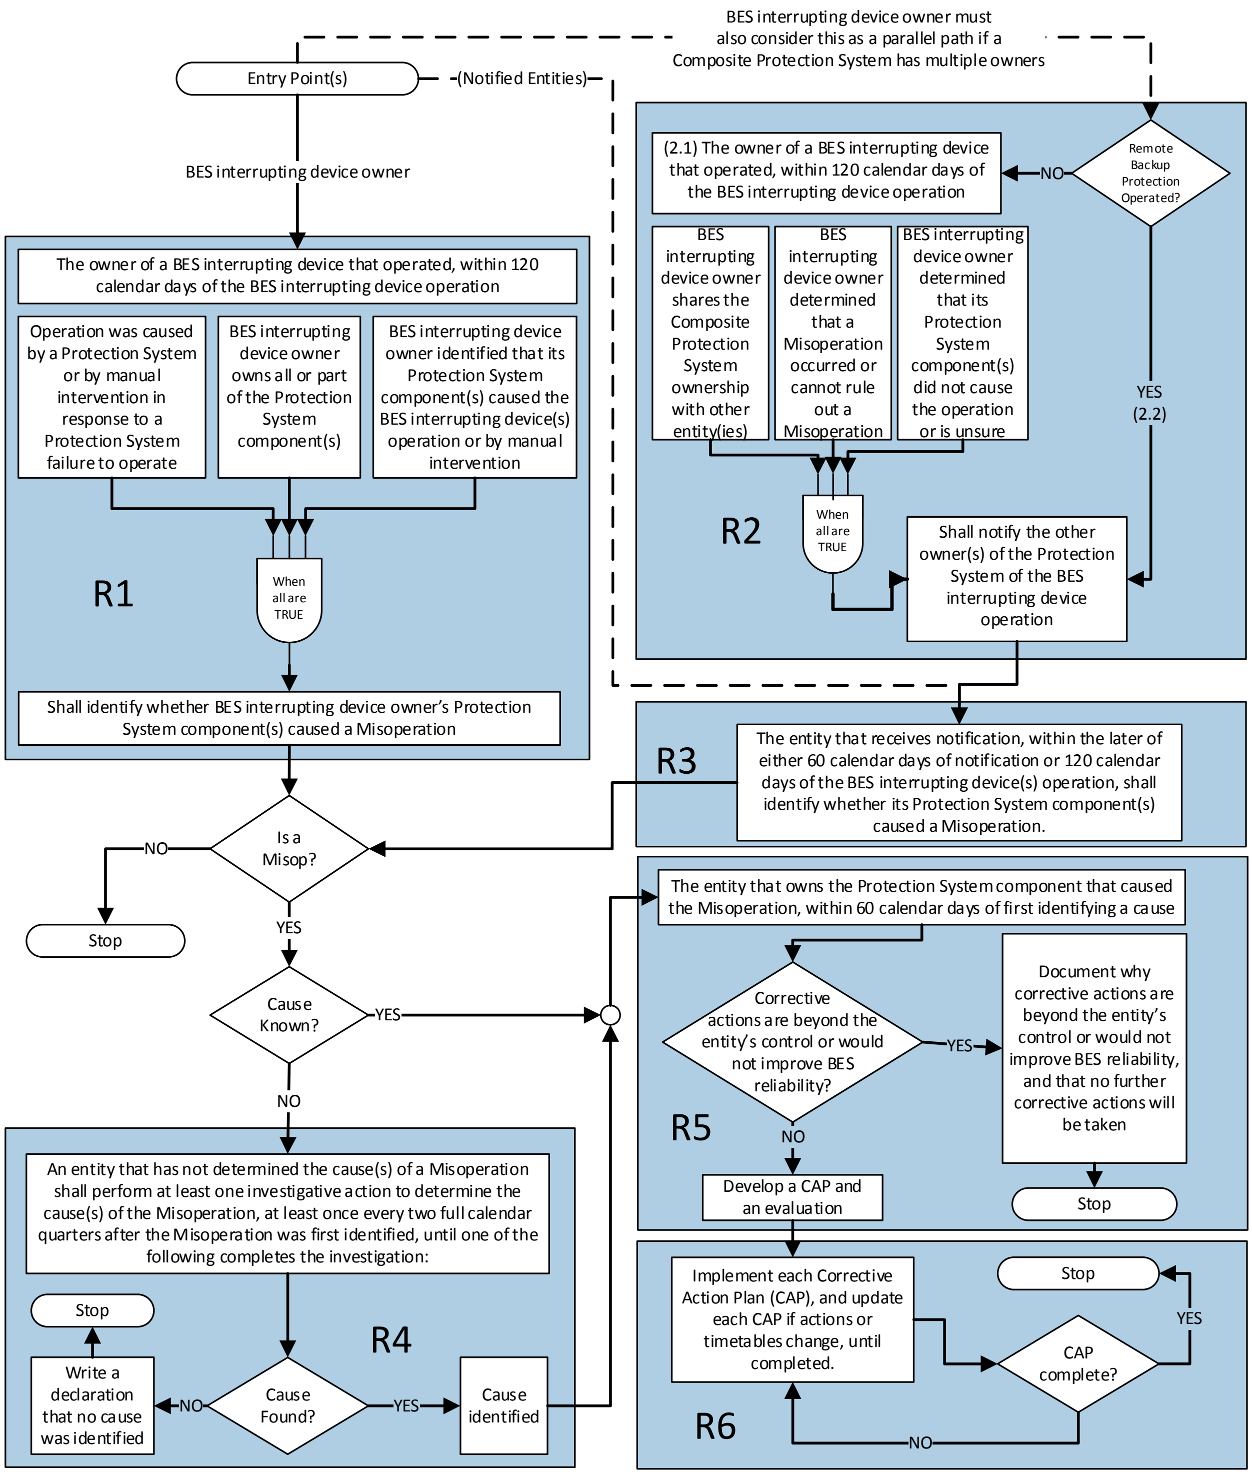
> **Example R6c:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.
>
> The impedance relay capacitor replacement was completed at stations A, B, and C on 08/16/2014. The impedance relay capacitor replacement was completed at stations D, E, and F on 10/24/2014. The impedance relay capacitor replacement for stations G, H, and I were postponed due to resource rescheduling from a scheduled 02/01/15 completion to 04/01/2015 completion. Capacitor replacement was completed on 03/09/2015 at stations G, H, and I. All stations identified in the evaluation have been completed.
>
> CAP completed on 03/09/2015.

The following is an example of a completed CAP for corrective actions with updated actions for a firmware problem and preemptive actions for similar installations. (See also, Example R5d).

> **Example R6d:** Actions: fault records were provided to the manufacturer on 06/04/2014. The manufacturer responded that the Misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 08/12/2014.
>
> Nine of the twelve relays were updated to version 3 firmware on 09/23/2014. The manufacturer provided a subsequent update which was determined to be beneficial for the remaining relays. The remaining three of twelve relays identified as having the version 2 firmware were updated to version 3.01 firmware on 11/10/2014.
>
> CAP completed on 11/10/2014.

The CAP is complete when all of the actions identified within the CAP have been completed.

Process Flow Chart: Below is a graphical representation demonstrating the relationships between ~~requirements~~Requirements:



A. ~~Introduction~~

~~Title: Analysis~~ Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and ~~**Mitigation of Transmission**~~ *will be removed when the standard becomes effective.*

Development Steps Completed

1. The SC authorized moving the SAR forward for standard development at their June 9, 2011 meeting.
2. The SAR was posted for informal comment June 10 – July 11, 2011.
3. Draft 1 of PRC-004-3 was posted for a 30-day formal comment period from June 10 – July 11, 2011.
4. Draft 2 of PRC-004-3 was posted for a 45-day formal comment period from July 25 – September 7, 2012 and ~~Generation~~an initial ballot in the last ten days of the comment period from August 29 – September 7, 2012.
5. Draft 3 of PRC-004-3 was posted for a 30-day formal comment period from January 22 – February 20, 2013 and a successive ballot in the last ten days of the comment period from February 11-20, 2013.
6. Draft 4 of PRC-004-3 was posted for a 45-day additional comment period from January 17 – March 11, 2014 and an additional ballot in the last ten days of the comment period from February 2 – March 11, 2014 under the new Standards Process Manual (Effective: June 26, 2013).
7. Draft 5 of PRC-004-3 was posted for a 45-day additional comment period from May 16 – July 9, 2014 and an additional ballot in the last ten days of the comment period from June 20 – July 9, 2014.

Description of Current Draft

The Protection System Misoperations Standard Drafting Team (PSMSDT) is posting Draft 6 of PRC-004-3 – Protection System Misoperation Identification and Correction for a 10-day final ballot.

~~**1. Number:** PRC-004-2.1a~~

~~**2. Purpose:** Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated.~~

~~**3. Applicability**~~

~~**3.1.** Transmission Owner.~~

~~**3.2.** Distribution Provider that owns a transmission Protection System.~~

Formatted: Font: Times New Roman, 12 pt, Not Bold

~~**3.3.** Generator Owner.~~

~~**4.** **(Proposed) Effective Date:** In those jurisdictions where regulatory approval is required, all requirements become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements become effective upon Board of Trustees' adoption.~~

~~A. Requirements~~

~~**R1.** The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.~~

~~**R2.** The Generator Owner shall analyze its generator and generator interconnection Facility Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.~~

~~**R3.** The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.~~

~~B. Measures~~

~~**M1.** The Transmission Owner, and any Distribution Provider that owns a transmission Protection System shall each have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.~~

~~**M2.** The Generator Owner shall have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.~~

~~**M3.** Each Transmission Owner, and any Distribution Provider that owns a transmission Protection System, and each Generator Owner shall have evidence it provided documentation of its Protection System Misoperations, analyses and Corrective Action Plans according to the Regional Entity's procedures.~~

B. ~~Compliance~~

1. ~~Compliance Monitoring Process~~

1.1. ~~Compliance Enforcement Authority~~

~~Regional Entity.~~

~~1.2. Compliance Monitoring Period and Reset Time Frame~~

~~Not applicable.~~

~~1.3. Compliance Monitoring and Enforcement Processes:~~

~~Compliance Audits~~

~~Self-Certifications~~

~~Spot Checking~~

~~Compliance Violation Investigations~~

~~Self-Reporting~~

~~Complaints~~

~~1.4. Data Retention~~

~~The Transmission Owner, and Distribution Provider that own a transmission Protection System and the Generator Owner that owns a generation or generator interconnection Facility Protection System shall each retain data on its Protection System Misoperations and each accompanying Corrective Action Plan until the Corrective Action Plan has been executed or for 12 months, whichever is later.~~

~~The Compliance Monitor shall retain any audit data for three years.~~

~~1.5.~~1.2. ~~Additional Compliance Information~~

~~The Transmission Owner, and any Distribution Provider that owns a transmission Protection System and the Generator Owner shall demonstrate compliance through self- certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.~~

~~2. Violation Severity Levels (no changes)~~

~~C. Regional Differences~~

~~None identified.~~

Anticipated Actions	Anticipated Date
10-day Final Ballot	July 2014
BOT Approval	August 2014

Effective Dates

The standard, the revised definition of "Misoperation," and the new definition of "Composite Protection System" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard, the revised definition of "Misoperation," and the new definition of "Composite Protection System" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to "en dash" (–) and "em dash (—)." 2. Added "periods" to items where appropriate. Changed "Timeframe" to "Time Frame" in item D, 1.2.	01/20/06
2		Modified to address Order No. 693 Directives contained in paragraph 1469.	Revised
2	August 5, 2010	Adopted by NERC Board of Trustees	
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by the Board of Trustees	
1a	September 26, 2011	FERC Order issued approving the interpretation of R1 and R3 (FERC's Order is effective as of September 26, 2011)	

—2a	September 26, 2011	Appended FERC-approved interpretation of R1 and R3 to version 2	
2.1a		Errata change: Edited R2 to add "…and generator interconnection Facility…"	Revision under Project 2010-07
2.1a	February 9, 2012	Errata change adopted by the Board of Trustees	
2.1a	September 19, 2013	FERC Order issued approving PRC-004-2.1a (approval becomes effective November 25, 2013).	
3	TBD	Adopted by Board of Trustees	Revision under Project 2010-05.1

~~Appendix 1~~[1]

~~**Requirement Number and Text of Requirement**~~
~~**R1.** The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's procedures developed for Reliability Standard PRC-003 Requirement 1.~~ ~~**R3**. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Reliability Organization, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Reliability Organization's procedures developed for PRC-003 R1.~~
~~**Question:**~~
~~Is protection for a radially-connected transformer protection system energized from the BES considered a transmission Protection System subject to this standard?~~
~~**Response:**~~
~~The request for interpretation of PRC-004-1 Requirements R1 and R3 focuses on the applicability of the term "transmission Protection System." The NERC Glossary of Terms Used in Reliability Standards contains a definition of "Protection System" but does not contain a definition of transmission Protection System. In these two standards, use of the phrase transmission Protection System indicates that the requirements using this phrase are applicable to any Protection System that is installed for the purpose of detecting faults on transmission elements (lines, buses, transformers, etc.) identified as being included in the Bulk Electric System (BES) and trips an interrupting device that interrupts current supplied directly from the BES.~~ ~~A Protection System for a radially connected transformer energized from the BES would be considered a transmission Protection System and subject to these standards only if the protection trips an interrupting device that interrupts current supplied directly from the BES and the transformer is a BES element.~~

~~[1] When the request for interpretation was made, it was for a previous version of the standard. Although the interpretation references a previous version of the standard, because it is still applicable in this case, it is appended to this version of the standard.~~

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the *Glossary of Terms Used in NERC Reliability Standards* ("NERC Glossary") are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the NERC Glossary.

Composite Protection System:

The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element's Protection System(s) is excluded.

Misoperation:

The failure of a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.
6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

When this standard has received ballot approval, the rationale boxes will be moved to the Application Guidelines Section of the Standard.

C. Introduction

2. Title: **Protection System Misoperation Identification and Correction**

3. Number: PRC-004-3

4. Purpose: Identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements.

5. Applicability:

5.1. Functional Entities:

5.1.1 Transmission Owner

5.1.2 Generator Owner

5.1.3 Distribution Provider

5.2. Facilities:

5.2.1 Protection Systems for BES Elements, with the following exclusions:

5.2.1.1 Non-protective functions that are embedded within a Protection System.

5.2.1.2 Protective functions intended to operate as a control function during switching.[2]

5.2.1.3 Special Protection Systems (SPS).

5.2.1.4 Remedial Action Schemes (RAS).

5.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

Rationale for Applicability: Protection Systems that protect BES Elements are integral to the operation and reliability of the BES. Some functions of relays are not used as protection but as control functions or for automation; therefore, any operation of the control function portion or the automation portion of relays is excluded from this standard. See the Application Guidelines for detailed examples of non-protective functions. Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are excluded in this standard because they are planned to be handled in the second phase of this project.

[2] For additional information and examples, see the "Non-Protective Functions" and "Control Functions" sections in the Application Guidelines.

6. Background:

A key factor for BES reliability is the correct performance of Protection Systems. The monitoring of Protection System events for BES Elements, as well as identifying and correcting the causes of Misoperations, will improve Protection System performance. This Reliability Standard PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In the FERC Order No. 693, the Commission identified PRC-003-0 as a "fill-in-the-blank" standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the Requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

This project includes revising the existing definition of Misoperation, which reads:

Misoperation

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity.

In general, this definition needed more specificity and clarity. The terms "specified time" and "abnormal condition" are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical, yet explainable, condition is a Misoperation.

The SAR for this project also included clarifying reporting requirements. Misoperation data, as currently collected and reported, is not optimal to establish consistent metrics for measuring Protection System performance. As such, the data reporting obligation for this standard is being removed and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information ("data request"). As a result of the data request, NERC will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. The removal of the data collection obligation from the standard does not result in a reduction of reliability. The standard and data request have been developed in a manner such that evidence used for compliance with the standard and data request are intended to be independent of each other.

The proposed Requirements of the revised Reliability Standard PRC-004-3 meet the following objectives:

- Review all Protection System operations on the BES to identify those that are Misoperations of Protection Systems for Facilities that are part of the BES.
- Analyze Misoperations of Protection Systems for Facilities that are part of the BES to identify the cause(s).
- Develop and implement Corrective Action Plans to address the cause(s) of Misoperations of Protection Systems for Facilities that are part of the BES.

Misoperations associated with Special Protection Schemes (SPS) and Remedial Action Schemes (RAS) are not addressed in this standard due to their inherent complexities. NERC plans to handle SPS and RAS in the second phase of this project.

The Western Electric Coordinating Council (WECC) Regional Reliability Standard PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation relates to the reporting of Misoperations of Protection Systems and RAS for a limited set of WECC Paths. The WECC region plans to conduct work to harmonize the regional standard with this continent-wide proposed standard and the second phase of this project concerning SPS and RAS.

Undervoltage load shedding (UVLS) has not been included in this standard's applicability because Misoperations of UVLS relays are currently addressed by Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance, Requirement R1.5. Underfrequency load shedding (UFLS) was added to PRC-004-3 to close a gap in reliability as Misoperations of UFLS relays are not covered by a Reliability Standard currently.

7. Effective Dates:

The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

D. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated under the circumstances in Parts 1.1 through 1.3 shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation: *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and

1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and

1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation or was caused by manual intervention in response to its Protection System failure to operate.

M1. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified the Misoperation of its Protection System component(s), if any, that meet the circumstances in Requirement R1, Parts 1.1, 1.2, and 1.3 within the allotted time period. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R1: This Requirement ensures that entities review those Protection System operations meeting the circumstances in all three Parts (1.1, 1.2, and 1.3) and identify any that are Misoperations. The BES interrupting device owner is assigned the responsibility to initiate the review because the owner is in the best position to be aware of the operation. Manual intervention is included as a condition that initiates a review. Occasionally, Protection System failures do not yield other Protection System operations and manual intervention is required to isolate the problematic equipment. The 120 calendar day period accounts for the sporadic volumes of Protection System operations, and provides the opportunity to identify any Misoperations which were initially missed.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in Parts 2.1 and 2.2. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

2.1 For a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:

2.1.1 The BES interrupting device owner shares the Composite Protection System ownership with any other owner; and

2.1.2 The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and

2.1.3 The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.

2.2 For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's BES Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.

M2. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates notification to the other owner(s), within the allotted time period for either Requirement R2, Part 2.1, including subparts 2.1.1, 2.1.2, and 2.1.3 and Requirement R2, Part 2.2. Acceptable evidence for Requirement R2, including Parts 2.1 and 2.2 may include, but is not limited to the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

Rationale for R2: Part 2.1 ensures that the BES interrupting device owner notifies the other owners of the Composite Protection System. The phrase "owner(s) that share Misoperation identification responsibility" allows entities to notify the specific other owners that will actually review the operation to determine if a Misoperation occurred. Part 2.2 ensures that the Protection System owner(s) for which backup protection was provided receives notification, within the same 120 calendar day period as R1. This ensures other entities are notified to review their Protection System components. The expectation is that entities will communicate accordingly and when it is clear that Part 2.1, 2.2, or both are met, the entity would make the notification. It is not intended for entities to automatically and unnecessarily notify other entities before adequate detail is known.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified whether its Protection System component(s) caused a Misoperation within the allotted time period. Acceptable evidence for Requirement R3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R3: When an entity receives notification of a Protection System operation by the BES interrupting device owner, the other Protection System owner is allotted at least 60 calendar days to identify whether it was a Misoperation. A shorter time period is allotted on the basis that the BES interrupting device owner has already performed preliminary work, collaborated with the other owners, and that other owners generally have fewer associated Protection System components.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: *[Violation Risk Factor: Medium] [Time Horizon: Operations Assessment, Operations Planning]*

- The identification of the cause(s) of the Misoperation; or
- A declaration that no cause was identified.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it performed at least one investigative action according to Requirement R4 every two full calendar quarters until a cause is identified or a declaration is made. Acceptable evidence for Requirement R4 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R4: If a Misoperation cause is not identified within the time period established by Requirements R1 or R3 (i.e., 120 calendar days), the Protection System component owner must demonstrate investigative actions toward identifying the cause(s). Performing at least one action every two full calendar quarters from first identifying the Misoperation encourages periodic focus on finding the cause of the Misoperation.

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations; or
- Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP's applicability to other Protection Systems and locations, or a declaration in accordance with Requirement R5. Acceptable evidence for Requirement R5 may include, but is not limited to the following dated documentation (electronic or hardcopy format): CAP and evaluation, or declaration.

Rationale for R5: A formal CAP is a proven tool for resolving and reducing the possibility of reoccurrence of operational problems. A time period of 60 calendar days is based on industry experience and operational coordination time needed for considering such things as alternative solutions, coordination of resources, or development of a schedule. When the cause of a Misoperation is identified, a CAP will generally be developed. An evaluation of the CAP's applicability to the entity's other Protection Systems including other locations helps identify similar problems, the potential for Misoperation occurrences in other Protection Systems, common mode failure, design problems, etc.

In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, a statement documenting the reasons for taking no corrective actions is essential for future reference and for justifying the absence of a CAP.

R6. Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. *[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Long-Term Planning]*

M6. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it implemented each CAP, including updating actions or timetables. Acceptable evidence for Requirement R6 may include, but is not limited to the following dated documentation (electronic or hardcopy format): records that document the implementation of each CAP and the completion of actions for each CAP including revision history of each CAP. Evidence may also include work management program records, work orders, and maintenance records.

Rationale for R6: Each CAP must accomplish all identified objectives to be complete. During the course of implementing a CAP, updates may be necessary for a variety of reasons such as new information, scheduling conflicts, or resource issues. Documenting changes or completion of CAP activities provides measurable progress and confirmation of completion.

~~D.~~E. Compliance

~~3.~~8. Compliance Monitoring Process

~~3.1.~~8.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

8.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

> The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirements R1, R2, R3, and R4, Measures M1, M2, M3, and M4 for a minimum of 12 calendar months following the completion of each Requirement.
>
> The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R5, Measure M5, including any supporting analysis per Requirements R1, R2, R3, and R4, for a minimum of 12 calendar months following completion of each CAP, completion of each evaluation, and completion of each declaration.
>
> The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R6, Measure M6 for a minimum of 12 calendar months following completion of each CAP.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

8.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

~~3.2.~~8.4. Additional Compliance Information

F. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to identify whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R2	Operations Assessment, Operations Planning	Medium	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late. OR The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	Operations Assessment, Operations Planning	Medium	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late. OR The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	Operations Planning, Long-Term Planning	Medium	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation. OR (See next page)	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop a CAP or explain in a declaration in accordance with Requirement R5. OR (See next page)

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	(Continued)		The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop an evaluation in accordance with Requirement R5.
R6	Operations Planning, Long-Term Planning	Medium	The responsible entity implemented, but failed to update a CAP, when actions or timetables changed, in accordance with Requirement R6.	N/A	N/A	The responsible entity failed to implement a CAP in accordance with Requirement R6.

Guidelines and Technical Basis

Introduction

This standard addresses the reliability issues identified in the letter[4] from Gerry Cauley, NERC President and CEO, dated January 7, 2011.

> "Nearly all major system failures, excluding perhaps those caused by severe weather, have misoperations of relays or automatic controls as a factor contributing to the propagation of the failure. …Relays can misoperate, either operate when not needed or fail to operate when needed, for a number of reasons. First, the device could experience an internal failure – but this is rare. Most commonly, relays fail to operate correctly due to incorrect settings, improper coordination (of timing and set points) with other devices, ineffective maintenance and testing, or failure of communications channels or power supplies. Preventable errors can be introduced by field personnel and their supervisors or more programmatically by the organization."

The standard also addresses the findings in the *2011 Risk Assessment of Reliability Performance*[5]; July 2011.

> "…a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry."

The *State of Reliability 2014*[6] report continued to identify Protection System Misoperations as a significant contributor to automatic transmission outage severity. The report recommended completion of the development of PRC-004-3 as part of the solution to address Protection System Misoperations.

Definitions

The Misoperation definition is based on the IEEE/PSRC Working Group I3 "Transmission Protective Relay System Performance Measuring Methodology[7]." Misoperations of a Protection

System include failure to operate, slowness in operating, or operating when not required either during a Fault or non-Fault condition.

For reference, a "Protection System" is defined in the *Glossary of Terms Used in NERC Reliability Standards* ("NERC Glossary") as:

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

A BES interrupting device is a BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current. Although BES interrupting device mechanisms are not part of a Protection System, the standard uses the operation of a BES interrupting device by a Protection System to initiate the review for Misoperation.

The following two definitions are being proposed for inclusion in the NERC Glossary:

> **Composite Protection System –** *The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element's Protection System(s) is excluded.*

The Composite Protection System definition is based on the principle that an Element's multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element's total complement of protection should be considered while evaluating an operation.

Composite Protection System – Line Example

The Composite Protection System of the Alpha-Beta line (Circuit #123) is comprised of current differential, permissive overreaching transfer trip (POTT), step distance (classic zone 1, zone 2, and zone 3), instantaneous-overcurrent, time-overcurrent, out-of-step, and overvoltage protection. The protection is housed at the Alpha and Beta substations, and includes the associated relays, communications systems, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Transformer Example

The Composite Protection System of the Alpha transformer (#2) is comprised of internal differential, overall differential, instantaneous-overcurrent, and time-overcurrent protection. The protection is housed at the Alpha substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Generator Example

The Composite Protection System of the Beta generator (#3) is comprised of generator differential, overall differential, overcurrent, stator ground, reverse power, volts per hertz, loss-of-field, and undervoltage protection. The protection is housed at the Beta generating plant and at the Beta substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Breaker Failure Example

Breaker failure protection provides backup protection for the breaker, and therefore is part of the breaker's Composite Protection System. Considering breaker failure protection to be part of another Element's Composite Protection System could lead to an incorrect conclusion that a breaker failure operation automatically satisfies the "Slow Trip" criteria of the Misoperation definition.

- An example of a correct operation of the breaker's Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. The breaker failure relaying operated because of a failed trip coil. The failed trip coil caused a Misoperation of the line's Composite Protection System.
- An example of a correct operation of the breaker's Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. Only the breaker failure relaying operated because of a failed breaker mechanism. This was not a Misoperation because the breaker mechanism is not part of the breaker's Composite Protection System.
- An example of an "Unnecessary Trip – During Fault" is when the breaker failure relaying tripped at the same time as the line relaying during a Fault. The Misoperation was due to the breaker failure timer being set to zero.

Misoperation – *The failure a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:*

1. **Failure to Trip – During Fault** *– A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*
2. ***Failure to Trip – Other Than Fault*** *– A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*
3. ***Slow Trip – During Fault*** *– A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.*
4. ***Slow Trip – Other Than Fault*** *– A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.*
5. ***Unnecessary Trip – During Fault*** *– An unnecessary Composite Protection System operation for a Fault condition on another Element.*
6. ***Unnecessary Trip – Other Than Fault*** *– An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.*

The Misoperation definition is based on the principle that an Element's total complement of protection is intended to operate dependably and securely.

- Failure to automatically reclose after a Fault condition is not included as a Misoperation because reclosing equipment is not included within the definition of Protection System.
- A breaker failure operation does not, in itself, constitute a Misoperation.
- A remote backup operation resulting from a "Failure to Trip" or a "Slow Trip" does not, in itself, constitute a Misoperation.

This proposed definition of Misoperation provides additional clarity over the current version. A Misoperation is the failure of a Composite Protection System to operate as intended for protection purposes. The definition includes six categories which provide further differentiation of what constitutes a Misoperation. These categories are discussed in greater detail in the following sections.

Failure to Trip – During Fault

This category of Misoperation typically results in the Fault condition being cleared by remote backup Protection System operation.

> **Example 1a:** A failure of a transformer's Composite Protection System to operate for a transformer Fault is a Misoperation.
>
> **Example 1b:** A failure of a "primary" transformer relay (or any other component) to operate for a transformer Fault is not a "Failure to Trip – During Fault" Misoperation as long as another component of the transformer's Composite Protection System operated.
>
> **Example 1c:** A lack of target information does not by itself constitute a Misoperation. When a high-speed pilot system does not target because a high-speed zone element trips first, it would not in and of itself be a Misoperation.
>
> **Example 1d:** A failure of an overall differential relay to operate is not a "Failure to Trip – During Fault" Misoperation as long as another component such as a generator differential relay operated.
>
> **Example 1e:** The Composite Protection System for a bus does not operate during a bus Fault which results in the operation of all local transformer Protection Systems connected to that bus and all remote line Protection Systems connected to that bus isolating the faulted bus from the grid. The operation of the local transformer Protection Systems and the operation of all remote line Protection Systems correctly provided backup protection. There is one "Failure to Trip – During Fault" Misoperation of the bus Composite Protection System.

In analyzing the Protection System for Misoperation, the entity must also consider whether the "Slow Trip – During Fault" category applies to the operation.

Failure to Trip – Other Than Fault

This category of Misoperation may have resulted in operator intervention. The "Failure to Trip – Other Than Fault" conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

> **Example 2a:** A failure of a generator's Composite Protection System to operate for an unintentional loss of field condition is a Misoperation.
>
> **Example 2b:** A failure of an overexcitation relay (or any other component) is not a "Failure to Trip – Other Than Fault" Misoperation as long as the generator's Composite Protection System operated as intended isolating the generator from the BES.

In analyzing the Protection System for Misoperation, the entity must also consider whether the "Slow Trip – Other Than Fault" category applies to the operation.

Slow Trip – During Fault

This category of Misoperation typically results in remote backup Protection System operation before the Fault is cleared.

> **Example 3a:** A Composite Protection System that is slower than required for a Fault condition is a Misoperation if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System. The current differential element of a multiple function relay failed to operate for a line Fault. The same relay's time-overcurrent element operated after a time delay. However, an adjacent line also operated from a time-overcurrent element. The faulted line's time-overcurrent element was found to be set to trip too slowly.

> **Example 3b:** A failure of a breaker's Composite Protection System to operate as quickly as intended to meet the expected critical Fault clearing time for a line Fault in conjunction with a breaker failure (i.e., stuck breaker) is a Misoperation if it resulted in an unintended operation of at least one other Element's Composite Protection System. If a generating unit's Composite Protection System operates due to instability caused by the slow trip of the breaker's Composite Protection System, it is not an "Unnecessary Trip – During Fault" Misoperation of the generating unit's Composite Protection System. This event would be a "Slow Trip – During Fault" Misoperation of the breaker's Composite Protection System.

> **Example 3c:** A line connected to a generation interconnection station is protected with two independent high-speed pilot systems. The Composite Protection System for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. During a Fault on this line, the two pilot systems fail to operate and the time-overcurrent scheme operates clearing the Fault with no generating units or other Elements tripping (i.e., no over-trips). This event is not a Misoperation.

The phrase "slower than required" means the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

The phrase "resulted in the operation of any other Composite Protection System" refers to the need to ensure that relaying operates in the proper or planned sequence (i.e., the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

In analyzing the Protection System for Misoperation, the entity must also consider the "Unnecessary Trip – During Fault" category to determine if an "unnecessary trip" applies to the Protection System operation of an Element other than the faulted Element.

If a coordination error was at the local terminal (i.e., set too slow), then it was a "Slow Trip," category of Misoperation at the local terminal.

Slow Trip – Other Than Fault

The phrase “slower than required” means the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

> **Example 4:** A phase to phase fault occurred on the terminals of a generator. The generator's Composite Protection System and a transmission line's Composite Protection System both operated in response to the fault. It was found during subsequent investigation that the generator protection contained an inappropriate time delay. This caused the transmission line's correctly set overreaching zone of protection to operate. This was a Misoperation of the generator’s Composite Protection System, but not of the transmission line’s Composite Protection System.

The “Slow Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

Unnecessary Trip – During Fault

An operation of a properly coordinated remote Protection System is not in and of itself a Misoperation if the Fault has persisted for a sufficient time to allow the correct operation of the Composite Protection System of the faulted Element to clear the Fault. A BES interrupting device failure, a “failure to trip” Misoperation, or a “slow trip” Misoperation may result in a proper remote Protection System operation.

> **Example 5:** An operation of a transformer's Composite Protection System which trips (i.e., over-trips) for a properly cleared line Fault is a Misoperation. The Fault is cleared properly by the faulted equipment's Composite Protection System (i.e., line relaying) without the need for an external Protection System operation resulting in an unnecessary trip of the transformer protection; therefore, the transformer Protection System operation is a Misoperation.
>
> **Example 5b:** An operation of a line's Composite Protection System which trips (i.e., over-trips) for a properly cleared Fault on a different line is a Misoperation. The Fault is cleared properly by the faulted line's Composite Protection System (i.e., line relaying); however, elsewhere in the system, a carrier blocking signal is not transmitted (e.g., carrier ON/OFF switch found in OFF position) resulting in the operation of a remote Protection System, single-end trip of a non-faulted line. The operation of the Protection System for the non-faulted line is an unnecessary trip during a Fault. Therefore, the non-faulted line Protection System operation is an “Unnecessary Trip – During Fault” Misoperation.

Example 5c: If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip – During Fault" category of Misoperation at the remote terminal.

Unnecessary Trip – Other Than Fault

Unnecessary trips for non-Fault conditions include but are not limited to: power swings, overexcitation, loss of excitation, frequency excursions, and normal operations.

Example 6a: An operation of a line's Composite Protection System due to a relay failure during normal operation is a Misoperation.

Example 6b: Tripping a generator by the operation of the loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation assuming the Composite Protection System was not intended to operate under this condition.

Example 6c: An impedance line relay trip for a power swing that entered the relay's characteristic is a Misoperation if the power swing was stable and the relay operated because power swing blocking was enabled and should have prevented the trip, but did not.

Example 6d: Tripping a generator operating at normal load by the operation of a reverse power protection relay due to a relay failure is a Misoperation.

Additionally, an operation that occurs during a non-Fault condition but was initiated directly by on-site (i.e., real-time) maintenance, testing, inspection, construction, or commissioning is not a Misoperation.

Example 6e: A BES interrupting device operation that occurs at the remote end of a line during a non-Fault condition because a direct transfer trip was initiated by system maintenance and testing activities at the local end of the line is not a Misoperation because of the maintenance exclusion in category 6 of the definition of "Misoperation."

The "on-site" activities at one location that initiates a trip to another location are included in this exemption. This includes operation of a Protection System when energizing equipment to facilitate measurements, such as verification of current circuits as a part of performing commissioning; however, once the maintenance, testing, inspection, construction, or commissioning activity associated with the Protection System is complete, the "on-site" Misoperation exclusion no longer applies, regardless of the presence of on-site personnel.

Special Cases

Protection System operations for these cases would not be a Misoperation.

Example 7a: A generator Protection System operation prior to closing the unit breaker(s) is not a Misoperation provided no in-service Elements are tripped.

This type of operation is not a Misoperation because the generating unit is not synchronized and is isolated from the BES. Protection System operations that occur when the protected Element is out of service and that do not trip any in-service Elements are not Misoperations.

In some cases where zones of protection overlap, the owner(s) of Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element.

> **Example 7b:** The high-side of a transformer connected to a line may be within the zone of protection of the supplying line's relaying. In this case, the line relaying is planned to protect the area of the high-side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for Faults on the high-side of the connected transformer. Therefore, the operation of the line relaying for a high-side transformer Fault operated as intended and would not be a Misoperation.

Below are examples of conditions that would be a Misoperation.

> **Example7c:** A 230 kV shunt capacitor bank was released for operational service. The capacitor bank trips due to a settings error in the capacitor bank differential relay upon energization.
>
> **Example 7d:** A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush after being released for operational service. Only the high-side breaker opens since the low-side breaker had not yet been closed.

Non-Protective Functions

BES interrupting device operations which are initiated by non-protective functions, such as those associated with generator controls, excitation controls, or turbine/boiler controls, static voltampere-reactive compensators (SVC), flexible ac transmission systems (FACTS), high-voltage dc (HVdc) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. The standard is not applicable to non-protective functions such as automation (e.g., data collection) or control functions that are embedded within a Protection System.

Control Functions

The entity must make a determination as to whether the standard is applicable to each operation of its Protection System in accordance with the provided exclusions in the standard's Applicability, see Section 4.2.1. The subject matter experts (SME) developing this standard recognize that entities use Protection Systems as part of a routine practice to control BES Elements. This standard is not applicable to operation of protective functions within a Protection System when intended for controlling a BES Element as a part of an entity's process or planned switching sequence. The following are examples of conditions to which this standard is not applicable:

> **Example 8a:** The reverse power protective function that operates to remove a generating unit from service using the entity's normal or routine process.
>
> **Example 8b:** The reverse power relay enables a permissive trip and the generator operator trips the unit.

The standard is not applicable to operation of the protective relay because its operation is intended as a control function as part of a controlled shutdown sequence for the generator. However, the standard remains applicable to operation of the reverse power relay when it operates for conditions not associated with the controlled shutdown sequence, such as a motoring condition caused by a trip of the prime mover.

The following is another example of a condition to which this standard is not applicable:

> **Example 8c:** Operation of a capacitor bank interrupting device for voltage control using functions embedded within a microprocessor based relay that is part of a Protection System.

The above are examples only, and do not constitute an all-inclusive list to which the standard is not applicable.

Extenuating Circumstances

In the event of a natural disaster or other extenuating circumstances, the December 20, 2012 Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, reads: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." The Regional Entities to whom NERC has delegated authority will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

The volume of Protection System operations tend to be sporadic. If a high rate of Protection System operations is not sustained, utilities will have an opportunity to catch up within the 120 day period.

Requirement Time Periods

The time periods within all the Requirements are distinct and separate. The applicable entity in Requirement R1 has 120 calendar days to identify whether a BES interrupting device operation is a Misoperation. Once the applicable entity has identified a Misoperation, it has completed its performance under Requirement R1. Identified Misoperations without an identified cause become subject to Requirement R4 and any subsequent Requirements as necessary. Identified Misoperations with an identified cause become subject to Requirement R5 and any subsequent Requirements as necessary.

In Requirement R2, the applicable entity has 120 calendar days, based on the date of the BES interrupting device operation, to provide notification to the other Protection System owners that meet the circumstances in Parts 2.1 and 2.2. For the case of an applicable entity that was notified (R3), it has the later of 120 calendar days from the date of the BES interrupting device operation or 60 calendar days of notification to identify whether its Protection System components caused a Misoperation.

Once a Misoperation is identified in either Requirement R1 or R3, and the applicable entity did not identify the cause(s) of the Misoperation, the time period for performing at least one investigative action every two full calendar quarters begins. The time period(s) in Requirement R4 resets upon each period. When the applicable entity's investigative actions identify the cause of the identified Misoperation or the applicable entity declares that no cause was found, the applicable entity has completed its performance in Requirement R4.

The time period in Requirement R5 begins when the Misoperation cause is first identified. The applicable entity is allotted 60 calendar days to perform one of the two activities listed in Requirement R5 (e.g., CAP or declaration) to complete its performance under Requirement R5.

Requirement R6 time period is determined by the actions and the associated timetable to complete those actions identified in the CAP. The time periods contained in the CAP may change from time to time and the applicable entity is required to update the timetable when it changes.

Time periods provided in the Requirements are intended to provide a reasonable amount of time to perform each Requirement. Performing activities in the least amount of time facilitates prompt identification of Misoperations, notification to other Protection System owners, identification of the cause(s), correction of the cause(s), and that important information is retained that may be lost due to time.

Requirement R1

This Requirement initiates a review of each BES interrupting device operation to identify whether or not a Misoperation may have occurred. Since the BES interrupting device owner typically monitors and tracks device operations, the owner is the logical starting point for identifying Misoperations of Protection Systems for BES Elements. A review is required when (1) a BES interrupting device operates that is caused by a Protection System or by manual intervention in response to a Protection System failure to operate, (2) regardless of whether the owner owns all or part of the Protection System component(s), and (3) the owner identified its Protection System component(s) as causing the BES interrupting device operation or was caused by manual intervention in response to its Protection System failure to operate.

Since most Misoperations result in the operation of one or more BES interrupting devices, these operations initiate a review to identify any Misoperation. If an Element is manually isolated in response to a failure to operate, the manual isolation of the Element triggers a review for Misoperation.

> **Example R1a:** The failure of a loss of field relay on a generating unit where an operator takes action to isolate the unit.

Manual intervention may indicate a Misoperation has occurred, thus requiring the initiation of an investigation by the BES interrupting device owner.

For the case where a BES interrupting device did not operate and remote clearing occurs due to the failure of a Composite Protection System to operate, the BES interrupting device owner would still review the operation under Requirement R1. However, if the BES interrupting device owner determines that its Protection System component operated as backup protection for a condition on another entity's BES Element, the owner would provide notification of the operation to the other Protection System owner(s) under Requirement R2, Part 2.2.

Protection Systems are made of many components. These components may be owned by different entities. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner's differential relay. All of these components and many more are part of a Protection System. It is expected that all of the owners will communicate with each other, sharing information freely, so that Protection System operations can be analyzed, Misoperations identified, and corrective actions taken.

Each entity is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation regardless of the level of ownership. A combination of available information from resources such as counters, relay targets, Supervisory Control and Data Acquisition (SCADA) systems, or Disturbance Monitoring Equipment (DME) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a cause of the Misoperation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation. The entity is allotted 120 calendar days from the date of its BES interrupting device operation to identify whether its Protection System component(s) caused a Misoperation.

The Protection System operation may be documented in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System.

Repeated operations which occur during the same automatic reclosing sequence do not need a separate identification under Requirement R1. Repeated Misoperations which occur during the same 24-hour period do not need a separate identification under Requirement R1. This is consistent with the NERC *Misoperations Report*[8] which states:

> "In order to avoid skewing the data with these repeated events, the NERC SPCS should clarify, in the next annual update of the misoperation template, that all misoperations due to the same equipment and cause within a 24 hour period be recorded as one misoperation."

The following is an example of a condition that is not a Misoperation.

> **Example R1b:** A high impedance Fault occurs within a transformer. The sudden pressure relaying detects and operates for the Fault, but the differential relaying did not operate due to the low Fault current levels. This is not a Misoperation because the Composite Protection System was not required to operate because the Fault was cleared by the sudden pressure relay.

Requirement R2

Requirement R2 ensures notification of those who have a role in identifying Misoperations, but were not accounted for within Requirement R1. In the case of multi-entity ownership, the entity that owns the BES interrupting device that operated is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation under Requirement R1; however, if the entity that owns a BES interrupting device determines that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation, it must notify the other Protection System owner(s) that share Misoperation identification responsibility when the criteria in Requirement R2 is met.

This Requirement does not preclude the Protection System owners from initially communicating and working together to determine whether a Misoperation occurred and, if so, the cause. The BES interrupting device owner is only required to officially notify the other owners when it: (1) shares the Composite Protection System ownership with other entity(ies), (2) determines that a Misoperation occurred or cannot rule out a Misoperation, and (3) determines its Protection System component(s) did not cause a Misoperation or is unsure. Officially notifying the other owners without performing a preliminary review may unnecessarily burden the other owners with compliance obligations under Requirement R3, redirect valuable resources, and add little benefit to reliability. The BES interrupting device owner should officially notify other owners when appropriate within the established time period.

[8] "Misoperations Report." Reporting Multiple Occurrences. NERC Protection System Misoperations Task Force. http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf. April 1, 2013. pg. 37 of 40.

The following is an example of a notification to another Protection System owner:

> **Example R2a:** Circuit breakers A and B at the Charlie station tripped from directional comparison blocking (DCB) relaying on 03/03/2014 at 15:43 UTC during an external Fault. As discussed last week, the fault records indicate that a problem with your equipment (failure to transmit) caused the operation.

> **Example R2b:** A generator unit tripped out immediately upon synchronizing to the grid due to a Misoperation of its overcurrent protection. The Transmission Owner owns the 230 kV generator breaker that operated. The Transmission Owner, as the owner of the BES interrupting device after determining that its Protection System components did not cause the Misoperation, notified the Generator Owner of the operation. The Generator Owner investigated and determined that its Protection System components caused the Misoperation. In this example, the Generator Owner's Protection System components did cause the Misoperation. As the owner of the Protection System components that caused the Misoperation, the Generator Owner is responsible for creating and implementing the CAP.

A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in Part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the Generator Owner and Transmission Owner functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.

> **Example R2c:** Line A Composite Protection System (owned by entity 1) failed to operate for an internal Fault. As a result, the zone 3 portion of Line B's Composite Protection System (owned by entity 2) and zone 3 portion of Line C's Composite Protection System (owned by entity 3) operated to clear the Fault. Entity 2 and 3 notified entity 1 of the remote zone 3 operation.

For the case where a BES interrupting device operates to provide backup protection for a non-BES Element, the entity reviewing the operation is not required to notify the other owners of Protection Systems for non-BES Elements. No notification is required because this Reliability Standard is not applicable to Protection Systems for non-BES Elements.

Requirement R3

For Requirement R3 (i.e., notification received), the entity that also owns a portion of the Composite Protection System is expected to use judgment to identify whether the Protection System operation is a Misoperation. A combination of available information from resources such as counters, relay targets, SCADA, DME, and information from the other owner(s) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a cause of the Misoperation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation.

The entity that is notified by the BES interrupting device owner is allotted the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation date to determine if its portion of the Composite Protection System caused the Protection System operation. It is expected that in most cases of a jointly owned Protection System, the entity making notification would have been in communication with the other owner(s) early in the process. This means that the shorter 60 calendar days only comes into play if the notification occurs in the second half of the 120 calendar days allotted to the BES interrupting device owner in Requirement R1.

The Protection System review may be organized in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System. The BES interrupting device owner's notification received may be documented in a variety of ways such as an email or a facsimile.

Requirement R4

The entity in Requirement R4 (i.e., cause identification), whether it is the entity that owns the BES interrupting device or an entity that was notified, is expected to use due diligence in taking investigative action(s) to determine the cause(s) of an identified Misoperation for its portion of the Composite Protection System. The SMEs developing this standard recognize there will be cases where the cause(s) of a Misoperation will not be revealed during the allotted time periods in Requirements R1 or R3; therefore, Requirement R4 provides the entity a mechanism to continue its investigative work to determine the cause(s) of the Misoperation when the cause is not known.

A combination of available information from resources such as counters, relay targets, SCADA, DME, test results, and studies would typically be used to determine the cause of the Misoperation. At least one investigative action must be performed every two full calendar quarters until the investigation is completed.

The following is an example of investigative actions taken to determine the cause of an identified Misoperation:

> **Example R4a**: A Misoperation was identified on 03/18/2014. A line outage to test the Protection System was scheduled on 03/24/2014 for 12/15/2014 as the first investigative action (i.e., beyond the next two full calendar quarters) due to summer peak conditions. The protection engineer contacted the manufacturer on 04/10/2014 (i.e., within two full calendar quarters) to obtain any known issues. The engineer reviewed manufacturer's documents on 05/27/2014. The outage schedule was confirmed on 08/29/2014 and was taken on 12/15/2014. Testing was completed on 12/16/2014 (i.e., in the second two full quarters) revealing the microprocessor relay as the cause of the Misoperation. A CAP is being developed to replace the relay.

Periodic action minimizes compliance burdens and focuses the entity's effort on determining the cause(s) of the Misoperation while providing measurable evidence. The SMEs recognize that certain planned investigative actions may require months or years to schedule and complete; therefore, the entity is only required to perform at least one investigative action every two full calendar quarters. If an investigative action is performed in the first quarter of a calendar year, the next investigative action would need to be performed by the end of the third calendar quarter. If an investigative action is performed in the last quarter of a calendar year, the next investigative action would need to be performed by the end of the second calendar quarter of the following calendar year. Investigative actions may include a variety of actions, such as reviewing DME records, performing or reviewing studies, completing relay calibration or testing, requesting manufacturer review, requesting an outage, or confirming a schedule.

The entity's investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for identifying the Misoperation cause. Historically, approximately 12% of Misoperations are unknown or unexplainable.[9]

Although the entity only has to document its specific investigative actions taken to determine the cause(s) of an identified Misoperation, the entity should consider the benefits of formally organizing (e.g., in a report or database) its actions and findings. Well documented investigative actions and findings may be helpful in future investigations of a similar event or circumstances. A thorough report or database may contain a detailed description of the event, information gathered, investigative actions, findings, possible causes, identified causes, and conclusions. Multiple owners of a Composite Protection System might consider working together to produce a common report for their mutual benefit.

[9] NERC System Protection and Control Subcommittee. Misoperations Report. April 1, 2013: http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf. Figure 15: NERC Wide Misoperations by Cause Code. pg. 22 of 40.

The following are examples of a declaration where no cause was determined:

Example R4b: A Misoperation was identified on 04/11/2014. All relays at station A and B functioned properly during testing on 08/26/2014 as the first investigative action. The carrier system functioned properly during testing on 08/27/2014. The carrier coupling equipment functioned properly during testing on 08/28/2014. A settings review completed on 09/03/2014 indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be correct, and the equipment at station A and station B is already monitored. The investigation is being closed because no cause was found.

Example R4c: A Misoperation was identified on 03/22/2014. The protection scheme was replaced before the cause was identified. The power line carrier or PLC based protection was replaced with fiber-optic based protection with an in-service date of 04/16/2014. The new system will be monitored for recurrence of the Misoperation.

Requirement R5

Resolving the causes of Protection System Misoperations benefits BES reliability by preventing recurrence. The Corrective Action Plan (CAP) is an established tool for resolving operational problems. The NERC Glossary defines a Corrective Action Plan as, *"A list of actions and an associated timetable for implementation to remedy a specific problem."* Since a CAP addresses specific problems, the determination of what went wrong needs to be completed before developing a CAP. When the Misoperation cause is identified in Requirement R1, R3 or R4, Requirement R5 requires Protection System owner(s) to develop a CAP, or explain why corrective actions are beyond the entity's control or would not improve BES reliability. The entity must develop the CAP or make a declaration why additional actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken within 60 calendar days of first determining a cause.

The SMEs developing this standard recognize there may be multiple causes for a Misoperation. In these circumstances, the CAP would include a remedy for the identified causes. The CAP may be revised if additional causes are found; therefore, the entity has the option to create a single or multiple CAP(s) to correct multiple causes of a Misoperation. The 60 calendar day period for developing a CAP (or declaration) is established on the basis of industry experience which includes operational coordination timeframes, time to consider alternative solutions, coordination of resources, and development of a schedule.

The development of a CAP is intended to document the specific corrective actions needed to be taken to prevent Misoperation recurrence, the timetable for executing such actions, and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. The evaluation of these other Protection Systems aims to reduce the risk and likelihood of similar Misoperations in other Protection Systems. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP and an evaluation of other Protection Systems including other locations must be developed to complete Requirement R5.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined capacitor replacement was not necessary.

For completion of each CAP in Examples R5a through R5d, please see Examples R6a through R6d.

> **Example R5a:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay has not been experiencing problems and is systematically being replaced with microprocessor relays as Protection Systems are modernized. Therefore, it was assessed that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for the system.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

> **Example R5b:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, a program should be established by 12/01/2014 for wholesale preemptive replacement of capacitors in this type of impedance relay.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

> **Example R5c:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, the preemptive replacement of capacitors in this type of impedance relay should be pursued for the identified stations A through I by 04/30/2015.
>
> A plan is being developed to replace the impedance relay capacitors at stations A, B, and C by 09/01/2014. A second plan is being developed to replace the impedance relay capacitors at stations D, E, and F by 11/01/2014. The last plan will replace the impedance relay capacitors at stations G, H, and I by 02/01/2015.

The following is an example of a CAP for a relay Misoperation that was due to a version 2 firmware problem and the evaluation of the cause at similar locations which determined the firmware needs preemptive correction action.

> **Example R5d:** Actions: Provide the manufacturer fault records. Install new firmware pending manufacturer results by 10/01/2014.
>
> Applicability to other Protection Systems: Based on the evaluation of other locations and a risk assessment, the newer firmware version 3 should be installed at all installations that are identified to be version 2. Twelve relays were identified across the system. Proposed completion date is 12/31/2014.

The following are examples of a declaration made where corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken.

> **Example R5e:** The cause of the Misoperation was due to a non-registered entity communications provider problem.
>
> **Example R5f:** The cause of the Misoperation was due to a transmission transformer tapped industrial customer who initiated a direct transfer trip to a registered entity's transmission breaker.

In situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity's control.

The following are examples of declarations made why corrective actions would not improve BES reliability.

> **Example R5g:** The investigation showed that the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations.
>
> **Example R5h:** As a result of an operation that left a portion of the power system in an electrical island condition, circuit XYZ within that island tripped, resulting in loss of load within the island. Subsequent investigation showed an overfrequency condition persisted after the formation of that island and the XYZ line protective relay operated. Since this relay was operating outside of its designed frequency range and would not be subject to this condition when line XYZ is operated normally connected to the BES, no corrective action will be taken because BES reliability would not be improved.

Example R5i: During a major ice storm, four of six circuits were lost at Station A. Subsequent to the loss of these circuits, a skywire (i.e., shield wire) broke near station A on line AB (between Station A and B) resulting in a phase-phase Fault. The protection scheme utilized for both protection groups is a permissive overreaching transfer trip (POTT). The Line AB protection at Station B tripped timed for this event (i.e., Slow Trip – During Fault) even though this line had been identified as requiring high speed clearing. A weak infeed condition was created at Station A due to the loss of 4 transmission circuits resulting in the absence of a permissive signal on Line AB from Station A during this Fault. No corrective action will be taken for this Misoperation as even under N-1 conditions, there is normally enough infeed at Station A to send a proper permissive signal to station B. Any changes to the protection scheme to account for this would not improve BES reliability.

A declaration why corrective actions are beyond the entity's control or would not improve BES reliability should include the Misoperation cause and the justification for taking no corrective action. Furthermore, a declaration that no further corrective actions will be taken is expected to be used sparingly.

Requirement R6

To achieve the stated purpose of this standard, which is to identify and correct the causes of Misoperations of Protection Systems for BES Elements, the responsible entity is required to implement a CAP that addresses the specific problem (i.e., cause(s) of the Misoperation) through completion. Protection System owners are required in the implementation of a CAP to update it when actions or timetable change, until completed. Accomplishing this objective is intended to reduce the occurrence of future Misoperations of a similar nature, thereby improving reliability and minimizing risk to the BES.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip (See also, Example R5a).

Example R6a: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

CAP completed on 06/25/2014.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip that resulted in the correction and the establishment of a program for further replacements (See also, Example R5b).

> **Example R6b:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.
>
> A program for wholesale preemptive replacement of capacitors in this type of impedance relay was established on 10/28/2014.
>
> CAP completed on 10/28/2014.

The following is an example of a completed CAP of corrective actions with a timetable that required updating for a failed relay and preemptive actions for similar installations (See also, Example R5c).

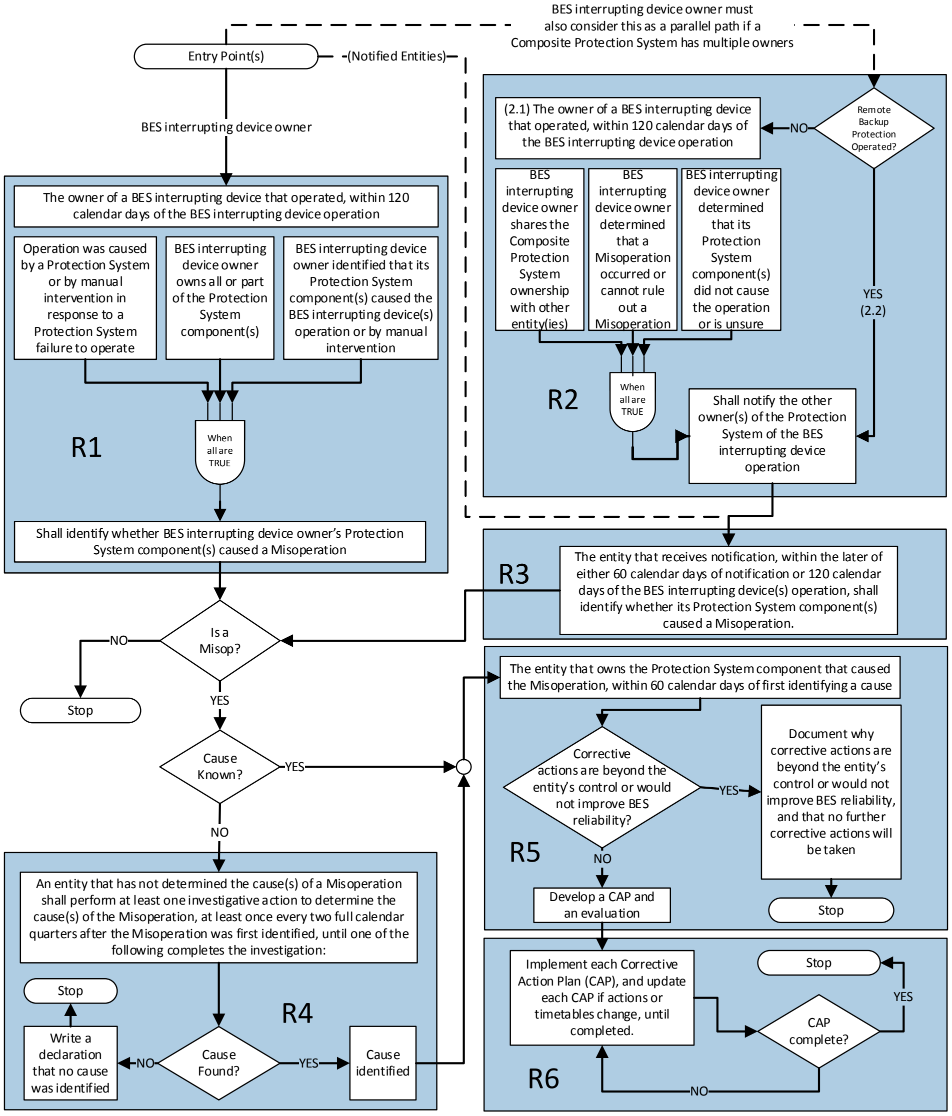
> **Example R6c:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.
>
> The impedance relay capacitor replacement was completed at stations A, B, and C on 08/16/2014. The impedance relay capacitor replacement was completed at stations D, E, and F on 10/24/2014. The impedance relay capacitor replacement for stations G, H, and I were postponed due to resource rescheduling from a scheduled 02/01/15 completion to 04/01/2015 completion. Capacitor replacement was completed on 03/09/2015 at stations G, H, and I. All stations identified in the evaluation have been completed.
>
> CAP completed on 03/09/2015.

The following is an example of a completed CAP for corrective actions with updated actions for a firmware problem and preemptive actions for similar installations. (See also, Example R5d).

> **Example R6d:** Actions: fault records were provided to the manufacturer on 06/04/2014. The manufacturer responded that the Misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 08/12/2014.
>
> Nine of the twelve relays were updated to version 3 firmware on 09/23/2014. The manufacturer provided a subsequent update which was determined to be beneficial for the remaining relays. The remaining three of twelve relays identified as having the version 2 firmware were updated to version 3.01 firmware on 11/10/2014.
>
> CAP completed on 11/10/2014.

The CAP is complete when all of the actions identified within the CAP have been completed.

Process Flow Chart: Below is a graphical representation demonstrating the relationships between Requirements:



Implementation Plan

Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)

Requested Approvals

- PRC-004-3 – Protection System Misoperation Identification and Correction
- Definitions of "Composite Protection System" and "Misoperation"

Requested Retirements

- PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection System
- PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

Prerequisite Approvals

- None

Revisions to Defined Terms in the NERC Glossary

The standard drafting team proposes the following new definition:

Composite Protection System:

The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element's Protection System(s) is excluded.

The standard drafting team proposes the following revised definition:

Misoperation:

The failure of a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage,

overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.

3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.
6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction or commissioning activities is not a Misoperation.

General Considerations

The implementation period allows adequate time for applicable entities to develop or modify its procedures and processes for reviewing Protection System operations. The development and implementation of a Corrective Action Plan remains within the scope of PRC-004; therefore, little additional time and resources should be needed to account for the increased detail in the required performance identified in the proposed PRC-004-3 Reliability Standard. The obligation for reporting Misoperations has been removed from PRC-004 and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information.

Applicability

This standard applies to the following functional entities:

- Transmission Owner
- Generator Owner
- Distribution Provider

This standard applies to the following Facilities:

- Protection Systems for BES Elements, with the following exclusions:
  - Non-protective functions that are embedded within a Protection System.
  - Protective functions intended to operate as a control function during switching.
  - Special Protection Systems (SPS).
  - Remedial Action Schemes (RAS).
- Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

Effective Dates of New or Revised Standards and Definitions

The standard, the revised definition of "Misoperation," and the new definition of "Composite Protection System" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard, the revised definition of "Misoperation," and the new definition of "Composite Protection System" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Retirement of Existing Standards

The existing standards, PRC-003-1 and PRC-004-2.1a, shall be retired at midnight of the day immediately prior to the Effective Date of PRC-004-3.

Implementation Plan

Revisions to Defined Terms in the NERC Glossary

The standard drafting team proposes the following new definition:

Composite Protection System:

The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided ~~to~~by a ~~remote~~different Element's Protection System(s) is excluded.

The standard drafting team proposes the following revised definition:

Misoperation:

The failure of a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition ~~if~~for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a

Misoperation as long as the ~~duration of its operating time resulted in~~performance of the ~~operation of at least one other Element's~~ Composite Protection System is correct.

3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.
6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction or commissioning activities is not a Misoperation.

General Considerations

The implementation period allows adequate time for applicable entities to develop or modify its procedures and processes for reviewing Protection System operations. The development and implementation of a Corrective Action Plan remains within the scope of PRC-004; therefore, little additional time and resources should be needed to account for the increased detail in the required performance identified in the proposed PRC-004-3 Reliability Standard. The obligation for reporting Misoperations has been removed from PRC-004 and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information.

Applicability

This standard applies to the following functional entities:

- Transmission Owner
- Generator Owner
- Distribution Provider

This standard applies to the following Facilities:

- Protection Systems for BES Elements~~. Non-protective functions that are embedded within a Protection System are excluded. Protective functions intended to operate as a control function during switching are excluded.~~, with the following exclusions:
  - o Non-protective functions that are embedded within a Protection System.
  - o Protective functions intended to operate as a control function during switching.
  - o Special Protection Systems (SPS).
  - o Remedial Action Schemes (RAS).
- Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

Effective Dates of New or Revised Standards and Definitions

The standard, the revised definition of "Misoperation~~"~~,~~"~~" and the new definition of "Composite Protection System" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard, the revised definition of "Misoperation~~"~~,~~"~~" and the new definition of "Composite Protection System" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Retirement of Existing Standards

The existing standards, PRC-003-1 and PRC-004-2.1a, shall be retired at midnight of the day immediately prior to the Effective Date of PRC-004-3.

Mapping Document

Project 2010-05.1 Protection Systems: Phase 1 (Misoperations)

Revisions or Retirements to Already Approved Standards

This mapping document shows the translation of PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems and PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations into the proposed PRC-004-3 – Protection System Misoperation Identification and Correction Reliability Standard. The following table identifies the sections of the approved standard that shall be added, retired, or revised when this standard is implemented. If the standard drafting team is recommending revisions to the standard, those changes are identified in the "Translation to PRC-004-3 or Other Action" column.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
4. Applicability: **4.1.** Regional Reliability Organization	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider	The proposed standard properly assigns responsibility to the registered entity functions that are responsible for Protection System Misoperation identification and correction. The Transmission Owner, Generator Owner, and Distribution Provider, by function, are Protection System asset owners and are in the best position be aware of and apply resources to review Protection System operations.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
R1. Each Regional Reliability Organization shall establish, document and maintain its procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations. These procedures shall include the following elements:		The Requirements in the proposed PRC-004-3 standard by their results-based standard (RBS) construction requires performance that is implicit of having procedures for the analysis of Protection System operations (R1, R2, R3, and R4) and mitigation of identified Misoperations (R5 and R6). The proposed requirements also directs focus to areas most important to reliability. For example, Requirement R1 requires the applicable entity to initiate a review upon a Bulk Electric System (BES) interrupting device operation and identify any Misoperation. Requirement R2 requires the applicable entity to notify all other owners that share a Misoperation identification responsibility of the Composite Protection System when it determines (or is unsure) its Protection System component(s) did not cause the BES interrupting device operation or it cannot rule out a Misoperation. Requirement R3 requires the notified entity to identify any Misoperation of its Protection System component(s) similar to Requirement R1. Requirement R4 directs the applicable entity to

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		continue its investigative work to determine the cause(s) of an identified Misoperation, if not determined in R1 or R3, until the cause(s) is determined or the entity declares that it is unable to determine the cause. Requirements R5 and R6 for developing and implementing a Corrective Action Plan (CAP) are also implicit of having a documented procedure. The implicit performance required by Requirements R1 through R6 necessitate that an entity have procedures to accomplish the objectives of the proposed standard. Requiring the applicable entities to have procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.
R1.1. The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**4.2.** Facilities: **4.2.1** Protection Systems for BES Elements, with the following exclusions: **4.2.1.1** Non-protective functions that are embedded	The previous PRC-003-1, Requirement R1.1 required the Regional Reliability Organization (RRO) to identify the Protection Systems to be reviewed and analyzed for Misoperation. The applicable Facilities have been clarified in the proposed PRC-004-3 to include Protection Systems for

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	within a Protection System. **4.2.1.2** Protective functions intended to operate as a control function during switching. **4.2.1.3** Special Protection Systems (SPS). **4.2.1.4** Remedial Action Schemes (RAS). **4.2.2** Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.	BES Elements. Additional language is provided for clarity that non-protective functions and those protective functions that are intended to operate as a control function (e.g., a reverse power relay operated to remove a generating unit from service as opposed to providing anti-motoring protection) are not applicable. The standard's Applicability is further clarified to include underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements to be more precise. Protection Systems associated with Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are excluded and will be addressed in phase two of this project and have been excluded in the Applicability.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated under the circumstances in 1.1 through 1.3 shall, within 120 calendar days of the BES interrupting device operation, identify whether its	The applicable entities will be required to identify whether a Misoperation occurred for each BES interrupting device operation which meet criteria 1.1 through 1.3. Requirement R1 is most clearly the direct carryover from the PRC-003-1 Reliability Standard which involves the "owner" of the Protection System. The previous standard was silent on the responsibilities of other Protection System owners and had no provision for

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	Protection System component(s) caused a Misoperation: **1.1** The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and **1.2** The BES interrupting device owner owns all or part of the Composite Protection System; and **1.3** The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation or was caused by manual intervention in response to a Protection System failure to operate.	ensuring that other owners had a responsibility to be involved in the review and analysis.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed	**R2.** Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated	Requirement R2 asserts a responsibility on the initiating entity (i.e., BES interrupting device owner) to notify other owners of the Composite Protection System when

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
for Misoperations (due to their potential impact on BES reliability).	shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in 2.1 and 2.2. **2.1** When a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances: **2.1.1** The BES interrupting device owner shares the Composite Protection System ownership with any other entity; and	the cause of a Protection System operation was not caused (or is undetermined) by the BES interrupting device owner and when a Misoperation is identified (or cannot be ruled out) in accordance with Part 2.1, including sub-parts 2.1.1 through 2.1.3.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	2.1.2 The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and **2.1.3** The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation. **2.2** For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's BES Element, notification of the operation shall	(Part 2.2) Since Requirement R1 initiates the reliability activity upon the operation of a BES interrupting device, Requirement R1 does not address the case of a Protection System failure where a remote BES interrupting device operates. The second Part 2.2 of Requirement R2 is a provision to require notification to the other owners when a remote BES interrupting device operates as backup protection for a condition on another entity's BES Element. This generally indicates that another BES interrupting device has most likely failed to operate. Part 2.2 requires the other owner for which backup protection was provided to be notified, thus initiating the reliability activity to

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	be provided to the other Protection System owner(s) for which that backup protection was provided.	identify a possible Misoperation under Requirement R3 by the other owner(s).
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation.	Requirement R3 places responsibility on the applicable entity that receives notification to review its Protection System component(s) for Misoperations similar to Requirement R1. It is common practice for the BES interrupting device owner that initiates the review to be in communication and collaboration with other Protection System component(s) owners during its review within the 120 calendar day period. The shorter 60 calendar day period for the notified entity assures that in the rare case where the notifying entity takes the majority of its allotted time (120 calendar days) to review an operation, the receiving entity will always have a minimum and reasonable time (60 calendar days) to conduct its review.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed	**R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a	Requirement R4 is essentially a new requirement to determine the cause(s) of a Misoperation where the previous requirements (i.e., R1 or R3) failed to reveal the

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
for Misoperations (due to their potential impact on BES reliability).	Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: • The identification of the cause(s) of the Misoperation; or • A declaration that no cause was identified.	cause(s) of a Misoperation. In most cases, the cause(s) of a Misoperation will be revealed during the course of review and when the cause(s) is not readily apparent, the applicable entity is required in Requirement R4 to conduct at least one investigative action every two full calendar quarters until the entity determines the cause(s) or declares that it could not determine the cause.
R1.2. Data reporting requirements (periodicity and format) for Misoperations.	None.	NERC Rules of Procedure, Section 1600 Request for Information or Data will replace the reporting obligations of the applicable entities. As such, reporting to Regional Entities will end and continent-wide single reporting to the Electric Reliability Organization (ERO) will be required. The ERO will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		remediation techniques; and publicize lessons learned for the industry. Metrics will be validated and shared with each Regional Entity. The removal of the data collection from the standard does not result in a reduction of reliability.
R1.3. Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	**R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: • Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations, or • Explain in a declaration why corrective actions are beyond the	The proposed PRC-004-3, Requirement R5 provides a step not apparent in the previous PRC-003-1 which is the development of a Corrective Action Plan (CAP) within 60 calendar days of first identifying the Misoperation cause. Requirement R5 also requires each applicable entity to perform an evaluation of the CAP's applicability to the entity's other Protection Systems, including those at other locations. Furthermore, Requirement R5 accounts for those cases why corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken. This could be a result of a cause created by a non-registered third party, such as a communication provider. Also, should implementing the changes not improve BES reliability, the entity may

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	entity's control or would not improve BES reliability, and that no further corrective actions will be taken.	document in a declaration that a CAP is not practical. The entity must explain in a declaration why no further action will be taken.
(Continued) **R1.3.** Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	**R6.** Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed.	Requirement R6 requires the implementation of the CAP. The applicable entity must update the CAP if actions or timetables change until the CAP is completed.
R1.4. Identification of the Regional Reliability Organization group responsible for the procedures and the process for approval of the procedures.	None.	The proposed PRC-004-3 now requires the applicable entities (GO, DP, and TO) to individually address Misoperations of its Protection Systems for BES Elements without regard to the Region or Regions in which it owns Protection Systems for BES Elements. The proposed PRC-004-3 Reliability Standard, revised definition of "Misoperation," and new definition of "Composite Protection System" provide sufficient clarity to entities; therefore, there is no reliability benefit to obtain the Regional Entity's (formerly Regional Reliability

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		Organization or RRO) approval of procedures. Each applicable entity will be measured on its performance with the proposed PRC-004-3 requirements.
R2. Each Regional Reliability Organization shall maintain and periodically update documentation of its procedures for review, analysis, reporting, and mitigation of transmission and generation Protection System Misoperations.	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider	The proposed PRC-004-3 implicitly requires each applicable entity to have its own procedures and processes; therefore, there is no need to have a specific requirement for dictating the updating of such procedures or processes by the previous Regional Reliability Organization (now Regional Entity) or applicable entities. Requiring the applicable entities to update procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.
R3. Each Regional Reliability Organization shall distribute procedures in Requirement 1 and any changes to those procedures, to the affected Transmission	None.	The proposed PRC-004-3 implicitly requires each applicable entity to have its own procedures and processes; therefore, there is no longer a need to distribute such procedures or processes by the previous Regional Reliability Organization (now Regional Entity) to the applicable entities. Requiring the applicable entities to distribute procedures is an activity or task that does

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners within 30 calendar days of approval of those procedures.		little, if anything, to benefit or protect the reliable operation of the BES.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
4. Applicability: **4.1.** Transmission Owner **4.2.** Distribution Provider that owns a transmission Protection System **4.3.** Generator Owner	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider **4.2.** Facilities: **4.2.1** Protection Systems for BES Elements, with the following exclusions: **4.2.1.1** Non-protective functions that are embedded within a Protection System. **4.2.1.2** Protective functions intended to operate as a control function during switching. **4.2.1.3** Special Protection Systems (SPS). **4.2.1.4** Remedial Action Schemes (RAS).	The same applicable entities will transition to the new PRC-004-3 standard. The clause about the Distribution Provider "*that owns a transmission Protection System*" has been removed because it was ambiguous. This clause is replaced by "*Protection Systems for BES Elements*" found in Section 4.2, Facilities and applies to all the applicable entities. Having the Applicability section address Facilities specifically removes the ambiguity of what a "*transmission Protection System*" includes. The proposed PRC-004-3 standard is specific that it includes those Protection Systems for BES Elements, including UFLS that is intended to trip one or more BES Elements. Additional language is provided for clarity that non-protective functions and those protective functions that are intended to operate as a control function (e.g., a reverse power relay operated to remove a generating unit from service) are not applicable. The standard's Applicability is further clarified to include underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements to be more precise. Protection Systems associated with Special Protection Systems (SPS) and

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.	Remedial Action Schemes (RAS) are addressed in phase two of this project and have been excluded in the Applicability.
R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures. **R2.** The Generator Owner shall analyze its generator and generator	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated under the circumstances in 1.1 through 1.3 shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation: **1.1** The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and **1.2** The BES interrupting device owner owns all or part of the Composite Protection System; and	The currently approved standard PRC-004-2.1a, Requirements R1 and R2 include three levels of performance which is analyze (Protection System operations), develop (CAP), and implement (CAP). The proposed standard, which includes the same three applicable entities (DP, GO, and TO), divides the three levels of performance into six discrete Requirements. Requirement R1 provides the "analyze" portion, requiring the initiating BES interrupting device owner to review its Protection System for each BES interrupting device operation that meets the three criteria (i.e., 1.1 thorough 1.3).

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
interconnection Facility Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.	**1.3** The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation or was caused by manual intervention in response to a Protection System failure to operate. **R2.** Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in 2.1 and 2.2. **2.1** When a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the	The "analyze" portion is further clarified in the proposed Requirement R2 by ensuring that any other owners of the Composite Protection System are notified when the cause of a Protection System operation was not caused (or is undetermined) by the BES interrupting device owner and when a Misoperation is identified (or cannot be ruled out) in accordance with Part 2.1, including sub-parts 2.1.1 through 2.1.3.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances: **2.1.1** The BES interrupting device owner shares the Composite Protection System ownership with any other entity; and **2.1.2** The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and **2.1.3** The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether	

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	its Protection System components caused the BES interrupting device(s) operation. **2.2** For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's BES Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided. **R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation.	(Part 2.2) Since Requirement R1 initiates the reliability activity upon the operation of a BES interrupting device, Requirement R1 does not address the case of a Protection System failure where a remote BES interrupting device operates. The second Part 2.2 of Requirement R2 is a provision to require notification to the other owners when a remote BES interrupting device operates as backup protection for a condition on another entity's BES Element. This generally indicates that another BES interrupting device has most likely failed to operate. Part 2.2 requires the other owner for which backup protection was provided to be notified, thus initiating the reliability activity to identify a possible Misoperation under Requirement R3 by the other owner. Requirement R3 places responsibility on the applicable entity that receives notification to review its Protection System component(s) for Misoperations similar to Requirement R1. It is common practice for the BES interrupting device owner that initiates the review to be

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	R4. Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: • The identification of the cause(s) of the Misoperation; or • A declaration that no cause was identified. **R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar	in communication and collaboration with other Protection System component(s) owners during its review within the 120 calendar day period. The shorter 60 calendar day period for the notified entity assures that in the rare case where the notifying entity takes the majority of its allotted time (120 calendar days) to review an operation, the receiving entity will always have a minimum and reasonable time (60 calendar days) to conduct its review. Requirement R4 is essentially a new requirement to determine the cause(s) of a Misoperation where the previous requirements (i.e., R1 or R3) failed to reveal the cause(s) of an identified Misoperation. In most cases, the cause(s) of a Misoperation will be revealed during the course of review and when the cause(s) is not readily apparent, the applicable entity is required in Requirement R4 to conduct at least one investigative action every two full calendar quarters until the entity determines the cause(s) or declares that it could not determine the cause.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	days of first identifying a cause of the Misoperation: • Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations, or • Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken. **R6.** Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed.	The proposed PRC-004-3, Requirement R5 provides a step not apparent in the previous PRC-003-1 which is the development of a Corrective Action Plan (CAP) within 60 calendar days of first identifying the Misoperation cause. Requirement R5 also requires each applicable entity to perform an evaluation of the CAP's applicability to the entity's other Protection Systems, including those Protection Systems at other locations. Furthermore, Requirement R5 accounts for those cases why corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken. This could be a result of a cause created by a non-registered third party, such as a communication provider. Also, should implementing the changes not improve BES reliability, the entity must document in a declaration that a CAP actions are beyond the entity's control or would not improve BES reliability. The entity must explain in a declaration why no further action will be taken.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		Requirement R6 requires the implementation of the CAP. The applicable entity must update the CAP if actions or timetables change until the CAP is completed.
R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.	None.	Since the NERC Rules of Procedure, Section 1600 Request for Data or Information will replace the reporting obligations, NERC will receive the data on a periodic basis, analyze, establish metrics, and share results accordingly with the Regional Entities as well as industry. Having reporting obligations as a Requirement is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.

Mapping Document

Project 2010-05.1 Protection Systems: Phase 1 (Misoperations)

Revisions or Retirements to Already Approved Standards

This mapping document shows the translation of PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems and PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations into the proposed PRC-004-3 – Protection System Misoperation Identification and Correction Reliability Standard. The following table identifies the sections of the approved standard that shall be added, retired, or revised when this standard is implemented. If the standard drafting team is recommending revisions to the standard, those changes are identified in the "Translation to PRC-004-3 or Other Action" column.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
4. Applicability: **4.1.** Regional Reliability Organization	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider	The proposed standard properly assigns responsibility to the registered entity functions that are responsible for Protection System Misoperation identification and correction. The Transmission Owner, Generator Owner, and Distribution Provider, by function, are Protection System asset owners and are in the best position be aware of and apply resources to review Protection System operations.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
R1. Each Regional Reliability Organization shall establish, document and maintain its procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations. These procedures shall include the following elements:		The Requirements in the proposed PRC-004-3 standard by their results-based standard (RBS) construction requires performance that is implicit of having procedures for the analysis of Protection System operations (R1, R2, R3, and R4) and mitigation of identified Misoperations (R5 and R6). The proposed requirements also directs focus to areas most important to reliability. For example, Requirement R1 requires the applicable entity to initiate a review upon a Bulk Electric System (BES) interrupting device operation and identify any Misoperation. Requirement R2 requires the applicable entity to notify all other owners that share a Misoperation identification responsibility of the Composite Protection System when it determines (or is unsure) its Protection System component(s) did not cause the BES interrupting device operation or it cannot rule out a Misoperation. Requirement R3 requires the notified entity to identify any Misoperation of its Protection System component(s) similar to Requirement R1. Requirement R4 directs the applicable entity to

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		continue its investigative work to determine the cause(s) of an identified Misoperation, if not determined in R1 or R3, until the cause(s) is determined or the entity declares that it is unable to determine the cause. Requirements R5 and R6 for developing and implementing a Corrective Action Plan (CAP) are also implicit of having a documented procedure. The implicit performance required by Requirements R1 through R6 necessitate that an entity have procedures to accomplish the objectives of the proposed standard. Requiring the applicable entities to have procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.
R1.1. The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**4.2.** Facilities: **4.2.1** Protection Systems for BES Elements, with the following exclusions: **4.2.1.1** Non-protective functions that are embedded	The previous PRC-003-1, Requirement R1.1 required the Regional Reliability Organization (RRO) to identify the Protection Systems to be reviewed and analyzed for Misoperation. The applicable Facilities have been clarified in the proposed PRC-004-3 to include Protection Systems for

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	within a Protection System. **4.2.1.2** Protective functions intended to operate as a control function during switching. **4.2.1.3** Special Protection Systems (SPS). **4.2.1.4** Remedial Action Schemes (RAS). **4.2.2** Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.	BES Elements. Additional language is provided for clarity that non-protective functions and those protective functions that are intended to operate as a control function (e.g., a reverse power relay operated to remove a generating unit from service as opposed to providing anti-motoring protection) are not applicable. The standard's Applicability is further clarified to include underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements to be more precise. Protection Systems associated with Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are excluded and will be addressed in phase two of this project and have been excluded in the Applicability.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated under the circumstances in 1.1 through 1.3 shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused	The applicable entities will be required to identify whether a Misoperation occurred for each BES interrupting device operation which meet criteria 1.1 through 1.3. Requirement R1 is most clearly the direct carryover from the PRC-003-1 Reliability Standard which involves the "owner" of the Protection System. The previous standard was silent on the responsibilities of other Protection System owners and had no provision for

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	a Misoperation ~~under the following circumstances~~: **1.1** The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and **1.2** The BES interrupting device owner owns all or part of the Composite Protection System; and **1.3** The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation~~.~~ or was caused by manual intervention in response to a Protection System failure to operate.	ensuring that other owners had a responsibility to be involved in the review and analysis.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed	**R2.** Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated	Requirement R2 asserts a responsibility on the initiating entity (i.e., BES interrupting device owner) to notify other owners of the Composite Protection System when

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
for Misoperations (due to their potential impact on BES reliability).	shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in 2.1 and 2.2. **2.1** When a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances: **2.1.1** The BES interrupting device owner shares the Composite Protection System ownership with any other entity; and	the cause of a Protection System operation was not caused (or is undetermined) by the BES interrupting device owner and when a Misoperation ~~occurred~~is identified (or cannot be ruled out) in accordance with Part 2.1, including sub-parts 2.1.1 through 2.1.3.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	2.1.2 The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and **2.1.3** The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation. **2.2** For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's BES Element, notification of the operation shall	(Part 2.2) Since Requirement R1 initiates the reliability activity upon the operation of a BES interrupting device, Requirement R1 does not address the case of a Protection System failure where a remote BES interrupting device operates. The second Part 2.2 of Requirement R2 is a provision to require notification to the other owners when a remote BES interrupting device ~~owner in performing Requirement R1 determines that it's Protection System operated~~operates as backup protection for a condition on another entity's BES Element. This generally indicates that another BES interrupting device ~~which~~ has most likely failed to operate. Part 2.2 requires the other owner for which backup protection was provided to be notified,

Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	be provided to the other Protection System owner(s) for which that backup protection was provided.	thus initiating the reliability activity to identify a possible Misoperation under Requirement R3 ~~for~~by the other owner~~.~~(s).
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation.	Requirement R3 places responsibility on the applicable entity that receives notification to review its Protection System component(s) for Misoperations similar to Requirement R1. It is common practice for the BES interrupting device owner that initiates the review to be in communication and collaboration with other Protection System component(s) owners during its review within the 120 calendar day period. The shorter 60 calendar day period for the notified entity assures that in the rare case where the notifying entity takes the majority of its allotted time (120 calendar days) to review an operation, the receiving entity will always have a minimum and reasonable time (60 calendar days) to conduct its review.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed	**R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a	Requirement R4 is essentially a new requirement to determine the cause(s) of a Misoperation where the previous requirements (i.e., R1 or R3) failed to reveal the

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
for Misoperations (due to their potential impact on BES reliability).	Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: • The identification of the cause(s) of the Misoperation; or • A declaration that no cause was identified.	cause(s) of a Misoperation. In most cases, the cause(s) of a Misoperation will be revealed during the course of review and when the cause(s) is not readily apparent, the applicable entity is required in Requirement R4 to conduct at least one investigative action every two full calendar quarters until the entity determines the cause(s) or declares that it could not determine the cause.
R1.2. Data reporting requirements (periodicity and format) for Misoperations.	None.	NERC Rules of Procedure, Section 1600 Request for Information or Data will replace the reporting obligations of the applicable entities. As such, reporting to Regional ~~reporting~~Entities will end and continent-wide single reporting to the Electric Reliability Organization (ERO) will be required. The ERO will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability;

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		identify remediation techniques; and publicize lessons learned for the industry. Metrics will be validated and shared with each ~~Region~~Regional Entity. The removal of the data collection from the standard does not result in a reduction of reliability.
R1.3. Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	**R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: • Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations, or • Explain in a declaration why corrective actions are beyond the	The proposed PRC-004-3, Requirement R5 provides a step not apparent in the previous PRC-003-1 which is the development of a Corrective Action Plan (CAP) within 60 calendar days of first identifying the Misoperation cause. Requirement R5 also requires each applicable entity to perform an evaluation of the CAP's applicability to the entity's other Protection Systems, including those at other locations. Furthermore, Requirement R5 accounts for those cases why corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken. This could be a result of a cause created by a non-registered third party, such as a communication provider. Also, should implementing the changes not improve BES reliability, the entity may

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	entity's control or would not improve BES reliability, and that no further corrective actions will be taken.	document ~~this as well and not make a change. In cases where the entity, in its judgment, determines~~ in a declaration that a CAP is not practical ~~for improving BES reliability, the~~. The entity must explain in a declaration ~~its conclusions~~ why no further action will be taken.
(Continued) **R1.3.** Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	**R6.** Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed.	Requirement R6 requires the implementation of the CAP. The applicable entity must update the CAP if actions or timetables change until the CAP is completed.
R1.4. Identification of the Regional Reliability Organization group responsible for the procedures and the process for approval of the procedures.	None.	The proposed PRC-004-3 now requires the applicable entities (GO, DP, and TO) to individually address Misoperations of its Protection Systems for BES Elements without regard to the Region or Regions in which it owns Protection Systems for BES Elements. The proposed PRC-004-3 Reliability Standard, revised definition of "Misoperation," and new definition of "Composite Protection System" provide sufficient clarity to entities; therefore, there is no reliability benefit to obtain the

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		Regional Entity's (formerly Regional Reliability Organization or RRO) approval~~.~~ of procedures. Each applicable entity will be measured on its performance with the proposed PRC-004-3 requirements.
R2. Each Regional Reliability Organization shall maintain and periodically update documentation of its procedures for review, analysis, reporting, and mitigation of transmission and generation Protection System Misoperations.	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider	The proposed PRC-004-3 implicitly requires each applicable entity to have its own procedures and processes; therefore, there is no need to have a specific requirement for dictating the updating of such procedures or processes by the previous Regional Reliability Organization (now Regional Entity) or applicable entities. Requiring the applicable entities to update procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.
R3. Each Regional Reliability Organization shall distribute procedures in Requirement 1 and any changes to those procedures, to the	None.	The proposed PRC-004-3 implicitly requires each applicable entity to have its own procedures and processes; therefore, there is no longer a need to distribute such procedures or processes by the previous Regional Reliability Organization (now Regional Entity) ~~or~~to the applicable entities. Requiring the applicable

Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation. **R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: • The identification of the cause(s) of the Misoperation; or • A declaration that no cause was identified. **R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System	BES interrupting device owner that initiates the review to be in communication and collaboration with other Protection System component(s) owners during its review within the 120 calendar day period. The shorter 60 calendar day period for the notified entity assures that in the rare case where the notifying entity takes the majority of its allotted time (120 calendar days) to review an operation, the receiving entity will always have a minimum and reasonable time (60 calendar days) to conduct its review. ~~Last,~~ Requirement R4 ~~requires~~ is essentially a new requirement to determine the cause(s) of a Misoperation where the previous requirements (i.e., R1 or R3) failed to reveal the cause(s) of an identified Misoperation. In most cases, the cause(s) of a Misoperation will be revealed during the course of review and when the cause(s) is not readily apparent, the applicable entity is required in Requirement R4 to conduct at least one investigative ~~actions~~ action every two full calendar quarters until ~~it~~the entity determines the cause(s) or declares that it ~~has been unable to~~could not determine the cause~~(s)~~.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: • Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations, or • Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken. **R6.** Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP	The proposed PRC-004-3, Requirement R5 ~~addresses~~provides a step not apparent in the ~~"develop" a~~ previous PRC-003-1 which is the development of a Corrective Action Plan (CAP~~)" portion,~~) within 60 calendar days of first identifying the Misoperation cause. Requirement R5 also requires each applicable entity to perform an evaluation of the CAP's applicability to the entity's other Protection Systems, including those Protection Systems at other locations. Furthermore, Requirement R5 accounts for those cases why corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken. This could be a result of a cause created by a non-registered third party, such as a communication provider. Also, should implementing the changes not improve BES reliability, the entity must document in a declaration that a CAP actions are beyond the entity's control or would not improve BES reliability. The entity must explain in a declaration why no further action will be taken.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	if actions or timetables change, until completed.	Requirement R6 ~~addresses the "implement" portion of the CAP~~requires the implementation of the CAP. The applicable entity must update the CAP if actions or timetables change until the CAP is completed.
R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.	None.	Since the NERC Rules of Procedure, Section 1600 Request for Data or Information will replace the reporting obligations, NERC will receive the data on a periodic basis, analyze, establish metrics, and share results accordingly with the Regional Entities as well as industry. Having reporting obligations as a Requirement is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.

Violation Risk Factors and Violation Severity Level Justifications

PRC-004-3 – Protection System Misoperation Identification and Correction

Project 2010-05.1 – Protection System (Misoperations)

Violation Risk Factor and Violation Severity Level Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in: PRC-004-3 – Protection System Misoperation Identification and Correction.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the base penalty amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Protection System Misoperations Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project.

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if

violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

The standard drafting team (SDT) also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VRF Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System: [2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination

[1] *N. Am. Elec. Reliability Corp.*, 119 FERC ¶ 61,145 (2007) ("VRF Order"), *order on reh'g and compliance filing*, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] *Id.* at fn 15.

- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

VRF Discussion

The discussion below in the tables addresses how the SDT considered FERC's VRF Guidelines 1 through 5. PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations and combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

The proposed PRC-004-3 Reliability Standard has six (6) discrete requirements that incorporate and enhance the intent of the requirements of PRC-004-2.1a and PRC-003-1.[3] First, the revised standard requires the Transmission Owner, Generator Owner, and Distribution Provider to review each BES interrupting device operation meeting the criteria in Requirement R1, which includes: when caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate and identify each that is a Misoperation; regardless of whether the BES interrupting device owner owns all or part of the Composite Protection System; and when BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

Second, the BES interrupting device owner is required to notify the other Composite Protection System component owner(s) when the criteria in Requirement R2 are met, which includes: Composite Protection System ownership is shared with another owner; the BES interrupting device owner determined that a Misoperation occurred or cannot rule out a Misoperation; and the BES interrupting device owner determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or is unsure.

Third, if a Transmission Owner, Generator Owner, or Distribution Provider is notified by a BES interrupting device owner that the Composite Protection System operated, it must review the operation according to Requirement R3. In most cases, Requirement R1 or R3 will reveal the cause of the Misoperation. If not, Requirement R4 mandates the entity perform investigative action(s) to determine the cause(s) as the fourth discrete Requirement. If a cause is not identified, the entity either may continue its investigation until a cause is identified or the entity may write a declaration that no cause was identified. If a cause is identified, the entity advances to the fifth Requirement.

In Requirement R5, the entity whose Protection System component was identified as the cause of the Misoperation must either develop a Corrective Action Plan (CAP) or explain in a declaration why it cannot correct the cause of the Misoperation. In developing a Corrective Action Plan (CAP) for the identified Protection System component(s), the entity must perform an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. If the entity determines that corrective actions are beyond the entity's control or would not improve BES reliability, it must explain this in a declaration why no further corrective actions will be taken.

In the last Requirement R6, the entity must implement and complete the CAP. The entity must update the CAP during implementation when actions or timetables change.

[3] The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations.

The requirements of the proposed PRC-004-3 do not map, one-to-one, with the Requirements of the two legacy standards, PRC-003-1 and PRC-004-2.1a. The new Requirements comingle various reliability attributes of the legacy standards with precise reliability objectives. In developing the new VRFs for the Requirements of PRC-004-3, the Standard Drafting Team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. The VRFs of the FERC approved PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations (R1 & R2 – High VRF), PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation (R1 – Lower VRF), PRC-016-0.1 – Special Protection System Misoperation (R2 – Medium VRF), and PRC-022-1 – Under-Voltage Load Shedding Program Performance (R1 & R1.5 – Medium VRF), all influenced (citing FERC VRF Guideline 3) the drafting team's VRF decisions, as such, the VRFs for PRC-004-3 Requirements R1 through R6 are assigned a VRF of Medium.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF and VSL Justifications – PRC-004-3, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could, in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Composite Protection System operations reviewed for proper operation by an owner is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is not in itself likely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards:

VRF and VSL Justifications – PRC-004-3, R1	
	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO), which both have a VRF of "High." The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan". The performance activity that has been isolated in Requirement R1 of PRC-004-3, to "review" (similar to "analyze"), is consistent with similar requirements in Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 ("…shall analyze its SPS operations and maintain a record of all misoperations…") and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 ("…shall analyze and document all UVLS operations and Misoperations.") which both have a VRF of Medium. A VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement comingles multiple activities
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could, in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Protection System operations reviewed for proper operation by their owner(s) is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justifications – PRC-004-3, R1			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to identify whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The VSLs appropriately assess the severity of the violation with the failure to perform a review for Misoperation as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.

VRF and VSL Justifications – PRC-004-3, R1	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to notify the other owner(s) of a Composite Protection System when the initiating owner determined its Protection System components did not cause a Misoperation or it did not rule out a Misoperation, could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.

VRF and VSL Justifications – PRC-004-3, R2	
	Unresolved Misoperations of Composite Protection Systems owned by others that are not ruled out as a Misoperation could affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system by creating a gap in analysis.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: This is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. A lack of coordination on system protection was one of eight factors common to substantive outages prior to and including the August 14, 2003 Blackout. The initiating entity in the planning time frame is required to notify the other owner(s) of the Composite Protection System component(s) when it determines that (or is unsure whether)its component(s) did not cause a Misoperation or when it is unable to rule out a Misoperation of the Composite Protection System owned by others. This ensures that all owners review their equipment for proper operation which may include checking for proper coordination depending on the circumstances.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards:

VRF and VSL Justifications – PRC-004-3, R2	
	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO), which both have a VRF of High. The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan”. This requirement and a VRF assignment of Medium is consistent, for example, with Reliability Standards FAC-008-3 – Facility Ratings, R7 (“…shall provide Facility Ratings (for its solely and jointly owned Facilities…”), MOD-012-0 – Dynamics Data for Modeling and Simulation of the Interconnected Transmission System, R2 (“…shall provide appropriate equipment characteristics and system data…”), IRO-015-1 – Special Protection System Data and Documentation, R1.1 (“…shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas.”), and IRO-016-1 – Coordination of Real-time Activities Between Reliability Coordinators, R1 (“…shall contact the other Reliability Coordinator(s) to confirm that there is a problem and then discuss options and decide upon a solution to prevent or resolve the identified problem.”) which all have a VRF of Medium. Other Protection Systems based Reliability Standards such as PRC-005-1b – Transmission and Generation Protection System Maintenance and Testing, R2 (“…shall provide documentation…”), PRC-016-0.1 – Special Protection System Misoperations, R3 (“…that owns an SPS shall provide documentation of the misoperation analyses…”), and PRC-017-0 – Special Protection System Maintenance and Testing, R2 (“…SPS shall provide documentation of the program…) all have a VRF of Lower; however, these requirements involve the administrative reporting to either the Regional Reliability Organization (now Regional Entity) or NERC and not a reliability function like the previously mentioned FAC-008-3 and MOD-012-0 Reliability Standards. As such, this Requirement R2 is assigned a VRF of Medium because it has a reliability need to be communicated to other owners.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs:

VRF and VSL Justifications – PRC-004-3, R2			
	Failure to notify other entities to review each Protection System operation, identify Misoperations, and determine the cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Unresolved Misoperations of Composite Protection Systems owned by others that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation. OR

VRF and VSL Justifications – PRC-004-3, R2			
			The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement is new to the standard and had no previous level of compliance. Other Reliability Standards use a variety of VSLs ranging from a single severe level (i.e., binary), two levels, to four VSL levels. Some use a percentage as the failure of the number entities not notified; however, this would not be practical for this requirement as Composite Protection Systems that are owned by multiple entities is generally limited to one or two owners. The incremental increase in violation is consistent with the NERC Guidelines and is reasonable in consideration of the time periods provided by the Requirement.		
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b:		

VRF and VSL Justifications – PRC-004-3, R2	
Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R3	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure of another Composite Protection System owner to review its component(s) for Misoperation, upon notification, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Composite Protection System operations reviewed for proper operation by the other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.

VRF and VSL Justifications – PRC-004-3, R3	
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which both have a VRF of High. This Requirement R3, to "review" (similar to "analyze"), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 ("…shall analyze its SPS operations and maintain a record of all misoperations…") and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 ("…shall analyze and document all UVLS operations and Misoperations.") which both have a VRF of Medium. A VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure of another Composite Protection System owner to review its component(s) for Misoperation, upon notification, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Composite Protection System operations reviewed for proper operation by the other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage.

VRF and VSL Justifications – PRC-004-3, R3			
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late. OR The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (DP) and R2 (GO & TO) for the notified Protection System owner. The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. A VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-004-3, R3	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R4	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to identify the cause(s) of a Misoperation (if not determined in Requirements R1 or R3) could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.

VRF and VSL Justifications – PRC-004-3, R4	
	An Unidentified cause(s) of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. The applicable entity must conduct investigative action(s) to determine the cause(s) of a Misoperation, if not determined during the course of a review as proposed in Requirements R1 and R3.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO), which have a VRF of High. The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." This Requirement R4, to perform at least one "investigative action" (similar to "analyze"), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 ("…shall analyze its SPS operations and maintain a record of all misoperations…") and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 ("…shall analyze and document all UVLS operations and Misoperations.") which both have a VRF of Medium.

VRF and VSL Justifications – PRC-004-3, R4	
	A VRF of Medium is not inadvertently lowering the current VRF of High in the former PRC-004-2.1a, Requirements R1 or R3, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous. This VRF of Medium comports with the VRF assignment of Medium for PRC-004-3, Requirements R1 and R3, which will generally reveal the cause(s) of an identified Misoperation.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to identify the cause(s) of a Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Unidentified causes of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justifications – PRC-004-3, R4			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late. OR The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.		

VRF and VSL Justifications – PRC-004-3, R4	
	This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.

VRF and VSL Justifications – PRC-004-3, R4	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R5	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to develop a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. An unresolved cause of a Misoperation or failing to consider other locations with similar Protection System components could affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.

VRF and VSL Justifications – PRC-004-3, R5	
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the development of a Corrective Action Plan (CAP) associated with Protection Systems.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which have a VRF of High. This requirement is consistent with Reliability Standards PRC-016-0.1, R2 ("…shall take corrective actions to avoid future Misoperations"), PRC-022-1, R1.5 ("For any Misoperation, a Corrective Action Plan…"), FAC-003, R5 ("…Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management") all three of which have a VRF of Medium.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to develop a CAP for a Misoperation with an identified cause or failing to consider other locations with similar components could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.

VRF and VSL Justifications – PRC-004-3, R5			
	An unresolved cause of a Misoperation could affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system if the same condition resulted in a future Misoperation.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation. OR	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation. OR	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation. OR	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop a CAP or explain in a declaration in accordance with Requirement R5. OR

VRF and VSL Justifications – PRC-004-3, R5			
The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop an evaluation in accordance with Requirement R5.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. Varying VSLs are provided for the omission of the evaluation when developing the Corrective Action Plan and for failure to develop the evaluation.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which have varying VSLs. This VSL does not lower the current level of compliance because the former VSL in PRC-004-2.1a was comingled with the other activities. This Requirement has a Severe VSL for failure to develop the CAP with the other VSLs being based on tardiness of the development.		

VRF and VSL Justifications – PRC-004-3, R5	
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.
FERC VSL G4	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R5	
Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	

VRF and VSL Justification – PRC-004-3, R6	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to implement a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. An uncorrected cause of a Misoperation as a result of not implementing a Corrective Action Plan, could affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system since the condition could occur again.

VRF and VSL Justification – PRC-004-3, R6	
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the implementation of a Corrective Action Plan (CAP) associated with Protection Systems.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2.1a, R1 (TO & DP) and R2 (GO),which both have a VRF of High. The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan". This requirement is consistent with Reliability Standards PRC-016-0.1, R2 ("…shall take corrective actions to avoid future misoperations.") and PRC-022-1, R1.5 ("For any Misoperation, a Corrective Action Plan…") which both have a VRF of Medium. The proposed VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.

VRF and VSL Justification – PRC-004-3, R6			
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to implement a Corrective Action Plan for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. An uncorrected cause of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity implemented, but failed to update a CAP, when actions or timetables changed, in accordance with Requirement R6.	N/A	N/A	The responsible entity failed to implement a CAP in accordance with Requirement R6.

VRF and VSL Justification – PRC-004-3, R6	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—The VSLs cover aspects of this Requirement that are not equal in importance and performance.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed Requirement is a Severe VSL for failure to implement the CAP with the Lower VSL being based on the failure of updating the CAP when actions or timetables change which is administrative in nature.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justification – PRC-004-3, R6	
Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

Violation Risk Factors and Violation Severity Level Justifications

PRC-004-3 – Protection System Misoperation Identification and Correction

Project 2010-05.1 – Protection System (Misoperations)

Violation Risk Factor and Violation Severity Level Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in: PRC-004-3 ~~—~~– Protection System ~~Misoperations~~Misoperation Identification and Correction.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the ~~Base Penalty Amount~~base penalty amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Protection System Misoperations Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project.

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if

violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

The standard drafting team (SDT) also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the ~~VSL~~VRF Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System: [2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination

[1] ~~North American Electric~~*N. Am. Elec.* *Reliability Corp.*, 119 FERC ¶ 61,145~~,~~ (2007) ("VRF Order"), *order on reh'g and compliance filing*, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] *Id.* at ~~footnote~~fn 15.

- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

VRF Discussion

The ~~following~~ discussion below in the tables addresses how the SDT considered FERC's VRF Guidelines 1 through 5. PRC-004-3 – Protection System Misoperation Identification and

Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations~~." The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In FERC Order No. 693, the Commission identified PRC-003-0 as a "fill-in-the-blank" standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3~~ and combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

The proposed PRC-004-3 Reliability Standard has six (6) discrete requirements that incorporate and enhance the intent of the requirements of PRC-004-2.1a and PRC-003-1.[3] First, the revised standard requires the Transmission Owner, Generator Owner, and Distribution Provider to review each BES interrupting device operation meeting the criteria in Requirement R1, which includes: when caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate and identify each that is a Misoperation; regardless of whether the BES interrupting device owner owns all or part of the Composite Protection System; and when BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

Second, the BES interrupting device owner is required to notify the other Composite Protection System component owner(s) when the criteria in Requirement R2 are met, which includes: Composite Protection System ownership is shared with another owner; the BES interrupting device owner determined that a Misoperation occurred or cannot rule out a Misoperation; and the BES interrupting device owner determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or is unsure.

Third, if a Transmission Owner, Generator Owner, or Distribution Provider is notified by a BES interrupting device owner that the Composite Protection System operated, it must review the operation according to Requirement R3. In most cases, Requirement R1 or R3 will reveal the cause of the Misoperation. If not, Requirement R4 mandates the entity perform investigative action(s) to determine the cause(s) as the fourth discrete Requirement. If a cause is not identified, the entity either may continue its investigation until a cause is identified or the entity may write a declaration that no cause was identified. If a cause is identified, the entity advances to the fifth Requirement.

In Requirement R5, the entity whose Protection System component was identified as the cause of the Misoperation must either develop a Corrective Action Plan (CAP) or explain in a declaration why it cannot correct the cause of the Misoperation. In developing a Corrective Action Plan (CAP) for the identified Protection System component(s), the entity must perform

[3] The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations.

an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. If the entity determines that corrective actions are beyond the entity's control or would not improve BES reliability, it must explain this in a declaration why no further corrective actions will be taken.

In the last Requirement R6, the entity must implement and complete the CAP. The entity must update the CAP during implementation when actions or timetables change.

The requirements of the proposed PRC-004-3 do not map, one-to-one, with the Requirements of the two legacy standards, PRC-003-1 and PRC-004-2.1a. The new Requirements comingle various reliability attributes of the legacy standards with precise reliability objectives~~, thus a Requirement-to-Requirement comparison of VRFs is not possible.~~. In developing the new VRFs for the Requirements of PRC-004-3, the Standard Drafting Team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. The VRFs of the FERC approved PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations (R1 & R2 – High VRF), PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation (R1 – Lower VRF), PRC-016-0.1 – Special Protection System Misoperation (R2 – Medium VRF), and PRC-022-1 – Under-Voltage Load Shedding Program Performance (R1 & R1.5 – Medium VRF), all influenced (citing FERC VRF Guideline 3) the drafting team's VRF decisions, as such, the VRFs for PRC-004-3 Requirements R1 through R6 are assigned a VRF of Medium.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of

the full intent of the requirement.	intent of the requirement.	value in meeting the intent of the requirement.	the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF and VSL Justifications – PRC-004-3, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could, in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. ~~However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.~~ Composite Protection System operations reviewed for proper operation by an owner is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is ~~unlikely~~not in itself likely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard:

VRF and VSL Justifications – PRC-004-3, R1	
	This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO~~).~~), which both have a VRF of “High.” The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan~~” which both have a VRF of High. This~~”. The performance activity that has been isolated in Requirement R1 of PRC-004-3, to “review” (similar to “analyze”), ~~comports~~is consistent with similar requirements in Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“…shall analyze its SPS operations and maintain a record of all misoperations…”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“…shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium. A VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement ~~contained multiple activities and is ambiguous. The VRF assignment also comports with the currently effective standards PRC-016-0.1 and PRC-022-1.~~comingles multiple activities
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs:

VRF and VSL Justifications – PRC-004-3, R1	
	Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could, in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. ~~However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.~~ Protection System operations reviewed for proper operation by their owner(s) is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. ~~However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.~~
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justifications – PRC-004-3, R1			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity identified whether ~~or not~~ its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether ~~or not~~ its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether ~~or not~~ its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether ~~or not~~ its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to identify whether ~~or not~~ its Protection System component(s) caused a Misoperation in accordance with Requirement R1.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The VSLs appropriately assess the severity of the violation with the failure to perform a review for Misoperation as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.

VRF and VSL Justifications – PRC-004-3, R1	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to notify the other owner(s) of a Composite Protection System when the initiating owner determined its Protection System components did not cause a Misoperation or it did not rule out a Misoperation, could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. ~~However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.~~ Unresolved Misoperations of Composite Protection Systems owned by others that are not ruled out as a Misoperation could ~~contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.~~affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system by creating a gap in analysis.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report:

VRF and VSL Justifications – PRC-004-3, R2	
	This is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. A lack of coordination on system protection was one of eight factors common to substantive outages prior to and including the August 14, 2003 Blackout. The initiating entity in the planning time frame is required to notify the other owner(s) of the Composite Protection System component(s) when it determines that (or is unsure whether)its component(s) did not cause a Misoperation or when it is unable to rule out a Misoperation of the Composite Protection System owned by others. This ensures that all owners review their equipment for proper operation which may include checking for proper coordination depending on the circumstances.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards:

VRF and VSL Justifications – PRC-004-3, R2	
	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO~~).~~), which both have a VRF of High. The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan~~" which both have a VRF of High.~~". This requirement and a VRF assignment of Medium is consistent, for example, with Reliability Standards FAC-008-3 – Facility Ratings, R7 ("…shall provide Facility Ratings (for its solely and jointly owned Facilities…"), MOD-012-0 – Dynamics Data for Modeling and Simulation of the Interconnected Transmission System, R2 ("…shall provide appropriate equipment characteristics and system data…"), ~~and~~ IRO-015-1 – ~~NAME~~Special Protection System Data and Documentation, R1.1 ("…shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas~~.")~~."), and IRO-016-1 – Coordination of Real-time Activities Between Reliability Coordinators, R1 ("…shall contact the other Reliability Coordinator(s) to confirm that there is a problem and then discuss options and decide upon a solution to prevent or resolve the identified problem.") which all have a VRF of Medium. Other Protection Systems based Reliability Standards such as PRC-005-1b – Transmission and Generation Protection System Maintenance and Testing, R2 ("…shall provide documentation…"), PRC-016-0.1 – Special Protection System Misoperations, R3 ("…that owns an SPS shall provide documentation of the misoperation analyses…"), and PRC-017-0 – Special Protection System Maintenance and Testing, R2 ("…SPS shall provide documentation of the program…) all have a VRF of Lower; however, these requirements involve the administrative reporting to either the Regional Reliability Organization (now Regional Entity) or NERC and not a reliability function like the previously mentioned FAC-008-3 and MOD-012-0 Reliability Standards. As such, this Requirement R2 is assigned a VRF of Medium because it has a reliability need to be communicated to other owners.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs:

VRF and VSL Justifications – PRC-004-3, R2	
	Failure to notify other entities to review each Protection System operation, identify Misoperations, and determine the cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. ~~However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.~~ Unresolved Misoperations of Composite Protection Systems owned by others that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. ~~However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.~~
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justifications – PRC-004-3, R2			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement is new to the standard and had no previous level of compliance. Other Reliability Standards use a variety of VSLs ranging from a single severe level (i.e., binary), two levels, to four VSL levels. Some use a percentage as the failure of the number entities not notified; however, this would not be practical for this requirement as Composite Protection Systems that are owned by multiple entities is generally limited to one or two owners. The incremental increase in violation is consistent with the NERC Guidelines and is reasonable in consideration of the time periods provided by the Requirement.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.

VRF and VSL Justifications – PRC-004-3, R2	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R3	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure of another Composite Protection System owner to review its component(s) for Misoperation, upon notification, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. ~~However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.~~ Composite Protection System operations reviewed for proper operation by the other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. ~~However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.~~
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.

VRF and VSL Justifications – PRC-004-3, R3	
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which both have a VRF of High. This Requirement R3, to “review” (similar to “analyze”), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“…shall analyze its SPS operations and maintain a record of all misoperations…”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“…shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium. A VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.

VRF and VSL Justifications – PRC-004-3, R3	
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure of another Composite Protection System owner to review its component(s) for Misoperation, upon notification, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. ~~However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.~~ Composite Protection System operations reviewed for proper operation by the other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. ~~However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.~~
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late. OR The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (DP) and R2 (GO & TO) for the notified Protection System owner. The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. A VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-004-3, R3	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R4	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to identify the cause(s) of a Misoperation (if not determined in Requirements R1 or R3) could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.~~ However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.~~ An Unidentified cause(s) of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage.~~ However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.~~
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. The applicable entity must conduct investigative action(s) to determine the cause(s) of a Misoperation, if not determined during the course of a review as proposed in Requirements R1 and R3.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.

VRF and VSL Justifications – PRC-004-3, R4	
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO~~).~~), which have a VRF of High. The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan~~" which have a VRF of High.~~." This Requirement R4, to perform at least one "investigative action" (similar to "analyze"), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 ("…shall analyze its SPS operations and maintain a record of all misoperations…") and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 ("…shall analyze and document all UVLS operations and Misoperations.") which both have a VRF of Medium. A VRF of Medium is not inadvertently lowering the current VRF of High in the former PRC-004-2.1a, Requirements R1 or R3, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous. This VRF of Medium comports with the VRF assignment of Medium for PRC-004-3, Requirements R1 and R3, which will generally reveal the cause(s) of an identified Misoperation.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to identify the cause(s) of a Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. ~~However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.~~

VRF and VSL Justifications – PRC-004-3, R4			
	Unidentified causes of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. ~~However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.~~		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late. OR The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.

VRF and VSL Justifications – PRC-004-3, R4	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-004-3, R4	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R5	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to develop a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. ~~However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.~~ An unresolved cause of a Misoperation or failing to consider other locations with similar Protection System components could ~~contribute~~affect the ~~severity~~electrical state or capability of ~~future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to~~the bulk electric system~~ instability, separation~~, or ~~cascading failures~~the ability to effectively monitor, control, or restore the bulk electric system.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the development of a Corrective Action Plan (CAP) associated with Protection Systems.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.

VRF and VSL Justifications – PRC-004-3, R5	
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which have a VRF of High. This requirement is consistent with Reliability Standards PRC-016-0.1, R2 ("…shall take corrective actions to avoid future Misoperations"), PRC-022-1, R1.5 ("For any Misoperation, a Corrective Action Plan…"), FAC-003, R5 ("…Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management") all three of which have a VRF of Medium.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to develop a CAP for a Misoperation with an identified cause or failing to consider other locations with similar components could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. ~~However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.~~ An unresolved cause of a Misoperation could ~~contribute~~affect the ~~severity~~electrical state or capability of ~~future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to~~the bulk electric system~~ instability, separation~~, or ~~cascading failures~~the ability to effectively monitor, control, or restore the bulk electric system if the same condition resulted in a future Misoperation.

VRF and VSL Justifications – PRC-004-3, R5			
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation. OR	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation. OR	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop a CAP or explain in a declaration in accordance with Requirement R5. OR

VRF and VSL Justifications – PRC-004-3, R5			
The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation.		The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop an evaluation in accordance with Requirement R5.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. Varying VSLs are provided for the omission of the evaluation when developing the Corrective Action Plan and for failure to develop the evaluation.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which have varying VSLs. This VSL does not lower the current level of compliance because the former VSL in PRC-004-2.1a was comingled with the other activities. This Requirement has a Severe VSL for failure to develop the CAP with the other VSLs being based on tardiness of the development.		

VRF and VSL Justifications – PRC-004-3, R5	
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.
FERC VSL G4	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R5	
Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	

VRF and VSL Justification – PRC-004-3, R6	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to implement a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. ~~However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.~~ An uncorrected cause of a Misoperation as a result of not implementing a Corrective Action Plan, could ~~contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.~~affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system since the condition could occur again.

VRF and VSL Justification – PRC-004-3, R6	
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the implementation of a Corrective Action Plan (CAP) associated with Protection Systems.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2.1a, R1 (TO & DP) and R2 (GO~~).~~),which both have a VRF of High. The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan~~” which both have a VRF of High.~~”. This requirement is consistent with Reliability Standards PRC-016-0.1, R2 (“…shall take corrective actions to avoid future misoperations.”) and PRC-022-1, R1.5 (“For any Misoperation, a Corrective Action Plan…”) which both have a VRF of Medium. The proposed VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.

VRF and VSL Justification – PRC-004-3, R6	
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to implement a Corrective Action Plan for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.~~ However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.~~ An uncorrected cause of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage.~~ However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.~~
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justification – PRC-004-3, R6			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity implemented, but failed to update a CAP, when actions or timetables changed, in accordance with Requirement R6.	N/A	N/A	The responsible entity failed to implement a CAP in accordance with Requirement R6.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—The VSLs cover aspects of this Requirement that are not equal in importance and performance.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed Requirement is a Severe VSL for failure to implement the CAP with the Lower VSL being based on the failure of updating the CAP when actions or timetables change which is administrative in nature.		

VRF and VSL Justification – PRC-004-3, R6	
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.
FERC VSL G4	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justification – PRC-004-3, R6	
Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	

Table of Issues and Directives

Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)

Table of Issues and Directives Associated with PRC-003-1			
Source	**Issue or Directive Language (including Para. #)**	**Section and/or Requirement(s)**	**Consideration of Issue or Directive**
FERC Order No. 693, P 1460.	For the reasons stated in the NOPR, the Commission will not approve or remand PRC-003-1. (For reference) P 1458. In the NOPR, the Commission identified PRC-003-1 as a fill-in-the-blank standard. The NOPR stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-1 until the ERO submitted the additional information.	PRC-004-3	PRC-003-1 will be retired and replaced by PRC-004-3.

Table of Issues and Directives Associated with PRC-003-1			
Source	**Issue or Directive Language (including Para. #)**	**Section and/or Requirement(s)**	**Consideration of Issue or Directive**
FERC Order No. 693, P 1461.	We agree with APPA that the ERO should consider whether greater consistency can be achieved in this Reliability Standard. In Order No. 672, the Commission also encouraged greater uniformity in the development of Reliability Standards. Consistent with that goal, the Commission directs the ERO to consider APPA's suggestions in the Reliability Standards development process as it modifies PRC-003-1 to provide missing information needed for the Commission to act on this Reliability Standard. (For reference) P 1459. APPA agrees with the Commission's proposed course of action. It states that there are significant and substantive differences between regional procedures due to the characteristics of various regional grids and industry structures. Further it suggests that NERC and the Regional Entities consider whether they can attain greater consistency on an Interconnection-wide basis in completing this Reliability Standard.	NERC Rules of Procedure, Section 1600 Request for Data or Information.	PRC-003-1 will be retired and replaced by PRC-004-3. The responsibility to address all aspects of a Protection System Misoperation is assigned to the owner(s) of the Protection System(s) - the Transmission Owner, Generation Owner, and Distribution Provider. Additionally, further consistency has been achieved by specifying the data reporting requirements for periodic Misoperations reporting based on a continent-wide template. All reporting of Misoperations will be done through a data request according to the NERC Rules of Procedures, Section 1600, Request for Data or Information instead of having PRC-004-3 specify an administrative reporting requirement.

Table of Issues and Directives Associated with PRC-003-1			
Source	**Issue or Directive Language (including Para. #)**	**Section and/or Requirement(s)**	**Consideration of Issue or Directive**
FERC Order No. 693, P 1469 (first directive only)	We direct the ERO to consider ISO-NE's suggestion that LSEs and transmission operators should be included in the applicability section, in the Reliability Standards development process as it modifies PRC-004-1. (For reference) P 1466. ISO-NE further requests the Commission to direct NERC to modify PRC-004-1 to include LSEs and transmission operators in the applicability section. It states that based on current practice in the ISO-NE balancing area, transmission operators, transmission owners, LSEs and distribution providers may individually or jointly own and operate a protection system. It therefore suggests that transmission operators and LSEs should also be included in the applicability section. ISO-NE provides the same suggestion with regard to PRC-005-1, PRC-008-0, PRC-011-0, PRC-015-0, PRC-016-0, PRC-017-0 and PRC-021-1.	PRC-004-3 all Requirements.	PRC-004-2.1a will be retired and replaced by PRC-004-3.The Transmission Owner, Generator Owner, and Distribution Provider own the BES Protection Systems. The owners of BES Protection Systems have been assigned responsibility for this standard.

Standards Announcement

Project 2010-05.1 Protection System (Misoperations)
PRC-004-3

Final Ballot Now Open through August 7, 2014

Now Available

A final ballot for **PRC-004-3 – Protection System Misoperation Identification and Correction** and is open through **8 p.m. Eastern on Thursday, August 7, 2014**.

Instructions for Balloting

In the final ballot, votes are counted by exception. Only members of the ballot pool may cast a ballot; all ballot pool members may change their previously cast votes. A ballot pool member who failed to cast a ballot during the last ballot window may cast a ballot in the final ballot window. If a ballot pool member previously cast a vote, but does not participate in the final ballot, the member's vote cast in the previous ballot will be carried over as their vote in the final ballot.

Members of the ballot pool associated with this project may log in and submit their vote for the standard by clicking here.

Next Steps

Voting results for the standard will be posted and announced after the ballot window closes. If approved, it will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller (via email), Standards Development Administrator, or at 404-446-2560.

Standards Announcement Updated

Project 2010-05.1 Protection System (Misoperations) PRC-004-3

Final Ballot Results

Now Available

A final ballot for **PRC-004-3 – Protection System Misoperation Identification and Correction** concluded **8 p.m. Eastern on Thursday, August 7, 2014.**

The standard achieved a quorum and sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballot.

Standard	Quorum / Approval
PRC-004-3	77.94% / 79.75%

Background information for this project can be found on the project page.

Next Steps

The standard will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller (via email), Standards Development Administrator, or at 404-446-2560.

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Request for Data or Information

Protection System Misoperation Data Collection

August 14, 2014

RELIABILITY | ACCOUNTABILITY

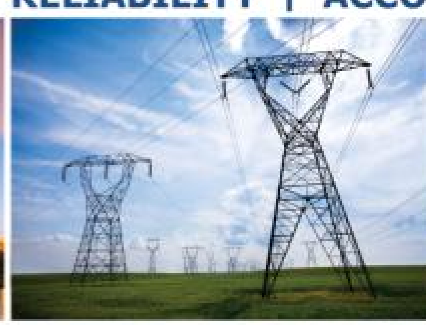

Table of Contents

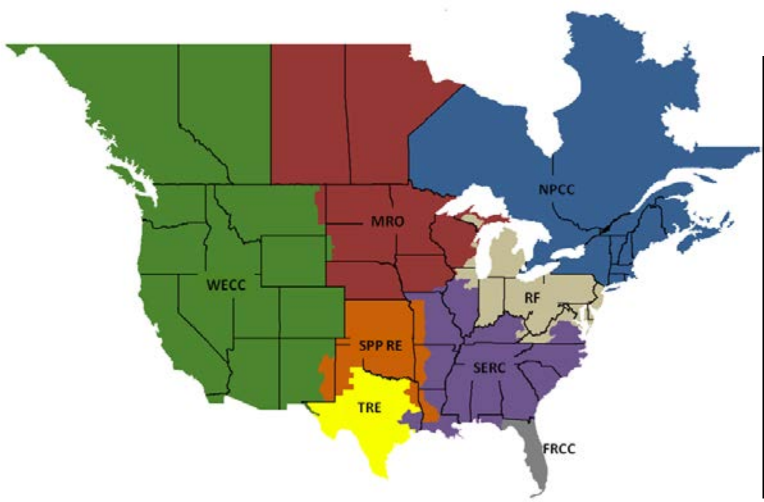
Preface

The North American Electric Reliability Corporation (NERC) is a not-for-profit international regulatory authority whose mission is to ensure the reliability of the bulk power system (BPS) in North America. NERC develops and enforces Reliability Standards; annually assesses seasonal and long-term reliability; monitors the BPS through system awareness; and educates, trains, and certifies industry personnel. NERC's area of responsibility spans the continental United States, Canada, and the northern portion of Baja California, Mexico. NERC is the electric reliability organization (ERO) for North America, subject to oversight by the Federal Energy Regulatory Commission (FERC) and governmental authorities in Canada. NERC's jurisdiction includes users, owners, and operators of the BPS, which serves more than 334 million people.

The North American BPS is divided into several assessment areas within the eight Regional Entity (RE) boundaries, as shown in the map and corresponding table below.



FRCC	Florida Reliability Coordinating Council
MRO	Midwest Reliability Organization
NPCC	Northeast Power Coordinating Council
RF	ReliabilityFirst
SERC	SERC Reliability Corporation
SPP-RE	Southwest Power Pool Regional Entity
TRE	Texas Reliability Entity
WECC	Western Electricity Coordinating Council

Introduction and Survey Scope

In accordance with Section 1600 of the NERC *Rules of Procedure*,[1] NERC may request data or information ("Data Request") necessary in order to meet its obligations under Section 215 of the Federal Power Act, as authorized by Section 39.2(d)[2] of the Federal Energy Regulatory Commission's ("FERC" or "Commission") regulations.

Standard development Project 2010-05.1 – Phase 1: Protection Systems (Misoperations[3]) involves the revision of Reliability Standard PRC-004-2.1a (Analysis and Mitigation of Transmission and Generation Protection System Misoperations). The revised standard, PRC-004-3 (Protection System Misoperation Identification and Correction), will combine Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems and Reliability Standard PRC-004-2.1a.

The Standards Authorization Request in Project 2010-05.1, which sets the scope of work for combining Reliability Standards PRC-003-1 and PRC-004-2.1a, includes instructions to address the following in Project 2010-05.1:

- Clarify the definition of "Misoperation;"
- Establish a consistent metric for measuring Protection System performance with uniform applicability;
- Clarify reporting requirements and processes;
- Review all Faults or Protection System operations on the Bulk Electric System ("BES") to identify those that are BES Protection System Misoperations;
- Analyze BES Protection System Misoperations to determine cause(s); and
- Develop and implement Corrective Action Plans to address the causes of BES Protection System Misoperations.

The Protection System Misoperations Standard Drafting Team (SDT) in Project 2010-05.1 has removed the data reporting obligation included in Reliability Standard PRC-004-2.1a[4] from the revised standard and recommended that NERC request the data required for performance analysis purposes pursuant to Section 1600 of the NERC *Rules of Procedure*. The revised Reliability Standard PRC-004-3 will continue to require retention of data or evidence of compliance with the standard, but will no longer require periodic reporting of that information. Periodic, quarterly submittals of Misoperation data will be associated with reporting under this Section 1600 Data Request.

The purpose of this Data Request is to continue consistent reporting of Misoperation data to NERC through a standardized template for performance analysis. NERC will analyze the data to:

- Develop meaningful metrics to assess Protection System performance;
- Identify trends in Protection System performance that negatively impact reliability;
- Identify remediation techniques to reduce the rate of occurrence and severity of Misoperations;

---

[1] NERC's *Rules of Procedure* are available at: http://www.nerc.com/AboutNERC/Pages/Rules-of-Procedure.aspx.

[2] 18 C.F.R. § 39.2(d) (2014).

[3] "Misoperation" is a defined term in the NERC *Glossary of Terms Used in NERC Reliability Standards* ("NERC Glossary"), *available at*: http://www.nerc.com/pa/Stand/Glossary%20of%20Terms/Glossary_of_Terms.pdf.

[4] Requirement R3 of PRC-004-2.1a requires Transmission Owners, any Distribution Providers that own a transmission Protection System, and Generator Owners to provide to its Regional Entity documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.

- Provide focused assistance to entities in need of guidance; and
- Publicize lessons learned to the industry.

Monitoring, analyzing, and tracking trends in Protection System Misoperations are critical to improve BES reliability. Historically, Protection System Misoperations have exacerbated the severity of most cascading power outages. For example, Protection System Misoperations played a significant role in expanding the impacts of the August 14, 2003 Northeast blackout.[5] In the 2012 State of Reliability report,[6] Misoperations were identified as one of the top risks to reliability. Additionally, Protection System Misoperations were cited as being one of the primary risk factors in the 2013 State of Reliability report.[7] Following the recommendations in the 2012 State of Reliability report, the Protection System Misoperations Task Force was formed to review Misoperations and provide recommendations for reducing Misoperations. The task force analyzed the top three causes of Misoperations between the first quarter of 2011 and the second quarter of 2012 and developed suggestions to reduce Misoperations. This analysis relied heavily on the data collected under Reliability Standard PRC-004-002.1a. Absent this information, the analysis would not have been possible. The 2014 State of Reliability report continued to identify Protection System Misoperations as a significant contributor to automatic transmission outage severity. The report recommended completion of the development of PRC-004-3 as part of the solution to address Protection System Misoperations.

Further, Misoperation data collection provides several benefits to BES reliability and supports NERC's mission of ensuring the reliability of the BPS in North America. The proposed Data Request will make available the information necessary for NERC to provide high value risk analysis. This data will also allow NERC to identify areas for improvement in Misoperation rates through quantitative data analysis. For these reasons, NERC is proposing to continue collection of the data immediately upon the retirement of the data reporting obligation in Reliability Standard PRC-004-2.1a.

NERC posted a proposed Data Request in accordance with the requirements of Section 1602 of the NERC *Rules of Procedure* for a 45-day public comment period. On July 23, 2013, NERC provided this proposed Data Request to FERC for review as required by Section 1602 of the NERC *Rules of Procedure*. After consideration of comments received, NERC made revisions to the proposed Data Request. If approved by the Board as required by Section 1602 of the NERC *Rules of Procedure,* this Data Request will become mandatory concurrently with the retirement of Reliability Standard PRC-004-2.1a which presently contains the data reporting obligation.

NERC Contact Information

The Data Request must be completed in electronic format. Should the submitting entity experience any issues with submitting its data, contact Charles Aderholdt via email at Charles.Aderholdt@nerc.net or by telephone at (404) 446-2569. If the respondent believes that any of the responses to this survey should remain confidential, contact the project manager directly for further instructions.

Official correspondence may be mailed to:

Atlanta, GA 08540

Authority

Under Section 215 of the Federal Power Act (16 U.S.C. § 824o), Congress entrusted FERC with the duties of approving and enforcing rules to ensure the reliability of the BPS, and with the duties of certifying an Electric Reliability Organization ("ERO") that would be charged with developing and enforcing mandatory Reliability Standards, subject to FERC approval. NERC was certified as the ERO on July 20, 2006. NERC's authority for issuing this survey is derived from Section 215 of the Federal Power Act, and from the following sources:

Section 39.2(d) of the FERC's regulations (18 C.F.R. §39.2(d)) provides:

> Each user, owner or operator of the Bulk-Power System within the United States (other than Alaska and Hawaii) shall provide the Commission, the Electric Reliability Organization and the applicable Regional Entity such information as is necessary to implement section 215 of the Federal Power Act as determined by the Commission and set out in the Rules of the Electric Reliability Organization and each applicable Regional Entity. The Electric Reliability Organization and each Regional Entity shall provide the Commission such information as is necessary to implement section 215 of the Federal Power Act.

Section 1600 of NERC's *Rules of Procedure* provides:

> ***1601. Scope of a NERC or Regional Entity Request for Data or Information***
>
> *Within the United States, NERC and Regional Entities may request data or information that is necessary to meet their obligations under Section 215 of the Federal Power Act, as authorized by Section 39.2(d) of the Commission's regulations, 18 C.F.R. § 39.2(d). In other jurisdictions, NERC and Regional Entities may request comparable data or information, using such authority as may exist pursuant to these rules and as may be granted by ERO governmental authorities in those other jurisdictions. The provisions of Section 1600 shall not apply to requirements contained in any Reliability Standard to provide data or information; the requirements in the Reliability Standards govern. The provisions of Section 1600 shall also not apply to data or information requested in connection with a compliance or enforcement action under Section 215 of the Federal Power Act, Section 400 of these Rules of Procedure, or any procedures adopted pursuant to those authorities, in which case the Rules of Procedure applicable to the production of data or information for compliance and enforcement actions shall apply.*

1602. Procedure for Authorizing a NERC Request for Data or Information

1. *NERC shall provide a proposed request for data or information or a proposed modification to a previously-authorized request, including the information specified in paragraph 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability at least twenty-one (21) days prior to initially posting the request or modification for public comment. Submission of the proposed request or modification to the Office of Electric Reliability is for the information of the Commission. NERC is not required to receive any approval from the Commission prior to posting the proposed request or modification for public comment in accordance with paragraph 1602.2 or issuing the request or modification to reporting entities following approval by the Board.*

2. *NERC shall post a proposed request for data or information or a proposed modification to a previously authorized request for data or information for a forty-five (45) day public comment period.*

2.1. *A proposed request for data or information shall contain, at a minimum, the following information: (i) a description of the data or information to be requested, how the data or information will be used, and how the availability of the data or information is necessary for NERC to meet its obligations under applicable laws and agreements; (ii) a description of how the data or information will be collected and validated; (iii) a description of the entities (by functional class and jurisdiction) that will be required to provide the data or information ("reporting entities"); (iv) the schedule or due date for the data or information; (v) a description of any restrictions on disseminating the data or information (e.g., "confidential," "critical energy infrastructure information," "aggregating" or "identity masking"); and (vi) an estimate of the relative burden imposed on the reporting entities to accommodate the data or information request.*

2.2. *A proposed modification to a previously authorized request for data or information shall explain (i) the nature of the modifications; (ii) an estimate of the burden imposed on the reporting entities to accommodate the modified data or information request, and (iii) any other items from paragraph 1.1 that require updating as a result of the modifications.*

3. *After the close of the comment period, NERC shall make such revisions to the proposed request for data or information as are appropriate in light of the comments. NERC shall submit the proposed request for data or information, as revised, along with the comments received, NERC's evaluation of the comments, and recommendations, to the Board.*

4. *In acting on the proposed request for data or information, the Board may authorize NERC to issue it, modify it, or remand it for further consideration.*

5. *NERC may make minor changes to an authorized request for data or information without Board approval. However, if a reporting entity objects to NERC in writing to such changes within 21 days of issuance of the modified request, such changes shall require Board approval before they are implemented.*

6. *Authorization of a request for data or information shall be final unless, within thirty (30) days of the decision by the Board, an affected party appeals the authorization under this Section 1600 to the ERO governmental authority.*

1603. Owners, Operators, and Users to Comply

Owners, operators, and users of the BPS registered on the NERC Compliance Registry shall comply with authorized requests for data and information. In the event a reporting entity within the United States fails to comply with an authorized request for data or information under Section 1600, NERC may request the Commission to exercise its enforcement authority to require the reporting entity to comply with the request for data or information and for other appropriate enforcement action by the Commission. NERC will make any request for the Commission to enforce a request for data or information through a non-public submission to the Commission's enforcement staff.

1605. Confidentiality

If the approved data or information request includes a statement under Section 1602.1.1(v) that the requested data or information will be held confidential or treated as Critical Energy Infrastructure Information, then the applicable provisions of Section 1500 will apply without further action by a Submitting Entity. A Submitting Entity may designate any other data or information as Confidential Information pursuant to the provisions of Section 1500, and NERC or the Regional Entity shall treat that data or information in accordance with Section 1500. NERC or a Regional Entity may utilize additional protective procedures for handling particular requests for data or information as may be necessary under the circumstances.

1606. Expedited Procedures for Requesting Time-Sensitive Data or Information

1. *In the event NERC or a Regional Entity must obtain data or information by a date or within a time period that does not permit adherence to the time periods specified in Section 1602, the procedures specified in Section 1606 may be used to obtain the data or information. Without limiting the circumstances in which the procedures in Section 1606 may be used, such circumstances include situations in which it is necessary to obtain the data or information (in order to evaluate a threat to the reliability or security of the BPS, or to comply with a directive in an order issued by the Commission or by another Applicable Governmental Authority) within a shorter time period than possible under Section 1602. The procedures specified in Section 1606 may only be used if authorized by Board prior to activation of such procedures.*

2. *Prior to posting a proposed request for data or information, or a modification to a previously-authorized request, for public comment under Section 1606, NERC shall provide the proposed request or modification, including the information specified in paragraph 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability. The submission to the Commission's Office of Electric Reliability shall also include an explanation of why it is necessary to use the*

expedited procedures of Section 1606 to obtain the data or information. The submission shall be made to the Commission's Office of Electric Reliability as far in advance, up to twenty-one (21) days, of the posting of the proposed request or modification for public comments as is reasonably possible under the circumstances, but in no event less than two (2) days in advance of the public posting of the proposed request or modification.

3. *NERC shall post the proposed request for data or information or proposed modification to a previously-authorized request for data or information for a public comment period that is reasonable in duration given the circumstances, but in no event shorter than five (5) days. The proposed request for data or information or proposed modification to a previously-authorized request for data or information shall include the information specified in Section 1602.2.1 or 1602.2.2, as applicable, and shall also include an explanation of why it is necessary to use the expedited procedures of Section 1606 to obtain the data or information.*

4. *The provisions of Sections 1602.3, 1602.4, 1602.5 and 1602.6 shall be applicable to a request for data or information or modification to a previously-authorized request for data or information developed and issued pursuant to Section 1606, except that (a) if NERC makes minor changes to an authorized request for data or information without Board approval, such changes shall require Board approval if a Reporting Entity objects to NERC in writing to such changes within five (5) days of issuance of the modified request; and (b) authorization of the request for data or information shall be final unless an affected party appeals the authorization of the request by the Board to the Applicable Governmental Authority within five (5) days following the decision of the Board authorizing the request, which decision shall be promptly posted on NERC's website.*

Data Request

Data Description

Effective immediately upon the retirement of Reliability Standard PRC-004-2.1a, data included in Table 1 below will be collected quarterly on a per-entity basis. The data will be collected for Misoperations, as defined in the NERC Glossary, which are identified pursuant to Reliability Standard PRC-004. In cases where multiple entities own a Protection System, the entity responsible for identifying whether its Protection System Component(s) caused a Misoperation pursuant to PRC-004 will report Misoperation data under this Data Request.

Table 1: Protection System Misoperation Fields	
Tab 1 – Operation Summary	
Field Name	**Field Description**
Data Submission Year	The calendar year for which the operation data is reported.
Data Submission Quarter	The calendar quarter for which the operation data is reported.
Regional Entity Name	The entity's Regional Entity. If the entity is registered in multiple Regional Entities, the Regional Entity area where the Misoperation occurred.
Functional Entity NERC ID	The entity's NERC compliance registry number. If the entity does not have a NERC compliance registry number, the company name.
Total Protection System Operations by Voltage Class	The total number of Protection System operations by system voltage based on the definition in the reporting template.
Tab 2 – Misoperation Entry Form	
Field Name	**Field Description**
Misoperation ID	An entity-specific Misoperation identifier.
Regional Entity	The entity's Regional Entity. If the entity is registered in multiple Regional Entities, the Regional Entity area where the Misoperation occurred.
NERC ID	The entity's NERC compliance registry number. If the entity does not have a NERC compliance registry number, the company name.
Misoperation Date	The date of the Misoperation.
Misoperation Time	The time of the Misoperation.
Time Zone	The time zone in which the Misoperation occurred.
Facility Name (Location of Misoperation)	The name of the facility (i.e., substation or generating station) where the Misoperation occurred.
Equipment Name (protected by Protection System that Misoperated)	The name of the generator, transmission line, transformer, bus, or equipment protected by the Protection System that misoperated.
Equipment Type	The type of equipment being protected (e.g., line, transformer, etc.).
Facility Voltage	The system voltage of the protected Element. If the Element is a transformer, the high-side voltage. If the Element is a generator, the GSU transformer high-side voltage.

Table 1: Protection System Misoperation Fields	
Equipment Removed from Service (Permanently or Temporarily) as the result of the Misoperation	The names of the equipment becoming unavailable due to the Misoperation (Equipment refers only to circuits, transformers, buses, but not breakers UNLESS the breaker is the only Element). Breaker should be used only if a single breaker tripped and did not disconnect any Element at one of its terminals (one breaker in a multiple breaker protected line, bus tie breaker, etc.).
Event Description	A brief description of the event including: 1. Initiating event: include a description of any internal or external fault causes, any abnormal system conditions which may have contributed to the Misoperation, or state that the Misoperation occurred under normal operating conditions. 2. Facilities involved on which Protection Systems operated correctly and/or incorrectly concurrent with the Misoperation. 3. Component(s) of the Protection System(s) that failed and/or did not function correctly. 4. Detailed description of root causes determined by completed Corrective Action Plans.
Misoperation Category (as defined in the reporting template)	The category of the Misoperation: • Failure to Trip – During Fault • Failure to Trip – Other Than Fault • Slow Trip – During Fault • Slow Trip – Other Than Fault • Unnecessary Trip – During Fault • Unnecessary Trip – Other Than Fault
Cause(s) of Misoperation (as defined in the reporting template)	The primary cause of the Misoperation: • AC system • As-left personnel error • Communication failures • DC system • Incorrect settings • Logic errors • Design errors • Relay failures/malfunctions • Unknown/unexplainable • Other/Explainable
Protection Systems/Components that Misoperated	Information on the Protection Systems/Components that Misoperated. If the “Cause of Misoperation” is “Relay failures/malfunctions,” “Incorrect settings,” “Logic errors,” or “Design errors,” and the cause is associated with a relay, this field is used to identify the relay models (types) and protection schemes.
Relay Technology	If the Cause of Misoperation is “Relay failures/malfunctions,” “Incorrect settings,” “Logic errors,” or “Design errors”, this field is used to identify the relay technology installed. • Electromechanical • Solid State • Microprocessor

Table 1: Protection System Misoperation Fields	
Is this a Transmission Availability Data System (TADS) reportable event?	Whether the Misoperation involved the automatic outage of a TADS-reportable transmission Element. (Reporting by Transmission Owners only.)
Select one or more TADS "Element IDs" for any TADS reportable Elements outaged in the Misoperation.	If a TADS reportable Element was outaged due to the Misoperation, the Element(s) in a comma-separated list. (Reporting by Transmission Owners only.)
Is this a Generation Availability Data System (GADS) reportable event?	Whether the Misoperation involved the automatic outage of a GADS-reportable Element. (Reporting by Generator Owners only.)
If the Misoperation caused a generator forced outage, select one or more Generation Availability Data System (GADS) "Unit IDs" for any GADS reportable Elements outaged in the Misoperation.	If a GADS reportable Element was outaged due to the Misoperation, the Element(s) in a comma-separated list. (Reporting by Generator Owners only.)
Analysis and Corrective Action Status	The status, selected from a drop-down list.
Corrective Action Plan	Identification of the corrective actions. “None” if, in place of a CAP, a declaration was made stating no further corrective actions will be taken.
Corrective Action Plan Target Completion Date	If corrective actions are not complete, an estimate of when they will be complete.
Actual Completion Date	If corrective actions are complete, the actual completion date.
Reported By	The person who filled out the report.
Reporter’s Telephone Number	The reporting person's phone number.
Reporter’s Email Address	The e-mail address of the reporter.
Date Reported	The report date.
Additional Contact Name (Optional)	An additional contact with knowledge of the data.
Additional Contact’s Phone Number (Optional)	If entering an additional contact, the person's phone number.
Additional Contact’s Email Address (Optional)	If entering an additional contact, the person's email.

There are several differences between the data fields used in previous reporting and the proposed data fields. These differences are summarized in Table 2 below.

Table 2: Changes to Misoperation Data Fields	
Field Name	**Field Description**
Misoperation Category	The Failure to Trip and Slow Trip categories have been divided into four categories by splitting each into “During Fault” and “Other than Fault” categories, consistent with the revised Misoperation definition.

Table 2: Changes to Misoperation Data Fields	
Field Name	**Field Description**
Cause(s) of Misoperation	The “Incorrect settings/logic/design errors” cause has been separated into three causes: “Incorrect settings”, “Logic errors”, and “Design errors”.
Is this a Generation Availability Data System (GADS) reportable event?	A field has been added to identify whether the Misoperation involved the automatic outage of a GADS reportable Element.
If the Misoperation caused a generator forced outage, select one or more Generation Availability Data System (GADS) "Unit IDs" for any GADS reportable Elements outaged in the Misoperation.	A field has been added to identify the GADS reportable Elements outaged.

Use of Data

NERC will continue to use the Misoperation information and Protection System operation information to develop statistics regarding the Misoperation rates for the BES. Collection of the total Protection System operations facilitates normalization to account for differences among Registered Entities (e.g., location, climate, size, density, protection schemes used). The Misoperation rate metric can be used to gauge the performance of BES Protection Systems for both generation and transmission Elements. The relative percentage indicates the relative performance of Protection System operations, specifically Protection System Misoperations as a ratio of total Protection System operations. Without knowledge of the Misoperation rates across NERC, normalized measurement of Misoperation reduction will not be possible. In addition, NERC and the Regional Entities will analyze the raw data to identify trends in Protection System Misoperations. Finally, the Misoperation data will be used to support statistical analysis of risks to the BES.

Section 215(g) of the Federal Power Act requires NERC to make periodic assessments on the reliability of the BPS in North America. This Data Request will provide NERC the data necessary to make periodic risk-based assessments to evaluate BPS reliability and provide for continuous analysis of performance and reliability risk. A better understanding of Protection System Misoperations will allow NERC to develop effective requirements to address one of the top risks to the BES.

Entities Required to Comply

The submission of Protection System Misoperation data is mandatory for all U.S. Transmission Owners, Generator Owners, and Distribution Providers who are on the NERC Compliance Registry. Non-U.S. Transmission Owners, Generator Owners, and Distribution Providers should provide data in accordance with the legislation, laws, regulations, rules or orders of their Applicable Governmental Authority. Non-U.S. Transmission Owners, Generator Owners, and Distribution Providers are strongly encouraged to provide the requested data to ensure the completeness of the data collected for analysis.

Scheduling and Reporting

Entities will report data on a quarterly basis. The first reporting period under the Data Request will be the quarter beginning on the first day of the first calendar quarter that is nine (9) months after the date that the PRC-004-3 is approved by an Applicable Governmental Authority or as otherwise provided for in a jurisdiction where approval by an Applicable Governmental Authority is required for a standard to go into effect. Where approval by an Applicable Governmental Authority is not required, the first reporting period under the Data Request will be the quarter beginning on first day of the first calendar quarter that is nine (9) months after the date the Data Request is approved by the Board or as otherwise provided for in that jurisdiction. The deadline for reporting will be 60 days after the end of each quarter.

The reporting schedule is intended to prevent any gap or overlap with reporting that is required pursuant to PRC-004-2.1a. As a result, data for the last quarter occurring prior to retirement of PRC-004-2.1a will be reported under the Data Request. This transition is necessary because the reporting deadline for one period during transition will occur when PRC-004-2.1a is no longer subject to enforcement.

The data will be manually entered or bulk uploaded by Transmission Owners, Generator Owners, and Distribution Providers that own a BES Protection System into the Misoperation module of the webTADS system. After the software checks for errors, a review period will be provided for Regional Entities to review data submitted by the entities in their Region. The Regional Entities will review and sign-off on the data prior to review by NERC. Subsequent to Regional Entity review, NERC will further validate the data and use the data as described above. A final template to be used for bulk uploads is available at: http://www.nerc.com/pa/RAPA/ProctectionSystemMisoperations/Section_1600_Misoperations_Final_Template.xlsx. Data will be bulk uploaded or entered manually through a graphical user interface using the same fields.

Dissemination of Data

NERC's treatment of confidential information is governed by Section 1500 of NERC's *Rules of Procedure* and other agreements with Applicable Governmental Authorities. Individual Misoperation reports are considered confidential. Aggregated Misoperation information is considered public information. However, aggregated Misoperation data public reports will not inadvertently release confidential information by the display of regional or NERC information from which an entity's confidential information could be ascertained.

Burden to Entities

Because entities have been reporting similar data since 2011, there is minimal additional burden for this Data Request. All eight Regional Entities already collect this, or very similar, information using a common template. Reporting Entities are already reporting Misoperations data under the regional procedures as required in Reliability Standard PRC-004-2.1a and minimal changes should be necessary to comply with this Data Request.
