North American Electric Reliability Corporation	**)** **)**	**Docket Nos. ____________ RM06-16-000**

PETITION OF THE
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION
FOR APPROVAL OF PROPOSED RELIABILITY STANDARD
PRC-004-3

Pursuant to Section 215(d)(1) of the Federal Power Act ("FPA")[1] and Section 39.5[2] of the Federal Energy Regulatory Commission's ("FERC" or "Commission") regulations, the North American Electric Reliability Corporation ("NERC")[3] hereby submits for Commission approval proposed Reliability Standard PRC-004-3 (Protection System Misoperation Identification and Correction) (Exhibit A). NERC requests that the Commission approve the proposed Reliability Standard and find that it is just, reasonable, not unduly discriminatory or preferential, and in the public interest.[4] NERC also requests approval of: (i) a revised definition of "Misoperation" and a new definition of "Composite Protection System" for inclusion in the NERC Glossary of Terms; (ii) the Implementation Plan for the proposed Reliability Standard (Exhibit B); (iii) the associated Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") (Exhibits A and F); and (iv) the retirement of Reliability Standards PRC-004-2.1a (Analysis and Mitigation

---

1 16 U.S.C. § 824o (2012).

2 18 C.F.R. § 39.5 (2014).

3 The Commission certified NERC as the electric reliability organization ("ERO") in accordance with Section 215 of the FPA on July 20, 2006. *N. Am. Elec. Reliability Corp.*, 116 FERC ¶ 61,062 (2006).

4 Unless otherwise designated, capitalized terms shall have the meaning set forth in the *Glossary of Terms Used in NERC Reliability Standards* ("NERC Glossary of Terms"), *available at* http://www.nerc.com/files/Glossary_of_Terms.pdf.

of Transmission and Generation Protection System Misoperations) and PRC-003-1 (Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection System) as listed in the Implementation Plan.[5]

As required by Section 39.5(a)[6] of the Commission's regulations, this petition presents the technical basis and purpose of proposed Reliability Standard PRC-004-3, a summary of the development history (Exhibit G), and a demonstration that the proposed Reliability Standard meets the criteria identified by the Commission in Order No. 672[7] (Exhibit D). The NERC Board of Trustees adopted proposed Reliability Standard PRC-004-3 on August 14, 2014.

I. EXECUTIVE SUMMARY

Reducing the risk to reliability from Protection System misoperations will require consistent collection of Misoperation information along with systematic analysis and correction of the underlying causes of preventable Misoperations. Proposed PRC-004-3 and the separate Request for Data or Information prepared pursuant to Section 1600 of NERC's Rules of Procedure ("Misoperations Data Request"), provide the means to accomplish this systematic analysis and correction. Proposed Reliability Standard PRC-004-3 replaces Reliability Standards PRC-004-2.1a and PRC-003-1 to create a single Reliability Standard requiring Transmission Owners, Generator Owners, and Distribution Providers to identify and correct causes of Misoperations of certain Protection Systems for Bulk Electric System Elements. Proposed Reliability Standard PRC-004-3 requires the applicable entities to review Protection System

---

5 PRC-003-1 is not a Commission-approved NERC Reliability Standard. *See Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, 72 Fed. Reg. 16416, FERC Stats. & Regs. ¶ 31,242, at PP 1460-61 (2007) (neither approving nor remanding PRC-003-1).

6 18 C.F.R. § 39.5(a) (2014).

7 The Commission specified in Order No. 672 certain general factors it would consider when assessing whether a particular Reliability Standard is just and reasonable. *See Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204, at P 262, 321-37, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006).

operations to identify Misoperations, including those where there is a shared responsibility for the review, and correct the causes of Misoperations to avoid reoccurrence. In developing PRC-004-3, NERC has addressed outstanding Commission concerns and directives related to PRC-004-2.1a and PRC-003-1 as well as made other improvements to the standard. For the reasons discussed in this Petition, NERC respectfully requests that the Commission approve the proposed Reliability Standard PRC-004-3, including its associated new and revised defined terms, as just, reasonable, not unduly discriminatory or preferential, and in the public interest.

III. BACKGROUND

A. Regulatory Framework

[8] Persons to be included on the Commission's service list are identified by an asterisk. NERC respectfully requests a waiver of Rule 203 of the Commission's regulations, 18 C.F.R. § 385.203 (2014), to allow the inclusion of more than two persons on the service list in this proceeding.

By enacting the Energy Policy Act of 2005,[9] Congress entrusted the Commission with the duties of approving and enforcing rules to ensure the reliability of the Nation's Bulk-Power System, and with the duties of certifying an Electric Reliability Organization ("ERO") that would be charged with developing and enforcing mandatory Reliability Standards, subject to Commission approval. Section 215(b)(1)[10] of the FPA states that all users, owners, and operators of the Bulk-Power System in the United States will be subject to Commission-approved Reliability Standards. Section 215(d)(5)[11] of the FPA authorizes the Commission to order the ERO to submit a new or modified Reliability Standard. Section 39.5(a)[12] of the Commission's regulations requires the ERO to file with the Commission for its approval each Reliability Standard that the ERO proposes should become mandatory and enforceable in the United States, and each modification to a Reliability Standard that the ERO proposes should be made effective.

The Commission has the regulatory responsibility to approve Reliability Standards that protect the reliability of the Bulk-Power System and to ensure that such Reliability Standards are just, reasonable, not unduly discriminatory or preferential, and in the public interest. Pursuant to Section 215(d)(2) of the FPA[13] and Section 39.5(c)[14] of the Commission's regulations, the Commission will give due weight to the technical expertise of the ERO with respect to the content of a Reliability Standard.

B. NERC Reliability Standards Development Procedure

---

9 16 U.S.C. § 824o (2012).
10 *Id.* § 824(b)(1).
11 *Id.* § 824o(d)(5).
12 18 C.F.R. § 39.5(a).
13 16 U.S.C. § 824o(d)(2).
14 18 C.F.R. § 39.5(c)(1).

The proposed Reliability Standard was developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[15] NERC develops Reliability Standards in accordance with Section 300 (Reliability Standards Development) of its Rules of Procedure and the NERC Standard Processes Manual.[16] In its order certifying NERC as the Commission's Electric Reliability Organization, the Commission found that NERC's proposed rules provide for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing Reliability Standards[17] and thus satisfies certain of the criteria for approving Reliability Standards.[18] The development process is open to any person or entity with a legitimate interest in the reliability of the Bulk-Power System. NERC considers the comments of all stakeholders, and stakeholders must approve, and the NERC Board of Trustees must adopt a Reliability Standard before the Reliability Standard is submitted to the Commission for approval.

C. History of PRC-004 and PRC-003

PRC-003 requires the Regional Reliability Organizations to establish, document and maintain regional procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations, and PRC-004 requires entities to analyze their

18 Order No. 672 at PP 268, 270.

Protection System Misoperations and develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the regional procedures.

In Order No. 693, the Commission approved PRC-004-1 as mandatory and enforceable.[19] The Commission also stated that PRC-004 "serves an important purpose in ensuring that transmission and generation protection system misoperations affecting the reliability of the Bulk-Power System are analyzed and mitigated."[20] In the *Notice of Proposed Rulemaking* preceding Order No. 693, the Commission stated that it did not identify any substantive issues with the Reliability Standard.[21] Since the approval of version 1 of PRC-004, the Commission has also approved other minor changes to the Reliability Standard and an interpretation.[22]

In Order No. 693, the Commission identified PRC-003-1 as a "fill-in-the-blank"[23] standard because the standard included references to regional procedures that had not been submitted by NERC.[24] As a result, the Commission decided to not approve or remand PRC-003-1 until NERC submitted the additional information. Since PRC-003-1 is not mandatory and

21 Order No. 693 NOPR, 117 FERC ¶ 61,084 at P 834.

22 *See Generator Requirements at the Transmission Interface*, Order No. 785, 144 FERC ¶ 61,221 (2012) (approving PRC-004-2.1a and clarifying that the requirements in PRC-004 extend not only to protection systems associated with the generating facility or station itself, but also to any protection systems associated with the generator interconnection facilities); *N. Am. Elec. Reliability Corp.*, 134 FERC ¶ 61,015 (2011) (approving PRC-004-2, which included modifications in response to Order No. 693 P 1469); *N. Am. Elec. Reliability Corp.*, 136 FERC ¶ 61,208 (2011) (approving an interpretation for the term "transmission Protection System" as it appears in Requirements R1 and R3).

23 In Order No. 693, certain Reliability Standards were classified as "fill-in-the-blank" standards because they contained provisions that required the regional reliability organizations to develop criteria for use by users, owners or operators within each region. Order No. 693 at PP 287-88, 297.

24 Order No. 693 at PP 1458, 1460.

enforceable, there is not a Commission-approved standard for Regional procedures to support the requirements of PRC-004.[25]

D. History of Project 2010-05.1 Protection System (Misoperations)

When the original scope for the NERC System Protection and Control Task Force (now the System Protection and Control Subcommittee "SPCS") was developed, one of the assigned items was to review all of the existing PRC-series of Reliability Standards, to advise the NERC Planning Committee on their status, and to develop Standards Authorization Requests ("SARs"), as appropriate, to address any perceived deficiencies.[26] In May of 2009, the SPCS released an assessment of Reliability Standards PRC-003-1, PRC-004-1, and PRC-016-1. The assessment acted as a precursor for a SAR to be submitted by the SPCS that would recommend revision of the definition of Misoperation, modification of PRC-003, PRC-004, and PRC-012, and retirement of PRC-016. The approach in proposed PRC-004-3 and the separate data request prepared by NERC is consistent with the reliability objectives in the SPCS report. NERC has modified PRC-004 and proposed to retire PRC-003, opting instead to reflect the objectives in PRC-003 in the PRC-004 revisions. The second phase of the Project, as described below, will address the SPS/RAS aspects of the SPCS report including changes to PRC-012 and PRC-016.

Project 2010-05 – Protection Systems was established to improve monitoring of Bulk Electric System Protection System events, as well as identify and correct the causes of Misoperations to improve Protection System performance. In 2011, the work in the Project 2010-05was subdivided into two phases, Project 2010-05.1 and Project 2010-05.2, in order to address the work associated with Misoperations of Protection Systems ahead of the work

---

[25] Although PRC-003-1 is not FERC-approved, NERC still uses the standard to support efforts related to PRC-004-2.

[26] *NERC SPCS Assessment of Standards*, System Protection and Control Subcommittee at ii (May 22, 2009).

associated with Special Protection Systems and Remedial Action Schemes.[27] Phase I - Project 2010-05.1 Protection System (Misoperations), which is the subject of this Petition, includes the modification of the definition of "Misoperation", modification of PRC-004-2.1a, and the retirement of both PRC-004-2.1a and PRC-003-1.[28,29]

IV. JUSTIFICATION FOR APPROVAL

As discussed in Exhibit D and below, the proposed Reliability Standard PRC-004-3 and associated new and revised definitions, satisfy the Commission's criteria in Order No. 672 and are just, reasonable, not unduly discriminatory or preferential, and in the public interest. The following section provides background information from NERC's *State of Reliability* 2014 report[30] on NERC's analysis of misoperations. It also explains the purpose of PRC-004-3, provides a description of and the technical basis for the requirements, and describes how the proposed Reliability Standard and associated definitions improve reliability as compared to prior versions. This section also provides a brief summary of how the proposed Reliability Standards satisfy the outstanding Commission directives from Order No. 693 related to PRC-004 and PRC-003. Finally, this section includes a discussion of the enforceability of the proposed Reliability Standard.

---

28 The standard development page for Project 2010-05.1 is available here: http://www.nerc.com/pa/Stand/Pages/Project2010-05_Protection_System_Misoperations.aspx.

29 Phase II, Project 2010-05.2 Special Protection Systems is addressing all aspects of Special Protection Systems and Remedial Action Schemes including Misoperations of Special Protection Systems. Project 2010-05.2 will consider retirement of or modifications to Reliability Standards PRC-012-0 (Special Protection System Review Procedure), PRC-013-0 (Special Protection System Database), PRC-014-0 (Special Protection System Assessment), PRC-015-0 (Special Protection System data and Documentation), PRC-016-0.1 (Special Protection System Misoperations), and PRC-017-0 (Special Protection System Maintenance and Testing). The standard development page for Project 2010-05.2 is available here: http://www.nerc.com/pa/Stand/Pages/Project-2010-05_2–Special-Protection-Systems.aspx.

30 *State of Reliability 2014*, NERC (May 2014), *available at* http://www.nerc.com/pa/RAPA/PA/Performance%20Analysis%20DL/2014_SOR_Final.pdf.

A. Misoperations

Nearly all major system failures, excluding those caused by severe weather, include Misoperations as a factor contributing to the propagation of the events. As noted in the *State of Reliability 2014* report, Bulk-Power System reliability and performance remains high; however, Protection System Misoperation was identified as having a significant probability of occurrence and is positively correlated with transmission severity when outages do occur.[31] The report made three additional findings from analyses of misoperations from 2011 through 2013:

- Misoperation occurrences have been consistent over the past three years, with approximately 2,000 misoperations per year.
- The rate of misoperations, as a percentage of total operations, has remained consistent during this period at approximately 10 percent (i.e., roughly one in 10 operations is a misoperation).
- The three most common causes of misoperations remain the same (approximately 65 percent of misoperations are caused by settings/logic/design errors, communication failures, and relay failures).[32]

The report concluded that understanding and reducing misoperations should remain a focus of NERC and industry participants. The report recommends completion of the development of proposed Reliability Standard PRC-004-3 as a means to address the reliability risks posed by misoperations.[33] Reducing the risk to reliability from Protection System misoperations will require consistent collection of Misoperation information along with systematic analysis and correction of the underlying causes of preventable Misoperations. Proposed PRC-004-3, and the parallel Section 1600 Data Request provide means to accomplish this systematic analysis and correction.

---

[31] One dataset used to assess risk associated with misoperations is the data collected by the Regions and NERC through periodic reporting pursuant to PRC-004-2.1a.

[32] *State of Reliability 2014* at 16.

[33] Other NERC activities aimed at reducing misoperations are detailed in the *State of Reliability 2014* report.

B. Proposed Reliability Standard PRC-004-3

1. Purpose and Applicability of PRC-004-3

Proposed Reliability Standard PRC-004-3 revises the currently effective PRC-004-2.1a Reliability Standard. PRC-004-2.1a ensures that all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System are analyzed and mitigated. Similarly, the purpose of the proposed Reliability Standard is to identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System Elements. The proposed standard also takes into account the reliability objective of PRC-003-1, which is to establish, document and maintain regional procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations. PRC-004-3 eliminates the need for regional procedures by providing continent-wide parameters for investigating Protection System operations and identifying Misoperations. Proposed PRC-004-3 applies to Transmission Owners, Generator Owners, and Distribution Providers. It also applies to underfrequency load shedding that is intended to trip one or more Bulk Electric System Elements. Underfrequency load shedding was added to PRC-004-3 to close a gap in reliability as Misoperations of these relays are not currently covered by a Reliability Standard.[34] The standard further specifies that the requirements apply to Protection Systems for Bulk Electric System Elements, with four exclusions as described below.

During development of the proposed standard, the standard drafting team determined that specific exclusions were needed to provide clarity on what facilities are included within the

[34] Undervoltage load shedding has not been included in the proposed Reliability Standard because Misoperations of undervoltage load shedding relays are currently addressed by Requirement R1 of Reliability Standard PRC-022-1 (Under-Voltage Load Shedding Program Performance). *See* PRC-022-1, *available at* http://www.nerc.com/_layouts/PrintStandard.aspx?standardnumber=PRC-022-1&title=Under-Voltage Load Shedding Program Performance&jurisdiction=United States.

scope of proposed PRC-004-3. The exclusions do not change the applicability of the standard; rather, they clarify the existing applicability and provide certainty to entities regarding the facilities subject to the standard. First, BES interrupting device operations initiated by non-protective functions are not Protection System operations. Because the definition of Misoperation, as described more fully below, is tailored to cover "the failure of a Composite Protection System to operate as intended *for protection purposes*"[35] (emphasis added), these operations initiated by non-protective functions would not fall within the scope of the standard. Second, the standard drafting team included an explicit exclusion in Section 4.2.1.1 of the Applicability of the proposed standard for "[n]on-protective functions that are embedded within a Protection System." The standard drafting team also recognized that entities use Protection Systems as part of a routine practice to control BES Elements. As a result, the standard drafting team in Section 4.1.1.2 excluded "[p]rotective functions intended to operate as a control function during switching." Finally, the standard drafting team separately excluded Special Protection Systems and Remedial Action Schemes. Misoperations of Special Protection Systems and Remedial Action Schemes are currently addressed in Reliability Standard PRC-016-0.1. Requirements related to Special Protection Systems and Remedial Action Schemes, as noted above, will be addressed in the second phase of this Project.

2. Proposed Defined Terms and Requirements

a) Proposed Defined Terms

In order to improve the clarity of the definition of Misoperation and the coverage of Protection Systems in the requirements, two new or revised defined terms were developed by the

[35] *See infra* proposed definition of Misoperation in Section IV.B.2.a.

standard drafting team and are proposed for use with the requirements in PRC-004-3. The proposed defined terms and an explanation of each are included below.

(1) Definition of Composite Protection System

A new defined term, "Composite Protection System" has been introduced in the proposed standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element's total complement of protection should be considered while evaluating an operation of that Element's Protection System. The Composite Protection System definition is based on the principle that an Element's multiple layers of protection are intended to function collectively. Five examples of a Composite Protection System are included in the proposed PRC-004-3 Application Guidelines.

(2) Definition of Misoperation

The standard drafting team determined that the existing definition of Misoperation lacked sufficient clarity and specificity to achieve consistent application on a continent-wide basis. The current definition reads:

> • Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
>
> • Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
>
> • Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity.

For example, the terms "specified time" and "abnormal condition" used in the existing definition are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical, yet explainable, condition is a Misoperation. The proposed definition resolves these issues by simplifying the definition to be any failure of a Composite Protection System to operate as intended for protection purposes and provides six categories of Misoperation. The revised definition improves the use of "specified time" by describing a slow trip as a duration that results in the operation of at least one other Element's Composite Protection System in the two categories for a slow trip of a Protection System (Slow Trip – During Fault and Slow Trip – Other Than Fault). The revised definition removes the ambiguity of "abnormal condition" by using the phrase "for a non-Fault condition, and specifically for the failure to trip category, by using the phrase "to operate for a non-Fault condition for which it is designed." The definition of "Misoperation" is further enhanced by incorporating the new proposed term "Composite Protection System" within the definition. The use of Composite Protection System indicates that a single component failure does not constitute a Misoperation if the overall (composite) Protection System operates as intended. Without the reference to Composite Protection System, applicable entities have been left to make a determination as to whether a single component failure would qualify the Protection System operation as a Misoperation and, therefore, has led to inconsistent identification and reporting.

The proposed definition of Misoperation provides additional clarity over the current version. It is based on the principle that an Element's total complement of protection is intended to operate dependably and securely. For example, the Failure to Trip and Slow Trip categories are associated with Protection System dependability, while the Unnecessary Trip categories are associated with Protection System security. The definition includes six categories, as noted below, which provide further differentiation within the definition of what constitutes a Misoperation. The proposed PRC-004-3 Application Guidelines contain additional detail on these categories. The proposed definition reads:

Misoperation: The failure of a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. Failure to Trip – During Fault – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. Failure to Trip – Other Than Fault – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
3. Slow Trip – During Fault – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
4. Slow Trip – Other Than Fault – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
5. Unnecessary Trip – During Fault – An unnecessary Composite Protection System operation for a Fault condition on another Element.
6. Unnecessary Trip – Other Than Fault – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

b) Proposed Requirements

In designing the Requirements[36] in proposed PRC-004-3, the standard drafting team used three objectives as identified in the SAR as a drafting guide to ensure key elements were included in the proposed standard. First, the standard must include the review of all Protection System operations on the Bulk Electric System in order to identify those operations that classify as Misoperations of Protection Systems for Facilities that are part of the Bulk Electric System.[37] Second, the standard must require entities to analyze Misoperations of Protection Systems for Facilities that are part of the Bulk Electric System to identify the cause(s). Third, the standard must require entities to develop and implement Corrective Action Plans to address the cause(s) of Misoperations of Protection Systems for Facilities that are part of the Bulk Electric System.

(1) Requirement R1

> ***R1.*** *Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated under the circumstances in Parts 1.1 through 1.3 shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*
>
> > ***1.1*** *The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and*
> >
> > ***1.2*** *The BES interrupting device owner owns all or part of the Composite Protection System; and*
> >
> > ***1.3*** *The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation or was caused by manual intervention in response to its Protection System failure to operate.*

---

36 A graphical representation demonstrating the relationships between Requirements developed by the standard drafting team can be found on page 42 of proposed PRC-004-3 in the Application Guidelines.

37 NERC will address Misoperations associated with Special Protection Systems and Remedial Action Schemes in the second phase of this project.

Requirement R1 requires a review of each BES interrupting device[38] operation meeting the circumstances in Parts 1.1, 1.2, and 1.3 to identify whether or not a Misoperation may have occurred. Since the BES interrupting device owner monitors and tracks device operations, the owner is the logical entity to initiate the process of identifying Misoperations of Protection Systems for BES Elements. A review is required when (1) a BES interrupting device operates that is caused by a Protection System or by manual intervention in response to a Protection System failure to operate, (2) the owner owns all or part of the Protection System component(s), and (3) the owner identified its Protection System component(s) as causing the BES interrupting device operation or the operation was caused by manual intervention in response to its Protection System failure to operate.

The applicable entity in Requirement R1 has 120 calendar days[39] to identify whether a BES interrupting device operation was initiated by a Protection System Misoperation. Once the applicable entity has identified a Misoperation, it has completed its performance under Requirement R1. Identified Misoperations without an identified cause become subject to Requirement R4 and any subsequent Requirements as necessary. Identified Misoperations with an identified cause become subject to Requirement R5 and any subsequent Requirements as necessary. While identifying the cause is implicit in the structure of the proposed standard, it is necessary to identify the cause in order to determine whether an entity is responsible for performance under other Requirements.

---

[38] A BES interrupting device is a BES Element, e.g. a circuit breaker or circuit switcher that has the capability to interrupt fault current. Although BES interrupting device mechanisms are not part of a Protection System, the standard uses the operation of a BES interrupting device by a Protection System to initiate the review for Misoperation. *See* PRC-004-3, Application Guidelines at 23.

[39] The time period within each Requirement is distinct and separate from the time periods listed in other Requirements.

(2) Requirement R2

R2. *Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in Parts 2.1 and 2.2. [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

> ***2.1*** *For a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:*
>
> > ***2.1.1*** *The BES interrupting device owner shares the Composite Protection System ownership with any other owner; and*
> >
> > ***2.1.2*** *The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and*
> >
> > ***2.1.3*** *The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.*
>
> ***2.2*** *For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's BES Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.*

Requirement R2 ensures notification occurs to those who must play a role in identifying Misoperations for an applicable BES interrupting device operation. Notification is not accounted for within Requirement R1 to limit each requirement to a single performance category in each requirement. In the case of multi-entity ownership, the entity that owns the BES interrupting device that operated is expected to identify those Protection System operations meeting the circumstances in Parts 2.1.1, 2.1.2, and 2.1.3; however, if the entity that owns a BES interrupting device determines that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation, it must notify the other Protection System owner(s) that share Misoperation identification responsibility when the criteria in Requirement R2 are met. Requirement R2 does not preclude the Protection System owners from initially communicating and working together to determine whether a Misoperation occurred and, if so, the cause. Notification is required when the circumstances in Parts 2.1.1, 2.1.2, and 2.1.3 are met, thus avoiding unnecessary notifications and redirecting of resources by the recipient. The applicable entity has 120 calendar days, based on the date of the BES interrupting device operation, to provide notification to the other Protection System owners that meet the circumstances in Parts 2.1 and 2.2.

Part 2.2 is applicable when a BES interrupting device fails to operate due to a Protection System failure and results in operation of a Protection System intended to operate as backup protection for a condition on another entity's BES Element. In this case, the entity that provided backup protection, upon identifying operation of its Protection System providing backup protection for a condition on another entity's BES Element, must provide notification of the operation to the other. The applicable entity receiving the notification must initiate a review of its Protection System under Requirement R3.

Of particular note, a Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in Part 2.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the Generator Owner and Transmission Owner functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.

(3) Requirement R3

> ***R3.*** *Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation. [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

For Requirement R3 (i.e., notification received), the entity that also owns a portion of the Composite Protection System is expected to identify whether the Protection System operation is a Misoperation. A combination of available information from resources such as operation counters, relay targets, supervisory control and data acquisition (SCADA), Disturbance Monitoring Equipment (DME), and information from the other owner(s) would typically be used to determine whether or not a Misoperation occurred. The entity that is notified by the BES interrupting device owner is allowed until the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation date to determine if its Protection System components caused a Misoperation. It is expected that in most cases of a jointly owned Protection System, the entity making notification would have been in communication with the other owner(s) early in the process. This means that the "60 calendar days" only comes into play if the notification occurs in the second half of the 120 calendar days allotted to the BES interrupting device owner in Requirement R1. This setup assures that entities will, at a minimum, have 60 calendar days to determine if its Protection System components caused a Misoperation.

(4) Requirement R4

> ***R4.*** *Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: [Violation Risk Factor: Medium] [Time Horizon: Operations Assessment, Operations Planning]*
>
> - *The identification of the cause(s) of the Misoperation; or*
> - *A declaration that no cause was identified.*

Requirement R4 requires the entity that owns the BES interrupting device or an entity that was notified to take investigative action(s) to determine the cause(s) of an identified Misoperation for its portion of the Composite Protection System. The standard drafting team included this Requirement because there will be cases where the cause(s) of a Misoperation will not be revealed during the review for Misoperation in Requirements R1 or R3. Requirement R4 provides a mechanism to continue the investigative work to determine the cause(s) of an identified Misoperation when the cause is not known. At least one investigative action must be performed every two full calendar quarters until the investigation is completed. This time period was allocated in recognition of the time needed to schedule and complete certain planned investigative actions. The entity's investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined.

(5) Requirement R5

> ***R5.*** *Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-Term Planning]*

• Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations; or

• Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.

Resolving the causes of Protection System Misoperations benefits BES reliability by preventing recurrence. A formal Corrective Action Plan ("CAP") is a proven tool for resolving and reducing the possibility of recurrence of operational problems. When the Misoperation cause is identified in Requirement R1, R3 or R4, Requirement R5 requires Protection System owner(s), within 60 calendar days of first determining a cause, to develop a CAP, or explain why corrective actions are beyond the entity's control or would not improve BES reliability. The 60 calendar day period for developing a CAP (or declaration) is established based on industry experience, which includes operational coordination timeframes, time to consider alternative solutions, coordination of resources, and development of a schedule. The development of a CAP is intended to document the specific corrective actions needed to prevent Misoperation recurrence, the timetable for executing such actions, and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. The evaluation of these other Protection Systems aims to reduce the risk and likelihood of similar Misoperations of other Protection Systems. The PRC-004-3 Application Guidelines contain examples of CAPs and other declarations to assist applicable entities.

(6) Requirement R6

R6. *Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. [Violation Risk Factor: Medium][Time Horizon: Operations Planning, Long-Term Planning]*

To achieve the stated purpose of this standard, which is to identify and correct the causes of Misoperations of Protection Systems for BES Elements, the responsible entity is required to implement a CAP that addresses the specific problem (i.e., cause(s) of the Misoperation) through completion. Protection System owners are required in the implementation of a CAP to update it when actions or timetables change, until completed. Accomplishing this objective is intended to reduce the occurrence of future Misoperations of a similar nature, thereby improving reliability and minimizing risk to the Bulk-Power System.

3. Improvements Reflected in Proposed PRC-004-3

Proposed PRC-004-3 and its associated new and revised definitions improve upon the currently effective Reliability Standard and the current method of collecting Misoperation data. First, the proposed standard takes the three reliability activities co-mingled in the Requirements of PRC-004-2.1a and separates them into individual Requirements. Second, the Requirements now also include additional specificity for notifying other owners and requiring other owners that receive notification to review its Protection System components for Misoperations. Third, the revised definition of Misoperation and the revised Applicability section of proposed PRC-004-3 provide necessary clarity regarding the components, conditions, and categories that are within scope of the review for Misoperations. Fourth, as noted below in NERC's response to the Commission's directives, the results-based Requirements in proposed PRC-004-3 require performance based on uniform, continent-wide criteria for the analysis of Protection System operations through Requirements R1, R2, R3, and R4 and mitigation of identified Misoperations (Requirements R5 and R6). As a result, NERC is able to streamline the body of Reliability Standards and eliminate PRC-003-1, allowing NERC to increase uniformity in the approach to addressing Misoperations. Finally, moving the periodic reporting of Misoperations from the standard and into a separate data request pursuant to Section 1600 of NERC's Rules of Procedure will permit NERC's data analysis to continue separately from compliance with the standard and continue reporting, using a standardized template, for all entities subject to the data request. All of these improvements will result in improved and more consistent review, reporting, and analysis of Protection System operations for Misoperation.

C. Consideration of the Commission's Directives

In Order No. 693, the Commission issued directives related to both PRC-004-3 and PRC-003-1, leaving unresolved issues for NERC to address. With respect to PRC-003-1, the Commission did not approve or remand PRC-003-1, instead choosing to wait to act until NERC submitted additional information.[40] As explained in the Tables of Issues and Directives (Exhibit E) and the Mapping Document (Exhibit C), PRC-003-1 will be retired by proposed PRC-004-3. The results-based Requirements in proposed PRC-004-3 require performance based on uniform, continent-wide criteria for the analysis of Protection System operations through Requirements R1, R2, R3, and R4 and mitigation of identified Misoperations (Requirements R5 and R6). Thus, it is not necessary to maintain a separate standard for process alone. Therefore, NERC will not submit the additional information needed to obtain Commission action to approve PRC-003-1. The standard drafting team has considered the additional directive from Order No. 693 related to PRC-003-1 in its construction of PRC-004-3. In P 1461, the Commission directed NERC to consider whether greater consistency can be achieved. This is achieved, as noted above, through the uniform, continent-wide criteria for analyzing Protection System operations and identifying Misoperations and by maintaining the reporting requirements for periodic

---

[40] Order No. 693 at P 1460.

Misoperations based on a continent-wide template. All reporting of Misoperations will be done through the separate Misoperations Data Request instead of having PRC-004-3 specify an administrative reporting requirement as a compliance element. The Misoperations Data Request has been included for informational purposes as Exhibit H.

With respect to PRC-004, the Commission directed NERC in Order No. 693 to "consider ISO-NE's suggestion that LSEs and transmission operators should be included in the applicability section, in the Reliability Standards development process as it modifies PRC-004-1."[41] The standard drafting team took ISO-NE's comments under advisement and determined that the proper functional entities to include in the applicability are the Transmission Owner, Generator Owner, and Distribution Provider who own the BES Protection Systems. Owners of Protection Systems have personnel with subject matter expertise, Protection System design and setting information, and disturbance monitoring data, necessary to identify whether Protection System components cause a Misoperation, identify causes, and develop and implement CAPs. As owners of Protection Systems, the Transmission Owner, Generator Owner, and Distribution Provider have the responsibility to assure proper operation and implement corrective actions as needed. It therefore would be inappropriate to assign responsibility to entities that do not own Protection Systems, such as Load Serving Entities and Transmission Operators.

D. Enforceability of Proposed Reliability Standards

The proposed Reliability Standard PRC-004-3 includes Measures that support each requirement to help ensure that the requirements will be enforced in a clear, consistent, non-preferential manner and without prejudice to any party. The proposed Reliability Standard also includes VRFs and VSLs for each requirement. The VRFs and VSLs for the proposed

---

[41] *Id.* at P 1469.

Reliability Standard comport with NERC and Commission guidelines related to their assignment. A detailed analysis of the assignment of VRFs and the VSLs for proposed PRC-004-3 is included as Exhibit F.

V. CONCLUSION

For the reasons set forth above, NERC respectfully requests that the Commission approve:

- the proposed Reliability Standard and other associated elements included in Exhibit A;
- the new and revised definitions, as noted herein;
- the VRFs and VSLs (Exhibits A and F); and
- the Implementation Plan, including the noted retirement, included in Exhibit B.

Respectfully submitted,

/s/ William H. Edwards

Date: September 15, 2014

CERTIFICATE OF SERVICE

I hereby certify that I have served a copy of the foregoing document upon all parties listed on the official service list compiled by the Secretary in the RM06-16-000 proceeding.

Dated at Washington, D.C. this 15th day of September, 2014.

/s/ William H. Edwards

William H. Edwards
Counsel for North American Electric Reliability Corporation

Exhibit A

Proposed Reliability Standard PRC-004-3

A. Introduction

1. **Title:** **Protection System Misoperation Identification and Correction**

2. **Number:** PRC-004-3

3. **Purpose:** Identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Transmission Owner

   4.1.2 Generator Owner

   4.1.3 Distribution Provider

   4.2. Facilities:

   4.2.1 Protection Systems for BES Elements, with the following exclusions:

   4.2.1.1 Non-protective functions that are embedded within a Protection System.

   4.2.1.2 Protective functions intended to operate as a control function during switching.[1]

   4.2.1.3 Special Protection Systems (SPS).

   4.2.1.4 Remedial Action Schemes (RAS).

   4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

5. **Background**:

   A key factor for BES reliability is the correct performance of Protection Systems. The monitoring of Protection System events for BES Elements, as well as identifying and correcting the causes of Misoperations, will improve Protection System performance. This Reliability Standard PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In the FERC Order No. 693, the Commission identified PRC-003-0 as a "fill-in-the-blank" standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the Requirements of PRC-004-2.1a. This is a potential reliability gap;

[1] For additional information and examples, see the "Non-Protective Functions" and "Control Functions" sections in the Application Guidelines.

consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

This project includes revising the existing definition of Misoperation, which reads:

Misoperation

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity.

In general, this definition needed more specificity and clarity. The terms “specified time” and “abnormal condition” are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical, yet explainable, condition is a Misoperation.

The SAR for this project also included clarifying reporting requirements. Misoperation data, as currently collected and reported, is not optimal to establish consistent metrics for measuring Protection System performance. As such, the data reporting obligation for this standard is being removed and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information (“data request”). As a result of the data request, NERC will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. The removal of the data collection obligation from the standard does not result in a reduction of reliability. The standard and data request have been developed in a manner such that evidence used for compliance with the standard and data request are intended to be independent of each other.

The proposed Requirements of the revised Reliability Standard PRC-004-3 meet the following objectives:

- Review all Protection System operations on the BES to identify those that are Misoperations of Protection Systems for Facilities that are part of the BES.
- Analyze Misoperations of Protection Systems for Facilities that are part of the BES to identify the cause(s).
- Develop and implement Corrective Action Plans to address the cause(s) of Misoperations of Protection Systems for Facilities that are part of the BES.

Misoperations associated with Special Protection Schemes (SPS) and Remedial Action Schemes (RAS) are not addressed in this standard due to their inherent complexities. NERC plans to handle SPS and RAS in the second phase of this project.

The Western Electric Coordinating Council (WECC) Regional Reliability Standard PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation relates to the reporting of Misoperations of Protection Systems and RAS for a limited set of WECC Paths. The WECC region plans to conduct work to harmonize the regional standard with this continent-wide proposed standard and the second phase of this project concerning SPS and RAS.

Undervoltage load shedding (UVLS) has not been included in this standard's applicability because Misoperations of UVLS relays are currently addressed by Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance, Requirement R1.5. Underfrequency load shedding (UFLS) was added to PRC-004-3 to close a gap in reliability as Misoperations of UFLS relays are not covered by a Reliability Standard currently.

6. Effective Dates:

The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated under the circumstances in Parts 1.1 through 1.3 shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation: *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and

1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and

1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation or was caused by manual intervention in response to its Protection System failure to operate.

M1. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified the Misoperation of its Protection System component(s), if any, that meet the circumstances in Requirement R1, Parts 1.1, 1.2, and 1.3 within the allotted time period. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in Parts 2.1 and 2.2. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

2.1 For a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:

2.1.1 The BES interrupting device owner shares the Composite Protection System ownership with any other owner; and

2.1.2 The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and

2.1.3 The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.

2.2 For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's BES Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.

M2. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates notification to the other owner(s), within the allotted time period for either Requirement R2, Part 2.1, including subparts 2.1.1, 2.1.2, and 2.1.3 and Requirement R2, Part 2.2. Acceptable evidence for Requirement R2, including Parts 2.1 and 2.2 may include, but is not limited to the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified whether its Protection System component(s) caused a Misoperation within the allotted time period. Acceptable evidence for Requirement R3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: *[Violation Risk Factor: Medium] [Time Horizon: Operations Assessment, Operations Planning]*

- The identification of the cause(s) of the Misoperation; or
- A declaration that no cause was identified.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it performed at least one investigative action according to Requirement R4 every two full calendar quarters until a cause is identified or a declaration is made. Acceptable evidence for Requirement R4 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations; or
- Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP's applicability to other Protection Systems and locations, or a declaration in accordance with Requirement R5. Acceptable evidence for Requirement R5 may include, but is not limited to the following dated documentation (electronic or hardcopy format): CAP and evaluation, or declaration.

R6. Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. *[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Long-Term Planning]*

M6. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it implemented each CAP, including updating actions or timetables. Acceptable evidence for Requirement R6 may include, but is not limited to the following dated documentation (electronic or hardcopy format): records that document the implementation of each CAP and the completion of actions for each CAP including revision history of each CAP. Evidence may also include work management program records, work orders, and maintenance records.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

> The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirements R1, R2, R3, and R4, Measures M1, M2, M3, and M4 for a minimum of 12 calendar months following the completion of each Requirement.
>
> The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R5, Measure M5, including any supporting analysis per Requirements R1, R2, R3, and R4, for a minimum of 12 calendar months following completion of each CAP, completion of each evaluation, and completion of each declaration.
>
> The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R6, Measure M6 for a minimum of 12 calendar months following completion of each CAP.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

D. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to identify whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R2	Operations Assessment, Operations Planning	Medium	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late. OR The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	Operations Assessment, Operations Planning	Medium	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late. OR The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.

2.1a		Errata change: Edited R2 to add "…and generator interconnection Facility…"	Revision under Project 2010-07
2.1a	February 9, 2012	Errata change adopted by the Board of Trustees	
2.1a	September 19, 2013	FERC Order issued approving PRC-004-2.1a (approval becomes effective November 25, 2013).	
3	August 14, 2014	Adopted by Board of Trustees	Revision under Project 2010-05.1

Guidelines and Technical Basis

Introduction

This standard addresses the reliability issues identified in the letter[3] from Gerry Cauley, NERC President and CEO, dated January 7, 2011.

> "Nearly all major system failures, excluding perhaps those caused by severe weather, have misoperations of relays or automatic controls as a factor contributing to the propagation of the failure. …Relays can misoperate, either operate when not needed or fail to operate when needed, for a number of reasons. First, the device could experience an internal failure – but this is rare. Most commonly, relays fail to operate correctly due to incorrect settings, improper coordination (of timing and set points) with other devices, ineffective maintenance and testing, or failure of communications channels or power supplies. Preventable errors can be introduced by field personnel and their supervisors or more programmatically by the organization."

The standard also addresses the findings in the *2011 Risk Assessment of Reliability Performance*[4]; July 2011.

> "…a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry."

The *State of Reliability 2014*[5] report continued to identify Protection System Misoperations as a significant contributor to automatic transmission outage severity. The report recommended completion of the development of PRC-004-3 as part of the solution to address Protection System Misoperations.

Definitions

The Misoperation definition is based on the IEEE/PSRC Working Group I3 "Transmission Protective Relay System Performance Measuring Methodology[6]." Misoperations of a Protection System include failure to operate, slowness in operating, or operating when not required either during a Fault or non-Fault condition.

6 "Transmission Protective Relay System Performance Measuring Methodology." Working Group I3 of Power System Relaying Committee of IEEE Power Engineering Society. 1999.

For reference, a "Protection System" is defined in the *Glossary of Terms Used in NERC Reliability Standards* ("NERC Glossary") as:

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

A BES interrupting device is a BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current. Although BES interrupting device mechanisms are not part of a Protection System, the standard uses the operation of a BES interrupting device by a Protection System to initiate the review for Misoperation.

The following two definitions are being proposed for inclusion in the NERC Glossary:

> **Composite Protection System –** *The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element's Protection System(s) is excluded.*

The Composite Protection System definition is based on the principle that an Element's multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element's total complement of protection should be considered while evaluating an operation.

Composite Protection System – Line Example

The Composite Protection System of the Alpha-Beta line (Circuit #123) is comprised of current differential, permissive overreaching transfer trip (POTT), step distance (classic zone 1, zone 2, and zone 3), instantaneous-overcurrent, time-overcurrent, out-of-step, and overvoltage protection. The protection is housed at the Alpha and Beta substations, and includes the associated relays, communications systems, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Transformer Example

The Composite Protection System of the Alpha transformer (#2) is comprised of internal differential, overall differential, instantaneous-overcurrent, and time-overcurrent protection. The protection is housed at the Alpha substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Generator Example

The Composite Protection System of the Beta generator (#3) is comprised of generator differential, overall differential, overcurrent, stator ground, reverse power, volts per hertz, loss-of-field, and undervoltage protection. The protection is housed at the Beta generating plant and at the Beta substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Breaker Failure Example

Breaker failure protection provides backup protection for the breaker, and therefore is part of the breaker’s Composite Protection System. Considering breaker failure protection to be part of another Element’s Composite Protection System could lead to an incorrect conclusion that a breaker failure operation automatically satisfies the “Slow Trip” criteria of the Misoperation definition.

- An example of a correct operation of the breaker’s Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. The breaker failure relaying operated because of a failed trip coil. The failed trip coil caused a Misoperation of the line’s Composite Protection System.
- An example of a correct operation of the breaker’s Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. Only the breaker failure relaying operated because of a failed breaker mechanism. This was not a Misoperation because the breaker mechanism is not part of the breaker’s Composite Protection System.
- An example of an “Unnecessary Trip – During Fault” is when the breaker failure relaying tripped at the same time as the line relaying during a Fault. The Misoperation was due to the breaker failure timer being set to zero.

Misoperation – *The failure a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:*

1. **Failure to Trip – During Fault –** *A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*
2. ***Failure to Trip – Other Than Fault*** *– A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*

3. ***Slow Trip – During Fault*** *– A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.*
4. ***Slow Trip – Other Than Fault*** *– A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.*
5. ***Unnecessary Trip – During Fault*** *– An unnecessary Composite Protection System operation for a Fault condition on another Element.*
6. ***Unnecessary Trip – Other Than Fault*** *– An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.*

The Misoperation definition is based on the principle that an Element's total complement of protection is intended to operate dependably and securely.

- Failure to automatically reclose after a Fault condition is not included as a Misoperation because reclosing equipment is not included within the definition of Protection System.
- A breaker failure operation does not, in itself, constitute a Misoperation.
- A remote backup operation resulting from a "Failure to Trip" or a "Slow Trip" does not, in itself, constitute a Misoperation.

This proposed definition of Misoperation provides additional clarity over the current version. A Misoperation is the failure of a Composite Protection System to operate as intended for protection purposes. The definition includes six categories which provide further differentiation of what constitutes a Misoperation. These categories are discussed in greater detail in the following sections.

Failure to Trip – During Fault

This category of Misoperation typically results in the Fault condition being cleared by remote backup Protection System operation.

Example 1a: A failure of a transformer's Composite Protection System to operate for a transformer Fault is a Misoperation.

Example 1b: A failure of a "primary" transformer relay (or any other component) to operate for a transformer Fault is not a "Failure to Trip – During Fault" Misoperation as long as another component of the transformer's Composite Protection System operated.

Example 1c: A lack of target information does not by itself constitute a Misoperation. When a high-speed pilot system does not target because a high-speed zone element trips first, it would not in and of itself be a Misoperation.

Example 1d: A failure of an overall differential relay to operate is not a "Failure to Trip – During Fault" Misoperation as long as another component such as a generator differential relay operated.

Example 1e: The Composite Protection System for a bus does not operate during a bus Fault which results in the operation of all local transformer Protection Systems connected to that bus and all remote line Protection Systems connected to that bus isolating the faulted bus from the grid. The operation of the local transformer Protection Systems and the operation of all remote line Protection Systems correctly provided backup protection. There is one “Failure to Trip – During Fault” Misoperation of the bus Composite Protection System.

In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – During Fault” category applies to the operation.

Failure to Trip – Other Than Fault

This category of Misoperation may have resulted in operator intervention. The “Failure to Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

Example 2a: A failure of a generator's Composite Protection System to operate for an unintentional loss of field condition is a Misoperation.

Example 2b: A failure of an overexcitation relay (or any other component) is not a "Failure to Trip – Other Than Fault" Misoperation as long as the generator's Composite Protection System operated as intended isolating the generator from the BES.

In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – Other Than Fault” category applies to the operation.

Slow Trip – During Fault

This category of Misoperation typically results in remote backup Protection System operation before the Fault is cleared.

Example 3a: A Composite Protection System that is slower than required for a Fault condition is a Misoperation if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. The current differential element of a multiple function relay failed to operate for a line Fault. The same relay's time-overcurrent element operated after a time delay. However, an adjacent line also operated from a time-overcurrent element. The faulted line's time-overcurrent element was found to be set to trip too slowly.

Example 3b: A failure of a breaker's Composite Protection System to operate as quickly as intended to meet the expected critical Fault clearing time for a line Fault in conjunction with a breaker failure (i.e., stuck breaker) is a Misoperation if it resulted in an unintended operation of at least one other Element’s Composite Protection System. If a generating unit’s Composite Protection System operates due to instability caused by the slow trip of the breaker's Composite Protection System, it is not an “Unnecessary Trip – During Fault” Misoperation of the generating unit’s Composite Protection System. This event would be a “Slow Trip – During Fault” Misoperation of the breaker's Composite Protection System.

Example 3c: A line connected to a generation interconnection station is protected with two independent high-speed pilot systems. The Composite Protection System for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. During a Fault on this line, the two pilot systems fail to operate and the time-overcurrent scheme operates clearing the Fault with no generating units or other Elements tripping (i.e., no over-trips). This event is not a Misoperation.

The phrase “slower than required” means the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

The phrase “resulted in the operation of any other Composite Protection System” refers to the need to ensure that relaying operates in the proper or planned sequence (i.e., the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

In analyzing the Protection System for Misoperation, the entity must also consider the “Unnecessary Trip – During Fault” category to determine if an “unnecessary trip” applies to the Protection System operation of an Element other than the faulted Element.

If a coordination error was at the local terminal (i.e., set too slow), then it was a "Slow Trip," category of Misoperation at the local terminal.

Slow Trip – Other Than Fault

The phrase “slower than required” means the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

Example 4: A phase to phase fault occurred on the terminals of a generator. The generator's Composite Protection System and a transmission line's Composite Protection System both operated in response to the fault. It was found during subsequent investigation that the generator protection contained an inappropriate time delay. This caused the transmission line's correctly set overreaching zone of protection to operate. This was a Misoperation of the generator’s Composite Protection System, but not of the transmission line’s Composite Protection System.

The “Slow Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

Unnecessary Trip – During Fault

An operation of a properly coordinated remote Protection System is not in and of itself a Misoperation if the Fault has persisted for a sufficient time to allow the correct operation of the Composite Protection System of the faulted Element to clear the Fault. A BES interrupting device failure, a “failure to trip” Misoperation, or a “slow trip” Misoperation may result in a proper remote Protection System operation.

> **Example 5:** An operation of a transformer's Composite Protection System which trips (i.e., over-trips) for a properly cleared line Fault is a Misoperation. The Fault is cleared properly by the faulted equipment's Composite Protection System (i.e., line relaying) without the need for an external Protection System operation resulting in an unnecessary trip of the transformer protection; therefore, the transformer Protection System operation is a Misoperation.
>
> **Example 5b:** An operation of a line's Composite Protection System which trips (i.e., over-trips) for a properly cleared Fault on a different line is a Misoperation. The Fault is cleared properly by the faulted line's Composite Protection System (i.e., line relaying); however, elsewhere in the system, a carrier blocking signal is not transmitted (e.g., carrier ON/OFF switch found in OFF position) resulting in the operation of a remote Protection System, single-end trip of a non-faulted line. The operation of the Protection System for the non-faulted line is an unnecessary trip during a Fault. Therefore, the non-faulted line Protection System operation is an “Unnecessary Trip – During Fault” Misoperation.
>
> **Example 5c:** If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip – During Fault" category of Misoperation at the remote terminal.

Unnecessary Trip – Other Than Fault

Unnecessary trips for non-Fault conditions include but are not limited to: power swings, overexcitation, loss of excitation, frequency excursions, and normal operations.

> **Example 6a:** An operation of a line's Composite Protection System due to a relay failure during normal operation is a Misoperation.
>
> **Example 6b:** Tripping a generator by the operation of the loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation assuming the Composite Protection System was not intended to operate under this condition.
>
> **Example 6c:** An impedance line relay trip for a power swing that entered the relay’s characteristic is a Misoperation if the power swing was stable and the relay operated because power swing blocking was enabled and should have prevented the trip, but did not.
>
> **Example 6d:** Tripping a generator operating at normal load by the operation of a reverse power protection relay due to a relay failure is a Misoperation.

Additionally, an operation that occurs during a non-Fault condition but was initiated directly by on-site (i.e., real-time) maintenance, testing, inspection, construction, or commissioning is not a Misoperation.

> **Example 6e:** A BES interrupting device operation that occurs at the remote end of a line during a non-Fault condition because a direct transfer trip was initiated by system maintenance and testing activities at the local end of the line is not a Misoperation because of the maintenance exclusion in category 6 of the definition of "Misoperation."

The "on-site" activities at one location that initiates a trip to another location are included in this exemption. This includes operation of a Protection System when energizing equipment to facilitate measurements, such as verification of current circuits as a part of performing commissioning; however, once the maintenance, testing, inspection, construction, or commissioning activity associated with the Protection System is complete, the "on-site" Misoperation exclusion no longer applies, regardless of the presence of on-site personnel.

Special Cases

Protection System operations for these cases would not be a Misoperation.

> **Example 7a:** A generator Protection System operation prior to closing the unit breaker(s) is not a Misoperation provided no in-service Elements are tripped.

This type of operation is not a Misoperation because the generating unit is not synchronized and is isolated from the BES. Protection System operations that occur when the protected Element is out of service and that do not trip any in-service Elements are not Misoperations.

In some cases where zones of protection overlap, the owner(s) of Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element.

> **Example 7b:** The high-side of a transformer connected to a line may be within the zone of protection of the supplying line's relaying. In this case, the line relaying is planned to protect the area of the high-side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for Faults on the high-side of the connected transformer. Therefore, the operation of the line relaying for a high-side transformer Fault operated as intended and would not be a Misoperation.

Below are examples of conditions that would be a Misoperation.

> **Example7c:** A 230 kV shunt capacitor bank was released for operational service. The capacitor bank trips due to a settings error in the capacitor bank differential relay upon energization.

> **Example 7d:** A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush after being released for operational service. Only the high-side breaker opens since the low-side breaker had not yet been closed.

Non-Protective Functions

BES interrupting device operations which are initiated by non-protective functions, such as those associated with generator controls, excitation controls, or turbine/boiler controls, static voltampere-reactive compensators (SVC), flexible ac transmission systems (FACTS), high-voltage dc (HVdc) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. The standard is not applicable to non-protective functions such as automation (e.g., data collection) or control functions that are embedded within a Protection System.

Control Functions

The entity must make a determination as to whether the standard is applicable to each operation of its Protection System in accordance with the provided exclusions in the standard's Applicability, see Section 4.2.1. The subject matter experts (SME) developing this standard recognize that entities use Protection Systems as part of a routine practice to control BES Elements. This standard is not applicable to operation of protective functions within a Protection System when intended for controlling a BES Element as a part of an entity's process or planned switching sequence. The following are examples of conditions to which this standard is not applicable:

> **Example 8a:** The reverse power protective function that operates to remove a generating unit from service using the entity's normal or routine process.
>
> **Example 8b:** The reverse power relay enables a permissive trip and the generator operator trips the unit.

The standard is not applicable to operation of the protective relay because its operation is intended as a control function as part of a controlled shutdown sequence for the generator. However, the standard remains applicable to operation of the reverse power relay when it operates for conditions not associated with the controlled shutdown sequence, such as a motoring condition caused by a trip of the prime mover.

The following is another example of a condition to which this standard is not applicable:

> **Example 8c:** Operation of a capacitor bank interrupting device for voltage control using functions embedded within a microprocessor based relay that is part of a Protection System.

The above are examples only, and do not constitute an all-inclusive list to which the standard is not applicable.

Extenuating Circumstances

In the event of a natural disaster or other extenuating circumstances, the December 20, 2012 Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, reads: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." The Regional Entities to whom NERC has delegated authority will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

The volume of Protection System operations tend to be sporadic. If a high rate of Protection System operations is not sustained, utilities will have an opportunity to catch up within the 120 day period.

Requirement Time Periods

The time periods within all the Requirements are distinct and separate. The applicable entity in Requirement R1 has 120 calendar days to identify whether a BES interrupting device operation is a Misoperation. Once the applicable entity has identified a Misoperation, it has completed its performance under Requirement R1. Identified Misoperations without an identified cause become subject to Requirement R4 and any subsequent Requirements as necessary. Identified Misoperations with an identified cause become subject to Requirement R5 and any subsequent Requirements as necessary.

In Requirement R2, the applicable entity has 120 calendar days, based on the date of the BES interrupting device operation, to provide notification to the other Protection System owners that meet the circumstances in Parts 2.1 and 2.2. For the case of an applicable entity that was notified (R3), it has the later of 120 calendar days from the date of the BES interrupting device operation or 60 calendar days of notification to identify whether its Protection System components caused a Misoperation.

Once a Misoperation is identified in either Requirement R1 or R3, and the applicable entity did not identify the cause(s) of the Misoperation, the time period for performing at least one investigative action every two full calendar quarters begins. The time period(s) in Requirement R4 resets upon each period. When the applicable entity's investigative actions identify the cause of the identified Misoperation or the applicable entity declares that no cause was found, the applicable entity has completed its performance in Requirement R4.

The time period in Requirement R5 begins when the Misoperation cause is first identified. The applicable entity is allotted 60 calendar days to perform one of the two activities listed in Requirement R5 (e.g., CAP or declaration) to complete its performance under Requirement R5.

Requirement R6 time period is determined by the actions and the associated timetable to complete those actions identified in the CAP. The time periods contained in the CAP may change from time to time and the applicable entity is required to update the timetable when it changes.

Time periods provided in the Requirements are intended to provide a reasonable amount of time to perform each Requirement. Performing activities in the least amount of time facilitates prompt identification of Misoperations, notification to other Protection System owners, identification of the cause(s), correction of the cause(s), and that important information is retained that may be lost due to time.

Requirement R1

This Requirement initiates a review of each BES interrupting device operation to identify whether or not a Misoperation may have occurred. Since the BES interrupting device owner typically monitors and tracks device operations, the owner is the logical starting point for identifying Misoperations of Protection Systems for BES Elements. A review is required when (1) a BES interrupting device operates that is caused by a Protection System or by manual intervention in response to a Protection System failure to operate, (2) regardless of whether the owner owns all or part of the Protection System component(s), and (3) the owner identified its Protection System component(s) as causing the BES interrupting device operation or was caused by manual intervention in response to its Protection System failure to operate.

Since most Misoperations result in the operation of one or more BES interrupting devices, these operations initiate a review to identify any Misoperation. If an Element is manually isolated in response to a failure to operate, the manual isolation of the Element triggers a review for Misoperation.

> **Example R1a:** The failure of a loss of field relay on a generating unit where an operator takes action to isolate the unit.

Manual intervention may indicate a Misoperation has occurred, thus requiring the initiation of an investigation by the BES interrupting device owner.

For the case where a BES interrupting device did not operate and remote clearing occurs due to the failure of a Composite Protection System to operate, the BES interrupting device owner would still review the operation under Requirement R1. However, if the BES interrupting device owner determines that its Protection System component operated as backup protection for a condition on another entity’s BES Element, the owner would provide notification of the operation to the other Protection System owner(s) under Requirement R2, Part 2.2.

Protection Systems are made of many components. These components may be owned by different entities. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner’s differential relay. All of these components and many more are part of a Protection System. It is expected that all of the owners will communicate with each other, sharing information freely, so that Protection System operations can be analyzed, Misoperations identified, and corrective actions taken.

Each entity is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation regardless of the level of ownership. A combination of available information from resources such as counters, relay targets, Supervisory Control and Data Acquisition (SCADA) systems, or Disturbance Monitoring Equipment (DME) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a cause of the Misoperation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation. The entity is allotted 120 calendar days from the date of its BES interrupting device operation to identify whether its Protection System component(s) caused a Misoperation.

The Protection System operation may be documented in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System.

Repeated operations which occur during the same automatic reclosing sequence do not need a separate identification under Requirement R1. Repeated Misoperations which occur during the same 24-hour period do not need a separate identification under Requirement R1. This is consistent with the NERC *Misoperations Report*[7] which states:

> "In order to avoid skewing the data with these repeated events, the NERC SPCS should clarify, in the next annual update of the misoperation template, that all misoperations due to the same equipment and cause within a 24 hour period be recorded as one misoperation."

The following is an example of a condition that is not a Misoperation.

> **Example R1b:** A high impedance Fault occurs within a transformer. The sudden pressure relaying detects and operates for the Fault, but the differential relaying did not operate due to the low Fault current levels. This is not a Misoperation because the Composite Protection System was not required to operate because the Fault was cleared by the sudden pressure relay.

Requirement R2

Requirement R2 ensures notification of those who have a role in identifying Misoperations, but were not accounted for within Requirement R1. In the case of multi-entity ownership, the entity that owns the BES interrupting device that operated is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation under Requirement R1; however, if the entity that owns a BES interrupting device determines that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation, it must notify the other Protection System owner(s) that share Misoperation identification responsibility when the criteria in Requirement R2 is met.

This Requirement does not preclude the Protection System owners from initially communicating and working together to determine whether a Misoperation occurred and, if so, the cause. The BES interrupting device owner is only required to officially notify the other owners when it: (1) shares the Composite Protection System ownership with other entity(ies), (2) determines that a Misoperation occurred or cannot rule out a Misoperation, and (3) determines its Protection System component(s) did not cause a Misoperation or is unsure. Officially notifying the other owners without performing a preliminary review may unnecessarily burden the other owners with compliance obligations under Requirement R3, redirect valuable resources, and add little

---

[7] "Misoperations Report." Reporting Multiple Occurrences. NERC Protection System Misoperations Task Force. http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf. April 1, 2013. pg. 37 of 40.

benefit to reliability. The BES interrupting device owner should officially notify other owners when appropriate within the established time period.

The following is an example of a notification to another Protection System owner:

> **Example R2a:** Circuit breakers A and B at the Charlie station tripped from directional comparison blocking (DCB) relaying on 03/03/2014 at 15:43 UTC during an external Fault. As discussed last week, the fault records indicate that a problem with your equipment (failure to transmit) caused the operation.

> **Example R2b:** A generator unit tripped out immediately upon synchronizing to the grid due to a Misoperation of its overcurrent protection. The Transmission Owner owns the 230 kV generator breaker that operated. The Transmission Owner, as the owner of the BES interrupting device after determining that its Protection System components did not cause the Misoperation, notified the Generator Owner of the operation. The Generator Owner investigated and determined that its Protection System components caused the Misoperation. In this example, the Generator Owner's Protection System components did cause the Misoperation. As the owner of the Protection System components that caused the Misoperation, the Generator Owner is responsible for creating and implementing the CAP.

A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in Part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the Generator Owner and Transmission Owner functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.

> **Example R2c:** Line A Composite Protection System (owned by entity 1) failed to operate for an internal Fault. As a result, the zone 3 portion of Line B's Composite Protection System (owned by entity 2) and zone 3 portion of Line C's Composite Protection System (owned by entity 3) operated to clear the Fault. Entity 2 and 3 notified entity 1 of the remote zone 3 operation.

For the case where a BES interrupting device operates to provide backup protection for a non-BES Element, the entity reviewing the operation is not required to notify the other owners of Protection Systems for non-BES Elements. No notification is required because this Reliability Standard is not applicable to Protection Systems for non-BES Elements.

Requirement R3

For Requirement R3 (i.e., notification received), the entity that also owns a portion of the Composite Protection System is expected to use judgment to identify whether the Protection System operation is a Misoperation. A combination of available information from resources such as counters, relay targets, SCADA, DME, and information from the other owner(s) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion.

In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a cause of the Misoperation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation.

The entity that is notified by the BES interrupting device owner is allotted the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation date to determine if its portion of the Composite Protection System caused the Protection System operation. It is expected that in most cases of a jointly owned Protection System, the entity making notification would have been in communication with the other owner(s) early in the process. This means that the shorter 60 calendar days only comes into play if the notification occurs in the second half of the 120 calendar days allotted to the BES interrupting device owner in Requirement R1.

The Protection System review may be organized in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System. The BES interrupting device owner's notification received may be documented in a variety of ways such as an email or a facsimile.

Requirement R4

The entity in Requirement R4 (i.e., cause identification), whether it is the entity that owns the BES interrupting device or an entity that was notified, is expected to use due diligence in taking investigative action(s) to determine the cause(s) of an identified Misoperation for its portion of the Composite Protection System. The SMEs developing this standard recognize there will be cases where the cause(s) of a Misoperation will not be revealed during the allotted time periods in Requirements R1 or R3; therefore, Requirement R4 provides the entity a mechanism to continue its investigative work to determine the cause(s) of the Misoperation when the cause is not known.

A combination of available information from resources such as counters, relay targets, SCADA, DME, test results, and studies would typically be used to determine the cause of the Misoperation. At least one investigative action must be performed every two full calendar quarters until the investigation is completed.

The following is an example of investigative actions taken to determine the cause of an identified Misoperation:

> **Example R4a**: A Misoperation was identified on 03/18/2014. A line outage to test the Protection System was scheduled on 03/24/2014 for 12/15/2014 as the first investigative action (i.e., beyond the next two full calendar quarters) due to summer peak conditions. The protection engineer contacted the manufacturer on 04/10/2014 (i.e., within two full calendar quarters) to obtain any known issues. The engineer reviewed manufacturer's documents on 05/27/2014. The outage schedule was confirmed on 08/29/2014 and was taken on 12/15/2014. Testing was completed on 12/16/2014 (i.e., in the second two full quarters) revealing the microprocessor relay as the cause of the Misoperation. A CAP is being developed to replace the relay.

Periodic action minimizes compliance burdens and focuses the entity's effort on determining the cause(s) of the Misoperation while providing measurable evidence. The SMEs recognize that certain planned investigative actions may require months or years to schedule and complete; therefore, the entity is only required to perform at least one investigative action every two full calendar quarters. If an investigative action is performed in the first quarter of a calendar year, the next investigative action would need to be performed by the end of the third calendar quarter. If an investigative action is performed in the last quarter of a calendar year, the next investigative action would need to be performed by the end of the second calendar quarter of the following calendar year. Investigative actions may include a variety of actions, such as reviewing DME records, performing or reviewing studies, completing relay calibration or testing, requesting manufacturer review, requesting an outage, or confirming a schedule.

The entity's investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for identifying the Misoperation cause. Historically, approximately 12% of Misoperations are unknown or unexplainable.[8]

Although the entity only has to document its specific investigative actions taken to determine the cause(s) of an identified Misoperation, the entity should consider the benefits of formally organizing (e.g., in a report or database) its actions and findings. Well documented investigative actions and findings may be helpful in future investigations of a similar event or circumstances. A thorough report or database may contain a detailed description of the event, information gathered, investigative actions, findings, possible causes, identified causes, and conclusions. Multiple owners of a Composite Protection System might consider working together to produce a common report for their mutual benefit.

[8] NERC System Protection and Control Subcommittee. Misoperations Report. April 1, 2013: http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf. Figure 15: NERC Wide Misoperations by Cause Code. pg. 22 of 40.

The following are examples of a declaration where no cause was determined:

Example R4b: A Misoperation was identified on 04/11/2014. All relays at station A and B functioned properly during testing on 08/26/2014 as the first investigative action. The carrier system functioned properly during testing on 08/27/2014. The carrier coupling equipment functioned properly during testing on 08/28/2014. A settings review completed on 09/03/2014 indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be correct, and the equipment at station A and station B is already monitored. The investigation is being closed because no cause was found.

Example R4c: A Misoperation was identified on 03/22/2014. The protection scheme was replaced before the cause was identified. The power line carrier or PLC based protection was replaced with fiber-optic based protection with an in-service date of 04/16/2014. The new system will be monitored for recurrence of the Misoperation.

Requirement R5

Resolving the causes of Protection System Misoperations benefits BES reliability by preventing recurrence. The Corrective Action Plan (CAP) is an established tool for resolving operational problems. The NERC Glossary defines a Corrective Action Plan as, *"A list of actions and an associated timetable for implementation to remedy a specific problem."* Since a CAP addresses specific problems, the determination of what went wrong needs to be completed before developing a CAP. When the Misoperation cause is identified in Requirement R1, R3 or R4, Requirement R5 requires Protection System owner(s) to develop a CAP, or explain why corrective actions are beyond the entity's control or would not improve BES reliability. The entity must develop the CAP or make a declaration why additional actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken within 60 calendar days of first determining a cause.

The SMEs developing this standard recognize there may be multiple causes for a Misoperation. In these circumstances, the CAP would include a remedy for the identified causes. The CAP may be revised if additional causes are found; therefore, the entity has the option to create a single or multiple CAP(s) to correct multiple causes of a Misoperation. The 60 calendar day period for developing a CAP (or declaration) is established on the basis of industry experience which includes operational coordination timeframes, time to consider alternative solutions, coordination of resources, and development of a schedule.

The development of a CAP is intended to document the specific corrective actions needed to be taken to prevent Misoperation recurrence, the timetable for executing such actions, and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. The evaluation of these other Protection Systems aims to reduce the risk and likelihood of similar Misoperations in other Protection Systems. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP and an evaluation of other Protection Systems including other locations must be developed to complete Requirement R5.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined capacitor replacement was not necessary.

For completion of each CAP in Examples R5a through R5d, please see Examples R6a through R6d.

> **Example R5a:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay has not been experiencing problems and is systematically being replaced with microprocessor relays as Protection Systems are modernized. Therefore, it was assessed that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for the system.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

> **Example R5b:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, a program should be established by 12/01/2014 for wholesale preemptive replacement of capacitors in this type of impedance relay.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

> **Example R5c:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.
>
> Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, the preemptive replacement of capacitors in this type of impedance relay should be pursued for the identified stations A through I by 04/30/2015.
>
> A plan is being developed to replace the impedance relay capacitors at stations A, B, and C by 09/01/2014. A second plan is being developed to replace the impedance relay capacitors at stations D, E, and F by 11/01/2014. The last plan will replace the impedance relay capacitors at stations G, H, and I by 02/01/2015.

The following is an example of a CAP for a relay Misoperation that was due to a version 2 firmware problem and the evaluation of the cause at similar locations which determined the firmware needs preemptive correction action.

> **Example R5d:** Actions: Provide the manufacturer fault records. Install new firmware pending manufacturer results by 10/01/2014.
>
> Applicability to other Protection Systems: Based on the evaluation of other locations and a risk assessment, the newer firmware version 3 should be installed at all installations that are identified to be version 2. Twelve relays were identified across the system. Proposed completion date is 12/31/2014.

The following are examples of a declaration made where corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken.

> **Example R5e:** The cause of the Misoperation was due to a non-registered entity communications provider problem.
>
> **Example R5f:** The cause of the Misoperation was due to a transmission transformer tapped industrial customer who initiated a direct transfer trip to a registered entity's transmission breaker.

In situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity's control.

The following are examples of declarations made why corrective actions would not improve BES reliability.

> **Example R5g:** The investigation showed that the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations.
>
> **Example R5h:** As a result of an operation that left a portion of the power system in an electrical island condition, circuit XYZ within that island tripped, resulting in loss of load within the island. Subsequent investigation showed an overfrequency condition persisted after the formation of that island and the XYZ line protective relay operated. Since this relay was operating outside of its designed frequency range and would not be subject to this condition when line XYZ is operated normally connected to the BES, no corrective action will be taken because BES reliability would not be improved.

> **Example R5i:** During a major ice storm, four of six circuits were lost at Station A. Subsequent to the loss of these circuits, a skywire (i.e., shield wire) broke near station A on line AB (between Station A and B) resulting in a phase-phase Fault. The protection scheme utilized for both protection groups is a permissive overreaching transfer trip (POTT). The Line AB protection at Station B tripped timed for this event (i.e., Slow Trip – During Fault) even though this line had been identified as requiring high speed clearing. A weak infeed condition was created at Station A due to the loss of 4 transmission circuits resulting in the absence of a permissive signal on Line AB from Station A during this Fault. No corrective action will be taken for this Misoperation as even under N-1 conditions, there is normally enough infeed at Station A to send a proper permissive signal to station B. Any changes to the protection scheme to account for this would not improve BES reliability.

A declaration why corrective actions are beyond the entity's control or would not improve BES reliability should include the Misoperation cause and the justification for taking no corrective action. Furthermore, a declaration that no further corrective actions will be taken is expected to be used sparingly.

Requirement R6

To achieve the stated purpose of this standard, which is to identify and correct the causes of Misoperations of Protection Systems for BES Elements, the responsible entity is required to implement a CAP that addresses the specific problem (i.e., cause(s) of the Misoperation) through completion. Protection System owners are required in the implementation of a CAP to update it when actions or timetable change, until completed. Accomplishing this objective is intended to reduce the occurrence of future Misoperations of a similar nature, thereby improving reliability and minimizing risk to the BES.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip (See also, Example R5a).

> **Example R6a:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.
>
> CAP completed on 06/25/2014.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip that resulted in the correction and the establishment of a program for further replacements (See also, Example R5b).

> **Example R6b:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.
>
> A program for wholesale preemptive replacement of capacitors in this type of impedance relay was established on 10/28/2014.
>
> CAP completed on 10/28/2014.

The following is an example of a completed CAP of corrective actions with a timetable that required updating for a failed relay and preemptive actions for similar installations (See also, Example R5c).

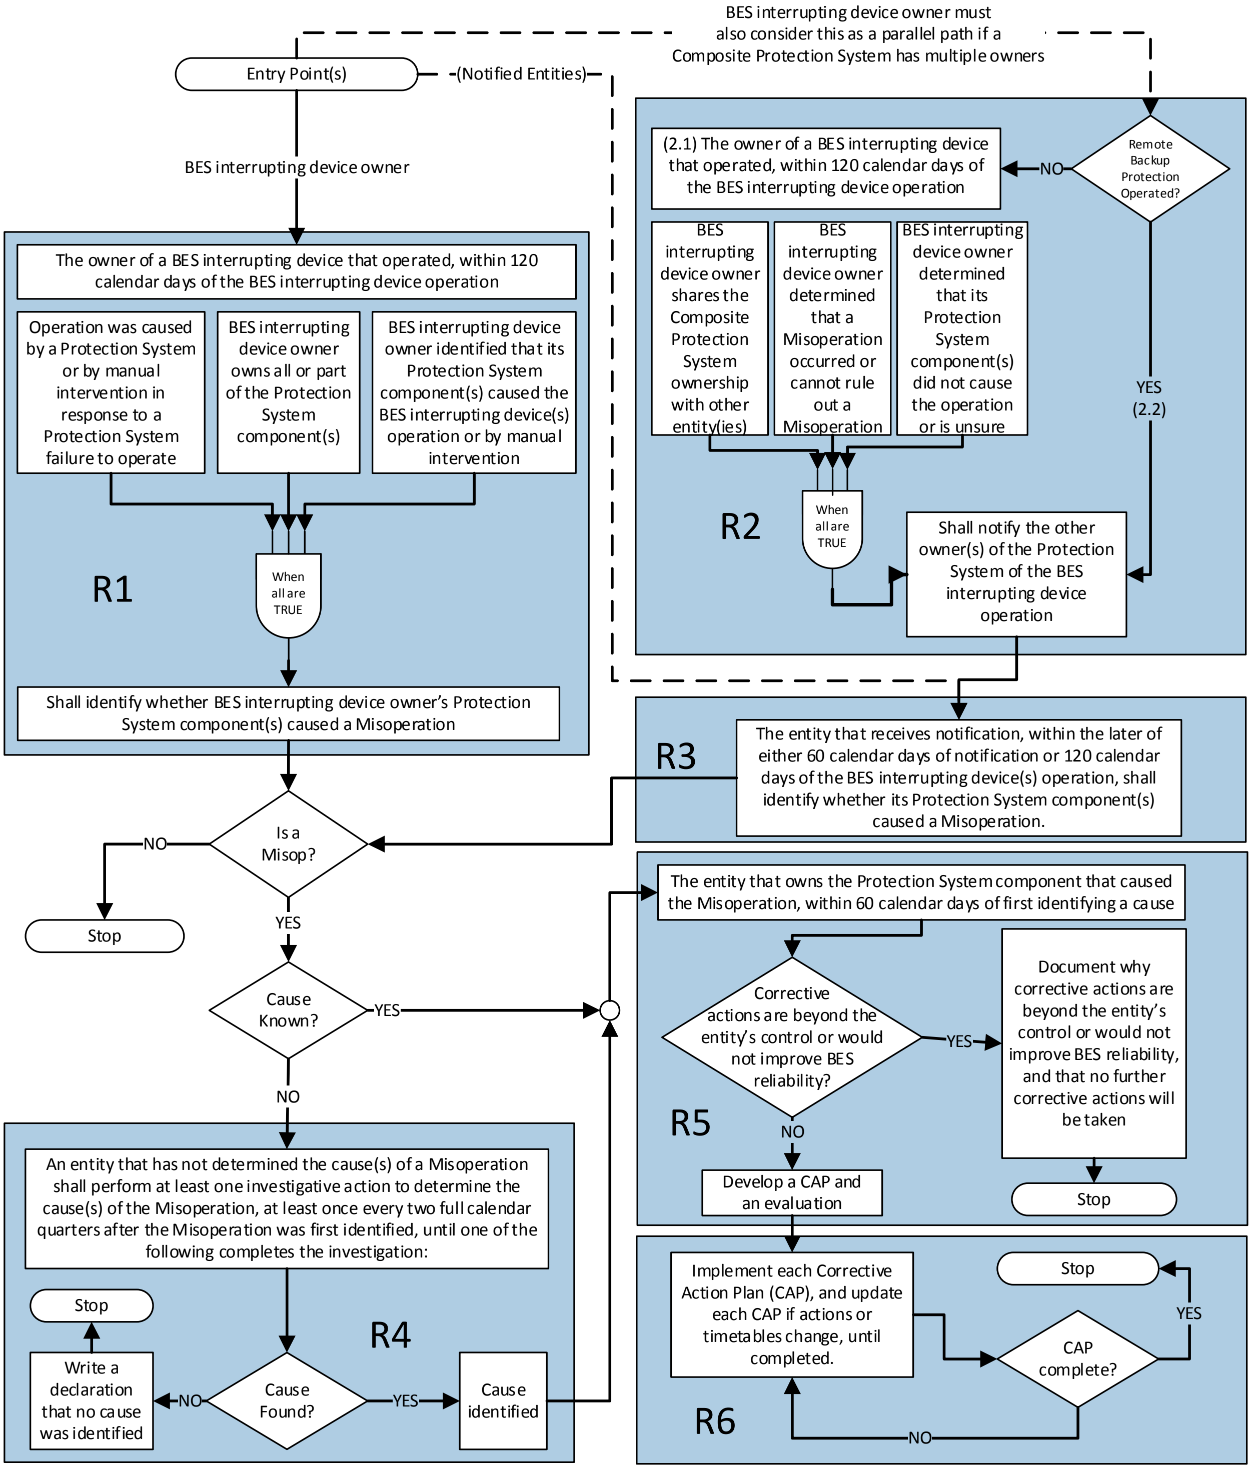
> **Example R6c:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.
>
> The impedance relay capacitor replacement was completed at stations A, B, and C on 08/16/2014. The impedance relay capacitor replacement was completed at stations D, E, and F on 10/24/2014. The impedance relay capacitor replacement for stations G, H, and I were postponed due to resource rescheduling from a scheduled 02/01/15 completion to 04/01/2015 completion. Capacitor replacement was completed on 03/09/2015 at stations G, H, and I. All stations identified in the evaluation have been completed.
>
> CAP completed on 03/09/2015.

The following is an example of a completed CAP for corrective actions with updated actions for a firmware problem and preemptive actions for similar installations. (See also, Example R5d).

> **Example R6d:** Actions: fault records were provided to the manufacturer on 06/04/2014. The manufacturer responded that the Misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 08/12/2014.
>
> Nine of the twelve relays were updated to version 3 firmware on 09/23/2014. The manufacturer provided a subsequent update which was determined to be beneficial for the remaining relays. The remaining three of twelve relays identified as having the version 2 firmware were updated to version 3.01 firmware on 11/10/2014.
>
> CAP completed on 11/10/2014.

The CAP is complete when all of the actions identified within the CAP have been completed.

Process Flow Chart: Below is a graphical representation demonstrating the relationships between Requirements:



Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes were moved to this section.

Rationale for Applicability:

Protection Systems that protect BES Elements are integral to the operation and reliability of the BES. Some functions of relays are not used as protection but as control functions or for automation; therefore, any operation of the control function portion or the automation portion of relays is excluded from this standard. See the Application Guidelines for detailed examples of non-protective functions. Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are excluded in this standard because they are planned to be handled in the second phase of this project.

Rationale for R1:

This Requirement ensures that entities review those Protection System operations meeting the circumstances in all three Parts (1.1, 1.2, and 1.3) and identify any that are Misoperations. The BES interrupting device owner is assigned the responsibility to initiate the review because the owner is in the best position to be aware of the operation. Manual intervention is included as a condition that initiates a review. Occasionally, Protection System failures do not yield other Protection System operations and manual intervention is required to isolate the problematic equipment. The 120 calendar day period accounts for the sporadic volumes of Protection System operations, and provides the opportunity to identify any Misoperations which were initially missed.

Rationale for R2:

Part 2.1 ensures that the BES interrupting device owner notifies the other owners of the Composite Protection System. The phrase "owner(s) that share Misoperation identification responsibility" allows entities to notify the specific other owners that will actually review the operation to determine if a Misoperation occurred. Part 2.2 ensures that the Protection System owner(s) for which backup protection was provided receives notification, within the same 120 calendar day period as R1. This ensures other entities are notified to review their Protection System components. The expectation is that entities will communicate accordingly and when it is clear that Part 2.1, 2.2, or both are met, the entity would make the notification. It is not intended for entities to automatically and unnecessarily notify other entities before adequate detail is known.

Rationale for R3:

When an entity receives notification of a Protection System operation by the BES interrupting device owner, the other Protection System owner is allotted at least 60 calendar days to identify whether it was a Misoperation. A shorter time period is allotted on the basis that the BES interrupting device owner has already performed preliminary work, collaborated with the other owners, and that other owners generally have fewer associated Protection System components.

Rationale for R4:

If a Misoperation cause is not identified within the time period established by Requirements R1 or R3 (i.e., 120 calendar days), the Protection System component owner must demonstrate investigative actions toward identifying the cause(s). Performing at least one action every two full calendar quarters from first identifying the Misoperation encourages periodic focus on finding the cause of the Misoperation.

Rationale for R5:

A formal CAP is a proven tool for resolving and reducing the possibility of reoccurrence of operational problems. A time period of 60 calendar days is based on industry experience and operational coordination time needed for considering such things as alternative solutions, coordination of resources, or development of a schedule. When the cause of a Misoperation is identified, a CAP will generally be developed. An evaluation of the CAP's applicability to the entity's other Protection Systems including other locations helps identify similar problems, the potential for Misoperation occurrences in other Protection Systems, common mode failure, design problems, etc.

In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, a statement documenting the reasons for taking no corrective actions is essential for future reference and for justifying the absence of a CAP.

Rationale for R6:

Each CAP must accomplish all identified objectives to be complete. During the course of implementing a CAP, updates may be necessary for a variety of reasons such as new information, scheduling conflicts, or resource issues. Documenting changes or completion of CAP activities provides measurable progress and confirmation of completion.

Exhibit B

Implementation Plan

Implementation Plan

Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)

Requested Approvals

- PRC-004-3 – Protection System Misoperation Identification and Correction
- Definitions of "Composite Protection System" and "Misoperation"

Requested Retirements

- PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection System
- PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

Prerequisite Approvals

- None

Revisions to Defined Terms in the NERC Glossary

The standard drafting team proposes the following new definition:

Composite Protection System:

The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element's Protection System(s) is excluded.

The standard drafting team proposes the following revised definition:

Misoperation:

The failure of a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage,

overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.

3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.
6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction or commissioning activities is not a Misoperation.

General Considerations

The implementation period allows adequate time for applicable entities to develop or modify its procedures and processes for reviewing Protection System operations. The development and implementation of a Corrective Action Plan remains within the scope of PRC-004; therefore, little additional time and resources should be needed to account for the increased detail in the required performance identified in the proposed PRC-004-3 Reliability Standard. The obligation for reporting Misoperations has been removed from PRC-004 and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information.

Applicability

This standard applies to the following functional entities:

- Transmission Owner
- Generator Owner
- Distribution Provider

This standard applies to the following Facilities:

- Protection Systems for BES Elements, with the following exclusions:
    - Non-protective functions that are embedded within a Protection System.
    - Protective functions intended to operate as a control function during switching.
    - Special Protection Systems (SPS).
    - Remedial Action Schemes (RAS).
- Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

Effective Dates of New or Revised Standards and Definitions

The standard, the revised definition of “Misoperation,” and the new definition of “Composite Protection System” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard, the revised definition of “Misoperation,” and the new definition of “Composite Protection System” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Retirement of Existing Standards

The existing standards, PRC-003-1 and PRC-004-2.1a, shall be retired at midnight of the day immediately prior to the Effective Date of PRC-004-3.

Exhibit C

Mapping Document

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Mapping Document

Project 2010-05.1 Protection Systems: Phase 1 (Misoperations)

Revisions or Retirements to Already Approved Standards

This mapping document shows the translation of PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems and PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations into the proposed PRC-004-3 – Protection System Misoperation Identification and Correction Reliability Standard. The following table identifies the sections of the approved standard that shall be added, retired, or revised when this standard is implemented. If the standard drafting team is recommending revisions to the standard, those changes are identified in the "Translation to PRC-004-3 or Other Action" column.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
4. Applicability: **4.1.** Regional Reliability Organization	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider	The proposed standard properly assigns responsibility to the registered entity functions that are responsible for Protection System Misoperation identification and correction. The Transmission Owner, Generator Owner, and Distribution Provider, by function, are Protection System asset owners and are in the best position be aware of and apply resources to review Protection System operations.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
R1. Each Regional Reliability Organization shall establish, document and maintain its procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations. These procedures shall include the following elements:		The Requirements in the proposed PRC-004-3 standard by their results-based standard (RBS) construction requires performance that is implicit of having procedures for the analysis of Protection System operations (R1, R2, R3, and R4) and mitigation of identified Misoperations (R5 and R6). The proposed requirements also directs focus to areas most important to reliability. For example, Requirement R1 requires the applicable entity to initiate a review upon a Bulk Electric System (BES) interrupting device operation and identify any Misoperation. Requirement R2 requires the applicable entity to notify all other owners that share a Misoperation identification responsibility of the Composite Protection System when it determines (or is unsure) its Protection System component(s) did not cause the BES interrupting device operation or it cannot rule out a Misoperation. Requirement R3 requires the notified entity to identify any Misoperation of its Protection System component(s) similar to Requirement R1. Requirement R4 directs the applicable entity to

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		continue its investigative work to determine the cause(s) of an identified Misoperation, if not determined in R1 or R3, until the cause(s) is determined or the entity declares that it is unable to determine the cause. Requirements R5 and R6 for developing and implementing a Corrective Action Plan (CAP) are also implicit of having a documented procedure. The implicit performance required by Requirements R1 through R6 necessitate that an entity have procedures to accomplish the objectives of the proposed standard. Requiring the applicable entities to have procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.
R1.1. The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**4.2.** Facilities: **4.2.1** Protection Systems for BES Elements, with the following exclusions: **4.2.1.1** Non-protective functions that are embedded	The previous PRC-003-1, Requirement R1.1 required the Regional Reliability Organization (RRO) to identify the Protection Systems to be reviewed and analyzed for Misoperation. The applicable Facilities have been clarified in the proposed PRC-004-3 to include Protection Systems for

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	within a Protection System. **4.2.1.2** Protective functions intended to operate as a control function during switching. **4.2.1.3** Special Protection Systems (SPS). **4.2.1.4** Remedial Action Schemes (RAS). **4.2.2** Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.	BES Elements. Additional language is provided for clarity that non-protective functions and those protective functions that are intended to operate as a control function (e.g., a reverse power relay operated to remove a generating unit from service as opposed to providing anti-motoring protection) are not applicable. The standard's Applicability is further clarified to include underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements to be more precise. Protection Systems associated with Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are excluded and will be addressed in phase two of this project and have been excluded in the Applicability.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated under the circumstances in 1.1 through 1.3 shall, within 120 calendar days of the BES interrupting device operation, identify whether its	The applicable entities will be required to identify whether a Misoperation occurred for each BES interrupting device operation which meet criteria 1.1 through 1.3. Requirement R1 is most clearly the direct carryover from the PRC-003-1 Reliability Standard which involves the "owner" of the Protection System. The previous standard was silent on the responsibilities of other Protection System owners and had no provision for

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	Protection System component(s) caused a Misoperation: **1.1** The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and **1.2** The BES interrupting device owner owns all or part of the Composite Protection System; and **1.3** The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation or was caused by manual intervention in response to a Protection System failure to operate.	ensuring that other owners had a responsibility to be involved in the review and analysis.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed	**R2.** Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated	Requirement R2 asserts a responsibility on the initiating entity (i.e., BES interrupting device owner) to notify other owners of the Composite Protection System when

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
for Misoperations (due to their potential impact on BES reliability).	shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in 2.1 and 2.2. **2.1** When a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances: **2.1.1** The BES interrupting device owner shares the Composite Protection System ownership with any other entity; and	the cause of a Protection System operation was not caused (or is undetermined) by the BES interrupting device owner and when a Misoperation is identified (or cannot be ruled out) in accordance with Part 2.1, including sub-parts 2.1.1 through 2.1.3.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	2.1.2 The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and **2.1.3** The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation. **2.2** For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's BES Element, notification of the operation shall	(Part 2.2) Since Requirement R1 initiates the reliability activity upon the operation of a BES interrupting device, Requirement R1 does not address the case of a Protection System failure where a remote BES interrupting device operates. The second Part 2.2 of Requirement R2 is a provision to require notification to the other owners when a remote BES interrupting device operates as backup protection for a condition on another entity's BES Element. This generally indicates that another BES interrupting device has most likely failed to operate. Part 2.2 requires the other owner for which backup protection was provided to be notified, thus initiating the reliability activity to

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	be provided to the other Protection System owner(s) for which that backup protection was provided.	identify a possible Misoperation under Requirement R3 by the other owner(s).
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	**R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation.	Requirement R3 places responsibility on the applicable entity that receives notification to review its Protection System component(s) for Misoperations similar to Requirement R1. It is common practice for the BES interrupting device owner that initiates the review to be in communication and collaboration with other Protection System component(s) owners during its review within the 120 calendar day period. The shorter 60 calendar day period for the notified entity assures that in the rare case where the notifying entity takes the majority of its allotted time (120 calendar days) to review an operation, the receiving entity will always have a minimum and reasonable time (60 calendar days) to conduct its review.
(Continued) **R1.1.** The Protection Systems to be reviewed and analyzed	**R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a	Requirement R4 is essentially a new requirement to determine the cause(s) of a Misoperation where the previous requirements (i.e., R1 or R3) failed to reveal the

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
for Misoperations (due to their potential impact on BES reliability).	Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: • The identification of the cause(s) of the Misoperation; or • A declaration that no cause was identified.	cause(s) of a Misoperation. In most cases, the cause(s) of a Misoperation will be revealed during the course of review and when the cause(s) is not readily apparent, the applicable entity is required in Requirement R4 to conduct at least one investigative action every two full calendar quarters until the entity determines the cause(s) or declares that it could not determine the cause.
R1.2. Data reporting requirements (periodicity and format) for Misoperations.	None.	NERC Rules of Procedure, Section 1600 Request for Information or Data will replace the reporting obligations of the applicable entities. As such, reporting to Regional Entities will end and continent-wide single reporting to the Electric Reliability Organization (ERO) will be required. The ERO will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		remediation techniques; and publicize lessons learned for the industry. Metrics will be validated and shared with each Regional Entity. The removal of the data collection from the standard does not result in a reduction of reliability.
R1.3. Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	**R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: • Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations, or • Explain in a declaration why corrective actions are beyond the	The proposed PRC-004-3, Requirement R5 provides a step not apparent in the previous PRC-003-1 which is the development of a Corrective Action Plan (CAP) within 60 calendar days of first identifying the Misoperation cause. Requirement R5 also requires each applicable entity to perform an evaluation of the CAP's applicability to the entity's other Protection Systems, including those at other locations. Furthermore, Requirement R5 accounts for those cases why corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken. This could be a result of a cause created by a non-registered third party, such as a communication provider. Also, should implementing the changes not improve BES reliability, the entity may

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	entity's control or would not improve BES reliability, and that no further corrective actions will be taken.	document in a declaration that a CAP is not practical. The entity must explain in a declaration why no further action will be taken.
(Continued) **R1.3.** Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	**R6.** Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed.	Requirement R6 requires the implementation of the CAP. The applicable entity must update the CAP if actions or timetables change until the CAP is completed.
R1.4. Identification of the Regional Reliability Organization group responsible for the procedures and the process for approval of the procedures.	None.	The proposed PRC-004-3 now requires the applicable entities (GO, DP, and TO) to individually address Misoperations of its Protection Systems for BES Elements without regard to the Region or Regions in which it owns Protection Systems for BES Elements. The proposed PRC-004-3 Reliability Standard, revised definition of "Misoperation," and new definition of "Composite Protection System" provide sufficient clarity to entities; therefore, there is no reliability benefit to obtain the Regional Entity's (formerly Regional Reliability

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		Organization or RRO) approval of procedures. Each applicable entity will be measured on its performance with the proposed PRC-004-3 requirements.
R2. Each Regional Reliability Organization shall maintain and periodically update documentation of its procedures for review, analysis, reporting, and mitigation of transmission and generation Protection System Misoperations.	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider	The proposed PRC-004-3 implicitly requires each applicable entity to have its own procedures and processes; therefore, there is no need to have a specific requirement for dictating the updating of such procedures or processes by the previous Regional Reliability Organization (now Regional Entity) or applicable entities. Requiring the applicable entities to update procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.
R3. Each Regional Reliability Organization shall distribute procedures in Requirement 1 and any changes to those procedures, to the affected Transmission	None.	The proposed PRC-004-3 implicitly requires each applicable entity to have its own procedures and processes; therefore, there is no longer a need to distribute such procedures or processes by the previous Regional Reliability Organization (now Regional Entity) to the applicable entities. Requiring the applicable entities to distribute procedures is an activity or task that does

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners within 30 calendar days of approval of those procedures.		little, if anything, to benefit or protect the reliable operation of the BES.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
4. Applicability: **4.1.** Transmission Owner **4.2.** Distribution Provider that owns a transmission Protection System **4.3.** Generator Owner	**4. Applicability:** **4.1. Functional Entities:** **4.1.1** Transmission Owner **4.1.2** Generator Owner **4.1.3** Distribution Provider **4.2.** Facilities: **4.2.1** Protection Systems for BES Elements, with the following exclusions: **4.2.1.1** Non-protective functions that are embedded within a Protection System. **4.2.1.2** Protective functions intended to operate as a control function during switching. **4.2.1.3** Special Protection Systems (SPS). **4.2.1.4** Remedial Action Schemes (RAS).	The same applicable entities will transition to the new PRC-004-3 standard. The clause about the Distribution Provider "*that owns a transmission Protection System*" has been removed because it was ambiguous. This clause is replaced by "*Protection Systems for BES Elements*" found in Section 4.2, Facilities and applies to all the applicable entities. Having the Applicability section address Facilities specifically removes the ambiguity of what a "*transmission Protection System*" includes. The proposed PRC-004-3 standard is specific that it includes those Protection Systems for BES Elements, including UFLS that is intended to trip one or more BES Elements. Additional language is provided for clarity that non-protective functions and those protective functions that are intended to operate as a control function (e.g., a reverse power relay operated to remove a generating unit from service) are not applicable. The standard's Applicability is further clarified to include underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements to be more precise. Protection Systems associated with Special Protection Systems (SPS) and

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.	Remedial Action Schemes (RAS) are addressed in phase two of this project and have been excluded in the Applicability.
R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures. **R2.** The Generator Owner shall analyze its generator and generator	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated under the circumstances in 1.1 through 1.3 shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation: **1.1** The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and **1.2** The BES interrupting device owner owns all or part of the Composite Protection System; and	The currently approved standard PRC-004-2.1a, Requirements R1 and R2 include three levels of performance which is analyze (Protection System operations), develop (CAP), and implement (CAP). The proposed standard, which includes the same three applicable entities (DP, GO, and TO), divides the three levels of performance into six discrete Requirements. Requirement R1 provides the "analyze" portion, requiring the initiating BES interrupting device owner to review its Protection System for each BES interrupting device operation that meets the three criteria (i.e., 1.1 thorough 1.3).

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
interconnection Facility Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.	**1.3** The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation or was caused by manual intervention in response to a Protection System failure to operate. **R2.** Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in 2.1 and 2.2. **2.1** When a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the	The "analyze" portion is further clarified in the proposed Requirement R2 by ensuring that any other owners of the Composite Protection System are notified when the cause of a Protection System operation was not caused (or is undetermined) by the BES interrupting device owner and when a Misoperation is identified (or cannot be ruled out) in accordance with Part 2.1, including sub-parts 2.1.1 through 2.1.3.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances: **2.1.1** The BES interrupting device owner shares the Composite Protection System ownership with any other entity; and **2.1.2** The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and **2.1.3** The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether	

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	its Protection System components caused the BES interrupting device(s) operation. **2.2** For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's BES Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided. **R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation.	(Part 2.2) Since Requirement R1 initiates the reliability activity upon the operation of a BES interrupting device, Requirement R1 does not address the case of a Protection System failure where a remote BES interrupting device operates. The second Part 2.2 of Requirement R2 is a provision to require notification to the other owners when a remote BES interrupting device operates as backup protection for a condition on another entity's BES Element. This generally indicates that another BES interrupting device has most likely failed to operate. Part 2.2 requires the other owner for which backup protection was provided to be notified, thus initiating the reliability activity to identify a possible Misoperation under Requirement R3 by the other owner. Requirement R3 places responsibility on the applicable entity that receives notification to review its Protection System component(s) for Misoperations similar to Requirement R1. It is common practice for the BES interrupting device owner that initiates the review to be

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	R4. Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: • The identification of the cause(s) of the Misoperation; or • A declaration that no cause was identified. **R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar	in communication and collaboration with other Protection System component(s) owners during its review within the 120 calendar day period. The shorter 60 calendar day period for the notified entity assures that in the rare case where the notifying entity takes the majority of its allotted time (120 calendar days) to review an operation, the receiving entity will always have a minimum and reasonable time (60 calendar days) to conduct its review. Requirement R4 is essentially a new requirement to determine the cause(s) of a Misoperation where the previous requirements (i.e., R1 or R3) failed to reveal the cause(s) of an identified Misoperation. In most cases, the cause(s) of a Misoperation will be revealed during the course of review and when the cause(s) is not readily apparent, the applicable entity is required in Requirement R4 to conduct at least one investigative action every two full calendar quarters until the entity determines the cause(s) or declares that it could not determine the cause.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
	days of first identifying a cause of the Misoperation: • Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations, or • Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken. **R6.** Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed.	The proposed PRC-004-3, Requirement R5 provides a step not apparent in the previous PRC-003-1 which is the development of a Corrective Action Plan (CAP) within 60 calendar days of first identifying the Misoperation cause. Requirement R5 also requires each applicable entity to perform an evaluation of the CAP's applicability to the entity's other Protection Systems, including those Protection Systems at other locations. Furthermore, Requirement R5 accounts for those cases why corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken. This could be a result of a cause created by a non-registered third party, such as a communication provider. Also, should implementing the changes not improve BES reliability, the entity must document in a declaration that a CAP actions are beyond the entity's control or would not improve BES reliability. The entity must explain in a declaration why no further action will be taken.

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to PRC-004-3 or Other Action**	**Comments**
		Requirement R6 requires the implementation of the CAP. The applicable entity must update the CAP if actions or timetables change until the CAP is completed.
R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.	None.	Since the NERC Rules of Procedure, Section 1600 Request for Data or Information will replace the reporting obligations, NERC will receive the data on a periodic basis, analyze, establish metrics, and share results accordingly with the Regional Entities as well as industry. Having reporting obligations as a Requirement is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.

Exhibit D

Order No. 672 Criteria

Exhibit D
<u>Order No. 672 Criteria</u>

In Order No. 672,[1] the Commission identified a number of criteria it will use to analyze Reliability Standards proposed for approval to ensure they are just, reasonable, not unduly discriminatory or preferential, and in the public interest. The discussion below identifies these factors and explains how the proposed Reliability Standard has met or exceeded the criteria:

1. **Proposed Reliability Standards must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve that goal.[2]**

Proposed Reliability Standard PRC-004-3 achieves the specific reliability goal of identifying and correcting the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements. Proposed Reliability Standard PRC-004-3 revises the currently effective PRC-004-2.1a Reliability Standard, which ensures that all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System are analyzed and mitigated. The proposed standard also takes into account the reliability objective of PRC-003-1 (Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection

---

[1] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006).

[2] Order No. 672 at P 321. The proposed Reliability Standard must address a reliability concern that falls within the requirements of section 215 of the FPA. That is, it must provide for the reliable operation of Bulk-Power System facilities. It may not extend beyond reliable operation of such facilities or apply to other facilities. Such facilities include all those necessary for operating an interconnected electric energy transmission network, or any portion of that network, including control systems. The proposed Reliability Standard may apply to any design of planned additions or modifications of such facilities that is necessary to provide for reliable operation. It may also apply to Cybersecurity protection.

Order No. 672 at P 324. The proposed Reliability Standard must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve this goal. Although any person may propose a topic for a Reliability Standard to the ERO, in the ERO's process, the specific proposed Reliability Standard should be developed initially by persons within the electric power industry and community with a high level of technical expertise and be based on sound technical and engineering criteria. It should be based on actual data and lessons learned from past operating incidents, where appropriate. The process for ERO approval of a proposed Reliability Standard should be fair and open to all interested persons.

Systems), which is to establish, document and maintain regional procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations. PRC-004-3 eliminates the need for regional procedures by providing continent-wide parameters for investigating Protection System operations and identifying Misoperations.

2. **Proposed Reliability Standards must be applicable only to users, owners and operators of the bulk power system, and must be clear and unambiguous as to what is required and who is required to comply.[3]**

The proposed Reliability Standard applies to Transmission Owners, Generator Owners, and Distribution Providers. It also applies to underfrequency load shedding that is intended to trip one or more Bulk Electric System Elements.. The proposed Reliability Standard is clear and unambiguous as to what is required and who is required to comply. For a complete description of each requirement and the language in each, please refer to Section IV.B.2.b of NERC's Petition. The proposed Reliability Standard separates each performance element required to identify and correct Misoperations into a separate requirement to improve clarity and remove the comingling of performance elements found in the requirements of PRC-004-2.1a. The proposed standard also includes clear timing elements, which are supported by detailed explanation in the application guidelines developed by the standard drafting team.

3. **A proposed Reliability Standard must include clear and understandable consequences and a range of penalties (monetary and/or non-monetary) for a violation.[4]**

---

[3] Order No. 672 at P 322. The proposed Reliability Standard may impose a requirement on any user, owner, or operator of such facilities, but not on others.

Order No. 672 at P 325. The proposed Reliability Standard should be clear and unambiguous regarding what is required and who is required to comply. Users, owners, and operators of the Bulk-Power System must know what they are required to do to maintain reliability.

[4] Order No. 672 at P 326. The possible consequences, including range of possible penalties, for violating a proposed Reliability Standard should be clear and understandable by those who must comply.

The Violation Risk Factor ("VRF") and Violation Severity Level ("VSL") for the proposed Reliability Standard comport with NERC and Commission guidelines related to their assignment. The assignment of the severity levels for the VSLs is consistent with the corresponding Requirement and will ensure uniformity and consistency in the determination of penalties. The VSLs do not use any ambiguous terminology, and support uniformity and consistency in the determination of similar penalties for similar violations. For these reasons, the proposed Reliability Standard includes clear and understandable consequences.

4. A proposed Reliability Standard must identify clear and objective criterion or measure for compliance, so that it can be enforced in a consistent and non-preferential manner.[5]

The proposed Reliability Standard contains Measures that support the requirements by clearly identifying what is required and how the requirements will be measured for compliance. The Measures, contained in Section C of the proposed PRC-004-3 Reliability Standard are as follows:

> **M1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified the Misoperation of its Protection System component(s), if any, that meet the circumstances in Requirement R1, Parts 1.1, 1.2, and 1.3 within the allotted time period. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.
>
> **M2.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates notification to the other owner(s), within the allotted time period for either Requirement R2, Part 2.1, including subparts 2.1.1, 2.1.2, and 2.1.3

[5] Order No. 672 at P 327. There should be a clear criterion or measure of whether an entity is in compliance with a proposed Reliability Standard. It should contain or be accompanied by an objective measure of compliance so that it can be enforced and so that enforcement can be applied in a consistent and non-preferential manner.

and Requirement R2, Part 2.2. Acceptable evidence for Requirement R2, including Parts 2.1 and 2.2 may include, but is not limited to the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified whether its Protection System component(s) caused a Misoperation within the allotted time period. Acceptable evidence for Requirement R3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it performed at least one investigative action according to Requirement R4 every two full calendar quarters until a cause is identified or a declaration is made. Acceptable evidence for Requirement R4 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP's applicability to other Protection Systems and locations, or a declaration in accordance with Requirement R5. Acceptable evidence for Requirement R5 may include, but is not limited to the following dated documentation (electronic or hardcopy format): CAP and evaluation, or declaration.

M6. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it implemented each CAP, including updating actions or timetables. Acceptable evidence for Requirement R6 may include, but is not limited to the following dated documentation (electronic or hardcopy format): records that document the implementation of each CAP and the completion of actions for each CAP including revision history of each CAP. Evidence may also include work management program records, work orders, and maintenance records.

5. **Proposed Reliability Standards should achieve a reliability goal effectively and efficiently — but do not necessarily have to reflect "best practices" without regard to implementation cost or historical regional infrastructure design.[6]**

The proposed Reliability Standard achieves the reliability goal effectively and efficiently in accordance with Order No. 672. The proposed Reliability Standard continues to employ a similar process to identify and correct Misoperations of Protection Systems as that utilized in the currently effective Reliability Standard, thereby using the most efficient means to maintain the effective identification and correction of these occurrences. NERC has also moved the periodic reporting of Misoperations from the standard and into a separate data request pursuant to Section 1600 of NERC's Rules of Procedure. This will permit NERC's data analysis to continue separately from compliance with the standard and continue reporting, using a standardized template, for all entities subject to the data request. This separation promotes efficiency in implementing and monitoring compliance of the Reliability Standard by moving the reporting burden into NERC's data collection program rather than as part of the standard.

6. **Proposed Reliability Standards cannot be "lowest common denominator," *i.e.*, cannot reflect a compromise that does not adequately protect Bulk-Power System reliability. Proposed Reliability Standards can consider costs to implement for smaller entities, but not at consequences of less than excellence in operating system reliability.[7]**

---

[6] Order No. 672 at P 328. The proposed Reliability Standard does not necessarily have to reflect the optimal method, or "best practice," for achieving its reliability goal without regard to implementation cost or historical regional infrastructure design. It should however achieve its reliability goal effectively and efficiently.

[7] Order No. 672 at P 329. The proposed Reliability Standard must not simply reflect a compromise in the ERO's Reliability Standard development process based on the least effective North American practice — the so-called "lowest common denominator" — if such practice does not adequately protect Bulk-Power System reliability. Although FERC will give due weight to the technical expertise of the ERO, we will not hesitate to remand a proposed Reliability Standard if we are convinced it is not adequate to protect reliability.

Order No. 672 at P 330. A proposed Reliability Standard may take into account the size of the entity that must comply with the Reliability Standard and the cost to those entities of implementing the proposed Reliability Standard. However, the ERO should not propose a "lowest common denominator" Reliability Standard that would achieve less than excellence in operating system reliability solely to protect against reasonable expenses for supporting this vital national infrastructure. For example, a small owner or operator of the Bulk-Power System must bear the cost of complying with each Reliability Standard that applies to it.

The proposed Reliability Standard does not reflect a "lowest common denominator" approach. This proposed Reliability Standard is the result of multiple industry ballots and revisions that reflect an active comment and response process between industry and the standard drafting team. The result of these efforts was a stronger final proposed Reliability Standard that protects the reliability of the Bulk-Power System. The standard also reflects direction and input through an assessment of NERC's System Protection and Control Subcommittee. Further, NERC's current data collection efforts related to Misoperations of Protection Systems and NERC's *State of Reliability* reports provided additional information to develop the proposed Reliability Standard.

7. **Proposed Reliability Standards must be designed to apply throughout North America to the maximum extent achievable with a single Reliability Standard while not favoring one geographic area or regional model. It should take into account regional variations in the organization and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.[8]**

The proposed Reliability Standard applies throughout North America and does not favor one geographic area or regional model. The proposed standard also does not conflict with any existing regional differences, such as regional Reliability Standard PRC-004-WECC-1 (Protection System and Remedial Action Scheme Misoperation).

8. **Proposed Reliability Standards should cause no undue negative effect on competition or restriction of the grid beyond any restriction necessary for reliability.[9]**

---

8 Order No. 672 at P 331. A proposed Reliability Standard should be designed to apply throughout the interconnected North American Bulk-Power System, to the maximum extent this is achievable with a single Reliability Standard. The proposed Reliability Standard should not be based on a single geographic or regional model but should take into account geographic variations in grid characteristics, terrain, weather, and other such factors; it should also take into account regional variations in the organizational and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.

9 Order No. 672 at P 332. As directed by section 215 of the FPA, FERC itself will give special attention to the effect of a proposed Reliability Standard on competition. The ERO should attempt to develop a proposed Reliability Standard that has no undue negative effect on competition. Among other possible considerations, a

Proposed Reliability Standard PRC-004-3 has no undue negative effect on competition and does not unreasonably restrict transmission or generation operation on the Bulk-Power System.

9. The implementation time for the proposed Reliability Standard is reasonable.[10]

The effective date for the proposed Reliability Standard appropriately balances the urgency to implement the standard against the time needed by those who must comply to develop necessary adjustments to procedures in support of the proposed Reliability Standard. To allow covered Entities adequate and reasonable time to comply with the proposed Reliability Standard, the effective date is twelve (12) months following the date that the proposed standard is approved.

10. The Reliability Standard was developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[11]

The proposed Reliability Standard was developed in accordance with NERC's Commission-approved, ANSI- accredited processes for developing and approving Reliability Standards. Exhibit G includes a summary of the standard development proceedings, and details the processes followed to develop the Reliability Standard. These processes included, among other

proposed Reliability Standard should not unreasonably restrict available transmission capability on the Bulk-Power System beyond any restriction necessary for reliability and should not limit use of the Bulk-Power System in an unduly preferential manner. It should not create an undue advantage for one competitor over another.

10 Order No. 672 at P 333. In considering whether a proposed Reliability Standard is just and reasonable, FERC will consider also the timetable for implementation of the new requirements, including how the proposal balances any urgency in the need to implement it against the reasonableness of the time allowed for those who must comply to develop the necessary procedures, software, facilities, staffing or other relevant capability.

11 Order No. 672 at P 334. Further, in considering whether a proposed Reliability Standard meets the legal standard of review, we will entertain comments about whether the ERO implemented its Commission-approved Reliability Standard development process for the development of the particular proposed Reliability Standard in a proper manner, especially whether the process was open and fair. However, we caution that we will not be sympathetic to arguments by interested parties that choose, for whatever reason, not to participate in the ERO's Reliability Standard development process if it is conducted in good faith in accordance with the procedures approved by FERC.

things, multiple comment periods, pre-ballot review periods, and balloting periods. Additionally, all meetings of the standard drafting team were properly noticed and open to the public.

11. NERC must explain any balancing of vital public interests in the development of proposed Reliability Standards.[12]

NERC has not identified competing public interests regarding the request for approval of the proposed Reliability Standard. No comments were received that indicated the proposed Reliability Standard conflicts with other vital public interests.

12. Proposed Reliability Standards must consider any other appropriate factors.[13]

No other factors relevant to whether the proposed Reliability Standard is just and reasonable were identified.

---

[12] Order No. 672 at P 335. Finally, we understand that at times development of a proposed Reliability Standard may require that a particular reliability goal must be balanced against other vital public interests, such as environmental, social and other goals. We expect the ERO to explain any such balancing in its application for approval of a proposed Reliability Standard.

[13] Order No. 672 at P 323. In considering whether a proposed Reliability Standard is just and reasonable, we will consider the following general factors, as well as other factors that are appropriate for the particular Reliability Standard proposed.

Exhibit E

Table of Issues and Directives

Table of Issues and Directives

Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)

Table of Issues and Directives Associated with PRC-003-1			
Source	**Issue or Directive Language (including Para. #)**	**Section and/or Requirement(s)**	**Consideration of Issue or Directive**
FERC Order No. 693, P 1460.	For the reasons stated in the NOPR, the Commission will not approve or remand PRC-003-1. (For reference) P 1458. In the NOPR, the Commission identified PRC-003-1 as a fill-in-the-blank standard. The NOPR stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-1 until the ERO submitted the additional information.	PRC-004-3	PRC-003-1 will be retired and replaced by PRC-004-3.

Table of Issues and Directives Associated with PRC-003-1			
Source	**Issue or Directive Language (including Para. #)**	**Section and/or Requirement(s)**	**Consideration of Issue or Directive**
FERC Order No. 693, P 1461.	We agree with APPA that the ERO should consider whether greater consistency can be achieved in this Reliability Standard. In Order No. 672, the Commission also encouraged greater uniformity in the development of Reliability Standards. Consistent with that goal, the Commission directs the ERO to consider APPA's suggestions in the Reliability Standards development process as it modifies PRC-003-1 to provide missing information needed for the Commission to act on this Reliability Standard. (For reference) P 1459. APPA agrees with the Commission's proposed course of action. It states that there are significant and substantive differences between regional procedures due to the characteristics of various regional grids and industry structures. Further it suggests that NERC and the Regional Entities consider whether they can attain greater consistency on an Interconnection-wide basis in completing this Reliability Standard.	NERC Rules of Procedure, Section 1600 Request for Data or Information.	PRC-003-1 will be retired and replaced by PRC-004-3. The responsibility to address all aspects of a Protection System Misoperation is assigned to the owner(s) of the Protection System(s) - the Transmission Owner, Generation Owner, and Distribution Provider. Additionally, further consistency has been achieved by specifying the data reporting requirements for periodic Misoperations reporting based on a continent-wide template. All reporting of Misoperations will be done through a data request according to the NERC Rules of Procedures, Section 1600, Request for Data or Information instead of having PRC-004-3 specify an administrative reporting requirement.

Table of Issues and Directives Associated with PRC-003-1			
Source	**Issue or Directive Language (including Para. #)**	**Section and/or Requirement(s)**	**Consideration of Issue or Directive**
FERC Order No. 693, P 1469 (first directive only)	We direct the ERO to consider ISO-NE's suggestion that LSEs and transmission operators should be included in the applicability section, in the Reliability Standards development process as it modifies PRC-004-1. (For reference) P 1466. ISO-NE further requests the Commission to direct NERC to modify PRC-004-1 to include LSEs and transmission operators in the applicability section. It states that based on current practice in the ISO-NE balancing area, transmission operators, transmission owners, LSEs and distribution providers may individually or jointly own and operate a protection system. It therefore suggests that transmission operators and LSEs should also be included in the applicability section. ISO-NE provides the same suggestion with regard to PRC-005-1, PRC-008-0, PRC-011-0, PRC-015-0, PRC-016-0, PRC-017-0 and PRC-021-1.	PRC-004-3 all Requirements.	PRC-004-2.1a will be retired and replaced by PRC-004-3.The Transmission Owner, Generator Owner, and Distribution Provider own the BES Protection Systems. The owners of BES Protection Systems have been assigned responsibility for this standard.

Violation Risk Factors and Violation Severity Level Justifications

PRC-004-3 – Protection System Misoperation Identification and Correction

Project 2010-05.1 – Protection System (Misoperations)

Violation Risk Factor and Violation Severity Level Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in: PRC-004-3 – Protection System Misoperation Identification and Correction.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the base penalty amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Protection System Misoperations Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project.

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if

violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

The standard drafting team (SDT) also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VRF Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System: [2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination

[1] *N. Am. Elec. Reliability Corp.*, 119 FERC ¶ 61,145 (2007) (“VRF Order”), *order on reh’g and compliance filing*, 120 FERC ¶ 61,145 (2007) (“VRF Rehearing Order”).
[2] *Id.* at fn 15.

- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

VRF Discussion

The discussion below in the tables addresses how the SDT considered FERC's VRF Guidelines 1 through 5. PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations and combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

The proposed PRC-004-3 Reliability Standard has six (6) discrete requirements that incorporate and enhance the intent of the requirements of PRC-004-2.1a and PRC-003-1.[3] First, the revised standard requires the Transmission Owner, Generator Owner, and Distribution Provider to review each BES interrupting device operation meeting the criteria in Requirement R1, which includes: when caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate and identify each that is a Misoperation; regardless of whether the BES interrupting device owner owns all or part of the Composite Protection System; and when BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

Second, the BES interrupting device owner is required to notify the other Composite Protection System component owner(s) when the criteria in Requirement R2 are met, which includes: Composite Protection System ownership is shared with another owner; the BES interrupting device owner determined that a Misoperation occurred or cannot rule out a Misoperation; and the BES interrupting device owner determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or is unsure.

Third, if a Transmission Owner, Generator Owner, or Distribution Provider is notified by a BES interrupting device owner that the Composite Protection System operated, it must review the operation according to Requirement R3. In most cases, Requirement R1 or R3 will reveal the cause of the Misoperation. If not, Requirement R4 mandates the entity perform investigative action(s) to determine the cause(s) as the fourth discrete Requirement. If a cause is not identified, the entity either may continue its investigation until a cause is identified or the entity may write a declaration that no cause was identified. If a cause is identified, the entity advances to the fifth Requirement.

In Requirement R5, the entity whose Protection System component was identified as the cause of the Misoperation must either develop a Corrective Action Plan (CAP) or explain in a declaration why it cannot correct the cause of the Misoperation. In developing a Corrective Action Plan (CAP) for the identified Protection System component(s), the entity must perform an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. If the entity determines that corrective actions are beyond the entity's control or would not improve BES reliability, it must explain this in a declaration why no further corrective actions will be taken.

In the last Requirement R6, the entity must implement and complete the CAP. The entity must update the CAP during implementation when actions or timetables change.

[3] The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations.

The requirements of the proposed PRC-004-3 do not map, one-to-one, with the Requirements of the two legacy standards, PRC-003-1 and PRC-004-2.1a. The new Requirements comingle various reliability attributes of the legacy standards with precise reliability objectives. In developing the new VRFs for the Requirements of PRC-004-3, the Standard Drafting Team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. The VRFs of the FERC approved PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations (R1 & R2 – High VRF), PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation (R1 – Lower VRF), PRC-016-0.1 – Special Protection System Misoperation (R2 – Medium VRF), and PRC-022-1 – Under-Voltage Load Shedding Program Performance (R1 & R1.5 – Medium VRF), all influenced (citing FERC VRF Guideline 3) the drafting team's VRF decisions, as such, the VRFs for PRC-004-3 Requirements R1 through R6 are assigned a VRF of Medium.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF and VSL Justifications – PRC-004-3, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could, in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Composite Protection System operations reviewed for proper operation by an owner is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is not in itself likely to lead to bulk electric system instability, separation, or cascading failures.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards:

VRF and VSL Justifications – PRC-004-3, R1	
	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO), which both have a VRF of “High.” The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan”. The performance activity that has been isolated in Requirement R1 of PRC-004-3, to “review” (similar to “analyze”), is consistent with similar requirements in Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“…shall analyze its SPS operations and maintain a record of all misoperations…”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“…shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium. A VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement comingles multiple activities
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could, in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Protection System operations reviewed for proper operation by their owner(s) is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justifications – PRC-004-3, R1			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation. OR The responsible entity failed to identify whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The VSLs appropriately assess the severity of the violation with the failure to perform a review for Misoperation as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.

VRF and VSL Justifications – PRC-004-3, R1	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to notify the other owner(s) of a Composite Protection System when the initiating owner determined its Protection System components did not cause a Misoperation or it did not rule out a Misoperation, could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.

VRF and VSL Justifications – PRC-004-3, R2	
	Unresolved Misoperations of Composite Protection Systems owned by others that are not ruled out as a Misoperation could affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system by creating a gap in analysis.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: This is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. A lack of coordination on system protection was one of eight factors common to substantive outages prior to and including the August 14, 2003 Blackout. The initiating entity in the planning time frame is required to notify the other owner(s) of the Composite Protection System component(s) when it determines that (or is unsure whether)its component(s) did not cause a Misoperation or when it is unable to rule out a Misoperation of the Composite Protection System owned by others. This ensures that all owners review their equipment for proper operation which may include checking for proper coordination depending on the circumstances.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards:

VRF and VSL Justifications – PRC-004-3, R2	
	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO), which both have a VRF of High. The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan”. This requirement and a VRF assignment of Medium is consistent, for example, with Reliability Standards FAC-008-3 – Facility Ratings, R7 (“…shall provide Facility Ratings (for its solely and jointly owned Facilities…”), MOD-012-0 – Dynamics Data for Modeling and Simulation of the Interconnected Transmission System, R2 (“…shall provide appropriate equipment characteristics and system data…”), IRO-015-1 – Special Protection System Data and Documentation, R1.1 (“…shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas.”), and IRO-016-1 – Coordination of Real-time Activities Between Reliability Coordinators, R1 (“…shall contact the other Reliability Coordinator(s) to confirm that there is a problem and then discuss options and decide upon a solution to prevent or resolve the identified problem.”) which all have a VRF of Medium. Other Protection Systems based Reliability Standards such as PRC-005-1b – Transmission and Generation Protection System Maintenance and Testing, R2 (“…shall provide documentation…”), PRC-016-0.1 – Special Protection System Misoperations, R3 (“…that owns an SPS shall provide documentation of the misoperation analyses…”), and PRC-017-0 – Special Protection System Maintenance and Testing, R2 (“…SPS shall provide documentation of the program…) all have a VRF of Lower; however, these requirements involve the administrative reporting to either the Regional Reliability Organization (now Regional Entity) or NERC and not a reliability function like the previously mentioned FAC-008-3 and MOD-012-0 Reliability Standards. As such, this Requirement R2 is assigned a VRF of Medium because it has a reliability need to be communicated to other owners.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs:

VRF and VSL Justifications – PRC-004-3, R2			
	Failure to notify other entities to review each Protection System operation, identify Misoperations, and determine the cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Unresolved Misoperations of Composite Protection Systems owned by others that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation. OR

VRF and VSL Justifications – PRC-004-3, R2			
			The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement is new to the standard and had no previous level of compliance. Other Reliability Standards use a variety of VSLs ranging from a single severe level (i.e., binary), two levels, to four VSL levels. Some use a percentage as the failure of the number entities not notified; however, this would not be practical for this requirement as Composite Protection Systems that are owned by multiple entities is generally limited to one or two owners. The incremental increase in violation is consistent with the NERC Guidelines and is reasonable in consideration of the time periods provided by the Requirement.		
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b:		

VRF and VSL Justifications – PRC-004-3, R2	
Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R3	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure of another Composite Protection System owner to review its component(s) for Misoperation, upon notification, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Composite Protection System operations reviewed for proper operation by the other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.

VRF and VSL Justifications – PRC-004-3, R3	
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which both have a VRF of High. This Requirement R3, to "review" (similar to "analyze"), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 ("…shall analyze its SPS operations and maintain a record of all misoperations…") and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 ("…shall analyze and document all UVLS operations and Misoperations.") which both have a VRF of Medium. A VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure of another Composite Protection System owner to review its component(s) for Misoperation, upon notification, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Composite Protection System operations reviewed for proper operation by the other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage.

VRF and VSL Justifications – PRC-004-3, R3			
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late. OR The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (DP) and R2 (GO & TO) for the notified Protection System owner. The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. A VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-004-3, R3	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R4	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to identify the cause(s) of a Misoperation (if not determined in Requirements R1 or R3) could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.

VRF and VSL Justifications – PRC-004-3, R4	
	An Unidentified cause(s) of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. The applicable entity must conduct investigative action(s) to determine the cause(s) of a Misoperation, if not determined during the course of a review as proposed in Requirements R1 and R3.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO), which have a VRF of High. The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” This Requirement R4, to perform at least one “investigative action” (similar to “analyze”), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“…shall analyze its SPS operations and maintain a record of all misoperations…”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“…shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium.

VRF and VSL Justifications – PRC-004-3, R4	
	A VRF of Medium is not inadvertently lowering the current VRF of High in the former PRC-004-2.1a, Requirements R1 or R3, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous. This VRF of Medium comports with the VRF assignment of Medium for PRC-004-3, Requirements R1 and R3, which will generally reveal the cause(s) of an identified Misoperation.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to identify the cause(s) of a Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Unidentified causes of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

VRF and VSL Justifications – PRC-004-3, R4			
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late. OR The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.		

VRF and VSL Justifications – PRC-004-3, R4	
	This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.

VRF and VSL Justifications – PRC-004-3, R4	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R5	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to develop a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. An unresolved cause of a Misoperation or failing to consider other locations with similar Protection System components could affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.

VRF and VSL Justifications – PRC-004-3, R5	
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the development of a Corrective Action Plan (CAP) associated with Protection Systems.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which have a VRF of High. This requirement is consistent with Reliability Standards PRC-016-0.1, R2 ("…shall take corrective actions to avoid future Misoperations"), PRC-022-1, R1.5 ("For any Misoperation, a Corrective Action Plan…"), FAC-003, R5 ("…Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management") all three of which have a VRF of Medium.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to develop a CAP for a Misoperation with an identified cause or failing to consider other locations with similar components could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.

VRF and VSL Justifications – PRC-004-3, R5			
	An unresolved cause of a Misoperation could affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system if the same condition resulted in a future Misoperation.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation. OR	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation. OR	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation. OR	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop a CAP or explain in a declaration in accordance with Requirement R5. OR

VRF and VSL Justifications – PRC-004-3, R5			
The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation.	The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation. OR The responsible entity failed to develop an evaluation in accordance with Requirement R5.
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. Varying VSLs are provided for the omission of the evaluation when developing the Corrective Action Plan and for failure to develop the evaluation.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan" which have varying VSLs. This VSL does not lower the current level of compliance because the former VSL in PRC-004-2.1a was comingled with the other activities. This Requirement has a Severe VSL for failure to develop the CAP with the other VSLs being based on tardiness of the development.		

VRF and VSL Justifications – PRC-004-3, R5	
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.
FERC VSL G4	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R5	
Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	

VRF and VSL Justification – PRC-004-3, R6	
Proposed VRF	**Medium**
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to implement a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. An uncorrected cause of a Misoperation as a result of not implementing a Corrective Action Plan, could affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system since the condition could occur again.

VRF and VSL Justification – PRC-004-3, R6	
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the implementation of a Corrective Action Plan (CAP) associated with Protection Systems.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2.1a, R1 (TO & DP) and R2 (GO),which both have a VRF of High. The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan”. This requirement is consistent with Reliability Standards PRC-016-0.1, R2 (“…shall take corrective actions to avoid future misoperations.”) and PRC-022-1, R1.5 (“For any Misoperation, a Corrective Action Plan…”) which both have a VRF of Medium. The proposed VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.

VRF and VSL Justification – PRC-004-3, R6			
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to implement a Corrective Action Plan for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. An uncorrected cause of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The responsible entity implemented, but failed to update a CAP, when actions or timetables changed, in accordance with Requirement R6.	N/A	N/A	The responsible entity failed to implement a CAP in accordance with Requirement R6.

VRF and VSL Justification – PRC-004-3, R6	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—The VSLs cover aspects of this Requirement that are not equal in importance and performance.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are "analyze Protection System Misoperations," "develop a Correction Action Plan," and "implement a Corrective Action Plan." The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard. The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed Requirement is a Severe VSL for failure to implement the CAP with the Lower VSL being based on the failure of updating the CAP when actions or timetables change which is administrative in nature.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	Guideline 2a: This requirement is not binary; therefore, this criterion does not apply. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justification – PRC-004-3, R6	
Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

Exhibit G

Summary of Development History and Complete Record of Development

Summary of Development History

Project 2010-5.1 – Protection System (Misoperations)

The development record for proposed Reliability Standard PRC-004-3 is summarized below.

I. Overview of the Standard Drafting Team

When evaluating a proposed Reliability Standard, the Commission is expected to give "due weight" to the technical expertise of the ERO.[1] The technical expertise of the ERO is derived from the standard drafting team ("SDT"). For this project, the standard drafting team consisted of industry experts, all with a diverse set of experiences. A roster of the team members is included in **Exhibit I**.

II. Standard Development History

A. Standard Authorization Request Development

The Standard Authorization Request ("SAR") was posted for informal comment from May 20, 2011 to June 3, 2011. The SAR was submitted to the Standards Committee ('SC") for approval on June 9, 2011.

B. First Posting - Formal Comment Period

Proposed Reliability Standard PRC-004-3 was posted for a 30-day public comment period from June 10, 2011 through July 11, 2011. There were 52 sets of comments, including comments from approximately 146 different individuals from approximately 106 companies, representing 10 of the 10 industry segments.

The SDT considered stakeholder comments regarding proposed Reliability Standard PRC-004-3 and made the following observations and modifications based on those comments:

[1] *See*16 U.S.C. §824(d)(2) (2012).

- Modified the definition of Protection System Misoperation.
- An additional category of "Slow Trip-Other Than Fault" was added for consistency.
- Exclusion of Protection System operations because of on-site maintenance, testing, construction, or commissioning activities was added.
- An exclusion to the category "Unnecessary Trip-During Fault" was added related to the proper remote Protection System operation.
- Revised the standard by increasing the timelines and clarifying the steps involved to complete the investigation of a Misoperation.
- Revised the standard to clarify the starting point of the Misoperation investigation (new Requirement R2) is the occurrence of the Protection System operation.
- Revised the Guidelines and Technical Basis section of the standard to include the following statement regarding extenuating circumstances: "The Sanction Guidelines of the North American Electric Reliability Corporation, effective January 15, 2008, provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions."
- Revised the language in Attachment 1 of the categories to match the language approved for use in the revised Standard PRC-004.
- Removed the word "written".
- Redrafted the Evidence Retention section to follow the NERC Rules of Procedure, Appendix 4C, and CMEP Section 3.1.4.2.
- Modified the Background statement to better reflect the interaction between this standard and the WECC regional Misoperations reporting standard.
- Changed the effective date (implementation time) to 12 months.

C. The Second Posting - Comment Period, Initial Ballot and Non-Binding Poll

Proposed Reliability Standard PRC-004-3 was posted for a 45-day public comment period from July 25, 2012 through September 7, 2012. A Non-Binding poll of the VRFs and VSLs was conducted for the second comment posting for Reliability Standard PRC-004-3. There were 95 sets of comments, including comments from approximately 230 different individuals from approximately 145 companies representing 9 of the 10 industry segments. The proposed Reliability Standard received a quorum of 86.71% and an approval of 37.68%.

The SDT considered stakeholder comments regarding proposed Reliability Standard PRC-004-3 and made the following observations and modifications based on those comments:

- The term ‘composite Protection System’ was incorporated into the introductory sentence of the definition to indicate that a Misoperation pertains to the ‘composite Protection System’ and clarify that only the overall performance of the Protection System is considered when determining a Misoperation.
- The definition categories were edited and revised to provide more specificity and clarity.
- Revised the Facilities portion of the Applicability section to provide more specificity.
- Revised Requirement R1 to provide more clarity regarding the responsibilities of the BES interrupting device owner and the Protection System owner.
- Revised Requirement R4, removing the parts to eliminate the administrative aspects.
- Modified the measures to complement the revised requirements.
- Added for clarity in Compliance 1.2 the following sentence: “The Transmission Owner Generator Owner and Distribution Provider that owns a BES Protection System shall retain evidence for all Misoperations with an open investigation, action plan, or CAP even if the BES interrupting device operation occurred prior to the current audit period.”
- Modified the boiler plate language for clarity.
- Removed the language from Compliance 1.4.
- Removed from the standard all reporting obligations.
- Changes made to the VSLs in conjunction with the revised requirements.
- Changes made to the Guidelines and Technical Basis corresponding to all changes to the standard.
- Revised the effective date from six months to twelve months following applicable regulatory approvals.
- Changes made to Implementation Plan.

D. The Third Posting - Comment Period, Successive Ballot and Non-Binding Poll

Proposed Reliability Standard PRC-004-3 was posted for a 30-day formal comment period from January 22, 2013 through February 20, 2013. A Non-Binding poll of the VRFs and VSLs was conducted for the third comment posting for Reliability Standard PRC-004-3.There were 76 sets of comments, including comments from approximately 210 different individuals from approximately 132 companies representing all 10 of the industry segments. The proposed Reliability Standard received a quorum of 77.62% and an approval of 50.66%.

The SDT considered stakeholder comments regarding proposed Reliability Standard PRC-004-3 and made the following observations and modifications based on those comments:

- The Standard drafting team proposed a new definition to support the revisions to the definition of Misoperation.
- Update occurrences were made of “composite Protection System” with the newly proposed term of Composite Protection System.
- Removed the uses of “zone”, and mostly notably updated the category of Slow Trip-During Fault” to address high-speed performance.
- Modified the last category of “Unnecessary Trip-Other Than Fault” to be clear that a Protection System operation due to on-site personnel is not a Misoperation.
- Reorganized the purpose statement to clarify that the standard applies to those Protection Systems for Bulk Electric System Elements.
- Revised the Facilities section of the Applicability to remove exclusions for Special Protection Systems (SPS) and Remedial Action Schemes (RAS).
- Exclusions concerning non-protective functions embedded within a Protection System and protective functions intended to operate as a control function has been moved to the main Applicability for Facilities to add clarity that these applicable as Protection Systems for Bulk Electric System (BES) Elements.
- Reorganized Requirement R1 to improve clarity of the required performance, allotted time periods, and a single reliability objective in a Requirement.
- Clarifying revisions made to Requirement R2 to pinpoint the Protection System component that caused the Misoperation as being subject to the (CAP).
- Added the word “first” before”…identifying the cause…” to improve clarity that upon identifying the “first cause” starts the 60 calendar day time period for developing the CAP.
- Added the clause “…and that no further corrective actions will be taken” to require entities to clearly state that no additional actions are planned to be taken to provide a measurable close to the performance in the declaration.
- The phrase “would reduce BES reliability” was replaced with “would not improve BES reliability” to align with those conditions where corrective action may not be practical.
- Requirement R3 was removed due to the use of “action plan” along with Corrective Action Plan created unnecessary confusion.
- Requirement R4 is nor Requirement R6 and is essentially the same as the previous Requirement R4, except that “action plan” was removed.
- Compliance section was corrected to comport with the standard language NERC uses in Reliability Standards.
- The Evidence Retention section was changed to reduce the minimum time periods that were previously proposed at six years for all Requirement to 12 calendar months for all Requirements according to the Standard Drafting Guidelines for evidence retention.
- Lowered Requirement R4 (implement the CAP) Violation Risk Level (VRF) from High to Medium.
- The violation Severity Levels were completely rewritten due to the substantive changes made in restructuring the Requirements to meet a single reliability objective in a requirement.

- Reorganized the Guidelines and Technical Basis section of the Application Guidelines for organization and flow.
- Section headers were added and reordered to create additional examples for guidance.

E. Fourth Posting- Comment Period, Additional Ballot and Non-Binding Poll

Proposed Reliability Standard PRC-004-3 was posted for a 45-day formal and public comment period from January 17, 2014 through March 11, 2014, with an additional ballot in the last 10 days of the comment. A Non-Binding poll of the VRFs and VSLs was conducted for the fourth comment posting for Reliability Standard PRC-004-3. There were 63 sets of comments, including comments from approximately 173 different individuals from approximately 99 companies representing 9 of the 10 of the industry segments. The proposed Reliability Standard received a quorum of 75.06% and an approval of 62.63%.

The SDT considered stakeholder comments regarding proposed Reliability Standard PRC-004-3 and made the following observations and modifications based on those comments:

- Revised definition of "Composite Protection System" for clarity.
- Revised last category of "Unnecessary Trip-Other Than Fault" slightly to clarify that a Protection System operation caused by on-site personnel is not a Misoperation.
- "Composite" was inserted before "Protection System" for consistency with the proposed definition of "Composite Protection System".
- An exclusion for Remedial Action Schemes (RAS) and Special Protection System (SPS) has been provided to increase clarity that these Protection Systems are not applicable to the standard.
- Eliminated the extended implementation provision of 24 calendar months previously provided to entities in the Western Electric Coordination Council (WECC) Region.
- Inserted effective date language into Section 6 of the standard for completeness.
- Non-substantive revision made in Requirement R1 to more clearly describe that the BES interrupting device operation that meets the three sub-part (i.e., 1.1, 1.2, and 1.3).
- Revised Requirement R2 to address a gap in performance identified through continued review during the formal comment period.
- Revised Requirement R4 for clarity by adding "for a Misoperation" to more clearly reference the Misoperation identified in either Requirement R1 or R3.

- Updated each of the six Measures to provide the entity that is required to demonstrate compliance.
- Clarification was made for Requirement R5 that evidence retention related to the "development" of the Corrective Action Plan (CAP), each evaluation, and each declaration.
- Clarification was made to the Application Guidelines to note that timeframes are distinct and separate from the other Requirements.

F. Fifth Posting - Comment Period, Additional Ballot and Non-Binding Poll

Proposed Reliability Standard PRC-004-3 was posted for a 45-day public comment period from June 20, 2014 through July 9, 2014. A Non-Binding poll of the VRFs and VSLs was conducted for the fifth comment posting for Reliability Standard PRC-004-3. There were 47 sets of comments, including comments from approximately 136 different individuals from approximately 101 companies representing all 10 of the industry segments. The proposed Reliability Standard received a quorum of 76.98% and an approval of 74.53%.

The SDT considered stakeholder comments regarding proposed Reliability Standard PRC-004-3 and made the following observations and modifications based on those comments:

- Clarified the second sentence of the definition of "Composite Protection System" by changing the wording from "inclusionary" to an "exclusionary" statement.
- Clarified Requirement R1 by moving the clause "under the following circumstances" (referring to Part 1.1, 1.2, and 1.3).
- Added the clause with the clarifying reference to the Parts "under the circumstances in Parts 1.1 through 1.3" before the "shall" statement.
- Clarified Requirement R1, Part 1.3 based on a comment revealing an unintentional omission in the circumstances in which an entity is required to review a BES interrupting device operation.
- Clarified Requirement R2, Part 2.1 to include "manual intervention" as Requirement R1, Part 1.3 based on comments.
- Inserted the term "BES" in Requirement R2, Part 2.2 before "Element" to clarify that backup protection was provided for a condition on another entity's "BES Element" and not on another entity's non-BES Element,
- Clarified Requirement R4 by adding a parenthetical "(s)" to the second occurrence of "cause" for consistency with a previous occurrence in the Requirement.
- Added the clause "a minimum of" to the paragraphs pertaining to Requirements R1through R6 to clarify that the evidence retention periods stated in the Compliance section are minimum retention periods.

- Added the clause “following the completion of each Requirement” to add clarity that the minimum retention period applies to each Requirement.
- Clarified that evidence from R1 through R4 must be retained with the Corrective Action Plan.
- Deleted “or not” from each of the Requirement R1 Violation Severity Levels.
- Made grammatical corrections to text in the Rationale boxes associated with several Requirements.
- Rationale boxes will be moved to the end of the Guidelines.
- Consolidated text about time periods into its own section, “Requirement Time Periods”.
- Corrections made to the flowchart text to more closely align with the text in the Requirements.
- Corrected Implementation Plan to align the definition of “Misoperation,” category 2 and Applicability section concerning Facilities with the draft PRC-004-3 Reliability Standard.

G. Final Ballot

Proposed Reliability Standard PRC-004-3 was posted for a 10-day public comment period from July 29, 2014 through August 7, 2014. The proposed Reliability Standard received a quorum of 77.94% and an approval of 79.75%.

H. Board of Trustees Adoption

Proposed Reliability Standard PRC-004-3 was adopted by the NERC Board of Trustees on August 14, 2014.

Project 2010-05.1 Protection System (Misoperations)

Related Files

Status:

Adopted by the NERC Board of Trustees on August 14, 2014 and pending regulatory approval.

Purpose / Industry Need:

A key element for Bulk Electric System (BES) reliability is the correct performance of Protection Systems. Monitoring BES Protection System events, as well as identifying and correcting the root causes of Misoperations, will improve Protection System performance.

In FERC Order No. 693 (dated March 16, 2007), the Commission identified PRC-003-1 (Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems) as a "fill-in-the-blank" standard and did not approve or remand the standard since the regional procedures had not been submitted. Since PRC-003-1 is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2 (Analysis and Mitigation of Transmission and Generation Protection System Misoperations). This could lead to a potential reliability gap. Additionally, regional procedures are not standardized among the regions, and preclude the development of consistent metrics for measuring Protection System performance.

Phase 1 of this project will develop an improved standard to support the analysis and mitigation of Misoperations. Later phases of this project will address Special Protection Systems and Remedial Action Schemes.

Additional Information:

This Project is also being used to meet one of the objectives identified within the ERO Strategic Goals for 2011-2015. In support of ensuring NERC has clear, high technical quality results-based reliability standards that provide for an adequate level of bulk power system reliability and that are delivered in a timely and efficient manner, the following objective was proposed:

- Modify the standards development process to allow rapid development of an initial draft standard by a small professional team with requisite expertise and skills, including legal and compliance, followed by subsequent stakeholder consensus review, comment and balloting; the process will provide early consultation, including with regulatory authority staff, to determine a clear set of objectives for the standard. The process will allow highest priority standards to be delivered to the board within one year.

NERC's Standard Processes Manual allows significant flexibility in the initial informal stages of SAR and standard development, and at this time, no changes to the standards development process are anticipated to be needed to meet this objective. When the informal "Rapid-Development Team" completes its work and submits it to the Standards Committee, the work will be posted for industry consideration and transitioned to a formal Drafting Team for further development under the regular rules defined in the Standards Process Manual.

Nomination Form for Phase 1 of Protection Systems (Misoperations) Standard Drafting Team (Project 2010-05.1)

Please do not use this form. Please submit the electronic nomination form by 06/03/2011. If you have any questions, please contact Andy Rodriquez at andy.rodriquez@nerc.net.

By submitting the following information you are indicating your commitment to actively participate in drafting team meetings if appointed by the Standards Committee. This includes a commitment to travel to and attend face-to-face meetings of the drafting team (the average drafting team holds approximately six multi-day meetings per year), participate in conference call meetings of the drafting team (the average team meets by conference call approximately 20 times per year), and perform additional work outside of meetings as required. These obligations can be extended if work is not completed. You need to commit approximately 15% of your time over the next year and have your management's support to make this firm commitment.

Project 2010-05.1 – Phase 1 of Protection Systems (Misoperations)

A key element of bulk power system reliability is the performance of the Protection Systems. To properly gauge Protection System performance, it is necessary to have a consistent set of metrics on Protection System Misoperations. Current PRC standards and definitions related to Protection System Misoperations are confusing and do not support a good metric for measurement of Protection System performance. There are no consistent misoperation categories and cause codes among all eight Regional Entities, which prevents meaningful analysis and measurement of Protection System performance. The System Protection and Coordination Subcommittee (SPCS) has recommended that a project be initiated to:

- Revise the definition of Misoperation (Reportable Protection Misoperation)
- Combine PRC-003-1 and PRC-004-1 into a single standard with revised requirements to

address the need for consistent reporting to support meaningful analysis of Protection System Misoperation, and withdraw existing standard PRC-003-1.

We are seeking industry experts in protection systems and events analysis to participate on this drafting team.

Please briefly describe your experience and qualifications directly related to the issues to be addressed by the drafting team for Project 2010-05.1.

Are you currently a member of any NERC or Regional Entity SAR or standard drafting team? If yes, please list each team here.

☐ No

☐ Yes:

Have you previously worked on any NERC or Regional Entity SAR or standard drafting teams? If yes, please list them here.

☐ No

☐ Yes:

Please identify the NERC Region(s) in which your company operates and for which you are able to represent your company's position relative to the applicable issues while serving on the drafting team:

☐ ERCOT	☐ MRO	☐ RFC	☐ SPP
☐ FRCC	☐ NPCC	☐ SERC	☐ WEC

☐ Not Applicable or None of the Above

Please identify the industry segment(s) you can represent on behalf of your company while serving on the drafting team:

☐	1 — Transmission Owners
☐	2 — RTOs and ISOs
☐	3 — Load-serving Entities

☐	4 — Transmission-dependent Utilities
☐	5 — Electric Generators
☐	6 — Electricity Brokers, Aggregators, and Marketers
☐	7 — Large Electricity End Users
☐	8 — Small Electricity End Users
☐	9 — Federal, State, and Provincial Regulatory or other Government Entities
☐	10 — Regional Reliability Organizations and Regional Entities
☐	Not applicable

Based on your expertise or responsibilities, please identify which of the following Functional Entities[1] you can represent on behalf of your company while serving on the drafting team:

☐ Balancing Authority	☐ Planning Coordinator
☐ Compliance Enforcement Authority	☐ Transmission Operator
☐ Distribution Provider	☐ Transmission Owner
☐ Generator Operator	☐ Transmission Planner
☐ Generator Owner	☐ Transmission Service Provider
☐ Interchange Authority	☐ Purchasing-selling Entity
☐ Load-serving Entity	☐ Resource Planner
☐ Market Operator	☐ Reliability Coordinator

Please provide the names and contact information for two references whom we have permission to contact for attestation to your technical qualifications and your ability to work well in a group:

Standards Announcement

Project 2010-05.1 Protection System Misoperations
Drafting Team Nomination Period Open
May 20 – June 3, 2011

The Standards Committee is seeking industry experts to serve on the Protection System Phase 1 - Misoperations Standard Drafting Team. This drafting team will draft revisions to the definition of Misoperation as well as revisions to combine PRC-003 and PRC-004 into a single standard.

If you are interested in serving on this drafting team, please complete this nomination form **by June 3, 2011**.

Project Background

A key element for Bulk Electric System (BES) reliability is the correct performance of Protection Systems. Monitoring BES Protection System events, as well as identifying and correcting the root causes of Misoperations, will improve Protection System performance.

In FERC Order No. 693 (dated March 16, 2007), the Commission identified PRC-003-1 (Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems) as a “fill-in-the-blank” standard and did not approve or remand the standard since the regional procedures had not been submitted. Since PRC-003-1 is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2 (Analysis and Mitigation of Transmission and Generation Protection System Misoperations). This could lead to a potential reliability gap. Additionally, regional procedures are not standardized among the regions, and preclude the development of consistent metrics for measuring Protection System performance. This project will develop an improved standard to support the analysis and mitigation of Misoperations.

In addition, to ensure NERC has clear, technically correct, results-based reliability standards that provide for an adequate level of bulk power system reliability and that are delivered in a timely and efficient manner, NERC has a goal to modify the standards development process to allow rapid development of an initial draft standard by a small professional team with requisite expertise and skills, including legal and compliance, followed by subsequent stakeholder consensus review, comment and balloting. The proposed process provides early consultation, including with regulatory authority staff, to determine a clear set of objectives for the standard. The process could allow highest priority standards to be delivered to the board in a shorter time period than experienced when a larger drafting team is appointed to develop a standard later in the standard development process.

Project 2010-05.1 Protection Systems Misoperations was chosen as a pilot to evaluate one approach for accomplishing this goal. In this approach, an ad hoc team made up of subject matter experts and other diverse skill sets, including legal, compliance, and regulatory expertise will deliver a SAR and draft standard to the Standards Committee (as is allowed within the rules of the current Standards Development process). This delivery will occur in early June.

The Standards Committee is seeking candidates to proceed with the remaining steps of refining and balloting the standard using the normal standard development process.

The Standards Committee is seeking industry experts in protection systems and events analysis to participate on this drafting team.

Further details are included on the Project 2010-05 project page:
http://www.nerc.com/filez/standards/Project2010-05_Protection_System_Misoperations.html

Standards Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Eleanor Crouch,
Standards Administrative Assistant, at eleanor.crouch@nerc.net or at 609.452.8060.

Standard Authorization Request Form

Title of Proposed Standard	Protection System Misoperation Identification and Correction
Request Date	June 9, 2011

SAR Requester Information	**SAR Type** (*Check a box for each one that applies.*)	
Name: NERC Pilot Rapid Development Team	☐	New Standard
Primary Contact: Al McMeekin	☒	Revision to existing Standard (revise Misoperation definition; combine PRC-003-1, PRC-004-1a, and PRC-004-2)
Telephone: (803) 530-1963 Fax	☒	Withdrawal of existing Standard (PRC-003-1)
E-mail: al.mcmeekin@nerc.net	☐	Urgent Action

Purpose (Describe what the standard action will achieve in support of bulk power system reliability.)

A key element for Bulk Electric System (BES) reliability is the correct performance of Protection Systems. Monitoring BES Protection System events, as well as identifying and correcting the root causes of Misoperations will improve Protection System performance.

Industry Need (Provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)

In FERC Order No. 693 (dated March 16, 2007), the Commission identified PRC-003-1 as a “fill-in-the-blank” standard and did not approve or remand the standard since the regional procedures had not been submitted.

Since PRC-003-1 is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2. This could lead to a potential reliability gap.

Brief Description (Provide a paragraph that describes the scope of this standard action.)

- Revise the definition of Misoperation
- Combine PRC-003 and PRC-004, and retire standard PRC-003.

Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR.)

This project will revise the existing definition of Misoperation, which reads:

Misoperation (current definition)

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity

In general, this definition needs more specificity and clarity. The terms “specified time” and “abnormal condition” are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical yet explainable condition is a Misoperation.

Misoperation data, as currently collected and reported, is not usable to establish a consistent metric for measuring Protection System performance. The NERC Pilot Rapid Development Team recommends establishing a standard with uniform applicability, revising the definition of Misoperation and clarifying reporting requirements.

Furthermore, the proposed requirements of the revised Reliability Standard PRC-004-3 should meet the following objectives:

- Review all Faults or Protection System operations on the BES to identify those that are BES Protection System Misoperations
- Analyze BES Protection System Misoperations to determine the cause(s)
- Develop and implement Corrective Action Plans to address the causes of BES Protection System Misoperations

Reliability Functions

The Standard will Apply to the Following Functions *(Check box for each one that applies.)*		
☐	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☐	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☐	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☐	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check box for all that apply.)*	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☐	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The reliability of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment (Dates of posting).
2. SC authorized moving the SAR forward to standard development (SC meeting date when authorized).

Description of Current Draft

(Describe the type of action associated with this posting such as 30-day informal comment period, 30-day formal comment period, 45 day formal comment period with parallel initial ballot, 30-day formal comment period with parallel successive ballot, recirculation ballot)

Anticipated Actions	Anticipated Date
30-day Formal Comment Period	June 9, 2011
45-day Formal Comment Period with Parallel Initial Ballot	September 16, 2011
Recirculation ballot	December 19, 2011
BOT adoption	February 13, 2012

Effective Dates: Requirement R1 and its associated parts shall become effective on the first day of the first calendar quarter, 3 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements go into effect on the first day of the first calendar quarter, 3 months after Board of Trustees adoption.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Misoperation:

Any of the following:

1. **Failure to Trip - During Fault** - Any failure of a Protection System to operate for a Fault within the zone it is designed to protect.

2. **Failure to Trip - Other Than Fault** - Any failure of a Protection System to operate for a non-Fault condition such as power swings, under-voltage, over excitation, or loss of excitation for which the Protection System was intended to operate.

3. **Slow Trip** - Any Protection System operation that is slower than planned for a Fault within the zone it is designed to protect.

4. **Unnecessary Trip - During Fault** - Any Protection System operation for a Fault not within the zone it is designed to protect.

5. **Unnecessary Trip - Other Than Fault** - Any Protection System operation for non-Fault conditions such as power swings, under-voltage, over excitation, or loss of excitation for which the Protection System is not intended to operate.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Protection System Misoperation Identification and Correction**
2. **Number:** PRC-004-3
3. **Purpose:** Identify and correct the causes of Misoperations of Bulk Electric System (BES) Protection Systems.
4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Transmission Owner

   4.1.2 Generator Owner

   4.1.3 Distribution Provider

   4.2. Facilities

   4.2.1 Protection Systems for Facilities that are part of the BES.

   4.2.2 Special Protection Systems (SPS), Remedial Action Schemes (RAS), and Under Voltage Load Shedding programs are excluded from this standard.

5. **Background**:

   A key element for BES reliability is the correct performance of Protection Systems. Monitoring BES Protection System events, as well as identifying and correcting the causes of Misoperations, will improve Protection System performance. In FERC Order No. 693 (dated March 16, 2007), the Commission identified PRC-003-1 as a "fill-in-the-blank" standard and did not approve or remand the standard since the regional procedures had not been submitted.

   Since PRC-003-1 is not enforceable, there is no mandatory requirement for the Regional Entity procedures to support the requirements of PRC-004-2. This represents a potential reliability gap.

   This project includes revising the existing definition of Misoperation, which reads:

   Misoperation

   - Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
   - Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).

- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity

In general, this definition needs more specificity and clarity. The terms “specified time” and “abnormal condition” are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical yet explainable condition is a Misoperation.

Misoperation data, as currently collected and reported, is not usable to establish a consistent metric for measuring Protection System performance. The SAR includes establishing a standard with uniform applicability, revising the definition of Misoperation, and clarifying reporting requirements.

The proposed requirement of the revised Reliability Standard PRC-004-3 meets the following objectives:

- Review all Faults and Protection System operations on the BES to identify those that are BES Protection System Misoperations.
- Analyze BES Protection System Misoperations to determine the cause(s).
- Develop and implement Corrective Action Plans to address the cause(s) of BES Protection System Misoperations.

The reporting of Misoperations associated with Special Protection Schemes, Remedial Action Schemes, and Under-Voltage Load Shedding has not been addressed in this standard due the complexity of the subject matter. NERC intends to address these areas through a separate project in the future.

Note that there are two WECC standards, PRC-003-STD-1 and PRC-004-WECC-1, related to reporting of Misoperations for a limited set of WECC Paths and Remedial Action Schemes. In those cases where those standards will overlap with the Continent-wide standard, entities are expected to comply with the more stringent standard. Doing so will ensure compliance with the less stringent standard as well. There are no apparent conflicts between the standards that would lead to mutually exclusive compliance.

B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall have and implement a procedure to identify and address all Protection System Misoperations within its system. At a minimum, the procedure shall include: [*Violation Risk Factor: High*] [*Time Horizon: Operations Assessment, Operations Planning*]

1.1 A detailed description of the processes used to:

1.1.1 Document and review all BES Faults and BES Protection System operations.

1.1.2 Identify and document all associated Misoperations, if any.

1.1.3 Investigate and address each Misoperation.

1.2 A requirement that the Registered Entity shall, within 90 calendar days of each identified Misoperation, investigate the Misoperation to determine its cause(s) and do one of the following:

- For each Misoperation where the cause(s) are identified, document the investigation and the cause(s).
- For those cases where the cause(s) are not identified, document the investigation, any cause(s) that were ruled out, and any additional steps planned to identify the cause(s).

1.3 A requirement that for all Misoperations for which the cause(s) was (were) identified, the Registered Entity shall, within 120 calendar days of the Misoperation, develop one of the following:

- A Corrective Action Plan (CAP) that includes:
  1. Interim corrective actions (if any).
  2. Final corrective or mitigating actions to reduce potential impacts to BES reliability.
  3. A work timetable.
- A declaration explaining why there is no need to develop a CAP.

1.4 A requirement that for all Misoperations for which the cause(s) was (were) not identified, the Registered Entity shall, within 120 calendar days of the Misoperation, develop one of the following:

- An action plan that identifies:
  1. Additional investigative actions and/or Protection System modifications.
  2. A work timetable.
- A declaration that includes an explanation of why no further investigation or actions will be taken.

1.5 A requirement that the Registered Entity complete each CAP or action plan as outlined in its timetable, and document its completion as implemented.

Rationale for R1: This requirement mandates entities have a process to identify and correct Protection System Misoperations. A review of the Transmission Availability Data System (TADS) data for the past three years reveals that the fourth ranked initiating cause of BES outages not related to weather is “Failed Protection System Equipment.” By developing more structure regarding the manner in which Misoperations are identified and corrected, risks to the BES caused by Misoperations can be reduced by ensuring that certain mandatory practices are consistently undertaken. Further, such consistency will also enhance reporting and the development of performance metrics that indicate overall system health, as well as facilitate the sharing of “lessons learned.”

M1. The Transmission Owner, Generator Owner and Distribution Provider shall have a current copy of its procedure for identifying and addressing Misoperations in accordance with Requirement R1.

M2. The Transmission Owner, Generator Owner and Distribution Provider shall have dated written lists of Faults, Protection System operations, and identified Misoperations with their associated date of occurrence to demonstrate implementation of the procedural elements related to Requirement R1, Part 1.1.

M3. The Transmission Owner, Generator Owner and Distribution Provider shall have a dated written investigation report for each Misoperation identifying either cause(s), or where the cause(s) of the Misoperation cannot be identified, any additional steps planned for identifying causes to demonstrate implementation of the procedural elements related to Requirement R1, Part 1.2.

M4. To demonstrate implementation of the procedural elements related to Requirement R1, Part 1.3, the responsible entity shall have, for each Misoperation with an identified cause or causes, a dated CAP or a dated written declaration explaining why there is no need to develop a CAP.

M5. To demonstrate implementation of the procedural elements related to Requirement R1, Part 1.4, the responsible entity shall have, for each Misoperation without an identified cause or causes, a dated written action plan that includes a work timetable for implementation or a dated written declaration explaining why no further investigation or actions will be taken.

M6. The responsible entity shall have dated evidence, such as work management program records or work orders or other dated evidence, to demonstrate implementation of any plans completed during the implementation of the procedural elements related to Requirements R1, Part 1.5.

M7. The responsible entity shall have dated documentation that describes the manner in which the each CAP or action plan was completed to demonstrate compliance with the procedural elements related to Requirements R1, Parts 1.5

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity

1.2. Evidence Retention

The Transmission Owner, Generator Owner and each Distribution Provider that owns a BES Protection System shall retain data or evidence to show compliance with Requirement R1 and Measures M1, M2, M3, M4, M5, M6, and M7 for six calendar years unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Compliance Monitor shall retain any audit data for six years.

If a Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System is found non-compliant, it shall keep information related to the non-compliance until found compliant, or for the time specified above, whichever is longer.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaints

1.4. Additional Compliance Information

Periodic Data Submittal: Within 60 calendar days following the end of each calendar quarter, each Transmission Owner, Generator Owner, and each Distribution Provider that owns BES protection Systems will submit a quarterly report to its Regional Entity that lists all Protection System Misoperations identified in accordance with Requirement R1 using the format specified by the ERO. Each responsible entity will include the status of each of its Misoperation CAPs or action plans developed until these CAPs or action plans are reported complete.

The Regional Entity will report the Misoperation information provided by the responsible entities to NERC on a quarterly basis.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Assessment, Operations Planning**	**High**	The responsible entity documented the investigation and either identified the cause or listed the additional steps planned to identify the cause in more than 90 calendar days but less than or equal to 120 calendar days following the Misoperation.	The responsible entity documented the investigation and either identified the cause or listed the additional steps planned to identify the cause in more than 120 calendar days but less than or equal to 130 calendar days following the Misoperation.	The responsible entity documented the investigation and either identified the cause or listed the additional steps planned to identify the cause in more than 130 calendar days but less than or equal to 140 calendar days following the Misoperation.	The responsible entity did not have a procedure to identify and address all Protection System Misoperations. OR The responsible entity failed to implement its procedure to identify and address all Protection System Misoperations. OR The responsible entity documented the investigation and either identified the cause or listed the additional steps planned to identify the cause in more than 140 calendar days following the Misoperation. OR

						The responsible entity failed to document the investigation and identify the cause or list the additional steps planned to identify the cause.
			OR	OR	OR	OR
			The responsible entity developed and documented a CAP or a declaration in more than 120 calendar days but less than or equal to 150 calendar days following the Misoperation.	The responsible entity developed and documented a CAP or a declaration in more than 150 calendar days but less than or equal to 160 calendar days following the Misoperation.	The responsible entity developed and documented a CAP or a declaration in more than 160 calendar days but less than or equal to 170 calendar days following the Misoperation.	The responsible entity developed and documented a CAP or a declaration in more than 170 calendar days following the Misoperation.
				OR	OR	OR
				The responsible entity developed and documented a CAP but failed to include one of the elements listed in Requirement R1, Part 1.3.	The responsible entity developed and documented a CAP but failed to include two of the elements listed in Requirement R1, Part 1.3.	The responsible entity failed to develop and document a CAP or a declaration following a Misoperation.

OR The responsible entity developed and documented an action plan but failed to include the delivery dates in accordance with the work timetable specified in Requirement R1, Part1.4. OR The responsible entity implemented the CAP or other action plan, but did not meet the completion timeline stated in the plan.	days following the Misoperation. OR The responsible entity failed to develop and document an action plan or a declaration following a Misoperation. OR The responsible entity failed to implement a CAP or other action plan.

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

None.

Guidelines and Technical Basis

A revised Misoperation definition is being proposed for industry adoption. It includes the following conditions:

(1) Any failure of a Protection System to operate for a Fault within the zone it is designed to protect. A lack of target information, e.g. when a high-speed pilot system does not trip because a high-speed zone element trips first, is not a Misoperation. If a fault or abnormal condition is cleared within the time normally expected with proper functioning of at least one Protection System element, then failure of another Protection System element associated with the protection scheme is not a Misoperation.

(2) Any failure of a Protection System to trip for a non-Fault condition such as power swings, over excitation, or loss of excitation for which the Protection System was intended to operate. For example, failure to trip the generator by loss of field protection for a loss of field condition on that generator is a Misoperation.

(3) Any Protection System operation that is slower than planned for a Fault within the zone it is designed to protect. Delayed fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high speed performance is not required by planning studies associated with the TPL standards or by coordination requirements with other Protection Systems.

(4) Any Protection System operation for a Fault not within the zone it is designed to protect. An example of this type of Misoperation is an over-reaching trip due to a lack of coordination between Protection System relays. Note: Operation of properly coordinated backup Protection System relays to clear the fault in an adjacent zone is not a Misoperation if the primary protection fails to clear the fault within the specified time.

(5) Any Protection System operation for non-Fault conditions such as power swings, over excitation, or loss of excitation for which the Protection System is not intended to operate. For example, tripping a generator by the operation of loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation.

This definition is based on the established IEEE/PSRC I3 Working Group on 'Transmission Protective Relay System Performance Measuring Methodology' categories (excluding Failure to Reclose) of Relay System Misoperation. The phrase abnormal condition has been replaced with "non-fault condition" to remove ambiguity.

Failure to automatically reclose after a fault is not included as a Protection System Misoperation because reclosing equipment is not included under the definition of Protection Systems. Operations which are initiated by control systems (not by Protection Systems), such as those associated with generator controls, or turbine/boiler controls, Static VAR Compensators (SVCs), Flexible AC Transmission Systems (FACTS), High-Voltage DC (HVDC) transmission systems, circuit breaker mechanisms, or other facility control systems are also not Misoperations of a Protection System.

Requirement R1 states the overall objective of the standard, which is to ensure that entities have and consistently implement a procedure to identify and correct all Protection System Misoperations. Specific detail regarding what this procedure must include is provided in the **Parts 1.1 through 1.5**.

Part 1.1 requires that entities have a process to review all events for potential Misoperations and identify all Misoperations found. Reviewing all events associated with Faults on the BES and reviewing all BES Protection System Operations is necessary for reviewing all events which may be associated with BES Protection System Misoperations. The process of identifying a Misoperation from an analytical standpoint begins with a review of all situations that challenge Protection Systems. Faults are one of the major sources of challenge to the BES Protection System. A fault does not need to occur on the BES to result in a BES Protection System Misoperation. To completely identify Misoperations, it must be determined if the Protection System operated for a Fault within its zone of protection, a Fault outside its zone, or a no-Fault condition. Unless all BES Protection System operations and Faults that challenge them are reviewed, it cannot be determined with certainty that all Misoperations are identified. For example, if you only reviewed Faults resulting in an overtrip, you would not necessarily identify Misoperations caused by slow trips.

Given that a Misoperation has been identified, **Part 1.2** requires the responsible entity accurately identify the underlying or "root" cause in sufficient detail to develop a corrective action plan that remedies the problem to prevent Misoperation recurrence. The cause of most Misoperations can be identified without extraordinary effort. Where a cause cannot be identified, a thorough documentation of the investigation is required to aid future investigation of the Misoperation particularly if it recurs. It is expected that the responsible entity will perform due diligence to identify the Misoperation cause.

An investigation report generally includes the following information: 1) initial evidence, 2) probable or potential causes, 3) tests and studies, and 4) conclusions. A brief description of the event surrounding the Misoperation may be included if not separately documented. The initial evidence, which may also be documented separately, contains the sequence of events, relay targets and a summary of Disturbance Monitoring Equipment (DME) records. The probable (or potential) causes are a list of those causes which are most likely to have contributed to the Misoperation and could be considered for testing. The test and studies documented in the report would describe and provide findings of those tests (e.g. relay calibration and simulation tests, communication noise and attenuation tests, CT/VT ratio tests, DC continuity checks and functional tests) and studies (e.g. short circuit and coordination studies) performed in the attempt to determine the root cause. The conclusions should summarize the root cause(s) substantiated by the evidence and findings of the tests and studies.

If no root cause was found, then the conclusions would attest to the indeterminate results and delineate those causes that have been eliminated.

Part 1.2 gives 90 calendar days from the date of the Misoperation to complete the investigation. The 90 day allowance was selected to provide sufficient time for the responsible entity to get through a seasonal period that can restrict the ability to take the outages necessary to effectively identify the Misoperation root cause(s) or document the investigation for unsolved root causes. This standard applies to all BES Protection Systems some of which are more critical than others. It is assumed that critical systems will be addressed with more urgency which may delay the investigation of less critical systems. Some regional standards (such as PRC-004-WECC-1) may identify those critical elements and provide more stringent time frames.

In most cases where a root cause of a Misoperation is identified, a Corrective Action Plan to address the cause will improve the performance and reliability of the BES. **Part 1.3, Bullet 1** establishes the need for an entity to have a procedure for developing Corrective Action Plans. A Corrective Action Plan should include interim corrective actions, final corrective actions, and a timeline for completion delivery dates. Interim corrective actions may be useful to quickly address some of the aspects of the Misoperation prior to implementation of a final solution. Examples for interim corrective actions are: disabling a blocking scheme prior to conversion to a permissive scheme, and taking equipment offline or removing equipment from service until new equipment is available.

The reliability of the BES could be greatly enhanced by making it immune to faults. Protection Systems are applied to the BES to clear faults and contain their negative impacts, thereby maintaining the reliability and stability of the BES. However, it is impossible (or at least highly impractical) to create failure proof Protection Systems. This is particularly true of Protection Schemes which rely on substation to substation communications for proper operation. The communication equipment can be spread over large distances, and be exposed to failure causes beyond the capability of the Protection System's owner's capability to control. Part of proper application of these Protection Systems involves analysis of their behavior during communication failures.

Where studies have determined that high speed clearing is required over 100% of the protected element to maintain stability, a communication failure must not prevent high speed fault clearing. In general, this will result in some amount of tripping for external faults. That, by definition, is a misoperation. There are usually things that can be done to reduce the tendency to misoperate, and to reduce the impact of a misoperation. However, the possibility typically cannot be eliminated. Altering the Protection System to eliminate tripping for every possible over trip during communication failures would prevent this type of misoperation, but it would negatively impact the stability of the BES.

Where studies have determined that excessive tripping is a greater threat to stability than slow tripping for a remote end line fault, permissive schemes can be used to provide high speed tripping. These schemes provide security against excessive tripping during communication failures, but will result in slower tripping for some faults. Under the proposed Misoperation definition, this may not always be considered a Misoperation, but it is certainly less than optimal Protection System performance. It does promote system stability however. Improving the likelihood of high speed clearing at the expense of security in these cases, will negatively impact the stability of the BES.

In rare cases such as the one described above, where altering a Protection System to avoid the recurrence of a Misoperation may lower the reliability or performance of the BES, a declaration addressing the lack of a CAP is required. Additionally, if analysis of the event shows that the cause of the failure is beyond the Protection System owner's ability to prevent or correct (such as a communication failure caused by an external dig in), corrective action may not be appropriate.

Part 1.3 Bullet 2 allows for this situation by requiring that where corrective action is not taken, the Protection System owner has to provide a declaration that includes a description of the failure mode, the Misoperation, and the potential impacts on the BES of eliminating the mode of Misoperation.

While many things can be done to improve the performance of Protection Systems, it is not possible to prevent all failures. Protection Systems which are designed to operate during partial failure modes in a manner that promotes the maintenance of BES stability may experience Misoperations for which a Corrective Action Plan may not be appropriate.

In some cases, analysis of all available information will not identify a root cause. **Part 1.4** is intended to allow entities to deal with these scenarios and still meet the overall objectives of the reliability standard.

In some of these cases additional steps may be identified (such as applying more monitoring equipment) to aid in future investigations of subsequent Misoperations. Modifications to the Protection System may be identified which could reduce the likelihood of a recurrence of the Misoperations. These steps and modifications should be identified to aid in future investigations of recurring Misoperations.

When a root cause is not identified and all investigative avenues have been exhausted, a declaration detailing the description of the investigative work conducted as well as the justification for the decision to conclude the investigation is required.

Parts 1.3 and 1.4 both give 120 calendar days from the date of the Misoperation to develop a plan or otherwise address the Misoperation. This give an additional 30 days beyond the deadline established on **Part 1.2.** As discussed above, this allowance provides sufficient time for the responsible entity to get through a seasonal period that can restrict the ability to take the outages necessary to effectively identify the Misoperation root cause(s) or document the investigation for unsolved root causes. Also as discussed above, some regions may choose to implement more stringent deadlines for some of all of its Protection Systems.

Finally, the goal of the standard has not been met unless action plans are actually implemented, as is required in **Part 1.5.** The responsible entity is required to implement and complete a CAP or other action plan to accomplish the purpose of this standard, which is to prevent future Misoperations, thereby minimizing risk to the BES. The CAP or action plan is intended to correct the root causes of Protection System Misoperations and prevent them from recurring. The responsible entity is also required to complete the CAP or action plan, document the manner in which the plan was implemented, and retain the appropriate evidence to demonstrate implementation.

This requirement sets the expectation that the work identified in the CAP or action plan will be completed on schedule as planned. Deferrals or other relevant changes to the CAP or action plan need to be documented so that the record includes not only what was planned, but what was implemented. Depending on the planning and documentation format used by the responsible entity, evidence of successful CAP or action plan execution could consist of signed-off work orders, printouts from work management systems, spreadsheets of planned versus completed work, timesheets, work inspection reports, paid invoices, photographs, walk-through reports or other evidence.

A review of the Transmission Availability Data System (TADS) data for the past three years reveals that the fourth ranked initiating cause of BES outages not related to weather is “Failed Protection System Equipment.” Given the high ranking of this metric, it is appropriate to collect data on Protection System Misoperations for analysis to drive improvements in Protection System reliability.

Section C-1.4 requires periodic data reporting and references a common reporting format to facilitate consistent reporting of Misoperation data by all Transmission Owners, Generator Owners, and Distribution Providers. Reporting Misoperation data in a common format permits the ERO to analyze the data, develop meaningful metrics for measuring Protection System performance, identify trends in Protection System performance that negatively impact reliability, and identify lessons learned.

Analysis of data from all Misoperations across North America makes possible identification of issues and trends that may not be identifiable through analysis of smaller data sets on an entity or regional basis. Information regarding identified issues and trends and recommended actions will be shared with Transmission Owners, Generator Owners, and Distribution Providers through lessons learned or industry alerts. Sharing this information will permit recipients to take appropriate actions to drive improvements in Protection System performance.

The common reporting template also will improve the usefulness of metrics developed to track Protection System performance. While the most relevant category defined in TADS is titled "Failed Protection System Equipment," the title is not an accurate description of the information reported in the metric. This metric includes all Protection System Misoperations that are not related to human error, which is only a subset of all Protection System Misoperations. The Protection System Misoperations related to human error (e.g., miscoordinated settings, incorrect setting calculations, and errors in applying settings to the relay, etc.) are tracked separately from Protection System equipment-related Misoperations, and are grouped together with other human errors by a utility employee or contractor. Similarly, Protection System Misoperations related to failed equipment such as a failed CVT on the primary insulation side are reported under "Failed AC Substation Equipment." Reporting of Misoperations data using the common format specified in **C-1.4** will permit development of metrics specific to Protection System Misoperations, with the potential to break down the metric by category of Misoperation (e.g., failure to trip, slow trip, unnecessary trip, etc.) and cause of Misoperation (ac system, dc system, as-left personnel error, incorrect setting/logic/design, and relay failures/malfunctions).

Attachment 1: Quarterly Misoperations Reporting Data

Field Name	Field Description	Example Data
Resubmittal Check	Identify if this is a resubmission of data. **Field Value:** Yes or No	No
Regional Entity	Identify Regional Entity. **Field Value:** FRCC, MRO, NPCC, RFC, SERC, SPP, TRE, or WECC	SERC
Entity Name	Enter Entity name. **Field Value:** User-defined Text	National Power
Misoperation Date	Enter the date of the Misoperation. **Field Value:** MM/DD/YYYY format	5/25/2010
Misoperation Time	Enter the time of the Misoperation. **Field Value:** HH:MM:SS format (use 24 hour clock)	10:02:31
Time Zone	Identify time zone. **Field Value:** ADT, AST, CDT, CST, EDT, EST, MDT, MST, PDT, PST, or GMT	EDT
Facility Name	Identify the name of the substation or generating station Facility where the Misoperation occurred. **Field Value:** User-defined Text	Lois Lane
Equipment Name	Identify the name of the generator, transmission line, transformer, bus or equipment protected by the Protection System that Misoperated. **Field Value:** User-defined Text	Kent - Lois Lane 115 kV line
Equipment Type	Identify the type of equipment being protected. **Field Value:** Line, Transformer, Generator, Shunt Capacitor, Series Capacitor, Bus, Shunt Reactor/Inductor, Series Reactor/Inductor, Dynamic Var Systems, Breaker, HVdc, or Other	Line
Facility Voltage (kV)	Identify the system voltage of the protected element (For transformers, use high-side voltage). **Field Value:** <100, 100, 115, 120, 138, 161, 230, 345, 500, 735, 765, or HVdc	115
Equipment Removed from Service	Identify the equipment removed from service (sustained or momentary - less than one minute) because of the Misoperation. **Field Value:** User-defined Text specifying the Circuits, Transformers, Buses (and also Breakers only if the Breaker is the only element to trip)	Lois Lane-Kent 115 kV line
Event Description	Provide a brief description of the event and detailed description of Misoperation root cause(s). **Field Value:** User-defined Text	Primary Ground Relay (KRP) failed to operate.

		Resulted in slow clearing at Lois Lane Substation. At Lois Lane, field found KA-4 relay with failed RRH/RRT coil that prevented a trip output from the KRP Primary ground relay.
Misoperation Category	Identify the Misoperation Category. **Field Value:** Failure to Trip – During Fault, Failure to Trip – Other Than Fault, Slow Trip, Unnecessary Trip – During Fault, or Unnecessary Trip – Other Than Fault	Slow trip
Cause(s) of Misoperation	Identify the root cause(s) of the Misoperation	Relay failures/malfunctions
	Field Value: AC System - This category includes Misoperations caused by problems with the AC source to the Protection System equipment. Examples include Misoperation caused by CT saturation, loss of potential and rodent damage to voltage or current circuit wiring.	
	Field Value: As-left Personnel Error - This category includes Misoperations caused by incorrect as-left Protection System element settings following maintenance or construction activities. Examples include leaving test switches open, wiring errors where correct drawings were provided for use, leaving carrier grounds in place, installing the wrong relay settings, and making incorrect field settings during calibration testing.	
	Field Value: Communication Failure - This category includes Misoperations caused by protection scheme communication system failure include failure of installed transmitters and receivers. Examples include Misoperation caused by loss of carrier, spurious transfer trips associated with noisy channels, leased-line failure or performance issues caused by telephone company error, loss of fiber optic communication equipment, and microwave communication problems caused by weather conditions.	
	Field Value: DC System - This category includes Misoperations caused by problems with the DC source to Protection System equipment. Examples include problems with the battery, battery charging system, circuit breaker trip circuits, or loss of DC power to a relay or communication device.	

	Field Value: Incorrect Setting/Logic/Design Errors - This category includes Misoperations caused by Protection System owner engineering staff errors. Examples include setting errors, errors contained in provided documentation, application errors, failure to coordinate settings, incorrect schematics and drawings, and having a protection scheme with multiple CT ground connections installed as specified by provided design drawings.	
	Field Value: Relay Failure/Malfunction - This category includes Misoperations caused by incorrect operation of Protection System relays. Examples include component failure, equipment physical damage, firmware problems, manufacturer error, aging capacitors causing a change in relay characteristics, misfiring thyristors, water damage, relay power supply failure, internal relay wiring/logic error and failure of protection scheme auxiliary tripping relays.	
	Field Value: Unknown/Unexplainable - This category includes Misoperations that occur for which a bonafide cause cannot be determined. If selecting this cause code as Misoperation root cause, then detailed documentation of investigative actions performed justifying selection of this cause code is required to be created and maintained for review.	
Protection Systems/Components that Misoperate	Provide information on the protection systems/components that misoperate. Also list the relay model(s) and protection scheme(s) involved if the Cause(s) of Misoperation is identified as either "Relay Failure/Malfunction" or "Incorrect Settings/Logic/Design Errors". **Field Value:** User-defined Text	KRP ground relay and KA-4 used in DCB scheme
Relay Technology	Identify the relay technology installed if the Cause(s) of Misoperation is "Relay failures/malfunctions" or "Incorrect settings/logic/design errors". **Field Value:** Electromechanical, Solid State, or Microprocessor	Electromechanical
TADS Reportable Outage?	Identify if this outage is a TADS reportable outage. **Field Value:** Yes or No	No
TADS Cause Code	The corresponding TADs Cause Code is automatically added to this record if the outage is a TADS reportable outage. **Field Value:** (No entry required)	Not a Reportable TADS outage
TADS Event ID(s)	Enter each TADS Event ID(s) associated with the Misoperation event using TADS Form 5 if the outage is a TADS reportable outage. **Field Value:** User-defined Text	N/A
Analysis and Corrective Action Status	Identify Misoperation investigation and resolution status. **Field Value:** Analysis - In Progress, Analysis - Completed, Corrective Action - In Progress, or Corrective Action - Completed	Analysis - Completed
Corrective Action Plan	Identify the corrective actions taken. **Field Value:** User-defined Text	The powerline carrier

		transceiver at Lois Lane is scheduled to be replaced due to an unrelated failure. This KA-4 relay will be replaced at that time.
CAP Target Completion Date	Enter the Corrective Action Plan target completion date. **Field Value:** MM/DD/YYYY format	12/31/2010
Actual CAP Completion Date	Enter the Corrective Action Plan actual completion date. **Field Value:** MM/DD/YYYY format	
Reported By	Identify the reporting Entity point of contact. **Field Value:** User-defined Text	Tom Jefferson
Phone Number	Identify the reporting Entity point of contact phone number. **Field Value:** User-defined Text	959-867-5309
E-Mail Address	Identify the reporting Entity point of contact E-Mail address. **Field Value:** User-defined Text	TJ@NPI.net
Date Reported	Enter the report date. **Field Value:** MM/DD/YYYY format	6/30/2010

Implementation Plan for PRC-004-03

Standards Involved:

- Approval:
  - PRC-004-3 – Protection System Misoperation Identification and Correction

- Retirements:
  - PRC-003-1— Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems
  - PRC-004-1a — Analysis and Mitigation of Transmission and Generation Protection System Misoperations
  - PRC-004-2 — Analysis and Mitigation of Transmission and Generation Protection System Misoperations
- Related
  - PRC-003-STD-1, PRC-004-WECC-1: These are two regional standards related to reporting of Misoperations for a limited set of WECC Paths and Remedial Action Schemes. In those cases where those standards will overlap with the Continent-wide standard, entities are expected to comply with the more stringent standard. Doing so will ensure compliance with the less stringent standard as well. There are no apparent conflicts between the standards that would lead to mutually exclusive compliance.

Prerequisite Approvals:
The proposed standard is **not** dependent on any prerequisite approvals.

Revision to Sections of Approved Standards and Definitions:
There is one revised definition for the proposed standard:

Misoperation: Any of the following:

1. **Failure to Trip - During Fault -** Any failure of a Protection System to operate for a Fault within the zone it is designed to protect.
2. **Failure to Trip - Other Than Fault -** Any failure of a Protection System to operate for a non-Fault condition such as power swings, under-voltage, over excitation, or loss of excitation for which the Protection System was intended to operate.
3. **Slow Trip -** Any Protection System operation that is slower than planned for a Fault within the zone it is designed to protect.
4. **Unnecessary Trip - During Fault -** Any Protection System operation for a Fault not within the zone it is designed to protect.
5. **Unnecessary Trip - Other Than Fault -** Any Protection System operation for non-Fault conditions such as power swings, under-voltage, over excitation, or loss of excitation for which the Protection System is not intended to operate.

Retirement of Existing Standards:
The existing Standards PRC-003-1, PRC-004-1a, and PRC-004-2 shall be retired upon regulatory approval of PRC-004-3.

PRC-003-1 is currently not enforceable, but requires the establishment of a procedure by the RRO. The new PRC-004-3 puts this obligation on the Functional Entities instead, and specifies the minimum elements required in the procedure, making PRC-003-1 unnecessary and duplicative.
PRC-004-1a and -2 Requirements R1 and R2 require the Functional Entities implement the procedures specified in PRC-003-1. R1 in the new PRC-004-3 includes this obligation. R3 in PRC-004-1A and -2 requires reporting to the RRO, which has now been included in the Compliance section of the standard. Together, these elements make PRC-004-1A and -2 superfluous as well.

Applicability:
This standard applies to the following functional entities:

- Transmission Owners
- Generator Owners
- Distribution Providers

This standard applies to the following Facilities:

- Protection Systems for Facilities that are part of the BES.
- Special Protection Systems (SPS), Remedial Action Schemes (RAS), and Under Voltage Load Shedding programs are excluded from this standard.

Effective Date:
The effective date is the date entities are expected to meet the performance identified in this standard.

Requirement R1 and its associated parts shall become effective on the first day of the first calendar quarter, 3 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements go into effect on the first day of the first calendar quarter, 3 months after Board of Trustees adoption.

Because the standard does not deviate significantly from what is required today, it is believed that this standard can be implemented on a relatively short schedule.

A. Introduction

1. **Title:** **Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems**

2. **Number:** PRC-003-1

3. **Purpose:** To ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated.

4. **Applicability**

   4.1. Regional Reliability Organization

5. **Effective Date:** May 1, 2006.

B. Requirements

R1. Each Regional Reliability Organization shall establish, document and maintain its procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations. These procedures shall include the following elements:

R1.1. The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).

R1.2. Data reporting requirements (periodicity and format) for Misoperations.

R1.3. Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.

R1.4. Identification of the Regional Reliability Organization group responsible for the procedures and the process for approval of the procedures.

R2. Each Regional Reliability Organization shall maintain and periodically update documentation of its procedures for review, analysis, reporting, and mitigation of transmission and generation Protection System Misoperations.

R3. Each Regional Reliability Organization shall distribute procedures in Requirement 1 and any changes to those procedures, to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners within 30 calendar days of approval of those procedures.

C. Measures

M1. The Regional Reliability Organization shall have procedures for the review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations as defined in R1.

M2. The Regional Reliability Organization shall have evidence it maintained and periodically updated its procedures for review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations as defined in Requirement 2.

M3. The Regional Reliability Organization shall have evidence it provided its procedures for the review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners as defined in Requirement 3.

D. Compliance

1. **Compliance Monitoring Process**

1.1. Compliance Monitoring Responsibility

NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The Regional Reliability Organization shall retain documentation of its procedures for analysis of transmission and generation Protection System Misoperations and any changes to those procedures for three years.

The Compliance Monitor shall retain any audit data for three years.

1.4. Additional Compliance Information

The Regional Reliability Organization shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Levels of Non-Compliance

2.1. Level 1: Procedures were not reviewed and updated within the review cycle period as required in R2.

2.2. Level 2: Procedures did not include one of the elements defined in R1.1 through R1.4.

2.3. Level 3: Procedures did not include two or more of the elements defined in R1.1 through R1.4.

2.4. Level 4: There shall be a level four non-compliance if either of the following conditions exist:

2.4.1 No evidence of Procedures.

2.4.2 Procedures were not provided to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners as defined in R3.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to “en dash” (–) and “em dash (—).” 2. Added “periods” to items where appropriate. 3. Changed “Timeframe” to “Time Frame” in item D, 1.2.	01/20/06

A. Introduction

1. Title: **Analysis and Mitigation of Transmission and Generation Protection System Misoperations**

2. Number: PRC-004-1a

3. Purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated.

4. Applicability

4.1. Transmission Owner.

4.2. Distribution Provider that owns a transmission Protection System.

4.3. Generator Owner.

5. Effective Date: To be determined

B. Requirements

R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's procedures developed for Reliability Standard PRC-003 Requirement 1.

R2. The Generator Owner shall analyze its generator Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's procedures developed for PRC-003 R1.

R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Reliability Organization, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Reliability Organization's procedures developed for PRC-003 R1.

C. Measures

M1. The Transmission Owner, and any Distribution Provider that owns a transmission Protection System shall each have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Reliability Organization procedures developed for PRC-003 R1.

M2. The Generator Owner shall have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's procedures developed for PRC-003 R1.

M3. Each Transmission Owner, and any Distribution Provider that owns a transmission Protection System, and each Generator Owner shall have evidence it provided documentation of its Protection System Misoperations, analyses and Corrective Action Plans according to the Regional Reliability Organization procedures developed for PRC-003 R1.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organization.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The Transmission Owner, and Distribution Provider that own a transmission Protection System and the Generator Owner that owns a generation Protection System shall each retain data on its Protection System Misoperations and each accompanying Corrective Action Plan until the Corrective Action Plan has been executed or for 12 months, whichever is later.

The Compliance Monitor shall retain any audit data for three years.

1.4. Additional Compliance Information

The Transmission Owner, and any Distribution Provider that owns a transmission Protection System and the Generator Owner shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Levels of Non-Compliance for Transmission Owners and Distribution Providers that own a Transmission Protection System:

2.1. Level 1: Documentation of Misoperations is complete according to PRC-004 R1, but documentation of Corrective Action Plans is incomplete.

2.2. Level 2: Documentation of Misoperations is incomplete according to PRC-004 R1 and documentation of Corrective Action Plans is incomplete.

2.3. Level 3: Documentation of Misoperations is incomplete according to PRC-004 R1 and there are no associated Corrective Action Plans.

2.4. Level 4: Misoperations have not been analyzed and documentation has not been provided to the Regional Reliability Organization according to Requirement 3.

3. Levels of Non-Compliance for Generator Owners

3.1. Level 1: Documentation of Misoperations is complete according to PRC-004 R2, but documentation of Corrective Action Plans is incomplete.

3.2. Level 2: Documentation of Misoperations is incomplete according to PRC-004 R2 and documentation of Corrective Action Plans is incomplete.

3.3. Level 3: Documentation of Misoperations is incomplete according to PRC-004 R2 and there are no associated Corrective Action Plans.

3.4. Level 4: Misoperations have not been analyzed and documentation has not been provided to the Regional Reliability Organization according to R3.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to “en dash” (–) and “em dash (—).” 2. Added “periods” to items where appropriate. Changed “Timeframe” to “Time Frame” in item D, 1.2.	01/20/06
1.a	February 17, 2011	3. Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1.a	February 17, 2011	Adopted by the Board of Trustees	

Appendix 1

Requirement Number and Text of Requirement
R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's procedures developed for Reliability Standard PRC-003 Requirement 1. **R3**. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Reliability Organization, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Reliability Organization's procedures developed for PRC-003 R1.
Question:
Is protection for a radially-connected transformer protection system energized from the BES considered a transmission Protection System subject to this standard?
Response:
The request for interpretation of PRC-004-1 Requirements R1 and R3 focuses on the applicability of the term "transmission Protection System." The NERC Glossary of Terms Used in Reliability Standards contains a definition of "Protection System" but does not contain a definition of transmission Protection System. In these two standards, use of the phrase transmission Protection System indicates that the requirements using this phrase are applicable to any Protection System that is installed for the purpose of detecting faults on transmission elements (lines, buses, transformers, etc.) identified as being included in the Bulk Electric System (BES) and trips an interrupting device that interrupts current supplied directly from the BES. A Protection System for a radially connected transformer energized from the BES would be considered a transmission Protection System and subject to these standards only if the protection trips an interrupting device that interrupts current supplied directly from the BES and the transformer is a BES element.

A. Introduction

1. **Title:** Analysis and Mitigation of Transmission and Generation Protection System Misoperations

2. **Number:** PRC-004-2

3. **Purpose:** Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated.

4. **Applicability**

   4.1. Transmission Owner.

   4.2. Distribution Provider that owns a transmission Protection System.

   4.3. Generator Owner.

5. **(Proposed) Effective Date:** The first day of the first calendar quarter, one year after applicable regulatory approval; or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter one year after Board of Trustees' adoption.

B. Requirements

R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.

R2. The Generator Owner shall analyze its generator Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.

R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.

C. Measures

M1. The Transmission Owner, and any Distribution Provider that owns a transmission Protection System shall each have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.

M2. The Generator Owner shall have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.

M3. Each Transmission Owner, and any Distribution Provider that owns a transmission Protection System, and each Generator Owner shall have evidence it provided documentation of its Protection System Misoperations, analyses and Corrective Action Plans according to the Regional Entity's procedures.

D. Compliance

1. **Compliance Monitoring Process**

   1.1. Compliance Enforcement Authority

   Regional Entity.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

The Transmission Owner, and Distribution Provider that own a transmission Protection System and the Generator Owner that owns a generation Protection System shall each retain data on its Protection System Misoperations and each accompanying Corrective Action Plan until the Corrective Action Plan has been executed or for 12 months, whichever is later.

The Compliance Monitor shall retain any audit data for three years.

1.5. Additional Compliance Information

The Transmission Owner, and any Distribution Provider that owns a transmission Protection System and the Generator Owner shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Violation Severity Levels (no changes)

E. Regional Differences

None identified.

Violation Risk Factor and Violation Severity Level Assignments

2010-05.1 – Phase 1 of Protection Systems (Misoperations)

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in the following draft standards:

- PRC-004-3 — Protection System Misoperation Identification, Correction and Reporting

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The Protection Systems Misoperations Rapid Development Team applied the following NERC criteria when proposing VRFs for the requirements under this project:

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The RDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs[1]:

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report
The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards
The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

---

[1] North American Electric Reliability Corp., 119 FERC 61,145, order on reh'g and compliance filing, 120 FERC 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the RDT considered the FERC VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Guideline 1 identifies a list of topics that encompass nearly all topics within the NERC Reliability Standards and implies that these requirements should be assigned a High VRF. Guideline 4 directs assignment of VRFs based on the impact of a specific requirement on the reliability of the system. The RDT believes that Guideline 4 better reflects the intent for assigning VRFs since this approach is focused on the reliability impact of the requirement.

VRF for PRC-004-3:

There is one requirement in PRC-004-3. The VRF was determined as follows:

VRF for PRC-004-3, Requirements R1: HIGH

- FERC Guideline 2 — Consistency within a Reliability Standard exists, as there is only one requirement in the standard.
- FERC Guideline 3 — Consistency among Reliability Standards exists. The requirement is similar to EOP-004-1 R2, which was assigned a "Medium" VRF. However, the RDT believes specifying a "High" VRF is appropriate because this requirement, unlike EOP-004-1 R2, requires that entities also implement a procedure to correct the causes of Misoperations to prevent their reoccurrence in the future.
- FERC Guideline 4 **—** Consistency with NERC's Definition of the VRF Level selected exists. Not correcting the cause or causes of a Protection System Misoperation could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures. Accordingly, the VRF has been established as "High."
- FERC Guideline 5 **—** Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement does not co-mingle more than one obligation. All Parts are related to the creation and implementation of the procedure to identify and correct the causes of Protection System Misoperations.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the standards under this project, the RDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The RDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in standards under this project meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a “binary” type requirement must be a “Severe” VSL.

Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties per violation per day basis is the “default” for penalty calculations.

VSLs for PRC-004-3 Requirement R1:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	The NERC VSL guidelines are satisfied by grading of the requirement. Because of the interdependence of the various Parts and the manner in which they contribute to the ultimate goal of correcting Misoperations, each Part has been considered independently, and missing a precursor Part has the potential to result in a Severe violation.	PRC-003-1 proposed VSL elements are similar to PRC-004-2 approved VSL elements. Complete failures to analyze Misoperations are treated as Severe violations, similar to the current standard. Proposed VSL assignments do not have the unintended consequence of lowering current compliance.	Proposed VSLs are graded and address each of the Parts of the requirement. Proposed VSL language does not include ambiguous terms and ensures uniformity and consistency in the determination of penalties.	Proposed VSL's do not expand on what is required in the requirement. Proposed VSL's are consistent with the requirement, and all Parts of the requirement have been addressed in the VSLs.	Proposed VSL's are based on a single violation and not a cumulative number of violations.

Table of Contents

1. Background

The NERC System Protection and Control Subcommittee (SPCS) was requested to provide input to the ERO Reliability Assessment and Performance Analysis (ERO-RAPA) Group regarding development of a consistent format and specification for Registered Entities to report protection system misoperation data to the Regions under NERC Reliability Standards PRC-003 and PRC-004. The SPCS assigned a team to develop proposals for SPCS consideration and the full SPCS discussed these proposals during its November 9-11, 2010 meeting. SPCS recommendations were forwarded by e-mail on November 10. This report provides formal documentation of the recommendations forwarded previously.

2. Reporting Template

SPCS comments on the ERO-RAPA Group proposed template are provided in an additional column added by the SPCS for this purpose. The SPCS agrees with the information to be collected in the template provided the template is used to collect data under PRC-004 (as is currently planned). However, in the event that agreement is not reached by the regions on a common reporting format and the template is used to collect data specifically for the purpose of reliability metric ALR4-1, then the template should collect only the data required for the metric; i.e., in this case the Corrective Action Plan information should be excluded from the template.

The SPCS comments provided in the template are focused primarily on ensuring that enough clarity is provided to obtain consistent reporting of information. The SPCS is available to review these comments with the ERO-RAPA Group and provide more detail. The work necessary to fully develop the format includes items such as development of drop-down boxes, etc., and the SPCS is available to work with NERC Staff or the ERO-RAPA Group to develop the specifics.

The template, with SPCS comments, is provided in Attachment A of this report.

3. Misoperation Categories

The SPCS recommends four misoperation categories as presented below in Table 1. The categories include two categories related to Protection System dependability and two categories related to Protection System security. These four categories are very similar to what is currently used by most regions.

Table 1: Misoperation Categories

Misoperation Categories
Failure to Trip
Slow trip (i.e., slower than required to meet TPL requirements)
Unnecessary Trip during fault
Unnecessary Trip other than fault

4. Cause Codes

The SPCS recommends six Cause Codes as presented below in Table 2. Cause codes also are based on current regional procedures. Adopting these six Cause Codes will require reporting more detail for some regions and less for others. The SPCS believes that these six Cause Codes strike a necessary balance between having enough Cause Codes to track meaningful trends in Protection System performance, while avoiding confusion and inconsistent reporting that may occur with too many Cause Codes.

Table 2: Cause Codes

Cause Codes	Cause Code Description
Incorrect setting/logic/design errors	This category includes misoperations due to "engineering" errors by the protection system owner. These include setting errors, errors in documentation, and errors in application. Examples would include uncoordinated settings, incorrect schematics, or multiple CT grounds in the design.
Relay failures/malfunctions	This category includes misoperations due to improper operation of the relays themselves. These may be due to component failures, physical damage to a device, firmware problems, or manufacturer errors. Examples would include misoperations caused by changes in relay characteristic due to capacitor aging, misfiring thyristors, damage due to water from a leaking roof, relay power supply failure, or internal wiring error. Failures of auxiliary tripping relays fall under this category.
Communication failures	This category includes misoperations due to failures in the communication systems associated with protection schemes inclusive of transmitters and receivers. Examples would include misoperations caused by loss of carrier, spurious transfer trips associated with noise, Telco errors resulting in malperformance of communications over leased lines, or microwave problems associated with weather conditions.
As-left personnel error	This category includes misoperations due to the condition the protection system was left in following maintenance or construction procedures. These include test switches left open, wiring errors not associated with incorrect drawings, carrier grounds left in place, or settings placed in the wrong relay.
AC system	This category includes misoperations due to problems in the ac inputs to the protection system. Examples would include misoperations associated with CT saturation, loss of potential, or rodent damaged wiring in voltage or current circuit.
DC system	This category includes misoperations due to problems in the DC control circuits. These include problems in the battery or charging systems, trip wiring to breakers, or loss of dc power to a relay or communication device.
Unknown/unexplainable	Requires extensive documentation of investigative actions if this cause code is utilized.

5. Applicability

During its discussion the SPCS noted that input had not been requested on the subject of the system Elements for which Protection System misoperations should be reported. The SPCS noted that because regional differences presently exist, it is necessary to provide guidance on this subject to achieve uniform reporting. The SPCS has previously provided input on this subject during its review of PRC-003, PRC-004, and PRC-016.[1] The SPCS discussed this subject and decided to update its previous recommendation to reflect FERC communications, modifications to the NERC Statement of Compliance Registry Criteria, and other industry developments that have occurred since May 2009.

The SPCS proposes that reporting of misoperations under PRC-004 apply to the Protection Systems defined below.

Protection Systems which trip:

a. Transmission system elements 100 kV and above

b. Transformers with 100 kV or higher on the secondary side

c. Generators that meet the definition in the NERC Statement of Compliance Registry Criteria and are connected to the transmission system at 100 kV or higher

d. Generator step-up transformers for generators that meet the definition in the NERC Statement of Compliance Registry Criteria and are connected to the transmission system at 100 kV or higher

[1] NERC SPCS Assessment of Standards: PRC-003-1, PRC-004-1, and PRC-016-1, May 22, 2009.

APPENDIX A – Draft Reporting Template with SPCS Comments

Field Name Common to All Regions Entity Name	Necessary Field Name Entity Name	Other Desired Information* Field Name	Information Explanation Name of Entity which owns the facility	SPCS Comments
Misoperation Date	Misoperation Date		Enter the date of the Misoperation	
	Misoperation Time		Enter the time of the Misoperation in (24 hr.) HH:MM:SS format	
	Time Zone		The time zone of the reported time of the Misoperation	*Include a drop-down menu for time zone entry (include GMT as one of the drop-down entries).*
		Equipment lost	Names of the equipment becoming unavailable due to the event	*Need to provide more specific instructions: e.g., define transmission lines by terminals and voltage; define transformers by substation name and terminal voltages*
	Facility Name Location of Misoperation)		Identify the name of the facility (i.e., substation or generating station) where the Misoperation occurred	*Suggest using another term than "facility" to avoid confusion with NERC defined term, "Facility"*
	Equipment Name (protected by Protection System that Misoperated)		Identify by name the generator, transmission line, transformer, bus or equipment protected by the Protection System that Misoperated	*Need to provide more specific instructions: e.g., define transmission lines by terminals and voltage; define transformers by substation name and terminal voltages*
	Equipment Type		Type of equipment being protected (e.g. Generator, Line, Capacitor, Transformer, Bus, Inductor, or Other)	*In order to obtain consistency in naming; dropdown menus will be helpful*
	Facility Voltage		System voltage (in kV) of the protected element (if transformer, high side kV)	
Event Description	Description of Event		Provide a brief description of the event and Misoperation	
	Protection Systems that Misoperated		Information on the Protection Systems that Misoperated including relay types and protection schemes	*In order to obtain consistency in naming; dropdown menus will be helpful*
	Misoperation Category		Categories include (but not limited to): Failure to Trip, Slow Trip,	*The SPCS recommends four Misoperation Categories (Failure*

Field Name Common to All Regions Entity Name	Necessary Field Name Entity Name	Other Desired Information* Field Name	Information Explanation Name of Entity which owns the facility	SPCS Comments
			Unnecessary Trip During Fault, Unnecessary Trip Other than Fault, Under Review	*to Trip; Slow trip (i.e., slower than required to meet TPL requirements); Unnecessary Trip during fault; Unnecessary Trip other than fault*
	Cause(s) of Misoperation		Identification of the root cause(s) of the Misoperation	*Reporting the Cause of Misoperation should include two fields: one for a description and one to enter the Cause Code (SPCS recommends six Cause Codes)*
Corrective Action Plan and Investigation	Corrective Action Plan and Investigation		Identify the investigations and corrective actions taken or being taken	*Corrective Action Plan information is appropriate for inclusion in the template for reporting under PRC-004-1. If the regions do not reach agreement and the template is used for a Section 1600 Data Request to collect data for ALR4-1, then the Corrective Action Plan information should be deleted from the template.*
	Proposed Completion Date		If corrective actions are not complete, estimate when they will be complete	*See note above.*
	Completion Date		If corrective actions are complete, enter the completion date	*See note above.*
	Reported By		Enter the name of the person filling out the report	
	Phone		Enter the reporting person's phone number	
	E-Mail		Enter the reporting E-MAIL address	
	Date Reported		The date that the Misoperation is/was reported to the Region

Table of Contents

Introduction

When the original scope for the System Protection and Control Task Force (SPCTF, now the System Protection and Control Subcommittee – SPCS) was developed, one of the assigned items was to review all of the existing PRC-series of Reliability Standards, to advise the Planning Committee, and to develop Standards Authorization Requests, as appropriate, to address any perceived deficiencies.

This report presents the SPCS' assessment of three of the PRC standards pertaining to relay misoperations:

- PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems
- PRC-004-1 – Analysis and Mitigation of Transmission and Generation Protection Misoperations
- PRC-016-1 – Special Protection System Misoperations

This report serves as a precursor for a Standards Authorization Request (SAR) for modifications to PRC-003 that will be submitted by the SPCS.

Executive Summary

Standard PRC-003 is intended to ensure that all System Protection Misoperations are analyzed and mitigated according to guidelines established by the regions. The FERC, in Order 693, dated March 16, 2007, declared this standard as a “fill in the blank” type of standard that does not merit approval unless it is modified to make it more specific and consistent for all Regions. The SPCS concurs with the FERC order and provides recommendations on how the standard can be rewritten.

Because the procedures for analyzing and mitigating Misoperations were to be established by the regions, there is significant dissimilarity between the Misoperation data reported by each region, resulting in a virtually unusable misoperation metric for North America. SPCS recommends a change to the definition of Misoperation (Reportable Protection Misoperation) to provide uniformity to the misoperation data reported to the regions and NERC.

Protection System elements used for Special Protection Systems (SPS) or Remedial Action Schemes (RAS) are no different from those used for non Special Protection Systems. The revision to Standard PRC-003 should therefore apply to all Protection Systems, including SPS and RAS.

The SPCS also recommends that Standard PRC-016-0 – Special Protection System Misoperations, be requirements, merging its SPS/RAS Misoperation reporting, Corrective Action Plans, and tracking requirements into PRC-004 – Analysis and Mitigation of Transmission and Generation Protection System Misoperations.

Whenever an SPS/RAS misoperates and requires a Corrective Action Plan, that plan should become subject to review under PRC-012 to ensure that the changes proposed to the SPS are still properly designed, meet performance requirements, and is coordinated with other Protection Systems. Therefore, PRC-012 should be revised to require that review and PRC-004 should be modified to refer to that review process.

A Standards Authorization Request (SAR) will be submitted by the SPCS calling for a standards project to:

- Revise the definition of Misoperation (Reportable Protection Misoperation)
- Modify PRC-003, PRC-004, and PRC-012
- Retire PRC-016.

Assessment of PRC-003-1

PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires the regions to establish procedures for analysis of Misoperations. This has resulted in significant and substantive differences in regional procedures and this was noted in FERC's recommendation for "greater uniformity."

SPCS proposes updating the PRC-003-1 standard to be applicable to all regions based on following tenets:

1. **Applicability** – The existing standard says that the Protection Systems shall be reviewed but does not specify which systems apply to this standard.

   It is necessary for the new standard to define the protections systems to which the standard applies:

   - Transmission Protection Systems which trip:
     a. Transmission system elements 200-kV and above
     b. Operationally significant system elements 100-kV to 200-kV
     c. Transformers with 100-kV or higher on the low side
     d. GSU transformers with high side voltages of 100-kV or higher
   - Generation Protection Systems which trip:
     a. Transmission system elements 200-kV and above
     b. Operationally significant system elements 100-kV to 200-kV
     c. Transformers with 100-kV or higher on the low side
     d. GSU transformers with high side voltages of 100-kV or higher
     e. Generators connected through GSU transformers with high side voltages of 100-kV or higher
   - Protection Systems that trip aggregate generation of 75 MW or more (such as wind farms, geothermal, or solar) connected to the transmission system at 100-kV or higher.

2. **Definitions** – The NERC Glossary of Terms currently defines Misoperation as:

   Misoperation (current definition)
   - Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.

- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity

The existing definition does not address what are reportable and non-reportable misoperations. Reportable misoperations should be redefined in terms of both dependability and security, as a function of the impact of the Protection Systems on the electric system performance. SPCS recommends the following definition:

Reportable Protection Misoperation (proposed definition)

Dependability (failure to operate):

- Failure of the composite Protection System to initiate the isolation of a faulted power system Element as designed or within its designed operating time.
- Failure of the composite Protection System to operate as intended for a non-fault condition, such as out-of-step, overload, etc., within its designed operating time.
- Failure of an SPS/RAS, UVLS system, or UFLS system to operate for an intended condition or within its designed operating time.

Security (false or undesirable operations):

- Improper operation of a Protection System in absence of a fault on the power system Element it is designed to protect.
- Improper operation of a Protection System during a fault on any other power system Element it is not designed to protect.
- Improper operation of an SPS/RAS, UVLS system, or UFLS system in absence of its designed trigger conditions.
- Over-response of an SPS/RAS, UVLS system, or UFLS system

Notes to the proposed definition:

A. The composite Protection System in the context of this standard is the total complement of protection for a system Element (line, bus, transformer, generator, etc). Primary and secondary protection of a given Element is considered as the composite Protection System, not two separate Protection Systems.

B. *Delayed clearing, where a high-speed system is employed and is essential for transmission system performance, is considered a reportable misoperation of the high-speed system.*

C. *Lack of targeting of the high-speed system, such as when it is beat out by a high-speed zone, is not considered a reportable misoperation.*

D. *Multiple misoperations of a Protection System before it can be reasonably investigated and remedied should be considered as a single misoperation.*

E. *Failure to automatically reclose after a fault is not a reportable misoperation.*

F. *Human errors made in protection settings either as calculated or as installed, or wiring errors, which result in a misoperation are reportable.*

G. *Protection System operations related to on-site maintenance, testing, construction and or commissioning activities for that Protection System, when no fault or other abnormal condition has occurred, are not considered reportable Protection System misoperations.*

H. *Operations which are initiated by control systems (not by the Protection Systems), such as those associated with generator controls or turbine/boiler controls, SVCs, FACTS, HVDC, circuit breaker mechanism, or insulation media, or other facility control systems, are not reportable Protection System misoperations.*

I. *Protection System operations which occur with the protected element already out of service, that do not trip any in-service elements, are not reportable Protection System misoperations.*

3. **Reporting of Misoperations –** Because the current PRC-003 calls for regional procedures and reporting requirements, there is a wide variation in those requirements from region to region, making comparison of misoperations metrics at the NERC level virtually impossible. Since any assessment of the success or failure of the NERC protection-related standards to maintain or improve reliability depends on those metrics, it is important to provide for uniformity.

   The variations in definitions can be corrected by the adoption of the Reportable Protection Misoperation definition above.

   Uniform reporting can be addressed by following proposed reporting requirements:

   - Transmission Owner or Generation Owners that own Protection Systems shall submit a quarterly report of the total number of events analyzed, the number of Protection System misoperations, and the number of events still under analysis, in a prescribed format (to be part of the revised PRC-003 standard) no later than two calendar months after each quarter.

- The regions shall, in turn, submit a quarterly report to NERC – consolidated data for the Region in a prescribed format (also part of the revised PRC-003 standard).
- The regions shall provide any additional information on misoperations to NERC as requested.

4. **Analyses of All Protection System Operations –** All transmission and generation Protection System operations should be analyzed to determine if the operation was correct. Merely reporting the number of misoperations is meaningless unless put in the context of the total number of operations.

5. **Peer Review of Misoperations –** Peer review of misoperations and tracking of mitigation plans is an important part of improving Protection System performance. Logically, that function should be done by the Regional Entities. However, since standards requirements cannot be placed on the Regional Entities, the following suggestions are made but the mechanics are left open.

   - The regions, through their appropriate committees or subcommittee, shall review the misoperation reports. This review should determine whether further analysis, data, or other documentation is required, and it will confirm that appropriate mitigation is defined and scheduled.
   - The regions should maintain records of the quarterly reports and confirm the implementation of any proposed mitigation plan.
   - The regions should track the mitigation of reported misoperations to avoid further occurrences.

Assessment of PRC-004 and PRC-016-0

NERC standards PRC-004-1 – Analysis and Mitigation of Transmission and Generation Protection Misoperations, and PRC-016 – Special Protection System Misoperations both require that Protection System misoperations are analyzed and reported, and that corrective actions are taken where necessary. However, PRC-016 exclusively applies to special protection systems (SPS), also know as remedial action schemes (RAS). Since analysis and reporting of protection system misoperations is the same regardless of whether or not a SPS/RAS is involved; there is no need for a separate standard. Standard PRC-004-1 should be revised to include SPS/RAS, and PRC-016 should be retired.

SPS Corrective Action Plan Review

PRC-012-0 – Special Protection System Review Procedure is intended to provide a review procedure to ensure that all SPS/RAS are properly designed, meet performance requirements, and are coordinated with other Protection Systems.

Whenever an SPS/RAS misoperates and requires a Corrective Action Plan, that plan should become subject to review under PRC-012 to ensure that the changes proposed to the SPS are still properly designed, meet performance requirements, and are coordinated with other Protection Systems. Therefore, PRC-012 should be revised to require that review and PRC-004 should refer to that review process.

Proposed PRC-004-1 Revisions

SPCS recommends the following revisions to PRC-004-1 requirements to encompass those of PRC-016:

R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System or SPS shall each analyze its transmission Protection System or SPS Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature in accordance with Standard PRC-003 (revised).

R2. The Generator Owner shall analyze its generator Protection System or SPS Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature in accordance with Standard PRC-003 (revised).

R3. The Transmission Owner, Generator Owner, and Distribution Provider that owns a transmission Protection System or an SPS shall provide documentation of the misoperation analyses and the Corrective Action Plans to its Regional Reliability Organization and NERC upon request (within 90 calendar days).

R4. All Corrective Action Plans for SPS shall be subject to SPS Review Procedures in accordance with Standard PRC-012.

			Information).
Version 0 Team	371. Need to define evidence	PRC-003-1 will be retired, replaced by PRC-004-3. Language of revised standard PRC-004-3 has greater clarity with respect to prior versions. Each Measure clearly identifies the kind of evidence necessary for compliance. Requirement R1 also contains Parts which specify the evidence required for drafting a Corrective Action Plan, action plan, or declaration.	PRC-004-3 Measures M1 through M7 and Requirement R1
Version 0 Team	372. Change wording to reporting instead of monitoring	PRC-003-1 will be retired, replaced by PRC-004-3. Revised standard PRC-004-3 language conveys a different context with greater clarity than prior versions. The words monitor, monitoring or reporting are not used in the standard requirements. The word report is used in revised standard PRC-004-3 Measure M2 (context: investigative report) and also PRC-004-3 Section 1.4 Additional Compliance Information requires functional entities to report Misoperations data quarterly.	PRC-004-3 Measure M2 and Section 1.4 Additional Compliance Information.

Fill in the Blank Team	379. Review PRC-003 and PRC-004 together to identify the specific requirements of the functional entities.	PRC-003-1 will be retired. PRC-003-1 assigned responsibility to the RRO to maintain procedures for identification through resolution of BES Misoperations. Responsibility has been reassigned to the Transmission Owner, Generation Owner, and Distribution Provider in revised standard PRC-004-3 which requires a review of all events to identify all BES Misoperations. The RRO has been deleted from the Applicability section. PRC-004-2 essentially requires the Transmission Owner, Generator Owner, and Distribution Provider to identify and correct BES Misoperations per the RRO procedure and to also report BES Misoperation data to the RRO. Reference to the RRO procedure has been deleted and the co-mingled actions of Requirements R1 and R2 have been unbundled into 5 separate requirements in revised standard PRC-004-3. Requirement R3 is now the Periodic Data submittal language of Section 1.4 Additional Compliance Information in the latest version of PRC-004.	PRC-004-3 Applicability section, Requirement R1 , and Section 1.4 Additional Compliance Information.

Compliance	667. Joel deJesus, June 2010 - Please review and update as necessary the data retention period. A number of standards provide for data retention periods that are shorter than the normal audit cycle either specifying that only the current document need be retained or that the data need only be retained for a time period (30-days, 60-days, 90-days, etc.) shorter than the normal 3-year or 6-year audit cycle. This inconsistency between data retention periods and audit periods creates an unintended inconsistency. Changes to the Compliance Monitoring and Enforcement Program (CMEP) that are being applied to the Regional Delegation Agreements (RDA) in 2010, provide for the following: The Registered Entity will be expected to demonstrate compliance for the entire period described above. However, if a Reliability Standard specifies a document retention period that does not cover the entire period described above, the Registered Entity will not be found in noncompliance solely on the basis of the lack of specific information that has rightfully not been retained based on the retention period specified in the Reliability Standard, with the Reliability Standard for failing to produce a document for a period earlier than	The revised standard PRC-004-3 Evidence Retention section requires a 6 calendar year evidence retention period.	PRC-004-3 Evidence Retention.

Table of Issues and Directives Associated with PRC-004			
Source	**Directive Language (including pg #)**	**Disposition**	**Section and/or Requirement(s)**
	the start of the retention period specified in the Reliability Standard; However, in such cases, Compliance Audit team the Compliance Enforcement Authority will require the Registered Entity to demonstrate will test compliance through other means. Language in the standards regarding data retention should track this same thought. That would mean deleting any provision that requires only the retention of the current document, and by indicating that while other documents need only be retained for a short time(30-days, 60-days, 90-days, etc.), the standard should indicate that The Registered Entity will be expected to demonstrate compliance for the entire period described above.		
FERC Order 693	1079. Consider ISO-NE's suggestion that LSEs and transmission operators should be listed as applicable entities.	LSE and transmission operators do not own BES Protection Systems or apparatus. The owners of the equipment have been assigned responsibility for this standard.	PRC-004-3 Applicability section

FERC Order 693	1080. The regional entity should develop procedures for corrective action plans.	The revised standard establishes specific elements that must be included in the procedure for identifying and correcting Protection System Misoperation. In so doing, the obligation for the Regional Entity to undertake this effort has been removed. Instead, consistent with the need for the Reliability Standards to apply to the users, owners, and operators of the BES, that obligation now resides with the entities themselves.	PRC-004-3 Requirement R1,
NERC	659. Modify standard to conform to the latest version of NERCs Reliability Standards Development Procedure, the NERC Standard Drafting Team Guidelines, and the ERO Rules of Procedure	The revised standard PRC-004-3 is based on the new RBS format with development work based on the latest version of the NERC Standard Drafting Team Guidelines and ERO Rules of Procedure.	Reliability standard PRC-004-3.

Mapping Document Showing Translation of PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems, and PRC-004-2 – Analysis and Mitigation of Transmission and Generation Protection System Misoperations into PRC-004-3 — Protection System Misoperation Identification and Correction

Standard: PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language in PRC-004-3 – Protection System Misoperation Identification and Correction or Comment**
R1. Each Regional Reliability Organization shall establish, document and maintain its procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations. These procedures shall include the following elements:	PRC-004-3 Requirement R1 replaces the Regional Reliability Organization with the Transmission Owner, Generator Owner, and Distribution Provider as the Responsible entity(s) for reviewing events to identify all Misoperations. Additionally, the Standard has specified the minimum elements that must be included in the procedure.	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have and implement a procedure to identify and address all Protection System Misoperations within its system. At a minimum, the procedure shall include: [*Violation Risk Factor: High*] [*Time Horizon: Operations Assessment, Operations Planning*] **(parts omitted for brevity)**

R1, Part 1.1. The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	PRC-004-3 Requirement R1, Part 1.1 specifies, using glossary terms, all events involving BES Faults or BES Protection Systems operations are reviewed to identify all Misoperations.	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have and implement a procedure to identify and address all Protection System Misoperations within its system. At a minimum, the procedure shall include: [*Violation Risk Factor: High*] [*Time Horizon: Operations Assessment, Operations Planning*] **R1.1.** A detailed description of the processes used to: **1.1.1** Document and review all BES Faults and BES Protection System operations. **1.1.2** Identify and document all associated Misoperations, if any. **1.1.3** Investigate and address each Misoperation.
R1, Part 1.2. Data reporting requirements (periodicity and format) for Misoperations.	PRC-004-3 Section 1.4 Additional Compliance Information specifies submitting Misoperation data on a quarterly basis using the format specified by the ERO. The format for data submission is based on the current TADS reporting template.	**1.4. Additional Compliance Information** **Periodic Data Submittal:** Within 60 calendar days following the end of the calendar quarter, each Transmission Owner, Generator Owner, or Distribution Provider that owns BES protection Systems will submit a quarterly report to its Regional

		Entity, identifying all Misoperations in accordance with Requirement R1using the format as specified by the ERO. Each Misoperation shall be updated on a quarterly basis until the CAP or action plan is reported complete. The Regional Entity will report the Misoperation information provided by the responsible entities to NERC on a quarterly basis.
R1, Part 1.3. Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	PRC-004-3 Requirement R1 specifies the owner of the BES Protection System that Misoperated shall develop and document a Corrective Action Plan or declaration if cause is known, and that the owner of the BES Protection System that Misoperated shall develop and document an action plan or declaration if cause is not known.	**R1.2.** A requirement that the Registered Entity shall, within 90 calendar days of each identified Misoperation, investigate the Misoperation to determine its cause(s) and do one of the following: • For each Misoperation where the cause(s) are identified, document the investigation and the cause(s). • For those cases where the cause(s) are not identified, document the investigation, any cause(s) that were ruled out, and any additional steps planned to identify the cause(s). **R1.3.** A requirement that for all Misoperations for which the cause(s) was (were) identified, the Registered

		Entity shall, within 120 calendar days of the Misoperation, develop one of the following: • A Corrective Action Plan (CAP) that includes: 1. Interim corrective actions (if any). 2. Final corrective or mitigating actions to reduce potential impacts to BES reliability. 3. A work timetable. • A declaration explaining why there is no need to develop a CAP. **R1.4.** A requirement that for all Misoperations for which the cause(s) was (were) not identified, the Registered Entity shall, within 120 calendar days of the Misoperation, develop one of the following: • An action plan that identifies: 1. Additional investigative actions and/or Protection System modifications.

		2. A work timetable. • A declaration that includes an explanation of why no further investigation or actions will be taken. A requirement that the Registered Entity complete each CAP or action plan as outlined in its timetable, and document its completion as implemented.
R1, Part 1.4. Identification of the Regional Reliability Organization group responsible for the procedures and the process for approval of the procedures.	PRC-004-3 Requirement R1 replaces the Regional Reliability Organization with the Transmission Owner, Generator Owner, and Distribution Provider as the Responsible entity(s) for reviewing events to identify all Misoperations.	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have and implement a procedure to identify and address all Protection System Misoperations within its system. At a minimum, the procedure shall include: [*Violation Risk Factor: High*] [*Time Horizon: Operations Assessment, Operations Planning*] **(parts omitted for brevity)**
R2. Each Regional Reliability Organization shall maintain and periodically update documentation of its procedures for review, analysis, reporting, and mitigation of transmission and generation Protection System Misoperations.	PRC-004-3 Requirement R1 replaces the Regional Reliability Organization with the Transmission Owner, Generator Owner, and Distribution Provider as the Responsible entity(s) for reviewing events to identify all Misoperations. Rather than requiring ongoing updates and maintenance of the procedure, the Standard has specified the minimum elements that must be included in the procedure.	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have and implement a procedure to identify and address all Protection System Misoperations within its system. At a minimum, the procedure shall include: [*Violation Risk Factor: High*] [*Time Horizon: Operations Assessment, Operations Planning*] **(parts omitted for brevity)**

R3. Each Regional Reliability Organization shall distribute procedures in Requirement 1 and any changes to those procedures, to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners within 30 calendar days of approval of those procedures.	PRC-004-3 Requirement R1 replaces the Regional Reliability Organization with the Transmission Owner, Generator Owner, and Distribution Provider as the Responsible entity(s) for reviewing events to identify all Misoperations. Accordingly, there is no need to distribute the procedures.	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have and implement a procedure to identify and address all Protection System Misoperations within its system. At a minimum, the procedure shall include: [*Violation Risk Factor: High*] [*Time Horizon: Operations Assessment, Operations Planning*] **(parts omitted for brevity)**

Standard: PRC-004-2 - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language in PRC-004-3 – Protection System Misoperations or Comment**
R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.	PRC-004-3 Requirement R1 specifies the Transmission Owner and Distribution Provider must have and implement a procedure that requires analysis and development of pans as appropriate.	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have and implement a procedure to identify and address all Protection System Misoperations within its system. At a minimum, the procedure shall include: [*Violation Risk Factor: High*] [*Time Horizon: Operations Assessment, Operations Planning*] **(parts omitted for brevity)**

R2. The Generator Owner shall analyze its generator Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.	PRC-004-3 Requirement R1 specifies the Generator Owner must have and implement a procedure that requires analysis and development of pans as appropriate.	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have and implement a procedure to identify and address all Protection System Misoperations within its system. At a minimum, the procedure shall include: [*Violation Risk Factor: High*] [*Time Horizon: Operations Assessment, Operations Planning*] **(parts omitted for brevity)**
R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.	PRC-004-3 Section 1.4 Additional Compliance Information specifies submitting Misoperation data on a quarterly basis using the format specified by the ERO. The format for data submission is based on the current TADS reporting template. PRC-004-3 Measures specifies documentation requirements with Evidence Retention of 6 years.	**1.4. Additional Compliance Information** **Periodic Data Submittal:** Within 60 calendar days following the end of the calendar quarter, each Transmission Owner, Generator Owner, or Distribution Provider that owns BES protection Systems will submit a quarterly report to its Regional Entity, identifying all Misoperations in accordance with Requirement R1using the format as specified by the ERO. Each Misoperation shall be updated on a quarterly basis until the CAP or action plan is reported complete. The Regional Entity will report the Misoperation information provided by the responsible entities to NERC on a quarterly basis.

Unofficial Comment Form for 1st Draft of PRC-004-3 – Protection System Misoperation Identification and Correction [Project 2010-05.1 Phase1]

Please **DO NOT** use this form to submit comments on the 1st draft of the standard for Protection System Misoperation Identification and Correction. Comments must be submitted by **July 9, 2011**. If you have questions please contact Al McMeekin at al.mcmeekin@nerc.net or by telephone at 803-530-1963.

http://www.nerc.com/filez/standards/Project2010-05_Protection_System_Misoperations.html

Background Information:

This project addresses two very important issues for NERC and the entire ERO enterprise - reliability and accountability.

A key element for BES reliability is the correct performance of Protection Systems. Monitoring BES Protection System events, as well as identifying and correcting the causes of Misoperations, will improve Protection System performance. In FERC Order No. 693 (dated March 16, 2007), the Commission identified PRC-003-1 as a “fill-in-the-blank” standard and did not approve or remand the standard since the regional procedures had not been submitted.

Since PRC-003-1 is not enforceable, there is no mandatory requirement for the Regional Entity procedures to support the requirements of PRC-004-2. This gap has been addressed in the draft standard by incorporating a requirement for quarterly reporting of Misoperations data, using a uniform template (provided as an Excel file).

Misoperation data, as currently collected and reported, is not usable to establish a consistent measure of Protection System performance. The SAR includes establishing a standard with uniform applicability, revising the definition of Misoperation, and clarifying reporting requirements.

The proposed requirement of the revised Reliability Standard PRC-004-3 would require that responsible entities establish and implement a procedure for reviewing all Faults and Protection System operations on the BES be to identify those that are BES Protection System Misoperations; and for each Misoperation, conduct an analysis to determine and address the cause(s) of the Misoperation.

This project also includes revising the existing definition of Misoperation to make it less ambiguous.

There are two WECC standards, PRC-003-STD-1 and PRC-004-WECC-1, related to reporting of Misoperations for a limited set of WECC Paths and Remedial Action Schemes. In those cases where those standards will overlap with the Continent-wide standard, entities are expected to comply with the more stringent standard. Doing so will ensure compliance with the less stringent standard as well. There are no apparent conflicts between the proposed continent-wide standard and WECC regional standards that would lead to mutually exclusive compliance.

The reporting of Misoperations associated with Special Protection Schemes, Remedial Action Schemes, and Under-Voltage Load Shedding has not been addressed in this standard due the complexity of the subject matter. NERC intends to address these areas through a separate project in the future.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. The definition of 'Misoperation' has been revised. Do you agree with the proposed definition? If not, please provide specific suggestions for improvement.

   ☐ Yes

   ☐ No

   Comments:

2. In Requirement R1, the team is requiring the identification of all Misoperations. Do you agree that Requirement R1 is sufficient to identify Misoperations? If not, please provide specific suggestions for improvement.

   ☐ Yes

   ☐ No

   Comments:

3. Requirements R2, R3, and R4 introduce time limits associated with identifying, investigating, and addressing Misoperations. Do you agree with the allotted times? If not, please provide specific reasons why not and alternative recommendations.

   ☐ Yes

   ☐ No

   Comments:

4. The team has included VRFs, VSLs, and Time Horizons with this posting. Do you agree with the assignments that have been made? If not, please provide specific suggestions for change.

   ☐ Yes

   ☐ No

Standards Announcement

Project 2010-05.1 Protection Systems Phase 1 (Misoperations)
Formal and Informal Comment Period Open June 10 – July 11, 2011

Now available at: http://www.nerc.com/filez/standards/Project2010-05_Protection_System_Misoperations.html

The Standards Committee has authorized posting a draft SAR for Phase 1 (Misoperations) of Project 2010-05, Protection Systems, along with an initial draft of PRC-004-3 Protection System Misoperation Identification and Correction, an Excel template to be used for quarterly reporting of misoperations data as called for in the Compliance section of the standard, and a reference document, which is an example to assist entities in completing the reporting template. A proposed implementation plan and several related documents have also been posted for reference, including clean copies of current versions of PRC-003-1, PRC-004-1a, and PRC-004-2, a white paper developed by the NERC System Protection and Control Subcommittee, a list of stakeholder-identified issues and FERC directives associated with the project, and a mapping of the requirements in the current standards to the proposed new requirement.

The SAR is posted for a 30-day informal comment period, and the standard is posted concurrently for a 30-day formal comment period. A single comment form is being used to collect both sets of comments, and the comment period will end at **8 p.m. Eastern on Monday, July 11, 2011.**

Instructions for Commenting

Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page:
http://www.nerc.com/filez/standards/Project2010-05_Protection_System_Misoperations.html

Next Steps

The Standards Committee will appoint a drafting team from the nominations submitted during the nomination period that closed on June 3, 2011. The appointed team will consider all comments and make revisions to the draft standard to address issues identified by commenters. The team will submit its work for quality review. Following quality review, the team's consideration of comments will be posted, along with the revised standard, associated implementation plan, and supporting documents. The standard will then be posted for a 45-day formal comment period with an initial ballot conducted during the last 10 days of the comment period.

Background

This project addresses two very important issues for NERC and the entire ERO enterprise - reliability and accountability. A key element for BES reliability is the correct performance of Protection Systems. Identifying and correcting the causes of Misoperations should improve Protection System performance.

The scope of the work in this project includes the following:

- Revise the definition of Misoperation
- Combine PRC-003 and PRC-004
- Retire standard PRC-003.

In FERC Order No. 693 (dated March 16, 2007), the Commission identified PRC-003-1 as a "fill-in-the-blank" standard and did not approve or remand the standard since the regional procedures had not been submitted. Since PRC-003-1 is not enforceable, there is no mandatory requirement for the Regional Reliability Organization to develop procedures to support the requirements of PRC-004-2. This gap has been addressed in the draft standard by incorporating the details of what to investigate into new requirements and by adding a periodic data submittal for quarterly reporting of Misoperations data, using a uniform template (provided as an Excel file) in the compliance section of the proposed standard.

The second phase of this project will address revision of the standards associated with Special Protection Systems.

Additional information is available on the project page at http://www.nerc.com/filez/standards/Project2010-05_Protection_System_Misoperations.html

Standards Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Guy Zito
No
The new definitions only addressed “Slow Trip”. “Fast Trip” could cause misoperation as well. Suggest

that the new definition should include “Fast Trip”. In the definition of Slow Trip, the word “planned” should be replaced with designed. Not all faults have characteristics as planned, but fall within a Protection System’s designed capability. The “Unnecessary Trip-Other Than Fault” definition as written now would include trips during protection testing and commissioning. Suggest retaining phrase similar to one in current definition: “Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity.” It can be said that Protection System Operations for settings that have been miscalculated or applied incorrectly are not misoperations because the hardware operated correctly. It has to be made clear that even though the hardware might operate correctly, for these situations it does not operate as desired. Terminology that has been used for these operations is “correct but undesired”. Suggested rewording for “Unnecessary Trip-Other Than Fault”: Any Protection System Operation for non-Fault conditions such as power swings, undervoltage, overexcitation, or loss of excitation for which the Protection System is not intended to operate. This would also include any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity, or correct but undesired operations because of settings that have been miscalculated or incorrectly applied.
Yes
This item refers to Part 1.1.
No
(This item actually refers to Parts 1.2, 1.3, and 1.4.) The Part 1.2 time interval of 90 days may not be sufficient, in some cases, to complete investigation due to inability to obtain suitable power system outages where they might be necessary. A T.O. or G.O. should have the authority to determine that a delay in the investigation is less of a power system reliability threat than an inappropriate outage. Although provision for this is made in Part 1.4, the language in Part 1.2 should be changed so as not to prejudge the appropriateness of an owner’s actions.
No
As noted in the comment above, a T.O. or G.O. may be held to be inappropriately non-Compliant due to delaying an investigation until a safer outage window may be available. Many factors affect power system reliability, and an entity should have leeway to determine which is most important.
No
Measure M2 requires additional documentation with no additional value. Why would the “Quarterly Misoperations Reporting Data” table, in the format of the template provided with the standard, not be sufficient?
Yes
Although the inclusion of the Application Guidelines is generally helpful, care is needed not to override the judgment of the Protection System owner for setting and designing its relay protection systems, particularly regarding the bias towards security or dependability. For example, the 4th paragraph on Page 14 (“Where studies have…) seems unduly prescriptive.

No
My concerns surround sub requirement 1.1 and 1.1.1. First concern is 1.1 the word detailed is too subjective of a term to be audited in my opinion. I would suggest replacing it with "step by step". Second concern is 1.1.1 "Document and review "all" BES Faults and BES Protection System operations." It does not address that protection system operations occur daily in a cycling combined cycle possibly other generation plants too. As an example the steam turbine is brought offline using the reverse power relay. That is a BES protection system operation. I would suggest language that

allows documentation of expected "normal operations" and secondly exempting those expected operations from the "document and review" requirement.
Yes
Just a comment for possible exceptions. When gathering data from manufacturers the 90day time frame can be aggressive. e.g. (GE) some language added to allow for information gathering time outside of the entities control would be helpful.
No
The term "written" keeps coming up and I feel it needs to be deleted since it has the connotation of a long hand "written" document and leaves no opportunity for an electronic format.

John Seelke
Yes
The definition is acceptable provided the clarifications in the “Guidelines and Technical Basis” section of the draft is part of the standard.
Yes
Yes
Requirements R2, R3, and R4 do not exist. If R1-1.2, 1.3, and 1.4 are meant for comment, then the allotted times are agreeable with the following exception. As 1.4 is written it sounds like even after investigating for 90 days and not being able to find a cause for the misoperation, an action plan is needed to continue looking for the cause. The intent of the action plan in 1.4 (as indicated in the second and third full paragraphs on page 15) is not to conclusively determine a cause, but to take actions that may further a future investigation should another misoperation occur. The wording of 1.4 should be revised to reflect the true intent. We suggest changing 90 days in R1.2 to 180 days, and changing 120 days in R1.4 to 210 days (180 +30). In certain cases, root causes may not be able to be fully evaluated in 90 days because lines may need to be removed from service to do so, and clearances may not be granted within the 90-day window. By extending the time frame to 180 days, the time needed for removing lines from service for root cause determination will be sufficient in virtually all cases, thereby eliminating the burden for Corrective Action Plans and the associated requirements of such plans. The first sentence of Section 1.4 should also be changed to read “Within 60 days following June 30 and December 31,” and in Attachment 1 the title “Quarterly” should be changed to “Semi-Annual.” Other suggestions: Change the second bullet in R1.2 so that it directly refers to R1.4. Also, make R1.2 language “past’ tense to be consistent with R1.3 and R1.4.
No
Setting the VRF as HIGH seems to indicate there is no time to waste in finding and correcting the cause of the misoperation, yet 90 days are allowed currently to investigate, and another 30 days are allowed to develop a Corrective Action Plan, for which there is no timeframe given for completing other than to document a timeframe and abide by it. Because of this long timeframe in the standard as currently drafted, a VRF of MEDIUM is appropriate.
No
We recommend that R1.5, which is referenced in M6 and M7, be eliminated because the progress reporting of each CAP, including its completion, is sufficiently addressed in Section 1.4 (of the Compliance Monitoring Process section of the standard) which states “Each responsible entity will include the status of its Misoperation CAPS or action plans developed until these CAPs or action plans

are reported complete." We note that Attachment 1, which defines the format of these periodic reports, allows an entity to enter CAP progress data beginning at the bottom of page 3 with corrective actions taken, and continuing on page 4 where CAP target and actual completion dates are reported. Evidence supporting those periodic reports could be requested as needed, and if necessary, the retention of evidence supporting the reports can be addressed in Section 1.2 of the Compliance Monitoring Process. With the elimination of R1.5, M6 and M7 can also be eliminated.
Yes
See the previous comment in response to question 3 regarding semi-annual rather than quarterly reports. In addition, the current format of the Excel file can be improved to make it more "user-friendly." We recommend that the information in Row 3 be converted into Excel "comments" and placed in Row 2. This will eliminate a row from viewing and allow the user to scroll down and still have the valuable information from Row 3 available in Row 2 if needed. In addition, adjusting the font size may allow for more columns to be viewed on one screen.

Ingleside Cogeneration LP
No
Ingleside Cogeneration LP believes that that the NERC Glossary definition of Misoperation must coincide exactly with the one used by the ERO-Reliability Assessment and Performance Analysis (RAPA) Group. Although the differences are minor, the two processes need to seamlessly flow together so that data needs and reporting templates do not diverge.
No
There needs to be a tight correlation with the Misoperation cause codes already introduced in the RAPA reporting template. Since those codes are already acceptable to NERC, it provides a technically sound starting point for a Misoperation investigation. If the RAPA team accumulates enough data to justify another cause code or provide further examples, than they can control it at one place.

Ingleside Cogeneration believes that this is the only way that reporting needs can be managed properly. If guidance is not provided in PRC-004-3, then regional differences will continue to crop up – with unique data requirements and reporting templates.
Yes
Ingleside Cogeneration believes that 90 days is generally enough to assess a Misoperation – or to have evaluated and documented multiple possible causes if the source of the Misoperation cannot be determined. The 120 day corrective action plan time frame is acceptable to us as well.
No
Ingleside Cogeneration LP does not believe that a Severe VSL is appropriate if a Protection System operation with an obvious cause is not captured in a summary listing (R1.1 and M2). We understand the need for a rigorous review process, but in many cases, a thorough evaluation is just not needed.
Yes

The definition of a Misoperation no longer includes an exclusion for maintenance activities. Is this intended? While I certainly agree that human erors can cause serious disturbances - for instance the Florida event in 2008 - these events also present lots of challenges to correct. Their can be labor issues, disciplinary issues, and a general problem of what CAP to take when the field person says "I knew better. I just screwed up." So, I wanted to know if the drafting team had explicitly considered this topic and chose to include it as a Misoperation going forward.
No
In R1.1.1, the drafting team calls for all BES faults and operations to be documented and reviewed. Why? Presumably, the drafting team is concerned that Misoperations can go undetected and that the opportunity to learn from - and avoid that SECOND Misoperation - would be lost. However, in the Guidelines and Technical Basis found on page 12 of 16, the drafting team proceeds to define certain protection system "failures" (my term) as not being a Misoperation. For instance, the failure of a redundant Protection System when another Protection System operates correctly or the failure of a communication scheme when TPL standards were not violated. Conceptually, this makes no sense. Either you are worried about undetected Misoperations or you are not. But you cannot have it both ways. Imho (in my honest opinion, so my grand kids tell me, you should write the investigation requirements like this. One must investigate to see if a Misoperation occurred when: a) the operation of any current interrupting device (i.e. breaker) by relay action for a fault not in its primary zone of protection, b) the oepration of any circuit interrupting device by relay action when no fault occurred, c) when equipment damage due to a fault condition occurs , but no Protection System operated. The wording can be improved, but I believe you can get the idea. If the drafting team believes it must have all operations analyzed, then it must remove the exemptions in the Guidelines and Technical Basis, as these are inconsistent with analyzing all operations for Misoperations.
No
See my comments on Question 9.
No
Yes
I thank the drafting team for their efforts to date and for the opportunity to comment. The job of a drafting team is not easy. My comments are as follows: 1) I just wanted to add what I thought the true Purpose of the standard is/should be: Misoperation analysis is a reactive tool – one waits for a Misoperation, then analyzes why it happened with the purpose of determining what, if any, changes need to be made to prevent another occurrence in the entity's system. Changes could be simple or complex, at one location or at many locations. Primarily, you are working to prevent a SECOND Misoperation. The SECOND misoperation could be either on existing system(s) or on future systems. I think it is important to note that it is the occurrence of the SECOND misoperation that is the true indicator of whether the efforts to prevent a Misoepration have been successful. A SECOND Misoperation indicates that it has not. 2) In R1, the drafting team calls for each entity to have a procedure. I am unclear on what benefit this provides, other than giving the auditors something to audit. Why not just call for an entity to do XYZ rather than say they must have a procedure that says they will do XYZ and they must follow the procedure. I see requiring a procedure as unnecessary documentation. Can the drafting team comment on why they asked for a procedure? 3) In R1.1, the drafting team calls for a "detailed" description. There is no measure for 'detailed". I believe the drafting team should seek to avoid such undefined terms. Shouldn't the standard just call for a procedure that includes the things listed in the standard? Or better yet, not call for a procedure at all, but just say you must do XYZ? 4) In the Background, it states that one goal of the standard is to collect data to establish a metric to measure Protection System performance. While I think this is a worthy goal in theory, I am skeptical about its usefulness in practice. Protection systems are an Art, not a science, and while most protection systems are made from the same building blocks, the application of them can vary wildly from utility to utility. Before requiring data collection - which would presumably cause a utility to get a NERC violation for failing to send in the data - I would be curious to know how this has worked in the regions that do, today, colelct this data. For instance, I

believe SERC collects this kind of data. Has this proven useful for developing a metric for SERC entities? If it has not, why not? Let's not repeat a mistake on a continent wide basis. 5) CAPs - the drafting team has written all kinds of rules for CAPs, including trying to hold the entity to a work timetable. What if the entity chooses to say it will take 100 years to fix so that they avoid the possibility of getting a violation for missing their timetable? I personally think CAPs should be eliminated from the standard as they are simply un-workable. You cannot know whether the CAP makes sense without evaluating them on a case-by-case basis. Consider that the CAP actions fall into three broad areas: a) Do nothing (for any of a boatlaod of reasons) b) Correct the issue at this one location c) Correct the issue at all locations Generally, c) is preferred, but their may be times when a) is the best solution, because fixing the issue may make things worse. So, instead, how about a performance standard, whereby an entity gets a violation if a Misoperation occurs a SECOND time. I'll be the first to admit that the devil is in the details, but at least in this case, we're getting at the true reason for the standard - preventing that SECOND occurrence. Ultimately, we don't care how they do it, as long as they do it.
I'm not in the industry anymore, but I think the SAR assumes things that are not truly agreed upon by the industry. My comments are as follows: Review all BES faults/operations - see my comments in Q9. I do not believe the industry is in agreement that all operations need to be reviewed. Presumably, one could review a sub-set and capture the vast majority of potential Misoperations. This would be a better use of resources. So, my complaint here is that the SAR should not tie the hands of the drafting team by requiring that all operations are reviewed unless it makes sense. CAPs - again, see my comments in Q9. I'm unconvinced that you need lots of rules for CAPs. I think a performance requirement would be a better way to go. My complaint here is that it is too prescriptive. Again, the hands of the drafting team should not be tied like this.

The previous “out” for outages which occur during on-site maintenance and testing is missing from the new definition. We would definitely like to see this added. We do like the “Guidelines and Technical Basis” section at the back of the standard which provides some clarification. Hopefully this section gets retained and we agree with most of what is stated, in particular it gives us an “out” for comm-aided protection which is not required by Planning Studies. Misop Category 4 – it is desirable in some cases to “overprotect” or intentionally miscoordinate based on exposure and risk. For example, we tend to allow our Zone 1 elements to cover 85% of our subtransmission lines even though it will miscoordinate with high side tapped transformer protection. This is done so that we will react quickly to the majority of faults which occur mainly on the line. The incidence of high side faults on the tapped transformers is low and we accept the risk of overtripping in those cases. Allowance should be made for entities to intentionally miscoordinate where risk and value make sense. Misop Category 5 – this should actually be strengthened to mention a trip which occurs for non-Fault conditions where the relay or protection system fails. Is this not a misoperation?
Yes
Yes
No
M2 calls for a list of faults, protection system operations,etc. Would be good to be able to just point to our outage database instead of having to create a separate list. We are creating a separate spreadsheet at this point. Six years for evidence retention seems kind of long. We would suggest 3 years or one audit period.
No

Yes
The SAR refers to WECC standards PRC-003-STD-1 and PRC-004-WECC-1. It talks about how those standards might overlap. It is our understanding that PRC-004-WECC-1 replaces PRC-003-STD-1 so we don’t understand what NERC is getting at. Only one of those standards should be active at any point in time.

No
“Unnecessary Trip – Other than fault” is not clear if an impedance-based transmission line Protection System trip in response to an unstable (or stable) power swing is a misoperation. “Failure to trip” as described in the Application Guidelines should have the reference to “within the time normally expected” removed as this would be addressed in “Slow Trip”.
No
The requirement should be specific to BES Misoperations.
No
Requirements R1.2, R1.3, and R1.4 introduce time limits. The requirements need additional clarification on the timeframes. Are the timeframes from when the operation occurs or from when the operation is determined to be a Misoperation? Exemptions to the established timeframes should be available in cases of large scale events. R1.2 – remove the requirement to document causes that were ruled out, overly burdensome and unnecessary. Remove the reference or specifically define what constitutes a declaration. R1.4 – remove or refine, overly burdensome and unnecessary. R1.5 – remove, vague and unnecessary.
No
No
Data retention should coincide with the audit cycle.
Yes
Consistency between the Standard requirements and the ‘Quarterly Misoperations Reporting Data’ table and template must be ensured.
Individual
Chris de Graffenried
Consolidated Edison Co. of NY, Inc.
No
The fifth category “Unnecessary Trip-Other Than Fault” definition as written now would include trips during protection testing and commissioning. This adds extra work and documentation while adding little value since system operators are aware when such work is going on and thus are prepared for these unnecessary trips. Suggest retaining phrase similar to one in current definition, that is, “… unrelated to on-site maintenance and testing activity”. The new definition only addressed “Slow Trip”. Many times, “Fast Trip” could cause misoperation as well. We suggest that the new definition should include “Fast Trip”.
Yes
By selecting “Yes”, we assume “R1” mentioned here is really “R1.1”.
No
(Assume this item actually refers to Requirements 1.2, 1.3, and 1.4.) Requirement 1.2 time interval of 90 days will not be sufficient, in some cases, to complete investigation due to inability to obtain suitable power system outages. A T.O. or G.O. should have the authority to determine that a delay in

the investigation is less of a power system reliability threat than an inappropriate outage. Although Provision for this is made in Requirement 1.4, the language in 1.2 should be changed so as not to prejudge the appropriateness of an owner's actions.
No
As noted in the comment above, a T.O. or G.O. may be held to be inappropriately non-Compliant due to delaying an investigation until a safer outage window may be available. Several factors affect power system reliability and an entity should have leeway to determine which is most important.
No
Measure M2 requires additional documentation with no additional value. Why would the "Quarterly Misoperations Reporting Data" table, in the format of the template provided with the standard, not be sufficient?
Yes
Although the inclusion of the Application Guideline is generally helpful, care is needed not to override the judgment of the Protection System owner for setting and designing its relay protection systems, particularly regarding the bias towards security or dependability. For example, the 4th paragraph on Page 14 ("Where studies have…) seems unduly prescriptive.

For example, the 4th paragraph on Page 14 ("Where studies have…) seems unduly prescriptive. Also, we have concerns with the identified time lines in R1.2, R1.3 and R1.4. Is the intent of the requirement for the RE to initiate action within the specified time once the misoperation is identified? The identification of a misoperation may not occur for some time after the actual protection system operation as there can be a lag between an operation occurring and the analysis of that operation. Some misoperations may be obvious but some others not so much. We think that more clarity is needed here.

1. Failure to operate as designed: a) The protection system failed to operate for a fault within the designated zone of protection. b) The protection system failed to protect a designated BES component from a system abnormallity as designed. 2. Operating external to design parameters: a) The protection system operated with no fault condition persent. b) The protection system interrupted power to a BES component with no system abnormallity present. - Slow Trip (as defined) is difficult to measure without "smart relays" or fault recorders or sequence of event recorders in every BES station. A high impedance fault will naturally cause slow clearing times and may indicate an out of zone trip when compared to a bolted fault.
No
R.1.1.2 is extraneous. If R1.1.1 is adhered to, all misoperations will be identified and documented.
Yes
Agreed in principle, however the question should be R1.2, R1.3 and R1.4. Not R2, R3, R4.
Yes
No
PRC-018-1 R5 DME data retention for RRO events is 3 years. 3 years should be adequate considering data is now available in spreadsheet format.
Yes

Spreadsheets make terrible flat databases. Is this spreadsheet wiped clean each quarter or do incomplete CAPs carry over to the next quarter? What is the procedure to have a field modified if the normal "pull down" selection is not adequate?
No

There needs to be a continuation of the specific exclusion for operations that occur as a result of on-site maintenance or testing activity. It seems that the exclusion is intended to remain since there is no “Cause of Misoperation” associated with maintenance or testing. We are not certain how the “Guidelines and Technical Basis” will accompany the new definition in the “NERC Glossary of Terms,” but the last sentence in (1) of the Guidelines is not supported by the definition. We disagree that the failure of one high speed Protection System to operate when another does operate should not be classified as a Protection System Misoperation. There may be times when that philosophy is appropriate, but not usually. If the non-operating system can be shown to have simply not had time to operate, then that can be explained in the event report, but typically both high-speed Protection Systems should operate unless one is designed to have a delay. But if it has a delay it shouldn’t be classified as high-speed.
No
The term “detailed” is too vague and should be eliminated. See comments to the “Measures.”
Yes
The limits for those parts are acceptable (though, as we comment in 4. below, we believe the parts should be individual requirements).
No
The Requirement R1 should be split into several requirements with individual VRFs and VSLs. For example, the Measure associated with Requirement R1, Part 1.1 is primarily administrative in nature and should not have a “High” VRF.
No
Measure M2 (and possibly others) is a Requirement. It does not improve reliability, but only provides for additional record keeping for compliance documentation.
Yes
All columns that reference “TADS” should be removed. Protection engineers, who will be filing these reports, do not generally have access to the TADS information or filings. Much of the TADS information is not required quarterly so it may not even be available for submittal by the Protection staff. The Regional Entities can supply the TADS information after it is received by them.
No
None
None.
Yes
As stated earlier, we believe the requirements should be expanded to state what is required rather than putting requirements in the measures. At that point we would be in a better position to address our comments to the requirements. We believe that UVLS and SPS/RAS should be included in this standard and then PRC-012, Requirements R1.6, R1.7, and PRC-016 can be eliminated. If the standard is not changed to include UVLS and SPS, why is UVLS excluded but not UFLS? Corrective Action Plan is defined in the NERC Glossary of Terms. Requirement 1, Part 1.3 should not describe what should be included in the CAP.

The last bullet of the current definition includes the phrase “unrelated to on-site maintenance and testing activity”. We suggest this be retained in the proposed definition to alleviate any misunderstandings among the responsible entities.
No
1. We do not believe that 1.1.1 (Document and review all BES Faults and BES Protection System operations.) should apply to GO as written, even though R1 indicates it would. We realize that the Glossary definition of BES includes generation resources, but as 1.1.1 is written, it implies that it's referring to the transmission system. 2. Regarding the phrase “within its system" at the end of R1, we ask that this be clarified by changing the phrase to “within its area of ownership or control”. 3. We ask that the requirements to “have” and “implement” a misoperations procedure be separated. We suggest removing the word “implement” from R1 and creating a separate R2. Furthermore, see our answer to Question 4 regarding VRF.
No
Various testing or investigating recommendations may require BES equipment be taken out of service to accomplish the appropriate testing and investigation involved with relay misoperations. This testing may dictate what CAP are appropriate. The time limits stated do not provide any exceptions for equipment which cannot be taken out of service within the time limits identified for operational concerns or when these equipment outages are cancelled by operations based on system integrity concerns. There should be some exceptions for these instances. R1.2 prescribes 90 days to investigate the misoperation. Compliance section 1.4 prescribes 60 days following the end of each calendar quarter to provide periodic data submittal. This timing will create a situation where the last month of the reporting time period will not yet be due for completion of the original investigation. We suggest the compliance section 1.4 agree with the 90 day investigation period so that all original investigations are completed at the time of the data submittal.
No
We do not agree with a HIGH VRF for the sole requirement in the proposed standard. We believe that not having a procedure for handling misoperations is much less of a risk to reliability than the actual reporting of the misoperations. We suggest that having a procedure requirement be assigned a LOW VRF, and the requirement to implement be assigned a “MEDIUM” VRF. Since this standard pertains to after-the-fact reporting, there is no immediate risk to the BES and none of the requirements therefore warrant a HIGH VRF.
No
Measure M7 – Since M6 already requires evidence to show implementation of the CAP as required by R1 subpart 1.5, we do not see the need to have M7 and suggest it be removed.
Yes
We ask that it be clear within the standard (maybe a link in the standard) of where you can obtain this form used for quarterly updates.
No
Not aware of any at this time.
Regional Variance:
This standard should be coordinated with regional reporting requirements to avoid duplication of efforts. For instance, RFC has Mis-Operations reporting requirements (per procedure titled “Reporting, Review, and Analysis of Protection System and Under Voltage Load Shedding (UVLS) Misoperations”) for Protection systems AND UVLS system. Since this standard covers reporting of Protection system mis-operations, it should include a variance for the RFC region, or NERC should direct RFC to revise their reporting requirements to remove protection system misoperations to avoid redundancy.
Yes
1. R1 Subpart 1.5 – We would appreciate clarification on the following regarding what constitutes successful completion of the Corrective Action Plan: Given the scenario of a maintenance error that

caused the operation of a protection system, we understand that per this standard, if this misoperation is reported, and the error was corrected per the reported corrective action plan, then the entity is compliant with the standard even if the human error occurs again on a separately reported misoperation incident. Please confirm this understanding. 2. Applicability Section – The proposed standard excludes SPS, RAS, and UVLS systems. However, we do not see an exclusion for UFLS. The standard should clarify whether or not UFLS are applicable. 3. Effective Date - We believe that the proposed 3 month implementation of PRC-004-3 is much too short for an entity to be able to achieve auditable compliance because it may require changes to internal procedures and business unit awareness of the new standard. We suggest at least 6 months after regulatory approval.

No
The original definition excluded protective system operations related to on-site maintenance and testing activities. The new definition does not. A true measure of the performance of a protective system should not include protective system operations caused or initiated by human errors during on-site activities. These include such things as failure to pull appropriate test switches during testing, inadvertently keying a direct transfer trip channel, accidently shorting or bridging a terminal block during construction activities while landing secondary cables, etc. As such, we would propose amending Item 5 of the proposed misoperation definition as follows: 5. Unnecessary Trip – Other Than Fault – Any Protective System Operation for non-fault conditions such as power swings, under-voltage, over excitation, or loss of excitation for which the Protective system is not intended to operate. Unintended Protective System Operations that occur during on-site maintenance, testing, construction, and/or commissioning activities are not considered Protective System Misoperations. (this qualification is consistent with the definition included with the proposed misoperation reporting spreadsheet and with the intent of the original definition) Also, the qualifying comments in the “Application Guidelines” section associated with the five Categories of Protective System Misoperations should be included, either in the standard itself, or as part of the misoperation definition. Without these specific qualifications it is not possible to reach a uniform consensus on what constitutes a misoperation and what does no
No
Requirement R1 should be modified to read “Each Transmission Owner, Generation Owner, and Distribution Provider shall have and implement a procedure to identify and address all BES Protective System Misoperations within its system.” The term BES was omitted from R1. We feel the term BES should appear in both R1, as well as R1.1.1, since this requirement is applicable only to protective systems associated with the BES.
No
The 90 day window to conduct an investigation and identify the cause of a protective system misoperation is not practical in many situations and unreasonable. Outage windows for transmission facilities are highly dependent on weather and system loading conditions and as such are usually relegated to only a relatively few months during the Spring and Fall. Also, during these mild weather / low load times any outage request submitted to investigate a protective system misoperation is competing with numerous other construction related outage requests being evaluated by the Transmission Operator for TPL infrastructure upgrades in addition to other facility maintenance outages. The Transmission Operator typically requires a minimum 30 day lead time for scheduling outages on BES facilities. Granting of these outages is the sole responsibility of the Transmission Operator, not the Transmission Owner. Canceling of the outage by the Transmission Operator may require the Transmission Owner to go through the 30 day re-submittal process. Denial of an outage request by the Transmission Operator could delay the misoperation investigation and force the Transmission Owner to be in non-compliance. An emergency outage could be declared to enable a misoperation investigation to take place, but depending on loading and system conditions, the facility forced outage could result in an increased reliability risk to the system, and/or the need to run expensive off cost generation. Declaration of an emergency outage should rarely be used, only for those instances of very high risk. In summary, it is not practical in many situations or reasonable to expect the Transmission Owner to be responsible to investigate the cause of a misoperation within 90

days when they have no control over the outage scheduling and approval process. As such, both the 90 and 120 day time frames should be removed entirely from the standard (i.e., structure the requirements similar to existing PRC-004-1 & PRC-004-2). Alternatively, but not recommended, would be to develop time frames only for those activities over which the Transmission Owner has full control. This second approach would of course require an extensive rewrite of Requirements R1.2, R1.3 and R1.4 and would in the end contribute little to improving the timeliness of investigations, since the majority of the time consumed in the investigation process is waiting for outages to be granted. For example, a requirement could be established that “within 45 days of the date of each identified misoperation launch an investigation into the cause and submit an outage request for any facility outages as necessary for diagnostic testing.” These tasks are within the Transmission Owners control. However, completion of the investigation can not be bounded since the outage process is indeterminate and out of the control of the Transmission Owner. Similarly, since the development of the corrective action plan is dependent on completing the investigation (which is outage dependent), development of the CAP cannot be bounded either. Because of this it is recommended that all time frames be removed.
No
Most of the VSL’s are related to the time frames with which the misoperation investigation is completed, or the corrective action plan developed. Both of these are completely dependent on the availability of outages to perform diagnostic testing to determine the cause of the misoperation. As described extensively in Question #3 the Transmission Owner cannot be held responsible to complete these tasks within a specified time frame when they have no control over the outage scheduling and approval process. Compliance should be judged on whether all BES events were reviewed, an investigation conducted and a corrective action plan developed and implemented. Not whether these activities were completed within some arbitrarily chosen time frame. Compliance could also be judged on the timeliness and completeness of the quarterly data submittal mentioned in section C1.4 of the standard.
No
The data retention provisions within the proposed standard seem reasonable. However, there are concerns with several of the Measures. M2 – This measure should be re-written to state the entity shall “have evidence showing the dates of occurrence of all BES faults, associated protective system operations, and identified misoperations.” The standard should not specify the format that this data should be in. Some companies retain this data in their internal database format, or write detailed reports for each operation (both correct and incorrect). Specifying that a dated list be provided is unnecessary and non productive when other means of supplying the required evidence is available. M4 & M5 - To avoid duplication of efforts and record keeping, the evidence required to satisfy these two measures should be included on the ERO spreadsheet. This way the review and feedback from the Compliance Monitor on the data supplied will be more timely than waiting for the next audit cycle, which may be years away. This would improve the overall objective of improving the thoroughness of the investigations and corrective action plans. Also, the ERO spreadsheet and this feedback from the Compliance Monitor could be used as evidence of compliance during a formal audit.
No
No
Yes
Section 4.2.2 should be revised to read “Special Protection Systems (SPS), Remedial Action Schemes (RAS), Under Voltage and Under Frequency load shedding programs, and Sudden Pressure Relays (SPR) are excluded from this standard.” There has been past confusion as to whether the misoperation of an underfrequency relay, which is part of a regional load shedding program, is reportable under this standard. Excluding UFLS programs eliminates this confusion. Adding SPR to the exclusions will also eliminate confusion. Also, as mentioned in Question #1 the qualifying comments in the “Application Guidelines” section associated with the five Categories of Protective System Misoperations should be included, either in the standard itself, or as part of the misoperation definition. Without these specific qualifications it is not possible to reach a uniform consensus on what constitutes a misoperation and what does not. However, the remaining sections of the “Application

Guidelines" appear to be either tutorial, or background, in nature and should not be part of the standard itself. Compliance data submittal C1.4 requires a quarterly report (ERO spreadsheet) be submitted within 60 calendar days following the end of each calendar quarter. However, as was pointed out repeatedly, due to the difficulty in obtaining outages it is highly unlikely that many misoperation investigations could be completed, or corrective action plans developed / implemented, within 60 days after a quarter ends (particularly for those events which occur late in the quarter). For instance, suppose a misoperation occurs in June (second quarter). Data submittal will be required 60 days after the quarter ends (August 31). However, outages to conduct the necessary diagnostic testing will not be available until mid to late September. Therefore in an attempt to improve the percentage of reported events where investigations are complete and causes determined, we would suggest requiring the data submittal 90 days following the end of each quarter. This additional delay in data submittal will not impact the reliability of the BES, since any protective system misoperation contributing to a major system disturbance is already being thoroughly reviewed / investigated under EOP-004 Disturbance Reporting Requirements. Under Section C 1.4 Additional Compliance Information, there is a reporting requirement. This should be included as a specific requirement in Section B. If not included in Sec B, it could easily be missed by the applicable entity as a requirement.

We have created an MSAccess database to track all misoperation information starting in 2011. An export file is created in the format of the WECC spreadsheet to meet your requirements. We feel that the MSAccess database offers several advantages in terms of the ability to sort records in many ways, offering a historical view of misoperations that will span multiple quarters and years, and still offers all of the "pull down" choices related to definitions and codes.
No
Combining similar standards and clarifying definitions or requirements is always good. Thanks for the effort.

The proposal for a revised definition of “Misoperation” in the NERC Glossary of Terms includes five conditions. This definition is insufficient in the absence of considering such conditions in conjunction with the additional illustrative information offered in the “Guidelines and Technical Basis” (the “Guidelines”) appended to the draft of PRC-004-3 for industry review and comment. PacifiCorp believes that the proposed revised definition of “Misoperation” should either be: (1) expanded to include additional technical information such as that included in the Guidelines; or (2) revised to expressly provide that the Guidelines, as appended to the standard, are incorporated by reference in the definition. The definition of “Misoperation,” if included in the NERC Glossary of Terms as presently proposed, is not sufficiently robust for the purpose of registered entities properly identifying and addressing all Protection System Misoperations within their respective systems.

PacifiCorp suggests that Section 4.2.2 (regarding applicability of facilities) be revised to state as follows: “Special Protection Systems (SPS), Remedial Action Schemes (RAS), Under Frequency Load Shedding programs, and Under Voltage Load Shedding programs are excluded from this standard.” PacifiCorp believes that the same rationale for excluding UVLS programs from this proposed standard should apply for UFLS programs. If the Standards Drafting Team has a specific rationale for making UFLS programs subject to this standard, please provide an explanation as part of the revised standard circulated for the next formal comment and voting period. In accordance with the Standards Processes Manual, the drafting team will respond to comments made in response to the following question informally (in summary form only).

The definition of Misoperation as proposed in the definition section of the standard needs more detail.

In particular, with regard to “Failure to Trip – During Fault”, Protection System communication aided schemes which are not essential to meet NERC Planning Standards should be excluded from the definition of Misoperation. An entity that voluntarily exceeds NERC requirements by applying communication aided schemes with more rigor than is required by standards should not be exposed to additional compliance consequences as a result of exceeding those standards. The revised misoperation definition should specifically include such exception in the actual standard definition and NERC Glossary. In particular, the definition of Misoperation should be changed as follows: Failure to Trip - During Fault - Any failure of a Protection System to operate for a Fault within the zone it is designed to protect. Protection System communication aided schemes which are not essential to meet NERC Planning Standards are excluded from this definition.
Yes
No
For Misoperation corrective action plans which could require out of budget cycle funding, significant project coordination with other groups or entities, and/or require major outage considerations, 120 calendar days is too aggressive to meet a corrective action plan development requirement which includes “final corrective or mitigating actions…..”. We suggest the timing for R1.3 and R1.4 be 120 days following the completion of R1.2. Therefore, we suggest the wording for R1.3 and R1.4 be revised to: 1.3 A requirement that for all Misoperations for which the cause(s) was (were) identified, the Registered Entity shall, within 120 calendar days following the completion of the investigation in R1.2, develop one of the following: 1.4 A requirement that for all Misoperations for which the cause(s) was (were) not identified, the Registered Entity shall, within 120 calendar days following the completion of the investigation in R1.2, develop one of the following:
No
A single high VRF is too broad to be applied for all elements and geographical areas of the electrical system. Also, lower and moderate VSL assignments should be included for the corrective action plan completion timeline requirements.
Yes
The present template does not contain enough cause options. Additional granularity is needed to identify misoperation trends and to provide better focus on potential areas of improvement. For example, selecting AC failure as a misoperation cause which was due to rodent damage, or a relay failure cause due to a leaky roof, doesn’t provide cause information which would be useful to determine whether we are experiencing actual equipment problems or some other unrelated problem. Also, add a “No Problem Found” cause, to address those rare evolving type scenarios which would challenge even the best relay(s) and schemes, and where we actually know what happened, but there is no reasonable corrective action to prevent it from reoccurring.
There are instances when an entity will justifiably need to defer a corrective action plan. The standard needs to include provisions to be able to adjust or defer corrective action plans if necessary.

GenOn Energy
No
In the numerous locations used in the definition, replace “Any” with “A” Definition should incorporate the following exclusions: 1. Misoperations from human intervention during maintenance activities 2. Failure of a relay control function or protective function not associated with protection of the BES or a BES element, i.e. a microprocessor relay serving multiple functions including, but not exclusively, BES Protection. 3. Misoperations resulting from the effects of a disaster upon the Protection System components, i.e. a hurricane, tornado, fire, or flood destroys a substation control house.
No

The intent is understood: to promote timely investigations and responses. However, the allotted times assumes that scheduling outages for investigation, testing, or maintenance are easy to obtain in every instance. 90 days is insufficient time for seasonal periods lasting five or six months or more.
No
VRFs are worst-case one-size fits all. The risk applied to a 500kV transmission line is the same applied to a radial connected 75 MW generating unit on a 138kV system. The risk applied to the implementation of a corrective action plan is the same applied to post correction record keeping.
No
Yes
The attempt to keep the Standard simple and straightforward is appreciated. In the Requirements section, please simply state the intended requirement and eliminate the repeated use of catch-all terms such as “any” and “all” which open the door to future unintended interpretations. In R1.1, a “detailed” description is arbitrary and subjective. Reword the statement as follows: “A description of the processes used to:” In R1.1.1, reword the requirement, “Identify and document Faults and Protection System operations.” Documenting “all BES Faults” covers the entire continent. In Section R1.3 and R1.4, it is suggested to replace “a work timetable” with “a projected schedule.”

IMPA has serious concerns that the proposed definition of “Misoperation”, including the list of conditions in Draft #1 dated June 9, 2011 (page 12/16) is broad and far reaching and could potentially include equipment not currently defined as Protection System equipment. For example, (3) includes “Any Protection System operation that is slower than planned for a Fault within the zone it is designed to protect” could be interpreted to include high voltage circuit breakers – if a breaker operates (trips) slower than intended (for example in 20 cycles instead of the factory stated 5 cycles) then this could potentially be termed a “Misoperation”. By default this would expand the scope of PRC-005 to include additional equipment not currently covered in PRC-005. In addition the Misoperation Categories listed in the drop-down box for Misoperation Category on the Quarterly Misoperation Reporting Form are even less detailed and could be interpreted differently and broader than the proposed definitions themselves. In addition there seems to be an extraordinary amount of effort in PRC-004-3 to lay blame for an operation (now termed “Misoperation”) on operating/maintenance/engineering personnel leaving the reporting utility open for damages because of “errors”. Utilities have and always will use good faith efforts and follow prudent utility practices when operating their utility. The goal of any utility is to minimize outages/customer interruptions – with PRC-004-3 we are now opening ourselves up to fines for lack of compliance and potential lawsuits should personnel “miss” a setting. Additional causes listed include in the definitions tab on the spreadsheet include, for instance, under Communications failures, Telco errors resulting in the malperformance of communications over leased lines. Once a leased line leaves the utility’s premises they have NO control over that circuit – it is the property of the Telco. If a TELCO technician lifts a bridge clip at a CO on a protection circuit then the utility could potentially be held responsible for a Misoperation. IMPA had no objections with the current definition of Misoperation and feels the proposed definition should stay consistent with current definition.
No
In its current proposed format R1. requires that ALL operations have to be reviewed and documented for determination of a possible “Misoperation”. Examples given as a “Misoperation” in the spreadsheet included a failed secondary potential breaker (see 1. above – PRC-004-3 greatly expands the equipment utilities must now test on a regular basis). IMPA feels that R1 goes above and beyond a good faith effort to identify a true protection system misoperation. In addition the process of documenting and reporting requirements are onerous and time consuming and could potentially become costly in terms of the dollars required to prove an operation was not a misoperation and in terms of the manpower required to oversee this effort. The BES is a dynamic system that undergoes changes continuously - for a utility to have the ability to foresee all of these real-time changes, anticipate the effect that these changes will have on their protection systems and eliminate all misoperations is not possible with today’s technology.
No
The times as listed are aggressive, especially for smaller utilities that have facilities whose loss would have minimal impact on the BES. It may be more appropriate to break the time limits into different categories, such as operations (and Misoperations) that impact critical facilities versus those operations that impact facilities that are not critical to the BES. For instance the time limits listed should apply only to critical facilities. For non-critical facilities the times should be extended to 180 days from the date of a Misoperation to complete the investigation and 240 days to develop a plan or otherwise address the Misoperation.
No
IMPA believes that all the sub-requirements should have their own individual VSL and VRF (similar to BAL-006-2). When assigning VRFs and VSLs to the requirement and sub-requirements, the SDT needs to keep in mind the name of the standard is Analysis and Mitigation of Transmission and Generation Protection System Misoperations. The title is NOT Analysis and Mitigation of Transmission and Generation Protection System Operations. The way the draft is currently written if one operation is missed and it is not documented and reviewed then an entity has violated a requirement with a high Violation Risk Factor and a severe Violation Severity Limit even if no misoperation has occurred.
No
In the previous two version of PRC-004, the data retention time was not six years. How does the SDT

plan on making the implementation to the six year data retention when the previous data retention time was 12 months or until your CAP was completed? IMPA believes the previous data retention time requirement should be used on this version of PRC-004.
Yes
IMPA does not agree with the proposed definition of “Misoperation” and feels that the selections under Misoperation Category are broad and far reaching and will result in the vast majority of operations being termed “Misoperation”. In addition the definitions listed in the Definition Tab under the Cause(s) of Misoperation include equipment not covered under other Reliability Standards, such as Telco errors. These Causes need to be reviewed and modified to include only equipment covered by other Reliability Standards.
no comment
no comment
Yes
A NERC Rapid Development Team (one industry stakeholder out of ten individuals) drafted the SAR and the first draft copy of PRC-004-3. IMPA believes SAR development in this manner is fine, but the first draft of a standard should not be written by the NERC Rapid Development Team. This new process should not compromise the current stakeholder process of writing reliability standards. By using the Rapid Development Team in the attempt to gain efficiency or speed, the risk of becoming inefficient and increasing drafting standard time is greater because problems will have to be address formally through comments and revisions instead of through the informal drafting work of the stakeholder’s standard drafting team. IMPA appreciates the effort of trying to make the standard easier to understand by the use of Application Guidelines, but we are concern that the Application Guidelines will become, by association, part of the requirements of the standard. Application Guidelines will be used by auditors as a draft of what a Compliance Program should include and that registered entities will be required to comply with the suggestions listed for Part 1.1 – Part 1.4 and Section C-1.4. For instance, it is stated that an investigation report generally includes the following information: 1) initial evidence, 2) probable or potential causes, 3) tests and studies, and 4) conclusions. Are utilities going to be required to have the supporting documentation required for each of these steps? For instance, as stated in the Application Guideline, initial evidence “…contains the sequence of events, relay targets, and a summary of Disturbance Monitoring Equipment (DME) records.” However not all registered entities to which this draft Standard would apply to are currently required to have sequence of events and/or DME’s. If this source of information is not available to them will they be penalized or forced to install this equipment thereby subjecting them to further Standards? In addition short circuit and coordination studies are mentioned as being included in report. These studies can be costly and time consuming – will utilities be required to provide these in a report for each operation in order to prove that it was not a “Misoperation”? Guidelines should be viewed as just that – a guideline and should not be viewed as what a utility should include in their Compliance Program. For this standard, it has about a page and a quarter of requirements and almost five pages of Application Guidelines to tell an entity how to be in compliant. The requirements should be written in a manner to stand by themselves without guidelines and allow an entity the option of determining the best method of being in compliance with the requirement.

John Bee on behalf of the Exelon Companies
Exelon
Yes
The definitions are fairly generic but there are additional qualifications in the Application Guidelines. See #3 Slow Trip definitions versus Application Guidelines # 3, this could lead to inconsistent applications. ComEd: Suggest including verbiage regarding human performance events. Is the intent of bullet #5, on page 3, to excluded human performance events as with the previous definition?
No
PECO: Similar to what Reliability First Corporation has created; PECO suggests that the five categories of misoperations should be expanded to provide examples of what would constitute a misoperation vs. a non-misoperation for each of the categories. Exelon Nuclear: SERC Regional Criteria procedure for "Analysis and Reporting of Transmission and Generation Protection System

Misoperations," currently includes guidance on misoperation categories and classifications and provides comprehensive examples of misoperation classifications. Such guidance has proved invaluable when determining if an event met the definition for reporting to the Region in accordance with PRC-004. It is strongly suggested that the NERC SDT provide similar guidance to registered entities to ensure timely and consistent reporting. ComEd: A formatting comment; the Requirement number formatting does not align with the questions in the comment form. Assuming question 2 referring to R1 items 1.1 – 1.1.3, question 3 is referring to Requirements R1.2, R1.3 and R1.4. TS&C: The requirement should not be to “have a procedure” The reliability objective should be to record, investigate and if required, develop corrective actions for mis operations. Suggest the Requirement read: R1. The Applicable Entity shall record, investigate and implement corrective action planning for all faults and misoperations. R1.1 Record all BES faults and Protections System operations. R1.2. Complete an investigation and implement immediate corrective actions within 30 days. R1.3. Report mis operations each quarter using the reporting template. R1.4. Complete a corrective action plan for each identified mis operation. Requirements 1.2, 1.3 and 1.4 should be removed and replaced by one requirement. See suggested R1 above. Corrective Action Planning, Performance Improvement, Root Cause Analysis and Investigations are all standard business practices with widely accepted protocols and methodologies. The details concerning the possible outcomes of a CAP should be removed The standard requirements should not try to anticipate the possible outcomes, “cause not identified” and subsequent actions, “interim actions, final actions, timetables etc.” Nor should the standard include a statement requiring an entity to state that there is “no need to develop a CAP” or that “no further investigation is required”.
Yes
PECO: Time limits are reasonable; however, the drafting team should consider requests for extensions based on extenuating circumstances, i.e. emergent work/storm related issues, etc., related to R1.2, R1.3, and R1.4. It is not clear what the deferral reference on page 15 of 16 of the Application Guidelines refers to. It appears to allude to a deferral process for CAPs but this is not specifically identified in R1.5 of the standard. ComEd: For R1.3, is there an intended limit on the work time table? Coordinating mitigating actions between customer premises or other entities can extend corrective plans significantly. Exelon Nuclear: Time limits are reasonable; however, the SDT should strongly consider a provision for those events where the root cause of a misoperation may be dependent on an external investigation (e.g., a relay may have to be examined by the manufacturer in an attempt to determine a defect). The timeline associated with forensics performed by an external company are outside the control of the registered entity.
No
ComEd: For R1 VSL, not all potential actions can be identified based on ability to obtain outages associated with an investigation and many times an investigation start leads to other paths. If an entity then creates generic all encompassing check list to meet the intent of R1, would they be held accountable to complete all the items listed when the cause was found at step 3 of 50 as an example. Exelon Nuclear: Suggest rewording the VSL to state that "… either identified the cause or listed the preliminary actions planned to identify the cause …" to address the concern that not all potential actions may be able to be identified within the required timeline.
Yes
ComEd: On Measurement M3 & M4 with regards to a dated documentation, do these have to be captured in a system outside of a standard business application for the purpose of locking a tracking date?
Yes
Column Q, “Is this a TADs reportable outage”, should have NA as an option with a footnote or some acknowledgement that generators do not report or participate in the TADs system. Exelon Nuclear: Column Q should have an "N/A" or and "unknown" field as a selectable option. GO/GOPs do not report or participate in the TADs system.
No
Yes
What are the reporting expectations when a Protection System misoperation occurs between entities

and the failure is with the one of the entities? Would the entity not responsible for the cause also report a misoperation as a means to show cooperation? In accordance with the Standards Processes Manual, the drafting team will respond to comments made in response to the following question informally (in summary form only).
Exelon Nuclear: Nuclear GO/GOPs have an existing Corrective Action Program that is required by 10 CFR 50 Appendix B Criterion XVI (quoted below). This regulatory requirement and associated mandatory implementation of a Corrective Action Program by a Nuclear GO/GOP fully envelopes the intent of the draft revision to PRC-004. An additional "procedure" to identify and address all Protection System Misoperations with set timelines and attributes is not necessary. "XVI. Corrective Action Measures shall be established to assure that conditions adverse to quality, such as failures, malfunctions, deficiencies, deviations, defective material and equipment, and nonconformances are promptly identified and corrected. In the case of significant conditions adverse to quality, the measures shall assure that the cause of the condition is determined and corrective action taken to preclude repetition. The identification of the significant condition adverse to quality, the cause of the condition, and the corrective action taken shall be documented and reported to appropriate levels of management."
Group
Southern Company Generation
Bill Shultz
No
The proposed definition is excessively lengthly. Items 1, 2, and 3 should be combined into one statement: Any failure of a Protection System to operate for a fault or non-fault condition as it is designed to operate. Items 4 & 5 should be combined into one statement: Any Protection System operation for a fault or non-fault condition when it was not designed to operate. Alternatively, all five statements could be replaced with this one statement: A misoperation is either the operation of a Protection System when it should not have operated or the failure of a Protection System to operate when it should have operated.
No
We believe that too many details are included in the existing Requirement R1. It is not necessary to be so specific on the documentation process. A high level requirement is much more appropriate. With so many details regarding the investigation compositional elements, valuable attention to resolving the operation/mis-operation is diverted to record keeping. Keep in mind that a large utility may have several relay operations per week, and requiring specific time tabling for each requirement with varying start dates for the magnitude of relay operations makes the proposed approach quite burdensome. It is not necessary to have a written relay operation investigation methodology in order to investigate all relay operation. Requiring a program document is not an essential component of reviewing operations and executing corrective action if they are needed. Please consider changing the existing lengthly requirement that, in our opinion, has far too many detailed requirements with the following three requirements which match the objectives of the current draft on page 5 of the PRC-004-3 draft standard dated 09 Jun 2011 (Draft #1). R1: Review all Protection System operations on the BES and identify those that are BES Protection System Misoperations. R2: Analyze BES Protection System Misoperations to determine the cause(s). R3: Where appropriate, implement Corrective Action Plans to address the cause(s) of the BES Protection System Misoperation. The requirements do not need to be any more complicated that these. The accompanying measures to match these requirements can be: M1: Documentation proving that all (BES Protection System) operations werer reviewed. M2: Documentation of analyses to determine cause(s) of the mis-operation. M3: Documentation of all Corrective Action Plans (problem resolution) resulting from misoperations. Revising the requirements to match the objectives listed provides an effective. simply stated standard for identifying and correcting Protection System misoperations.
No
There are no requirements R2, R3, and R4 in the 09 Jun 2011 Draft #1 posted in the "Standards Under Development" NERC web site. Responding to these actions as written in R1.2, R1,3, and R1.4 of the draft standard, we believe that specifying so many deadlines for individual tasks will make the identification, investigation, analysis process too cumbersome. The periodic reporting requirements to the regional entity requires continuing attention to these tasks and is sufficient to ensure their completion.

Yes
The VRF needs to be high as is specified in the draft. The magnitude of the components that make up the VSL matrix in the proposed draft #1 is indicative of the excessively prescriptive composition. The requirements, measures, and violation severity levels need to be simplified as described in the comment to question 2 above.
No
As noted above in the comment with Question 2, the Measures along with the Requirements should be phrased to establish the objectives only and not in the details of one possible way to accomplished the objectives. Regarding the data (evidence) retention, what is the basis for the six year retention requirement? The data retention period needs to be the time elapsed since the previous audit unless directed by a Compliance Enforcement Authority to retain specific evidence for longer periods as part of an investigation. The Additional Conpliance Information section (1.4) contains a requirement for the TO/GO/DP to report to the RE. This should be in the main requirement section of the standard. Also, to eliminate PRC-003, a requirement is needed for the RE to gather the region's records and report to NERC.
Yes
Eliminate the TADS columns Q, R, and S for generators as this code is meaningless for those entities.
Yes
1) In 4.2.2, point to PRC-016 for SPS Misoperations. 2) In suggesting to use the objectives listed (on page 5 of the 09 Jun 2011 draft standard) as the recommended requirements in the comments to Question 2 above, the removal of "faults" from the first objective was intentional. Generator Owners are not advised of "all faults" and have no way of knowing of all faults. Our experience has been that some Protection System will ultimately operate whenever a Protection System Misoperation occurs, therefore the suggested R1 was written excluding "all faults". 3) Another reason for eliminating all of the time frames suggested by R1 (R1.2, R1.3, and R1.4) relates to the 60 day reporting requirement to regions. A misoperation can occur on the last day of the quarter which must be reported 60 days later. The R1 subsections above time frames overlap the 60 days for a misoperation occurring late in the quarter. The simplified requirements suggested eliminate this problem. 4) We disagree with the statement made in item 3 of the Guidelines and Technical Basis section (page 12) of the draft standard. If the system did not perform as it was intended to (designed to), then it is a misoperation. 5) It is unclear what the phrase "situations that challenge a Protection System" means on page 13, Part 1.1 of the draft standard. 6) The exhaustive description of an investigation (page 13 Part 1.2 paragraph) should only be required where a definitive cause is not identified. For those cases where the cause has been determined, only the bottom line needs to be formally documented. 7) Will the Guidelines and Technical Basis section of the draft standard (p 12-16) become part of the standard? It is not referenced in Section F Associated Documents (p 11). 8) Will the Background section (A5) be retained with the standard? 9) Are revisions to Corrective Action Plans allowed to facilitate handling contingencies?

Cynthia S. Bogorad
Yes

We understand that the draft standard was drafted by a “rapid development team” rather than by a stakeholder Standard Drafting Team. This new rapid development team process should not displace or compromise the stakeholder process. TAPS supports the goal of developing better standards more efficiently. If NERC and Regional staff draft a standard without the benefit of significant industry input, however, we could risk moving toward greater inefficiency and delay, because problems that could have been addressed informally in drafting will instead have to be addressed formally through comments and revisions. Instead, the rapid development team should develop only the SAR, with the drafting of the standard left to the Standard Drafting Team, advised by technical writers and attorneys as appropriate.

Would like to add either in this section or in the application guidelines a reference to trips prior to synchronization would not be reported. They would be investigated and corrected but not reported. We are concerned that the definition would lose clarity if the application guidelines are moved out of the standard. If this happens we would like to see some of the meat of the guidelines added to the definition.
No
Want to be clear that the wording in R1 and in section R1.1.2 refer to the BES and not all Misoperations. Would like to see BES included in R1 between address all BES protection system misoperations. Also would like BES added to Section 1.1.2 for clarity. We would ask that this requirement be broken up to address identification, corrective action, and reporting. This would give you greater flexibility to create different VRF and VSLs for each piece that is being addressed. We feel that making an administrative action, such as completing a report, a high on the VRFs and VSLs isn’t justified.
No
We don’t agree with placing a timeframe on the investigation of a misoperation. There is an inconsistency with section 1.2 of the application guidelines and section 1.2 of R1. One states that its 90 days from the identification of the misoperation and the other states from the date that the misoperation occurred. If it’s the case that the 90 days start from the occurrence of the misoperation we are concerned that putting a timeframe on the analysis would cause detriment analysis especially during system wide event I.E hurricane. Could cause hundreds of operations and would need a longer analysis timeframe for these. Could add a process by which the entity could file for extension during these extraordinary circumstances. Was the intent for the timeframes to start after the misoperation was identified or was the intent to start the clock after the operation occurs? In the question it should have read R1.2, 1.3, 1.4 rather than R2, R3, R4.
No
See comment in question two.
No
We would like to see in section M2 BES faults added here as well to clarify that we are talking about BES rather than any fault. Should data retention follow the audit cycle for each applicable entity? I.E. if your audit cycle was three years then it would be three years and if it was six years then it would be the six years mentioned.
Yes
Attaching the TADS reference to this template could cause a non reporting for instances in which other entities actually report the TADS information and not the Misoperation. There needs to be consistency with the excel sheet language and the standard itself. Under the definitions tab in the excel sheet the language isn’t consistent with the language in the standard itself.
No
Would like clarification on failures during the synchronization of a unit. Clear line to when the point of

misoperation could occur. Shouldn't under frequency load shed also be excluded to be addressed at a later date? Under the applicability section shouldn't the wording have been kept from the last posting that it would be distribution provider that owns a BES protection system. Under compliance section third line protection needs to be capitalized. On the same line shall submit a quarterly report. Need to insert, "quarterly report for the previous quarter".

No
Item 3 (Slow Trip) in the definition of 'Misoperation' should be clarified by replacing the word 'planned' with 'specified'.
No
R1 should be clarified by changing '... and address all Protection System Misoperations within its system' to '... and address all Protection System Misoperations within its BES'. While the standard only applies to Protection Systems for Facilities that are part of the BES as stated in the Applicability Section, R1.1.1 explicitly states 'BES Faults' and 'BES Protection System operations' making R1 read like it refers to all Protection Misoperations in the Registered Entities' entire system. R1.1.1 and M2 are too prescriptive and should not specify the process that a Registered Entity must follow to determine when a Protection System Misoperation has occurred. R1.1.1 and M2 should only require a process to identify a list of all Protection System Misoperations rather than a list of every single fault and BES protection system operations on the Registered Entity's system.
Yes
No
Manitoba Hydro suggests that the sub-requirements of R1 are split into separate requirements (eg. R1, R2, R3, etc.) or each of the sub-requirements are assigned a separate VSL. The current VSL matrix is unclear.
No
Manitoba Hydro suggests that the Evidence Retention period be 3 Calendar Years to align with the data retention required for audits. The standard drafting team has not provided justification for extending the Evidence Retention period to 6 Calendar Years and given that Misoperations will be reported quarterly, it is not clear why 6 Calendar Years of evidence would be required.
Yes
In Column M (Misoperation Category) of the spreadsheet, only 4 Misoperation types are provided for selection - Failure to Trip, Slow Trip, Unnecessary Trip - During Fault, and Unnecessary Trip - Other than Fault. To be consistent with the proposed definition, Failure to Trip should be replaced with Failure to Trip - During Fault, and Failure to Trip - Other than Fault.
Yes
A number of Canadian Entities have the BES defined within their provincial legislation. This may introduce differences between the Protection System elements that are included in the BES according to provincial legislation and the NERC definition. This may impact the Protection System Misoperations that are reported. As well, since Canadian Entities are not under FERC jurisdiction, the effective date of PRC-004-3 and the associated Misoperation reporting requirements may differ for Canadian entities and entities under FERC jurisdiction.
Individual
Keith Morisette
Tacoma Power
Yes
Yes, the proposed definition is reasonable, provided that protection system operations resulting from

maintenance, testing, or similar inadvertent activities are excluded, as is the case with the existing definition. Alternatively, the proposed definition is reasonable if under R1.3, “a declaration explaining why there is no need to develop a CAP” is acceptable.
Yes
None
No
The Guidelines and Technical Basis section asserts that the 90 and 120 day timeframes “provide sufficient time for the responsible entity to get through a seasonal period that can restrict the ability to take the outages necessary to effectively identify the Misoperation root cause(s) or document the investigation for unsolved root causes.” For some responsible entities, this period arguably could approach 6 months (180 days). Exacerbating this issue is the fact that the VSL increases rapidly after the 90 and 120 day timeframes are exceeded. While identification, analysis, and correction of protection system mis-operations is important to reliability of the BES, the responsible entity should be granted greater latitude to triage investigations based upon the perceived severity of the nature of the mis-operation with respect to other operational constraints. Not all mis-operations are equal in potential impact. Investigating a mis-operation should not degrade system reliability in the name of compliance, and the 90 and 120 day timeframes may result in undue hurried response for some, less critical mis-operations.
No
An automatic VSL of severe should not be assigned by failure to review one event. A VSL structure similar to draft 4 of PRC-005-2 is more reasonable. It seems reasonable that an entity should be penalized less severely if a lower percentage (1) of BES faults and BES Protection System operations have been documented and reviewed, (2) of misoperations have been identified and documented, or (3) of misoperations have been investigated and addressed. Part of the concern is that an entity may be heavily penalized for failing to identify a misoperation, based upon a later finding or a technicality, even if the entity has performed due diligence. Such a later finding may place an entity in a Severe VSL category, and a fear of such a scenario may cause an entity to devote an unreasonable amount of resources to develop or implement its procedure per this draft standard, particularly for arguably less severe misoperations.
No
The distinction between M6 and M7 is unclear.

Please 1) show the present Misoperation definition so that entities can see how much SDT is proposing to change it. The entire 3rd bullet item (excluding on-site maintenance caused) of the existing definition needs to be retained in your proposed definition items 2 and 5; 2) clarify in item 3 ‘Slow Trip’ by adding ‘slower than required to meet TPL requirements’ as the SPCS intended; 3) explain in the Background section that “a Protection System” is an element’s protection in its entirety (e.g. for a transmission line, it would typically consist of both the primary and secondary protection designed to protect the line) and provide such an example; and, 4) remove ‘power swings’ from items 2 and 5 ‘Other Than Fault’ examples because it is pre-mature to include until after protective relay response during power swings is addressed in Phase 3 of Project 2010-13.
No
We assume you mean R1 and R1.1 here. Please 1) review and incorporate the Project 2009-17 interpretations that have been correctly incorporated in PRC-004-1a; the SDT should recognize PRC-004-1a in the Background section to provide correct history and continuity. 2) reword R1 to state:

“Each … and address its Protection System Misoperations.” This removes ‘all’ because though we strive to find all it is impractical to guarantee all were found. The TO, GO, DP is responsible for the Protection Systems they each own, thus use ‘its’ and remove ‘within its system’ for clarity of responsibility. 3) reword R1.1.1 to replace ‘all’ with ‘its’ for the same reasons as 2) above. 4) reword R1.1.3 to insert ‘identified’ before Misoperation.
No
We don’t see R2, R3, and R4 in the posted document; We assume the SDT mean R1.2, 1.3 and 1.4. 1)From our perspective, the SDT rationale for R1 is flawed. Using the posted TADS 2008 and 2009 reports, Failed Protection System Equipment is only responsible for 1.1% of the hours of AC Circuit Sustained Outages and ranks as the 9th Cause Code. Considering the large number of sustained outages, even larger number of momentary outages, and huge number of non-outage hours in which the Protection System correctly restrained, the Protection System is extremely reliable across a wide range of conditions and numerous challenges. We agree that Misoperations should be investigated and corrective actions taken if a reasonable cause is found, but the importance of this issue is being overstated. 2)In R1.2, please rReplace ’90 calendar days’ with ‘six calendar months’ to allow sufficient investigation time in non-peaking periods because BES equipment outages are needed for a fair number of investigations. 3)In R1., please restate as “ A requirement that for each Misoperation for which the cause(s) was (were) identified, the Registered Entity shall, within 120 calendar days of the cause being identified per R1.2, develop one of the following …” because the Corrective Action Plan cannot be developed until after the cause is identified. 4)R1.4 also needs to be 120 days subsequent to initial field investigation of R1.2, similar to R1.3, and replace ‘all’ with ‘each’.
No
1) R1 VRF should be Low because the risk to BES reliability from one BES Fault or one BES Protection System operation not being documented and reviewed is very minute. The SDT itself alleges that up until now there are not even required Regional Entity procedures to support PRC-004-2, which would lead to numerous omissions in such regions. Operating as such under the proposed PRC-004-3 would lead to numerous High VRF and Severe VSL violations. One would expect a very unreliable BES over the past 4 years; however, the BES has been extremely reliable in this time frame. 2) The VSL need to be completely restated to recognize that a higher volume and BES voltage level >200kV Misoperations deserve a higher severity level, but fixing the number of days an entity is late at 90 days. For example, if an entity is unaware of one Misoperation on the <200kV, they’ll end up missing all the deadlines; this belongs in the Lower VSL category. But one omitted Misoperation on the >200kV belongs in Moderate VSL. We propose <200kV omission quantities of 1, 2 to 4, 5 to 10, and >10 Misoperations in the Low, Moderate, High, and Severe VSL respectively. We propose >200kV omission quantities of 1, 2 to 4, and >4 Misoperations in the Moderate, High, and Severe VSL respectively. Similarly missing R1 deadlines by >90 days for identified Misoperations of the same number (1, 2 to 4, etc.) and voltage level would fall into our proposed VSL categories.
No
1) We believe that the Evidence Retention back to the most recent Compliance Audit is sufficient. The Regional Entity has access to all evidence during the Compliance Audit so it need not be retained after that. TO, GO, and DP are reporting Misoperations quarterly to the Regional Entity, so sufficient ongoing monitoring can occur. 2) Many measures require ‘dated written lists’. We presently use an outage tracking database, which includes our correct operations and Misoperations. Are you requiring us to revise this software so that it automatically tracks date and time of entry of each pertinent item of this standard? Please provide some guidance or point us to what NERC accepts as an equivalent to a ‘dated written list’. 3) In M, please remove ‘each’ as this in an extra word. There seems to be a few other grammatical errors in this sentence.
Yes
1) For Time Zone use Prevailing Time, e.g. CPT for Central Prevailing Time because that’s what EMS systems provide. The switch to Daylight Savings time is simultaneous. 2) Require GO to use their GSU high side voltage for Facility Voltage, rather than the generator voltage which will always be <100 as the Facility Voltage.
1) The industry is in the process of adopting the RAPA template. We disagree with the Background statement that Misoperation data, as currently collected and reported is not usable. It seems to us

that plenty of Misoperation statistics have been issued, though they may be misleading. 2) We have been through multiple audits and regional reviews of our reported Misoperations, and strongly disagree with the Background statement that the present PRC003 / 4 status is a 'reliability gap'. 3) Are the "Guidelines and Technical Basis" part of the standard? What is their purpose? They do provide a reasonable engineering practice explanation in several cases. In item (3), please strike "or by coordination requirements with other Protection Systems." 4) The evidentiary requirements of this proposed standard greatly exceed those of the present standard, and rigid timelines are required. Entities need more time to make software changes, increase and train staff, and implement processes. Please change implementation to 'first day... 6 months after applicable regulatory approval'. 5) The standard and implementation plan should also exclude UFLS. Add 'Underfrequency Load Shedding' in 4.2.2.

MRO's NERC Standards Review Forum
Carol Gerou
Yes
No
This requirement is overly prescriptive and unnecessary. The requirements (and its parts) should not prescribe how entities should comply, but address the "what" is to be accomplished within this requirement. NERC Reliability Standards should specify simple actions such as: 1) that the applicable entities should have a procedure for identifying all BES protection system misoperation on BES protection systems installed for detecting faults on BES elements, 2) implement corrective actions for identified systemic causes of BES protection system misoperations, 3) document those actions, and 4) report all BES misoperations to their regional entity on a quarterly basis. This is a better way to meet the goal to require the identification of all BES protection systems installed for detecting faults on BES elements. Simply have a plan, implement the plan when warranted, document what the entity accomplished and report quarterly to the applicable Region. The misoperation report could also be used by NERC and the applicable Region for trending of misoperations. It is recommended that the SDT align this project with the NERC Functional model. The reference to its system implies operations when it's more like the equipment it owns, please clarify. R1 also uses the word "all" with Protection System Misoperations. Since the SDT has defined 5 different attributes of what a Misoperation is, this would require every function of a relay to have 5 areas that "identify and address" the associated Misoperation. If an entity's relay has 15 functions associated with it, they will need to identify up to 75 ways of identifying and addressing the Misoperation. Note that Protection System is clearly defined and has 5 components to it. So the 75 ways to identify and address the Misoperation will also need 4 more (not five since relays are used as the example). Recommend that the SDT rewrite R1 to read: Each TO, GO, and DP shall have and implement when required, a procedure to identify and address the Misoperation of a BES Protection System within its metered boundaries. Recommend that the SDT add a requirement 2 that fulfils the section 1.4 additional compliance information concerning quarterly reporting. Requirement 1.1.1 should be for BES Protection System misoperations not all operations. The use of the word "all" BES Protection System operations seems unreasonable and un-necessary. Exceptions need to be allowed e.g., acts of god, storms, etc. This requirement is overly burdensome for those individuals involved in restoration. (Certain relays lose information once they are reset.) The NSRF recommends that that this requirement be removed altogether unless further clarified.
No
We agree with the time tables/time lines if a bullet is added to allow the Regional Entity to grant the registered entity an extension beyond the 90 days within R1.2 and beyond the 120 days within R1.3 and R1.4.
No
The VSLs are incorrect. All documentation time frame references should be deleted. If they are retained the VRF for R1 should be dropped to lower as the requirement is now administrative documentation. Documentation does not affect the electrical state or capability of the bulk electric system. The non documentation items under the severe VSLs can be modified to fit the moderate, high, and severe categories as follows: Moderate: The responsible entity did not identify all protection system misoperations High: The responsible entity did not investigate all identified protection system

misoperations Severe: The responsible entity did not have a procedure to address protection system misoperations OR the responsible entity did not implement a plan to correct any misoperations.
No
The measures are incorrect and must be changed to match the modified requirements. However, the measures are reasonable and could be translated into requirements R1 – R6 or R1 – R7 with corresponding measures. The data retention is incorrect. The data retention should state that data should be retained back to the last audit period. If not, the drafting team should provide the reliability reasoning why an entity with an audit cycle faster than six years would need to retain data past its last audit cycle. In 1.2 Evidence Retention, the "and Measures M1, M2, M3, M4, M5, M6, and M7" reference should be deleted.
Yes
This should be a requirement.
Yes
Where does PRC-009 (new PRC-006) & PRC-020 overlap or are they in conflict with this standard?
Yes
Clearly exclude power plant trips when they aren't part of the BES as misoperations. Trips can occur easily during synchronization and may not be a reliability problem. There are many mechanical issues related to a power plant that may result in an electrical synchronization trip. It's best to avoid inadvertently requiring unnecessary work that won't benefit reliability by clearly excluding plants that are not connected to the BES or plants in the process of synchronizing to the BES. Non-BES plants should all be excluded. In accordance with the Standards Processes Manual, the drafting team will respond to comments made in response to the following question informally (in summary form only).
Individual
Brian Evans-Mongeon
Utility Services, Inc.
No
Utility Services disagrees with the addition of incorrect settings to the definition of a Misoperation (Cause Code in Table 2 of the White Paper). Misoperations imply that there was an action or inaction based upon the equipment not performing. It is our view that incorrect settings are a maintenance and testing function, not a misoperation. Utility Services is NOT suggesting that we ignore incorrect settings of these devices. I believe that incorrect settings should be dealt with in the PRC-005 standard instead. As a part of regular maintenance and or testing, the settings should be validated and affirmed by the entity. A misoperation is when a device fails to act or acts inappropriately. Finding out at the time of the misoperation that the settings are incorrect are not the right time to determine this. The better standard of reliability for these devices is to do it before they misoperate. If the M&T routines are validating the settings on a regular basis, then the discovery/re-correction will actually benefit reliability because they will be corrected prior to any so-called misoperation.
No
Please refer to our response to Question 1.
While we understand the need to move the Standards Development process on a faster pace, aka Rapid Development process; Utility Services feels that the RDp should not have the initial standard language drafted by RDp group. The SDT should be the group to draft the initial requirements. As outlined in the ROP, industry should be leading this effort.
Individual

Thad Ness
American Electric Power
No
It would appear that the proposed definition is overly broad, when compared to the application guidelines specified on page 12. For example, going strictly by the criteria on page 3, one might unnecessarily report a misoperation when it would not be considered such according to the guidelines. Employee action, during on-site maintenance and testing or commissioning activities, that directly initiates an unintentional operation should not be included in this category. However, for example, if an employee leaves trip test switches or cut-off switches in an inappropriate position following maintenance and testing or commissioning activities and a system fault or condition causes a misoperation, this would be counted as a misoperation.
No
We are confused by the numbering of the requirements in this question versus the numbering within the proposed standard. In addition, rather than developing additional sub-requirements and sub-sub-requirements which make it difficult to track compliance, we suggest discrete requirements which stand on their own. Requirement R1 is not sufficient, because there are additional considerations set forth in the Standard's "Guidelines and Technical Basis section" regarding the identification of misoperations. Requirement R1 should include a clear reference to the guidelines to lessen the possibility of confusion by an Entity or auditor. 1.1.3 appears redundant with 1.2, as operations must be investigated in order to identify whether or not a misoperation has occurred. In addition, more detail is needed as to the exact intention of the word "address".
No
There is no R2, R3, and R4 in the current draft of the standard. Also, the process needs to accommodate for the later identification of a misoperation after new information is obtained. Some investigations might take a month after an event occurs before that event could or would be declared a misoperation.
Yes
Though we agree overall with the VRFs, VSLs, and Time Horizons specified, the table seems more complex than necessary due to the number of "or" clauses involved. Should the sub-requirements perhaps stand on their own as individual requirements?
No
Within M4 and M5, it is not clear what the meaning or intent is of "dated written declaration", or what it would constitute.
No
AEP is not aware of any conflicts between the proposed standard and any regulatory function, rule, order, tariff, rate schedule, legislative requirement, or agreement, however, the definitions and reporting requirements for this standard would potentially be quite different from those required an RTO. This would not only produce duplication of efforts, but would also result in conflicting metrics.
We see no need for regional variances, whether for WECC or any other region.
Why is it necessary to have PRC-004 along with both PRC-006 and PRC-016? It is not clear why these cannot also be addressed in this revision process, as for AEP, it would seem to be a natural extension of these responsibilities. We suggest there should there be an explicit requirement regarding reporting, rather than providing this detail within the Compliance section. It is not clear how much flexibility, if any, there is in completing investigative work in a timetable as required by R 1.5. For example, due to outages or required maintenance activities, one might not be able to meet the date as set within the timetable, which would require a new proposed completion date. If one were to be held to the standard "literally", is it even allowable to complete the work early? Though the application guide seems to partially address allowing changes to the CAP, the standard should be more explicit in doing so.

The definition of Unnecessary Trip – During Fault should be changed to “Any Protection System operation that causes a circuit breaker/switcher to trip for a Fault not within the zone it is designed to protect.” The definition for Unnecessary Trip – Other Than Fault should be changed to “Any Protection System operation that causes a circuit breaker/switcher to trip for non-Fault conditions such as power swings, under-voltage, over excitation, or loss of excitation for which the Protection System is not intended to operate.”
Yes
No
What about wide scale events such as the 2003 blackout? There does not appear to be an exception. ATC suggests that a provision be made to allow for declaration of an extension of the timelines identified in requirements R1.2, R1.3 and R1.4 in the case of a wide scale system event (NERC event categories 4 or 5).
No
ATC is concerned that the measures defined in M2, M3 and M5 leave out the possibility of using a database to capture the data. Please replace the term “dated written” in the measures section with “dated records”. This change allows for records stored in databases, generated from manufacturer programs as well as for written records.
Yes
In the supporting document “SPCS Input on Uniform Misoperations Reporting”: The Misoperations Categories include Slow trip (i.e., slower than required to meet TPL requirements). The parenthetical should be removed. Using the criteria of being slower than TPL standards, could be used as a loop hole. The Cause Code Description for As-left personnel error should be improved by adding a description to make it clear that human error due to ongoing testing is not included. ATC believes the intent is to include only those items when the technician has left the substation in an unwanted state.
Individual
Armin Klusman
CenterPoint Energy
No
The proposed revision to the definition of Misoperation includes conditions that are found in the Guidelines and Technical Basis in PRC-004-3, but not in the definition itself. CenterPoint Energy recommends that the conditions be included in the formal definition, instead of in a separate document. Should this recommendation not be accepted, as an alternative, the following statement should be added to each of the five items in the definition of Misoperation: “For specific conditions, refer to the Guidelines and Technical Basis in PRC-004-3 reliability standard.”

CenterPoint Energy recommends that Under Frequency Load Shedding programs be excluded from this standard. In the Applicability section of PRC-004-3, 4.2.2 should be written as follows: "Special Protection Systems (SPS), Remedial Action Schemes (RAS), Under Frequency Load Shedding programs (UFLS), and Under Voltage Load Shedding programs (UVLS) are excluded from this standard."
Individual
Steve Boutilier

No
Item #5 Unnecessary Trip – Other than Fault The misoperation definition included in the misoperation reporting template includes the caveat "an operation that occurs during on-site maintenance, testing, construction and/or commissioning activities is not a reportable misoperation. This should be carried through the definition as well.
Yes
No comment.
No
R1.2 through R1.4 require the registered entity to complete various phases of a misoperation investigation by specific times. In general the times are generous enough to comply with, but the fact is many investigations require transmission facility outages that must be approved by the Transmission Operator, and these may not be granted. To meet the timeline set forth in the Requirements the Registered Entity may have to declare an emergency outage and accrue the expense of running off cost generation. While this requirement is seemingly reasonable, it unreasonably holds compliance by the Registered Entity hostage to the entities who have no "skin in the game".
No
The VSL 's are tied to the timetables set out in Requirements R1.2 through R1.4. As stated before, this unreasonably holds the registered entity hostage to the whims of a Transmission Operator or other entity who at best may have "no skin in the game" and at worst may have competing priorities…
No
M2. Through M5 requires "written lists, written investigation reports, written declarations, and written action plans…." The intent here should simply be all protection system operations, with auditable investigations reports, and clearly documented action plans. In a modern world these can be accomplished in many ways… The use of the term "written" is archaic….
Yes
The Application Guidelines need to be incorporated into the standard or specifically called out as a binding attachment to the standard.

The definition is acceptable; however, the following recommendations are provided to clarify the Guidelines and Technical Basis for the definition. Failure to Trip - During Fault: The reference to the time in which a Protection System is normally expected to operate introduces aspects of a slow trip into the discussion of failure to trip. To avoid confusion between failure to trip and slow trip, the

second sentence should be revised as follows: “If a fault or abnormal condition is cleared by at least one Protection System element, then failure of another Protection System element associated with the protection scheme is not a Misoperation.” Slow Trip: The TPL standards require that the system is designed to meet performance requirements specified in TPL-001 through TPL-004, but does not require any specific remedy to assure that the requirements are met. Suggest referring to high-speed performance in the context of meeting the performance requirements in place of high-speed performance required by the TPL standards. The sentence should be revised as follows: “Delayed fault clearing caused by a failure of an installed high-speed protection scheme is not a Misoperation if the high speed performance is not required to meet the performance requirements of the TPL standards or by coordination requirements with other Protection Systems.” Unnecessary Trip - During Fault: Clarify that while operation of the backup system is not a misoperation, that failure of the protection for the adjacent zone is a misoperation. The Note should be revised as follows: “Operation of properly coordinated backup Protection System relays to clear the fault in an adjacent zone is not a Misoperation of that backup system if the protection for the adjacent zone fails to clear the fault within the specified time. However, the failure of the Protection System for the adjacent zone is a Misoperation.” Unnecessary Trip - Other Than Fault: The description for this part of the definition lacks clarity as to whether operation of an impedance-based transmission line Protection System in response to a power swing is a Misoperation. The description should be modified to provide clarity on this issue.
Yes
No
The 90 day and 120 day periods are acceptable; however, the start of the 90 day and 120 day periods requires clarification that time is measured from the “date of occurrence of each identified Misoperation.”
Not Applicable
Yes
Although we feel that tie back to TADS reporting will not accomplish the needed data unless TADS is modified to include 100-kV and above and generation facilities. Unless this is done, The tie back to TADS should be eliminated, if implemented, we would suggest the following modification: The recommendation is to state the actual range of TADS data collected. Proposed text – A review of the Transmission Availability Data System (TADS) data (20XX to 20XX) reveals that the fourth ranked initiating cause of BES outages not related to weather is “Failed Protection System Equipment.”
Individual
Eric Salsbury
Consumers Energy
No
This definition is much better than the current definition. However, the Unnecessary Trip - Other Than Fault should specifically exclude operations during on-site activities.
No
Suggest removing the term "all" in R1 and R1.1.1 as the Standard should focus only on Misoperations and not evaluation of all operations.
No
The time limits should be from the date of identification of a Misoperation and not the date of the Misoperation. This will allow for the time required to gather information from the field to determine if a Misoperation has actually occurred.

Yes
The Misoperation Category descriptions in the reporting template should match the wording of the proposed Misoperation definition as closely as possible.
Yes
1) The reporting template describes several typesof events that are "not reportable Misoperations". These types of events should also be specifically excluded in the standard, especially operations that occur during on-site activities. 2) The Effective Dates, listed in the Implementation Plan, are confusing as written. We suggest "first day of the first calendar quarter, at least 3 months after..." 3) Section 4.2.1 of the Applicability indicates the Standard is applicable to "Protection Systems". Since Protection System is capitalized, this indicates it is defined in the NERC Glossary. Is the intent of this standard to be inclusive of all protection system components (relays, cts, vt, dc circuits, and station batteries)? 4) In M2 remove "written lists". We are suggesting that no reference be made to lists.

No
Problems with 3. Slow Trip Use of term “slower” in the definition (Page 3 of 16) and “delayed” in the Application Guidelines (Page 12 of 16) is vague. “Slower” seems to indicate an unintentional time period before tripping while “Delayed” implies an intentional time period before tripping. Slow trip definition introduces the term “planned” which adds confusion. Reference to TPL standards implies the need for more and new System Studies. Must these studies be performed and documented prior to installation? What is requirement for keeping these studies current? NERC Glossary definition of Misoperation makes reference to a failure to operate within a specified time for an abnormal condition. There is no mention of “Slow” trip for a non-fault condition in the proposed definition. Only those terms that are in the NERC Glossary should be capitalized. Suggest wording changes as follows 1. Failure to trip - during Fault - Any failure of a Protection System to operate for a Fault within the zone it is intended to protect. 2. Failure to trip - other than Fault - Any failure of a Protection System to operate for a non-Fault condition such as power swings, under-voltage, over excitation, or loss of excitation for which the Protection System was intended to operate. 3. Slow trip – during Fault - Any Protection System operation that is slower than designed for a Fault within the zone it is intended to protect. 4. Slow trip – other than Fault - Any Protection System operation that is slower than designed for a non-Fault condition such as power swings, under-voltage, over excitation, or loss of excitation for which it is intended to operate. 5. Unnecessary trip - during Fault - Any Protection System operation for a Fault not within the zone it is intended to protect. 6. Unnecessary trip - other than Fault - Any Protection System operation for non-Fault conditions such as power swings, under-voltage, over excitation, or loss of excitation for which the Protection System is not intended to operate including trips occurring when no disturbance is present. Excludes on-site maintenance and testing.
Yes
Dominion suggests R1 to read “Each Transmission Owner, Generator Owner, and Distribution Provider shall have and implement a procedure to identify and address all BES Protection System Misoperations within its system.” While the purpose statement indicates that is the intent of the standard, we believe the inclusion of BES in the first sentence of R1 will avoid questions as to whether this standard applies to ALL Protection System Misoperations (including those that are not designed to protect the BES). Recommend changing (R.1.1.1) to state “Document and review all BES Faults and BES Element operations. (R1.) Lists in the requirement that entities must identify and address all Protection System Misoperations. To do this you must either have a Fault or Element to operate to initiate the process. Having the Violation Risk Factor listed in the brackets under (R1.) only adds confusion to the Requirement. In (R1.), only list those specific items that are required according to the new standard and remove the reference to the Violation Risk Factor. The VRF and VSL information should be in a separate dedicated section and not in the requirement section.
No

Question states R2, R3, and R4. Assume the question is referring to (R1.2), (R1.3), and (R1.4)? (R1.3) and (R1.4) does not give appropriate time to gather data, run studies and perform field investigations for complex events where a Misoperation can occur. Recommend changing the 120 day requirement to 180 days. Remove Box with “Rational for R1”. It is not needed in the standard. In (R1.2), (R1.3), (R1.4) and (R1.5) the requirement wording starts with “A requirement…”, recommend removing “A requirement that” in each section. Suggest wording change as follows: R1.2 The responsible entity shall within 90 calendar days of each identified Misoperation, investigate each Misoperation to determine its cause and do one of the following: R1.3 The responsible entity shall within 180 calendar days of each Misoperation for which the cause was identified develop one of the following: R1.4 The responsible entity shall within 180 calendar days of each Misoperation for which the cause was not identified develop one of the following:
No
Adjust the VSL time horizons and Application Guidelines to reflect a change in (R1.3) and (R1.4) from 120 days to 180 days.
No
Recommend removing Measures from (B.) and creating a separate section for Measures. (B.) should be changed to (B. Requirements) Also change to (C. Measures) (D. Compliance) (E. Regional Variances) (F. Interpretations) (G. Associated Documents) Suggest wording change as follows: C. Measures M1. The responsible entity shall have a current copy of its procedure for identifying and addressing Misoperations in accordance with Requirement R1. M2. The responsible entity shall have documentation of Faults, BES Element operations, and identified Misoperations with their associated date of occurrence to demonstrate implementation of the processes related to Requirement R1, Part 1.1. M3. The responsible entity shall have documentation for each Misoperation investigation with their associated dates and either cause or where the cause of the Misoperation cannot be identified, any additional steps planned for identifying causes to demonstrate implementation of the processes related to Requirement R1, Part 1.2. M4. The responsible entity shall have documentation with associated dates of a CAP or an explanation of why there is no need to develop a CAP, for each Misoperation with an identified cause to demonstrate implementation of the processes related to Requirement R1, Part 1.3. M5. The responsible entity shall have documentation with associated dates that includes a work timetable for implementation or an explanation of why no further investigation or actions will be taken for each Misoperation without an identified cause to demonstrate implementation of the processes related to Requirement R1, Part 1.4. M6. The responsible entity shall have documentation with associated dates such as work management program records, work orders or other dated evidence, to demonstrate implementation of action plans related to Requirements R1, Part 1.5. M7. The responsible entity shall have documentation with associated dates that describes the manner in which the each CAP or action plan was completed to demonstrate compliance with the processes related to Requirements R1, Parts 1.5
Yes
The following comments are related to the “Quarterly Misoperations Reporting Data” table and template: 1) The fields associated with TADS reporting appear to be outside the scope of this reliability standard as stated in the Purpose, therefore we do not agree with inclusion of TADS. 2) The form does not address “action plans” that would be developed in response to Requirement R1, Part 1.4. The form appears to be collecting additional information that goes beyond the Purpose of the standard, i.e., “Identify and correct the causes of Misoperations of Bulk Electric System (BES) Protection Systems.” Specific information includes: Equipment Type; Facility Voltage (kV); Equipment Removed from Service; Relay Technology. The following comments are related to the reference document, SPCS Input on Uniform Misoperations Reporting: 1) The document and template appear to be focused on collecting data for the purpose of reliability metric ALR4-1. This additional data collection is outside the scope of draft standard PRC-004-3 and the proposed requirements stated in the associated Standards Authorization Request (SAR). Therefore, Dominion recommends that only data necessary to address the standard requirements be collected. 2) Section 3 Misoperation Categories 1st Paragragh and Table 1 Misoperations Categories are not consistent with the categories contained in PRC-004-3. Suggest revising document to include the five categories contained in the draft standard. 3) Section 4 Cause Codes 1st paragrah suggests there are six cause codes in Table 2 which is inconsistent with Table 2 that shows seven cause codes. Suggest revising document in the 1st paragraph to say seven cause codes. 4) Template is hard to use because of the number of horizontal columns of data being requested. The number of fields of data being requested seems to

be excessive. Any way to reduce the number of fields? 5) Facility Name (Location of Misoperation) field – IS this asking for location that caused the misoperation or the location of the breakers that operated? For example, when a failed carrier set at Station A causes the other terminal at station B to misoperate during a fault, do I enter Station A or Station B? 6) Equipment Type field - includes Dynamic VAR Systems but does not include Static VAR Systems (SVC for example). Should SVC be included? 7) Facility Voltage (kV) field - includes a choice of <100. Since the BES is defined as those elements >100 KV, this choice should be deleted. 8) For a unit connected generating unit with a 230 kV – 13.8 KV GSU and the 230KV generator output breakers trip when the unit trips, what KV do I enter? For a generator that has a 13.8 KV output breaker and a 230 kV – 13.8 kV GSU and the 13.8 KV breaker trips when the unit trips, what KV do I enter? 9) Equipment Removed from Service field – Isn't this the same information as the Equipment Name field? In the example provided there is no difference in what was entered. The Field Value info apparently limits this to Circuits, Transformers, Buses (and also breakers if the breaker is the only element to trip). Does "Circuits" mean the same as Lines? Suggest Circuits be changed to Lines. Do we include generators? Note that TADS does not require reporting of breaker trips unless a Line or Transformer is affected, shouldn't Misoperations do the same? Note that TADS does not include reporting of Buses or many of the other Equipment Types mentioned in the Misoperations template. Do you want all Equipment Types listed or only Lines and Transformers? We suggest it be limited to one entry focusing on the Equipment (ie Element) that misoperated. 10) Event Description field – The title using the word Event seems to entail the overall event which could include correct operations and misoperations, and the description indicates a brief description of the event and a detailed misoperation description. But the example data seems to indicate only a misoperation description. Can you include as an example description that has a problem on one line and another line overtrips. 11) Causes(s) of Misoperation field – Field is named Cause but description asks for root cause(s). Are you looking for one or are you asking for more than one to be entered? Suggest that the word "root" be removed from description. TADS and other industry benchmarking use Cause not root cause. Suggest that only one choice be allowed for entry. 12) Protection Systems/Components that Misoperate field – Is this redundant since you have asked for a detailed description of the Misoperation in the Event Description field? 13) Relay Technology field – suggest that only one choice be allowed. What do you enter if no entry is required (leave it blank or indicate n/a)? We suggest blank. 14) Actual CAP Completion Date field – Change name to CAP Actual Completion Date be consistent with the CAP Target Completion Date field. 15) If the SDT ultimately decides to use one or more of the availability reporting systems (TADS or GADS or DADS), we have the following questions/comments: a. Cause Code field - What do you enter if no entry is required (leave it blank or indicate n/a)? We suggest blank b. Event ID(s) field - What do you enter if no entry is required (leave it blank or indicate n/a)? We suggest blank
Yes
Conflict: Collection of additional data pursuant to Section 1600 of NERC's Rules of Procedure, such as TADS information, does not belong in a NERC Reliability Standard.
Regional Variance:
Regional Variance: WECC Should consider the fact that WECC has Misoperation requirements that are not recognized by the other regions and the purpose of this standard is to standardize Misoperation documentation, reporting and definition of a Misoperation. Suggest no regional variances be allowed.
Yes
Dominion offers the following comments: 1) The "Rationale for R1" suggest that this revision will afford "enhanced reporting and the development of performance metrics that indicate overall system health, as well as facilitate the sharing of 'lessons learned'." Dominion notes that both performance metrics and lessons learned are outside of the scope of this reliability standard. Additionally, NERC is developing an Event Analysis process (currently in field trial) that includes a lessons learned component. Suggest NERC review the current process of blending data collection for other purposes with compliance. 2) The "Guidelines and Technical Basis" section appears to contain language that one could interpret as expanding the Requirements. Suggest clearly noting that this section is guidance only and not intended for compliance. 3) Section (5. Background) should be removed from the standard. This has no relevance to the Requirements or Measures of the new standard. 4) PRC 003 had the Regional Entity as a Functional Entity under Applicability; previous versions of PRC 004 have the TO, GO and DP listed as the Functional Entities under Applicability. PRC004-3 Background states that "PRC 003-1 is not enforceable…" and "This represents a potential reliability gap". According to PRC 004-3, responsible entities are to report to the Regional entities quarterly, so why

isn't the Regional Entity listed in the new standard as a Functional Entity? Is the objective to require the regions to submit the data collected to NERC? 5) (R1.5) does not allow for extending the CAP beyond the pre-determined timeline when system conditions will not allow for equipment removal, outages, or project schedule changes. There are circumstances where outages continue to move and schedules are adjusted due to operating conditions or limitations that are beyond the control of those developing a projected CAP work timetable. Timetables can be set but it is not unusual that later, when the work is to be performed, that system conditions dictate a change in the schedule. 6) In (C.1.4) the Regional Entity and ERO references require more emphasis by creating a separate section listing Regional Entity requirements. 7) In the Application Guidelines; the Misoperation Definitions (1 - 5), could include better examples or “bulleted” examples. 8) Consider not switching to landscape in the middle of the document. If landscape must be used move Regional Variances, Interpretations, and Associated Documentation to a new page. 9) Need to revise “Guidelines and Technical Basis” section to include Slow trip – other than Fault
See response to Question 6 above.

Yes
No
Within 1.1.1 the wording “and BES Protection System operations” may be interpreted to include all components within a Protection System which could lead to a monumental task and is not necessary if no outage occurred. 1.1.2 should be written to read simpler. Suggested changes: 1.1.1 Document and review all BES Faults or outages caused by BES Protection System operations. 1.1.2 Identify and document all Misoperations.
No
Because of coordination to shutdown the associated equipment, the time to investigate may exceed the time limit of 90 calendar days following the misoperation.
No
Answered No because of issues with meeting present time limit.
No
Within M2 “Protection System operations” should not be included. Suggest changing this to “BES outages”.
Yes
Misoperation reports can be quite lengthy to provide the needed details. Because there can be significant information for an adequate report a spreadsheet is not the best way to collect and distribute this data. Higher level software applications should be used.
Based on the specified time intervals quarterly reports will likely hinder the process, suggest changing the data submittal to semiannual and for it to be submitted within 90 days following the end of the first or second half of the year. In accordance with the Standards Processes Manual, the drafting team will respond to comments made in response to the following question informally (in summary form only).
Suggest changing the first bullet to begin “Review all Faults or outages caused by Protection System operations…”. The draft standard 4.2.2 indicates that SPS, RAS and UVLS programs are excluded and this should also be indicated in the SAR.
Group
Pacific Northwest Small Public Power Utility Comment Group
Steve AlexandersonPE
No
The emphasis on the Protection System disregards the effect the breaker might have, since the breaker is not part of the NERC definition of Protection System. The consequences of a slow or failed

circuit breaker operation are similar to those of slow or failed protection system operation and should be treated the same. The comment group is concerned regarding the definition of Slow Trip as a “Protection System operation that is slower than planned.” How much slower than planned? How do we prove what may have been “planned” many years ago? And even if the settings, documentation, and trip times agree within some not yet defined tolerance; the “plan” itself may be too slow to provide an adequate coordination margin or to prevent instability when relay error, CT error, or subsequent system changes are considered. We propose eliminating the “plan” and looking at the result. We see that Slow Trip is more narrowly defined in the Guidelines and Technical Basis document, but believe this should be extended to the official NERC definition as well. 1. Failure to Trip - During Fault - Any failure of a Protection System or associated protective device to operate for a Fault within the zone it is designed to protect. 2. Failure to Trip - Other Than Fault - Any failure of a Protection System or associated protective device to operate for a non-Fault condition such as power swings, under-voltage, over excitation, or loss of excitation for which the it was intended to operate. 3. Slow Trip - Any Protection System or associated protective device operation that is slower than needed to prevent miscoordination or system instability for a Fault within the zone it is designed to protect.
No
Please see our answer to Q1. Slow tripping events that went according to “plan” are not identified as misoperations even though the result may not have been intended. Slow or failed breaker operation are also not identified as misoperations.
No
While we realize many entities may want or need the structure presented, we can see situations where the cause would be immediately evident and can and should be rectified at the time of the initial site visit. The problem and corrective action would then be documented afterward. While the second bullet of 1.3 suggests this might be allowed, it is not explicitly so stated. In the name of reliability, shortcuts such as this should be explicitly allowed in order to avoid repeated identical misoperations caused mainly by the standard process itself.
No
M6 and M7 appear to be duplicative. Please combine into a single measure, or more clearly state how they are different.
Yes
The misoperation category dropdown list does not match the five categories of the definition.
Yes
Conflict: Section 215 of the Federal Power Act At least one regional entity is consistently applying PRC-004-1 to distribution systems in violation of the FPA. Version 3 adds nothing to limit or clarify the extent of the standard’s reach.
Group
LG&E and KU Energy
Brent Ingebrigtson
No
LG&E and KU Energy believe that further clarity is needed in the definition of misoperation. Specifically: Item #3 Slow Trip the Standard should specifically exclude those incidents involving slow “total clearing times” that are due to mechanical (or other) problems with the breaker, where all protection system components operated as expected. Item 4 Unnecessary Trip During Fault. The definition should include unnecessary trips due to improper coordination of relay operating times. (Example: Zone 2 or Zone 3 trip occurring for a fault within its desired reach (zone), but prior to the desired time delay)
No
Much more than Misoperations is required in R1.1.1. 1) The GO/DP would not have knowledge of BES faults outside the boundaries of GO or DP, and this requirement should only involve the TO; 2)

Reporting correctly operating equipment will not increase the reliability of the BES system. Any operator-initiated action or normal/expected operation of relays should not require documentation when the goal of this standard appears to be about “Misoperations”. Having to document/investigate correct operation will delay performing required actions to bring a unit on-line to support the BES system.
No
We assume the SDT is referring to R1.2, R1.3, and R1.4 as there are no other requirements shown as R2, R3, and R4. Therefore, we have the following comment on R1.3: On Requirement R1.3, could the SDT clarify a little bit better that only a timetable and plans are needed to be completed within the 120 days, and not that the entire correction be completed within 120 days. Currently, R1.3 could be interpreted either way. Therefore, so that an auditor would not interpret it that the corrective action plan needs to be completed within 120 days, this needs to be clarified. Because GO’s oftentimes have to wait to complete a corrective action plan until the next outage on a unit, which would probably be greater than 120 days.
Yes
This seems to be the Excel Spreadsheet that NERC has already placed in force effective with 2Q 2011 reporting of Misoperations
Individual
Dale Fredrickson
Wisconsin Electric
No
The 5th category, "Unnecessary Trip – Other Than Fault", should also include an exception for trips which occur during onsite testing or maintenance work on the associated protection system. This exception is in the existing definition, and we maintain it should remain in the new definition. This is needed to allow exceptions for trips which may occur during commissioning or when making modifications due to the complexity of modern protection and control schemes.
Yes
Yes
The second bullet under R1.2 is unnecessary given R1.4. Also, replace “timetable” with “schedule” in 1.3, 1.4, and 1.5. The “…was (were) …” references in R1.3 and R1.4 should be replaced with the plural case alone for clarity. E.g, “…for all Misoperations for which the causes were identified.”
No
In M1 through M5, the adjective “written” list, report, etc should be removed since any such evidence may be electronic and not necessarily written on paper. In M5, replace “work timetable” with “schedule”. M6 should be replaced by a simpler statement like, “The responsible entity shall have dated evidence, such as work management records or other evidence, to demonstrate completion of all plans required by R1.5.” M7 is superfluous to M6 and should be removed.

Jason Marshall
No
It is not clear which definition of Protection System is intended to apply to the definition. Does the current FERC approved definition apply or does the definition approved by the NERC BOT on 11/19/2010 apply. The meaning of Misoperations will be different based on the two definitions. The implementation plan does not make it clear when the new definition will take effect and when the old one will be retired.
No
While R1 is sufficient to identify Misoperations, there are several issues with the requirements. In R1, use of Protection System as a description with Misoperations is redundant. The proposed definition of Misoperations includes Protection System. While we understand Part 4.2.1 of the Applicability section limits the applicability of the standard to Facilities that are part of the BES, we are concerned that the applicability section could be overlooked. Thus, we suggest the language (“Distribution Provider that owns a BES Protection System”) from the previous version of the standard be incorporated into the requirements. The language of the “within its system” should be replaced with “on its equipment”. The Generation Owner, Transmission Owner and Distribution Providers don’t have systems in the traditional sense. They own parts of the System. “On its equipment” should be appended to the end of Part 1.1.1. Otherwise, the part could be inadvertently interpreted as applying to every BES Fault and BES Protection System regardless of equipment ownership. For example, TO A might have to evaluate a Fault on TO B’s equipment. Clearly, this is not the intent. The second bullet under Part 1.2 and the bullet under Part 1.4 are redundant. Both require the registered entity to identify additional steps for an investigation.
No
We disagree that the VRF is consistent with other Reliability Standards. The SDT cites the need to deviate from the Medium VRF assigned to the similar requirement of EOP-004-1 R2 because it does not include implementation of corrective actions after the analysis. We disagree with this assessment as there is an implied obligation to implement any recommendations from analysis done to comply with EOP-004-1 R2. NERC investigative and enforcement personnel have routinely expected implementation of corrective actions from investigations. Thus, for consistency (as required by FERC Guideline 3), the VRF for PRC-004-3 R1 should be Medium. We disagree with inclusion of Operations Planning in the Time Horizon. This is a backwards looking analysis. While it does correct for forward looking operations, it is not intended for planning but to simply correct an operational issue. Otherwise, Operations Assessment should be eliminated as a category as the purpose of looking backwards is to correct operations going forward and another category would always be selected along with Operations Assessment. Any late completion of the CAP results in a High VSL. The drafting team should consider graduated steps based on the lateness of completion. Missing the CAP completion work timetable by a few days is not nearly as big a violation as missing the CAP work timetable by months. The second to last High VSL expands upon the requirement by mentioning delivery dates which would violate FERC Guideline 3 for VSLs. The requirements establish that a work timetable must be established. A timetable could be based on quarters rather than specific dates. If specific dates are desired, the requirement should be fine tuned to make this clear. Several of the VSLs mention a “declaration”. These VSLs should be expanded to match the language of the requirement more closely for clarity.
No
M1 is not consistent with the NERC Compliance Process Bulletin #2011-001 issued on May 20, 2011. In that bulletin, NERC states that an entity may be held in violation of the requirement if it cannot produce previous versions of a procedure. Six years seems quite excessive for data retention. Three years should be sufficient. Six years appears to have been selected to match the audit cycle of the applicable functional entities. NERC contemplates that the data retention period may not be as long as the audit period in the NERC Compliance Process Bulletin #2011-001 issued on May 20, 2011. Thus, it is not necessary for the date retention period to match the audit cycle.

No
The draft document defines several categories of Misoperation, of which the last is, "Unnecessary Trip - Other Than Fault - Any Protection System operation for non-Fault conditions such as power swings, under-voltage, over excitation, or loss of excitation for which the Protection System is not intended to operate." The NERC glossary presently states, "Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity." It appears that NERC is dropping the exception for maintenance and test-related relay trips. It would be best to retain the present definition, since such trips usually have little on no bearing on long-term operational reliability.
No
Requirement 1.2 states, "A requirement that the Registered Entity shall, within 90 calendar days of each identified Misoperation, investigate the Misoperation to determine its cause(s)." This should be clarified to be “within 90 calendar days of identifying a Misoperation.” Requirement 1.3 indicates within 120 days, the Registered Entity shall develop a CAP that includes “Final corrective or mitigating actions to reduce potential impacts to BES reliability.” This should be clarified to be “Final corrective or mitigating actions the Registered Entities plans to complete that reduce potential impacts to BES reliability.” It should be clear that not all “Final corrective or mitigating actions” need to be complete by the 120-day timeframe. Also, as suggested above, the language “within 120 calendar days” should be clarified to be “within 120 calendar days of identifying a Misoperation.”
Requirement 1.5 states that the procedure shall include, "A requirement that the Registered Entity complete each CAP or action plan as outlined in its timetable, and document its completion as implemented." Schedule changes may be needed as a result of unforeseen events. This should be clarified to be “A requirement that the Registered Entity complete each CAP or action plan as outlined in its timetable or document the basis for needed schedule changes. The procedure shall also include a requirement to document its completion as implemented.”

We support the use of a Rapid Development Team (RDT) to help speed up the process; however, we only support the RDT drafting the SAR and not the first draft standard. We do not believe an RDT without broad industry representation drafting a standard meets the intent of the Federal Power Act, Section 215 (c)(2)(A) for a "fair stakeholder representation". It is also out of alignment with the Rules of Procedure, Standard Process Manual. And, it is presumptuous to assume that the SAR will not have significant comments that will change the scope and direction of the standard, or that the Standard Development Team, once fully formed, will not scrap the work done by the RDT and start all over again wasting time and effort. As a result, we choose not to comment on the standard, implementation plan, etc., and we only offer comments on the SAR and white paper and highly encourage NERC to reconsider how it deploys RPDs.

A concerning statement in the SAR is the proposal to add a requirement to the standard to: "Review all Faults or Protection System operations on the BES to identify those that are BES Protection System Misoperations". We are uncomfortable with the word "review". We would imagine only those protection system operation that fell outside of a certain tolerance would need to be reviewed, e.g., more than one Element tripped, the trip took longer than X cycles, a trip happened without a fault, etc. Review implies something more than looking to see if a criteria was met for further review. So, does review mean to evaluate whether certain criteria was met, or to do a thorough review? We're concerned with the administrative burden of having to do more than a high level review for each and every protection system operation or fault. What sort of evidence would be required to prove that we looked at every Protection System operation and fault on the BES? This could create an unnecessary administrative burden on the industry. Also, in the white paper, the paper identifies incorrect settings as a misoperation (see Table 2 on Cause Codes). To us, incorrect setting is not a misoperation and to call it such creates double jeopardy. If an engineer calculates the incorrect setting for a relay, that should be a PRC-001 standard implication. If a relay tech puts the wrong setting in the relay and tests to that wrong setting, that should be a PRC-005 issue, and not a PRC-004 issue.

No
BPA believes that the new definition does not specify if an inadvertent relay operation due to maintenance or other human activity is a misoperation. This occurs fairly often, and to prevent a lot of confusion, the definition must specify whether or not this is a misoperation. In the previous definition, this was not a misoperation, and we would prefer that it also not be a misoperation in the new definition. Another comment is that the previous definition of a misoperation is included in the Background section of the draft standard. BPA feels that this is confusing to list this old definition within the standard because it appears that the standard is providing this definition as part of the standard. BPA suggests moving the entire Background section out of the standard.
No
BPA feels that R1.1 is ambiguous. In R1.1.1, what does it mean to document and review a BES fault? In R1.1.2, identify and document all misoperations associated to what? In R1.1.3, BPA believes the word "address" is ambiguous.
Yes
BPA believes the alloted time seems adequate.
No
BPA believes that under M1: Entities should not be required to provide documentation of the processes and procedures that they use to identify and address misoperations. M2 thru M7: BPA feels that the measures given are overly burdensome. Reading these measures would lead one to believe that NERC has an expert panel of protection engineers on standby, waiting to sift through the data provided for each misoperation, and give expert guidance to the industry. BPA feels that this is not accurate, as this NERC standard will only capture an overview of the number and types of

misoperations experienced in the industry. BPA feels that the documentation requested will require many hours of work, and feels that the only review of it will be from an auditor whose only purpose is to make sure that it was accumulated. BPA feels that the burden of providing these detailed investigative reports and corrective action plans will result in less productive time for the individuals who are the ones capable of solving the problems. BPA feels that only basic information, such as an elementary description of the misoperation, and a basic corrective action plan should be required. Lists of faults, investigative reports, work management program records, etc. seem to be unnecessary. If the experts at NERC need more information on a particular misoperation, they can always request it.
Yes
If NERC really needs the information in the this table, then BPA will support it. However, the way that TADS event IDs are assigned, doesn't easily align with relay misoperations and may be cumbersome and BPA questions whether or not it is be necessary to provide the TADS event ID. BPA suggests that the quarterly reporting requirement given under Section 1.4, Additional Compliance Information is misplaced and suggests that it be given as "ONE" of the requirements. BPA feels that the quarterly reporting table should be all the information that is required, and suggests that measures M1 thru M7 should be removed.
No
BPA feels that in regards to the final paragraph of Section 5, Background, states that with regard to the WECC regional misoperation standard (PRC-004-WECC-1), complying with the more stringent standard will ensure compliance with the less stringent as well. BPA feels that this is not correct because the two standards have different requirements, and will require different actions to be in compliance with both. BPA believes that it would be helpful if WECC would rescind PRC-004-WECC-1. BPA asks, "Will the regional criterion, such as PRC-003-WECC-CRT-1 be rescinded?"
BPA believes that the requirements in this standard to create and provide procedures and detailed descriptions of the processes used to analyze relay misoperations are burdensome. In addition, BPA feels that the requirement to provide your own processes and procedures results in extra steps that waste valuable time. Documenting these processes and procedures and then providing them in self-certifications and at audits results in appreciable work. This step also results in one more potential audit violation. This approach is the one that was used in PRC-005-1. There it resulted in inconsistent levels of relay maintenance between entities and inequitable penalties. That approach is being dropped in PRC-005-2, and BPA believes that it should not be used in this standard either. A more concise and acceptable standard would simply specify the minimum requirements for analyzing and documenting relay operations and not require the documentation of procedures and detailed descriptions of the processes used by individual entities.

Duke Energy
No
• On #2 “Failure to Trip – Other Than Fault”, need to add the word “abnormal” before the word “non-Fault” in order to exclude normal non-Fault situations such as where protective relays are used for control functions (i.e. reverse power relays on generators). • On #4 “Unnecessary Trip – During Fault”, need to replace the phrase “not within the zone it is designed to protect” with the phrase “for which the Protection System is not intended to operate”. The current wording would not require reporting of unnecessary trips for a fault within the zone the Protection System is designed to protect. For example, we use over-reaching protection for breaker failure protection. • On #5 “Unnecessary Trip – Other Than Fault”, It should be made clear where failed relays would be reported. For clarity, add the phrase “or any other normal system condition” after the phrase “loss of excitation”.
No
In the lead-in paragraph for R1, the word “all” should be replaced with “BES” for clarity. NOTE: R1.2, R1.3 and R1.4 are addressed in our response to question #3 below.
No
• R1.2 – replace the phrase “identified Misoperation” with the phrase “Protection System Operation”

to clarify that the clock starts with the Protection System Operation, not when you identify a Misoperation. Also replace the phrase “investigate the Misoperation” with the phrase “analyze any Misoperation”. • R1.2 first bullet – Reword as follows: “For each Misoperation where the cause(s) are identified, document the analysis and the cause(s) determined.” • R1.2 – Increase the time to 120 calendar days and note under the second bullet that where a transmission or generation outage is required to complete an analysis (i.e. nuclear switchyard), it’s permissible to document that as additional steps planned to identify the cause(s). • R1.2 second bullet - Change the word “investigation” to “analysis”. • R1.3 – Change 120 to 60 calendar days, and replace the phrase “of the Misoperation’ with the phrase “of completing the analysis in R1.2”. • R1.4 – Delete R1.4 because it is redundant to parts of R1.2 and R1.3 • R1.5 – Modify R1.5 so that a Registered Entity can revise its CAP or action plan as outlined in its timetable, in order to deal with changes in outage schedules, etc.
No
VSLs should be revised consistent with our comments on the requirements.
No
• M5 – delete this Measure associated with R1.4 consistent with our response to question #3 above. • M6 and M7 should be combined.
Yes
• TADS transmission data may not be accessible to generators, and generator data may not be reported in TADS. • Need to add a 100 kV option on the template (column J).
No
Yes
• We like having the “Guidelines and Technical Basis” as part of the standard. • For clarity, revise the third paragraph under Section 5 of the “Guidelines and Technical Basis” as follows: Failure to automatically reclose after a fault is not included as a Protection System Misoperation because reclosing equipment is not included under the definition of Protection Systems. Further, operations which are initiated by control systems (not by Protection Systems), such as those associated with generator and excitation controls, protection used during generator startup and shutdown (such as reverse power relaying), or turbine/boiler controls, Static VAR Compensators (SVCs), Flexible AC Transmission Systems (FACTS), High-Voltage DC (HVDC) transmission systems, circuit breaker mechanisms, or other facility control systems are also not Misoperations of a Protection System. • The requirements to have documented processes for identifying, analyzing and reporting Misoperations as well as CAP and action plan tracking may impact some entities. For such entities, the Implementation Plan may not allow sufficient time to both develop and implement additional processes.

Constellation Power Generation/Constellation Energy Nuclear Group
No
The definition language is not clear on failures due to human intervention. For example when TO testing in a switchyard causes a GO trip, is that a misoperation?
No
The documentation requirement under 1.1.1 is too broad and onerous. As an example, some generating units upon shut down may have lockout relays associated with opening the generator breaker. This technically is a protection system operation, but is working as designed. If that same generating unit were to cycle every day, then a report identifying the operation and classifying it as not a misoperation would need to be created every day. Therefore, requiring the documentation of all protection system operations is purely an administrative requirement. The burden of documentation does not encourage reliability and should be carefully considered as part of the standard.
No
The “no” response is due to confusion in the question. We suspect that the requirements intended for reference were R1.2, R1.3 and R1.4. The time allotments seem reasonable.

Yes
Nuclear GO/GOPs have an existing Corrective Action Program that is required by 10 CFR 50 Appendix B Criterion XVI (quoted below). This regulatory requirement and associated mandatory implementation of a Corrective Action Program by a Nuclear GO/GOP fully envelopes the intent of the draft revision to PRC-004. An additional "procedure" to identify and address all Protection System Misoperations with set timelines and attributes is not necessary. "XVI. Corrective Action Measures shall be established to assure that conditions adverse to quality, such as failures, malfunctions, deficiencies, deviations, defective material and equipment, and nonconformances are promptly identified and corrected. In the case of significant conditions adverse to quality, the measures shall assure that the cause of the condition is determined and corrective action taken to preclude repetition. The identification of the significant condition adverse to quality, the cause of the condition, and the corrective action taken shall be documented and reported to appropriate levels of management."

No
SUB's concern is that if entities are required to report non-events, and then fail to do so, they would be in violation of the standard, and incur a possible penalty based on a violation severity level/violation risk factor of not reporting a misoperation. SUB is concerned that applying "High" VSLs and VRFs for failure to report non-events seems less about promoting reliability and points more toward a mechanism to collect penalty funds.
Yes
1)Under "Applicability" in PRC-004-3, SUB recommends that the language lists Functional Entities (TO, GO, DP) who own the following Facilities (Protection Systems, SPS). The current version of the PRC-004-3 draft lists Functional Entities and Facilities as separate applicability. 2)SUB would ask for PRC-004-3 to clarify whether or not Functional Entities would be required to submit a quarterly report if they do not have any misoperations occur during the quarter. SUB's concern is that if entities are required to report non-events, and then fail to do so, they would be in violation of the standard, and incur a possible penalty based on a violation severity level/violation risk factor of not reporting a misoperation. SUB is concerned that applying "High" VSLs and VRFs for failure to report non-events seems less about promoting reliability and points more toward a mechanism to collect penalty funds.

Yes
Yes

BC Hydro requests clarification for the unintentional protection system operation due to maintenance or testing. Is this unintentional operation considered a misoperation?
Yes
Yes
BC Hydro requests clarification for underfrequency load shedding schemes (UVLS). Would they fall under this standard?

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of Comments

Protection System Misoperations – Project 2010-05.1

The Protection System Misoperation Identification and Correction Drafting Team thanks all commenters who submitted comments on the first draft of the standard for Protection System Misoperation Identification and Correction. The standard and associated documents were posted for a 30-day public comment period from June 10, 2011 through July 11, 2011. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 52 sets of comments, including comments from approximately 146 different people from approximately 106 companies, representing 10 of the 10 Industry Segments, as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page:

http://www.nerc.com/filez/standards/Project2010-05_Protection_System_Misoperations.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President of Standards and Training, Herb Schrayshuen, at 404-446-2560, or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary Consideration of all Comments Received:

The definition of Protection System Misoperation has been modified to reflect comments received. Statements were incorporated into the definition so that only the overall performance of the Protection System is considered when determining a Misoperation. The non-functioning of high-speed Protection Systems required by the performance requirements of the TPL standards has been explicitly incorporated. An additional category of "Slow Trip – Other Than Fault" has been added for consistency. Exclusion of Protection System operations because of on-site maintenance, testing, construction, or commissioning activities has been added due to stakeholder comments. An exclusion to the category "Unnecessary Trip – During Fault" was added related to the proper remote Protection System operation. Comments related to "Fast Trip" were not incorporated because this type of Misoperation is included in the category "Unnecessary Trip – During Fault." Comments related to exclusion of incorrect settings or other design flaws were not incorporated because these fit within one of the established causes of Protection System Misoperation developed by the IEEE Power System Relaying Committee, Working Group I3.

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_Standard_Processes_Manual_20110825.pdf.

Some commented on the applicability of the requirements to the Distribution Provider and Generator Owner and the applicability to non-BES Protection Systems, even though the Applicability section specified that the requirements only applied to Protection System(s) of Facilities that are a part of the BES. The standard is applicable to Distribution Providers and Generator Owners and Transmission Owners because these entities can own Protection Systems of Facilities that are a part of the BES.

Some commenters asked why UFLS Misoperations are included in this standard. The drafting team responded that UFLS Misoperations were included because they are not explicitly covered by any existing NERC standards. Sudden Pressure Relay Misoperations are not included because they are not currently part of the Protection System definition.

Many commented that Requirement R1 was too all-encompassing since it was the only requirement in the standard. For example, two very different items, documentation of a process and implementation of the process were in the same requirement. As such, many commenters were concerned that only one VRF existed for the entire standard and the “High” VRF was not indicative of most of the parts contained within Requirement R1. The new draft has separate requirements for the process documentation, the implementation of the process, and other steps in the Misoperation investigation, correction, and reporting. VRFs were established for each of the new requirements.

Numerous commenters were concerned about the 90-day time limit to complete the investigation; including, possibly, taking necessary outages. The SDT revised the standard by increasing the timelines and clarifying the steps involved to complete the investigation of a Misoperation. Allowances for long investigations under an action plan were added. Many commenters were confused about the starting point of the time intervals associated with the Misoperation investigation. The SDT revised the standard to clarify the starting point of the Misoperation investigation (new Requirement R2) is the occurrence of the Protection System operation. Other commenters were concerned about compliance with the timelines in the standard after a natural disaster or significant system event. The SDT revised the Guidelines and Technical Basis section of the standard to include the following statement regarding extenuating circumstances: “The Sanction Guidelines of the North American Electric Reliability Corporation, effective January 15, 2008, provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions.”

Some commented that reporting Misoperations should be included as a requirement instead of in the Compliance Section. The drafting team consulted with NERC staff and decided that the Compliance Section is the appropriate location for Misoperations reporting. Several commenters proposed to make the Misoperation reporting template the official evidence of compliance. Attachment 1 “Quarterly Misoperations Reporting Data” reflects only identified Misoperations. It does not provide documentation that all Protection System operations have been reviewed so as to identify those that are Misoperations. Several commenters had concerns with the reporting form requiring TADS event I.D.’s. The correlation between Protection System Misoperation and TADS events is needed to determine Metric ALR4-1, developed by NERC Operating and Planning Committees under NERC’s Rules of Procedure, Section 809. Several commenters pointed out inconsistencies between the new definition of Misoperation and the categories in Attachment 1. The language in Attachment 1was revised to match the language approved for use in the revised Standard PRC-004. Other inconsistencies will also be resolved. Once the method (website, database, spreadsheets, other forms, etc.) of reporting is established, questions on how to remove previously reported Misoperations that have been determined to not be Misoperations and how to report no additional Misoperations during a reporting quarter will be clarified. One commenter had a concern with quarterly reporting requirements versus, possibly, semi-annual reporting. While some regions require semi-annual reporting today, on October 22, 2010, NERC's ERO Executive Management group endorsed an ERO-RAPA recommendation to the regions to start the collection of data on a quarterly basis beginning in 2011. The 2009 SPCS assessment of PRC-003-1, PRC-004-1, and PRC-016-1 also endorsed quarterly reporting.

Several commenters expressed concern that the use of the word "written" does not allow for electronic data retention. The word "written" has been removed. The measures now provide examples of acceptable evidence that can be used to demonstrate compliance with the requirements.

Several commenters expressed concern that the data retention period should not exceed the audit cycle. The Evidence Retention section was redrafted to follow the NERC Rules of Procedure, Appendix 4C, CMEP Section 3.1.4.2, which requires that data or evidence to show compliance be retained for the period beginning the day after the prior audit ended and ending with the End Date for the Compliance Audit.

A few commenters questioned whether Protection System operations occurring during generator synchronization would be covered under PRC-004-3. In the Guidelines and Technical Basis section of the standard, the drafting team explained that these operations are excluded because the generating unit is not synchronized and is isolated from the BES.

Several comments were received on possible conflicts with other NERC standards, Section 215 of the Federal Power Act, and NRC regulations. A review of the issues cited was performed and no conflict is believed to exist.

In response to one comment, the drafting team modified the Background statement to better reflect the interaction between this standard and the WECC regional Misoperations reporting standard. Regional standards for Misoperations reporting can still go beyond what the new NERC PRC-004 will require.

Numerous commenters were concerned about the prescriptive nature of the Guidelines and Technical Basis section of the standard. The SDT clarified that the Guidelines and Technical Basis section of the standard is not mandatory and enforceable and is included to provide insight into the thought processes of the drafting team as they developed the requirements.

One commenter wanted to be exempt from this standard because they are a nuclear generator operator and fall under NRC rules. The NRC rules cannot be used as a substitute for PRC-004-3 since they do not apply to Protection Systems on the electrical side of nuclear plants. In Order 706-B, FERC stated that much of a nuclear plant does not fall under the rules of the NRC. The NRC rules are applicable to the portions of the nuclear plant related to handling of radiological fuel, security, and safety. NERC rules apply to the portion of the plant not under the rules of the NRC. BES electrical Protection Systems do not fall under the rules of the NRC.

A few commenters expressed concern that the time allowed to develop and implement the required additional processes was too short. The SDT agreed and changed the effective date (implementation time) to 12 months.

Index to Questions, Comments, and Responses

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

1. **The definition of 'Misoperation' has been revised. Do you agree with the proposed definition? If not, please provide specific suggestions for improvement.**

Summary Consideration:

The definition has been modified to reflect comments received.

- Statements were incorporated into the definition so that the overall performance of the Protection System is considered in determining a Misoperation.
- Non-functioning of High-speed Protection Systems required by the performance requirements of the TPL standards has been explicitly incorporated.
- An additional category of "Slow Trip – Other Than Fault" has been added for consistency.
- Exclusion of Protection System operation(s) because of on-site maintenance, testing, construction or commissioning activities has been added.

Organization	Yes or No	Question 1 Comment
Northeast Power Coordinating Council	No	1. The new definitions only addressed "Slow Trip". "Fast Trip" could cause misoperation as well. Suggest that the new definition should include "Fast Trip". 2. In the definition of Slow Trip, the word "planned" should be replaced with "designed". Not all faults have characteristics as planned, but fall within a Protection System's designed capability. 3. The "Unnecessary Trip-Other Than Fault" definition as written now would include trips during protection testing and commissioning. Suggest retaining phrase similar to one in current definition: "Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity." 4. It can be said that Protection System Operations for settings that have been miscalculated or applied incorrectly are not Misoperations because the hardware operated correctly. It has to be made clear that even though the hardware might operate correctly, for these situations it does not operate as desired. Terminology that

		has been used for these operations is “correct but undesired”. Suggested rewording for “Unnecessary Trip-Other Than Fault”: Any Protection System Operation for non-Fault conditions such as power swings, undervoltage, over excitation, or loss of excitation for which the Protection System is not intended to operate. This would also include any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity, or correct but undesired operations because of settings that have been miscalculated or incorrectly applied.
Response: Thank you for your comments. **1. A “Fast Trip” is not by itself a Misoperation except perhaps when considering the relative operating times of an out-of-zone Protection System to that of an in-zone Protection System. In fact, if the Fault is within the Protection System’s zone, a faster than expected operation may be beneficial in reducing the amount of damage or length of the disturbance. The type of Misoperation that you are referring to would most likely be better classified as an “Unnecessary Trip - during Fault.” This category covers situations where the out-of-zone backup protection operates faster than the (correctly operating) in-zone primary protection.** **2. The SDT modified the definition based on your comment. We replaced the word “planned” with “intended”. The use of the term “designed” is inappropriate in this case as it could be postulated that a poorly designed system should operate much slower than expected or perhaps not at all.** **3. The SDT has modified the definition based on your comment. Language has been added to the proposed definition that reads “and is unrelated to on-site maintenance, testing, construction or commissioning activities.”** **4. The SDT disagrees. Protection System operations because of settings that have been miscalculated or incorrectly applied cannot be misconstrued as a “correct” operation when looking at the overall performance of the Protection System. These types of operations are simply incorrect and readily fall into an Unnecessary trip category. It is important to realize that it is the overall Protection System performance being judged and not any individual piece of equipment such as a relay.**		
Public Service Enterprise Group Company	Yes	The definition is acceptable provided the clarifications in the “Guidelines and Technical Basis” section of the draft is part of the standard.
Response: Thank you for your comment. **The SDT has incorporated some of the information from the Guidelines and Technical Basis section into the definition. The Guidelines and Technical Basis section will remain part of the standard. This is part of the new Results-based template for Reliability Standards.**		

Hydro One	No	The fifth category "Unnecessary Trip-Other Than Fault" definition as written now would include trips during protection testing and commissioning. This adds extra work and documentation while adding little value since system operators are aware when such work is going on and thus are prepared for these unnecessary trips. Suggest retaining phrase similar to one in current definition, that is, "… unrelated to on-site maintenance and testing activity".
Response: Thank you for your comment. **The SDT has modified the definition based on your comment. Language has been added to the proposed definition that reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities."**		
Tri-State Generation and Transmission Ass'n - System Protection	No	1. There needs to be a continuation of the specific exclusion for operations that occur as a result of on-site maintenance or testing activity. It seems that the exclusion is intended to remain since there is no "Cause of Misoperation" associated with maintenance or testing. 2. We are not certain how the "Guidelines and Technical Basis" will accompany the new definition in the "NERC Glossary of Terms," but the last sentence in (1) of the Guidelines is not supported by the definition. We disagree that the failure of one high speed Protection System to operate when another does operate should not be classified as a Protection System Misoperation. There may be times when that philosophy is appropriate, but not usually. If the non-operating system can be shown to have simply not had time to operate, then that can be explained in the event report, but typically both high-speed Protection Systems should operate unless one is designed to have a delay. But if it has a delay it shouldn't be classified as high-speed.
Response: Thank you for your comment. **1. The SDT has modified the definition based on your comment. Language has been added to the proposed definition that reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities."** **2. The exclusion of this type of failure is based on the NERC SPCS recommendation to consider the composite Protection System of a given Element rather than the individual protective schemes, such as the primary and secondary protection, for an Element.**		
FirstEnergy	No	The last bullet of the current definition includes the phrase "unrelated to on-site maintenance and testing activity". We suggest this be retained in the proposed definition to alleviate any misunderstandings among the responsible entities.

Response: Thank you for your comment. **The SDT has modified the definition based on your comment. Language has been added to the proposed definition that reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities."**		
Pepco Holdings Inc Affiliates	No	1. The original definition excluded protective system operations related to on-site maintenance and testing activities. The new definition does not. A true measure of the performance of a protective system should not include protective system operations caused or initiated by human errors during on-site activities. These include such things as failure to pull appropriate test switches during testing, inadvertently keying a direct transfer trip channel, accidently shorting or bridging a terminal block during construction activities while landing secondary cables, etc. As such, we would propose amending Item 5 of the proposed Misoperation definition as follows: 5. Unnecessary Trip - Other Than Fault - Any Protective System Operation for non-fault conditions such as power swings, under-voltage, over excitation, or loss of excitation for which the Protective system is not intended to operate. Unintended Protective System Operations that occur during on-site maintenance, testing, construction, and/or commissioning activities are not considered Protective System Misoperations. (this qualification is consistent with the definition included with the proposed Misoperation reporting spreadsheet and with the intent of the original definition) 2. Also, the qualifying comments in the "Application Guidelines" section associated with the five Categories of Protective System Misoperations should be included, either in the standard itself, or as part of the Misoperation definition. Without these specific qualifications it is not possible to reach a uniform consensus on what constitutes a Misoperation and what does no
Response: Thank you for your comments. 1. **The SDT has modified the definition based on your comment. Language has been added to the proposed definition that reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities."** 2. **Some of the information in the Guidelines has been incorporated in the definition. The Guidelines and Technical Basis section will remain part of the standard. This is part of the new Results-based template for Reliability Standards.**		
Southern Company Generation	No	The proposed definition is excessively lengthy. Items 1, 2, and 3 should be combined into one statement: Any failure of a Protection System to operate for a fault or non-fault condition as it is designed to operate. Items 4 & 5 should be combined into one statement: Any Protection System operation for a fault or non-fault condition when it was not designed to operate. Alternatively, all five statements could be replaced with this one

		statement: A Misoperation is either the operation of a Protection System when it should not have operated or the failure of a Protection System to operate when it should have operated.
Response: Thank you for your comments. **The proposed Misoperation definition is based on the established categories of relay system Misoperation developed by the IEEE Power System Relaying Committee Working Group I3. This definition is also meant to line up with the Misoperation Categories in the reporting form developed by the ERO-RAPA group. A sixth category was added to help clarify what constituted a failure of a Protection System to operate during a non-fault condition since the term “abnormal condition” is ambiguous. By adding this category, the Failure to Trip categories now mirrors the previously established Unnecessary Trip categories. Although it is certainly possible to shorten the definition by concatenating the categories into one or two sentences, it does not actually help in clarifying or correlating the definition to the Misoperation categories.**		
Transmission Access Policy Study Group		
SPP Reliability Standards Development Team	No	1. Would like to add either in this section or in the application guidelines a reference to trips prior to synchronization would not be reported. They would be investigated and corrected but not reported. 2. We are concerned that the definition would lose clarity if the application guidelines are moved out of the standard. If this happens we would like to see some of the meat of the guidelines added to the definition.
Response: Thank you for your comments. **1. The SDT agrees that false trips prior to synchronization should not be reported because the unit is isolated from the rest of the BES. The Guidelines and Technical Basis section has been updated to address your comment. The paragraph reads: “A generator Protection System operation prior to closing the unit breaker(s) is not considered a Misoperation. These types of operations are excluded from review because the generating unit is not synchronized and isolated from the BES. Protection System operations which occur with the protected Element already out of service, that do not trip any in-service Elements cannot be Misoperations.”** **2. Some of the information in the Guidelines and Technical Basis will be incorporated in the definition. The Guidelines and Technical Basis section will remain part of the standard. This is part of the new Results-based template for Reliability Standards.**		
MRO's NERC Standards	Yes	

Review Forum		
Electric Market Policy	No	1. Problems with 3. Slow Trip Use of term “slower” in the definition (Page 3 of 16) and “delayed” in the Application Guidelines (Page 12 of 16) is vague. “Slower” seems to indicate an unintentional time period before tripping while “Delayed” implies an intentional time period before tripping. Slow trip definition introduces the term “planned” which adds confusion. 2. Reference to TPL standards implies the need for more and new System Studies. Must these studies be performed and documented prior to installation? What is requirement for keeping these studies current? 3. NERC Glossary definition of Misoperation makes reference to a failure to operate within a specified time for an abnormal condition. There is no mention of “Slow” trip for a non-fault condition in the proposed definition. 4. Only those terms that are in the NERC Glossary should be capitalized. 5. Suggest wording changes as follows: 1. Failure to trip - during Fault - Any failure of a Protection System to operate for a Fault within the zone it is intended to protect. 2. Failure to trip - other than Fault - Any failure of a Protection System to operate for a non-Fault condition such as power swings, under-voltage, over excitation, or loss of excitation for which the Protection System was intended to operate. 3. Slow trip - during Fault - Any Protection System operation that is slower than designed for a Fault within the zone it is intended to protect.4. Slow trip - other than Fault - Any Protection System operation that is slower than designed for a non-Fault condition such as power swings, under-voltage, over excitation, or loss of excitation for which it is intended to operate.5. Unnecessary trip - during Fault - Any Protection System operation for a Fault not within the zone it is intended to protect.6. Unnecessary trip - other than Fault - Any Protection System operation for non-Fault conditions such as power swings, under-voltage, over excitation, or loss of excitation for which the Protection System is not intended to operate including trips occurring when no disturbance is present. Excludes on-site maintenance and testing.

Response: Thank you for your comments.

1. **The reference to “delayed” clearing in the Application Guidelines refers to specific situations when high-speed clearing is not required to meet TPL standards. However, even if high-speed clearing is not required, the Protection Systems must coordinate between zones to prevent a Misoperation (e.g. an over trip). The SDT has modified the definition of Misoperation based on comments. The word “planned” has been replaced with “intended”. Information in the Guidelines on “Delayed Fault Clearing” has been incorporated in the definition.**

2. Yes, system studies need to be performed prior to installation of most BES equipment such as a generator to check adequate system performance. The current TPL standards address these studies and their frequency. **3. The SDT added the following language to the definition of Misoperation to address your comment: Slow Trip - Other Than Fault - A Protection System operation that is slower than intended for a non-Fault condition such as power swings, under-voltage, over excitation, or loss of excitation for which the Protection System was intended to operate.** **4. Thank you for your remark on capitalization. These words are part of a category header and are capitalized for emphasis.** **5. The SDT has modified the definition based on comments. Language has been added to the proposed definition that reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities."**		
Pacific Northwest Small Public Power Utility Comment Group	No	1. The emphasis on the Protection System disregards the effect the breaker might have, since the breaker is not part of the NERC definition of Protection System. The consequences of a slow or failed circuit breaker operation are similar to those of slow or failed protection system operation and should be treated the same. 2. The comment group is concerned regarding the definition of Slow Trip as a "Protection System operation that is slower than planned." How much slower than planned? How do we prove what may have been "planned" many years ago? And even if the settings, documentation, and trip times agree within some not yet defined tolerance; the "plan" itself may be too slow to provide an adequate coordination margin or to prevent instability when relay error, CT error, or subsequent system changes are considered. We propose eliminating the "plan" and looking at the result. We see that Slow Trip is more narrowly defined in the Guidelines and Technical Basis document, but believe this should be extended to the official NERC definition as well. 3. Failure to Trip - During Fault - Any failure of a Protection System or associated protective device to operate for a Fault within the zone it is designed to protect. 2. Failure to Trip - Other Than Fault - Any failure of a Protection System or associated protective device to operate for a non-Fault condition such as power swings, under-voltage, over excitation, or loss of excitation for which the it was intended to operate. 3. Slow Trip - Any Protection System or associated protective device operation that is slower than needed to prevent miscoordination or system instability for a Fault within the zone it is designed to protect.
Response: Thank you for your comments. **1. The definition of Misoperation is only for Protection Systems and the entirety of breakers is not included in the**		

definition of Protection Systems. This is not meant to minimize the importance of interrupting devices but to narrow the targeted area of review, analysis and corrective actions. **2. The SDT added the following language to the definition of Misoperation to address your comment: Slow Trip - During Fault - A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. (Delayed Fault Clearing associated with an installed high-speed protection scheme is a Misoperation if the high-speed performance is required to meet the performance requirements of the TPL standards or by coordination requirements with other Protection Systems.)** **3. The addition of the words "or associated protective device" to parts of the definition seems unnecessary as the performance of the Protection System is being judged and not that of the current interrupting devices, i.e. breakers, they operate.**		
LG&E and KU Energy	No	LG&E and KU Energy believe that further clarity is needed in the definition of Misoperation. Specifically: 1. Item #3 Slow Trip the Standard should specifically exclude those incidents involving slow "total clearing times" that are due to mechanical (or other) problems with the breaker, where all protection system components operated as expected. 2. Item #4 Unnecessary Trip - During Fault. The definition should include unnecessary trips due to improper coordination of relay operating times. (Example: Zone 2 or Zone 3 trip occurring for a fault within its desired reach (zone), but prior to the desired time delay).
Response: Thank you for your comments. **1. It is not necessary to specifically exclude mechanically slow breakers as breakers are not included in the definition of Protection Systems.** **2. The Unnecessary Trip – During Fault category is meant to cover improper coordination and other conditions. Please see the Guidelines and Technical Basis section of the draft standard for examples.**		
APM Members	No	1. It is not clear which definition of Protection System is intended to apply to the definition. Does the current FERC approved definition apply or does the definition approved by the NERC BOT on 11/19/2010 apply. The meaning of Misoperations will be different based on the two definitions. 2. The implementation plan does not make it clear when the new definition will take effect

		and when the old one will be retired.
Response: Thank you for your comments. 1. **The current FERC approved definition of Protection Systems is the one applicable to the Misoperation definition. The newer, more detailed definition was approved by FERC in February 2012, and will be effective April 1, 2013.** 2. **The new definition of Misoperations will take effect when the Reliability Standard PRC-004-3 is FERC approved.**		
PPL Generation	No	The draft document defines several categories of Misoperation, of which the last is, "Unnecessary Trip - Other Than Fault - Any Protection System operation for non-Fault conditions such as power swings, under-voltage, over excitation, or loss of excitation for which the Protection System is not intended to operate." The NERC glossary presently states, "Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity." It appears that NERC is dropping the exception for maintenance and test-related relay trips. It would be best to retain the present definition, since such trips usually have little or no bearing on long-term operational reliability.
Response: Thank you for your comment. **The SDT has modified the definition based on your comment. Language has been added to the proposed definition that reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities."**		
Florida Municipal Power Agency	No	We support the use of a Rapid Development Team (RDT) to help speed up the process; however, we only support the RDT drafting the SAR and not the first draft standard. We do not believe an RDT without broad industry representation drafting a standard meets the intent of the Federal Power Act, Section 215 (c)(2)(A) for a "fair stakeholder representation". It is also out of alignment with the Rules of Procedure, Standard Process Manual. And, it is presumptuous to assume that the SAR will not have significant comments that will change the scope and direction of the standard, or that the Standard Development Team, once fully formed, will not scrap the work done by the RDT and start all over again wasting time and effort. As a result, we choose not to comment on the standard, implementation plan, etc., and we only offer comments on the SAR and white paper and highly encourage NERC to reconsider how it deploys RPDs.
Response: Thank you for your comment.		
Bonneville Power Administration	No	1. BPA believes that the new definition does not specify if an inadvertent relay operation due to maintenance or other human activity is a Misoperation. This occurs fairly often,

		and to prevent a lot of confusion, the definition must specify whether or not this is a Misoperation. In the previous definition, this was not a Misoperation, and we would prefer that it also not be a Misoperation in the new definition. 2. Another comment is that the previous definition of a Misoperation is included in the Background section of the draft standard. BPA feels that this is confusing to list this old definition within the standard because it appears that the standard is providing this definition as part of the standard. BPA suggests moving the entire Background section out of the standard.
Response: Thank you for your comments. **1. The SDT has modified the definition based on your comment. Language has been added to the proposed definition that reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities."** **2. The SDT is following the current template for a Results-based Reliability Standard which includes a Background section. The SDT believes showing the old definition of Misoperations in the Background section is appropriate.**		
Western Area Power Administration	No	1. The previous "out" for outages which occur during on-site maintenance and testing is missing from the new definition. We would definitely like to see this added. 2. We do like the "Guidelines and Technical Basis" section at the back of the standard which provides some clarification. Hopefully this section gets retained and we agree with most of what is stated, in particular it gives us an "out" for comm-aided protection which is not required by Planning Studies. 3. Misop Category 4 - it is desirable in some cases to "overprotect" or intentionally miscoordinate based on exposure and risk. For example, we tend to allow our Zone 1 elements to cover 85% of our sub transmission lines even though it will miscoordinate with high side tapped transformer protection. This is done so that we will react quickly to the majority of faults which occur mainly on the line. The incidence of high side faults on the tapped transformers is low and we accept the risk of over tripping in those cases. Allowance should be made for entities to intentionally miscoordinate where risk and value make sense. 4. Misop Category 5 - this should actually be strengthened to mention a trip which occurs for non-Fault conditions where the relay or protection system fails. Is this not a Misoperation?
Response: Thank you for your comments. **1. The SDT has modified the definition based on your comment. Language has been added to the proposed definition that**		

reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities." 2. The Guidelines and Technical Basis section is a part of the new template for Results-based Reliability Standards. 3. In the example provided, the high side of a tapped transformer is most likely within the zone of protection of the line relaying. If so, the line relaying is planned to protect this area and so its operation would not be considered a Misoperation. The SDT will add an example that covers this situation in the Guidelines and Technical Basis section of the draft standard. 4. The SDT modified the definition of Misoperation based on your comment. The SDT removed the phrase "such as power swings, under-voltage, over excitation or loss of excitation" from the category. There is no need to specifically indicate that a Protection System failure could be the cause for this category as a Protection System failure could cause failure to trips, slow trips and unnecessary trips during Faults.		
Westar Energy	No	1. "Unnecessary Trip - Other than fault" is not clear if an impedance-based transmission line Protection System trip in response to an unstable (or stable) power swing is a Misoperation. 2. "Failure to trip" as described in the Application Guidelines should have the reference to "within the time normally expected" removed as this would be addressed in "Slow Trip".
Response: Thank you for your comments. 1. A line impedance relay (set as intended) that trips for a power swing that entered the relay's characteristic for its set times is not a Misoperation. If incorrectly set, then it would be a Misoperation. 2. The phrase "within the time normally expected" is proper as used in the Application Guidelines and is not meant to address the "Slow Trip" categories.		
Georgia Transmission Corporation	No	1. Failure to operate as designed: a) The protection system failed to operate for a fault within the designated zone of protection. b) The protection system failed to protect a designated BES component from a system abnormality as designed. Operating external to design parameters: a) The protection system operated with no fault condition present. b) The protection system interrupted power to a BES component with no system abnormality present. 2. Slow Trip (as defined) is difficult to measure without "smart relays" or fault recorders or sequence of event recorders in every BES station. A high impedance fault will naturally cause slow clearing times and may indicate an out of zone trip when compared to a bolted fault.

Response: Thank you for your comments. 1. **The SDT started with the established categories of relay system misoperation developed by the IEEE Power System Relaying Committee Working Group I3. The "failure to operate" and "operating external to design parameters" categories are already covered under the failure to trip and unnecessary trip categories.** 2. **The SDT is neither mandating monitoring tools nor specifying how to investigate BES operations. The standard is being updated to make sure BES operations are analyzed to determine if the Protection System operated as designed and the BES reliability is thus maintained.**		
PacifiCorp	No	The proposal for a revised definition of "Misoperation" in the NERC Glossary of Terms includes five conditions. This definition is insufficient in the absence of considering such conditions in conjunction with the additional illustrative information offered in the "Guidelines and Technical Basis" (the "Guidelines") appended to the draft of PRC-004-3 for industry review and comment. PacifiCorp believes that the proposed revised definition of "Misoperation" should either be: (1) expanded to include additional technical information such as that included in the Guidelines; or (2) revised to expressly provide that the Guidelines, as appended to the standard, are incorporated by reference in the definition. The definition of "Misoperation," if included in the NERC Glossary of Terms as presently proposed is not sufficiently robust for the purpose of registered entities properly identifying and addressing all Protection System Misoperations within their respective systems.
Response: Thank you for your comment. **The SDT has incorporated some of the information from the Guidelines and Technical Basis section into the definition.**		
NextEra Energy, Inc.	No	NextEra Energy suggests modifying "Unnecessary Trip - Other Than Fault" to: Any Protection System operation in the absence of a fault or for non-Fault conditions such as power swings, under-voltage, over excitation, or loss of excitation for which the Protection System is not intended to operate.
Response: Thank you for your comment. **The category of "Unnecessary Trip - Other Than Fault" has been modified to be more inclusive.**		
Southern Company	No	The definition is acceptable; however, the following recommendations are provided to clarify the Guidelines and Technical Basis for the definition. 1. Failure to Trip - During Fault: The reference to the time in which a Protection System is normally expected to operate introduces aspects of a slow trip into the discussion of failure

		to trip. To avoid confusion between failure to trip and slow trip, the second sentence should be revised as follows: "If a fault or abnormal condition is cleared by at least one Protection System element, then failure of another Protection System element associated with the protection scheme is not a Misoperation." 2. Slow Trip: The TPL standards require that the system is designed to meet performance requirements specified in TPL-001 through TPL-004, but does not require any specific remedy to assure that the requirements are met. Suggest referring to high-speed performance in the context of meeting the performance requirements in place of high-speed performance required by the TPL standards. The sentence should be revised as follows: "Delayed fault clearing caused by a failure of an installed high-speed protection scheme is not a Misoperation if the high speed performance is not required to meet the performance requirements of the TPL standards or by coordination requirements with other Protection Systems." 3. Unnecessary Trip - During Fault: Clarify that while operation of the backup system is not a Misoperation, that failure of the protection for the adjacent zone is a Misoperation. The Note should be revised as follows: "Operation of properly coordinated backup Protection System relays to clear the fault in an adjacent zone is not a Misoperation of that backup system if the protection for the adjacent zone fails to clear the fault within the specified time. However, the failure of the Protection System for the adjacent zone is a Misoperation." 4. Unnecessary Trip - Other Than Fault: The description for this part of the definition lacks clarity as to whether operation of an impedance-based transmission line Protection System in response to a power swing is a Misoperation. The description should be modified to provide clarity on this issue.

Response: Thank you for your comments.

1. Your proposed change to "Failure to Trip - During Fault" in the Guidelines while helping to separate this category from that of "Slow Trip" does not indicate that that the Fault was properly cleared by the combined Protection Systems of the Faulted Element. Your suggestion indicates that the Fault clearing absolves it from being a Misoperation even though it could have been associated with a "Slow Trip" type of Misoperation. The definition of Failure to Trip – During Fault has been enhanced to include reference to overall performance of a Protection System.

2. The definition of Slow Trip was updated to reflect your comments about performance.

3. Your proposed changes to "Unnecessary Trip - During Fault" have been incorporated in the definition.

4. The non-fault conditions listed in this category of the standard has been eliminated. Changes to the Guidelines and Technical Basis section regarding "Unnecessary Trip - Other Than Fault" have been made for clarity. Four examples are

provided in the Guidelines and Technical Basis section including one specifically on power swings.		
Flathead Electric Cooperative, Inc.	No	The definition should be specific to Transmission or BES Misoperations
Response: Thank you for your comment. **Glossary definitions have no assigned applicability. The standard's Applicability (Functional Entities and Facilities) section specifies the applicability to the BES.**		
Green Country Energy	Yes	
Hydro-Quebec TransEnergie	Yes	
Ingleside Cogeneration LP	No	Ingleside Cogeneration LP believes that that the NERC Glossary definition of Misoperation must coincide exactly with the one used by the ERO-Reliability Assessment and Performance Analysis (RAPA) Group. Although the differences are minor, the two processes need to seamlessly flow together so that data needs and reporting templates do not diverge.
Response: Thank you for your comment. **The work of the RAPA Group on Misoperation reporting was considered as input to the standard drafting effort. The SDT is revising PRC-004-2a; PRC-004-3 will further refine the definition and reporting requirements.**		
Oncor Electric Delivery	Yes	
Private Citizen	No	The definition of a Misoperation no longer includes an exclusion for maintenance activities. Is this intended? While I certainly agree that human errors can cause serious disturbances - for instance the Florida event in 2008 - these events also present lots of challenges to correct. There can be labor issues, disciplinary issues, and a general problem of what CAP to take when the field person says "I knew better. I just screwed up." So, I wanted to know if the drafting team had explicitly considered this topic and chose to include it as a Misoperation going forward.
Response: Thank you for your comment. **The SDT has modified the definition based on comments. Language has been added to the proposed definition that reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities."**		

Consolidated Edison Co. of NY, Inc.	No	1. The fifth category "Unnecessary Trip-Other Than Fault" definition as written now would include trips during protection testing and commissioning. This adds extra work and documentation while adding little value since system operators are aware when such work is going on and thus are prepared for these unnecessary trips. Suggest retaining phrase similar to one in current definition, that is, "... unrelated to on-site maintenance and testing activity". 2. The new definition only addressed "Slow Trip". Many times, "Fast Trip" could cause Misoperation as well. We suggest that the new definition should include "Fast Trip".
Response: Thank you for your comments. **1. The SDT has modified the definition based on comments. Language has been added to the proposed definition that reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities."** **2. A "Fast Trip" is not by itself a Misoperation except perhaps when you are considering the relative operating times of an out-of-zone Protection System to that of an in-zone Protection System. In fact, if the Fault is within the Protection System's zone, a faster than expected operation may be beneficial in reducing the amount of damage or length of the disturbance. The type of Misoperation that you are referring to would most likely be better classified as an "Unnecessary trip - during Fault." This category covers situations where the out-of-zone backup protection operates faster than the (correctly operating) in-zone primary protection.**		
Orange and Rockland Utilities, Inc.	No	The new definition only addressed "Slow Trip". Many times, "Fast Trip" could cause Misoperation as well. We suggest that the new definition should include "Fast Trip".
Response: Thank you for your comment. **A "Fast Trip" is not by itself a Misoperation except perhaps when you are considering the relative operating times of an out-of-zone Protection System to that of an in-zone Protection System. In fact, if the Fault is within the Protection System's zone, a faster than expected operation may be beneficial in reducing the amount of damage or length of the disturbance. The type of Misoperation that you are referring to would most likely be better classified as an "Unnecessary trip - during Fault." This category covers situations where the out-of-zone backup protection operates faster than the (correctly operating) in-zone primary protection.**		
PSE	Yes	
TransAlta	No	To add item 6. Unnecessary Trip - Other than Fault - any Protection System Operation for non-fault conditions such as current sensing device failure, voltage sensing device failure,

		DC/AC control circuit/device failure.
Response: Thank you for your comment. **The category "Unnecessary Trip - Other than Fault" already existed and has been modified to incorporate comments received.**		
Entergy Services	No	The definition of Misoperation as proposed in the definition section of the standard needs more detail. In particular, with regard to "Failure to Trip - During Fault", Protection System communication aided schemes which are not essential to meet NERC Planning Standards should be excluded from the definition of Misoperation. An entity that voluntarily exceeds NERC requirements by applying communication aided schemes with more rigor than is required by standards should not be exposed to additional compliance consequences as a result of exceeding those standards. The revised Misoperation definition should specifically include such exception in the actual standard definition and NERC Glossary. In particular, the definition of Misoperation should be changed as follows: Failure to Trip - During Fault - Any failure of a Protection System to operate for a Fault within the zone it is designed to protect. Protection System communication aided schemes which are not essential to meet NERC Planning Standards are excluded from this definition.
Response: Thank you for your comment. **This category of the definition has been modified based on comments received.**		
GenOn Energy	No	1. In the numerous locations used in the definition, replace "Any" with "A" 2. Definition should incorporate the following exclusions: A. Misoperations from human intervention during maintenance activities B. Failure of a relay control function or protective function not associated with protection of the BES or a BES element, i.e. a microprocessor relay serving multiple functions including, but not exclusively, BES Protection. C. Misoperations resulting from the effects of a disaster upon the Protection System components, i.e. a hurricane, tornado, fire, or flood destroys a substation control house.
Response: Thank you for your comments. **1. The SDT modified the definition as you suggested.** **2. A. The SDT has modified the definition based on comments. Language has been added to the proposed definition that**		

reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities." B. The SDT agrees with the comment and modified the language in the Applicability section and Guidelines and Technical Basis section to reflect it. Control functions within relays are not included in the review of Protection System operations for identifying Misoperations. C. The SDT believes you cannot include exclusions for natural disasters in the definition without distorting the intended purpose.		
Indiana Municipal Power Agency	No	1. IMPA has serious concerns that the proposed definition of "Misoperation", including the list of conditions in Draft #1 dated June 9, 2011 (page 12/16) is broad and far reaching and could potentially include equipment not currently defined as Protection System equipment. For example, (3) includes "Any Protection System operation that is slower than planned for a Fault within the zone it is designed to protect" could be interpreted to include high voltage circuit breakers - if a breaker operates (trips) slower than intended (for example in 20 cycles instead of the factory stated 5 cycles) then this could potentially be termed a "Misoperation". By default this would expand the scope of PRC-005 to include additional equipment not currently covered in PRC-005. 2. In addition the Misoperation Categories listed in the drop-down box for Misoperation Category on the Quarterly Misoperation Reporting Form are even less detailed and could be interpreted differently and broader than the proposed definitions themselves. 3. In addition there seems to be an extraordinary amount of effort in PRC-004-3 to lay blame for an operation (now termed "Misoperation") on operating/maintenance/engineering personnel leaving the reporting utility open for damages because of "errors". Utilities have and always will use good faith efforts and follow prudent utility practices when operating their utility. The goal of any utility is to minimize outages/customer interruptions - with PRC-004-3 we are now opening ourselves up to fines for lack of compliance and potential lawsuits should personnel "miss" a setting. Additional causes listed include in the definitions tab on the spreadsheet include, for instance, under Communications failures, Telco errors resulting in the mal-performance of communications over leased lines. Once a leased line leaves the utility's premises they have NO control over that circuit - it is the property of the Telco. If a TELCO technician lifts a bridge clip at a CO on a protection circuit then the utility could potentially be held responsible for a Misoperation. IMPA had no objections with the current definition of Misoperation and feels the proposed definition should stay consistent with current definition.
Response: Thank you for your comments.		

1. **Incorrect functioning of equipment not included in the Protection System definition (e.g. breakers) does not fit into the classification of a Misoperation.** 2. **The Misoperation Categories listed in the drop-down box for Misoperation Category on the Quarterly Misoperation Reporting Form are titles that are defined in the definition.** 3. **The purpose of the standard is not to blame individuals for Misoperations but to set up requirements to identify and correct the causes of Misoperations in order to improve the reliability of the BES. It would be negligent of the industry to ignore the human factor as a contributor. In the example of a telecommunication company (TELCO) error causing a Misoperation, the electric utility is responsible for identifying that the Misoperation was due to a TELCO problem, follow up with TELCO to ensure the problem is fixed, consider whether any other corrective actions need to be taken and implement the corrective actions if applicable.**		
Exelon	Yes	1. The definitions are fairly generic but there are additional qualifications in the Application Guidelines. See #3 Slow Trip definitions versus Application Guidelines # 3, this could lead to inconsistent applications. 2. ComEd: Suggest including language regarding human performance events. Is the intent of bullet #5, on page 3, to excluded human performance events as with the previous definition?
Response: Thank you for your comments. 1. **The SDT has incorporated some of the information from the Guidelines and Technical Basis section into the definition.** 2. **The SDT has modified the definition based on comments. Language has been added to the proposed definition that reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities."**		
Manitoba Hydro	No	Item 3 (Slow Trip) in the definition of 'Misoperation' should be clarified by replacing the word 'planned' with 'specified'.
Response: Thank you for your comment. **The SDT replaced the word "planned" with "intended" based on other comments.**		
Tacoma Power	Yes	Yes, the proposed definition is reasonable, provided that protection system operations resulting from maintenance, testing, or similar inadvertent activities are excluded, as is the case with the existing definition. Alternatively, the proposed definition is reasonable if under R1.3, "a declaration explaining why there is no need to develop a CAP" is

		acceptable.
Response: Thank you for your comment. **The SDT has modified the definition based on comments. Language has been added to the proposed definition that reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities."**		
Ameren	No	Please 1) show the present Misoperation definition so that entities can see how much SDT is proposing to change it. 2) The entire 3rd bullet item (excluding on-site maintenance caused) of the existing definition needs to be retained in your proposed definition items 2 and 5; 3) clarify in item 3 'Slow Trip' by adding 'slower than required to meet TPL requirements' as the SPCS intended; 4) explain in the Background section that "a Protection System" is an element's protection in its entirety (e.g. for a transmission line, it would typically consist of both the primary and secondary protection designed to protect the line) and provide such an example; and, 5) remove 'power swings' from items 2 and 5 'Other Than Fault' examples because it is pre-mature to include until after protective relay response during power swings is addressed in Phase 3 of Project 2010-13.
Response: Thank you for your comments. **1. The existing definition is listed in the Background section. The definition was extensively rewritten; so, a red-lined version would be confusing.** **2. The SDT has modified the definition based on comments. Language has been added to the proposed definition that reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities."** **3. The reference to "delayed" clearing in the Application Guidelines refers to specific situations when high-speed clearing is not required to meet TPL standards. However, even if high-speed clearing is not required, the Protection Systems must coordinate between zones to prevent a Misoperation (e.g. an over trip). The SDT has modified the definition of Misoperation based on comments. The word "planned" has been replaced with "intended". Information in the Guidelines on "Delayed Fault Clearing" has been incorporated in the definition.** **4. The definition of Misoperation has been modified and addresses your concern.** **5. The project referenced addresses loadability of relays during stable power swings. The SDT agrees that "power swings" does not need to be mentioned in category 5 (now category 6); however, it should remain in category 2. For example, if a power swing enters an impedance characteristic of a relay that is intended to trip for such a power swing,**		

its failure to operate would be a Misoperation.		
Utility Services, Inc.	No	Utility Services disagrees with the addition of incorrect settings to the definition of a Misoperation (Cause Code in Table 2 of the White Paper). Misoperations imply that there was an action or inaction based upon the equipment not performing. It is our view that incorrect settings are maintenance and testing function, not a Misoperation. Utility Services is NOT suggesting that we ignore incorrect settings of these devices. I believe that incorrect settings should be dealt with in the PRC-005 standard instead. As a part of regular maintenance and or testing, the settings should be validated and affirmed by the entity. A Misoperation is when a device fails to act or acts inappropriately. Finding out at the time of the Misoperation that the settings are incorrect are not the right time to determine this. The better standard of reliability for these devices is to do it before they misoperated. If the M&T routines are validating the settings on a regular basis, then the discovery/re-correction will actually benefit reliability because they will be corrected prior to any so-called Misoperation.
Response: Thank you for your comment. **An incorrect relay setting can be the cause of a Misoperation and should be corrected whenever found. Incorrect settings are not always found by the maintenance and testing function; for example, if a setting was incorrectly calculated, the error would most likely not be discovered by maintenance and testing.**		
American Electric Power	No	It would appear that the proposed definition is overly broad, when compared to the application guidelines specified on page 12. For example, going strictly by the criteria on page 3, one might unnecessarily report a Misoperation when it would not be considered such according to the guidelines. Employee action, during on-site maintenance and testing or commissioning activities, that directly initiates an unintentional operation should not be included in this category. However, for example, if an employee leaves trip test switches or cut-off switches in an inappropriate position following maintenance and testing or commissioning activities and a system fault or condition causes a Misoperation, this would be counted as a Misoperation.
Response: Thank you for your comment. **The SDT has modified the definition based on comments. Language has been added to the proposed definition that reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities."**		
American Transmission Company, LLC	No	The definition of Unnecessary Trip - During Fault should be changed to "Any Protection System operation that causes a circuit breaker/switcher to trip for a Fault not within the

		zone it is designed to protect." The definition for Unnecessary Trip - Other Than Fault should be changed to "Any Protection System operation that causes a circuit breaker/switcher to trip for non-Fault conditions such as power swings, under-voltage, over excitation, or loss of excitation for which the Protection System is not intended to operate."
Response: Thank you for your comment. **The proposed definition was meant to generalize the operation function. The SDT believes the Misoperation categories "Unnecessary Trip" implies that an interrupting device has operated.**		
CenterPoint Energy	No	The proposed revision to the definition of Misoperation includes conditions that are found in the Guidelines and Technical Basis in PRC-004-3, but not in the definition itself. CenterPoint Energy recommends that the conditions be included in the formal definition, instead of in a separate document. Should this recommendation not be accepted, as an alternative, the following statement should be added to each of the five items in the definition of Misoperation: "For specific conditions, refer to the Guidelines and Technical Basis in PRC-004-3 Reliability Standard."
Response: Thank you for your comment. **The SDT has incorporated some of the information from the Guidelines and Technical Basis section into the definition.**		
BGE	No	Item #5 Unnecessary Trip - Other than Fault The Misoperation definition included in the Misoperation reporting template includes the caveat "an operation that occurs during on-site maintenance, testing, construction and/or commissioning activities is not a reportable Misoperation. This should be carried through the definition as well.
Response: Thank you for your comment. **The SDT has modified the definition based on comments. Language has been added to the proposed definition that reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities."**		
Consumers Energy	No	This definition is much better than the current definition. However, the Unnecessary Trip - Other Than Fault should specifically exclude operations during on-site activities.
Response: Thank you for your comment. **The SDT has modified the definition based on comments. Language has been added to the proposed definition that reads**		

"and is unrelated to on-site maintenance, testing, construction or commissioning activities."		
ITC	Yes	
Wisconsin Electric	No	The 5th category, "Unnecessary Trip - Other Than Fault", should also include an exception for trips which occur during onsite testing or maintenance work on the associated protection system. This exception is in the existing definition, and we maintain it should remain in the new definition. This is needed to allow exceptions for trips which may occur during commissioning or when making modifications due to the complexity of modern protection and control schemes.
Response: Thank you for your comment. **The SDT has modified the definition based on your comment. Language has been added to the proposed definition that reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities."**		
Duke Energy	No	1. On #2 "Failure to Trip - Other Than Fault", need to add the word "abnormal" before the word "non-Fault" in order to exclude normal non-Fault situations such as where protective relays are used for control functions (i.e. reverse power relays on generators). 2. On #4 "Unnecessary Trip - During Fault", need to replace the phrase "not within the zone it is designed to protect" with the phrase "for which the Protection System is not intended to operate". The current wording would not require reporting of unnecessary trips for a fault within the zone the Protection System is designed to protect. For example, we use over-reaching protection for breaker failure protection. 3. On #5 "Unnecessary Trip - Other Than Fault", it should be made clear where failed relays would be reported. For clarity, add the phrase "or any other normal system condition" after the phrase "loss of excitation".
Response: Thank you for your comments. **1. The SDT disagrees with the comment as abnormal in this case is a subjective term. Verbiage has been added to the "Guidelines and Technical Basis" section to provide clarity on the issue and to exempt control function operations from being classified as a Misoperation (whether or not the control function is performed within a protective relay).** **2. The SDT has modified the definition, as you suggested.** **3. The SDT modified the definition of Misoperation. The SDT removed the phrase "such as power swings, under-voltage, over excitation or loss of excitation" from the category. There is no need to specifically indicate that a Protection**		

System failure could be the cause for this category as a Protection System failure could cause failure to trips, slow trips and unnecessary trips during Faults.		
Constellation Power Generation/Constellation Energy Nuclear Group	No	The definition language is not clear on failures due to human intervention. For example when TO testing in a switchyard causes a GO trip, is that a Misoperation?
Response: Thank you for your comment. **The SDT has modified the definition based on comments. Language has been added to the proposed definition that reads "and is unrelated to on-site maintenance, testing, construction or commissioning activities."**		
Springfield Utility Board		
BC Hydro	Yes	

- An exclusion to the category "Unnecessary Trip – During Fault" was added to the definition related to the proper remote Protection System operation.
- Comments related to "Fast Trip" were not incorporated because the SDT believes that this type of Misoperation is included in the category "Unnecessary Trip – During Fault".
- Comments related to exclusion of incorrect settings or other design flaws not being a Misoperation were not incorporated because these fit within one of the established causes of relay system Misoperation developed by the IEEE Power System Relaying Committee Working Group I3.
- Comments related to inclusion of the entirety of breakers within the reporting of Misoperations were not included because the mechanical portion of a breaker is not part of a Protection System.

2. **In Requirement R1.1, the team is requiring the identification of all Misoperations. Do you agree that Requirement R1.1 is sufficient to identify Misoperations? If not, please provide specific suggestions for improvement.**

Summary Consideration:

The principle comments covered:

- The ambiguity concerning the scope of Misoperations. The SDT modified the requirements and clarified that Misoperations were limited to those components of Protection System(s) owned by the entity.
- The entire scope of Protection System operations need to be reviewed to determine if a Misoperation has occurred. The SDT clarified that review of Protection System operations was not associated with control functions of relays. The SDT also clarified that the classification of Protection System operations as a Misoperation does not include the individual components of the Protection System, if the Protection System, as a whole, operated correctly.
- The applicability of the requirements to the Distribution Provider and Generator Owner and the applicability of Protection Systems, whether BES or non-BES. The SDT referenced the Applicability section which specified the entities to which the requirements applied, and that the requirements only applied to Protection System(s) of Facilities that are a part of the BES.
- Concerns about the Misoperations procedure and its implementation. The requirement to have and implement a procedure has been eliminated.
- The drafting team explored various avenues for Misoperation(s) reporting such as including it as a standard requirement or as a Section 1600 data request, but did not believe either was appropriate. NERC staff has encouraged drafting teams to remove administrative and reporting requirements from the body of standards. These types of requirements do not have direct impact on reliability. The SDT included periodic data submittals in Section C 1.3 “Compliance Monitoring and Assessment Processes” of the standard and included a description identifying what to submit and the periodicity for submittal to the Compliance Enforcement Authority in Section C 1.4 "Additional Compliance Information".

Organization	Yes or No	Question 2 Comment
Northeast Power Coordinating Council	Yes	This item refers to Part 1.1.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comment.		
Public Service Enterprise Group Company	Yes	
Hydro One	Yes	
Tri-State Generation and Transmission Ass'n - System Protection	No	The term “detailed” is too vague and should be eliminated. See comments to the “Measures.”
Response: Thank you for your comments. **The SDT agrees and has removed the word ”detailed” from the standard. See the SDT response to your comments regarding Measures in Question 5.**		
FirstEnergy	No	1. We do not believe that 1.1.1 (Document and review all BES Faults and BES Protection System operations.) should apply to GO as written, even though R1 indicates it would. We realize that the Glossary definition of BES includes generation resources, but as 1.1.1 is written, it implies that it's referring to the transmission system. 2. Regarding the phrase “within its system" at the end of R1, we ask that this be clarified by changing the phrase to “within its area of ownership or control”. 3. We ask that the requirements to “have” and “implement” a Misoperations procedure be separated. We suggest removing the word “implement” from R1 and creating a separate R2. 4. Furthermore, see our answer to Question 4 regarding VRF.
Response: Thank you for your comments. 1. **Part 1.1.1 has been deleted and Requirements revised to remove the ambiguity relating to applicability to Generator Owners. The text in the requirements now refers to the Misoperations of the entity’s Protection System(s).** 2. **The phrase “within its area of ownership or control” of the Protection System could introduce an inadvertent reliability gap such as when instrument transformer windings are shared. By modifying the text as requested the team is concerned that the owner of the instrument transformer will expect the owner of the relay fed by the instrument**		

Organization	Yes or No	Question 2 Comment
transformer to provide the appropriate documentation. The application of the standard is by default limited to the Protection System(s) owned by the entity. The text has been revised to refer to the Misoperations of the entity's Protection System(s). 3. The standard has been revised to state what an entity must do to find and resolve Misoperations. The requirement to have and implement a procedure has been eliminated. 4. See our response in Question 4.		
Pepco Holdings Inc Affiliates	No	Requirement R1 should be modified to read "Each Transmission Owner, Generation Owner, and Distribution Provider shall have and implement a procedure to identify and address all BES Protective System Misoperations within its system." The term BES was omitted from R1. We feel the term BES should appear in both R1, as well as R1.1.1, since this requirement is applicable only to protective systems associated with the BES.
Response: Thank you for your comment. The standard has been revised to eliminate the use of the term 'BES' in the requirements. BES is mentioned in the Applicability section of the Standard.		
Southern Company Generation	No	We believe that too many details are included in the existing Requirement R1. It is not necessary to be so specific on the documentation process. A high level requirement is much more appropriate. With so many details regarding the investigation compositional elements, valuable attention to resolving the operation/mis-operation is diverted to record keeping. Keep in mind that a large utility may have several relay operations per week, and requiring specific time tabling for each requirement with varying start dates for the magnitude of relay operations makes the proposed approach quite burdensome. It is not necessary to have a written relay operation investigation methodology in order to investigate all relay operation. Requiring a program document is not an essential component of reviewing operations and executing corrective action if they are needed. Please consider changing the existing lengthy requirement that, in our opinion, has far too many detailed requirements with the following three requirements which match the objectives of the current draft on page 5 of the PRC-004-3 draft standard dated 09 Jun 2011 (Draft #1). R1: Review all Protection System operations on the BES and identify those that are BES Protection System Misoperations. R2: Analyze BES Protection System Misoperations to determine the cause(s). R3: Where appropriate, implement Corrective Action Plans to address the cause(s) of the BES Protection System Misoperation. The

Organization	Yes or No	Question 2 Comment
		requirements do not need to be any more complicated that these. The accompanying measures to match these requirements can be: M1: Documentation proving that all (BES Protection System) operations were reviewed. M2: Documentation of analyses to determine cause(s) of the mis-operation. M3: Documentation of all Corrective Action Plans (problem resolution) resulting from misoperations. Revising the requirements to match the objectives listed provides an effective, simply stated standard for identifying and correcting Protection System Misoperations.
Response: Thank you for your comments. **The details in the requirements are needed to ensure they are measureable and enforceable. The requirements have been revised to ensure only the necessary detail is included.**		
Transmission Access Policy Study Group		
SPP Reliability Standards Development Team	No	1. Want to be clear that the wording in R1 and in section R1.1.2 refer to the BES and not all Misoperations. 1. 2. Would like to see BES included in R1 between address all BES protection system Misoperations. Also would like BES added to Section 1.1.2 for clarity. 2. 3. We would ask that this requirement be broken up to address identification, corrective action, and reporting. This would give you greater flexibility to create different VRF and VSLs for each piece that is being addressed. 3. 4. We feel that making an administrative action, such as completing a report, a high on the VRFs and VSLs isn't justified.
Response: Thank you for your comments. 1. The language in the requirements has been revised to refer to the Misoperations of the entity's Protection System. 2. The Applicability Section specifically states, "Protection Systems for Facilities that are part of the BES." 3. The standard has been revised to separate these items into different requirements. The SDT explored using either a standard		

Organization	Yes or No	Question 2 Comment
		requirement or a Section 1600 data request for Misoperation(s) reporting. At this time, the SDT feels the appropriate place in the standard for Misoperation(s) reporting is section 1.4 Additional Compliance Information. 4. The Violation Risk Factors have been revised.
MRO's NERC Standards Review Forum	No	1. This requirement is overly prescriptive and unnecessary. The requirements (and its parts) should not prescribe how entities should comply, but address the "what" is to be accomplished within this requirement. NERC Reliability Standards should specify simple actions such as: 1) that the applicable entities should have a procedure for identifying all BES protection system misoperation on BES protection systems installed for detecting faults on BES elements, 2) implement corrective actions for identified systemic causes of BES protection system Misoperations, 3) document those actions, and 4) report all BES Misoperations to their regional entity on a quarterly basis. This is a better way to meet the goal to require the identification of all BES protection systems installed for detecting faults on BES elements. Simply have a plan, implement the plan when warranted, document what the entity accomplished and report quarterly to the applicable Region. The misoperation report could also be used by NERC and the applicable Region for trending of Misoperations. 2. It is recommended that the SDT align this project with the NERC Functional model. 3. The reference to its system implies operations when it's more like the equipment it owns, please clarify. 4. R1 also uses the word "all" with Protection System Misoperations. Since the SDT has defined 5 different attributes of what a Misoperation is, this would require every function of a relay to have 5 areas that "identify and address" the associated Misoperation. If an entity's relay has 15 functions associated with it, they will need to identify up to 75 ways of identifying and addressing the Misoperation. Note that Protection System is clearly defined and has 5 components to it. So the 75 ways to identify and address the Misoperation will also need 4 more (not five since relays are used as the example). 5. Recommend that the SDT rewrite R1 to read: Each TO, GO, and DP shall have and implement when required, a procedure to identify and address the Misoperation of a BES Protection System within its metered boundaries. 6. Recommend that the SDT add a requirement 2 that fulfils the section 1.4 additional compliance information concerning quarterly reporting.

Organization	Yes or No	Question 2 Comment
		7. Requirement 1.1.1 should be for BES Protection System Misoperations not all operations. The use of the word "all" BES Protection System operations seems unreasonable and un-necessary. Exceptions need to be allowed e.g., acts of god, storms, etc. This requirement is overly burdensome for those individuals involved in restoration. (Certain relays lose information once they are reset.) The NSRF recommends that that this requirement be removed altogether unless further clarified.
Response: Thank you for your comments. 1. The SDT has modified the standard to reduce the detail of the documented process for all processes associated with Misoperations. 2. It is not clear from your comment what aspect of the standard fails to be aligned with the NERC Functional Model. 3. The language in the requirements has been modified to refer to the Misoperations of the entity's Protection System. 4. The definition has been revised to address your comment. The phrase, "Failure of a Protection System to operate as intended," was added. 5. The standard has been revised to separate the documented process and the implementation of the process. In reference to the "when required" action, specific time frames are necessary to ensure a measureable and enforceable requirement. The language in the requirements has been revised to refer to the Misoperations of the entity's Protection System. 6. The drafting team explored various avenues for Misoperation(s) reporting such as including it as a standard requirement or as a Section 1600 data request, but did not believe either was appropriate. NERC staff has encouraged drafting teams to remove administrative and reporting requirements from the body of standards. These types of requirements do not have direct impact on reliability. The SDT included periodic data submittals in Section C 1.3 "Compliance Monitoring and Assessment Processes" of the standard and included a description identifying what to submit and the periodicity for submittal to the Compliance Enforcement Authority in Section C 1.4 "Additional Compliance Information". 7. The SDT has modified the standard to require the Registered Entity to develop a process that ensures each operation of its Protection System(s) is reviewed for Misoperations. To determine all Misoperations, all Protection System operations must be reviewed with a systematic approach. The Guidelines and Technical Basis section of the standard includes the following statement regarding extenuating circumstances: "In the event of a natural disaster, note that the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard."		
Electric Market Policy	Yes	1. Dominion suggests R1 to read "Each Transmission Owner, Generator Owner, and Distribution Provider shall have and implement a procedure to identify and address all BES Protection System Misoperations within its system." While the purpose statement

Organization	Yes or No	Question 2 Comment
		indicates that is the intent of the standard, we believe the inclusion of BES in the first sentence of R1 will avoid questions as to whether this standard applies to ALL Protection System Misoperations (including those that are not designed to protect the BES). 2. Recommend changing (R.1.1.1) to state "Document and review all BES Faults and BES Element operations. (R1.) Lists in the requirement that entities must identify and address all Protection System Misoperations. To do this you must either have a Fault or Element to operate to initiate the process. 3. Having the Violation Risk Factor listed in the brackets under (R1.) only adds confusion to the Requirement. In (R1.), only list those specific items that are required according to the new standard and remove the reference to the Violation Risk Factor. The VRF and VSL information should be in a separate dedicated section and not in the requirement section.
Response: Thank you for your comments. **1. The language of the requirement has been revised. The Applicability section specifically limits facilities to the Protection Systems of BES facilities.** **2. The Misoperations of the Protection System may be the result of faults on a Facility other than a BES facility. The SDT has modified the standard to require the Registered Entity to ensure each operation of its Protection System(s) is reviewed for Misoperations.** **3. This is the standard NERC format for Reliability Standards. The VRFs and VSLs are also provided in a separate section of the Reliability Standard named 'Table of Compliance Elements'.**		
Pacific Northwest Small Public Power Utility Comment Group	No	1. Please see our answer to Q1. 2. Slow tripping events that went according to "plan" are not identified as Misoperations even though the result may not have been intended. 3. Slow or failed breaker operations are also not identified as Misoperations.
Response: Thank you for your comments. 1. **The definition of Misoperation is only for Protection Systems; the entirety of breakers is not included in the definition of Protection Systems. This is not meant to minimize the importance of interrupting devices, but to narrow the targeted area of review, analysis, and corrective actions.**		

Organization	Yes or No	Question 2 Comment
2. **The SDT added the following language to the definition of Misoperation to address your comment: "Slow Trip - During Fault - A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect." Delayed Fault clearing associated with an installed high-speed protection scheme is a Misoperation if the high-speed performance is required to meet the performance requirements of the TPL standards or by coordination requirements with other Protection Systems.** 3. **The entirety of a breaker is not considered a part of a Protection System. Please see the Guidelines and Technical Basis section.**		
LG&E and KU Energy	No	1. Much more than Misoperations is required in R1.1.1. A) The GO/DP would not have knowledge of BES faults outside the boundaries of GO or DP, and this requirement should only involve the TO; B) Reporting correctly operating equipment will not increase the reliability of the BES system. 2. Any operator-initiated action or normal/expected operation of relays should not require documentation when the goal of this standard appears to be about "Misoperations". Having to document/investigate correct operation will delay performing required actions to bring a unit on-line to support the BES system.
Response: Thank you for your comments. 1. **A) The SDT has modified R1 to require the Registered Entity to ensure each operation of its Protection System(s) is reviewed for Misoperations.** **B) While Entities are not required to report correct operations, it is understood that the Entities need to have evidence that each Protection System operation has been reviewed.** 2. **The requirement language has been revised. The Standard has been revised to require review of each Protection System operation. There is no requirement to document operator-initiated actions in this standard.**		
APM Members	No	1. While R1 is sufficient to identify Misoperations, there are several issues with the requirements. In R1, use of Protection System as a description with Misoperations is redundant. The proposed definition of Misoperations includes Protection System. 2. While we understand Part 4.2.1 of the Applicability section limits the applicability of the standard to Facilities that are part of the BES, we are concerned that the applicability section could be overlooked. Thus, we suggest the language ("Distribution Provider that owns a BES Protection System") from the previous version of the standard be

Organization	Yes or No	Question 2 Comment
		incorporated into the requirements. 3. The language of the "within its system" should be replaced with "on its equipment". The Generation Owner, Transmission Owner and Distribution Providers don't have systems in the traditional sense. They own parts of the System. "On its equipment" should be appended to the end of Part 1.1.1. Otherwise, the part could be inadvertently interpreted as applying to every BES Fault and BES Protection System regardless of equipment ownership. For example, TO A might have to evaluate a Fault on TO B's equipment. Clearly, this is not the intent. 4. The second bullet under Part 1.2 and the bullet under Part 1.4 are redundant. Both require the registered entity to identify additional steps for an investigation.
Response: Thank you for your comments. 1. **Since the term "Misoperations" is defined as applicable to a Protection System, which is also a defined term, the language has been revised to remove the term Protection System in front of Misoperations.** 2. **The Applicability Section is a formal part of the Reliability Standard. Adding the additional statement would create redundancy.** 3. **The text has been revised to refer to the Misoperations of the entity's Protection System.** 4. **The standard has been revised.**		
PPL Generation		
Florida Municipal Power Agency	No	see comments to Question 1
Bonneville Power Administration	No	1. BPA feels that R1.1 is ambiguous. 2. In R1.1.1, what does it mean to document and review a BES fault? 3. In R1.1.2, identify and document all Misoperations associated to what? 4. In R1.1.3, BPA believes the word "address" is ambiguous.
Response: Thank you for your comments.		

Organization	Yes or No	Question 2 Comment
1. The standard has been revised in an attempt to remove ambiguity. 2. The reference to BES Faults has been removed. 3. The standard has been revised. Misoperations are associated with an entity's Protection System operations. 4. The word "address" is no longer used.		
Western Area Power Administration	Yes	
Westar Energy	No	The requirement should be specific to BES Misoperations.
Response: Thank you for your comment. **The term Misoperations only applies to Protection Systems which are limited in the Applicability section of the standard to 'Protection Systems for Facilities that are a part of the BES'.**		
Georgia Transmission Corporation	No	R.1.1.2 is extraneous. If R1.1.1 is adhered to, all Misoperations will be identified and documented.
Response: Thank you for your comment. **The standard has been revised.**		
PacifiCorp	Yes	
NextEra Energy, Inc.	Yes	
Southern Company	Yes	
Flathead Electric Cooperative, Inc.	No	1.1.2 & 3 should be specific to BES Misoperations
Response: Thank you for your comment. **The term Misoperations only applies to Protection Systems which are limited in the Applicability section of the standard to**		

Organization	Yes or No	Question 2 Comment
'Protection Systems for Facilities that are a part of the BES'.		
Green Country Energy	No	1. My concerns surround sub requirement 1.1 and 1.1.1. First concern is 1.1 the word detailed is too subjective of a term to be audited in my opinion. I would suggest replacing it with "step by step". 2. Second concern is 1.1.1 "Document and review "all" BES Faults and BES Protection System operations."It does not address that protection system operations occur daily in a cycling combined cycle possibly other generation plants too. As an example the steam turbine is brought offline using the reverse power relay. That is a BES protection system operation. I would suggest language that allows documentation of expected "normal operations" and secondly exempting those expected operations from the "document and review" requirement.
Response: Thank you for your comments. **1. The standard has been revised. The word "detailed" is no longer used.** **2. If the reverse power relay is used exclusively for control then it is not considered part of the Protection System. If the reverse power relay doubles for protection and control, review of the relay operation would be necessary when an unexpected operation occurs.**		
Hydro-Quebec TransEnergie	Yes	
Ingleside Cogeneration LP	No	There needs to be a tight correlation with the Misoperation cause codes already introduced in the RAPA reporting template. Since those codes are already acceptable to NERC, it provides a technically sound starting point for a Misoperation investigation. If the RAPA team accumulates enough data to justify another cause code or provide further examples, than they can control it at one place. Ingleside Cogeneration believes that this is the only way that reporting needs can be managed properly. If guidance is not provided in PRC-004-3, then regional differences will continue to crop up - with unique data requirements and reporting templates.
Response: Thank you for your comments. **The SDT has been coordinating with the ERO-RAPA group. The drafting team explored various avenues for Misoperation(s) reporting such as including it as a standard requirement or as a Section 1600 data request, but did not believe either was**		

Organization	Yes or No	Question 2 Comment
appropriate. NERC staff has encouraged drafting teams to remove administrative and reporting requirements from the body of standards. These types of requirements do not have direct impact on reliability. The SDT included periodic data submittals in Section C 1.3 “Compliance Monitoring and Assessment Processes” of the standard and included a description identifying what to submit and the periodicity for submittal to the Compliance Enforcement Authority in Section C 1.4 "Additional Compliance Information".		
Oncor Electric Delivery	Yes	
Private Citizen	No	In R1.1.1, the drafting team calls for all BES faults and operations to be documented and reviewed. Why? Presumably, the drafting team is concerned that Misoperations can go undetected and that the opportunity to learn from - and avoid that SECOND Misoperation - would be lost. However, in the Guidelines and Technical Basis found on page 12 of 16, the drafting team proceeds to define certain protection system "failures" (my term) as not being a Misoperation. For instance, the failure of a redundant Protection System when another Protection System operates correctly or the failure of a communication scheme when TPL standards were not violated. Conceptually, this makes no sense. Either you are worried about undetected Misoperations or you are not. But you cannot have it both ways. Imho (in my honest opinion, so my grand kids tell me, you should write the investigation requirements like this. One must investigate to see if a Misoperation occurred when: a) the operation of any current interrupting device (i.e. breaker) by relay action for a fault not in its primary zone of protection, b) the operation of any circuit interrupting device by relay action when no fault occurred, c) when equipment damage due to a fault condition occurs but no Protection System operated. The wording can be improved, but I believe you can get the idea. If the drafting team believes it must have all operations analyzed, then it must remove the exemptions in the Guidelines and Technical Basis, as these are inconsistent with analyzing all operations for Misoperations.
Response: Thank you for your comment. **The standard has been revised; the reference to Faults has been removed. The SDT believes a review of all Protection System operations is necessary to determine Misoperations. The Guidelines and Technical Basis section of the standard has been modified to be more aligned with the definition of Misoperation. The revised definition is consistent with the NERC System Protection and Control Subcommittee proposed definition of Misoperation.**		
Consolidated Edison Co. of	Yes	By selecting “Yes”, we assume “R1” mentioned here is really “R1.1”.

Orange and Rockland Utilities, Inc.	Yes	By selecting “Yes”, we assume “R1” mentioned here is really “R1.1”.
Response: Thank you for your comment about the typographical errors on the comment form.		
PSE	Yes	
TransAlta	Yes	
Entergy Services	Yes	
GenOn Energy		
Indiana Municipal Power Agency	No	In its current proposed format R1 requires that ALL operations have to be reviewed and documented for determination of a possible “Misoperation”. Examples given as a “Misoperation” in the spreadsheet included a failed secondary potential breaker (see 1. above - PRC-004-3 greatly expands the equipment utilities must now test on a regular basis). IMPA feels that R1 goes above and beyond a good faith effort to identify a true protection system misoperation. In addition the process of documenting and reporting requirements are onerous and time consuming and could potentially become costly in terms of the dollars required to prove an operation was not a misoperation and in terms of the manpower required to oversee this effort. The BES is a dynamic system that undergoes changes continuously - for a utility to have the ability to foresee all of these real-time changes, anticipate the effect that these changes will have on their protection systems and eliminate all Misoperations is not possible with today’s technology.
Response: Thank you for your comment. **The details in the requirements are needed to ensure they are measureable and enforceable. To determine all Misoperations, each Protection System operation must be reviewed with a systematic approach.**		

Organization	Yes or No	Question 2 Comment
Exelon	No	PECO: Similar to what Reliability First Corporation has created; PECO suggests that the five categories of Misoperations should be expanded to provide examples of what would constitute a misoperation vs. a non-misoperation for each of the categories. Exelon Nuclear: SERC Regional Criteria procedure for "Analysis and Reporting of Transmission and Generation Protection System Misoperations," currently includes guidance on misoperation categories and classifications and provides comprehensive examples of misoperation classifications. Such guidance has proved invaluable when determining if an event met the definition for reporting to the Region in accordance with PRC-004. It is strongly suggested that the NERC SDT provide similar guidance to registered entities to ensure timely and consistent reporting. ComEd: A formatting comment; the Requirement number formatting does not align with the questions in the comment form. Assuming question 2 referring to R1 items 1.1 - 1.1.3, question 3 is referring to Requirements R1.2, R1.3 and R1.4. TS&C: The requirement should not be to “have a procedure” The reliability objective should be to record, investigate and if required, develop corrective actions for mis operations. Suggest the Requirement read: R1. The Applicable Entity shall record, investigate and implement corrective action planning for all faults and Misoperations. R1.1 Record all BES faults and Protections System operations. R1.2. Complete an investigation and implement immediate corrective actions within 30 days. R1.3. Report Misoperations each quarter using the reporting template. R1.4. Complete a corrective action plan for each identified Misoperation. Requirements 1.2, 1.3 and 1.4 should be removed and replaced by one requirement. See suggested R1 above. Corrective Action Planning, Performance Improvement, Root Cause Analysis and Investigations are all standard business practices with widely accepted protocols and methodologies. The details concerning the possible outcomes of a CAP should be removed The standard requirements should not try to anticipate the possible outcomes, “cause not identified” and subsequent actions, “interim actions, final actions, timetables etc.” Nor should the standard include a statement requiring an entity to state that there is “no need to develop a CAP” or that “no further investigation is required”.

Response: Thank you for your comments.

PECO: The drafting team revised the definition of Misoperation to include more categories of Misoperations. There are

Organization	Yes or No	Question 2 Comment
examples of each category in the Guidelines and Technical Basis section of the standard. **Exelon Nuclear: The drafting team revised the definition of Misoperation to include more categories of Misoperations. There are examples of each category in the Guidelines and Technical Basis section of the standard.** **ComEd: The original comment form did have errors in reference. The standard has been revised.** **TS&C: The standard has been revised. The requirement to have and implement a procedure has been eliminated.**		
Manitoba Hydro	No	1. R1 should be clarified by changing '… and address all Protection System Misoperations within its system' to '… and address all Protection System Misoperations within its BES'. While the standard only applies to Protection Systems for Facilities that are part of the BES as stated in the Applicability Section, R1.1.1 explicitly states 'BES Faults' and 'BES Protection System operations' making R1 read like it refers to all Protection Misoperations in the Registered Entities' entire system. 2. R1.1.1 and M2 are too prescriptive and should not specify the process that a Registered Entity must follow to determine when a Protection System Misoperation has occurred. 3. R1.1.1 and M2 should only require a process to identify a list of all Protection System Misoperations rather than a list of every single fault and BES protection system operations on the Registered Entity's system.
Response: Thank you for your comments. **1. The application of the standard is by default limited to the Protection System(s) owned by the entity. The text has been revised to refer to the Misoperations of the entity's Protection System(s). The Applicability Section specifically states "Protection Systems for Facilities that are part of the BES".** **2. The details in the requirements are needed to ensure they are measureable and enforceable.** **3. To determine all Misoperations, all Protection System operations must be reviewed with a systematic approach.**		
Tacoma Power	Yes	None
Ameren	No	We assume you mean R1 and R1.1 here. Please 1) review and incorporate the Project 2009-17 interpretations that have been correctly incorporated in PRC-004-1a; the SDT should recognize PRC-004-1a in the Background section to provide correct history and continuity.

Organization	Yes or No	Question 2 Comment
		2) reword R1 to state: "Each ... and address its Protection System Misoperations." This removes 'all' because though we strive to find all it is impractical to guarantee all were found. The TO, GO, DP is responsible for the Protection Systems they each own, thus use 'its' and remove 'within its system' for clarity of responsibility. 3) Reword R1.1.1 to replace 'all' with 'its' for the same reasons as 2) above. 4) Reword R1.1.3 to insert 'identified' before Misoperation.
Response: Thank you for your comment. **We recognize there were typographical errors on the comment form.** **1. The mandatory and approved standard PRC-004-2a will be incorporated into this standard and will be recognized in the Background section.** **2. The standard has been revised.** **3. The standard has been revised.** **4. The standard has been revised.**		
Utility Services, Inc.	No	Please refer to our response to Question 1.
Response: Thank you for your comment.		
American Electric Power	No	1. We are confused by the numbering of the requirements in this question versus the numbering within the proposed standard. In addition, rather than developing additional sub-requirements and sub-sub-requirements which make it difficult to track compliance, we suggest discrete requirements which stand on their own. 2. Requirement R1 is not sufficient, because there are additional considerations set forth in the Standard's "Guidelines and Technical Basis section" regarding the identification of Misoperations. Requirement R1 should include a clear reference to the guidelines to lessen the possibility of confusion by an Entity or auditor. 3. 1.1.3 appears redundant with 1.2, as operations must be investigated in order to identify whether or not a misoperation has occurred. In addition, more detail is needed as to the exact intention of the word "address".

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comments. 1. We recognize there were typographical errors on the comment form. 2. The definition of Misoperation has been modified to be more aligned with the Guidelines and Technical Basis section of the standard. The revised definition is consistent with the NERC System Protection and Control Subcommittee proposed definition of Misoperation. 3. The standard has been revised; the word "address" has been removed.		
American Transmission Company, LLC	Yes	
CenterPoint Energy		
BGE	Yes	No comment.
Consumers Energy	No	Suggest removing the term "all" in R1 and R1.1.1 as the Standard should focus only on Misoperations and not evaluation of all operations.
Response: Thank you for your comment. To determine all Misoperations, each Protection System operation must be reviewed with a systematic approach.		
ITC	No	1. Within 1.1.1 the wording "and BES Protection System operations" may be interpreted to include all components within a Protection System which could lead to a monumental task and is not necessary if no outage occurred. 2. 1.1.2 should be written to read simpler. Suggested changes: 1.1.1 Document and review all BES Faults or outages caused by BES Protection System operations.1.1.2 Identify and document all Misoperations.
Response: Thank you for your comments. 1. To determine all Misoperations, each Protection System operation must be reviewed with a systematic approach. The revised Requirements deal with Protection System operations and not operation of components.		

Organization	Yes or No	Question 2 Comment
2. The standard has been revised.		
Wisconsin Electric	Yes	
Duke Energy	No	In the lead-in paragraph for R1, the word “all” should be replaced with “BES” for clarity. NOTE: R1.2, R1.3 and R1.4 are addressed in our response to question #3 below.
Response: Thank you for your comment. **The Applicability Section specifically states “Protection Systems for Facilities that are part of the BES”.**		
Constellation Power Generation/Constellation Energy Nuclear Group	No	The documentation requirement under 1.1.1 is too broad and onerous. As an example, some generating units upon shut down may have lockout relays associated with opening the generator breaker. This technically is a protection system operation, but is working as designed. If that same generating unit were to cycle every day, then a report identifying the operation and classifying it as not a misoperation would need to be created every day. Therefore, requiring the documentation of all protection system operations is purely an administrative requirement. The burden of documentation does not encourage reliability and should be carefully considered as part of the standard.
Response: Thank you for your comment. **If the relay is used exclusively for control then it is not considered part of a Protection System. If the reverse power relay doubles for protection and control, review of the relay operation would be necessary when an unexpected operation occurs.**		
Springfield Utility Board		
BC Hydro	Yes	BC Hydro requests clarification for the unintentional protection system operation due to maintenance or testing. Is this unintentional operation considered a misoperation?
Response: Thank you for your comment. **Language has been added to the proposed definition that reads “and is unrelated to on-site maintenance, testing, construction or commissioning activities”.**		

3. **Requirements R1.2, R1.3, and R1.4 introduce time limits associated with identifying, investigating, and addressing Misoperations. Do you agree with the allotted times? If not, please provide specific reasons why not and alternative recommendations.**

Summary Consideration:

Numerous commenters were concerned about the 90-day time limit associated with Requirement 1, Part 1.2 and its expected output; e.g., having completed the investigation including taking necessary outages. The SDT revised the standard by increasing the timelines and clarifying the steps involved to complete the investigation of a Misoperation.

Many commenters were confused about the starting point of the time intervals associated with the Misoperation investigation. The SDT has established the date of the Protection System operation as the reference point.

Other commenters were concerned about compliance with the standard after a natural disaster or significant system event. The SDT revised the Guidelines and Technical Basis section of the standard to include the following statement regarding extenuating circumstances: "The Sanction Guidelines of the North American Electric Reliability Corporation, effective January 15, 2008, provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions…"

Organization	Yes or No	Question 3 Comment
Northeast Power Coordinating Council	No	(This item actually refers to Parts 1.2, 1.3, and 1.4.) The Part 1.2 time interval of 90 days may not be sufficient, in some cases, to complete investigation due to inability to obtain suitable power system outages where they might be necessary. A T.O. or G.O. should have the authority to determine that a delay in the investigation is less of a power system reliability threat than an inappropriate outage. Although provision for this is made in Part 1.4, the language in Part 1.2 should be changed so as not to prejudge the appropriateness of an owner's actions.
Response: The SDT thanks you for your comment. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation, which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation, and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either; the Corrective Action Plan when a**		

Organization	Yes or No	Question 3 Comment
cause was determined; or an action plan of additional steps if the investigation failed to determine a cause.		
Public Service Enterprise Group Company	Yes	Requirements R2, R3, and R4 do not exist. If R1-1.2, 1.3, and 1.4 are meant for comment, then the allotted times are agreeable with the following exception. 1. As 1.4 is written it sounds like even after investigating for 90 days and not being able to find a cause for the misoperation, an action plan is needed to continue looking for the cause. The intent of the action plan in 1.4 (as indicated in the second and third full paragraphs on page 15) is not to conclusively determine a cause, but to take actions that may further a future investigation should another misoperation occur. The wording of 1.4 should be revised to reflect the true intent. 2. We suggest changing 90 days in R1.2 to 180 days, and changing 120 days in R1.4 to 210 days (180 +30). In certain cases, root causes may not be able to be fully evaluated in 90 days because lines may need to be removed from service to do so, and clearances may not be granted within the 90-day window. By extending the time frame to 180 days, the time needed for removing lines from service for root cause determination will be sufficient in virtually all cases, thereby eliminating the burden for Corrective Action Plans and the associated requirements of such plans. 3. The first sentence of Section 1.4 should also be changed to read "Within 60 days following June 30 and December 31," and in Attachment 1 the title "Quarterly" should be changed to "Semi-Annual." 4. Other suggestions: Change the second bullet in R1.2 so that it directly refers to R1.4. 5. Also, make R1.2 language "past' tense to be consistent with R1.3 and R1.4.
Response: The SDT thanks you for your comments. 1. The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause. 2. Tri-State Generation and Transmission Ass'n - System Protection	Yes	The limits for those parts are acceptable (though, as we comment in 4. below, we believe the parts should be individual requirements).
Response: The SDT thanks you for your comment. The SDT revised the standard.		

Organization	Yes or No	Question 3 Comment
FirstEnergy	No	1. Various testing or investigating recommendations may require BES equipment be taken out of service to accomplish the appropriate testing and investigation involved with relay Misoperations. This testing may dictate what CAP is appropriate. The time limits stated do not provide any exceptions for equipment which cannot be taken out of service within the time limits identified for operational concerns or when these equipment outages are cancelled by operations based on system integrity concerns. There should be some exceptions for these instances.R1.2 prescribes 90 days to investigate the misoperation. 2. Compliance section 1.4 prescribes 60 days following the end of each calendar quarter to provide periodic data submittal. This timing will create a situation where the last month of the reporting time period will not yet be due for completion of the original investigation. We suggest the compliance section 1.4 agree with the 90 day investigation period so that all original investigations are completed at the time of the data submittal.
Response: The SDT thanks you for your comments. 1. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause.** 2. **The drafting team retained the current time frames for reporting.**		
Pepco Holdings Inc Affiliates	No	**1.** The 90 day window to conduct an investigation and identify the cause of a protective system misoperation is not practical in many situations and unreasonable. Outage windows for transmission facilities are highly dependent on weather and system loading conditions and as such are usually relegated to only a relatively few months during the Spring and Fall. Also, during these mild weather / low load times any outage request submitted to investigate a protective system misoperation is competing with numerous other construction related outage requests being evaluated by the Transmission Operator for TPL infrastructure upgrades in addition to other

Organization	Yes or No	Question 3 Comment
		facility maintenance outages. The Transmission Operator typically requires a minimum 30 day lead time for scheduling outages on BES facilities. Granting of these outages is the sole responsibility of the Transmission Operator, not the Transmission Owner. Canceling of the outage by the Transmission Operator may require the Transmission Owner to go through the 30 day re-submittal process. Denial of an outage request by the Transmission Operator could delay the misoperation investigation and force the Transmission Owner to be in non-compliance. An emergency outage could be declared to enable a misoperation investigation to take place, but depending on loading and system conditions, the facility forced outage could result in an increased reliability risk to the system, and/or the need to run expensive off cost generation. Declaration of an emergency outage should rarely be used, only for those instances of very high risk.In summary, it is not practical in many situations or reasonable to expect the Transmission Owner to be responsible to investigate the cause of a misoperation within 90 days when they have no control over the outage scheduling and approval process. As such, both the 90 and 120 day time frames should be removed entirely from the standard (i.e., structure the requirements similar to existing PRC-004-1 & PRC-004-2). Alternatively, but not recommended, would be to develop time frames only for those activities over which the Transmission Owner has full control. This second approach would of course require an extensive rewrite of Requirements R1.2, R1.3 and R1.4 and would in the end contribute little to improving the timeliness of investigations, since the majority of the time consumed in the investigation process is waiting for outages to be granted. For example, a requirement could be established that “within 45 days of the date of each identified misoperation launch an investigation into the cause and submit an outage request for any facility outages as necessary for diagnostic testing.” These tasks are within the Transmission Owners control. However, completion of the investigation cannot be bounded since the outage process is indeterminate and out of the control of the Transmission Owner. **2.** Similarly, since the development of the corrective action plan is dependent on completing the investigation (which is outage dependent), development of the CAP cannot be bounded either. Because of this it is recommended that all time frames be removed.
Response: The SDT thanks you for your comment.		

Organization	Yes or No	Question 3 Comment
1. The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause. The standard allows for extended investigation periods in Requirement R4. **2. The CAP is developed after the investigation is completed and the cause determined.**		
Southern Company Generation	No	There are no requirements R2, R3, and R4 in the 09 Jun 2011 Draft #1 posted in the "Standards Under Development" NERC web site. Responding to these actions as written in R1.2, R1,3, and R1.4 of the draft standard, we believe that specifying so many deadlines for individual tasks will make the identification, investigation, analysis process too cumbersome. The periodic reporting requirements to the regional entity requires continuing attention to these tasks and is sufficient to ensure their completion.
Response: The SDT thanks you for your comment. **The SDT revised the standard. Timelines are included in the standard to ensure entities have clearly identifiable targets in investigating and correcting a Misoperation. The SDT believes the timelines in the requirements enhance reliability and are measureable and enforceable. Periodic reporting requirements to the Regional Entities cannot sufficiently achieve the reliability objectives of the Standard.**		
Transmission Access Policy Study Group		
SPP Reliability Standards Development Team	No	We don’t agree with placing a timeframe on the investigation of a misoperation. There is an inconsistency with section 1.2 of the application guidelines and section 1.2 of R1. One states that its 90 days from the identification of the misoperation and the other states from the date that the misoperation occurred. If it’s the case that the 90 days start from the occurrence of the misoperation we are concerned that putting a timeframe on the analysis would cause detriment analysis especially during system wide event I.E hurricane. Could cause hundreds of operations and would need a longer analysis timeframe for these. Could add a process by which the entity could file for extension

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 3 Comment</th></tr>
<tr><td></td><td></td><td>during these extraordinary circumstances. Was the intent for the timeframes to start after the misoperation was identified or was the intent to start the clock after the operation occurs? In the question it should have read R1.2, 1.3, 1.4 rather than R2, R3, R4.</td></tr>
<tr><td colspan="3">Response: The SDT thanks you for your comment.

The SDT revised the standard based on your comment. The SDT revised the Guidelines and Technical Basis section of the standard to include the following statement regarding extenuating circumstances: “The Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions.”</td></tr>
<tr><td>MRO's NERC Standards Review Forum</td><td>No</td><td>We agree with the time tables/time lines if a bullet is added to allow the Regional Entity to grant the registered entity an extension beyond the 90 days within R1.2 and beyond the 120 days within R1.3 and R1.4.</td></tr>
<tr><td colspan="3">Response: The SDT thanks you for your comment.

The SDT revised the standard and believes the new timeframes in the standard are sufficient.</td></tr>
<tr><td>Electric Market Policy</td><td>No</td><td>Question states R2, R3, and R4. Assume the question is referring to (R1.2), (R1.3), and (R1.4)?

1. (R1.3) and (R1.4) does not give appropriate time to gather data, run studies and perform field investigations for complex events where a Misoperation can occur. Recommend changing the 120 day requirement to 180 days.

2. Remove Box with “Rationale for R1”. It is not needed in the standard.

3. In (R1.2), (R1.3), (R1.4) and (R1.5) the requirement wording starts with “A requirement...”, recommend removing “A requirement that” in each section. Suggest wording change as follows: R1.2 The responsible entity shall within 90 calendar days of each identified Misoperation, investigate each Misoperation to determine its cause and do one of the following: R1.3 The responsible entity shall within 180 calendar days of each Misoperation for which the cause was identified develop one of the following:R1.4 The responsible entity shall within 180 calendar days of each Misoperation for which the cause was not identified develop one of the following:</td></tr>
</table>

Organization	Yes or No	Question 3 Comment
Response: The SDT thanks you for your comments. 1. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause.** 2. **The Rationale boxes are part of the new Results Based Standard Template. As noted in the "Definition of Terms Used in the Standard", once PRC-004-3 has received ballot approval, the Rationale boxes will be moved to the Application Guidelines Section of the standard.** 3. **The standard has been revised.**		
Pacific Northwest Small Public Power Utility Comment Group	No	While we realize many entities may want or need the structure presented, we can see situations where the cause would be immediately evident and can and should be rectified at the time of the initial site visit. The problem and corrective action would then be documented afterward. While the second bullet of 1.3 suggests this might be allowed, it is not explicitly so stated. In the name of reliability, shortcuts such as this should be explicitly allowed in order to avoid repeated identical Misoperations caused mainly by the standard process itself.
Response: The SDT thanks you for your comment. **In your example, if the corrective action is immediately completed then a CAP would be documented and the completion date indicated.**		
LG&E and KU Energy	No	We assume the SDT is referring to R1.2, R1.3, and R1.4 as there are no other requirements shown as R2, R3, and R4. Therefore, we have the following comment on R1.3:On Requirement R1.3, could the SDT clarify a little bit better that only a timetable and plans are needed to be completed within the 120 days, and not that the entire correction be completed within 120 days. Currently, R1.3 could be interpreted either way. Therefore, so that an auditor would not interpret it that the corrective action plan needs to be completed within 120 days, this needs to be clarified. Because GO's oftentimes have to wait to complete a corrective action plan until the next outage on a

Organization	Yes or No	Question 3 Comment
		unit, which would probably be greater than 120 days.
Response: The SDT thanks you for your comment. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause. New Requirement R3 does not indicate the CAP must be completed, only developed. New Requirement R4 requires completion of a CAP according to the work timetable. The entity has the ability to establish and revise the timeline for completion of its CAP or action plan.**		
APM Members		
PPL Generation	No	1. Requirement 1.2 states, "A requirement that the Registered Entity shall, within 90 calendar days of each identified Misoperation, investigate the Misoperation to determine its cause(s)." This should be clarified to be “within 90 calendar days of identifying a Misoperation.” 2. Requirement 1.3 indicates within 120 days, the Registered Entity shall develop a CAP that includes “Final corrective or mitigating actions to reduce potential impacts to BES reliability.” This should be clarified to be “Final corrective or mitigating actions the Registered Entities plans to complete that reduce potential impacts to BES reliability.” It should be clear that not all “Final corrective or mitigating actions” need to be complete by the 120-day timeframe. Also, as suggested above, the language “within 120 calendar days” should be clarified to be “within 120 calendar days of identifying a Misoperation.”
Response: The SDT thanks you for your comments. 1. **The SDT revised the standard for clarity.** 2. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection**		

Organization	Yes or No	Question 3 Comment
System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause. New Requirement R2 does not indicate the CAP must be completed, only developed. New Requirement R4 requires completion of a CAP according to the work timetable. The entity has the ability to establish and revise the timeline for completion of its CAP or action plan.		
Florida Municipal Power Agency	No	see comments to Question 1
Response: The SDT thanks you for your comment. See our response to your comment in Question 10.		
Bonneville Power Administration	Yes	BPA believes the allotted time seems adequate.
Response: The SDT thanks you for your comment.		
Western Area Power Administration	Yes	
Westar Energy	No	1. Requirements R1.2, R1.3, and R1.4 introduce time limits. The requirements need additional clarification on the timeframes. Are the timeframes from when the operation occurs or from when the operation is determined to be a Misoperation? 2. Exemptions to the established timeframes should be available in cases of large scale events. 3. R1.2 - remove the requirement to document causes that were ruled out, overly burdensome and unnecessary. 4. R1.3 - Remove the reference or specifically define what constitutes a declaration. 5. R1.4 - remove or refine, overly burdensome and unnecessary. 6. R1.5 - remove, vague and unnecessary.

Organization	Yes or No	Question 3 Comment
Response: The SDT thanks you for your comments. 1. **The SDT revised the standard for clarity.** 2. **The SDT revised the Guidelines and Technical Basis section of the standard to include the following statement regarding extenuating circumstances: "The Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions."** 3. **The SDT revised the standard.** 4. **A declaration in regards to the requirements of this standard is a statement explaining why you did not need a CAP or why no further actions will be taken. The SDT is not specifying the format of a declaration.** 5. **The SDT revised the standard. Timelines are included in the standard to ensure entities have clearly identifiable targets in investigating and correcting a Misoperation. The SDT believes the timelines in the requirements enhance reliability and are measureable and enforceable.** 6. **The SDT revised the standard, but disagrees with your comment. Completion of the CAP or action plan is necessary to correct the causes of Misoperations.**		
Georgia Transmission Corporation	Yes	Agreed in principle, however the question should be R1.2, R1.3 and R1.4. Not R2, R3, R4.
Response: The SDT thanks you for your comment. **We recognize there were typographical errors on the comment form.**		
PacifiCorp	Yes	
NextEra Energy, Inc.	Yes	(Refers to Requirements R1.2, R1.3 & R1.4)
Response: The SDT thanks you for your comment. **We recognize there were typographical errors on the comment form.**		
Southern Company	No	The 90 day and 120 day periods are acceptable; however, the start of the 90 day and 120 day periods requires clarification that time is measured from the "date of occurrence of

Organization	Yes or No	Question 3 Comment
		each identified Misoperation."
Response: The SDT thanks you for your comment. **The SDT revised the standard for clarity.**		
Flathead Electric Cooperative, Inc.	Yes	
Green Country Energy	Yes	Just a comment for possible exceptions. When gathering data from manufacturers the 90day time frame can be aggressive. e.g. (GE) some language added to allow for information gathering time outside of the entities control would be helpful.
Response: The SDT thanks you for your comment. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause.**		
Hydro-Quebec TransEnergie	Yes	
Ingleside Cogeneration LP	Yes	Ingleside Cogeneration believes that 90 days is generally enough to assess a Misoperation - or to have evaluated and documented multiple possible causes if the source of the Misoperation cannot be determined. The 120 day corrective action plan time frame is acceptable to us as well.
Response: The SDT thanks you for your comment.		
Oncor Electric Delivery	Yes	
Private Citizen	No	See my comments on Question 9.

Organization	Yes or No	Question 3 Comment
Response: The SDT thanks you for your comment. **See our answer to your comments in Question 9.**		
Consolidated Edison Co. of NY, Inc.	No	(Assume this item actually refers to Requirements 1.2, 1.3, and 1.4.) Requirement 1.2 time interval of 90 days will not be sufficient, in some cases, to complete investigation due to inability to obtain suitable power system outages. A T.O. or G.O. should have the authority to determine that a delay in the investigation is less of a power system reliability threat than an inappropriate outage. Although Provision for this is made in Requirement 1.4, the language in 1.2 should be changed so as not to prejudge the appropriateness of an owner's actions.
Response: The SDT thanks you for your comment. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause.**		
Orange and Rockland Utilities, Inc.	Yes	By selecting "Yes", we assume "R2, R3, and R4" mentioned here are actually "R1.2, R1.3, and R1.4" due to there are no R2, R3, and R4 in this new version (3).
Response: The SDT thanks you for your comment. **We recognize there were typographical errors on the comment form.**		
PSE	Yes	
TransAlta	No	There are no requirements R2, R3 and R4 on PRC-004-3
Response: The SDT thanks you for your comment. **We recognize there were typographical errors on the comment form.**		

Organization	Yes or No	Question 3 Comment
Entergy Services	No	For Misoperation corrective action plans which could require out of budget cycle funding, significant project coordination with other groups or entities, and/or require major outage considerations, 120 calendar days is too aggressive to meet a corrective action plan development requirement which includes “final corrective or mitigating actions.....”. We suggest the timing for R1.3 and R1.4 be 120 days following the completion of R1.2. Therefore, we suggest the wording for R1.3 and R1.4 be revised to:1.3 A requirement that for all Misoperations for which the cause(s) was (were) identified, the Registered Entity shall, within 120 calendar days following the completion of the investigation in R1.2, develop one of the following: 1.4 A requirement that for all Misoperations for which the cause(s) was (were) not identified, the Registered Entity shall, within 120 calendar days following the completion of the investigation in R1.2, develop one of the following:
Response: The SDT thanks you for your comment. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause.**		
GenOn Energy	No	The intent is understood: to promote timely investigations and responses. However, the allotted times assumes that scheduling outages for investigation, testing, or maintenance are easy to obtain in every instance. 90 days is insufficient time for seasonal periods lasting five or six months or more.
Response: The SDT thanks you for your comment. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause.**		

Organization	Yes or No	Question 3 Comment
Indiana Municipal Power Agency	No	The times as listed are aggressive, especially for smaller utilities that have facilities whose loss would have minimal impact on the BES. It may be more appropriate to break the time limits into different categories, such as operations (and Misoperations) that impact critical facilities versus those operations that impact facilities that are not critical to the BES. For instance the time limits listed should apply only to critical facilities. For non-critical facilities the times should be extended to 180 days from the date of a Misoperation to complete the investigation and 240 days to develop a plan or otherwise address the Misoperation.
Response: The SDT thanks you for your comment. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause. The SDT believes the time interval is sufficient to establish a suspected cause, or plan further steps for the investigation. This standard is applicable to BES facilities as listed in the Applicability section.**		
Exelon	Yes	PECO: **1.** Time limits are reasonable; however, the drafting team should consider requests for extensions based on extenuating circumstances, i.e. emergent work/storm related issues, etc., related to R1.2, R1.3, and R1.4. **2.** It is not clear what the deferral reference on page 15 of 16 of the Application Guidelines refers to. It appears to allude to a deferral process for CAPs but this is not specifically identified in R1.5 of the standard. ComEd: For R1.3, is there an intended limit on the work time table? Coordinating mitigating actions between customer premises or other entities can extend corrective plans significantly. Exelon Nuclear: Time limits are reasonable; however, the SDT should strongly consider a provision for those events where the root cause of a Misoperation may be dependent on an external investigation (e.g., a relay may have to be examined by the manufacturer in an attempt to determine a defect). The timeline associated with forensics performed by

Organization	Yes or No	Question 3 Comment
		an external company are outside the control of the registered entity.
Response: The SDT thanks you for your comments. **PECO** **1. The SDT revised the Guidelines and Technical Basis section of the standard to include the following statement regarding extenuating circumstances: "The Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions."** **2. The standard has been revised. New Requirement R4, Part 4.2: "Maintain detailed implementation records of each CAP or action plan including dated information surrounding any revision(s) and completion".** **ComEd** **The work timetable needs to reflect mitigating measures as a result of the Misoperation; depending on the scope of the corrective action it is impossible to generally impose such time limits on the work plan.** **Exelon Nuclear** **The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause.**		
Manitoba Hydro	Yes	
Tacoma Power	No	The Guidelines and Technical Basis section asserts that the 90 and 120 day timeframes "provide sufficient time for the responsible entity to get through a seasonal period that can restrict the ability to take the outages necessary to effectively identify the Misoperation root cause(s) or document the investigation for unsolved root causes." For some responsible entities, this period arguably could approach 6 months (180 days). Exacerbating this issue is the fact that the VSL increases rapidly after the 90 and 120 day timeframes are exceeded. While identification, analysis, and correction of protection system mis-operations is important to reliability of the BES, the responsible entity should be granted greater latitude to triage investigations based upon the perceived severity of

Organization	Yes or No	Question 3 Comment
		the nature of the mis-operation with respect to other operational constraints. Not all mis-operations are equal in potential impact. Investigating a mis-operation should not degrade system reliability in the name of compliance, and the 90 and 120 day timeframes may result in undue hurried response for some, less critical mis-operations.
Response: The SDT thanks you for your comment. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause. The SDT believes the timelines provide sufficient latitude for the entity to prioritize Misoperation response.**		
Ameren	No	**1.** We don't see R2, R3, and R4 in the posted document; We assume the SDT mean R1.2, 1.3 and 1.4. **2.** From our perspective, the SDT rationale for R1 is flawed. Using the posted TADS 2008 and 2009 reports, Failed Protection System Equipment is only responsible for 1.1% of the hours of AC Circuit Sustained Outages and ranks as the 9th Cause Code. Considering the large number of sustained outages, even larger number of momentary outages, and huge number of non-outage hours in which the Protection System correctly restrained, the Protection System is extremely reliable across a wide range of conditions and numerous challenges. We agree that Misoperations should be investigated and corrective actions taken if a reasonable cause is found, but the importance of this issue is being overstated. **3.** In R1.2, please replace '90 calendar days' with 'six calendar months' to allow sufficient investigation time in non-peaking periods because BES equipment outages are needed for a fair number of investigations. **4.** In R1., please restate as " A requirement that for each Misoperation for which the cause(s) was (were) identified, the Registered Entity shall, within 120 calendar days of the cause being identified per R1.2, develop one of the following ..." because the Corrective Action Plan cannot be developed until after the cause is identified. **5.** R1.4 also needs to be 120 days subsequent to initial field investigation of R1.2, similar

Organization	Yes or No	Question 3 Comment
		to R1.3, and replace 'all' with 'each'.
Response: The SDT thanks you for your comments. 1. **We recognize there were typographical errors on the comment form.** 2. **The majority of Protection System operations are correct. However PRC-004-3 is intended to address Protection System Misoperations on the BES. The SDT believes the timelines in the requirements enhance reliability and are measureable and enforceable. The activity of identifying and mitigating these Misoperations is essential to maintaining reliability of the BES.** 3. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause.** 4. **The SDT revised the standard.** 5. **The SDT revised the standard.**		
Utility Services, Inc.		
American Electric Power	No	**1.** There is no R2, R3, and R4 in the current draft of the standard. **2.** Also, the process needs to accommodate for the later identification of a misoperation after new information is obtained. Some investigations might take a month after an event occurs before that event could or would be declared a misoperation.
Response: The SDT thanks you for your comments. 1. **We recognize there were typographical errors on the comment form.** 2. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause**		

Organization	Yes or No	Question 3 Comment
is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause.		
American Transmission Company, LLC	No	What about wide scale events such as the 2003 blackout? There does not appear to be an exception. ATC suggests that a provision be made to allow for declaration of an extension of the timelines identified in requirements R1.2, R1.3 and R1.4 in the case of a wide scale system event (NERC event categories 4 or 5).
Response: The SDT thanks you for your comment. The SDT revised the Guidelines and Technical Basis section of the standard to include the following statement regarding extenuating circumstances: "The Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions."		
CenterPoint Energy		
BGE	No	R1.2 through R1.4 require the registered entity to complete various phases of a misoperation investigation by specific times. In general the times are generous enough to comply with, but the fact is many investigations require transmission facility outages that must be approved by the Transmission Operator, and these may not be granted. To meet the timeline set forth in the Requirements the Registered Entity may have to declare an emergency outage and accrue the expense of running off cost generation. While this requirement is seemingly reasonable, it unreasonably holds compliance by the Registered Entity hostage to the entities who have no "skin in the game".
Response: The SDT thanks you for your comment. The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause.		

Organization	Yes or No	Question 3 Comment
Consumers Energy	No	The time limits should be from the date of identification of a Misoperation and not the date of the Misoperation. This will allow for the time required to gather information from the field to determine if a Misoperation has actually occurred.
Response: The SDT thanks you for your comment. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause.**		
ITC	No	Because of coordination to shutdown the associated equipment, the time to investigate may exceed the time limit of 90 calendar days following the misoperation.
Response: The SDT thanks you for your comment. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause.**		
Wisconsin Electric	Yes	1. The second bullet under R1.2 is unnecessary given R1.4. 2. Also, replace “timetable” with “schedule” in 1.3, 1.4, and 1.5. 3. The “…was (were) …” references in R1.3 and R1.4 should be replaced with the plural case alone for clarity. E.g, “…for all Misoperations for which the causes were identified.”
Response: The SDT thanks you for your comments. **1. The SDT revised the standard.** **2. The use of the word “timetable” is consistent with the NERC Glossary definition of a Corrective Action Plan (CAP).**		

Organization	Yes or No	Question 3 Comment
3. The SDT revised the standard.		
Duke Energy	No	1. R1.2 - replace the phrase “identified Misoperation” with the phrase “Protection System Operation” to clarify that the clock starts with the Protection System Operation, not when you identify a Misoperation. 2. Also replace the phrase “investigate the Misoperation” with the phrase “analyze any Misoperation”. 3. R1.2 first bullet - Reword as follows: “For each Misoperation where the cause(s) are identified, document the analysis and the cause(s) determined.” 4. R1.2 - Increase the time to 120 calendar days and note under the second bullet that where a transmission or generation outage is required to complete an analysis (i.e. nuclear switchyard), it’s permissible to document that as additional steps planned to identify the cause(s). 5. R1.2 second bullet - Change the word “investigation” to “analysis”. 6. R1.3 - Change 120 to 60 calendar days, and replace the phrase “of the Misoperation’ with the phrase “of completing the analysis in R1.2”. 7. R1.4 - Delete R1.4 because it is redundant to parts of R1.2 and R1.3 8. R1.5 - Modify R1.5 so that a Registered Entity can revise its CAP or action plan as outlined in its timetable, in order to deal with changes in outage schedules, etc.
Response: The SDT thanks you for your comments. 1. **The SDT revised the standard.** 2. **The SDT revised the standard.** 3. **The SDT revised the standard.** 4. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. Organization	Yes or No	Question 3 Comment
a cause. 5. The SDT revised the standard. The SDT believes the word "investigate" is a more comprehensive term that includes "analysis", and we believe is a more appropriate word for the requirement. 6. The SDT revised the standard. 7. The SDT revised the standard. 8. The SDT revised the standard.		
Constellation Power Generation/Constellation Energy Nuclear Group	No	The "no" response is due to confusion in the question. We suspect that the requirements intended for reference were R1.2, R1.3 and R1.4. The time allotments seem reasonable.
Response: The SDT thanks you for your comment. We recognize there were typographical errors on the comment form.		
Springfield Utility Board		
BC Hydro	Yes	

4. The team has included VRFs, VSLs, and Time Horizons with this posting. Do you agree with the assignments that have been made? If not, please provide specific suggestions for change.

Summary Consideration:

1. Many commenters suggested dividing Requirement R1 into several requirements so that the VRFs could be set at different levels, rather than 'High' for all of the Parts of the old Requirement R1. The drafting team agreed and separated Requirement R1 into four requirements with appropriate VRFs and VSLs.
2. Many commenters believed the VSL matrix was too complex. Separating the single requirement into four requirements resolved this issue.
3. Many commenters questioned the VSL assignments. The drafting team included new VSLs to reflect the new requirements.
4. The drafting team explored various avenues for Misoperation(s) reporting such as including it as a standard requirement or as a Section 1600 data request, but did not believe either was appropriate. NERC staff has encouraged drafting teams to remove administrative and reporting requirements from the body of standards. These types of requirements do not have direct impact on reliability. The SDT included periodic data submittals in Section C 1.3 "Compliance Monitoring and Assessment Processes" of the standard and included a description identifying what to submit and the periodicity for submittal to the Compliance Enforcement Authority in Section C 1.4 "Additional Compliance Information".
5. One commenter wanted the "Operations Planning" Time Horizon removed but the SDT believes the Time Horizons are appropriate for each of the new requirements.

Organization	Yes or No	Question 4 Comment
Northeast Power Coordinating Council	No	As noted in the comment above, a T.O. or G.O. may be held to be inappropriately non-Compliant due to delaying an investigation until a safer outage window may be available. Many factors affect power system reliability, and an entity should have leeway to determine which is most important.
Response: Thank you for your comment. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation,**		

Organization	Yes or No	Question 4 Comment
investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause.		
Public Service Enterprise Group Company	No	Setting the VRF as HIGH seems to indicate there is no time to waste in finding and correcting the cause of the misoperation, yet 90 days are allowed currently to investigate, and another 30 days are allowed to develop a Corrective Action Plan, for which there is no timeframe given for completing other than to document a timeframe and abide by it. Because of this long timeframe in the standard as currently drafted, a VRF of MEDIUM is appropriate.
Response: Thank you for your comment. The drafting team agrees with your comment in principle and the requirements have been separated to provide for more granularity. The VRFs and VSLs have been assigned accordingly.		
Hydro One	No	As noted in the comment above, a T.O. or G.O. may be held to be inappropriately non-Compliant due to delaying an investigation until a safer outage window may be available. Several factors affect power system reliability and an entity should have leeway to determine which is most important.
Response: Thank you for your comment. The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause.		
Tri-State Generation and Transmission Ass'n - System Protection	No	The Requirement R1 should be split into several requirements with individual VRFs and VSLs. For example, the Measure associated with Requirement R1, Part 1.1 is primarily administrative in nature and should not have a “High” VRF.
Response: Thank you for your comment.		

Organization	Yes or No	Question 4 Comment
The drafting team agrees in principal and the requirements have been separated to provide for more granularity. The VRFs and VSLs have been assigned accordingly.		
FirstEnergy	No	We do not agree with a HIGH VRF for the sole requirement in the proposed standard. We believe that not having a procedure for handling Misoperations is much less of a risk to reliability than the actual reporting of the Misoperations. We suggest that having a procedure requirement be assigned a LOW VRF, and the requirement to implement be assigned a "MEDIUM" VRF. Since this standard pertains to after-the-fact reporting, there is no immediate risk to the BES and none of the requirements therefore warrant a HIGH VRF.
Response: Thank you for your comment. **The drafting team agrees in principal and the requirements have been separated to provide for more granularity. The VRFs and VSLs have been assigned accordingly.**		
Pepco Holdings Inc Affiliates	No	Most of the VSL's are related to the time frames with which the misoperation investigation is completed, or the corrective action plan developed. Both of these are completely dependent on the availability of outages to perform diagnostic testing to determine the cause of the misoperation. As described extensively in Question #3 the Transmission Owner cannot be held responsible to complete these tasks within a specified time frame when they have no control over the outage scheduling and approval process. 1. Compliance should be judged on whether all BES events were reviewed, an investigation conducted and a corrective action plan developed and implemented. Not whether these activities were completed within some arbitrarily chosen time frame. 2. Compliance could also be judged on the timeliness and completeness of the quarterly data submittal mentioned in section C1.4 of the standard.
Response: Thank you for your comments. **1. The drafting team has assigned VSLs in accordance with FERCs June 19, 2008 Order on Violation Severity Levels, as well as NERCs VSL guidelines. The drafting team extended the timeframes in the standard based on industry comments. The drafting team believes it is important to meet the established timeframes and has set the VSLs appropriately.** **2. The SDT agrees with your comment.**		

Organization	Yes or No	Question 4 Comment
Southern Company Generation	Yes	The VRF needs to be high as is specified in the draft. The magnitude of the components that make up the VSL matrix in the proposed draft #1 is indicative of the excessively prescriptive composition. The requirements, measures, and violation severity levels need to be simplified as described in the comment to question 2 above.
Response: Thank you for your comments. **The drafting team has assigned VSLs in accordance with FERCs June 19, 2008 Order on Violation Severity Levels, as well as NERCs VSL guidelines.**		
Transmission Access Policy Study Group		
SPP Reliability Standards Development Team	No	See comment in question two.
Response: Thank you for your comment. **See our response in Question 2.**		
MRO's NERC Standards Review Forum	No	The VSLs are incorrect. 1. All documentation time frame references should be deleted. 2. If they are retained the VRF for R1 should be dropped to lower as the requirement is now administrative documentation. Documentation does not affect the electrical state or capability of the bulk electric system. The non documentation items under the severe VSLs can be modified to fit the moderate, high, and severe categories as follows: Moderate: The responsible entity did not identify all protection system Misoperations High: The responsible entity did not investigate all identified protection system Misoperations Severe: The responsible entity did not have a procedure to address protection system Misoperations OR the responsible entity did not implement a plan to correct any Misoperations.
Response: Thank you for your comments. **1. The drafting team has retained the timeframe references because they are used to ensure that all operations are**		

Organization	Yes or No	Question 4 Comment
examined and that all Misoperations are discovered and action plans are developed in a timely manner. 2. The drafting team agrees in principle and the requirements have been separated to provide for more granularity. The VRFs and VSLs have been assigned accordingly.		
Electric Market Policy	No	Adjust the VSL time horizons and Application Guidelines to reflect a change in (R1.3) and (R1.4) from 120 days to 180 days.
Response: Thank you for your comment. The VSLs and time horizons are based on the new requirements.		
Pacific Northwest Small Public Power Utility Comment Group		
LG&E and KU Energy		
APM Members	No	1. We disagree that the VRF is consistent with other Reliability Standards. The SDT cites the need to deviate from the Medium VRF assigned to the similar requirement of EOP-004-1 R2 because it does not include implementation of corrective actions after the analysis. We disagree with this assessment as there is an implied obligation to implement any recommendations from analysis done to comply with EOP-004-1 R2. NERC investigative and enforcement personnel have routinely expected implementation of corrective actions from investigations. Thus, for consistency (as required by FERC Guideline 3), the VRF for PRC-004-3 R1 should be Medium. 2. We disagree with inclusion of Operations Planning in the Time Horizon. This is a backwards looking analysis. While it does correct for forward looking operations, it is not intended for planning but to simply correct an operational issue. Otherwise, Operations Assessment should be eliminated as a category as the purpose of looking backwards is to correct operations going forward and another category would always be selected along with Operations Assessment. 3. Any late completion of the CAP results in a High VSL. The drafting team should consider graduated steps based on the lateness of completion. Missing the CAP completion work timetable by a few days is not nearly as big a violation as missing the CAP work timetable by

Organization	Yes or No	Question 4 Comment
		months. 4. The second to last High VSL expands upon the requirement by mentioning delivery dates which would violate FERC Guideline 3 for VSLs. The requirements establish that a work timetable must be established. A timetable could be based on quarters rather than specific dates. If specific dates are desired, the requirement should be fine tuned to make this clear. 5. Several of the VSLs mention a “declaration”. These VSLs should be expanded to match the language of the requirement more closely for clarity.
Response: Thank you for your comments. **1. The drafting team agrees in principal and the requirements have been separated to provide for more granularity. The VRFs and VSLs have been assigned accordingly.** **2. The standard has been revised and the Time Horizons have been established for the new individual requirements. Time Horizons correspond to the period of time it could take to mitigate a violation of the requirement.** **3. The drafting team modified the VSLs.** **4. The drafting team modified the VSLs.** **5. The separation of the requirements and the new VSLs clarify the usage of the term “declaration,” which is used in the requirements.**		
PPL Generation		
Florida Municipal Power Agency	No	See comments to Question 1.
Response: Thank you for your comment. **See our response to your comment in Question 1.**

Organization	Yes or No	Question 4 Comment
Administration		
Westar Energy	No	
Georgia Transmission Corporation	Yes	
PacifiCorp		No comments.
NextEra Energy, Inc.	No	NextEra Energy thinks there should be flexibility with Corrective Action Plans (CAPs) and action plans. CAPs and action plans will involve steps that are prepared at a time when all relevant information is not available. As such, there may be a need to modify the CAPs and action plans as additional information becomes available. (See proposed text for Requirement R1.3 and R1.4 in the response for question 9 below.)
Response: Thank you for your comments. **The drafting team made modifications in the new Requirement R4 to add the flexibility to update a CAP.**		
Southern Company		Not Applicable
Flathead Electric Cooperative, Inc.	No	
Green Country Energy		
Hydro-Quebec TransÃ ‰ nergie	Yes	
Ingleside Cogeneration LP	No	Ingleside Cogeneration LP does not believe that a Severe VSL is appropriate if a Protection System operation with an obvious cause is not captured in a summary listing (R1.1 and M2). We understand the need for a rigorous review process, but in many cases, a thorough evaluation is just not needed.

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comment. **The drafting team has revised the requirements but retained the requirement to review all operations in order to discover all Misoperations. New VRFs and VSLs have been assigned.**		
Oncor Electric Delivery	Yes	
Private Citizen		
Consolidated Edison Co. of NY, Inc.	No	As noted in the comment above, a T.O. or G.O. may be held to be inappropriately non-Compliant due to delaying an investigation until a safer outage window may be available. Several factors affect power system reliability and an entity should have leeway to determine which is most important.
Response: Thank you for your comment. **The SDT revised the standard. The time interval establishes a timeline for the investigation and subsequent documentation of the Misoperation which would include analyses of relay targets and Disturbance Monitoring Equipment records. The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the findings whether or not a cause is identified. The standard was further modified to allow a time period of 60 days to develop either the Corrective Action Plan when a cause was determined or an action plan of additional steps if the investigation failed to determine a cause.**		
Orange and Rockland Utilities, Inc.	Yes	
PSE	Yes	
TransAlta	Yes	
Entergy Services	No	A single high VRF is too broad to be applied for all elements and geographical areas of the electrical system. Also, lower and moderate VSL assignments should be included for the corrective action plan completion timeline requirements.
Response: Thank you for your comment.		

Organization	Yes or No	Question 4 Comment
The drafting team agrees in principal and the requirements have been separated to provide for more granularity. The VRFs and VSLs have been assigned accordingly.		
GenOn Energy	No	1. VRFs are worst-case one-size fits all. The risk applied to a 500kV transmission line is the same applied to a radial connected 75 MW generating unit on a 138kV system. 2. The risk applied to the implementation of a corrective action plan is the same applied to post correction record keeping.
Response: Thank you for your comments. **1. The drafting team is following all the guidelines for assigning VRFs. Risk applied to the criticality of individual Facilities is not a part of the VRF assignment.** **2. The drafting team agrees in principal and the requirements have been separated to provide for more granularity. The VRFs and VSLs have been assigned accordingly.**		
Indiana Municipal Power Agency	No	1. IMPA believes that all the sub-requirements should have their own individual VSL and VRF (similar to BAL-006-2). 2. When assigning VRFs and VSLs to the requirement and sub-requirements, the SDT needs to keep in mind the name of the standard is Analysis and Mitigation of Transmission and Generation Protection System Misoperations. The title is NOT Analysis and Mitigation of Transmission and Generation Protection System Operations. The way the draft is currently written if one operation is missed and it is not documented and reviewed then an entity has violated a requirement with a high Violation Risk Factor and a severe Violation Severity Limit even if no misoperation has occurred.
Response: Thank you for your comment. **1. The drafting team agrees in principal and the requirements have been separated to provide for more granularity. The VRFs and VSLs have been assigned accordingly.** **2. The drafting team has retained the requirement to document and review all operations in order to discover all Misoperations. The VRFs and VSLs have been modified.**		
Exelon	No	1. ComEd: For R1 VSL, not all potential actions can be identified based on ability to obtain outages associated with an investigation and many times an investigation start leads to

Organization	Yes or No	Question 4 Comment
		other paths. If an entity then creates generic all encompassing check list to meet the intent of R1, would they be held accountable to complete all the items listed when the cause was found at step 3 of 50 as an example. 2. Exelon Nuclear: Suggest rewording the VSL to state that "... either identified the cause or listed the preliminary actions planned to identify the cause ..." to address the concern that not all potential actions may be able to be identified within the required timeline.
Response: Thank you for your comments. **1. The requirement has been revised to identify and review all Protection System operations and designate each Protection System Misoperation. Once the cause of the Misoperation is identified, the entity should proceed to the development of the CAP. The VSLs are based on the new requirement.** **2. The drafting team has adjusted the VSLs to reflect the new requirement.**		
Manitoba Hydro	No	Manitoba Hydro suggests that the sub-requirements of R1 are split into separate requirements (e.g. R1, R2, R3, etc.) or each of the sub-requirements are assigned a separate VSL. The current VSL matrix is unclear.
Response: Thank you for your comment. **The drafting team agrees in principle and the requirements have been separated to provide for more granularity. The VRFs and VSLs have been assigned accordingly.**		
Tacoma Power	No	An automatic VSL of severe should not be assigned by failure to review one event. A VSL structure similar to draft 4 of PRC-005-2 is more reasonable. It seems reasonable that an entity should be penalized less severely if a lower percentage (1) of BES faults and BES Protection System operations have been documented and reviewed, (2) of Misoperations have been identified and documented, or (3) of Misoperations have been investigated and addressed. Part of the concern is that an entity may be heavily penalized for failing to identify a misoperation, based upon a later finding or a technicality, even if the entity has performed due diligence. Such a later finding may place an entity in a Severe VSL category, and a fear of such a scenario may cause an entity to devote an unreasonable amount of resources to develop or implement its procedure per this draft standard, particularly for arguably less severe Misoperations.

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comment. **The drafting team has retained the requirement to document and review all operations in order to discover all Misoperations. The VRFs and VSLs have been modified.**		
Ameren	No	1) R1 VRF should be Low because the risk to BES reliability from one BES Fault or one BES Protection System operation not being documented and reviewed this very minute. The SDT itself alleges that up until now there are not even required Regional Entity procedures to support PRC-004-2, which would lead to numerous omissions in such regions. Operating as such under the proposed PRC-004-3 would lead to numerous High VRF and Severe VSL violations. One would expect a very unreliable BES over the past 4 years; however, the BES has been extremely reliable in this time frame. 2) The VSL need to be completely restated to recognize that a higher volume and BES voltage level >200kV Misoperations deserve a higher severity level, but fixing the number of days an entity is late at 90 days. For example, if an entity is unaware of one Misoperation on the <200kV, they'll end up missing all the deadlines; this belongs in the Lower VSL category. But one omitted Misoperation on the >200kV belongs in Moderate VSL. We propose <200kV omission quantities of 1, 2 to 4, 5 to 10, and >10 Misoperations in the Low, Moderate, High, and Severe VSL respectively. We propose >200kV omission quantities of 1, 2 to 4, and >4 Misoperations in the Moderate, High, and Severe VSL respectively. Similarly missing R1 deadlines by >90 days for identified Misoperations of the same number (1, 2 to 4, etc.) and voltage level would fall into our proposed VSL categories.
Response: Thank you for your comments. **1. The drafting team agrees in principal and the requirements have been separated to provide for more granularity. The VRFs and VSLs have been assigned accordingly.** **2. The drafting team is following the guidelines for assigning VRFs. Risk applied to the criticality of individual Facilities is not a part of the VRF assignment. The VSLs are categorized based on the extent of non-compliance to a requirement.**		
Utility Services, Inc.		
American Electric Power	Yes	Though we agree overall with the VRFs, VSLs, and Time Horizons specified, the table seems more complex than necessary due to the number of "or" clauses involved. Should the sub-

Organization	Yes or No	Question 4 Comment
		requirements perhaps stand on their own as individual requirements?
Response: Thank you for your comment. The drafting team agrees in principal and the requirements have been separated to provide for more granularity. The VRFs and VSLs have been assigned accordingly.		
American Transmission Company, LLC		
CenterPoint Energy		
BGE	No	The VSLs are tied to the timetables set out in Requirements R1.2 through R1.4. As stated before, this unreasonably holds the registered entity hostage to the whims of a Transmission Operator or other entity who at best may have “no skin in the game” and at worst may have competing priorities.
Response: Thank you for your comment. The time frames have been adjusted to allow for potential problems with outages. The new VSLs are based on the new time frames in the requirements.		
Consumers Energy		
ITC	No	Answered No because of issues with meeting present time limit.
Response: Thank you for your comment. The time frames have been adjusted to allow for more investigation if needed. The new VSLs are based on the new time frames in the requirements.		
Wisconsin Electric		
Duke Energy	No	VSLs should be revised consistent with our comments on the requirements.
Response: Thank you for your comments.		

Organization	Yes or No	Question 4 Comment
The VSLs are based on the new time frames in the new requirements.		
Constellation Power Generation/Constellation Energy Nuclear Group		
Springfield Utility Board	No	SUB's concern is that if entities are required to report non-events, and then fail to do so, they would be in violation of the standard, and incur a possible penalty based on a violation severity level/violation risk factor of not reporting a misoperation. SUB is concerned that applying "High" VSLs and VRFs for failure to report non-events seems less about promoting reliability and points more toward a mechanism to collect penalty funds.
Response: Thank you for your comment. **The drafting team agrees in principle and the requirements have been separated to provide for more granularity. The VRFs and VSLs have been assigned accordingly.**		
BC Hydro		

5. **The team has included Measures and Data Retention with this posting. Do you agree with the assignments that have been made? If not, please provide specific suggestions for improvement.**

Summary Consideration:

Several commenters proposed to make the reporting template the official document for compliance. The SDT responded that Attachment 1 reflects only identified Misoperations. It does not provide documentation that all Protection System operations have been reviewed to identify those that are Misoperations.

Several commenters expressed concern that the use of the word "written" does not allow for electronic data retention. The SDT redrafted the standard and the word "written" has been removed. The measures provide examples of acceptable evidence that can be used to demonstrate compliance with the requirements.

Several commenters expressed concern that the data retention period should not exceed the audit cycle. The SDT redrafted the Evidence Retention section to follow the NERC Rules of Procedure, Appendix 4C, CMEP Section 3.1.4.2, which requires that data or evidence to show compliance be retained for the period beginning the day after the prior audit ended, and ending with the End Date for the Compliance Audit.

Organization	Yes or No	Question 5 Comment
Northeast Power Coordinating Council	No	1. Measure M2 requires additional documentation with no additional value. 2. Why would the "Quarterly Misoperations Reporting Data" table, in the format of the template provided with the standard, not be sufficient?

Response: Thank you for your comments.

1. **The SDT revised the standard. Measure M1 (old M2) now states acceptable examples of evidence for the Transmission Owner, Generation Owner, and Distribution Provider to satisfy compliance with the requirement. To identify all Misoperations, all Protection System operations must be identified and reviewed with a systematic approach. Every Protection System operation is either a correct operation or a Misoperation. The review of correct operations may lead to the discovery of Misoperations (failure to trip). This documentation is needed to ensure the compliance with the requirements.**
2. **The "Quarterly Misoperations Reporting Data" table reflects only identified Misoperations. It does not provide documentation that all Protection System operations have been reviewed to identify those that are Misoperations.**

Organization	Yes or No	Question 5 Comment
Public Service Enterprise Group Company	No	We recommend that R1.5, which is referenced in M6 and M7, be eliminated because the progress reporting of each CAP, including its completion, is sufficiently addressed in Section 1.4 (of the Compliance Monitoring Process section of the standard) which states "Each responsible entity will include the status of its Misoperation CAPS or action plans developed until these CAPs or action plans are reported complete." We note that Attachment 1, which defines the format of these periodic reports, allows an entity to enter CAP progress data beginning at the bottom of page 3 with corrective actions taken, and continuing on page 4 where CAP target and actual completion dates are reported. Evidence supporting those periodic reports could be requested as needed, and if necessary, the retention of evidence supporting the reports can be addressed in Section 1.2 of the Compliance Monitoring Process. With the elimination of R1.5, M6 and M7 can also be eliminated.
Response: Thank you for your comment. **The SDT revised the standard. Requirement R4 now necessitates the completion of CAPs or action plans. Measure M4 now provides examples of acceptable evidence to demonstrate implementation and completion of any CAP or action plan.**		
Hydro One	No	1. Measure M2 requires additional documentation with no additional value. 2. Why would the "Quarterly Misoperations Reporting Data" table, in the format of the template provided with the standard, not be sufficient?
Response: Thank you for your comments. **1. The SDT revised the standard. Measure M1 (old M2) now states acceptable examples of evidence for the Transmission Owner, Generation Owner, and Distribution Provider to satisfy compliance with the requirement. To identify all Misoperations, all Protection System operations must be identified and reviewed with a systematic approach. Every Protection System operation is either a correct operation or a Misoperation. The review of correct operations may lead to the discovery of Misoperations (failure to trip). This documentation is needed to ensure the compliance with the requirements.** **2. The "Quarterly Misoperations Reporting Data" table reflects only identified Misoperations. It does not provide documentation that all Protection System operations have been reviewed to identify those that are Misoperations.**		
Tri-State Generation and Transmission Ass'n - System	No	Measure M2 (and possibly others) is a Requirement. It does not improve reliability, but only provides for additional record keeping for compliance documentation.

Organization	Yes or No	Question 5 Comment
Protection		
Response: Thank you for your comment. **The SDT revised the standard. Measure M1 (old M2) now states acceptable examples of evidence for the Transmission Owner, Generation Owner, and Distribution Provider to satisfy compliance with the requirement. To identify all Misoperations, all Protection System operations must be identified and reviewed with a systematic approach. Every Protection System operation is either a correct operation or a Misoperation. The review of correct operations may lead to the discovery of Misoperations (failure to trip). This documentation is needed to ensure compliance with the requirements.**		
FirstEnergy	No	Measure M7 - Since M6 already requires evidence to show implementation of the CAP as required by R1 subpart 1.5, we do not see the need to have M7 and suggest it be removed.
Response: Thank you for your comment. **The SDT revised the standard. Requirement R4 now necessitates the completion of CAPs or action plans. Measure M4 now provides examples of acceptable evidence to demonstrate implementation and completion of any CAP or action plan. Measure M7 has been eliminated.**		
Pepco Holdings Inc Affiliates	No	The data retention provisions within the proposed standard seem reasonable. 1. However, there are concerns with several of the Measures.M2 - This measure should be re-written to state the entity shall “have evidence showing the dates of occurrence of all BES faults, associated protective system operations, and identified misoperations.” The standard should not specify the format that this data should be in. Some companies retain this data in their internal database format, or write detailed reports for each operation (both correct and incorrect). Specifying that a dated list be provided is unnecessary and non productive when other means of supplying the required evidence is available. 2. M4 & M5 - To avoid duplication of efforts and record keeping, the evidence required to satisfy these two measures should be included on the ERO spreadsheet. This way the review and feedback from the Compliance Monitor on the data supplied will be more timely than waiting for the next audit cycle, which may be years away. This would improve the overall objective of improving the thoroughness of the investigations and corrective action plans. Also, the ERO spreadsheet and this feedback from the Compliance Monitor could be used as evidence of compliance during a formal audit.

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comments. **1. The SDT revised the standard. Measure M1 (old M2) now states that the examples of acceptable evidence "includes but is not limited to…" so it allows for flexibility in satisfying compliance with the requirement. This documentation is needed to ensure compliance with the requirements.** **2. The SDT revised the standard and Measure M4 now includes providing evidence for both the implementation and completion of CAPs and action plans. The data in the spreadsheet may not be complete evidence of implementing or completing a CAP or action plan.**		
Southern Company Generation	No	1. As noted above in the comment with Question 2, the Measures along with the Requirements should be phrased to establish the objectives only and not in the details of one possible way to accomplished the objectives. 2. Regarding the data (evidence) retention, what is the basis for the six year retention requirement? The data retention period needs to be the time elapsed since the previous audit unless directed by a Compliance Enforcement Authority to retain specific evidence for longer periods as part of an investigation. The Additional Compliance Information section (1.4) contains a requirement for the TO/GO/DP to report to the RE. This should be in the main requirement section of the standard. Also, to eliminate PRC-003, a requirement is needed for the RE to gather the region's records and report to NERC.
Response: Thank you for your comments. **1. The SDT revised the standard. The measures provide examples of evidence that can be used to demonstrate compliance with the requirements.** **2. The SDT revised the Evidence Retention section to follow the NERC Rules of Procedure, Appendix 4C CMEP Section 3.1.4.2 and requires that data or evidence to show compliance be retained for the period beginning the day after the prior audit ended and ending with the End Date for the Compliance Audit.**		
Transmission Access Policy Study Group		
SPP Reliability Standards Development Team	No	1. We would like to see in section M2 BES faults added here as well to clarify that we are talking about BES rather than any fault.

Organization	Yes or No	Question 5 Comment
		2. Should data retention follow the audit cycle for each applicable entity? I.E. if your audit cycle was three years then it would be three years and if it was six years then it would be the six years mentioned.
Response: Thank you for your comments. **1. The SDT removed BES Faults from the requirements because review of all Protection System operations would include Faults. The term BES is not used in the individual requirements and measures because the standard's Applicability section 4.2.1 states "Protection Systems for Facilities that are part of the BES."** **2. The SDT revised the Evidence Retention section to follow the NERC Rules of Procedure, Appendix 4C CMEP Section 3.1.4.2 and requires that data or evidence to show compliance be retained for the period beginning the day after the prior audit ended and ending with the End Date for the Compliance Audit.**		
MRO's NERC Standards Review Forum	No	1. The measures are incorrect and must be changed to match the modified requirements. However, the measures are reasonable and could be translated into requirements R1 - R6 or R1 - R7 with corresponding measures. 2. The data retention is incorrect. The data retention should state that data should be retained back to the last audit period. If not, the drafting team should provide the reliability reasoning why an entity with an audit cycle faster than six years would need to retain data past its last audit cycle. In 1.2 Evidence Retention, the "and Measures M1, M2, M3, M4, M5, M6, and M7" reference should be deleted.
Response: Thank you for your comments. **1. The SDT revised the standard. Each new requirement now has an associated measure.** **2. The SDT revised the Evidence Retention section to follow the NERC Rules of Procedure, Appendix 4C CMEP Section 3.1.4.2 which requires that data or evidence to show compliance be retained for the period beginning the day after the prior audit ended and ending with the End Date for the Compliance Audit.**		
Electric Market Policy	No	Recommend removing Measures from (B.) and creating a separate section for Measures. (B.) should be changed to (B. Requirements) Also change to (C. Measures) (D. Compliance) (E. Regional Variances) (F. Interpretations) (G. Associated Documents) Suggest wording change as follows: C. MeasuresM1. The responsible entity shall have a current copy of its procedure for identifying and addressing Misoperations in accordance with Requirement R1.

Organization	Yes or No	Question 5 Comment
		M2. The responsible entity shall have documentation of Faults, BES Element operations, and identified Misoperations with their associated date of occurrence to demonstrate implementation of the processes related to Requirement R1, Part 1.1. M3. The responsible entity shall have documentation for each Misoperation investigation with their associated dates and either cause or where the cause of the Misoperation cannot be identified, any additional steps planned for identifying causes to demonstrate implementation of the processes related to Requirement R1, Part 1.2. M4. The responsible entity shall have documentation with associated dates of a CAP or an explanation of why there is no need to develop a CAP, for each Misoperation with an identified cause to demonstrate implementation of the processes related to Requirement R1, Part 1.3.M5. The responsible entity shall have documentation with associated dates that includes a work timetable for implementation or an explanation of why no further investigation or actions will be taken for each Misoperation without an identified cause to demonstrate implementation of the processes related to Requirement R1, Part 1.4. M6. The responsible entity shall have documentation with associated dates such as work management program records, work orders or other dated evidence, to demonstrate implementation of action plans related to Requirements R1, Part 1.5. M7. The responsible entity shall have documentation with associated dates that describes the manner in which the each CAP or action plan was completed to demonstrate compliance with the processes related to Requirements R1, Parts 1.5
Response: Thank you for your comments. **The SDT is following the NERC template for the new Results-based Standards where the requirements and associated measures are together rather than separated. The SDT has revised the draft standard.**		
Pacific Northwest Small Public Power Utility Comment Group	No	M6 and M7 appear to be duplicative. Please combine into a single measure, or more clearly state how they are different.
Response: Thank you for your comment. **The SDT revised the standard. Requirement R4 now necessitates the completion of CAPs or action plans. Measure M4 now provides examples of acceptable evidence to demonstrate implementation and completion of any CAP or action plan. Measure M7 has been eliminated.**		

Organization	Yes or No	Question 5 Comment
LG&E and KU Energy		
APM Members	No	M1 is not consistent with the NERC Compliance Process Bulletin #2011-001 issued on May 20, 2011. In that bulletin, NERC states that an entity may be held in violation of the requirement if it cannot produce previous versions of a procedure. Six years seems quite excessive for data retention. Three years should be sufficient. Six years appears to have been selected to match the audit cycle of the applicable functional entities. NERC contemplates that the data retention period may not be as long as the audit period in the NERC Compliance Process Bulletin #2011-001 issued on May 20, 2011. Thus, it is not necessary for the date retention period to match the audit cycle.
Response: Thank you for your comment. **The SDT revised the Evidence Retention section to follow the NERC Rules of Procedure, Appendix 4C CMEP Section 3.1.4.2 which requires that data or evidence to show compliance be retained for the period beginning the day after the prior audit ended and ending with the End Date for the Compliance Audit.**		
PPL Generation		
Florida Municipal Power Agency	No	see comments to Question 1
Bonneville Power Administration	No	1. BPA believes that under M1: Entities should not be required to provide documentation of the processes and procedures that they use to identify and address Misoperations. 2. M2 thru M7: BPA feels that the measures given are overly burdensome. Reading these measures would lead one to believe that NERC has an expert panel of protection engineers on standby, waiting to sift through the data provided for each misoperation, and give expert guidance to the industry. BPA feels that this is not accurate, as this NERC standard will only capture an overview of the number and types of Misoperations experienced in the industry. 3. BPA feels that the documentation requested will require many hours of work, and feels that the only review of it will be from an auditor whose only purpose is to make sure that it was accumulated. BPA feels that the burden of providing these detailed investigative reports and corrective action plans will result in less productive time for the individuals who

Organization	Yes or No	Question 5 Comment
		are the ones capable of solving the problems. BPA feels that only basic information, such as an elementary description of the misoperation, and a basic corrective action plan should be required. Lists of faults, investigative reports, work management program records, etc. seem to be unnecessary. If the experts at NERC need more information on a particular misoperation, they can always request it.
Response: Thank you for your comments. 1. **The SDT revised the standard. Measure M1 (old M2) now states acceptable examples of evidence for the Transmission Owner, Generation Owner, and Distribution Provider to satisfy compliance with the requirement. To identify all Misoperations, all Protection System operations must be identified and reviewed with a systematic approach. Every Protection System operation is either a correct operation or a Misoperation. The review of correct operations may lead to the discovery of Misoperations (failure to trip). This documentation is needed to ensure compliance with the requirements.** 2. **Measures support requirements by identifying what evidence or types of evidence could be used to show that an entity is compliant with the requirement. The SDT revised the standard and each requirement now has an associated measure. The purpose of the draft standard is to identify and correct the causes of Misoperations of Bulk Electric System (BES) Protection Systems.** 3. **The SDT believes the requirements are necessary to achieve the stated purpose of the standard.**		
Western Area Power Administration	No	1. M2 calls for a list of faults, protection system operations, etc. Would be good to be able to just point to our outage database instead of having to create a separate list. We are creating a separate spreadsheet at this point. 2. Six years for evidence retention seems kind of long. We would suggest 3 years or one audit period.
Response: Thank you for your comments. 1. **The SDT redrafted the standard. Measure M1 (old M2) now states that the examples of acceptable evidence "includes but is not limited to…" so it allows for flexibility in satisfying compliance with the requirement. This documentation is needed to ensure compliance with the requirements.** 2. **The SDT redrafted the Evidence Retention section to follow the NERC Rules of Procedure, Appendix 4C CMEP Section 3.1.4.2 which requires that data or evidence to show compliance be retained for the period beginning the day after the prior audit ended and ending with the End Date for the Compliance Audit.**		

Organization	Yes or No	Question 5 Comment
Westar Energy	No	Data retention should coincide with the audit cycle.
Response: Thank you for your comments. **The SDT revised the Evidence Retention section to follow the NERC Rules of Procedure, Appendix 4C CMEP Section 3.1.4.2 which requires that data or evidence to show compliance be retained for the period beginning the day after the prior audit ended and ending with the End Date for the Compliance Audit.**		
Georgia Transmission Corporation	No	PRC-018-1 R5 DME data retention for RRO events is 3 years. 3 years should be adequate considering data is now available in spreadsheet format.
Response: Thank you for your comments. **The SDT revised the Evidence Retention section to follow the NERC Rules of Procedure, Appendix 4C CMEP Section 3.1.4.2 which requires that data or evidence to show compliance be retained for the period beginning the day after the prior audit ended and ending with the End Date for the Compliance Audit.**		
PacifiCorp	Yes	
NextEra Energy, Inc.	Yes	
Southern Company		
Flathead Electric Cooperative, Inc.	Yes	
Green Country Energy	No	The term "written" keeps coming up and I feel it needs to be deleted since it has the connotation of a long hand "written" document and leaves no opportunity for an electronic format.
Response: Thank you for your comment. **The SDT revised the standard and the word “written” has been removed. The measures provide examples of acceptable evidence that can be used to demonstrate compliance with the requirements.**

Organization	Yes or No	Question 5 Comment
Indiana Municipal Power Agency	No	In the previous two version of PRC-004, the data retention time was not six years. How does the SDT plan on making the implementation to the six year data retention when the previous data retention time was 12 months or until your CAP was completed? IMPA believes the previous data retention time requirement should be used on this version of PRC-004.
Response: Thank you for your comments. **The SDT revised the Evidence Retention section to follow the NERC Rules of Procedure, Appendix 4C CMEP Section 3.1.4.2 which requires that data or evidence to show compliance be retained for the period beginning the day after the prior audit ended and ending with the End Date for the Compliance Audit.**		
Exelon	Yes	ComEd: On Measurement M3 & M4 with regards to a dated documentation, do these have to be captured in a system outside of a standard business application for the purpose of locking a tracking date?
Response: Thank you for your comments. **The SDT revised the standard. Measure M1 (old M2) now requires the Transmission Owner, Generation Owner, and Distribution Provider to have documentation of identified and reviewed Protection System operations as well as indicating the ones that were designated as Misoperations. This documentation is needed to ensure compliance with the requirements.**		
Manitoba Hydro	No	Manitoba Hydro suggests that the Evidence Retention period be 3 Calendar Years to align with the data retention required for audits. The standard drafting team has not provided justification for extending the Evidence Retention period to 6 Calendar Years and given that Misoperations will be reported quarterly, it is not clear why 6 Calendar Years of evidence would be required.
Response: Thank you for your comments. **The SDT revised the Evidence Retention section to follow the NERC Rules of Procedure, Appendix 4C CMEP Section 3.1.4.2 which requires that data or evidence to show compliance be retained for the period beginning the day after the prior audit ended and ending with the End Date for the Compliance Audit.**		

Organization	Yes or No	Question 5 Comment
Tacoma Power	No	The distinction between M6 and M7 is unclear.
Response: Thank you for your comments. **The SDT revised the standard. Requirement R4 now necessitates the completion of CAPs or action plans. Measure M4 now provides examples of acceptable evidence to demonstrate implementation and completion of any CAP or action plan. Measure M7 has been eliminated.**		
Ameren	No	1. We believe that the Evidence Retention back to the most recent Compliance Audit is sufficient. The Regional Entity has access to all evidence during the Compliance Audit so it need not be retained after that. TO, GO, and DP are reporting Misoperations quarterly to the Regional Entity, so sufficient ongoing monitoring can occur. 2. Many measures require ‘dated written lists’. We presently use an outage tracking database, which includes our correct operations and Misoperations. Are you requiring us to revise this software so that it automatically tracks date and time of entry of each pertinent item of this standard? Please provide some guidance or point us to what NERC accepts as an equivalent to a ‘dated written list’. 3. In M, please remove ‘each’ as this in an extra word. There seems to be a few other grammatical errors in this sentence.
Response: Thank you for your comments. **1. The SDT revised the Evidence Retention section to follow the NERC Rules of Procedure, Appendix 4C CMEP Section 3.1.4.2 which requires that data or evidence to show compliance be retained for the period beginning the day after the prior audit ended and ending with the End Date for the Compliance Audit.** **2. The SDT revised the standard. The measures provide examples of acceptable evidence that can be used to demonstrate compliance with the requirements.** **3. The SDT revised the standard.**		
Utility Services, Inc.		
American Electric Power	No	Within M4 and M5, it is not clear what the meaning or intent is of “dated written declaration”, or what it would constitute.

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comment. **The SDT revised the standard. The measures provide examples of acceptable evidence that can be used to demonstrate compliance with the requirements.**		
American Transmission Company, LLC	No	ATC is concerned that the measures defined in M2, M3 and M5 leave out the possibility of using a database to capture the data. Please replace the term "dated written" in the measures section with "dated records". This change allows for records stored in databases, generated from manufacturer programs as well as for written records.
Response: Thank you for your comment. **The SDT revised the standard. The measures provide examples of acceptable evidence that can be used to demonstrate compliance with the requirements.**		
CenterPoint Energy		
BGE	No	M2. Through M5 requires "written lists, written investigation reports, written declarations, and written action plans...." The intent here should simply be all protection system operations, with auditable investigations reports, and clearly documented action plans. In a modern world these can be accomplished in many ways... The use of the term "written" is archaic....
Response: Thank you for your comment. **The SDT revised the standard and the word "written" has been removed. The measures provide examples of acceptable evidence that can be used to demonstrate compliance with the requirements.**		
Consumers Energy		
ITC	No	Within M2 "Protection System operations" should not be included. Suggest changing this to "BES outages".
Response: Thank you for your comment. **The SDT revised the standard. Measure M1 (old M2) now states acceptable examples of evidence for the Transmission**		

Organization	Yes or No	Question 5 Comment
Owner, Generation Owner, and Distribution Provider to satisfy compliance with the requirement. To identify all Misoperations, all Protection System operations must be identified and reviewed with a systematic approach. Every Protection System operation is either a correct operation or a Misoperation. The review of correct operations may lead to the discovery of Misoperations (failure to trip). This documentation is needed to ensure compliance with the requirements. The term BES is not used in the individual requirements and measures because the standard's Applicability Section 4.2.1 states "Protection Systems for Facilities that are part of the BES."		
Wisconsin Electric	No	1. In M1 through M5, the adjective "written" list, report, etc should be removed since any such evidence may be electronic and not necessarily written on paper. 2. In M5, replace "work timetable" with "schedule". 3. M6 should be replaced by a simpler statement like, "The responsible entity shall have dated evidence, such as work management records or other evidence, to demonstrate completion of all plans required by R1.5." M7 is superfluous to M6 and should be removed.
Response: Thank you for your comments. **1. The SDT revised the standard and the word "written" has been removed. The measures provide examples of acceptable evidence that can be used to demonstrate compliance with the requirements.** **2. The SDT used the term "timetable" to remain consistent with the definition of Correction Action Plan (CAP) in the NERC glossary.** **3. The SDT revised the standard. Measure M4 now provides examples of acceptable evidence to demonstrate implementation and completion of any CAP or action plan. Measure M7 has been eliminated.**		
Duke Energy	No	o M5 - delete this Measure associated with R1.4 consistent with our response to question #3 above. o M6 and M7 should be combined.
Response: Thank you for your comments. **The SDT revised the standard. Measure M4 now provides examples of acceptable evidence to demonstrate implementation and completion of any CAP or action plan.**

6. **The team has included the "Quarterly Misoperations Reporting Data" table and template, and the supporting reference document. Do you have any specific suggestions for improvement?**

Summary Consideration:

The drafting team explored various avenues for Misoperation(s) reporting such as including it as a standard requirement or as a Section 1600 data request, but did not believe either was appropriate. NERC staff has encouraged drafting teams to remove administrative and reporting requirements from the body of standards. These types of requirements do not have direct impact on reliability. The SDT included periodic data submittals in Section C 1.3 "Compliance Monitoring and Assessment Processes" of the standard and included a description identifying what to submit and the periodicity for submittal to the Compliance Enforcement Authority in Section C 1.4 "Additional Compliance Information".

Several commenters had concerns with the reporting form requiring TADS event ID's. The drafting team responded that correlating the Protection System Misoperation to a TADS event is needed to determine Metric ALR4-1 developed by NERC Operating and Planning Committees under NERC's Rules of Procedure Section 809.

Several commenters pointed out inconsistencies between the new definition of Misoperation and the categories on the template and Attachment 1. The drafting team responded that the template (form) itself will not be a part of this standard. The language in the Misoperation Reporting Template will be revised by the Reliability Assessment and Performance Analysis group and will match the language approved for use in the revised standard PRC-004.

Several commenters had concerns with the number of cause codes on the template and Attachment 1. The drafting team responded that the NERC SPCS recommended six Cause Codes in the whitepaper "SPCS Input on Uniform Misoperations Reporting" (Table 2) based on current regional procedures. While adopting these six Cause Codes will require reporting more detail for some regions and less for others, the SPCS believes they strike a necessary balance between having enough Cause Codes to track meaningful trends in Protection System performance while avoiding confusion and inconsistency. In addition to these six codes, the Misoperation Reporting Template will include "Other/Explainable" and "Unknown/Unexplained".

Several commenters had concerns with clarifying how to handle reporting if no Misoperations have occurred. The drafting team responded that today each Region has its own reporting procedures and some do require notification or completion of a form to indicate that the entity has no Misoperation to report. The process of how this will be handled in the future is outside the scope of this drafting team.

One commenter had a concern with quarterly reporting requirements versus semi-annual. The drafting team responded that while some regions require semi-annual reporting today, on October 22, 2010 NERC's ERO Executive Management group endorsed an ERO-

RAPA recommendation to the regions to start the collection of data on a quarterly basis beginning in 2011. The 2009 SPCS assessment of PRC-003-1, PRC-004-1, and PRC-016-1 also endorsed quarterly reporting.

Electric Market Policy	Yes	The following comments are related to the "Quarterly Misoperations Reporting Data" table and template: 1) The fields associated with TADS reporting appear to be outside the scope of this reliability standard as stated in the Purpose, therefore we do not agree with inclusion of TADS. 2) The form does not address "action plans" that would be developed in response to Requirement R1, Part 1.4.The form appears to be collecting additional information that goes beyond the Purpose of the standard, i.e., "Identify and correct the causes of Misoperations of Bulk Electric System (BES) Protection Systems." Specific information includes: Equipment Type; Facility Voltage (kV); Equipment Removed from Service; Relay Technology.

Organization	Yes or No	Question 6 Comment
		The following comments are related to the reference document, SPCS Input on Uniform Misoperations Reporting: 1) The document and template appear to be focused on collecting data for the purpose of reliability metric ALR4-1. This additional data collection is outside the scope of draft standard PRC-004-3 and the proposed requirements stated in the associated Standards Authorization Request (SAR). Therefore, Dominion recommends that only data necessary to address the standard requirements be collected. 2) Section 3 Misoperation Categories 1st Paragraph and Table 1 Misoperations Categories are not consistent with the categories contained in PRC-004-3. Suggest revising document to include the five categories contained in the draft standard. 3) Section 4 Cause Codes 1st paragrah suggests there are six cause codes in Table 2 which is inconsistent with Table 2 that shows seven cause codes. Suggest revising document in the 1st paragraph to say seven cause codes. 4) Template is hard to use because of the number of horizontal columns of data being requested. The number of fields of data being requested seems to be excessive. Any way to reduce the number of fields? 5) Facility Name (Location of Misoperation) field - IS this asking for location that caused the misoperation or the location of the breakers that operated? For example, when a failed carrier set at Station A causes the other terminal at station B to misoperate during a fault, do I enter Station A or Station B? 6) Equipment Type field - includes Dynamic VAR Systems but does not include Static VAR Systems (SVC for example). Should SVC be included? 7) Facility Voltage (kV) field - includes a choice of <100. Since the BES is defined as those elements >100 KV, this choice should be deleted. 8) For a unit connected generating unit with a 230 kV - 13.8 KV GSU and the 230KV generator output breakers trip when the unit trips, what KV do I enter? For a generator that has a 13.8 KV output breaker and a 230 kV - 13.8 kV GSU and the 13.8 KV breaker trips when the unit trips, what KV do I enter? 9) Equipment Removed from Service field - Isn't this the same information as the Equipment Name field? In the example provided there is no difference in what was entered. The Field Value info apparently limits this to Circuits, Transformers, Buses (and also breakers if the

Organization	Yes or No	Question 6 Comment
		breaker is the only element to trip). Does "Circuits" mean the same as Lines? Suggest Circuits be changed to Lines. Do we include generators? Note that TADS does not require reporting of breaker trips unless a Line or Transformer is affected, shouldn't Misoperations do the same? Note that TADS does not include reporting of Buses or many of the other Equipment Types mentioned in the Misoperations template. Do you want all Equipment Types listed or only Lines and Transformers? We suggest it be limited to one entry focusing on the Equipment (ie Element) that misoperated. 10) Event Description field - The title using the word Event seems to entail the overall event which could include correct operations and Misoperations, and the description indicates a brief description of the event and a detailed misoperation description. But the example data seems to indicate only a misoperation description. Can you include as an example description that has a problem on one line and another line over trips. 11) Causes(s) of Misoperation field - Field is named Cause but description asks for root cause(s). Are you looking for one or are you asking for more than one to be entered? Suggest that the word "root" be removed from description. TADS and other industry benchmarking use Cause not root cause. Suggest that only one choice be allowed for entry. 12) Protection Systems/Components that Misoperate field - Is this redundant since you have asked for a detailed description of the Misoperation in the Event Description field? 13) Relay Technology field - suggest that only one choice be allowed. What do you enter if no entry is required (leave it blank or indicate n/a)? We suggest blank. 14) Actual CAP Completion Date field - Change name to CAP Actual Completion Date be consistent with the CAP Target Completion Date field. 15) If the SDT ultimately decides to use one or more of the availability reporting systems (TADS or GADS or DADS), we have the following questions/comments: a. Cause Code field - What do you enter if no entry is required (leave it blank or indicate n/a)? We suggest blank. b. Event ID(s) field - What do you enter if no entry is required (leave it blank or indicate n/a)? We suggest blank.
Response: Thank you for your comments. **In regards to comments related to the Misoperation Reporting Template:** **1) Correlating the Protection System Misoperation to a TADS event is needed to determine Metric ALR4-1 developed by**

NERC Operating and Planning Committees under NERC's Rules of Procedure Section 809. The TADS Event ID Code is normally created by the Transmission Owner and they should be available to System Protection. If the TADS Event ID Code is not available at the time of the report, the column should be left blank and populated later either by the Regional Entity or the Transmission Owner. If the misoperation involves a generator, in most cases the TADS Reportable Outage = No and TADS Event ID(s) = N/A. 2) Thanks for this comment on how to report action plans when cause is not identified. The drafting team made modifications to the reference document "Quarterly Misoperations Reporting Data. In regards to comments related to the reference document "SPCS Input on Uniform Misoperations Reporting" 1) The SAR identified misoperation data currently collected is not usable to establish a consistent metric for measuring Protection System performance and to establish a standard with uniform applicability and clarifying reporting requirements. 2-3) The SDT cannot revise the SPCS whitepaper. 4-15) These comments are directed at revising and clarifying the Misoperation Reporting Template. The drafting team appreciates all these comments and will refer them to the SPCS and the ERO RAPA group for their use.		
Pacific Northwest Small Public Power Utility Comment Group	Yes	The misoperation category dropdown list does not match the five categories of the definition.
Response: Thank you for your comment and pointing out this inconsistency. The template (form) itself will not be a part of this standard. The language in the Misoperation Reporting Template will be revised by the Reliability Assessment and Performance Analysis group.		
LG&E and KU Energy	Yes	This seems to be the Excel Spreadsheet that NERC has already placed in force effective with 2Q 2011 reporting of Misoperations
Response: Thank you for your comment. The Misoperation Reporting Template (Excel) is the same as the spreadsheet proposed by the ERO-RAPA group which was reviewed and agreed by the NERC SPCS (with comments) in the whitepaper "SPCS Input on Uniform Misoperations Reporting."		

Organization	Yes or No	Question 6 Comment
APM Members		
PPL Generation		
Florida Municipal Power Agency	No	see comments to Question 1.
Response: Thank you for your comment.		
Bonneville Power Administration	Yes	1. If NERC really needs the information in the this table, then BPA will support it. However, the way that TADS event IDs are assigned, doesn't easily align with relay misoperations and may be cumbersome and BPA questions whether or not it is be necessary to provide the TADS event ID. 2. BPA suggests that the quarterly reporting requirement given under Section 1.4, Additional Compliance Information is misplaced and suggests that it be given as "ONE" of the requirements. BPA feels that the quarterly reporting table should be all the information that is required, and suggests that measures M1 thru M7 should be removed.
Response: Thank you for your comments. 1. **Correlating the Protection System Misoperation to a TADS event is needed to determine Metric ALR4-1 developed by NERC Operating and Planning Committees under NERC's Rules of Procedure Section 809. The TADS Event ID Code is normally created by the Transmission Owner and they should be available to System Protection. Organization	Yes or No	Question 6 Comment
Western Area Power Administration	No	
Westar Energy	Yes	Consistency between the Standard requirements and the 'Quarterly Misoperations Reporting Data' table and template must be ensured.
Response: Thank you for your comment and pointing out this inconsistency. **The drafting team will coordinate with the SPCS and the ERO RAPA group to ensure consistency.**		
Georgia Transmission Corporation	Yes	Spreadsheets make terrible flat databases. Is this spreadsheet wiped clean each quarter or do incomplete CAPs carry over to the next quarter? What is the procedure to have a field modified if the normal "pull down" selection is not adequate?
Response: Thank you for your comment. **The Misoperation Reporting Template (Excel) is the same as the spreadsheet proposed by the ERO-RAPA group which was reviewed and agreed by the NERC SPCS (with comments) in the whitepaper "SPCS Input on Uniform Misoperations Reporting". Follow-up detail for incomplete CAPS will be included on the next quarterly report with the field "Resubmittal Check" = Yes.**		
PacifiCorp		No comments.
NextEra Energy, Inc.		If a misoperation has multiple events before a root cause can be determined, then there should be one line item with multiple events, not multiple Misoperations.
Response: Thank you for your comment. **Correlating the Protection System Misoperation to a TADS event is needed to determine Metric ALR4-1 developed by NERC Operating and Planning Committees under NERC's Rules of Procedure Section 809. If a relay has misoperated multiple times before a cause can be determined, the Misoperation Reporting Form will require multiple entries as there will be multiple TADS outages. In this case each line may have the same Operation Category Code, Cause Code, and CAP, etc.**		
Southern Company		

Organization	Yes or No	Question 6 Comment
Flathead Electric Cooperative, Inc.	Yes	Need to make it clear that if there are no Misoperations no report is required.
Response: Thank you for your comment. **Today each Region has its own reporting procedures and some do require notification or completion of a form to indicate that the entity has no Misoperation to report. The process of how this will be handled in the future is outside the scope of this drafting team.**		
Green Country Energy	No	
Hydro-Quebec TransÃ ‰ nergie	Yes	
Ingleside Cogeneration LP		There needs to be a tight correlation with the Misoperation categories and cause codes introduced in the RAPA reporting template. Since those codes are already acceptable to NERC, it provides a technically sound starting point for a Misoperation investigation. If the RAPA team accumulates enough data to justify another cause code or provide further examples, than they can control it at one place. Ingleside Cogeneration believes that this is the only way that reporting needs can be managed properly. If guidance is not provided in PRC-004-3, then regional differences will continue to crop up - with unique data requirements and reporting templates.
Response: Thank you for your comment. **The NERC SPCS recommended six Cause Codes in the whitepaper "SPCS Input on Uniform Misoperations Reporting" (Table 2) based on current regional procedures. While adopting these six Cause Codes will require reporting more detail for some regions and less for others, the SPCS believes they strike a necessary balance between having enough Cause Codes to track meaningful trends in Protection System performance while avoiding confusion and inconsistency. In addition to these six codes, the Misoperation Reporting Template will include "Unknown/Unexplained" for cases where causes were not identified and properly documented.**		
Oncor Electric Delivery	No	
Private Citizen		

Organization	Yes or No	Question 6 Comment
Consolidated Edison Co. of NY, Inc.		
Orange and Rockland Utilities, Inc.		None
PSE	Yes	We have created an MS Access database to track all misoperation information starting in 2011. An export file is created in the format of the WECC spreadsheet to meet your requirements. We feel that the MS Access database offers several advantages in terms of the ability to sort records in many ways, offering a historical view of Misoperations that will span multiple quarters and years, and still offers all of the “pull down” choices related to definitions and codes.
Response: Thank you for your comment. **Today each Region has its own reporting procedures. The process of how this will be handled in the future is outside the scope of this drafting team.**		
TransAlta		
Entergy Services	Yes	1. The present template does not contain enough cause options. Additional granularity is needed to identify misoperation trends and to provide better focus on potential areas of improvement. For example, selecting AC failure as a misoperation cause which was due to rodent damage, or a relay failure cause due to a leaky roof, doesn’t provide cause information which would be useful to determine whether we are experiencing actual equipment problems or some other unrelated problem. 2. Also, add a “No Problem Found” cause, to address those rare evolving type scenarios which would challenge even the best relay(s) and schemes, and where we actually know what happened, but there is no reasonable corrective action to prevent it from reoccurring.
Response: Thank you for your comment. **1. The NERC SPCS recommended six Cause Codes in the whitepaper “SPCS Input on Uniform Misoperations Reporting” (Table 2) based on current regional procedures. While adopting these six Cause Codes will require reporting more detail**		

Organization	Yes or No	Question 6 Comment
for some regions and less for others, the SPCS believes they strike a necessary balance between having enough Cause Codes to track meaningful trends in Protection System performance while avoiding confusion and inconsistency. 2. The SDT is recommending the addition of another Cause Code "Other/Explainable" – for events that are explainable but do not fit into the existing Cause Codes. This would require explanation of the cause in the Event Description field, and if no CAP is proposed, an explanation of why it is not required. These types of Misoperations could be the result of multiple contingency events.		
GenOn Energy		
Indiana Municipal Power Agency	Yes	1. IMPA does not agree with the proposed definition of "Misoperation" and feels that the selections under Misoperation Category are broad and far reaching and will result in the vast majority of operations being termed "Misoperation". 2. In addition the definitions listed in the Definition Tab under the Cause(s) of Misoperation include equipment not covered under other Reliability Standards, such as Telco errors. These Causes need to be reviewed and modified to include only equipment covered by other Reliability Standards.
Response: Thank you for your comment. **1. The SDT disagrees that most operations will be classified as Misoperations. The definition was enhanced to add specificity. The selections under the Misoperation Category in the template will be expanded to accommodate the new definition of Misoperation.** **2. All components of a Protection System are considered in this standard regardless of ownership.**		
Exelon	Yes	Column Q, "Is this a TADs reportable outage", should have NA as an option with a footnote or some acknowledgement that generators do not report or participate in the TADs system. Exelon Nuclear: Column Q should have an "N/A" or and "unknown" field as a selectable option. GO/GOPs do not report or participate in the TADs system.
Response: Thank you for your comment. **If the misoperation involves a generator, the TADS Reportable Outage = No and TADS Event ID(s) = N/A.**		
Manitoba Hydro	Yes	In Column M (Misoperation Category) of the spreadsheet, only 4 Misoperation types are

Organization	Yes or No	Question 6 Comment
		provided for selection - Failure to Trip, Slow Trip, Unnecessary Trip - During Fault, and Unnecessary Trip - Other than Fault. To be consistent with the proposed definition, Failure to Trip should be replaced with Failure to Trip - During Fault, and Failure to Trip - Other than Fault.
Response: Thank you for your comment and pointing out this inconsistency. **The Misoperation Category drop down list in the Misoperation Reporting Template will match the list of Misoperation definitions.**		
Tacoma Power		None
Ameren	Yes	1) For Time Zone use Prevailing Time, e.g. CPT for Central Prevailing Time because that's what EMS systems provide. The switch to Daylight Savings time is simultaneous. 2) Require GO to use their GSU high side voltage for Facility Voltage, rather than the generator voltage which will always be <100 as the Facility Voltage.
Response: Thank you for your comments. **1) Not all utilities EMS switch to Daylight Savings Time, so indicating which Zone the Time is reported is required. Since cities and towns within time zones don't universally switch to daylight savings time, "Prevailing Time" would take on different meanings.** **2) In cases where the generator trips the high side GSU circuit breaker, the Misoperations Reporting Template specifies using the transformer high side voltage for the Facility voltage. In cases where the generator only trips it own unit circuit breaker, it is acceptable to use the generator voltage.**		
Utility Services, Inc.		
American Electric Power	No	
American Transmission Company, LLC	Yes	1. In the supporting document "SPCS Input on Uniform Misoperations Reporting":The Misoperations Categories include Slow trip (i.e., slower than required to meet TPL requirements). The parenthetical should be removed. Using the criteria of being slower than TPL standards, could be used as a loop hole.

Organization	Yes or No	Question 6 Comment
		2. The Cause Code Description for As-left personnel error should be improved by adding a description to make it clear that human error due to ongoing testing is not included. ATC believes the intent is to include only those items when the technician has left the substation in an unwanted state.
Response: Thank you for your comments. **1. In many cases high speed protection is installed as part of the utilities standard practice without having the need for high speed protection to meeting TPL requirements. A slow trip of this protection system would not negatively impact the BES, so it does not need to be reported.** **2. The Misoperations Reporting Template has a "Definition" tab with detailed definitions for the Cause Codes. It clarifies the As-left Personnel Error category as things left following maintenance or construction.**		
CenterPoint Energy		
BGE	Yes	The Application Guidelines need to be incorporated into the standard or specifically called out as a binding attachment to the standard.
Response: Thank you for your comment. **The ERO-RAPA group has indicated it plans to incorporate approved changes to the reference document titled "Quarterly Misoperations Reporting Data/Fields" into the Quarterly Misoperations Reporting Template. The reference document will be posted concurrently with the draft standard.**		
Consumers Energy	Yes	The Misoperation Category descriptions in the reporting template should match the wording of the proposed Misoperation definition as closely as possible.
Response: Thank you for your comment and pointing out this inconsistency. **The Misoperation Category drop down list in the Misoperation Reporting Template will match the list of Misoperation definitions.**		
ITC	Yes	Misoperation reports can be quite lengthy to provide the needed details. Because there can be significant information for an adequate report a spreadsheet is not the best way to collect and distribute this data. Higher level software applications should be used.

Organization	Yes or No	Question 6 Comment
Response: Thanks for your comment. **The Misoperation Reporting Template (Excel) is the same as the spreadsheet proposed by the ERO-RAPA group which was reviewed and agreed by the NERC SPCS (with comments) in the whitepaper "SPCS Input on Uniform Misoperations Reporting". If additional significant information is required, most Regional Entities provide the opportunity to attach additional documentation when submitting misoperation data. Today each Region has its own reporting procedures to report Misoperations. The process of how this will be handled in the future is outside the scope of this drafting team.**		
Wisconsin Electric		
Duke Energy	Yes	1. TADS transmission data may not be accessible to generators, and generator data may not be reported in TADS. 2. Need to add a 100 kV option on the template (column J).
Response: Thank you for your comments. **1. If the misoperation involves a generator, in most cases the TADS Reportable Outage = No and TADS Event ID(s) = N/A.** **2. The template has been modified and now includes a 100 kV option.**		
Constellation Power Generation/Constellation Energy Nuclear Group		
Springfield Utility Board	Yes	1) Under "Applicability" in PRC-004-3, SUB recommends that the language lists Functional Entities (TO, GO, DP) who own the following Facilities (Protection Systems, SPS). The current version of the PRC-004-3 draft lists Functional Entities and Facilities as separate applicability. 2) SUB would ask for PRC-004-3 to clarify whether or not Functional Entities would be required to submit a quarterly report if they do not have any Misoperations occur during the quarter. SUB's concern is that if entities are required to report non-events, and then fail to do so, they would be in violation of the standard, and incur a possible penalty based on a violation severity level/violation risk factor of not reporting a misoperation. SUB is concerned that applying "High" VSLs and VRFs for failure to report non-events seems less about promoting reliability and points more toward a mechanism to collect

Organization	Yes or No	Question 6 Comment
		penalty funds.
Response: Thank you for your comments. **2. 1. The Applicability should be read as a logical 'and' statement. For example, if you are a Distribution Provider and own Protection Systems that are a part of the BES, then the standard is applicable. If you are a Distribution Provider and do not own Protection Systems that are a part of the BES, then the standard is not applicable.** **3. 2. Today each Region has its own reporting procedures and some do require notification or completion of a form to indicate that the entity has no Misoperation to report. The process of how this will be handled in the future is outside the scope of this drafting team.**		
BC Hydro		

7. If you are aware of any conflicts between the proposed standard and any regulatory function, rule, order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

Summary Consideration:

Several comments were received on various possible conflicts, including possible conflicts with other NERC standards, Section 1600 data requests, Section 215 of the Federal Power Act, and NRC regulations. In all of these cases, the drafting team reviewed the issues cited and feels that no conflict exists.

In response to one comment, the drafting team modified the Background statement to better reflect the interaction between this standard and the WECC regional Misoperations reporting standard.

SPP Reliability Standards Development Team	No	
MRO's NERC Standards Review Forum	Yes	Where does PRC-009 (new PRC-006) & PRC-020 overlap or are they in conflict with this standard?
Response: Thank you for your comment. **The misoperation of Underfrequency equipment applied on the BES is covered by this standard. There is no conflict with PRC-009-0 and PRC-006-1 as they deal with Underfrequency equipment performance only during a legitimate Underfrequency Load-shedding event. There is no conflict with PRC-020 as it deals with Undervoltage Load-shedding which is specifically excluded from this standard.**		
Electric Market Policy	Yes	Conflict: Collection of additional data pursuant to Section 1600 of NERC's Rules of Procedure, such as TADS information, does not belong in a NERC Reliability Standard.
Response: Thank you for your comment. **The drafting team explored various avenues for Misoperation(s) reporting such as including it as a standard requirement or as a Section 1600 data request, but did not believe either was appropriate. NERC staff has encouraged drafting teams to remove administrative and reporting requirements from the body of standards. These types of requirements do not have direct impact on reliability. The SDT included periodic data submittals in Section C 1.3 "Compliance Monitoring and Assessment Processes" of the standard and included a description identifying what to submit and the periodicity for submittal to the Compliance Enforcement Authority in Section C 1.4 "Additional Compliance Information".**		
Pacific Northwest Small Public Power Utility Comment Group	Yes	Conflict: Section 215 of the Federal Power Act. At least one regional entity is consistently applying PRC-004-1 to distribution systems in violation of the FPA. Version 3 adds nothing to limit or clarify the extent of the standard's reach.

Organization	Yes or No	Question 7 Comment
Response: Thank you for your comment. **There is no conflict between Section 215 of the Federal Power Act and this standard. This standard is for "Protection Systems for Facilities that are part of the BES" as stated in the Applicability section.**		
LG&E and KU Energy

Manitoba Hydro	Yes	1. A number of Canadian Entities have the BES defined within their provincial legislation. This may introduce differences between the Protection System elements that are included in the BES according to provincial legislation and the NERC definition. This may impact the Protection System Misoperations that are reported. 2. As well, since Canadian Entities are not under FERC jurisdiction, the effective date of PRC-004-3 and the associated Misoperation reporting requirements may differ for Canadian entities and entities under FERC jurisdiction.
Response: Thank you for your comments. **1. The standard is applicable to BES Facilities; therefore, the applicability of the standard depends on the individual jurisdiction's definition of BES.** **2. The standard will become effective according to the applicable regulatory approval and its associated Implementation Plan.**

Constellation Power	Yes	Nuclear GO/GOPs have an existing Corrective Action Program that is required by 10 CFR

Organization	Yes or No	Question 7 Comment
Generation/Constellation Energy Nuclear Group		50 Appendix B Criterion XVI (quoted below). This regulatory requirement and associated mandatory implementation of a Corrective Action Program by a Nuclear GO/GOP fully envelopes the intent of the draft revision to PRC-004. An additional "procedure" to identify and address all Protection System Misoperations with set timelines and attributes is not necessary."XVI. Corrective Action Measures shall be established to assure that conditions adverse to quality, such as failures, malfunctions, deficiencies, deviations, defective material and equipment, and non-conformances are promptly identified and corrected. In the case of significant conditions adverse to quality, the measures shall assure that the cause of the condition is determined and corrective action taken to preclude repetition. The identification of the significant condition adverse to quality, the cause of the condition, and the corrective action taken shall be documented and reported to appropriate levels of management."
Response: Thank you for your comment. **The requirement(s) you cite cannot be used as a substitute for PRC-004-3 since they do not apply to Protection Systems on the electrical side of nuclear plants. In Order 706-B, FERC stated that much of a nuclear plant does not fall under the rules of the NRC. The NRC rules are applicable to the portions of the nuclear plant related to handling of radiological fuel, security and safety. NERC rules apply to the portion of the plant not under the rules of the NRC. BES electrical Protection Systems do not fall under the rules of the NRC.**		
Springfield Utility Board		
BC Hydro		

8. **If you are aware of the need for a regional variance or business practice that should be considered with this phase of the project, please identify it here.**

Summary Consideration:

Most commenters argued that the regions – and WECC in particular – should not be allowed to have a regional standard for Misoperations reporting. The SDT responded that any Regional Entity is allowed to have regional standards that have more stringent requirements than the continent-wide standards. See NERC Rules of Procedure, Section 312.

9. If you have any other comments on this Standard that you have not already provided in response to the prior questions, please provide them here.

Summary Consideration:

Numerous commenters were concerned about the prescriptive nature of the Guidelines and Technical Basis section of the standard. The SDT clarified that the Guidelines and Technical Basis section of the standard is included to provide further explanation and the thought processes of the drafting team as they developed the requirements. The Guidelines and Technical Basis section of the standard is not mandatory or enforceable.

Some commenters questioned the inclusion of SPS, RAS, UVLS, UFLS, and SPR in the draft standard. The SDT clarified that SPS and RAS Misoperations are excluded from PRC-004-3 because they will be addressed in the second phase of this project by another team. UVLS Misoperations are excluded because they are explicitly covered by PRC-022-1. UFLS Misoperations are included because not all aspects of UFLS Misoperations are explicitly covered by existing NERC standards. SPR Misoperations are not included because they are not currently part of the Protection System definition.

Several commenters were concerned about the implementation time being too short. The drafting team agreed and increased the implementation time for the new standard.

Some commenters questioned the purpose of the Background section. The SDT clarified that the Background section of the standard is part of the new NERC results-based template that will be used for all NERC Reliability Standards.

A few commenters questioned which entity had the responsibility of reporting Misoperations at an interface. The SDT clarified that the owner of the Protection System component that misoperated is required to report the misoperation.

A number of commenters questioned the location of the Misoperations reporting within the compliance section of the standard. The drafting team consulted NERC staff and decided the compliance section is the appropriate place for Misoperations reporting.

A few commenters questioned whether operations occurring during generator synchronization would be covered under PRC-004-3. In the Guidelines and Technical Basis section of the standard, the drafting team explained that these types of operations are excluded because the generating unit is not synchronized and is isolated from the BES.

Organization	Yes or No	Question 9 Comment

Organization	Yes or No	Question 9 Comment
Northeast Power Coordinating Council	Yes	Although the inclusion of the Application Guidelines is generally helpful, care is needed not to override the judgment of the Protection System owner for setting and designing its relay protection systems, particularly regarding the bias towards security or dependability. For example, the 4th paragraph on Page 14 ("Where studies have...) seems unduly prescriptive.
Response: Thank you for your comment. **The Guidelines and Technical Basis section of the standard is there to provide further explanation and the thought processes of the drafting team as they developed the requirements. The Guidelines and Technical Basis section of the standard is not mandatory or enforceable. The Protection System owner is responsible for the design of its protective systems. The Guidelines and Technical Basis section has been revised and the text referred to has been deleted.**		
Public Service Enterprise Group Company		
Hydro One	Yes	1. Although the inclusion of the Application Guideline is generally helpful, care is needed not to override the judgment of the Protection System owner for setting and designing its relay protection systems, particularly regarding the bias towards security or dependability. For example, the 4th paragraph on Page 14 ("Where studies have...) seems unduly prescriptive. 2. Also, we have concerns with the identified time lines in R1.2, R1.3 and R1.4. Is the intent of the requirement for the RE to initiate action within the specified time once the misoperation is identified? The identification of a misoperation may not occur for some time after the actual protection system operation as there can be a lag between an operation occurring and the analysis of that operation. Some Misoperations may be obvious but some others not so much. We think that more clarity is needed here.
Response: Thank you for your comments. **1. The Guidelines and Technical Basis section of the standard is there to provide further explanation and the thought processes of the drafting team as they developed the requirements. The Guidelines and Technical Basis section of the standard is not mandatory or enforceable. The Protection System owner is responsible for the design of its protective systems. The Guidelines and Technical Basis section has been revised and the text referred to has been deleted.**		

Organization	Yes or No	Question 9 Comment
2. The standard has been revised. The entity has 120 days after the occurrence of the operation to determine whether or not it was a Misoperation. For each designated Misoperation, investigate and document the findings including whether or not a cause is identified.		
Tri-State Generation and Transmission Ass'n - System Protection	Yes	1. As stated earlier, we believe the requirements should be expanded to state what is required rather than putting requirements in the measures. At that point we would be in a better position to address our comments to the requirements. 2. We believe that UVLS and SPS/RAS should be included in this standard and then PRC-012, Requirements R1.6, R1.7, and PRC-016 can be eliminated. If the standard is not changed to include UVLS and SPS, why is UVLS excluded but not UFLS? 3. Corrective Action Plan is defined in the NERC Glossary of Terms. Requirement 1, Part 1.3 should not describe what should be included in the CAP.
Response: Thank you for your comments. **1. The drafting team revised the requirements and measures for clarity.** **2. Misoperation associated with SPS/RAS will be addressed in the second phase of this project: Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS. The SAR for this project did not include modification of PRC-022-1 Under-Voltage Load Shedding Program Performance which covers Misoperations of UVLS. Presently, not all aspects of UFLS Misoperations are explicitly covered by existing NERC standards.** **3. The drafting team removed the additional details from Corrective Action Plan description.**		
FirstEnergy	Yes	1. R1 Subpart 1.5 - We would appreciate clarification on the following regarding what constitutes successful completion of the Corrective Action Plan: Given the scenario of a maintenance error that caused the operation of a protection system, we understand that per this standard, if this misoperation is reported, and the error was corrected per the reported corrective action plan, then the entity is compliant with the standard even if the human error occurs again on a separately reported misoperation incident. Please confirm this understanding. 2. Applicability Section - The proposed standard excludes SPS, RAS, and UVLS systems. However, we do not see an exclusion for UFLS. The standard should clarify whether or not UFLS are applicable. 3. Effective Date - We believe that the proposed 3 month implementation of PRC-004-3 is

Organization	Yes or No	Question 9 Comment
		much too short for an entity to be able to achieve auditable compliance because it may require changes to internal procedures and business unit awareness of the new standard. We suggest at least 6 months after regulatory approval.
Response: Thank you for your comments. 1. **The definition of a Misoperation has been modified to exclude an operation related to on-site maintenance, testing, construction or commissioning activities. If an operation occurred after the on-site activity and was related to a maintenance error, then it would be a Misoperation. The entity develops a CAP with the intention of correcting the cause of the Misoperation. The entity is responsible for its system performance and it is to its benefit to quickly correct Misoperations and prevent future Misoperations of a similar nature. The CAP is complete once all of the identified actions have been performed. The recurrence of a similar Misoperation at the same location is not a PRC-004-3 violation; however, it is an indication of the ineffectiveness of the completed CAP. A new CAP will need to be developed to remedy the specific problem. The new CAP should consider why the previous CAP did not result in the avoidance of a future Misoperation.** 2. **Presently, not all aspects of UFLS Misoperations are explicitly covered by existing NERC standards.** 3. **The drafting team agreed and increased the implementation time for the new standard.**		
Pepco Holdings Inc Affiliates	Yes	1. Section 4.2.2 should be revised to read "Special Protection Systems (SPS), Remedial Action Schemes (RAS), Under Voltage and Under Frequency load shedding programs, and Sudden Pressure Relays (SPR) are excluded from this standard." There has been past confusion as to whether the misoperation of an Underfrequency relay, which is part of a regional load shedding program, is reportable under this standard. Excluding UFLS programs eliminates this confusion. Adding SPR to the exclusions will also eliminate confusion. 2. Also, as mentioned in Question #1 the qualifying comments in the "Application Guidelines" section associated with the five Categories of Protective System Misoperations should be included, either in the standard itself, or as part of the misoperation definition. Without these specific qualifications it is not possible to reach a uniform consensus on what constitutes a misoperation and what does not. 3. However, the remaining sections of the "Application Guidelines" appear to be either tutorial, or background, in nature and should not be part of the standard itself. 4. Compliance data submittal C1.4 requires a quarterly report (ERO spreadsheet) be

Organization	Yes or No	Question 9 Comment
		submitted within 60 calendar days following the end of each calendar quarter. However, as was pointed out repeatedly, due to the difficulty in obtaining outages it is highly unlikely that many misoperation investigations could be completed, or corrective action plans developed / implemented, within 60 days after a quarter ends (particularly for those events which occur late in the quarter). For instance, suppose a misoperation occurs in June (second quarter). Data submittal will be required 60 days after the quarter ends (August 31). However, outages to conduct the necessary diagnostic testing will not be available until mid to late September. Therefore in an attempt to improve the percentage of reported events where investigations are complete and causes determined, we would suggest requiring the data submittal 90 days following the end of each quarter. This additional delay in data submittal will not impact the reliability of the BES, since any protective system misoperation contributing to a major system disturbance is already being thoroughly reviewed / investigated under EOP-004 Disturbance Reporting Requirements. 5. Under Section C 1.4 Additional Compliance Information, there is a reporting requirement. This should be included as a specific requirement in Section B. If not included in Sec B, it could easily be missed by the applicable entity as a requirement.

Response: Thank you for your comments.

1. **UFLS Misoperations on the BES are not excluded from this standard because they are not covered by any existing NERC standards. The standard relies on the applicable FERC approved definition of Protection Systems which currently does not include Sudden Pressure Relays (SPRs).**
2. **The drafting team revised the definition of Misoperation in the draft standard.**
3. **The Guidelines and Technical Basis section of the standard is there to provide further explanation and the thought processes of the drafting team as they developed the requirements. The Guidelines and Technical Basis section of the standard is not mandatory or enforceable. The Protection System owner is responsible for the design of its protective systems.**
4. **The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the results. The standard was further modified to allow a time period of 60 days to develop either; the corrective action plan when a cause was determined; or, an action plan of additional steps if the investigation failed to determine a cause. The requirement for data submission has been eliminated. The data submission time frame has been adjusted to 2 calendar months after the quarter.**

Organization	Yes or No	Question 9 Comment
5. **The drafting team explored various avenues for Misoperation(s) reporting such as including it as a standard requirement or as a Section 1600 data request, but did not believe either was appropriate. NERC staff has encouraged drafting teams to remove administrative and reporting requirements from the body of standards. These types of requirements do not have direct impact on reliability. The SDT included periodic data submittals in Section C 1.3 "Compliance Monitoring and Assessment Processes" of the standard and included a description identifying what to submit and the periodicity for submittal to the Compliance Enforcement Authority in Section C 1.4 "Additional Compliance Information".**		
Southern Company Generation	**Yes**	1) In 4.2.2, point to PRC-016 for SPS Misoperations. 2) In suggesting to use the objectives listed (on page 5 of the 09 Jun 2011 draft standard) as the recommended requirements in the comments to Question 2 above, the removal of "faults" from the first objective was intentional. Generator Owners are not advised of "all faults" and have no way of knowing of all faults. Our experience has been that some Protection System will ultimately operate whenever a Protection System Misoperation occurs, therefore the suggested R1 was written excluding "all faults". 3) Another reason for eliminating all of the time frames suggested by R1 (R1.2, R1.3, and R1.4) relates to the 60 day reporting requirement to regions. A misoperation can occur on the last day of the quarter which must be reported 60 days later. The R1 subsections above time frames overlap the 60 days for a misoperation occurring late in the quarter. The simplified requirements suggested eliminate this problem. 4) We disagree with the statement made in item 3 of the Guidelines and Technical Basis section (page 12) of the draft standard. If the system did not perform as it was intended to (designed to), then it is a misoperation. 5) It is unclear what the phrase "situations that challenge a Protection System" means on page 13, Part 1.1 of the draft standard. 6) The exhaustive description of an investigation (page 13 Part 1.2 paragraph) should only be required where a definitive cause is not identified. For those cases where the cause has been determined, only the bottom line needs to be formally documented. 7) Will the Guidelines and Technical Basis section of the draft standard (p 12-16) become part of the standard? It is not referenced in Section F Associated Documents (p 11). 8) Will the Background section (A5) be retained with the standard?

Organization	Yes or No	Question 9 Comment
		9) Are revisions to Corrective Action Plans allowed to facilitate handling contingencies?

Response: Thank you for your comments.

1. **It is not a good practice to reference other Reliability Standards within a standard because of the dynamic nature of standards development.**
2. **The drafting team revised the standard and 'Faults' have been removed as an initiating event. A Protection System operation of an interrupting device is now the initiating event for an investigation.**
3. **The time interval was restructured to allow the entity 120 days to determine if the Protection System operation was a Misoperation, investigate the Misoperation and document the results. The standard was further modified to allow a time period of 60 days to develop either; the Corrective Action Plan when a cause was determined; or, an action plan of additional steps if the investigation failed to determine a cause. The drafting team has retained Protection System Misoperation(s) reporting in Section C1.4 of the draft standard.**
4. **In many cases high speed protection is installed as part of the utilities standard practice without having the need for high speed protection to meeting TPL requirements. A slow trip of this protection system would not negatively impact the BES, so it does not need to be reported.**
5. **The drafting team revised the draft standard and has modified the Guidelines and Technical Basis section as well to reflect the new requirements.**
6. **The drafting team revised the draft standard and has modified the Guidelines and Technical Basis section as well to reflect the new requirements.**
7. **The Guidelines and Technical Basis section of the standard is there to provide further explanation and the thought processes of the drafting team as they developed the requirements. The Guidelines and Technical Basis section of the standard is not mandatory or enforceable. The Protection System owner is responsible for the design of its protective systems. The Background section of the standard is part of the new NERC results-based template that will be used for all NERC Reliability Standards.**
8. **Yes.**
9. **The drafting team revised the draft standard and the new Requirement R4 allows for revisions to CAPs.**

Organization	Yes or No	Question 9 Comment
Transmission Access Policy Study Group	Yes	We understand that the draft standard was drafted by a "rapid development team" rather than by a stakeholder Standard Drafting Team. This new rapid development team process should not displace or compromise the stakeholder process. TAPS supports the goal of developing better standards more efficiently. If NERC and Regional staff draft a standard

Organization	Yes or No	Question 9 Comment
		without the benefit of significant industry input, however, we could risk moving toward greater inefficiency and delay, because problems that could have been addressed informally in drafting will instead have to be addressed formally through comments and revisions. Instead, the rapid development team should develop only the SAR, with the drafting of the standard left to the Standard Drafting Team, advised by technical writers and attorneys as appropriate.
Response: Thank you for your comment.		
SPP Reliability Standards Development Team		1. Would like clarification on failures during the synchronization of a unit. Clear line to when the point of misoperation could occur. 2. Shouldn't under frequency load shed also be excluded to be addressed at a later date? 3. Under the applicability section shouldn't the wording have been kept from the last posting that it would be distribution provider that owns a BES protection system? 4. Under compliance section third line protection needs to be capitalized. 5. On the same line shall submit a quarterly report. Need to insert, "quarterly report for the previous quarter".
Response: Thank you for your comments. **1. The drafting team revised the draft standard, and the Guidelines and Technical Basis section of the standard includes an explanation regarding the synchronization of a unit.** **2. UFLS Misoperations are included because they are not covered by existing NERC standards.** **3. The Applicability should be read as a logical 'and' statement. For example, if you are a Distribution Provider and own Protection Systems that are a part of the BES, then the standard is applicable. If you are a Distribution Provider and do not own Protection Systems that are a part of the BES, then the standard is not applicable.** **4. Thank you for pointing this out.** **5. Thank you for your comment**		
MRO's NERC Standards Review Forum	Yes	1. Clearly exclude power plant trips when they aren't part of the BES as Misoperations. Trips can occur easily during synchronization and may not be a reliability problem. There are many mechanical issues related to a power plant that may result in an

Organization	Yes or No	Question 9 Comment
		electrical synchronization trip. It's best to avoid inadvertently requiring unnecessary work that won't benefit reliability by clearly excluding plants that are not connected to the BES or plants in the process of synchronizing to the BES. 2. Non-BES plants should all be excluded.
Response: Thank you for your comment. **1. In the Guidelines and Technical Basis section of the standard, the drafting team explained that these types of operations are excluded because the generating unit is not synchronized and is isolated from the BES.** **2. Non-BES connected plants are excluded from applicability to this standard due to the NERC Statement of Compliance Registry Criteria, Section III(c).**		
Electric Market Policy	Yes	Dominion offers the following comments: 1) The "Rationale for R1" suggest that this revision will afford "enhanced reporting and the development of performance metrics that indicate overall system health, as well as facilitate the sharing of 'lessons learned'." Dominion notes that both performance metrics and lessons learned are outside of the scope of this reliability standard. Additionally, NERC is developing an Event Analysis process (currently in field trial) that includes a lessons learned component. Suggest NERC review the current process of blending data collection for other purposes with compliance. 2) The "Guidelines and Technical Basis" section appears to contain language that one could interpret as expanding the Requirements. Suggest clearly noting that this section is guidance only and not intended for compliance. 3) Section (5. Background) should be removed from the standard. This has no relevance to the Requirements or Measures of the new standard. 4)PRC 003 had the Regional Entity as a Functional Entity under Applicability; previous versions of PRC 004 have the TO, GO and DP listed as the Functional Entities under Applicability. PRC004-3 Background states that "PRC 003-1 is not enforceable…" and "This represents a potential reliability gap". According to PRC 004-3, responsible entities are to report to the Regional entities quarterly, so why isn't the Regional Entity listed in the new standard as a Functional Entity? Is the objective to require the regions to submit the data collected to NERC?

Organization	Yes or No	Question 9 Comment
		5)(R1.5) does not allow for extending the CAP beyond the pre-determined timeline when system conditions will not allow for equipment removal, outages, or project schedule changes. There are circumstances where outages continue to move and schedules are adjusted due to operating conditions or limitations that are beyond the control of those developing a projected CAP work timetable. Timetables can be set but it is not unusual that later, when the work is to be performed, that system conditions dictate a change in the schedule. 6) In (C.1.4) the Regional Entity and ERO references require more emphasis by creating a separate section listing Regional Entity requirements. 7) In the Application Guidelines; the Misoperation Definitions (1 -5), could include better examples or "bulleted" examples. 8) Consider not switching to landscape in the middle of the document. If landscape must be used move Regional Variances, Interpretations, and Associated Documentation to a new page. 9) Need to revise "Guidelines and Technical Basis" section to include Slow trip - other than Fault

Response: Thank you for your comments.

1. **The drafting team retained Protection System Misoperation(s) reporting in Section C1.4 of the draft standard.**
2. **The Guidelines and Technical Basis section of the standard is there to provide further explanation and the thought processes of the drafting team as they developed the requirements. The Guidelines and Technical Basis section of the standard is not mandatory or enforceable**
3. **The Background section of the standard is part of the new NERC results-based template that will be used for all NERC Reliability Standards.**
4. **The Regional Entities can no longer be applicable functional entities in a Reliability Standard. The drafting team retained Protection System Misoperation(s) reporting in Section C1.4 of the draft standard.**
5. **The drafting team revised the draft standard and the new Requirement R4 allows for revisions to CAPs.**
6. **The language in C 1.4 has been revised to refer to the Compliance Enforcement Authority.**
7. **The drafting team revised the definition of Misoperation as well as the Application Guidelines that discusses the new**

Organization	Yes or No	Question 9 Comment
definition. 8. Thank you for your comment. 9. The drafting team revised the definition of Misoperation as well as the Guidelines and Technical Basis section that discusses the new definition.		
Pacific Northwest Small Public Power Utility Comment Group		
LG&E and KU Energy		
APM Members		
PPL Generation		Requirement 1.5 states that the procedure shall include, "A requirement that the Registered Entity complete each CAP or action plan as outlined in its timetable, and document its completion as implemented." Schedule changes may be needed as a result of unforeseen events. This should be clarified to be “A requirement that the Registered Entity complete each CAP or action plan as outlined in its timetable or document the basis for needed schedule changes. The procedure shall also include a requirement to document its completion as implemented.”
Response: Thank you for your comment. **The drafting team revised the draft standard and the new Requirement R4 allows for revisions to CAPs.**		
Florida Municipal Power Agency		see comments to Question 1
Bonneville Power Administration		BPA believes that the requirements in this standard to create and provide procedures and detailed descriptions of the processes used to analyze relay Misoperations are burdensome. In addition, BPA feels that the requirement to provide your own processes and procedures results in extra steps that waste valuable time. Documenting these processes and procedures and then providing them in self-certifications and at audits results in appreciable work. This step also results in one more potential audit violation.

Organization	Yes or No	Question 9 Comment
		This approach is the one that was used in PRC-005-1. There it resulted in inconsistent levels of relay maintenance between entities and inequitable penalties. That approach is being dropped in PRC-005-2, and BPA believes that it should not be used in this standard either. A more concise and acceptable standard would simply specify the minimum requirements for analyzing and documenting relay operations and not require the documentation of procedures and detailed descriptions of the processes used by individual entities.
Response: Thank you for your comment. **The details in the requirements are needed to ensure they are measureable and enforceable. The requirements have been revised to ensure only the necessary detail is included.**		
Western Area Power Administration	Yes	The SAR refers to WECC standards PRC-003-STD-1 and PRC-004-WECC-1. It talks about how those standards might overlap. It is our understanding that PRC-004-WECC-1 replaces PRC-003-STD-1 so we don't understand what NERC is getting at. Only one of those standards should be active at any point in time.
Response: Thank you for your comment. **The SAR is not referring to the two WECC standards overlapping each other, rather it is referring to those standards overlapping the proposed NERC Reliability Standard PRC-004-3.**		
Westar Energy		
Georgia Transmission Corporation	Yes	Will TADS be able to show the percentages of Misoperations versus total number of operations?
Response: Thank you for your comment. **This question is beyond the scope of this drafting team.**		
PacifiCorp		PacifiCorp suggests that Section 4.2.2 (regarding applicability of facilities) be revised to state as follows: "Special Protection Systems (SPS), Remedial Action Schemes (RAS), Under Frequency Load Shedding programs, and Under Voltage Load Shedding programs are excluded from this standard." PacifiCorp believes that the same rationale for excluding

Organization	Yes or No	Question 9 Comment
		UVLS programs from this proposed standard should apply for UFLS programs. If the Standards Drafting Team has a specific rationale for making UFLS programs subject to this standard, please provide an explanation as part of the revised standard circulated for the next formal comment and voting period. In accordance with the Standards Processes Manual, the drafting team will respond to comments made in response to the following question informally (in summary form only).
Response: Thank you for your comment. **Misoperation associated with SPS/RAS will be addressed in the second phase of this project: Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS. The SAR for this project did not include modification of PRC-022-1 Under-Voltage Load Shedding Program Performance which covers Misoperations of UVLS. UFLS Misoperations are not covered by existing NERC standards.**		
NextEra Energy, Inc.	Yes	The CAPs and action plans are living documents that should be revised as additional information is gained. Requirement 1.3 should be revised to read (highlighted section added): o A Corrective Action Plan (CAP) (which may be amended as appropriate) that includes: Requirement 1.4 should be revised to read (highlighted section added): o An action plan (which may be amended as appropriate) that identifies:
Response: Thank you for your comment. **The drafting team revised the draft standard and the new Requirement R4 allows for revisions to CAPs.**		
Southern Company	Yes	Although we feel that tie back to TADS reporting will not accomplish the needed data unless TADS is modified to include 100-kV and above and generation facilities. Unless this is done, The tie back to TADS should be eliminated, if implemented, we would suggest the following modification: The recommendation is to state the actual range of TADS data collected. Proposed text - A review of the Transmission Availability Data System (TADS) data (20XX to 20XX) reveals that the fourth ranked initiating cause of BES outages not related to weather is “Failed Protection System Equipment.”
Response: Thank you for your comment. **Changes to TADS are beyond the scope of this drafting team.**		

Organization	Yes or No	Question 9 Comment
Flathead Electric Cooperative, Inc.		
Green Country Energy		
Hydro-Quebec TransÃ ‰ nergie	No	
Ingleside Cogeneration LP		
Oncor Electric Delivery	No	
Private Citizen	Yes	I thank the drafting team for their efforts to date and for the opportunity to comment. The job of a drafting team is not easy. My comments are as follows: 1) I just wanted to add what I thought the true Purpose of the standard is/should be: Misoperation analysis is a reactive tool - one waits for a Misoperation, then analyzes why it happened with the purpose of determining what, if any, changes need to be made to prevent another occurrence in the entity's system. Changes could be simple or complex, at one location or at many locations. Primarily, you are working to prevent a SECOND Misoperation. The SECOND misoperation could be either on existing system(s) or on future systems. I think it is important to note that it is the occurrence of the SECOND misoperation that is the true indicator of whether the efforts to prevent a Misoperation have been successful. A SECOND Misoperation indicates that it has not. 2) In R1, the drafting team calls for each entity to have a procedure. I am unclear on what benefit this provides, other than giving the auditors something to audit. Why not just call for an entity to do XYZ rather than say they must have a procedure that says they will do XYZ and they must follow the procedure. I see requiring a procedure as unnecessary documentation. Can the drafting team comment on why they asked for a procedure? 3) In R1.1, the drafting team calls for a "detailed" description. There is no measure for 'detailed". I believe the drafting team should seek to avoid such undefined terms. Shouldn't the standard just call for a procedure that includes the things listed in the

Organization	Yes or No	Question 9 Comment
		standard? Or better yet, not call for a procedure at all, but just say you must do XYZ? 4) In the Background, it states that one goal of the standard is to collect data to establish a metric to measure Protection System performance. While I think this is a worthy goal in theory, I am skeptical about its usefulness in practice. Protection systems are an Art, not a science, and while most protection systems are made from the same building blocks, the application of them can vary wildly from utility to utility. Before requiring data collection - which would presumably cause a utility to get a NERC violation for failing to send in the data - I would be curious to know how this has worked in the regions that do, today, collect this data. For instance, I believe SERC collects this kind of data. Has this proven useful for developing a metric for SERC entities? If it has not, why not? Let's not repeat a mistake on a continent wide basis. 5) CAPs - the drafting team has written all kinds of rules for CAPs, including trying to hold the entity to a work timetable. What if the entity chooses to say it will take 100 years to fix so that they avoid the possibility of getting a violation for missing their timetable? I personally think CAPs should be eliminated from the standard as they are simply un-workable. You cannot know whether the CAP makes sense without evaluating them on a case-by-case basis. Consider that the CAP actions fall into three broad areas: a) Do nothing (for any of a boat-load of reasons) b) Correct the issue at this one location c) Correct the issue at all locations Generally, c) is preferred, but there may be times when a) is the best solution, because fixing the issue may make things worse. So, instead, how about a performance standard, whereby an entity gets a violation if a Misoperation occurs a SECOND time. I'll be the first to admit that the devil is in the details, but at least in this case, we're getting at the true reason for the standard - preventing that SECOND occurrence. Ultimately, we don't care how they do it, as long as they do it.

Response: Thank you for your comments.

1. **Thank you for your comment.**
2. **Having a standardized process provides a consistent application for evaluating Protection System operations. The details in the requirements are needed to ensure they are measureable and enforceable. The requirements have been revised to ensure only the necessary detail is included.**

Organization	Yes or No	Question 9 Comment
3. The drafting team revised the standard and removed the word 'detailed'. **4. Consistently reported Misoperation data can be used to measure the reliability of BES Protection Systems over time.** **5. The SDT appreciates your observations. The SDT believes the establishment and completion of CAPs for Misoperations will be more effective in reducing future Misoperations than imposing violations for repeated Misoperations.**		
Consolidated Edison Co. of NY, Inc.	Yes	Although the inclusion of the Application Guideline is generally helpful, care is needed not to override the judgment of the Protection System owner for setting and designing its relay protection systems, particularly regarding the bias towards security or dependability. For example, the 4th paragraph on Page 14 ("Where studies have...) seems unduly prescriptive.
Response: Thank you for your comment. **The Guidelines and Technical Basis section of the standard is there to provide further explanation and the thought processes of the drafting team as they developed the requirements. They are not mandatory or enforceable. The Protection System owner is responsible for the design of its protective systems.**		
Orange and Rockland Utilities, Inc.		None
PSE		
TransAlta		
Entergy Services		There are instances when an entity will justifiably need to defer a corrective action plan. The standard needs to include provisions to be able to adjust or defer corrective action plans if necessary.
Response: Thank you for your comment. **The drafting team revised the draft standard and the new Requirement R4 allows for revisions to CAPs.**		
GenOn Energy	Yes	The attempt to keep the Standard simple and straightforward is appreciated. 1. In the Requirements section, please simply state the intended requirement and

Organization	Yes or No	Question 9 Comment
		eliminate the repeated use of catch-all terms such as "any" and "all" which open the door to future unintended interpretations. 2. In R1.1, a "detailed" description is arbitrary and subjective. Reword the statement as follows: "A description of the processes used to:" 3. In R1.1.1, reword the requirement, "Identify and document Faults and Protection System operations." Documenting "all BES Faults" covers the entire continent. 4. In Section R1.3 and R1.4, it is suggested to replace "a work timetable" with "a projected schedule."
Response: Thank you for your comment **1. The SDT revised the draft standard.** **2. The SDT revised the draft standard and the word 'detailed' has been removed.** **3. The requirements have been rewritten. The "BES" reference was removed because BES is specified in the Applicability section 4.2.1. The "Faults" reference was removed because Misoperations may occur during non-fault conditions.** **4. The drafting team used the word 'timetable' to be consistent with the definition of a 'Corrective Action Plan' in the NERC Glossary of Terms.**		
Indiana Municipal Power Agency	Yes	1. A NERC Rapid Development Team (one industry stakeholder out of ten individuals) drafted the SAR and the first draft copy of PRC-004-3. IMPA believes SAR development in this manner is fine, but the first draft of a standard should not be written by the NERC Rapid Development Team. This new process should not compromise the current stakeholder process of writing reliability standards. By using the Rapid Development Team in the attempt to gain efficiency or speed, the risk of becoming inefficient and increasing drafting standard time is greater because problems will have to be address formally through comments and revisions instead of through the informal drafting work of the stakeholder's standard drafting team. 2. IMPA appreciates the effort of trying to make the standard easier to understand by the use of Application Guidelines, but we are concern that the Application Guidelines will become, by association, part of the requirements of the standard. Application Guidelines will be used by auditors as a draft of what a Compliance Program should include and that registered entities will be required to comply with the suggestions

Organization	Yes or No	Question 9 Comment
		listed for Part 1.1 - Part 1.4 and Section C-1.4. For instance, it is stated that an investigation report generally includes the following information: 1) initial evidence, 2) probable or potential causes, 3) tests and studies, and 4) conclusions. Are utilities going to be required to have the supporting documentation required for each of these steps? For instance, as stated in the Application Guideline, initial evidence "...contains the sequence of events, relay targets, and a summary of Disturbance Monitoring Equipment (DME) records." However not all registered entities to which this draft Standard would apply to are currently required to have sequence of events and/or DME's. If this source of information is not available to them will they be penalized or forced to install this equipment thereby subjecting them to further Standards? In addition short circuit and coordination studies are mentioned as being included in report. These studies can be costly and time consuming - will utilities be required to provide these in a report for each operation in order to prove that it was not a "Misoperation"? Guidelines should be viewed as just that - a guideline and should not be viewed as what a utility should include in their Compliance Program. For this standard, it has about a page and a quarter of requirements and almost five pages of Application Guidelines to tell an entity how to be in compliant. The requirements should be written in a manner to stand by themselves without guidelines and allow an entity the option of determining the best method of being in compliance with the requirement.
Response: Thank you for your comments. **1. The drafting team forwarded your comment to the NERC Standards Committee and NERC staff.** **2. The Guidelines and Technical Basis section of the standard is there to provide further explanation and the thought processes of the drafting team as they developed the requirements. The Guidelines and Technical Basis section of the standard is not mandatory or enforceable.**		
Exelon	Yes	What are the reporting expectations when a Protection System misoperation occurs between entities and the failure is with the one of the entities? Would the entity not responsible for the cause also report a misoperation as a means to show cooperation?
Response: Thank you for your comments. **The owner of the Protection System component that misoperated is required to report the misoperation.**		

Organization	Yes or No	Question 9 Comment
Manitoba Hydro		
Tacoma Power		The word 'detailed' should be removed from R1.1. Under R1.3, replace 'Interim corrective actions' with 'Interim corrective or mitigating actions.'
Response: Thank you for your comment. **The SDT revised the draft standard and the word 'detailed' has been removed.**		
Ameren		1) The industry is in the process of adopting the RAPA template. We disagree with the Background statement that Misoperation data, as currently collected and reported is not usable. It seems to us that plenty of Misoperation statistics have been issued, though they may be misleading. 2) We have been through multiple audits and regional reviews of our reported Misoperations, and strongly disagree with the Background statement that the present PRC003 / 4 status is a 'reliability gap'. 3) Are the "Guidelines and Technical Basis" part of the standard? What is their purpose? They do provide a reasonable engineering practice explanation in several cases. In item (3), please strike "or by coordination requirements with other Protection Systems." 4) The evidentiary requirements of this proposed standard greatly exceed those of the present standard, and rigid timelines are required. Entities need more time to make software changes, increase and train staff, and implement processes. Please change implementation to 'first day… 6 months after applicable regulatory approval'. 5) The standard and implementation plan should also exclude UFLS. Add 'Underfrequency Load Shedding' in 4.2.2.
Response: Thank you for your comment. **1. Thank you for your comment.** **2. Thank you for your comment.** **3. The Guidelines and Technical Basis section of the standard is there to provide further explanation and the thought processes of the drafting team as they developed the requirements. The Guidelines and Technical Basis section of the**		

Organization	Yes or No	Question 9 Comment
standard is not mandatory or enforceable. **4. The drafting team agreed and changed the effective date to twelve months after applicable regulatory approval.** **5. UFLS Misoperations are not covered by existing NERC standards.**		
Utility Services, Inc.		While we understand the need to move the Standards Development process on a faster pace, aka Rapid Development process; Utility Services feels that the RD p should not have the initial standard language drafted by RD p group. The SDT should be the group to draft the initial requirements. As outlined in the ROP, industry should be leading this effort.
Response: Thank you for your comments. **The drafting team forwarded your comment to the NERC Standards Committee and NERC staff.**		
American Electric Power		1. Why is it necessary to have PRC-004 along with both PRC-006 and PRC-016? It is not clear why these cannot also be addressed in this revision process, as for AEP, it would seem to be a natural extension of these responsibilities. 2. We suggest there should there be an explicit requirement regarding reporting, rather than providing this detail within the Compliance section. 3. It is not clear how much flexibility, if any, there is in completing investigative work in a timetable as required by R 1.5. For example, due to outages or required maintenance activities, one might not be able to meet the date as set within the timetable, which would require a new proposed completion date. If one were to be held to the standard "literally", is it even allowable to complete the work early? Though the application guide seems to partially address allowing changes to the CAP, the standard should be more explicit in doing so.
Response: Thank you for your comments. 1. **Misoperation associated with SPS/RAS will be addressed in the second phase of this project: Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS. The SAR for this project did not include modification of PRC-022-1 Under-Voltage Load Shedding Program Performance which covers Misoperations of UVLS. UFLS Misoperations are not covered by any existing NERC standards.** 2. **The drafting team explored various avenues for Misoperation(s) reporting such as including it as a standard requirement or as a Section 1600 data request, but did not believe either was appropriate. NERC staff has encouraged**		

Organization	Yes or No	Question 9 Comment
drafting teams to remove administrative and reporting requirements from the body of standards. These types of requirements do not have direct impact on reliability. The SDT included periodic data submittals in Section C 1.3 "Compliance Monitoring and Assessment Processes" of the standard and included a description identifying what to submit and the periodicity for submittal to the Compliance Enforcement Authority in Section C 1.4 "Additional Compliance Information". 3. **The drafting team revised the draft standard and the new Requirement R4 allows for revisions to CAPs.**		
American Transmission Company, LLC		
CenterPoint Energy		CenterPoint Energy recommends that Under Frequency Load Shedding programs be excluded from this standard. In the Applicability section of PRC-004-3, 4.2.2 should be written as follows: "Special Protection Systems (SPS), Remedial Action Schemes (RAS), Under Frequency Load Shedding programs (UFLS), and Under Voltage Load Shedding programs (UVLS) are excluded from this standard."
Response: Thank you for your comment. **UFLS Misoperations are not covered by any existing NERC standards.**		
BGE	No	No comment.
Consumers Energy	Yes	1) The reporting template describes several types of events that are "not reportable Misoperations". These types of events should also be specifically excluded in the standard, especially operations that occur during on-site activities. 2) The Effective Dates, listed in the Implementation Plan, are confusing as written. We suggest "first day of the first calendar quarter, at least 3 months after..." 3) Section 4.2.1 of the Applicability indicates the Standard is applicable to "Protection Systems". Since Protection System is capitalized, this indicates it is defined in the NERC Glossary. Is the intent of this standard to be inclusive of all protection system components (relays, cts, vt, dc circuits, and station batteries)? 4) In M2 remove "written lists". We are suggesting that no reference be made to lists.

Organization	Yes or No	Question 9 Comment
Response: Thank you for your comments. **1. The SDT has modified the definition of Misoperation to address on-site activities."** **2. Thank you for your suggestion. The drafting team changed the effective date to twelve months after applicable regulatory approval.** **3. Yes.** **4. The measures provide examples of acceptable evidence that can be used to demonstrate compliance with the requirements. Lists are one of the acceptable forms of evidence.**		
ITC		Based on the specified time intervals quarterly reports will likely hinder the process, suggest changing the data submittal to semiannual and for it to be submitted within 90 days following the end of the first or second half of the year.
Response: Thank you for your comment. **The drafting team retained the quarterly reporting period for Protection System Misoperation(s).**		
Wisconsin Electric		
Duke Energy	Yes	1. We like having the "Guidelines and Technical Basis" as part of the standard. For clarity, revise the third paragraph under Section 5 of the "Guidelines and Technical Basis" as follows: Failure to automatically reclose after a fault is not included as a Protection System Misoperation because reclosing equipment is not included under the definition of Protection Systems. Further, operations which are initiated by control systems (not by Protection Systems), such as those associated with generator and excitation controls, protection used during generator startup and shutdown (such as reverse power relaying), or turbine/boiler controls, Static VAR Compensators (SVCs), Flexible AC Transmission Systems (FACTS), High-Voltage DC (HVDC) transmission systems, circuit breaker mechanisms, or other facility control systems are also not Misoperations of a Protection System. 2. The requirements to have documented processes for identifying, analyzing and reporting Misoperations as well as CAP and action plan tracking may impact some entities. For such entities, the Implementation Plan may not allow sufficient time to both develop and implement additional processes.

Organization	Yes or No	Question 9 Comment
Response: Thank you for your comments. **1. The SDT revised the Guidelines and Technical Basis section to include more explanation.** **2. The drafting team agreed and changed the effective date to 12 months after applicable regulatory approval.**		
Constellation Power Generation/Constellation Energy Nuclear Group		
Springfield Utility Board		
BC Hydro	Yes	BC Hydro requests clarification for underfrequency load shedding schemes (UVLS). Would they fall under this standard?
Response: Thank you for your comment. **The SAR for this project did not include modification of PRC-022-1 Under-Voltage Load Shedding Program Performance which covers Misoperations of UVLS. UFLS Misoperations are not covered by any existing NERC standards.**		

10. **In accordance with the Standards Processes Manual, the drafting team will respond to comments made in response to the following question informally (in summary form only).**

If you have any comments on the draft SAR, please provide them here.

Summary Consideration:

A commenter had a concern with reviewing each Protection System operation. The SDT believes that an entity must look at (review) every Protection System operation to determine if a Misoperation has occurred. The standard does not attempt to define a review so as to leave the method of conduct of the review up to the entity. Measure M1 has been modified and provides examples of acceptable evidence to satisfy the review of operations Requirement. The SDT believes the review of Protection System operations is being performed already and just needs to be formally documented.

A commenter stated they believe that having a Misoperation makes them non-compliant. A Misoperation is not a violation of PRC-004 regardless of the cause. The purpose of PRC-004 is to identify and correct the causes of Misoperations of Bulk Electric System (BES) Protection Systems.

A request was made to add Protection System operation review to the Title and Purpose of the standard. The SDT disagrees because the focus is Misoperation identification and mitigation.

One commenter wanted to be exempt from this standard because they are a nuclear generator operator and fall under NRC rules. The NRC requirements cannot be used as a substitute for PRC-004-3 since they do not apply to Protection Systems on the electrical side of nuclear plants. In Order 706-B, FERC stated that much of a nuclear plant does not fall under the rules of the NRC. The NRC rules are applicable to the portions of the nuclear plant related to handling of radiological fuel, security and safety. NERC rules apply to the portion of the plant not under the rules of the NRC. BES electrical Protection Systems do not fall under the rules of the NRC.

Florida Municipal Power Agency		1) A concerning statement in the SAR is the proposal to add a requirement to the standard to: "Review all Faults or Protection System operations on the BES to identify those that are BES Protection System Misoperations". We are uncomfortable with the word "review". We would imagine only those protection system operation that fell outside of a certain tolerance would need to be reviewed, e.g., more than one Element tripped, the trip took longer than X cycles, a trip happened without a fault, etc. Review implies something more than looking to see if a criteria was met for further review. So, does review mean to evaluate whether certain criteria was met, or to do a thorough review? We're concerned with the administrative burden of having to do more than a high level review for each and every protection system operation or fault. 2) What sort of evidence would be required to prove that we looked at every Protection System operation and fault on the BES? 3) This could create an unnecessary administrative burden on the industry. 4) Also, in the white paper, the paper identifies incorrect settings as a misoperation (see Table 2 on Cause Codes). To us, incorrect setting is not a misoperation and to call it such creates double jeopardy. If an engineer calculates the incorrect setting for a relay, that should be a PRC-001 standard implication. If a relay tech puts the wrong setting in the relay and tests to that wrong setting that should be a PRC-005 issue, and not a PRC-004 issue.
Response: Thank you for your comments. **1) The Standard Drafting Team believes that an entity must look at (review) every Protection System operation to determine if a Misoperation has occurred. The standard does not attempt to define a review so as to leave the method of conduct of the review up to the entity. Your method of review seems acceptable but compliance review is up to each Regional Entity.** **2) Measure M1 has been modified and provides examples of acceptable evidence to satisfy Requirement R1.** **3) The SDT believes this review is being performed already and just needs to be formally documented.** **4) The SDT disagrees. A Misoperation is not a violation of PRC-004-3 regardless of the cause. The purpose of PRC-004-3 is to identify and correct the causes of Misoperations of Bulk Electric System (BES) Protection Systems.**

Private Citizen		I'm not in the industry anymore, but I think the SAR assumes things that are not truly agreed upon by the industry. My comments are as follows: 1) Review all BES faults/operations - see my comments in Q9. 2) I do not believe the industry is in agreement that all operations need to be reviewed. Presumably, one could review a sub-set and capture the vast majority of potential Misoperations. This would be a better use of resources. So, my complaint here is that the SAR should not tie the hands of the drafting team by requiring that all operations are

Organization	Yes or No	Question 10 Comment
		reviewed unless it makes sense. 3) CAPs - again, see my comments in Q9. I'm unconvinced that you need lots of rules for CAPs. I think a performance requirement would be a better way to go. My complaint here is that it is too prescriptive. Again, the hands of the drafting team should not be tied like this.
Response: Thank you for your comments. **1) See the SDT response to your comment in Q9.** **2) The Standard Drafting Team believes that an entity must look at (review) every Protection System operation to determine if a Misoperation has occurred. The standard does not attempt to define a review so as to leave the method of conduct of the review up to the entity. Review of a subset of all operations, while probabilistically significant, would not serve reliability properly. The SDT believes this review is being performed already and just needs to be formally documented.** **3) See the SDT response to your comment in Q9. If a Misoperation occurs, it needs to be corrected and documented in a Corrective Action Plan. The SDT believes the SAR is not too prescriptive regarding Corrective Action Plans.**

Exelon		Exelon Nuclear: Nuclear GO/GOPs have an existing Corrective Action Program that is required by 10 CFR 50 Appendix B Criterion XVI (quoted below). This regulatory requirement and associated mandatory implementation of a Corrective Action Program by a Nuclear GO/GOP fully envelopes the intent of the draft revision to PRC-004. An additional "procedure" to identify and address all Protection System Misoperations with set timelines and attributes is not necessary."XVI. Corrective Action Measures shall be established to assure that conditions adverse to quality, such as failures, malfunctions, deficiencies, deviations, defective material and equipment, and non-conformances are promptly identified and corrected. In the case of significant conditions adverse to quality, the measures shall assure that the cause of the condition is determined and corrective action taken to preclude repetition. The identification of the significant condition adverse to quality, the cause of the condition, and the corrective action taken shall be documented and reported to appropriate levels of management."
Response: Thank you for your comments. **These requirements cannot be used as a substitute for PRC-004-3 since they do not apply to Protection Systems on the electrical side of nuclear plants. In Order 706-B, FERC stated that much of a nuclear plant does not fall under the rules of the NRC. The NRC rules are applicable to the portions of the nuclear plant related to handling of radiological fuel, security and safety. NERC rules apply to the portion of the plant not under the rules of the NRC. BES electrical Protection Systems do not fall under the rules of the NRC.**

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. The SAR posted for informal comment June 10, 2011 through July 11, 2011.
2. SC authorized moving the SAR forward to standard development at the June 9, 2011 meeting.
3. First posting of Draft Version 1 on June 10, 2011 with a comment period closed on July 11, 2011.

Description of Current Draft

This is a 45 day formal comment period with parallel initial ballot.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Parallel Initial Ballot	July, 2012
Recirculation ballot	October, 2012
BOT Approval	November, 2012

Effective Dates: First day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Version History

Version	Date	Action	Change Tracking

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Misoperation:

Failure of a Protection System to operate as intended.

Any of the following is considered a Misoperation:

1. **Failure to Trip - During Fault** - A failure of a Protection System to operate for a Fault within the zone it is designed to protect. (The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for an Element is correct.)

2. **Failure to Trip - Other Than Fault** - A failure of a Protection System to operate for a non-Fault condition for which the Protection System was intended to operate, such as a power swing, under-voltage, over excitation, or loss of excitation. (The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for an Element is correct.)

3. **Slow Trip - During Fault** - A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. (Delayed Fault clearing associated with an installed high-speed protection scheme is a Misoperation if the high-speed performance is required to meet the performance requirements of the TPL standards or by coordination requirements with other Protection Systems.)

4. **Slow Trip** - **Other Than Fault** - A Protection System operation that is slower than intended for a non-Fault condition such as a power swing, under-voltage, over excitation, or loss of excitation for which the Protection System was intended to operate.

5. **Unnecessary Trip - During Fault** - A Protection System operation for a Fault for which the Protection System is not intended to operate, excluding any remote Protection System operation that resulted from a failure to trip or slow trip of a local Protection System in a faulted adjacent zone.

6. **Unnecessary Trip - Other Than Fault** - A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate, and is unrelated to on-site maintenance, testing, construction or commissioning activities.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Protection System Misoperation Identification and Correction**
2. **Number:** PRC-004-3
3. **Purpose:** Identify and correct the causes of Misoperations of Bulk Electric System (BES) Protection Systems.
4. **Applicability:**

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities

4.2.1 Protection Systems for Facilities that are part of the BES

4.2.2 Facilities not included

4.2.2.1 Special Protection Systems (SPS) or Remedial Action Schemes (RAS)

4.2.2.2 Undervoltage Load Shedding (UVLS)

4.2.3 Relay functions not included (these are non-protective functions that may be imbedded within a Protection System)

4.2.3.1 Control (e.g. controlled shut down of generators or capacitor bank switching. Also see Guidelines and Technical Basis section for detailed examples)

4.2.3.2 Automation (e.g. data collection)

Applicability: SPS and RMS schemes are not included in this version of the standard because they will be handled in the second phase of this project. UVLS is covered by PRC-022. Some functions of relays are not used as protection but as control function or for automation, therefore, any operation of the control function portion of the automation portion of relays are excluded from this standard.

5. Background:

A key element for BES reliability is the correct performance of Protection Systems. Monitoring BES Protection System events, as well as identifying and correcting the causes of Misoperations, will improve Protection System performance. PRC-004-3 Protection System Misoperations is a revision of PRC-004-2a Analysis and Mitigation of Transmission and Generation Protection System Misoperations with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated. PRC-003-1 Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems required the Regions to establish procedures for analysis of Misoperations. In the NOPR, the Commission identified PRC-003-0 as a fill-in-the-blank standard. The NOPR stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2a.

This project includes revising the existing definition of Misoperation, which reads:

Misoperation

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity

In general, this definition needs more specificity and clarity. The terms “specified time” and “abnormal condition” are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical yet explainable condition is a Misoperation.

Misoperation data, as currently collected and reported, is not usable to establish a consistent metric for measuring Protection System performance. The SAR includes establishing a standard with uniform applicability, revising the definition of Misoperation, and clarifying reporting requirements.

The proposed requirement of the revised Reliability Standard PRC-004-3 meets the following objectives:

- Review all Protection System operations on the BES to identify those that are Misoperations of Protection Systems for Facilities that are part of the BES.

- Analyze Misoperations Protection Systems for Facilities that are part of the BES to determine the cause(s).
- Develop and implement Corrective Action Plans to address the cause(s) of Misoperations of Protection Systems for Facilities that are part of the BES.

Misoperations of or associated with Special Protection Schemes, Remedial Action Schemes, and Under-Voltage Load Shedding are not addressed in this standard due to their inherent complexities. NERC intends to address these areas through future projects.

Note that the WECC Regional Reliability Standard PRC-004-WECC-1 relates to the reporting of Misoperations for a limited set of WECC Paths and Remedial Action Schemes. In those cases where PRC-004-WECC-1 overlaps with the Continent-wide standard, entities are expected to comply with the more stringent standard.

B. Requirements and Measures

R1. Within 120 calendar days of an interrupting device operation in its Facility caused by a Protection System operation, each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

1.1 Identify and review each Protection System operation. If the entity suspects a Protection System component(s) owned by another entity contributed to a Misoperation, notify the owner of that Protection System component and provide any requested investigative information.

1.2 Designate each Misoperation (if any).

1.3 Investigate each Misoperation (if any) and document the findings including a cause for each Misoperation, if identified.

M1. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Part 1.1

Rationale for R1: This requirement is the first step to ensuring that practices for reviewing and classifying Protection System operations and correcting Misoperations are consistently employed. The SDT believes 120 calendar days takes into account the seasonal nature of Protection System operations; both the volume of Protection System operations as well as outage constraints for investigative purposes can be seasonal. This requirement mandates entities identify and review Protection System operations. Risks to the BES caused by Misoperations are reduced by reviewing all Protection System operations and investigating any Misoperations to find their cause(s). The initial investigation documentation should be provided to the owner of the Protection System component(s) that contributed to the Misoperation, upon request. The owner of the interrupting device and the entity that owned the component that contributed to the Misoperation should be communicating about the operation before this notification is transmitted. The owner of the component that contributed to the Misoperation will create the CAP, action plan or declaration required by Requirements R2 and R3.

that may include, but is not limited to, dated lists, logs, or a database that documents the date and time of each interrupting device operation and an indication when each related Protection System operation was reviewed. Acceptable evidence for the notification required by Part 1.1 may include, but is not limited to, emails, electronic files, or hard copy records demonstrating transmittal and receipt of information. Acceptable evidence for Part 1.2 may include, but is not limited to, dated lists, logs, or a database that documents the date, time, Facility and equipment name associated with each Misoperation. Acceptable evidence for Part 1.3 may include, but is not limited to, a copy of a dated investigation report or documented findings for each Misoperation.

R2. Within 60 calendar days of identifying the cause(s) of each Misoperation, the Transmission Owner, Generator Owner, or Distribution Provider shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

- Develop and document a Corrective Action Plan (CAP) for the identified Protection System component(s) that includes an evaluation of the CAP's applicability to the entity's Protection Systems at other locations, or
- Explain in a declaration why corrective actions are beyond the entity's control or would reduce BES reliability.

M2. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R2 that must include a dated CAP or a dated declaration explaining why there is no need to develop a CAP.

Rationale for R2: A formal CAP is a proven tool for resolving operational problems. Based on industry experience and operational coordination timeframes, the SDT believes 60 calendar days is reasonable for considering such things as alternative solutions, coordination of resources, development of a schedule, or procurement of funds for a CAP.

In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, documenting the reasons for taking no corrective actions is essential for justifying the close out the Misoperation investigation process and future reference.

R3. For each Misoperation without an identified cause(s), the Transmission Owner, Generator Owner, or Distribution Provider shall, within 180 calendar days of the associated interrupting device operation, complete: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

- Development of an action plan that identifies any additional investigative actions and/or Protection System modifications, including a work timetable, or
- A declaration explaining why no further actions will be taken.

Rationale for R3: Where a Misoperation cause is not determined during the investigation, implementing an action plan of additional investigation/monitoring may determine a cause. The 180 calendar days is the sum of 120 calendar days (investigative period in Requirement R1) and a 60 calendar day period (similar timeframe as in Requirement R2 for developing a CAP.)

If the investigation does not provide direction for identifying the cause, then pursuing further action is not warranted. In these cases, documenting the reasons is essential for justifying the close out the Misoperation investigation process and future reference.

M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R3 that must include a dated action plan or a dated declaration.

R4. For each CAP or action plan, the Transmission Owner, Generator Owner, or Distribution Provider shall: [*Violation Risk Factor: High] [Time Horizon: Operations Planning, Long-Term Planning]*

4.1 Implement the CAP or action plan

4.2 Maintain detailed implementation records of each CAP or action plan including dated information surrounding any revision(s) and completion

Rationale for R4: The CAP or action plan must be fully implemented to accomplish all identified objectives. During the course of implementing a CAP or action plan, revisions may be necessary for a variety of reasons such as scheduling conflicts or resource issues. Documenting the CAP or action plan provides auditable progress and completion confirmation on any plan.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R4 that must include, but is not limited to, dated electronic or hard copy records which document the implementation of each CAP and action plan, completion of actions and revisions for each CAP or action plan; dated work management program records, dated work orders, or dated maintenance records.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority (CEA)

- Regional Entity or if the Responsible Entity is owned, operated or controlled by the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity) to be responsible for compliance enforcement.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System shall keep data or evidence to show compliance with Requirements R1, R2, R3, and R4 and Measures M1, M2, M3, and M4, since the last audit unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

Periodic Data Submittal

1.4. Additional Compliance Information

Each Transmission Owner, Generator Owner, and Distribution Provider that owns BES protection Systems will submit the data identified in PRC-004 - Attachment 1 to the CEA within two calendar months following the end of each calendar quarter.

The CEA will report the Misoperation information provided by the responsible entities to NERC on a quarterly basis.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Assessment, Operations Planning**	**Medium**	The responsible entity performed the actions in accordance with Requirement R1, Parts 1.1 – 1.3 in more than 120 calendar days but less than or equal to 130 calendar days of the operation's occurrence. Guidelines and Technical Basis

A revised Misoperation definition is being proposed for industry adoption. It includes the following conditions:

(1) A failure of a Protection System to operate for a Fault within the zone it is designed to protect. A lack of target information, e.g. when a high-speed pilot system does not trip because a high-speed zone element trips first, is not a Misoperation. If a fault or abnormal condition is cleared within the time normally expected with proper functioning of at least one Protection System element, then failure of another Protection System element associated with the protection scheme is not a Misoperation.

(2) A failure of a Protection System to operate for a non-Fault condition for which the Protection System was intended to operate, such as a power swing, under-voltage, over excitation, or loss of excitation. For example, failure to trip the generator by loss of field protection for a loss of field condition on that generator is a Misoperation.

(3) A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. Delayed fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high speed performance is not required by planning studies associated with the TPL standards or by coordination requirements with other Protection Systems.

(4) A Protection System operation that is slower than intended for a non-Fault condition such as a power swing, under-voltage, over excitation, or loss of excitation for which it was intended to operate. An example of this type of Misoperation is an over excitation condition where the protection designed to detect this condition operated slower than intended resulting in a higher degree of insulation stress than desired.

(5) A Protection System operation for a Fault for which the Protection System is not intended to operate, excluding any remote Protection System operation that resulted from a failure to trip or slow trip of a local Protection System in a faulted adjacent zone. An example of this type of Misoperation is an over-reaching trip due to a lack of coordination between remote and local Protection Systems. Note: Operation of properly coordinated remote Protection Systems to clear the Fault in adjacent zones is not a Misoperation of the remote Protection System if the local Protection System of the faulted Element fails to clear the Fault within the intended time; however, the failure of the local Protection System for the faulted zone is a Misoperation.

(6) A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate. These non-Fault conditions may include power swings, over excitation or loss of excitation but could include even normal conditions. For example, a relay failure during normal conditions could conceivably cause an incorrect trip and a Misoperation. In a second example, tripping a generator by the operation of loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation. In a third example, an impedance line relay trip for a power swing that entered the relay's characteristic is a Misoperation if the power swing was stable and the relay operated because it was set with an excessive reach that unnecessarily restricted the line's load carrying capability. This category of Misoperation cannot address at this time other operations during power swings unless the relay is clearly improperly set. Additional clarity on this specific issue will need to await completion of Phase III of Project 2010-13 on Relay Loadability which will address protective relay operations due to power swings as directed by FERC Order No. 733. Finally, an example of an operation that is not a Misoperation under this category is an unintended operation as a result of on-site maintenance, testing, construction or commissioning.

This definition is based on the established IEEE/PSRC I3 Working Group on ‘Transmission Protective Relay System Performance Measuring Methodology’ categories (excluding Failure to Reclose) of Relay System Misoperation. The phrase abnormal condition has been replaced with “non-fault condition” to remove ambiguity.

Failure to automatically reclose after a Fault is not included as a Misoperation because reclosing equipment is not included under the definition of Protection Systems.

Interrupting Device operations which are initiated by control systems, such as those associated with generator controls, or turbine/boiler controls, Static VAR Compensators (SVCs), Flexible AC Transmission Systems (FACTS), High-Voltage DC (HVDC) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. Additionally, operations initiated by control functions within protective relays are not considered Protection System operations. For example, in cases where a component of the Protection System or a function of a component within the Protection System is used for control of a generator, such as when a reverse power relay is used to trip a breaker during generator shutdown, the operation of the control component or the function when not providing protection is not included in the definition of Misoperation and its operation would not be reviewed under this standard.

A generator Protection System operation prior to closing the unit breaker(s) is not considered a Misoperation. These types of operations are excluded because the generating unit is not synchronized and is isolated from the BES. Protection System operations which occur with the protected Element out of service, that do not trip any in-service Elements are not Misoperations. Protection System operations which occur with the protected Element out of service, that trip any in-service Elements are Misoperations.

In some cases where zones of protection overlap, the owner of BES Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element. For example, the high side of a transformer connected to a line may be within the zone of protection of the supplying line’s relaying. In this case, the line relaying is planned to protect the area of the high side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for Faults on the high side of the connected transformer. Therefore, the operation of the line relaying for a high side transformer Fault would not be considered a Misoperation.

This standard addresses the reliability issues identified in the letter from Gerry Cauley, NERC President and CEO, dated January 17, 2010. “Nearly all major system failures include misoperation of relays as a factor contributing to the propagation of the events…….. Reducing the risk to reliability from relay Misoperations requires consistent collection of misoperation information by regional entities, along with systematic analysis and correction of the underlying causes of preventable Misoperations.” The standard also addresses the findings in the 2011 Risk Assessment of Reliability Performance; July 2011 “….a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry."

In the event of a natural disaster, note that the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

Requirement R1

This requirement promotes the prudent evaluation of all Protection System operations to designate Misoperations, even those difficult to detect. Unless all BES Protection System operations and Faults that challenge them are reviewed, it cannot be determined with certainty that all Misoperations are identified. For example, if you only reviewed Faults resulting in an overtrip, you would not necessarily identify Misoperations caused by slow trips.

Requirement 1 places the responsibility on the interrupting device owner to investigate operations initiated by a Protection System. The SDT believes the owner of the interrupting device that operated would be in the best position to analyze the Protection System operation, determine if a Misoperation occurred, and perform the initial investigation to determine the cause of the Misoperation. If the interrupting device owner suspects that the Misoperation was caused by a Protection System component owned by another entity, they must notify that component owner and document the notification. In this case, it is expected that both entities will work together to investigate the cause of the operation.

Protection Systems are made of many components. These components may be owned by more than one entity. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner's differential relay. All of these components and many more are part of a Protection System. It is expected that all the owners will communicate with each other, sharing any information freely, so that operations can be analyzed, Misoperations identified and corrective actions taken. If an entity feels it cannot get the level of cooperation it needs to adequately address a Misoperation, the entity should appeal to its Regional Entity for help in resolving the situation.

Determining the cause of Protection System Misoperations is essential in developing an effective remedy to avoid future Misoperations. The SDT believes 120 calendar days is a reasonable period of time to investigate operations, determine the cause for most Misoperations and document findings in an investigation report. This time frame takes into account the seasonal nature of Protection System operations. Both the volume of Protection System operations as well as outage constraints for investigative purposes can be seasonal.

Regardless of whether a cause is identified, the interrupting device owner must document the investigation as a potential aid in possible future Misoperation investigations. If a single Protection System causes multiple interrupting device owners to be affected, the entities may work together to produce a common investigation report. Similarly, if the interrupting device owner and the Protection System component owner that caused a Misoperation are different entities, they may work together to produce a common report. Each TO, GO, or DP would be expected to have a copy of the common investigation report.

An investigation report may include the following information: 1) initial evidence, 2) probable causes, 3) tests and studies, and 4) conclusions. A brief description of the event surrounding the Misoperation may be included if not separately documented. The initial evidence, which may also be documented separately, contains the sequence of events, relay targets and a summary of Disturbance Monitoring Equipment (DME) records. Probable causes are those causes which are most likely to have contributed to the Misoperation and could be considered for further testing. The test and studies documented in the report would describe and provide findings of those tests if the entity was able to perform them during the initial investigation phase (e.g. relay calibration and simulation tests, communication noise and attenuation tests, CT/VT ratio tests, DC continuity checks and functional tests) and studies (e.g. short circuit and coordination studies) performed in the attempt to determine the cause. The conclusions should summarize the cause(s) substantiated by the evidence and findings of the tests and studies.

Requirement 2

If the Misoperation cause is identified within 120 days of the event, Requirement R2 requires Protection System owners to develop a CAP or to make a declaration of no additional action within 60 calendar days of determining the cause. Based on industry experience and operational coordination timeframes, the SDT believes 60 calendar days is reasonable for considering such things as alternative solutions, coordination of resources, development of a schedule, or procurement of funds for a CAP, or to prepare a declaration justifying the lack of a CAP.

Where there are multiple Protection System owners involved in a Misoperation, the one or more owners whose Protection System component(s) contributed to the Misoperation will create a CAP or declaration as required by Requirement 2. Owners whose Protection System components operated correctly do not need to create a CAP. All owners should update their investigation documentation to indicate which party or parties are performing a CAP to address the Misoperation.

Resolving Misoperations benefits the Protection System owner and the BES by improving reliability and security. The CAP is an established tool for resolving operational problems. The NERC Glossary of Terms defines a Corrective Action Plan as "A list of actions and an associated timetable for implementation to remedy a specific problem".

Protection System owners are expected to exercise due diligence in the development and implementation of a CAP. Typically included would be any corrective actions taken to prevent recurrence (along with the date performed), and any corrective actions planned to be taken to prevent recurrence (along with the planned date).

An example of a CAP for a Misoperation determined to have been caused by a failed relay that has not been repaired might be: "Temporarily removed failed relay from service on xx/xx/xx. Plan to repair then return relay to service on xx/xx/xx."

An example of a CAP for a Misoperation determined to have been caused by a failed relay that has been repaired might be: "Temporarily removed failed relay from service on xx/xx/xx. Repaired then returned relay to service on xx/xx/xx."

An example of a CAP for a Misoperation suspected to have been caused by an intermittent relay failure might be: "Temporarily removed suspect relay from service on xx/xx/xx. Replaced with like kind, and placed in service on xx/xx/xx."

If the Misoperation cause is identified within 120 days, and no corrective action has been or is intended to be taken, Protection System owners are required to make a declaration to this effect. A "no CAP declaration" would typically include the Misoperation cause and justification for taking no corrective action.

An example of a "no CAP declaration" due to BES reliability might be: "The investigation showed the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Our studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations." A "no CAP declaration" due to BES reliability is expected to be used sparingly.

CAPs should include an evaluation as to whether the entity's Protection Systems at other locations are also vulnerable to the same type of Misoperation.

Requirement 3

If the Misoperation cause is not identified within 120 days, and reasonable investigative actions have not been exhausted, Protection System owners are expected to exercise due diligence in the development and implementation of an action plan for additional investigation. This action plan would typically include any investigative actions taken to determine the cause (along with the date performed), and any investigative actions planned to be taken to determine the cause (along with the planned date).

At the end of 180 days, the Protection System owner must have an action plan or a declaration why no further actions will be taken. The action plan does not need to have been implemented within the 180 days, but it must have been developed within this time frame. The 180 calendar days is the sum of 120 calendar days (investigative period in Requirement R1) and a 60 calendar day period (similar timeframe as in Requirement R2 for developing a CAP.)

Where there are multiple Protection System owners involved in a Misoperation and no cause has been determined, then each Protection System owner must either develop an action plan or declare why no further actions will be taken.

An example of an investigative action plan for more testing might be: "All relays at station A functioned properly during testing on xx/xx/xx. An outage is required to test the relays at station B. The outage is scheduled for xx/xx/xx."

An example of an action plan for adding monitoring might be: "All relays at station A and B functioned properly during testing on xx/xx/xx. It is planned to install a temporary DFR at station A on xx/xx/xx and to monitor the currents for at least 3 months."

An example of an action plan for reviewing relay settings might be: "All relays at station A functioned properly during testing on xx/xx/xx. All relays at station B functioned properly during testing on xx/xx/xx. The carrier system functioned properly during testing on xx/xx/xx. It is planned to complete a relay settings review by xx/xx/xx."

If the Misoperation cause is not identified and reasonable investigative actions have been exhausted within 180 days, Protection System owners are required to make a declaration to this effect. A "no action plan declaration" would typically include any investigative actions taken to determine the cause (along with the date performed), and justification for taking no additional investigative actions.

An example of a "no action plan declaration" might be: "All relays at station A and B functioned properly during testing on xx/xx/xx. The carrier system functioned properly during testing on xx/xx/xx. The carrier coupling equipment functioned properly during testing on xx/xx/xx. A settings review completed on xx/xx/xx indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be proper, and the equipment at station A and station B is already monitored, we have decided to close this investigation."

Requirement R4

Finally, the goal of the standard has not been met unless CAP(s) or action plans are actually implemented, as is required in Requirement R4. The responsible entity is required to implement and complete a CAP or action plan to accomplish the purpose of this standard, which is to prevent future Misoperations, thereby minimizing risk to the BES. The responsible entity is also required to complete the CAP or action plan, document the plan implementation, and retain the appropriate evidence to demonstrate implementation and completion.

The goal of an action plan created in Requirement R3 is to determine a cause so a CAP can be created to ultimately remedy the cause of the Misoperation. If the cause is determined as a result of the action plan, the entity must develop a CAP or a declaration within 60 days of determination of cause per Requirement 2. This requirement sets the expectation that the work identified in the CAP or action plan will be completed on schedule as planned. Deferrals or other relevant changes to the CAP or action plan need to be documented so that the record includes not only what was planned, but what was implemented. Depending on the planning and documentation format used by the responsible entity, evidence of successful CAP or action plan execution could consist of signed-off work orders, printouts from work management systems, spreadsheets of planned versus completed work, timesheets, work inspection reports, paid invoices, photographs, walk-through reports or other evidence.

Documentation of a CAP or action plan provides an auditable progress and completion confirmation for specific Misoperations. In addition, the investigative documentation may aid the responsible entity in remedying future Misoperations of a similar nature.

Reporting:

A review of the Transmission Availability Data System (TADS) data for the years 2008 – 2010 revealed that the fourth ranked initiating cause of BES outages not related to weather was “Failed Protection System Equipment.” Given the high ranking of this metric, it is appropriate to collect data on Protection System Misoperations for analysis to drive improvements in Protection System reliability.

Section C-1.4 requires periodic data reporting and references a common reporting format to facilitate consistent reporting of Misoperation data by all Transmission Owners, Generator Owners, and Distribution Providers. Reporting Misoperation data in a common format permits the ERO to analyze the data, develop meaningful metrics for measuring Protection System performance, identify trends in Protection System performance that negatively impact reliability, and identify lessons learned.

Analysis of data from all Misoperations across North America makes possible identification of issues and trends that may not be identifiable through analysis of smaller data sets on an entity or regional basis. Information regarding identified issues and trends and recommended actions will be shared with Transmission Owners, Generator Owners, and Distribution Providers through lessons learned or industry alerts. Sharing this information will permit recipients to take appropriate actions to drive improvements in Protection System performance.

The common reporting template also will improve the usefulness of metrics developed to track Protection System performance. While the most relevant category defined in TADS is titled "Failed Protection System Equipment," the title is not an accurate description of the information reported in the metric. This metric includes all Protection System Misoperations that are not related to human error, which is only a subset of all Protection System Misoperations. The Protection System Misoperations related to human error (e.g., miscoordinated settings, incorrect setting calculations, and errors in applying settings to the relay, etc.) are tracked separately from Protection System equipment-related Misoperations, and are grouped together with other human errors by a utility employee or contractor. Similarly, Protection System Misoperations related to failed equipment such as a failed CVT on the primary insulation side are reported under "Failed AC Substation Equipment." Reporting of Misoperations data using the common format specified in C-1.4 will permit development of metrics specific to Protection System Misoperations, with the potential to break down the metric by category of Misoperation (e.g., failure to trip, slow trip, unnecessary trip, etc.) and cause of Misoperation (ac system, dc system, as-left personnel error, incorrect setting/logic/design, and relay failures/malfunctions).

Reporting Misoperations and their CAPs or action plans provides a means of monitoring and assessing Misoperations. Reviewing and tracking this information provides a method of validating the actions taken to address the causes of Misoperations. A second need for reporting Misoperations is to facilitate the identification of trends in Protection System performance that negatively impact reliability. Analyzing data from all Misoperations across North America will make it possible to identify trends that may not be discernible through analysis of smaller data sets on an entity or regional basis.

Misoperations and updates will be submitted to the Regional Entity on a quarterly basis per the following schedule:

Reporting Quarter	**Submission Date**
1st Quarter (Jan 1 – March 31)	May 31
2nd Quarter (Apr 1 – June 30)	August 31
3rd Quarter (July 1 – Sept 30)	November 30
4th Quarter (Oct 1 – Dec 31)	February 28

The two calendar months reporting of Misoperations that occurred within the quarterly reporting period corresponds to the recommendations provided by ERO-RAPA and also correlates to the time which the majority of Regional Entities were using in 2011. It is believed that two calendar months is a reasonable time for an entity to submit their Misoperations data after the close of a reporting period. Reporting and updating on a limited time interval and lag (from occurrence) aids in focusing on high trend items of common mode failures. A longer period of time for reporting could prevent high trend failures from being quickly recognized.

Examples of reporting:

1. If a Misoperation occurred on March 30 but was not identified as a Misoperation until June 2, then this Misoperation would be reported in the second quarter reporting period.
2. If the Misoperation in example 1 was not completely investigated in the second quarter but a cause was determined on July 2, then a resubmittal should be reported in the third quarter.
3. If the Misoperation in examples 1 and 2 had its CAP completed on November 2, then a resubmittal indicating that the CAP was completed should be reported in the fourth quarter.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. The SAR posted for informal comment June 10, 2011 through July 11, 2011~~(Dates of posting)~~.
2. SC authorized moving the SAR forward to standard development ~~(SC meeting date when authorized).~~at the June 9, 2011 meeting.
3. ~~2.~~3. First posting of Draft Version 1 on June 10, 2011 with a comment period closed on July 11, 2011.

Description of Current Draft

~~(Describe the type of action associated with this posting such as 30-day informal comment period, 30-day formal comment period,~~This is a 45 day formal comment period with parallel initial ballot~~, 30-day formal comment period with parallel successive ballot, recirculation ballot)~~.

Anticipated Actions	Anticipated Date
~~30-day Formal Comment Period~~	~~June 9, 2011~~
45-day Formal Comment Period with Parallel Initial Ballot	~~September 16, 2011~~July, 2012
Recirculation ballot	~~December 19, 2011~~October, 2012
BOT ~~adoption~~Approval	~~February 13~~November, 2012

Effective Dates: ~~Requirement R1 and its associated parts shall become effective on the first~~First day of the first calendar quarter~~, 3~~ that is six months ~~after~~beyond the date that this standard is approved by applicable regulatory ~~approval. In~~authorities, or in those jurisdictions where ~~no~~ regulatory approval is not required, ~~all requirements go into effect on~~ the standard becomes effective on the first day of the first calendar quarter~~, 3~~ that is six months ~~after~~beyond the date this standard is approved by the NERC Board of Trustees ~~adoption~~, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Misoperation:

Failure of a Protection System to operate as intended.

Any of the following is considered a Misoperation:

1. **Failure to Trip - During Fault** - ~~Any~~A failure of a Protection System to operate for a Fault within the zone it is designed to protect. (The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for an Element is correct.)

2. **Failure to Trip - Other Than Fault** - ~~Any~~A failure of a Protection System to operate for a non-Fault condition for which the Protection System was intended to operate, such as a power ~~swings~~swing, under-voltage, over excitation, or loss of excitation~~ for which the Protection System was intended to operate. ~~. (The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for an Element is correct.)

3. **Slow Trip -** ~~Any~~**During Fault** - A Protection System operation that is slower than ~~planned~~intended for a Fault within the zone it is designed to protect. ~~-~~(Delayed Fault clearing associated with an installed high-speed protection scheme is a Misoperation if the high-speed performance is required to meet the performance requirements of the TPL standards or by coordination requirements with other Protection Systems.)

~~4.~~ ~~**Unnecessary**~~**Slow Trip** - ~~**During**~~**Other Than Fault** - ~~Any~~A Protection System operation ~~for a Fault not within the zone it is designed to protect.~~

~~5.~~4. ~~**Unnecessary Trip - Other Than Fault** - Any Protection System operation for~~ that is slower than intended for a non-Fault ~~conditions~~condition such as a power ~~swings~~swing, under-voltage, over excitation, or loss of excitation for which the Protection System ~~is not~~was intended to operate.

5. **Unnecessary Trip - During Fault** - A Protection System operation for a Fault for which the Protection System is not intended to operate, excluding any remote Protection System operation that resulted from a failure to trip or slow trip of a local Protection System in a faulted adjacent zone.

6. **Unnecessary Trip - Other Than Fault** - A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate, and is unrelated to on-site maintenance, testing, construction or commissioning activities.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Protection System Misoperation Identification and Correction**

2. **Number:** PRC-004-3

3. **Purpose:** Identify and correct the causes of Misoperations of Bulk Electric System (BES) Protection Systems.

4. **Applicability:**

> **Applicability:** SPS and RMS schemes are not included in this version of the standard because they will be handled in the second phase of this project. UVLS is covered by PRC-022. Some functions of relays are not used as protection but as control function or for automation, therefore, any operation of the control function portion of the automation portion of relays are excluded from this standard.

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities

4.2.1 Protection Systems for Facilities that are part of the BES~~.~~

4.2.2 Facilities not included

4.2.2.1 Special Protection Systems (SPS~~),~~) or Remedial Action Schemes (RAS~~), and Under Voltage~~)

4.2.2.2 Undervoltage Load Shedding ~~programs~~(UVLS)

~~**4.2.2**~~**4.2.3** Relay functions not included (these are ~~excluded from this standard.~~non-protective functions that may be imbedded within a Protection System)

4.2.3.1 Control (e.g. controlled shut down of generators or capacitor bank switching. Also see Guidelines and Technical Basis section for detailed examples)

4.2.3.2 Automation (e.g. data collection)

5. **Background**:

A key element for BES reliability is the correct performance of Protection Systems. Monitoring BES Protection System events, as well as identifying and correcting the causes of Misoperations, will improve Protection System performance. ~~In FERC Order No. 693 (dated March 16, 2007),~~PRC-004-3 Protection System Misoperations is a revision of PRC-004-2a Analysis and Mitigation of Transmission and Generation

Protection System Misoperations with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated. PRC-003-1 Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems required the Regions to establish procedures for analysis of Misoperations. In the NOPR, the Commission identified PRC-003-~~1~~0 as a ~~"~~fill-in-the-blank~~"~~ standard~~ and did not approve or remand the standard since~~. The NOPR stated that because the regional procedures had not been submitted~~.~~

~~Since~~, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is ~~no~~not a mandatory requirement for ~~the~~ Regional ~~Entity~~ procedures to support the requirements of PRC-004-~~2~~2a. This ~~represents~~is a potential reliability gap~~. ~~; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2a.

This project includes revising the existing definition of Misoperation, which reads:

Misoperation

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity

In general, this definition needs more specificity and clarity. The terms "specified time" and "abnormal condition" are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical yet explainable condition is a Misoperation.

Misoperation data, as currently collected and reported, is not usable to establish a consistent metric for measuring Protection System performance. The SAR includes establishing a standard with uniform applicability, revising the definition of Misoperation, and clarifying reporting requirements.

The proposed requirement of the revised Reliability Standard PRC-004-3 meets the following objectives:

- Review all ~~Faults and~~ Protection System operations on the BES to identify those that are ~~BES Protection System~~ Misoperations of Protection Systems for Facilities that are part of the BES.
- Analyze ~~BES Protection System~~ Misoperations Protection Systems for Facilities that are part of the BES to determine the cause(s).
- Develop and implement Corrective Action Plans to address the cause(s) of ~~BES Protection System~~ Misoperations of Protection Systems for Facilities that are part of the BES.

~~The reporting of~~ Misoperations of or associated with Special Protection Schemes, Remedial Action Schemes, and Under-Voltage Load Shedding ~~has~~are not ~~been~~ addressed in this standard due ~~the complexity of the subject matter.~~to their inherent complexities. NERC intends to address these areas through ~~a separate project in the~~ future projects.

Note that ~~there are two~~the WECC ~~standards, PRC-003-STD-1 and~~Regional Reliability Standard PRC-004-WECC-1~~, related~~ relates to the reporting of Misoperations for a limited set of WECC Paths and Remedial Action Schemes. In those cases where ~~those standards will overlap~~PRC-004-WECC-1 overlaps with the Continent-wide standard, entities are expected to comply with the more stringent standard. ~~Doing so will ensure compliance with the less stringent standard as well. There are no apparent conflicts between the standards that would lead to mutually exclusive compliance.~~

B. Requirements and Measures

R1. ~~Each~~Within 120 calendar days of an interrupting device operation in its Facility caused by a Protection System operation, each Transmission Owner, Generator Owner, and Distribution Provider shall ~~have and implement a procedure to identify and address all Protection System Misoperations within its system. At a minimum, the procedure shall include~~: *[Violation Risk Factor: ~~High~~] [Medium][Time Horizon: Operations Assessment, Operations Planning]*

Rationale for R1: This requirement is the first step to ensuring that practices for reviewing and classifying Protection System operations and correcting Misoperations are consistently employed. The SDT believes 120 calendar days takes into account the seasonal nature of Protection System operations; both the volume of Protection System operations as well as outage constraints for investigative purposes can be seasonal. This requirement mandates entities identify and review Protection System operations. Risks to the BES caused by Misoperations are reduced by reviewing all Protection System operations and investigating any Misoperations to find their cause(s). The initial investigation documentation should be provided to the owner of the Protection System component(s) that contributed to the Misoperation, upon request. The owner of the interrupting device and the entity that owned the component that contributed to the Misoperation should be communicating about the operation before this notification is transmitted. The owner of the component that contributed to the Misoperation will create the CAP, action plan or declaration required by Requirements R2 and R3.

~~**1.1** A detailed description of the processes used to:~~

~~**1.1.1** Document and review all BES Faults and BES Protection System operations.~~

~~**1.1.2** Identify and document all associated Misoperations, if any.~~

~~**1.1.3** Investigate and address each Misoperation.~~

~~**1.2** A requirement that the Registered Entity shall, within 90 calendar days of each identified Misoperation, investigate the Misoperation to determine its cause(s) and do one of the following:~~

1.1 ~~For~~Identify and review each Protection System operation. If the entity suspects a Protection System component(s) owned by another entity contributed to a

Misoperation, notify the owner of that Protection System component and provide any requested investigative information.

1.2 Designate each Misoperation ~~where the cause(s) are identified, document the investigation and the cause(s~~(if any).

1.3 ~~For those cases where the cause(s) are not identified,~~ Investigate each Misoperation (if any) and document the findings including a cause for each Misoperation, if identified.

M1. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Part 1.1 that may include, but is not limited to, dated lists, logs, or a database that documents the date and time of each interrupting device operation and an indication when each related Protection System operation was reviewed. Acceptable evidence for the notification required by Part 1.1 may include, but is not limited to, emails, electronic files, or hard copy records demonstrating transmittal and receipt of information. Acceptable evidence for Part 1.2 may include, but is not limited to, dated lists, logs, or a database that documents the date, time, Facility and equipment name associated with each Misoperation. Acceptable evidence for Part 1.3 may include, but is not limited to, a copy of a dated investigation~~, any cause(s) that were ruled out, and any additional steps planned to identify the cause(s).~~ report or documented findings for each Misoperation.

~~**1.3** A requirement that for all Misoperations for which the cause(s) was (were) identified, the Registered Entity shall, within 120 calendar days of the Misoperation, develop one of the following:~~

~~**Rationale for R1**: This requirement mandates entities have a process to identify and correct Protection System Misoperations. A review of the Transmission Availability Data System (TADS) data for the past three years reveals that the fourth ranked initiating cause of BES outages not related to weather is "Failed Protection System Equipment." By developing more structure regarding the manner in which Misoperations are identified and corrected, risks to the BES caused by Misoperations can be reduced by ensuring that certain mandatory practices are consistently undertaken. Further, such consistency will also enhance reporting and the development of performance metrics that indicate overall system health, as well as facilitate the sharing of "lessons learned."~~

R2. ~~A~~Within 60 calendar days of identifying the cause(s) of each Misoperation, the Transmission Owner, Generator Owner, or Distribution Provider shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

- Develop and document a Corrective Action Plan (CAP) for the identified Protection System component(s) that includes~~:~~ an evaluation of the CAP's

Rationale for R2: A formal CAP is a proven tool for resolving operational problems. Based on industry experience and operational coordination timeframes, the SDT believes 60 calendar days is reasonable for considering such things as alternative solutions, coordination of resources, development of a schedule, or procurement of funds for a CAP.

In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, documenting the reasons for taking no corrective actions is essential for justifying the close out the Misoperation investigation process and future reference.

applicability to the entity's Protection Systems at other locations, or

~~1. Interim~~Explain in a declaration why corrective actions ~~(if any).~~

- ~~Final corrective or mitigating actions to~~are beyond the entity's control or would reduce ~~potential impacts to~~ BES reliability.

~~2. A work timetable.~~

~~A~~ **M2.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R2 that must include a dated CAP or a dated declaration explaining why there is no need to develop a CAP.

~~A requirement that for all Misoperations for which the cause(s) was (were) not~~

R3. For each Misoperation without an identified~~, the Registered Entity~~ cause(s), the Transmission Owner, Generator Owner, or Distribution Provider shall, within ~~120~~180 calendar days of the ~~Misoperation, develop one~~associated interrupting device operation, complete: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

Rationale for R3: Where a Misoperation cause is not determined during the investigation, implementing an action plan of additional investigation/monitoring may determine a cause. The 180 calendar days is the sum of 120 calendar days (investigative period in Requirement R1) and a 60 calendar day period (similar timeframe as in Requirement R2 for developing a CAP.)

If the investigation does not provide direction for identifying the cause, then pursuing further action is not warranted. In these cases, documenting the reasons is essential for justifying the close out the Misoperation investigation process and future reference.

~~1.4~~ Development of ~~the following:~~

- ~~An~~an action plan that identifies~~:~~
  - ~~Additional~~ any additional investigative actions and/or Protection System modifications~~.~~, including a work timetable, or
    1. ~~A work timetable.~~
  - A declaration ~~that includes an explanation of~~explaining why no further ~~investigation or~~ actions will be taken.

~~1.5 A requirement that the Registered Entity complete each CAP or action plan as outlined in its timetable, and document its completion as implemented.~~

~~**M1.** The~~**M3.** Each Transmission Owner, Generator Owner ~~and Distribution Provider shall have a current copy of its procedure for identifying and addressing Misoperations in accordance with Requirement R1.~~

~~**M2.** The Transmission Owner, Generator Owner~~, and Distribution Provider shall have ~~dated written lists of Faults, Protection System operations, and identified Misoperations with their associated date of occurrence to demonstrate implementation of the procedural elements related to~~ evidence for Requirement ~~R1, Part 1.1.~~

~~**M3.** The Transmission Owner, Generator Owner and Distribution Provider shall have a dated written investigation report for each Misoperation identifying either cause(s), or where the cause(s) of the Misoperation cannot be identified, any additional steps planned for identifying causes to demonstrate implementation of the procedural elements related to Requirement R1, Part 1.2.~~

~~**M4.** To demonstrate implementation of the procedural elements related to Requirement R1, Part 1.3, the responsible entity shall have, for each Misoperation with an identified cause or causes, a dated CAP or a dated written declaration explaining why there is no need to develop a CAP.~~

~~To demonstrate implementation of the procedural elements related to Requirement R1, Part 1.4, the responsible entity shall have, for each Misoperation without an identified cause~~

~~or causes, a dated written action plan that includes a work timetable for implementation or~~ R3 that must include a dated ~~written~~ action plan or a dated declaration ~~explaining why no further investigation or actions will be taken.~~ .

R4. ~~The responsible entity~~For each CAP or action plan, the Transmission Owner, Generator Owner, or Distribution Provider shall: [*Violation Risk Factor: High] [Time Horizon: Operations Planning, Long-Term Planning]*

4.1 Implement the CAP or action plan

4.2 Maintain detailed implementation records of each CAP or action plan including dated information surrounding any revision(s) and completion

Rationale for R4: The CAP or action plan must be fully implemented to accomplish all identified objectives. During the course of implementing a CAP or action plan, revisions may be necessary for a variety of reasons such as scheduling conflicts or resource issues. Documenting the CAP or action plan provides auditable progress and completion confirmation on any plan.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have ~~dated~~ evidence~~, such as~~ for Requirement R4 that must include, but is not limited to, dated electronic or hard copy records which document the implementation of each CAP and action plan, completion of actions and revisions for each CAP or action plan; dated work management program records ~~or~~, dated work orders ~~or other dated evidence, to demonstrate implementation of any plans completed during the implementation of the procedural elements related to Requirements R1, Part 1.5~~, or dated maintenance records.

~~**M5.** The responsible entity shall have dated documentation that describes the manner in which the each CAP or action plan was completed to demonstrate compliance with the procedural elements related to Requirements R1, Parts 1.5~~

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority (CEA)

~~Regional Entity~~

- Regional Entity or if the Responsible Entity is owned, operated or controlled by the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity) to be responsible for compliance enforcement.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner and ~~each~~ Distribution Provider that owns a BES Protection System shall ~~retain~~keep data or evidence to show compliance with ~~Requirement~~Requirements R1, R2, R3, and R4 and Measures M1, M2, M3, and M4, ~~M5, M6, and M7 for six calendar years~~since the last audit unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

~~The Compliance Monitor shall retain any audit data for six years.~~

If a Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System is found non-compliant, it shall keep information related to the non-compliance until ~~found compliant~~mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance ~~Violation~~ Investigation

Self-Reporting

~~Complaints~~

Complaint

Periodic Data Submittal

1.4. Additional Compliance Information

~~***Periodic Data Submittal:*** Within 60 calendar days following the end of each calendar quarter, each~~ Each Transmission Owner, Generator Owner, and ~~each~~ Distribution Provider that owns BES protection Systems will submit ~~a quarterly report to its Regional Entity that lists all Protection System Misoperations~~the data identified in ~~accordance with Requirement R1 using~~ PRC-004 - Attachment 1 to the ~~format specified by the ERO. Each responsible entity will include the status of each of its Misoperation CAPs or action plans developed until these CAPs or action plans are reported complete~~CEA within two calendar months following the end of each calendar quarter.

The ~~Regional Entity~~CEA will report the Misoperation information provided by the responsible entities to NERC on a quarterly basis.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Assessment, Operations Planning**	~~High~~Medium	The responsible entity ~~documented~~performed the ~~investigation and either identified the cause or listed the additional steps planned to identify the cause~~actions in ~~more than 90 calendar days but less than or equal to 120 calendar days~~	The responsible entity ~~documented~~performed the ~~investigation and either identified the cause or listed the additional steps planned to identify the cause~~actions in accordance with Requirement R1, Parts 1.1 – 1.3 in	The responsible entity ~~documented~~performed the ~~investigation and either identified the cause or listed the additional steps planned to identify the cause~~actions in accordance with Requirement R1, Parts 1.1 – 1.3 in	The responsible entity ~~did not have a procedure to identify and address all Protection System Misoperations~~performed the actions in accordance with Requirement R1, Parts 1.1 – 1.3 in more than 150 calendar days of the operation's occurrence. OR The responsible entity failed to ~~implement~~identify and review a Protection System operation that operated one of its ~~procedure to identify and address all Protection System Misoperations~~interrupting devices in accordance with Requirement R1, Part 1.1.

			~~following the Misoperation.~~ ~~OR~~ ~~The responsible entity developed and documented a CAP or a declaration~~accordance with Requirement R1, Parts 1.1 – 1.3 in more than 120 calendar days but less than or equal to ~~150~~130 calendar days ~~following~~of the ~~Misoperation~~operation's occurrence.	more than ~~120~~130 calendar days but less than or equal to ~~130~~140 calendar days ~~following the Misoperation.~~ ~~OR~~ ~~The responsible entity developed and documented a CAP or a declaration in more than 150 calendar days but less than or equal to 160 calendar days following the Misoperation.~~ ~~OR~~ ~~The responsible entity developed and documented a CAP but failed to include one~~ of the ~~elements listed in Requirement R1, Part 1.3.~~	more than ~~130~~140 calendar days but less than or equal to ~~140~~150 calendar days ~~following the Misoperation.~~ ~~OR~~ ~~The responsible entity developed and documented a CAP or a declaration in more than 160 calendar days but less than or equal to 170 calendar days following the Misoperation.~~ ~~OR~~ ~~The responsible entity developed and documented a CAP but failed to include two~~ of the ~~elements listed in Requirement R1, Part 1.3.~~	OR The responsible entity ~~documented the investigation and either identified the cause or listed~~completed its review of a Protection System operation that operated one of its interrupting devices in 120 calendar days and determined the ~~additional steps planned to identify the cause in more than 140 calendar days following the~~ operation was a Misoperation and failed to designate the operation as a Misoperation in accordance with Requirement R1, Part 1.2. OR The responsible entity failed to investigate a Misoperation and document the ~~investigation and identify the cause or list the additional steps planned to identify the cause~~findings in

			OR The responsible entity ~~developed and documented an action plan or~~identified a ~~declaration~~Protection System operation that operated one of its interrupting devices but failed to review the operation in ~~more than~~accordance with Requirement R1, Part 1.1. OR The responsible entity completed its review of a Protection System Operation that operated one of its interrupting devices in 120 calendar days ~~but less than or equal to 150 calendar days following the~~ and determined the operation was a Misoperation~~.~~	~~OR~~ ~~The responsible entity developed and documented an action plan or a declaration in more than 150 calendar days but less than or equal to 160 calendar days following the Misoperation.~~ operation's occurrence.	~~OR~~ ~~The responsible entity developed and documented an action plan or a declaration in more than 160 calendar days but less than or equal to 170 calendar days following the Misoperation.~~ ~~OR~~ ~~The responsible entity developed and documented an action plan but failed to include the delivery dates in accordance with the work timetable specified in Requirement R1, Part1.4.~~ ~~OR~~ ~~The responsible entity implemented the CAP or other action plan, but did not meet the completion timeline stated in the plan~~operation's occurrence.	accordance with Requirement R1, Part 1.3. OR The responsible entity ~~developed and documented~~completed its investigation of a ~~CAP or a declaration~~Protection System Operation that operated one of its interrupting devices in ~~more than 170~~120 calendar days ~~following~~ and suspected that another entity's Protection System component contributed to the Misoperation~~.~~ ~~OR~~ ~~The responsible entity~~, and failed to ~~develop and document a CAP or a declaration following a Misoperation.~~ ~~OR~~ ~~The responsible entity developed~~notify and

			and failed to document the findings in accordance with Requirement R1, Part 1.3.			~~documented an action plan or a declaration in more than 170 calendar days following the Misoperation.~~ ~~OR~~ ~~The responsible entity failed to develop and document an action plan or a declaration following a Misoperation.~~ ~~OR~~ ~~The responsible entity failed~~provide requested investigative information to ~~implement a CAP or other action plan~~that entity in accordance with Requirement R1, Part 1.1.
R2	**Operations Planning, Long-Term Planning**	**Medium**	The responsible entity developed a CAP, or a declaration in accordance with Requirement R2, in	The responsible entity developed a CAP, or a declaration in accordance with Requirement R2, in	The responsible entity developed a CAP, or a declaration in accordance with Requirement R2, in	The responsible entity developed a CAP, or a declaration in accordance with Requirement R2, more than 90 calendar

Guidelines and Technical Basis

A revised Misoperation definition is being proposed for industry adoption. It includes the following conditions:

(1) ~~Any~~A failure of a Protection System to operate for a Fault within the zone it is designed to protect. A lack of target information, e.g. when a high-speed pilot system does not trip because a high-speed zone element trips first, is not a Misoperation. If a fault or abnormal condition is cleared within the time normally expected with proper functioning of at least one Protection System element, then failure of another Protection System element associated with the protection scheme is not a Misoperation.

(2) ~~Any~~A failure of a Protection System to ~~trip~~operate for a non-Fault condition ~~such as power swings, over excitation, or loss of excitation~~ for which the Protection System was intended to operate, such as a power swing, under-voltage, over excitation, or loss of excitation. For example, failure to trip the generator by loss of field protection for a loss of field condition on that generator is a Misoperation.

(3) ~~Any~~A Protection System operation that is slower than ~~planned~~intended for a Fault within the zone it is designed to protect. Delayed fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high speed performance is not required by planning studies associated with the TPL standards or by coordination requirements with other Protection Systems.

(4) ~~Any~~A Protection System operation that is slower than intended for a ~~Fault not within the zone it is~~ non-Fault condition such as a power swing, under-voltage, over excitation, or loss of excitation for which it was intended to operate. An example of this type of Misoperation is an over excitation condition where the protection designed to **~~protect.~~**detect this condition operated slower than intended resulting in a higher degree of insulation stress than desired.

(5) A Protection System operation for a Fault for which the Protection System is not intended to operate, excluding any remote Protection System operation that resulted from a failure to trip or slow trip of a local Protection System in a faulted adjacent zone. An example of this type of Misoperation is an over-reaching trip due to a lack of coordination between remote and local Protection ~~System relays~~Systems. Note: Operation of properly coordinated ~~backup~~remote Protection ~~System relays~~Systems to clear the ~~fault~~Fault in ~~an~~ adjacent ~~zone~~zones is not a Misoperation of the remote Protection System if the ~~primary protection~~ local Protection System of the faulted Element fails to clear the ~~fault~~Fault within the ~~specified~~intended time; however, the failure of the local Protection System for the faulted zone is a Misoperation.

(~~5) Any~~6) A Protection System operation for a non-Fault ~~conditions such as power swings, over excitation, or loss of excitation~~condition for which the Protection System is not intended to operate. ~~For~~These non-Fault conditions may include power swings, over excitation or loss of excitation but could include even normal conditions. For example, a relay failure during normal conditions could conceivably cause an incorrect trip and a Misoperation. In a second example, tripping a generator by the operation of loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation. In a third example, an impedance line relay trip for a power swing that entered the relay's characteristic is a Misoperation if the power swing was stable and the relay operated because it was set with an excessive reach that unnecessarily restricted the line's load carrying capability. This category of Misoperation cannot address at this time other operations during power swings unless the relay is clearly improperly set. Additional clarity on this specific issue will need to await completion of Phase III of Project 2010-13 on Relay Loadability which will address protective relay operations due to power swings as directed by FERC Order No. 733. Finally, an example of an operation that is not a Misoperation under this category is an unintended operation as a result of on-site maintenance, testing, construction or commissioning.

This definition is based on the established IEEE/PSRC I3 Working Group on 'Transmission Protective Relay System Performance Measuring Methodology' categories (excluding Failure to Reclose) of Relay System Misoperation. The phrase abnormal condition has been replaced with "non-fault condition" to remove ambiguity.

Failure to automatically reclose after a ~~fault~~Fault is not included as a~~ Protection System~~ Misoperation because reclosing equipment is not included under the definition of Protection Systems. ~~Operations~~

Interrupting Device operations which are initiated by control systems~~ (not by Protection Systems),~~, such as those associated with generator controls, or turbine/boiler controls, Static VAR Compensators (SVCs), Flexible AC Transmission Systems (FACTS), High-Voltage DC (HVDC) transmission systems, circuit breaker mechanisms, or other facility control systems are ~~also not Misoperations of a Protection System~~not operations of a Protection System. Additionally, operations initiated by control functions within protective relays are not considered Protection System operations. For example, in cases where a component of the Protection System or a function of a component within the Protection System is used for control of a generator, such as when a reverse power relay is used to trip a breaker during generator shutdown, the operation of the control component or the function when not providing protection is not included in the definition of Misoperation and its operation would not be reviewed under this standard.

~~**Requirement R1** states the overall objective of the standard, which is to ensure that entities have and consistently implement a procedure to identify and correct all Protection System Misoperations. Specific detail regarding what this procedure must include is provided in the **Parts 1.1 through 1.5**.~~

~~**Part 1.1** requires that entities have a process to review all events for potential Misoperations and identify all Misoperations found. Reviewing all events associated with Faults on the BES and reviewing all BES Protection System Operations is necessary for reviewing all events which may be associated with BES Protection System Misoperations. The process of identifying a Misoperation from an analytical standpoint begins with a review of all situations that challenge Protection Systems. Faults are one of the major sources of challenge to the BES Protection System. A fault does not need to occur on the BES to result in a BES Protection System Misoperation. To completely identify Misoperations, it must be determined if the Protection System operated for a Fault within its zone of protection, a Fault outside its zone, or a no-Fault condition.~~A generator Protection System operation prior to closing the unit breaker(s) is not considered a Misoperation. These types of operations are excluded because the generating unit is not synchronized and is isolated from the BES. Protection System operations which occur with the protected Element out of service, that do not trip any in-service Elements are not

Misoperations. Protection System operations which occur with the protected Element out of service, that trip any in-service Elements are Misoperations.

In some cases where zones of protection overlap, the owner of BES Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element. For example, the high side of a transformer connected to a line may be within the zone of protection of the supplying line's relaying. In this case, the line relaying is planned to protect the area of the high side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for Faults on the high side of the connected transformer. Therefore, the operation of the line relaying for a high side transformer Fault would not be considered a Misoperation.

This standard addresses the reliability issues identified in the letter from Gerry Cauley, NERC President and CEO, dated January 17, 2010. "Nearly all major system failures include misoperation of relays as a factor contributing to the propagation of the events…….. Reducing the risk to reliability from relay Misoperations requires consistent collection of misoperation information by regional entities, along with systematic analysis and correction of the underlying causes of preventable Misoperations." The standard also addresses the findings in the 2011 Risk Assessment of Reliability Performance; July 2011 "….a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry."

In the event of a natural disaster, note that the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

Requirement R1

This requirement promotes the prudent evaluation of all Protection System operations to designate Misoperations, even those difficult to detect. Unless all BES Protection System operations and Faults that challenge them are reviewed, it cannot be determined with certainty that all Misoperations are identified. For example, if you only reviewed Faults resulting in an overtrip, you would not necessarily identify Misoperations caused by slow trips.

~~Given that a Misoperation has been identified, **Part 1.2** requires the responsible entity accurately identify the underlying or "root" cause in sufficient detail to develop a corrective action plan that remedies the problem to prevent Misoperation recurrence. The cause of most Misoperations can be identified without extraordinary effort. Where a cause cannot be identified, a thorough documentation of the investigation is required to aid future investigation of the Misoperation particularly if it recurs. It is expected that the responsible entity will perform due diligence to identify the Misoperation cause.~~

Requirement 1 places the responsibility on the interrupting device owner to investigate operations initiated by a Protection System. The SDT believes the owner of the interrupting device that operated would be in the best position to analyze the Protection System operation, determine if a Misoperation occurred, and perform the initial investigation to determine the cause of the Misoperation. If the interrupting device owner suspects that the Misoperation was caused by a Protection System component owned by another entity, they must notify that component owner and document the notification. In this case, it is expected that both entities will work together to investigate the cause of the operation.

Protection Systems are made of many components. These components may be owned by more than one entity. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner's differential relay. All of these components and many more are part of a Protection System. It is expected that all the owners will communicate with each other, sharing any information freely, so that operations can be analyzed, Misoperations identified and corrective actions taken. If an entity feels it cannot get the level of cooperation it needs to adequately address a Misoperation, the entity should appeal to its Regional Entity for help in resolving the situation.

Determining the cause of Protection System Misoperations is essential in developing an effective remedy to avoid future Misoperations. The SDT believes 120 calendar days is a reasonable period of time to investigate operations, determine the cause for most Misoperations and document findings in an investigation report. This time frame takes into account the seasonal nature of Protection System operations. Both the volume of Protection System operations as well as outage constraints for investigative purposes can be seasonal.

Regardless of whether a cause is identified, the interrupting device owner must document the investigation as a potential aid in possible future Misoperation investigations. If a single Protection System causes multiple interrupting device owners to be affected, the entities may work together to produce a common investigation report. Similarly, if the interrupting device owner and the Protection System component owner that caused a Misoperation are different entities, they may work together to produce a common report. Each TO, GO, or DP would be expected to have a copy of the common investigation report.

An investigation report ~~generally includes~~may include the following information: 1) initial evidence, 2) probable~~ or potential~~ causes, 3) tests and studies, and 4) conclusions. A brief description of the event surrounding the Misoperation may be included if not separately documented. The initial evidence, which may also be documented separately, contains the sequence of events, relay targets and a summary of Disturbance Monitoring Equipment (DME) records. ~~The probable (or potential)~~Probable causes are~~ a list of~~ those causes which are most likely to have contributed to the Misoperation and could be considered for further testing. The test and studies documented in the report would describe and provide findings of those tests ~~(e.g.~~if the entity was able to perform them during the initial investigation phase (e.g. relay calibration and simulation tests, communication noise and attenuation tests, CT/VT ratio tests, DC continuity checks and functional tests) and studies (e.g. short circuit and coordination studies) performed in the attempt to determine the ~~root~~ cause. The conclusions should summarize the ~~root~~ cause(s) substantiated by the evidence and findings of the tests and studies.

~~If no root cause was found, then the conclusions would attest to the indeterminate results and delineate those causes that have been eliminated.~~

Part 1.2 ~~gives 90 calendar days from the date of the Misoperation to complete the investigation. The 90 day allowance was selected to provide sufficient time for the responsible entity to get through a seasonal period that can restrict the ability to take the outages necessary to effectively identify the Misoperation root cause(s) or document the investigation for unsolved root causes.~~

~~This standard applies to all BES Protection Systems some of which are more critical than others. It is assumed that critical systems will be addressed with more urgency which may delay the investigation of less critical systems. Some regional standards (such as PRC-004-WECC-1) may identify those critical elements and provide more stringent time frames.~~

~~In most cases where a root cause of a Misoperation is identified, a Corrective Action Plan to address the cause will improve the performance and reliability of the BES.~~ ~~**Part 1.3, Bullet 1**~~ ~~establishes the need for an entity to have a procedure for developing Corrective Action Plans. A Corrective Action Plan should include interim corrective actions, final corrective actions, and a timeline for completion delivery dates. Interim corrective actions may be useful to quickly address some of the aspects of the Misoperation prior to implementation of a final solution. Examples for interim corrective actions are: disabling a blocking scheme prior to conversion to a permissive scheme, and taking equipment offline or removing equipment from service until new equipment is available.~~

~~The reliability of the BES could be greatly enhanced by making it immune to faults. Protection Systems are applied to the BES to clear faults and contain their negative impacts, thereby maintaining the reliability and stability of the BES. However, it is impossible (or at least highly impractical) to create failure proof Protection Systems. This is particularly true of Protection Schemes which rely on substation to substation communications for proper operation. The communication equipment can be spread over large distances, and be exposed to failure causes beyond the capability of the Protection System's owner's capability to control. Part of proper application of these Protection Systems involves analysis of their behavior during communication failures.~~

~~Where studies have determined that high speed clearing is required over 100% of the protected element to maintain stability, a communication failure must not prevent high speed fault clearing. In general, this will result in some amount of tripping for external faults. That, by definition, is a misoperation. There are usually things that can be done to reduce the tendency to misoperate, and to reduce the impact of a misoperation. However, the possibility typically cannot be eliminated. Altering the Protection System to eliminate tripping for every possible over trip during communication failures would prevent this type of misoperation, but it would negatively impact the stability of the BES.~~

~~Where studies have determined that excessive tripping is a greater threat to stability than slow tripping for a remote end line fault, permissive schemes can be used to provide high speed tripping. These schemes provide security against excessive tripping during communication failures, but will result in slower tripping for some faults. Under the proposed Misoperation definition, this may not always be considered a Misoperation, but it is certainly less than optimal Protection System performance. It does promote system stability however. Improving the likelihood of high speed clearing at the expense of security in these cases, will negatively impact the stability of the BES.~~

~~In rare cases such as the one described above, where altering a Protection System to avoid the recurrence of a Misoperation may lower the reliability or performance of the BES, a declaration addressing the lack of a CAP is required. Additionally, if analysis of the event shows that the cause of the failure is beyond the Protection System owner's ability to prevent or correct (such as a communication failure caused by an external dig in), corrective action may not be appropriate.~~

~~**Part 1.3 Bullet 2** allows for this situation by requiring that where corrective action is not taken, the Protection System owner has to provide a declaration that includes a description of the failure mode, the Misoperation, and the potential impacts on the BES of eliminating the mode of Misoperation.~~

~~While many things can be done to improve the performance of Protection Systems, it is not possible to prevent all failures. Protection Systems which are designed to operate during partial failure modes in a manner that promotes the maintenance of BES stability may experience Misoperations for which a Corrective Action Plan may not be appropriate.~~

~~In some cases, analysis of all available information will not identify a root cause. **Part 1.4** is intended to allow entities to deal with these scenarios and still meet the overall objectives of the reliability standard.~~

~~In some of these cases additional steps may be identified (such as applying more monitoring equipment) to aid in future investigations of subsequent Misoperations. Modifications to the Protection System may be identified which could reduce the likelihood of a recurrence of the Misoperations. These steps and modifications should be identified to aid in future investigations of recurring Misoperations.~~

~~When a root cause is not identified and all investigative avenues have been exhausted, a declaration detailing the description of the investigative work conducted as well as the justification for the decision to conclude the investigation is required.~~

~~**Parts 1.3 and 1.4** both give 120 calendar days from the date of the Misoperation to develop a plan or otherwise address the Misoperation. This give an additional 30 days beyond the deadline established on **Part 1.2.** As discussed above, this allowance provides sufficient time for the responsible entity to get through a seasonal period that can restrict the ability to take the outages necessary to effectively identify the Misoperation root cause(s) or document the investigation for unsolved root causes. Also as discussed above, some regions may choose to implement more stringent deadlines for some of all of its Protection Systems.~~

Requirement 2

If the Misoperation cause is identified within 120 days of the event, Requirement R2 requires Protection System owners to develop a CAP or to make a declaration of no additional action within 60 calendar days of determining the cause. Based on industry experience and operational coordination timeframes, the SDT believes 60 calendar days is reasonable for considering such things as alternative solutions, coordination of resources, development of a schedule, or procurement of funds for a CAP, or to prepare a declaration justifying the lack of a CAP.

Where there are multiple Protection System owners involved in a Misoperation, the one or more owners whose Protection System component(s) contributed to the Misoperation will create a CAP or declaration as required by Requirement 2. Owners whose Protection System components operated correctly do not need to create a CAP. All owners should update their investigation documentation to indicate which party or parties are performing a CAP to address the Misoperation.

Resolving Misoperations benefits the Protection System owner and the BES by improving reliability and security. The CAP is an established tool for resolving operational problems. The

NERC Glossary of Terms defines a Corrective Action Plan as "A list of actions and an associated timetable for implementation to remedy a specific problem".

Protection System owners are expected to exercise due diligence in the development and implementation of a CAP. Typically included would be any corrective actions taken to prevent recurrence (along with the date performed), and any corrective actions planned to be taken to prevent recurrence (along with the planned date).

An example of a CAP for a Misoperation determined to have been caused by a failed relay that has not been repaired might be: "Temporarily removed failed relay from service on xx/xx/xx. Plan to repair then return relay to service on xx/xx/xx."

An example of a CAP for a Misoperation determined to have been caused by a failed relay that has been repaired might be: "Temporarily removed failed relay from service on xx/xx/xx. Repaired then returned relay to service on xx/xx/xx."

An example of a CAP for a Misoperation suspected to have been caused by an intermittent relay failure might be: "Temporarily removed suspect relay from service on xx/xx/xx. Replaced with like kind, and placed in service on xx/xx/xx."

If the Misoperation cause is identified within 120 days, and no corrective action has been or is intended to be taken, Protection System owners are required to make a declaration to this effect. A "no CAP declaration" would typically include the Misoperation cause and justification for taking no corrective action.

An example of a "no CAP declaration" due to BES reliability might be: "The investigation showed the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Our studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations." A "no CAP declaration" due to BES reliability is expected to be used sparingly.

CAPs should include an evaluation as to whether the entity's Protection Systems at other locations are also vulnerable to the same type of Misoperation.

Requirement 3

If the Misoperation cause is not identified within 120 days, and reasonable investigative actions have not been exhausted, Protection System owners are expected to exercise due diligence in the development and implementation of an action plan for additional investigation. This action plan would typically include any investigative actions taken to determine the cause (along with the date performed), and any investigative actions planned to be taken to determine the cause (along with the planned date).

At the end of 180 days, the Protection System owner must have an action plan or a declaration why no further actions will be taken. The action plan does not need to have been implemented within the 180 days, but it must have been developed within this time frame. The 180 calendar days is the sum of 120 calendar days (investigative period in Requirement R1) and a 60 calendar day period (similar timeframe as in Requirement R2 for developing a CAP.)

Where there are multiple Protection System owners involved in a Misoperation and no cause has been determined, then each Protection System owner must either develop an action plan or declare why no further actions will be taken.

An example of an investigative action plan for more testing might be: "All relays at station A functioned properly during testing on xx/xx/xx. An outage is required to test the relays at station B. The outage is scheduled for xx/xx/xx."

An example of an action plan for adding monitoring might be: "All relays at station A and B functioned properly during testing on xx/xx/xx. It is planned to install a temporary DFR at station A on xx/xx/xx and to monitor the currents for at least 3 months."

An example of an action plan for reviewing relay settings might be: "All relays at station A functioned properly during testing on xx/xx/xx. All relays at station B functioned properly during testing on xx/xx/xx. The carrier system functioned properly during testing on xx/xx/xx. It is planned to complete a relay settings review by xx/xx/xx."

If the Misoperation cause is not identified and reasonable investigative actions have been exhausted within 180 days, Protection System owners are required to make a declaration to this effect. A "no action plan declaration" would typically include any investigative actions taken to determine the cause (along with the date performed), and justification for taking no additional investigative actions.

An example of a "no action plan declaration" might be: "All relays at station A and B functioned properly during testing on xx/xx/xx. The carrier system functioned properly during testing on xx/xx/xx. The carrier coupling equipment functioned properly during testing on xx/xx/xx. A settings review completed on xx/xx/xx indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be proper, and the equipment at station A and station B is already monitored, we have decided to close this investigation."

Requirement R4

Finally, the goal of the standard has not been met unless CAP(s) or action plans are actually implemented, as is required in ~~**Part 1.5.**~~Requirement R4. The responsible entity is required to implement and complete a CAP or ~~other~~ action plan to accomplish the purpose of this standard, which is to prevent future Misoperations, thereby minimizing risk to the BES. ~~The CAP or action plan is intended to correct the root causes of Protection System Misoperations and prevent them from recurring.~~ The responsible entity is also required to complete the CAP or action plan, document the ~~manner in which the plan was implemented~~plan implementation, and retain the appropriate evidence to demonstrate implementation~~.~~ and completion.

The goal of an action plan created in Requirement R3 is to determine a cause so a CAP can be created to ultimately remedy the cause of the Misoperation. If the cause is determined as a result of the action plan, the entity must develop a CAP or a declaration within 60 days of determination of cause per Requirement 2. This requirement sets the expectation that the work identified in the CAP or action plan will be completed on schedule as planned. Deferrals or other relevant changes to the CAP or action plan need to be documented so that the record includes not only what was planned, but what was implemented. Depending on the planning and documentation format used by the responsible entity, evidence of successful CAP or action plan execution could consist of signed-off work orders, printouts from work management systems, spreadsheets of planned versus completed work, timesheets, work inspection reports, paid invoices, photographs, walk-through reports or other evidence.

Documentation of a CAP or action plan provides an auditable progress and completion confirmation for specific Misoperations. In addition, the investigative documentation may aid the responsible entity in remedying future Misoperations of a similar nature.

Reporting:

A review of the Transmission Availability Data System (TADS) data for the ~~past three~~ years ~~reveals~~2008 – 2010 revealed that the fourth ranked initiating cause of BES outages not related to weather ~~is~~was "Failed Protection System Equipment." Given the high ranking of this metric, it is appropriate to collect data on Protection System Misoperations for analysis to drive improvements in Protection System reliability.

Section C-1.4 requires periodic data reporting and references a common reporting format to facilitate consistent reporting of Misoperation data by all Transmission Owners, Generator Owners, and Distribution Providers. Reporting Misoperation data in a common format permits the ERO to analyze the data, develop meaningful metrics for measuring Protection System performance, identify trends in Protection System performance that negatively impact reliability, and identify lessons learned.

Analysis of data from all Misoperations across North America makes possible identification of issues and trends that may not be identifiable through analysis of smaller data sets on an entity or regional basis. Information regarding identified issues and trends and recommended actions will be shared with Transmission Owners, Generator Owners, and Distribution Providers through lessons learned or industry alerts. Sharing this information will permit recipients to take appropriate actions to drive improvements in Protection System performance.

The common reporting template also will improve the usefulness of metrics developed to track Protection System performance. While the most relevant category defined in TADS is titled "Failed Protection System Equipment," the title is not an accurate description of the information reported in the metric. This metric includes all Protection System Misoperations that are not related to human error, which is only a subset of all Protection System Misoperations. The Protection System Misoperations related to human error (e.g., miscoordinated settings, incorrect setting calculations, and errors in applying settings to the relay, etc.) are tracked separately from Protection System equipment-related Misoperations, and are grouped together with other human errors by a utility employee or contractor. Similarly, Protection System Misoperations related to failed equipment such as a failed CVT on the primary insulation side are reported under "Failed AC Substation Equipment." Reporting of Misoperations data using the common format specified in C-1.4 will permit development of metrics specific to Protection System Misoperations, with the potential to break down the metric by category of Misoperation (e.g., failure to trip, slow trip, unnecessary trip, etc.) and cause of Misoperation (ac system, dc system, as-left personnel error, incorrect setting/logic/design, and relay failures/malfunctions).

Reporting Misoperations and their CAPs or action plans provides a means of monitoring and assessing Misoperations. Reviewing and tracking this information provides a method of validating the actions taken to address the causes of Misoperations. A second need for reporting Misoperations is to facilitate the identification of trends in Protection System performance that negatively impact reliability. Analyzing data from all Misoperations across North America will make it possible to identify trends that may not be discernible through analysis of smaller data sets on an entity or regional basis.

Misoperations and updates will be submitted to the Regional Entity on a quarterly basis per the following schedule:

Reporting Quarter	**Submission Date**
1st Quarter (Jan 1 – March 31)	May 31
2nd Quarter (Apr 1 – June 30)	August 31
3rd Quarter (July 1 – Sept 30)	November 30
4th Quarter (Oct 1 – Dec 31)	February 28

The two calendar months reporting of Misoperations that occurred within the quarterly reporting period corresponds to the recommendations provided by ERO-RAPA and also correlates to the time which the majority of Regional Entities were using in 2011. It is believed that two calendar months is a reasonable time for an entity to submit their Misoperations data after the close of a reporting period. Reporting and updating on a limited time interval and lag (from occurrence) aids in focusing on high trend items of common mode failures. A longer period of time for reporting could prevent high trend failures from being quickly recognized.

Examples of reporting:

1. If a Misoperation occurred on March 30 but was not identified as a Misoperation until June 2, then this Misoperation would be reported in the second quarter reporting period.
2. If the Misoperation in example 1 was not completely investigated in the second quarter but a cause was determined on July 2, then a resubmittal should be reported in the third quarter.
3. If the Misoperation in examples 1 and 2 had its CAP completed on November 2, then a resubmittal indicating that the CAP was completed should be reported in the fourth quarter.

Implementation Plan

Project 2010-05.1 Protection Systems: Phase 1 (Misoperations)

Requested Approvals

- PRC-004-3 – Protection System Misoperation Identification and Correction

Requested Retirements

- PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection System
- PRC-004-2a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

Prerequisite Approvals

- None

Revisions to Defined Terms in the NERC Glossary

The standards drafting team proposes modifying the following approved definition:

Misoperation: Any of the following:

1. **Failure to Trip - During Fault -** A failure of a Protection System to operate for a Fault within the zone it is designed to protect. (The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for an Element is correct.)

2. **Failure to Trip - Other Than Fault -** A failure of a Protection System to operate for a non-Fault condition for which the Protection System was intended to operate, such as a power swing, under-voltage, over excitation, or loss of excitation. (The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for an Element is correct.)

3. **Slow Trip - During Fault -** A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. (Delayed Fault Clearing associated with an installed high-speed protection scheme is a Misoperation if the high-speed performance is required to meet the performance requirements of the TPL standards or by coordination requirements with other Protection Systems.)

4. **Slow Trip - Other Than Fault -** A Protection System operation that is slower than intended for a non-Fault condition such as a power swing, under-voltage, over excitation, or loss of excitation for which the Protection System was intended to operate.

5. **Unnecessary Trip - During Fault -** A Protection System operation for a Fault for which the Protection System is not intended to operate, excluding any remote Protection System operation that resulted from a failure to trip or slow trip of a local Protection System in a faulted adjacent zone.

6. **Unnecessary Trip - Other Than Fault -** A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate, and is unrelated to on-site maintenance, testing, construction or commissioning activities.

Background

PRC-004-3 Protection System Misoperations is a revision of PRC-004-2a Analysis and Mitigation of Transmission and Generation Protection System Misoperations with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated. PRC-003-1 Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems required the Regions to establish procedures for analysis of Misoperations. In the NOPR, the Commission identified PRC-003-0 as a fill-in-the-blank standard. The NOPR stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2a.

General Considerations

PRC-004-WECC-1 – This regional standard is related to reporting of Misoperations for a limited set of WECC Paths and Remedial Action Schemes. In those cases where PRC-004-WECC-1 overlaps with the Continent-wide standard, entities are expected to comply with the more stringent standard.

Applicability

This standard applies to the following functional entities:

- Transmission Owner
- Generator Owner
- Distribution Provider

This standard applies to the following Facilities:

- Protection Systems for Facilities that are part of the BES.

Facilities not included

- Special Protection Systems (SPS) or Remedial Action Schemes (RAS)
- Undervoltage Load Shedding (UVLS)

Relay functions not included (these are non-protective functions that may be imbedded within a Protection System)

- Control (e.g. controlled shut down of generators or capacitor bank switching. Also see Guidelines and Technical Basis section for detailed examples)

- Automation (e.g. data collection)

Effective Date of New or Revised Standards and Definitions

First day of the first calendar quarter that is six months beyond the date that PRC-004-3 is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

The proposed definition of Misoperation shall become effective on the same date as PRC-004-3. Entities shall use this definition when implementing any portions of Requirements R1, R2 R3 and R4 that use this defined term.

Implementation Plan for Requirements R1, R2, R3 and R4

Entities shall be 100% compliant on the first day of the first calendar quarter six months following applicable regulatory approvals, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter six months following Board of Trustees adoption.

Retirement of Existing Standards

The existing standards PRC-003-1 and PRC-004-2a shall be retired at midnight of the day immediately prior to the effective date of PRC-004-3.

Implementation Plan ~~for PRC-004-03~~

~~**Standards Involved:**~~

- ~~Approval:~~

Project 2010-05.1 Protection Systems: Phase 1 (Misoperations)

Requested Approvals

- PRC-004-3 – Protection System Misoperation Identification and Correction

Requested Retirements~~:~~

- PRC-003-1~~ – ~~ – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection ~~Systems~~System
- PRC-004-~~1a – ~~2a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations
  - ~~PRC-004-2 – Analysis and Mitigation of Transmission and Generation Protection System Misoperations~~
- ~~Related~~

~~PRC-003-STD-1, PRC-004-WECC-1: These are two regional standards~~

Prerequisite Approvals

- None

Revisions to Defined Terms in the NERC Glossary

The standards drafting team proposes modifying the following approved definition:

Misoperation: Any of the following:

1. **Failure to Trip - During Fault -** A failure of a Protection System to operate for a Fault within the zone it is designed to protect. (The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for an Element is correct.)

2. **Failure to Trip - Other Than Fault -** A failure of a Protection System to operate for a non-Fault condition for which the Protection System was intended to operate, such as a power swing, under-voltage, over excitation, or loss of excitation. (The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for an Element is correct.)

3. **Slow Trip - During Fault -** A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. (Delayed Fault Clearing associated with an installed high-speed protection scheme is a Misoperation if the high-speed performance is required to meet the performance requirements of the TPL standards or by coordination requirements with other Protection Systems.)

4. **Slow Trip - Other Than Fault -** A Protection System operation that is slower than intended for a non-Fault condition such as a power swing, under-voltage, over excitation, or loss of excitation for which the Protection System was intended to operate.

5. **Unnecessary Trip - During Fault -** A Protection System operation for a Fault for which the Protection System is not intended to operate, excluding any remote Protection System operation that resulted from a failure to trip or slow trip of a local Protection System in a faulted adjacent zone.

6. **Unnecessary Trip - Other Than Fault -** A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate, and is unrelated to on-site maintenance, testing, construction or commissioning activities.

Background

PRC-004-3 Protection System Misoperations is a revision of PRC-004-2a Analysis and Mitigation of Transmission and Generation Protection System Misoperations with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated. PRC-003-1 Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems required the Regions to establish procedures for analysis of Misoperations. In the NOPR, the Commission identified PRC-003-0 as a fill-in-the-blank standard. The NOPR stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2a.

General Considerations

PRC-004-WECC-1 – This regional standard is related to reporting of Misoperations for a limited set of WECC Paths and Remedial Action Schemes. In those cases where ~~those standards will overlap~~PRC-004-WECC-1 overlaps with the Continent-wide standard, entities are expected to comply with the more stringent standard~~. Doing so will ensure compliance with the less stringent standard as well. There are no apparent conflicts between the standards that would lead to mutually exclusive compliance~~.

~~**Prerequisite Approvals:**~~
~~The proposed standard is **not** dependent on any prerequisite approvals.~~

~~**Revision to Sections of Approved Standards and Definitions:**~~
~~There is one revised definition for the proposed standard:~~

~~***Misoperation:*** *Any of the following:*~~

1. ~~**Failure to Trip - During Fault** - Any failure of a Protection System to operate for a Fault within the zone it is designed to protect.~~
2. ~~**Failure to Trip - Other Than Fault** - Any failure of a Protection System to operate for a non-Fault condition such as power swings, under-voltage, over excitation, or loss of excitation for which the Protection System was intended to operate.~~
3. ~~**Slow Trip** - Any Protection System operation that is slower than planned for a Fault within the zone it is designed to protect.~~
4. ~~**Unnecessary Trip - During Fault** - Any Protection System operation for a Fault not within the zone it is designed to protect.~~
5. ~~**Unnecessary Trip - Other Than Fault** - Any Protection System operation for non-Fault conditions such as power swings, under-voltage, over excitation, or loss of excitation for which the Protection System is not intended to operate.~~

~~Retirement of Existing Standards:~~

~~The existing Standards PRC-003-1, PRC-004-1a, and PRC-004-2 shall be retired upon regulatory approval of PRC-004-3.~~

~~PRC-003-1 is currently not enforceable, but requires the establishment of a procedure by the RRO. The new PRC-004-3 puts this obligation on the Functional Entities instead, and specifies the minimum elements required in the procedure, making PRC-003-1 unnecessary and duplicative.~~

~~PRC-004-1a and -2 Requirements R1 and R2 require the Functional Entities implement the procedures specified in PRC-003-1. R1 in the new PRC-004-3 includes this obligation. R3 in PRC-004-1A and -2 requires reporting to the RRO, which has now been included in the Compliance section of the standard. Together, these elements make PRC-004-1A and -2 superfluous as well.~~

Applicability~~:~~

This standard applies to the following functional entities:

- Transmission ~~Owners~~Owner
- Generator ~~Owners~~Owner
- Distribution ~~Providers~~Provider

This standard applies to the following Facilities:

- Protection Systems for Facilities that are part of the BES.

Facilities not included

- Special Protection Systems (SPS~~),~~) or Remedial Action Schemes (RAS~~), and Under Voltage~~)
- Undervoltage Load Shedding ~~programs~~(UVLS)

Relay functions not included (these are ~~*excluded from this standard.*~~non-protective functions that may be imbedded within a Protection System)

- Control (e.g. controlled shut down of generators or capacitor bank switching. Also see Guidelines and Technical Basis section for detailed examples)
- Automation (e.g. data collection)

Effective Date~~:~~

~~The effective date is the date entities are expected to meet the performance identified in this standard.~~

~~Requirement R1~~ **of New or Revised Standards and** ~~its associated parts shall become effective on the~~

Definitions

First day of the first calendar quarter that is six months beyond the date that PRC-004-3 is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter~~, 3~~ that is six months ~~after~~beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

The proposed definition of Misoperation shall become effective on the same date as PRC-004-3. Entities shall use this definition when implementing any portions of Requirements R1, R2 R3 and R4 that use this defined term.

Implementation Plan for Requirements R1, R2, R3 and R4

Entities shall be 100% compliant on the first day of the first calendar quarter six months following applicable regulatory ~~***approval. In***~~approvals, or in those jurisdictions where no regulatory approval is required, ~~***all requirements go into effect***~~ on the first day of the first calendar quarter~~***, 3***~~ six months ~~***after***~~following Board of Trustees adoption.

Retirement of Existing Standards

~~Because the standard does not deviate significantly from what is required today, it is believed that this standard can be implemented on a relatively short schedule.~~

The existing standards PRC-003-1 and PRC-004-2a shall be retired at midnight of the day immediately prior to the effective date of PRC-004-3.

Project 2010-05.1 Protection System Misoperations

Please **DO NOT** use this form. Please use the electronic comment form at the link below to submit comments on the second draft of the PRC-004-3 standard for Protection System Misoperations. Comments must be submitted by **September 7, 2012.** If you have questions please contact Al McMeekin at al.mcmeekin@nerc.net or by telephone at 803-530-1963.

http://www.nerc.com/filez/standards/Project2010-05_Protection_System_Misoperations.html

Background Information:

The initial draft of this standard and associated documents were posted for a 30-day formal comment period from June 10, 2011 through July 11, 2011. Stakeholders from 106 companies representing all 10 Industry Segments provided feedback. The Protection System Misoperation Standard Drafting Team (PSM SDT) has responded to all commenters and developed a second draft of the standard for Protection System Misoperation Identification and Correction based on stakeholder input. Changes to the standard include:

- Revisions to the definition of Protection System Misoperation.
- Revisions to the Applicability section to include exclusions for relay functions.
- Separating Requirement R1 into four requirements.
- Introducing time intervals and activities in Requirements R1, R2, and R3 associated with identifying, investigating, and addressing Misoperations.
- Addressing Misoperations when two or more entities own separate components in a Protection System.
- Modifying the VRFs and VSLs to reflect the changes listed above.
- Modifying the Guidelines and Technical Basis section to include more explanation and examples for the definition of Misoperation and the requirements.

Please read and review the standard and the Consideration of Comments document carefully before answering the following questions. The '**Guidelines and Technical Basis**' section (pp 15-22) of the standard provides examples and discussion around the technical merits and intent of the requirements, measures, and definition(s), etc. Also, the drafting team's responses to stakeholder's comments and the subsequent changes made to the standard are explained in detail in the **Consideration of Comments** document. A thorough read and review of these documents may eliminate the need for additional comments thereby reducing workload for both the commenters and the drafting team. The PSM SDT is posting this standard for a formal 45-day comment period and successive ballot. The drafting team thanks you in advance for your constructive thoughts.

For questions 1-8, please provide specific comments related to the individual question. Please reserve question 9 for general comments not related to questions 1-9.

1. The definition of "Misoperation" has been revised from the initial posting. Do you agree with the revised definition? If not, please provide specific suggestions for improvement.

   ☐ Yes
   ☐ No

   Comments:

2. Requirement R1 requires the responsible entities to identify and review each Protection System operation that operates the entity's interrupting device, and designate each Misoperation. Do you agree with this approach? If you do not agree, please provide specific alternatives.

   ☐ Yes
   ☐ No

   Comments:

3. Requirements R1, R2, and R3 introduce time limits associated with identifying, investigating, and addressing Misoperations. Do you agree with these time limits? If not, please provide specific reasons why not and alternative recommendations.

   ☐ Yes
   ☐ No

   Comments:

4. The team has modified the standard to address Misoperations when two or more entities own separate components in a Protection System. Do you agree that the standard adequately deals with this situation? If not, please provide specific reasons why not and alternative recommendations.

☐ Yes

☐ No

Comments:

5. Attachment 1 lists and describes the data to be included in the quarterly reporting. Do you believe this data is appropriate for metric analysis? If not, please provide specific suggestions for improvement.

☐ Yes

☐ No

Comments:

6. The team has included VRFs, VSLs, and Time Horizons with this posting. Do you agree with the assignments that have been made? If not, please provide specific reasons why not and alternative recommendations and justifications.

☐ Yes

☐ No

Comments:

7. The team has included Measures and Data Retention with this posting. Do you agree with the assignments that have been made? If not, please provide specific suggestions for improvement.

☐ Yes

☐ No

Comments:

8. The team has included an Implementation Plan with this posting. Do you agree with the changes? If not, please provide specific suggestions for improvement.

☐ Yes

☐ No

Comments:

9. If you have any other comments on this Standard that you **have not already provided in response to the prior questions**, please provide them here.

A. Introduction

1. **Title:** **Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems**

2. **Number:** PRC-003-1

3. **Purpose:** To ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated.

4. **Applicability**

 4.1. Regional Reliability Organization

5. **Effective Date:** May 1, 2006.

B. Requirements

R1. Each Regional Reliability Organization shall establish, document and maintain its procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations. These procedures shall include the following elements:

 R1.1. The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).

 R1.2. Data reporting requirements (periodicity and format) for Misoperations.

 R1.3. Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.

 R1.4. Identification of the Regional Reliability Organization group responsible for the procedures and the process for approval of the procedures.

R2. Each Regional Reliability Organization shall maintain and periodically update documentation of its procedures for review, analysis, reporting, and mitigation of transmission and generation Protection System Misoperations.

R3. Each Regional Reliability Organization shall distribute procedures in Requirement 1 and any changes to those procedures, to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners within 30 calendar days of approval of those procedures.

C. Measures

M1. The Regional Reliability Organization shall have procedures for the review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations as defined in R1.

M2. The Regional Reliability Organization shall have evidence it maintained and periodically updated its procedures for review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations as defined in Requirement 2.

M3. The Regional Reliability Organization shall have evidence it provided its procedures for the review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners as defined in Requirement 3.

D. Compliance

1. **Compliance Monitoring Process**

1.1. Compliance Monitoring Responsibility

NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The Regional Reliability Organization shall retain documentation of its procedures for analysis of transmission and generation Protection System Misoperations and any changes to those procedures for three years.

The Compliance Monitor shall retain any audit data for three years.

1.4. Additional Compliance Information

The Regional Reliability Organization shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Levels of Non-Compliance

2.1. Level 1: Procedures were not reviewed and updated within the review cycle period as required in R2.

2.2. Level 2: Procedures did not include one of the elements defined in R1.1 through R1.4.

2.3. Level 3: Procedures did not include two or more of the elements defined in R1.1 through R1.4.

2.4. Level 4: There shall be a level four non-compliance if either of the following conditions exist:

2.4.1 No evidence of Procedures.

2.4.2 Procedures were not provided to the affected Transmission Owners, Distribution Providers that own transmission Protection Systems, and Generator Owners as defined in R3.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to “en dash” (–) and “em dash (—).” 2. Added “periods” to items where appropriate. 3. Changed “Timeframe” to “Time Frame” in item D, 1.2.	01/20/06

A. Introduction

1. **Title:** **Analysis and Mitigation of Transmission and Generation Protection System Misoperations**

2. **Number:** PRC-004-1a

3. **Purpose:** Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated.

4. **Applicability**

   4.1. Transmission Owner.

   4.2. Distribution Provider that owns a transmission Protection System.

   4.3. Generator Owner.

5. **Effective Date:** To be determined

B. Requirements

R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's procedures developed for Reliability Standard PRC-003 Requirement 1.

R2. The Generator Owner shall analyze its generator Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's procedures developed for PRC-003 R1.

R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Reliability Organization, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Reliability Organization's procedures developed for PRC-003 R1.

C. Measures

M1. The Transmission Owner, and any Distribution Provider that owns a transmission Protection System shall each have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Reliability Organization procedures developed for PRC-003 R1.

M2. The Generator Owner shall have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's procedures developed for PRC-003 R1.

M3. Each Transmission Owner, and any Distribution Provider that owns a transmission Protection System, and each Generator Owner shall have evidence it provided documentation of its Protection System Misoperations, analyses and Corrective Action Plans according to the Regional Reliability Organization procedures developed for PRC-003 R1.

D. Compliance

1. **Compliance Monitoring Process**

1.1. Compliance Monitoring Responsibility

Regional Reliability Organization.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The Transmission Owner, and Distribution Provider that own a transmission Protection System and the Generator Owner that owns a generation Protection System shall each retain data on its Protection System Misoperations and each accompanying Corrective Action Plan until the Corrective Action Plan has been executed or for 12 months, whichever is later.

The Compliance Monitor shall retain any audit data for three years.

1.4. Additional Compliance Information

The Transmission Owner, and any Distribution Provider that owns a transmission Protection System and the Generator Owner shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Levels of Non-Compliance for Transmission Owners and Distribution Providers that own a Transmission Protection System:

2.1. Level 1: Documentation of Misoperations is complete according to PRC-004 R1, but documentation of Corrective Action Plans is incomplete.

2.2. Level 2: Documentation of Misoperations is incomplete according to PRC-004 R1 and documentation of Corrective Action Plans is incomplete.

2.3. Level 3: Documentation of Misoperations is incomplete according to PRC-004 R1 and there are no associated Corrective Action Plans.

2.4. Level 4: Misoperations have not been analyzed and documentation has not been provided to the Regional Reliability Organization according to Requirement 3.

3. Levels of Non-Compliance for Generator Owners

3.1. Level 1: Documentation of Misoperations is complete according to PRC-004 R2, but documentation of Corrective Action Plans is incomplete.

3.2. Level 2: Documentation of Misoperations is incomplete according to PRC-004 R2 and documentation of Corrective Action Plans is incomplete.

3.3. Level 3: Documentation of Misoperations is incomplete according to PRC-004 R2 and there are no associated Corrective Action Plans.

3.4. Level 4: Misoperations have not been analyzed and documentation has not been provided to the Regional Reliability Organization according to R3.

E. Regional Differences

None identified.

1.a	February 17, 2011	3. Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1.a	February 17, 2011	Adopted by the Board of Trustees	

Appendix 1

Requirement Number and Text of Requirement
R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's procedures developed for Reliability Standard PRC-003 Requirement 1. **R3**. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Reliability Organization, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Reliability Organization's procedures developed for PRC-003 R1.
Question:
Is protection for a radially-connected transformer protection system energized from the BES considered a transmission Protection System subject to this standard?
Response:
The request for interpretation of PRC-004-1 Requirements R1 and R3 focuses on the applicability of the term "transmission Protection System." The NERC Glossary of Terms Used in Reliability Standards contains a definition of "Protection System" but does not contain a definition of transmission Protection System. In these two standards, use of the phrase transmission Protection System indicates that the requirements using this phrase are applicable to any Protection System that is installed for the purpose of detecting faults on transmission elements (lines, buses, transformers, etc.) identified as being included in the Bulk Electric System (BES) and trips an interrupting device that interrupts current supplied directly from the BES. A Protection System for a radially connected transformer energized from the BES would be considered a transmission Protection System and subject to these standards only if the protection trips an interrupting device that interrupts current supplied directly from the BES and the transformer is a BES element.

A. Introduction

1. **Title:** Analysis and Mitigation of Transmission and Generation Protection System Misoperations

2. **Number:** PRC-004-2

3. **Purpose:** Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated.

4. **Applicability**

   4.1. Transmission Owner.

   4.2. Distribution Provider that owns a transmission Protection System.

   4.3. Generator Owner.

5. **(Proposed) Effective Date:** The first day of the first calendar quarter, one year after applicable regulatory approval; or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter one year after Board of Trustees' adoption.

B. Requirements

R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.

R2. The Generator Owner shall analyze its generator Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.

R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.

C. Measures

M1. The Transmission Owner, and any Distribution Provider that owns a transmission Protection System shall each have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.

M2. The Generator Owner shall have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.

M3. Each Transmission Owner, and any Distribution Provider that owns a transmission Protection System, and each Generator Owner shall have evidence it provided documentation of its Protection System Misoperations, analyses and Corrective Action Plans according to the Regional Entity's procedures.

D. Compliance

1. **Compliance Monitoring Process**

   1.1. Compliance Enforcement Authority

   Regional Entity.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

The Transmission Owner, and Distribution Provider that own a transmission Protection System and the Generator Owner that owns a generation Protection System shall each retain data on its Protection System Misoperations and each accompanying Corrective Action Plan until the Corrective Action Plan has been executed or for 12 months, whichever is later.

The Compliance Monitor shall retain any audit data for three years.

1.5. Additional Compliance Information

The Transmission Owner, and any Distribution Provider that owns a transmission Protection System and the Generator Owner shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Violation Severity Levels (no changes)

E. Regional Differences

None identified.

Project 2010-05.1 – PRC-004-3: Protection System Misoperations

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-004-3 — Protection System Misoperations.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Protection System Misoperations Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report
The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.
In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

PRC-004-3 Protection System Misoperations is a revision of PRC-004-2a Analysis and Mitigation of Transmission and Generation Protection System Misoperations with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated. PRC-003-1 Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems required the Regions to establish procedures for analysis of Misoperations. In the NOPR, the Commission identified PRC-003-0 as a fill-in-the-blank standard. The NOPR stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2a.

PRC-004-3 has four (4) requirements that incorporate and enhance the intent of the requirements of PRC-004-2.1a and PRC-003-1. The revised standard requires entities to identify and review Protection System operations and designate each Misoperation; then investigate each Misoperation and document the findings. If a cause is identified, the entity either creates a Corrective Action Plan (CAP) or writes a declaration that they cannot correct the misoperating device(s). If a cause is not identified, the entity either creates an action plan for additional investigation or a writes a declaration that no further work will be done. The next step is to implement and complete the CAP or action plan. If the action plan leads to the determination of a cause, then the entity would either create a Corrective Action Plan (CAP) or write a declaration. The requirements recognize and encompass the possibility that components of a Protection System can be owned by different entities.

The requirements of PRC-004-3 do not map, one-to-one, with the requirements of the legacy standards. The new requirements comingle various reliability attributes of the legacy standards with new reliability objectives, thus a requirement-to-requirement comparison of VRFs is not possible. In developing the new VRFs for the requirements of PRC-004-3, the Standard Drafting Team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. The VRFs of the FERC approved PRC-004-WECC-1, EOP-008-1, PRC-004-2a and of TPL-001-2 influenced (citing FERC VRF Guideline 3) the drafting team's VRF decisions, as such, the VRFs for PRC-004-3 Requirements R1, R2 and R3 are assigned a VRF of Medium, while Requirement R4 is assigned a VRF of High.

PRC-004-3 Requirements R1, R2 and R3 are related to identifying Protection System operations, designating Misoperations, investigating Misoperations and developing Corrective Action Plans (CAP) or action plans. The SDT determined that the assignment of a VRF of Medium was consistent with the NERC criterion that states "A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures…"

PRC-004-3 Requirement R4 relates to implementing and completing CAPs or action plans. The SDT determined that the assignment of a VRF of High was consistent with the NERC criterion that states "A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures…"

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF and VSL Justifications – PRC-004-3, R1	
Proposed VRF	Medium
NERC VRF Discussion	Failure to identify and review each Protection System operation to designate Misoperations, investigate each Misoperation and document the findings could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. Unresolved Misoperations could contribute to more severe future disturbances affecting a wider area, or result in equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The applicable entities are always responsible for maintaining the reliability of the bulk electric system regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The requirement has Parts that all support the reliability objective so only one VRF was assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: The SDT has assigned a Medium VRF which is consistent with EOP-008-1 Requirement R8 (which is similar in nature to PRC-004-3 Requirement R1.)
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to identify and review each Protection System operation to designate Misoperations, investigate each Misoperation and document the findings could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. Unresolved Misoperations could contribute to more severe future disturbances affecting a wider area, or result in equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The applicable entities are always responsible for maintaining the reliability of the bulk electric system regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.

VRF and VSL Justifications – PRC-004-3, R1			
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; the assigned VRF of Medium is consistent throughout the requirement.		
Proposed VSL			
Lower	Moderate	High	Severe
The responsible entity performed the actions in accordance with Requirement R1, Parts 1.1 – 1.3 in more than 120 calendar days but less than or equal to 130 calendar days of the operation's occurrence. OR The responsible entity identified a Protection System operation that operated one of its interrupting devices but failed to review the operation in accordance with Requirement R1, Part 1.1. OR The responsible entity completed its review of a Protection System Operation that operated one of its interrupting devices in 120 calendar days and determined	The responsible entity performed the actions in accordance with Requirement R1, Parts 1.1 – 1.3 in more than 130 calendar days but less than or equal to 140 calendar days of the operation's occurrence. Standards Announcement

Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)

Ballot Pools Forming:	July 25 – August 27, 2012
Formal Comment Period Open:	July 25 – September 7, 2012

Upcoming Ballots:

Initial Ballot and Non-Binding Poll:	August 29 – September 7, 2012

Now Available

A formal comment period for **PRC-004-3 – Protection System Misoperation Identification and Correction** is open through 8 p.m. Eastern on Friday, September 7, 2012. Two ballot pools, one for the standard and one for the associated VRFs and VSLs, are open through **8 a.m. Eastern on Monday, August 27, 2012.**

Instructions for Joining Ballot Pool(s)

Two ballot pools are being formed. Registered Ballot Body members must join the first ballot pool to be eligible to vote in balloting of standard PRC-004-3, and a second, separate ballot pool to be eligible to cast an opinion in the non-binding poll of the associated VRFs and VSLs. Registered Ballot Body members may join each of these ballot pools at the following page: Join Ballot Pool

Note that there is no requirement to join both of these ballot pools; Registered Ballot Body members who are only interested in voting during the ballot of the standard are not required to join the ballot pool for the non-binding poll, and vice versa.

During the pre-ballot windows, members of the ballot pools may communicate with one another by using their "ballot pool list servers." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The ballot pool list servers for these ballot pools are:

Initial ballot: bp-2010-05.1_PRC-004-3_in@nerc.com
Non-binding poll: bp-2010-05.1_PRC-004_NB_in@nerc.com

The ballot pools are open **through 8 a.m. Eastern on Monday, August 27, 2012.**

Instructions for Commenting

A formal comment period is open through **8 p.m. Eastern on Friday, September 7, 2012**. Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Please read carefully: All stakeholders with comments (both members of the ballot pool as well as other stakeholders, including groups such as trade associations and committees) must submit comments through the electronic comment form. During the ballot window, balloters who wish to submit comments with their ballot *may no longer enter comments on the balloting screen*, but may still enter the comments through the electronic comment form. Balloters who wish to express support for comments submitted by another entity or group will have an opportunity to enter that information on the electronic survey, and are not required to answer any other questions.

Next Steps

An initial ballot of the standard and non-binding poll of the associated VRF/VSLs will be conducted beginning on Wednesday, August 29, 2012 through 8 p.m. Eastern on Friday, September 7, 2012.

Background

PRC-004-3 Protection System Misoperations is a revision of PRC-004-2a Analysis and Mitigation of Transmission and Generation Protection System Misoperations with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated. PRC-003-1 Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems required the Regions to establish procedures for analysis of Misoperations. In the NOPR, the Commission identified PRC-003-0 as a fill-in-the-blank standard. The NOPR stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2a.

Project 2010-05.1 is an important part of the ERO's strategic goal to develop technically sufficient standards with requirements that provide clear and unambiguous performance expectations and reliability benefits.

Standards Development Process

The Standards Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Standards Announcement

Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)

Initial Ballot and Non-Binding Poll Results

Now Available

An initial ballot for **PRC-004-3 – Protection System Misoperation Identification and Correction** and a non-binding poll of the associated VRF/VSLs concluded on Friday, September 7, 2012.

Voting statistics for each ballot are listed below, and the Ballots Results page provides a link to the detailed results.

Approval	Non-binding Poll Results
Quorum: 86.71%	Quorum: 84.17 %
Approval: 37.68%	Supportive Opinions: 37.36 %

Next Steps

The drafting team will consider all comments received during the formal comment and ballot period and, if needed, make revisions to the standard. If significant changes are made, the drafting team will submit the standard for quality review prior to posting for a successive ballot.

Background

PRC-003-1 Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems required the Regions to establish procedures for analysis of Misoperations. In the NOPR, the Commission identified PRC-003-0 as a fill-in-the-blank standard. The NOPR stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2a. This is a potential reliability gap; as a key Element for BES reliability is the correct performance of Protection Systems. PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2a.

Project 2010-05.1 is an important part of the ERO's strategic goal to develop technically sufficient standards with requirements that provide clear and unambiguous performance expectations and reliability benefits.

Standards Development Process

The [Standards Processes Manual] contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Monica Benson,
Standards Process Administrator, at monica.benson@nerc.net or at 404-446-2560.

Project 2010-05.1

Ballot Results	
Non-binding Poll Name:	Project 2010-05.1 Non-binding Poll
Poll Period:	8/29/2012 - 9/7/2012
Total # Opinions:	335
Total Ballot Pool:	398
Summary Results:	84.17% of those who registered to participate provided an opinion or an abstention; 37.36% of those who provided an opinion indicated support for the VRFs and VSLs.

Individual Ballot Pool Results

Segment	Organization	Member	Opinions	Comments
1	Ameren Services	Kirit Shah	Negative	
1	American Electric Power	Paul B. Johnson	Abstain	
1	Arizona Public Service Co.	Robert Smith	Affirmative	
1	Associated Electric Cooperative, Inc.	John Bussman	Affirmative

Northeast Power Coordinating Council
Guy Zito
Northeast Power Coordinating Council
Yes
No
Requirement R1 (as well as the other Requirements in the Standard) should be formatted to start with “Each…”. For consistency with the preferred format of all NERC Standards, a Requirement should start with the responsible entities, followed by under under what conditions, and then what they have to do. The use of the words “in its Facility” should be changed to reflect what is being protected. Suggested wording for consideration: R1. Each Transmission Owner, Generator Owner, and Distribution Provider within 120 calendar days of a Protection System Misoperation initiating an interrupting device operation in its system shall have and implement a procedure to identify and address all Protection System Misoperations within its system. Closure is also needed in the procedure to ensure a definitive corrective response to a misoperation to prevent its recurrence.
No
As with R1, Requirements R2 and R3 should be formatted to start with “Each...”. For consistency with the preferred format of all NERC Standards, a Requirement should start with the responsible entities, followed by under under what conditions, and then what they have to do. The time limits specified are excessive for plans that do not include correcting the problem. Correction of Misoperations is extremely important to reliability because the Misoperation may indicate a defect that could have significant consequences. The time limit for R1 should be 15 calendar days, an additional 15 calendar days for R2, and 15 days for R3. A definite completion time period for correcting the Misoperation should also be specified. Sixty days would not be an excessive time assuming outages may be needed, hardware ordered, etc. to prevent a recurrence.
Yes

No
An additional field should be added to improve the metric analysis of microprocessor relay malfunctions. For example, the field value for a microprocessor relay malfunction could include the following: Setting Error-Incorrect Numerical Input Specified Setting Error-Incorrect User-Programmed Custom Logic Incorrect Design-Incorrect User Application Incorrect Design-Wiring Firmware Version Mismatch by User Others
No
There should be no respopnse to this question. I can't deselect either "Yes" or "No".
Yes
Yes
Measurement M1 has that "Acceptable evidence for Part 1.3 may include, but is not limited to, a copy of dated investigation report or documented findings for each Misoperation." This provides a choice in a document type with either a formal report or other method of documenting the findings. On page 22 of 28 of PRC-004-3, in the Application Guidelines section, it states "An investigation report may include...” which dictates the use of an investigation report, and eliminates the choice between a formal report or other method of documenting findings as stated in M1. The Application Guidelines should be consistent with the standard portion of the document. There is a typographical error on the first bulleted item on page 6 of the standard. This item should read: Analyze Misoperations of Protection Systems for Facilities that are part of the BES to determine the cause(s).

In the VSL for R4 this is listed as a High Severity. We feel that small entities which are on a 6 year audit cycle could have issues with document retention. Small entities 6 year entities do not have the resources to have the backup systems that larger entities. Also 6 year entities do not have the space and budget to ensure all documents are retained.
No
As stated in Questin 6, we feel that a 6 year data retention policy could prove onerous to small entities. We would prefer a much smaller data retention policy, such as 3 years (which would be the retetion period of large entities.

With the proposed time limits, NERC may have to clarify how and when entities submit to the RE database misoperations that are still under investigation.
No
If Owner A notifies Owner B that Owner B’s component contributed to a misoperation, after being notified, Owner B should be responsible for performing misoperations analysis and reporting. The way the standard reads, there is no responbility for Owner B to investigate a component that didn’t operate but did contribute to a misoperation.
Yes
Yes
Yes
In Section C 1.2, the following sentence does not seem to make sense because there are no shorter time periods specified: “For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.”

For 1 through 3, The definitions should be revised to remove the need for the clarifications in parenthesis. One such revision should include clarifying the scope of a ‘Protection System.’ It is not clear whether multiple protection schemes for a single element would be considered one ‘Protection System’ or if each scheme is considered a ‘Protection System’. It may require clarifying the definition of ‘Protection System’ within NERC Glossary or addressing directly in this standard. What is the definition of ‘slow?’ Is it only defined by TPL standards or expected operation time designed into the ‘Protection System?’
No
Requirement R1 states that all operations need to be identified and reviewed. This requirement should clarified to exempt out-of-service equipment.
No
R1, 120 calendar days may not be enough time for those instances when multiple outages occur during large storms such as hurricanes, tornadoes, etc. This needs to be addressed in R1 and should allow that an extension can be requested for those types of events reported in DOE 417 and EOP 004.
No
It is unclear between R1 and R4 who needs to report the misoperation. R4 should specify the owner of the component that initiated the misoperation as the reporter so that a single misoperation is not reported by multiple entities. In 1.1 once notified, the other entity should be allowed additional time (possibly another 120 days?) to analyze the Protection System operation to determine the component that malfunctioned. As written there is only a single timeframe beginning with the outage. The word ‘necessary’ should be included between ‘any’ and ‘requested’ in R1.1.
No
If an entity is required to report a misoperation due to a malfunction of another entity’s component, then there should be a space for the other Registered Entity’s name.
No
The interval between severity levels should be 30 days instead of 10 days. For the lower severity level associated with R4, the standard of ‘incomplete records’ is subjective unless M4 is revised.
No
M1, M2, M3 seem sufficient. M4 is unclear. Please clarify. The following would be clearer. M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R4 that must include dated electronic or hard copy records that document the implementation, completion and any revision to each CAP or action plan. Acceptable records include, but are not limited to: - Dated work management program records - Dated Work orders - Dated Maintenance Records
Yes
Based on the specified time intervals quarterly reports will likely hinder the process, suggest changing the data submittal to semiannual and for it to be submitted within 90 days following the end of the

first or second half of the year. This comment was provided in July 2011, but the response did not explain the reason for quarterly reports. If the SDT feels it should remain, then please provide a technical justification for this decision. Has the “Application Guidelines” been thoroughly reviewed? Why haven’t there been any questions regarding what is in these guidelines? None of the Requirements, Measures or Compliance sections mentions it, so it should be treated only as a reference-guide. R2, first bullet point requires an entity to analyze the applicability of a CAP to other protection systems. This should be removed as it exceeds the scope of this standard.
Group
Western Small Entity Comment Group
Steve Alexanderson
Central Lincoln
No
The comment group is concerned with the use of the phrase “slower than intended” in definition 4. The actual intended speed of operation is/was in the mind of the protection engineer who may not necessarily be available to testify regarding his intent for every fault. Settings documentation generally does not show speed of operation, only set points and manufacturer curves. A speed of operation may be derived from these settings right down to the millisecond, but the protection engineer did likely count on this level of precision after considering CT and relay measurement error and coordinating margin. Lacking a tolerance, the documented settings do not fully show the “intent.” In addition the documentation itself may be in error and possibly be the cause of a misoperation (although not by this definition if we use the document to gage intent). Entities and Compliance Enforcement will need more guidance from the drafting team on just how to measure “slower than intended”, and to understand just how slow that is. In the end, however, it is not the intended speed that matters, it is the result. The parenthetical suggests it is the result that counts, but we don’t see the parenthetical overruling the “slower than intended” language. Slow Trip - During Fault - A slow Protection System operation for a Fault within the zone it is designed to protect, resulting in miscoordination with other Protection Systems or failure to meet the performance requirements of the TPL standards.
No
The comment group does not agree that every operation needs to be reviewed; only those that are clearly misoperations or are suspected to be misoperations should need to be reviewed. Reviewing and documenting the review of proper operations provides no reliability benefit and may cause a detriment to reliability by directing resources away from where they might make a difference.
Yes
Yes
Yes
But we do not like the new format. Having each event on an individual line made the information easier and quicker to find. The new format has each event spread over many rows and columns.
No
Violation risk factors should be entity specific based on the equipment owned and their place in the system and not on the requirement alone.
No
We disagree with M1 for the same reason we disagree with R1 in Q2 above.

Seattle City Light (SCL) does not agree with the time limits. SCL agrees that it is important for reliability that Misoperation CAPs be created and implemented within a reasonable time, but does not believe that the reliability benefit that might possibility accrue from meeting staged interim deadlines for analysis and for creating a CAP outweighs the administrative compliance burden created to document that each interim deadline has been met. SCL instead recommends that a single time limit be required for implementing an appropriate CAP following each Misoperation. Furthermore, SCL recommends a somewhat longer period, of either 240 or 365 days, to accommodate seasonal constraints. For SCL, elements associated with a Misoperation occurring in October at the beginning of the winter storm season might, in a heavy winter, not be available for operational analyses and testing until the following March or April, a length of time that could exceed 180 days. Such seasonal constraints are not unique to SCL, but also exist in summer for entities in the southern parts of North America.
Yes
No
I) There are too many classification choices in the “Resolution Status” field of the report form. An equally effective status report can be delivered using three choices: 1) Analysis In Progress [Still Under Investigation]; 2) Analysis Completed – Corrective Action Plan Pending; 3) Corrective Action Completed [Investigation Complete, Corrective Action Complete] II) The form for GOs should differ from that for TOs, for the following reasons: a. GOs are not in a position to respond to the last item on p.1, “Additional BES Interruptions.” We know only what happens in our plants, not repercussions on the grid. b. The “slow trip” entries in the “Misoperations Category” do not apply for the majority of Misoperations reported by GOs. The presence of such categories in the draft standard appears to derive from the belief that millisecond-resolution records of Misoperations are always available from DME; but, when this equipment is present at generation plants, it is installed only at the GSU and (if the GO is the owner) the yard breaker – that is, on high-side equipment. The DME is consequently not expected to yield any useful information for Faults occurring at the generator or other low-side components. Notes should be added to PRC-004-3 and the Application Guidelines to the effect that DME downloading and speed-of-response analysis pertain at generation Facilities only when DME is present and only to incoming Faults from the grid.
No
For R1, R2 and R3, SCL does not believe it is appropriate to increase the violation severity level based on the number of days beyond the required completion date. A company could have a great process and record of analyzing and correcting misoperations and receive a severe violation for a clerical error. Any potential violations in this area related to documentation and/or timing may fall into the “Find, Fix, and Track” category or non-zero-defect treatment, and the VRF and VSL levels ought to be set in order to allow for the FFT process to apply. It would be more appropriate to issue a lower VSL for a single instance of missing the required completion date or lacking documentation for a single event. A moderate or high VSL should be issued for missing multiple completion dates or lacking documentation in several areas. A severe VSL should be issued for not having a program or any evidence of achieving the requirement.
Yes
Yes

While Seattle City Light generally agrees with the concepts presented in the draft Standard and appreicates the effort required to develop and review Standards, SCL finds the reliability improvements promised by the draft to be diluted with unnecessary backwards-looking compliance activities. The draft appears tone-deaf to the changes at NERC regarding purely administrative tasks (e.g., Paragraph 81 effort to remove them, whereas this draft adds several such as R4.2 and the second bullets of R2 and R3). One example is the emphasis on meeting and documenting multiple dates for each Misoperation. Another is a need to document completion of each Misoperation CAP almost as if it were a Mitigation Plan to correct a Self-Reported violation, rather than, for example, relying primarily on the corrective action documentation already reported for GADS and TADS. The draft also would benefit from application of the non-zero-defect concepts introduced with the latest draft of CIP version 5. Changes such as these will minimize the need to revise the Standard yet again to align with present directions.

Need clarification on what is meant by referencing the TPL performance standards in section 3.
No
Please add some example(s) in the Guidelines and technical reference that outline what is meant for the review in R1. Does a review require a detailed report or could a simple check box be used for a review?
No
For those Major disturbances there needs to be a mechanism for extending the timeframes without being penalized. Additionally 60 days might not be enough time to procure funds for the CAP. We are ok with the time requirement on R3.
No
There is an issue with the timing and requesting data from these other entities that own part of the protection system. There isn't a timeframe for the other entity to return the data requested and seems like this could cause an entity to not meet the timeframes specified in the requirements. Also going back to the Major disturbance if multiple entities are hit then they will be busy taking care of their own operations and may not have time to coordinate the data request in a timely maner.
No
Our issue is not with the requested data but how the data is submitted. The current spreadsheet is very cubersome and needs to be reformatted.
No
It seems to us the SDT spends too much time on the VRFs and VSLs. An Entity is either compliant or not and verifying whether you are within so many days seems perculiar. Why was ten days choosen and not 30 or 45 days? The high VRF in requirement R4 applies to both 4.1 and 4.2. We agree that 4.1 should be a high VRF since it has to do with the actual implementation. On the other hand 4.2 seems to be purely administrative dealing only with maintaining implementation records. We don't agree that this is a high VRF. In fact we question if it should even be included in this requirement and should fall under the Paragraph 81 project that is ongoing.
Yes
Yes
In R2 under the first bullet the way it reads it would seem that you have to look at your entire system for a single misoperation. In example if you had the wrong setting on a single 421 do you have to go and look at every 421 on your system. This seems overly burdensome and could lead to someone constantly looking at the system. If you had a certain relay failure at one location do you go to all other locations that have that relay? If so then would you have to prove that at other locations you don't have this particular relay? The team may want to look at rewording this bullet maybe taking a sample of equipment or adding an additional bullet and gather all the CAPS for the year and review

the system over a 24 month period, but doing this all the time seems overly burdensome. Under the Application Guidelines generator protection section it has some language that is conflicting with section 6 of the proposed definition. We would suggest that the reference in the guidelines be removed. This could cause confusion with the industry and lead to mis classification of misoperations.

Distinguishing between NERC and WECC time requirements and deciding which is "more stringent" is too confusing and time-consuming. WECC requirements should fully complement and enhance NERC requirements. The WECC quarterly reporting system already in place is essentially a good one. In a nutshell: Q1. W/in 60 days of end of Q1 - elements of PRC-004-3.R1, Q2. W/in 60 days of end of Q2 - CAP created and documented, Q3. W/in 60 days of end of Q3 - CAP in place or reason for no CAP.

Yes
Yes
Yes
Yes
No
Establishing the "most stringent" standard between WECC & NERC requirements will be difficult and time-consuming. Regional standards should fully complement and enhance NERC Standards. To that end, the NERC standard PRC-004 should be written such that the related WECC standards CAN fully complement and enhance it.

The existing definition of misoperation in the NERC Glossary of Terms indicates that if any individual component of a Protection System fails it is considered a misoperation. This new PRC-004-3 proposed definition modifies the definition by treating the primary and back-up protection schemes protecting a circuit element as a composite protective system. Individual component failures would not be considered a misoperation if the “overall performance of the composite Protective System for an element is correct.” We support this intent, but feel that the present wording in the proposed misoperation definition is not clear enough to adequately emphasize this distinction. The capitalized term Protection System, which is a NERC defined term, is used throughout this standard. However, the applicability of the proposed misoperation definition applies to the “Composite Protective System”, and not to each of the primary and backup Protection Systems individually. This point must be made very clear in the misoperation definition, since it is the foundation of the requirements in PRC-003-4. As such, either a new term “Composite Protective System” needs to be defined and the language in the misoperation definition and PRC-004-3 changed to reference this term; OR a qualifying paragraph could be included within the misoperation definition that states that “In the context of this misoperation definition a Protective System is considered to be the entire complement of protective system components (including both primary and backup protection systems) designed to protect a circuit Element.”
No
1) The responsibility for R1 through R4 should be on the owner of the Protection System which initiated the interruption of a BES facility and not the owner of the interrupting device. The one who owns the interrupting device is not necessarily the one who owns the Protective System. For example, it is not uncommon for a generator to be interconnected to a TO switchyard, where the TO owns the breakers (interrupting devices) in the switchyard but the GO owns the Protection Systems protecting his generator unit. The GO Protection Systems trip the TO’s breakers to isolate the unit from the system. The way the present standard is written the TO would be responsible for also reviewing all GO protection initiated trips because the TO owns the interrupting device. This is unreasonable. The party who owns the Protective System(s) that protect the BES facility that was interrupted should be the one responsible for reviewing those Protective System operations and for developing any appropriate corrective action plans. Because of compliance implications the standard must make a very clear division of compliance responsibilities between the parties when interconnected Protective Systems are involved. The owner of the Protective System(s) that initiated the trip of the BES facility should be the one responsible for reviewing the operation for correctness (R1). The owner of the Protective System(s) whose misoperation led to the interruption of a BES Facility should be the one responsible for identifying the cause and developing and implementing a corrective action plan (R2,

R3, and R4). To make this perfectly clear we suggest re-wording Requirements R1, R2, R3, and R4 as follows: R1. Within 120 calendar days of an operation of an interrupting device which interrupts a BES Facility that was caused by a Protective System operation, each Transmission Owner, Generator Owner, and Distribution Provider, who owns a Protective System which protects the BES Facility that was interrupted shall: … R2. Within 60 calendar days of identifying the cause(s) of each Misoperation, the Transmission Owner, Generation Owner, or Distribution Provider, whose Protection System misoperated, shall… R3. For each misoperation without an identified cause(s), the Transmission Owner, Generation Owner, or Distribution Provider, whose Protection System misoperated, shall… R4. For each CAP or action plan, the Transmission Owner, Generation Owner, or Distribution Provider, whose Protection System misoperated, shall…. 2) What does R1.2 "Designate each misoperation" mean? Perhaps a more descriptive phrase would be "Designate which operations involve a Protective System Misoperation" OR "Identify and document each Protective System Misoperation".
Yes
The timeframes for R1, R2 & R3 are acceptable, since Requirement R3 provides a reasonable alternative if the investigation cannot be completed within the allotted 120 days in R1 (due to outage constraints, severe weather, resources, etc.). However, the commentary in the Rationale for R2 is misleading and incorrect with regard to the statement that 60 days is reasonable for the procurement of funds for a CAP. Capital dollars needed to fund larger CAP's (like other capital improvement projects) are budgeted for during a yearly budget cycle, usually in the fall of the preceding budget year. As such, unless the CAP was small and can be funded by an emergency blanket project it could take up to a year to get the necessary funding approved. We would suggest removing the procurement of funds from the R2 Rationale since it is not a pre-requisite for developing a CAP.
No
The responsibility for R1 through R4 should be on the owner of the Protection System which initiated the interruption of a BES facility and not the owner of the interrupting device. See extensive comments on this subject in our response to Question 2 (Requirement R1).
Yes
No
The language in the VSL's for Requirement R2 should be changed to match the language in the Requirement. The present language uses the phrase "…following the completion of the investigation or receiving notification." That phrase should be eliminated and instead the phrase "…after the cause of the misoperation has been identified" should be inserted.
No
The proposed data retention requirements seem reasonable. However, the following comments are offered in order to improve clarity and avoid confusion regarding the wording of Measures M1 and M2. 1) The wording on Measure M1 should be revised to substitute Requirement numbers in place of Part numbers. For example, it should read "shall have evidence for Requirement R1.1 that…." Instead of "shall have evidence for Part 1.1 that…." In addition, because the list of evidence is not all inclusive it should end with the phrase "or other records". For example, "but is not limited to dated lists, logs, databases, or other records, that document…" 2) Measurement M2 requires evidence which must include a "dated CAP". It is unclear what a "dated CAP" means. Does it refer to the date the CAP was developed; the date the CAP is proposed to be completed by; or both? This needs to be clarified.
No
We agree with the timetable associated with the implementation of the new definition of a misoperation and for implementing the requirements in PRC-004-3. However, the following changes in the commentary included in the Implementation Plan should be made: 1) Re-word the definition of misoperation in accordance with the comments that we provided in Question 1 in this form. 2) Modify the list of "Facilities not included" to add Underfrequency Load Shedding (UFLS). 3) Modify the list of "Facilities not included" to expand on the Control section as follows: "Control (e.g. controlled shutdown of generators, capacitor bank switching, and SVC, FACTS and HVDC control system actions. Also see Guidelines and Technical Basis section for detailed examples)" Although the list is not intended to be all inclusive, mentioning the most frequently used control systems negates the need to have to refer to the additional Guidelines and Technical Basis for most applications.
1) In Section 4.1.3 the wording should be changed to "Distribution Provider that owns a transmission

Protection System". This makes it consistent with the wording from previous versions of PRC-004, which recognized that it only applies to owners of Protection Systems that are applied to protect BES facilities. 2) A new Section 4.2.2.3 "Underfrequency Load Shedding (UFLS)" should be added under the Applicability Section "Facilities not included." Although UFLS schemes are Protection Systems covered under PRC-005 and are installed to preserve the BES from system underfrequency disturbances, they should not be included in this standard. Failing to specifically exclude them from this standard may lead to the assumption that they are by omission, included. Performance of UFLS schemes during system events are already covered in PRC-009, and as such do not need to be included in PRC-004-3. 3) Modify the list of "Facilities not included" to expand on the Control section as follows: "Control (e.g. controlled shutdown of generators, capacitor bank switching, and SVC, FACTS and HVDC control system actions. Also see Guidelines and Technical Basis section for detailed examples)" Although the list is not intended to be all inclusive, mentioning the most frequently used control systems negates the need to have to refer to the additional Guidelines and Technical Basis for most applications. 4) On page 6 of the Background section of PRC-004-3 there is a typographical error on the second bulleted item, "Analyze Misoperations of Protective Systems for Facilities ...." The word "of" is missing. 5) Also in the Background section the reason for the exclusion of UFLS should be addressed. 6) In Requirement R2 first bullet item remove the phrase "for the identified Protection System component(s)". The term "component" should not be used, as it may lead to confusion. Individual Protection System component failures do not require a CAP unless the overall performance of the Composite Protection System for an Element was compromised. The bullet should instead read: "Develop and document a Corrective Action Plan (CAP) to address the identified misoperation that includes...". 7) By NERC definition each CAP must contain a timeline for implementation. Requirement R4.1 requires you to complete the CAP. Does that mean that to be fully compliant the CAP must be completed within the proposed timeline stated in the CAP? If so, there needs to be a mechanism to revise the proposed completion date when circumstances arise that prevent implementation in accordance with the originally proposed timeline (denial of facility outages, equipment delivery problems, major storm events, etc.) without being held non-compliant. R4.2 "implies" that the CAP can be revised (presumably including the proposed completion date) as long as it is documented. If this is a correct interpretation of R4.2 then there is a mechanism to revise a CAP's proposed completion date. On the other hand, this would allow the implementation of a CAP to be extended indefinitely by continuing to revise the proposed completion date. We doubt this is what the Standard Drafting Team intended. As such, the SDT may want to revisit the language dealing with revisions to a CAP.

1. In R1, the existing wording begins with: "Within 120 calendar days of an interrupting device operation ...". This wording does not specifically require a review in situations where an interrupting device fails to operate for a fault or abnormal condition. Perhaps the wording should be expanded to include these non-operations in the requirement as well.

Yes
Yes
No
Under Equipment Type: Add an equipment Type, such as "Generator Tie Line", to indicate the conductors from the generator step-up transformer high-voltage terminals to the substation/switchyard bus. These conductors are not considered transmission Lines, so the "Line" equipment type designation would not be appropriate for these.
No
We suggest that the Time Horizon for all four Requirements should be the same, "Operations Planning, Long-Term Planning". R1 is presently listed as Operations Assessment, Operations Planning.
No
In M1, the acceptable evidence for Parts 1.1 and 1.2 should also include "electronic or hard copy records", as it does for the notification required by Part 1.1.
Yes
In the Applicability section, in 4.2.3 relay functions not included, under 4.2.3.1 Control: add "Generator Excitation controls/limiters and turbine controls" to the existing exclusions list. The revised wording suggested is: "4.2.3.1 Control (e.g. controlled shutdown of generators, generator excitation controls/limiters, turbine controls, capacitor or reactor bank switching".

Although we agree with most components of the definition, it is not clear to us what constitutes a “Failure to Trip”. For example, in cases of redundant “A” and “B” protection systems, if the “A” protection trips, but the “B” protection does not trip, would this be a misoperation reportable as a “Failure to Trip”? The first sentence of the second last paragraph of section A is not clear: “Misoperation of or associated with Special Portection schemes ….”
No
The wording of this requirement is not clear enough for us to determine if we agree with it. Specifically, in R1.1 it is not clear how extensive the review of each Protection System operation should be. In reading the words of the Requirement versus the words in the associated Measures, the review process seems a lot less onerous in the wording of the requirements versus the wording of the measure. Perhaps adding additional wording to the requirement, listing the steps that should to be undertaken during the review, or even providing a review template would provide additional clarity and consistency. An entity cannot be found non-compliant with a measure, only a requirement, so the requirement should be clear when read on its own without the measure.
No
The time limit for R2 should be changed from “60 calendar days of identifying the cause” to “180 calendar days from the misoperation”. Requiring the entity to track both the date of the operation (for R1) and the date the cause was identified (R2) seems like unnecessary work. This suggestion does not change the maximum time to complete R2.
Yes
Yes
No
Many of the requirements in this standard appear to be administrative or documentation based. It is therefore surprising to us that the VRFs and VSLs would be so high. As we understood it, NERC would

like to eliminate documentation-based requirements. Was that not the purpose of Project 2013-02 Paragraph 81? For documentation-based requirements, the VSLs appear to have very little leeway. For example, in R1 if an entity is 20 days late the VSL jumps to High. This seems disproportionate in comparison to the insignificant reliability impact that delaying the review by 20 days will have on the BES. An entity should be late by significantly more time to warrant going up to a High or Severe VSL. In terms of the VRFs, we do not agree that structured misoperation reporting will reduce misoperations and therefore feel that the VRFs should be lowered from Medium (R1, R2, R3) and High (R4) to Low and Medium. VSLs - R2 - The time frames should run from the 'identification of the cause(s) of each Misoperation' rather than completion of the investigation or receiving notification to be consistent with the requirement language. VSLs - R3 - High VSL and Severe VSL - the timeframes should run from the 'associated interrupting device operation' not the completion of the investigation to be consistent with the requirement language. Severe VSL - the word 'in' is missing from the first paragraph in describing more than 210 calendar days. 'Implement' should be removed from the second paragraph as this is not required in the language of the requirement; the 'ed' should be removed from documented.
No
In R1 and its associated measure, the measure implies that more work needs to be done in terms of the level of review that the requirement itself. The requirement is vague and could be interpreted differently by different people. This requirement and measure should both be re-worded to be more clear and consistent. (See related comments under Question 2.) Since for each Protection System operation, either R2 or R3 would apply, the words "As Applicable" should be added to these measures. Also, in M1 the wording "Part 1.1" is used. This should say "Requirement R1.1".
Effective Date - The language regarding the effective date needs to contemplate that Manitoba Hydro, like some other Canadian jurisdictions, will not have effective dates that are tied to Board of Trustees approval. We assuming that is what the proposed reference to 'laws applicable to such ERO governmental authorities' means but this is somewhat confusing. It would be more accurate to refer to the laws applicable to such functional entities. Background – We are not clear on whether the 'Background' section of the proposed standard becomes part of the standard when final or if it's just included at this stage when the proposed language is being circulated. Assuming it does become part of the standard, there are several issues with this section as drafted. There needs to be some sort of introductory sentence at the beginning of the paragraph that explains that PRC-004-3 is designed to replace PRC-004-2a and PRC-003-0 because otherwise there is no context for why these two standards are being discussed. The full name of the standard should be used in the fourth line (missing the words "Identification and Correction"). The NOPR is discussed without any explanation of what it is - the full name, date published, by FERC etc is needed. The same can be said for the reference to the SAR further down the page. The words 'by requiring applicable entities to' would make sense after the words "The proposed requirements of the revised Reliability Standard PRC-004-3 meets the following objectives". The terms Special Protection Systems, Remedial Action Schemes and Under-Voltage Load Shedding are used at the end of the Background section when these terms have already had acronyms attached to them above. R2 - More details should be provided regarding what level of detail is required when developing a CAP. Perhaps a template could be developed and attached to this standard. Also, the wording of R2 should be made more consistent with the wording of R3. R2 implies that a cause will always be identified. We suggest the words "For each Misoperation with an identified cause(s)" be added at the beginning of R2. R3 - The second bullet regarding the declaration should be re-worded to be consistent with the wording in R2. C. Compliance – (i) An acronym is assigned to CEA in 1.1, but it is used in full in 1.2. This is not necessary. (ii) The term "BES Protection Systems" is used in C. Section 1.2. It would be more accurate to use the term given in 4. Applicability, Section 4.2.1 "Protection Systems for Facilities that are part of the BES". (iii) C. Section 1.4 refers to PRC-004. It should refer to PRC-004-3. Technical Guidelines - Proper and complete references to document they refer to should be provided. For example, the July 2011 Risk Assessment doesn't indicate who published this or conducted this, where it is available, etc.

We understand why the parenthetical expressions are included in the first two parts of the definition since they clarify what is excluded from the definition. However, the parenthetical phrase in the third part of the definition seems to be another expression of what is to be considered a Misoperation, but it is not consistent with the non-parenthetical definition. We suggest changing it to “Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high-speed performance is not used to meet the performance requirements of the TPL standards nor is it required to ensure coordination with other Protection Systems.“ We have a question regarding the phrasing “required to meet the performance requirements of the TPL standards” (changed in our recommended language). Does this mean that a simulation has been performed that determines that high speed protection is required to meet TPL standard requirements? Or does it apply to the slower clearing if the reduced performance results in a failure to meet the requirements of the TPL standards regardless of whether it had been discovered and documented? While we did not base our “No” answer on the following, our belief is that the exclusions of individual Protection System component failures as long as the total Protection System operates to clear the Fault in the time and zone for which it was designed may lead to a reduced level of reliability to the BES. Failures of components may be easily overlooked if the entity doesn’t review the event closely enough to discover misoperating components because the aggregate system operated correctly. But we recognize that there is unclarity regarding the definition of Protection System and that unclarity could lead to considering the overall performance of the aggregate Protection System, which was the interpretation used by the drafting team.
Yes
Yes
No
It is not clear how the owner of the interrupting device that operates can designate and investigate the Misoperation of a Protection System component owned another entitity, but that seems to be what Parts 1.2 and 1.3 require. One solution would be to divide Requirement R1 into two requirements as described below. “R1. Within 120 calendar days of an interrupting device operation in its Facility caused by a Protection System operation, each Transmission Owner, Generator Owner, and Distribution Provider shall identify and review each Protection System operation. If the entity suspects a Misoperation of a Protection System component owned by another entity caused an unnecessary interrupting device operation, notify the owner of that Protection System component and provide any requested investigative information.” “R2. The owner of any Protection System identified as misoperating in Requirement R1 shall: 2.1 Designate each Misoperation. 2.2 Investigate each Misoperation and document the findings including a cause for each Misoperation, if identified. 2.3 Provide its Corrective Action Plan (CAP) to the other entity and notify the other entity upon completion of the CAP if the Protection System that Misoperated caused that other entity’s interrupting device to operate.”

No
We have a concern on R2 on the 60 calendar days to make a CAP (corrective action Plan). Making a plan with a timeline in 60 days poses an issue where budgeting is required to perform a major relay upgrade to fix a problem. We fear this wording could expose us to potential penalties for not meeting a CAP's stated time line that would be made before the budgeting approval and scheduling process is completed.

I am confused on the requirement to provide a quarterly report. In the current draft the reference to this requirement appears in Section 1.4 of the Compliance Monitoring Process. This requirement does not appear to be in the Requirements and Measures section. The quarterly reporting also does not appear to be in the Violation Severity Levels. So it appears that in this draft, there is no real "Requirement" that a quarterly report be submitted and there is no assignment of a violation to those TOs, GOs, and DPs that do not submit a quarterly report. Is that so or am I missing something? This seems odd. If TOs, GOs, and DPs are supposed to submit a quarterly report, why isn't this included in the Requirements? Please eliminate this ambiguity. Either add the reporting to a Requirements provision or get rid of the reference to the reporting requirement in the Compliance Monitoring section.

AEP believes that PRC-001, rather than PRC-004, is the most appropriate standard to address an entity being required to notify another entity of protection system disturbances involving Misoperations or otherwise. If the drafting insists adding such requirements to PRC-004, we recommend making the following changes to R1: a) For 1.1, striking the language “If the entity suspects a Protection System component(s) owned by another entity contributed to a Misoperation, notify the owner of that Protection System component and provide any requested investigative information” so that it simply reads “ Identify and review each Protection System operation.” b) Inserting an additional requirement inbetween 1.2 and 1.3 that simply states “If the investigating entity determines Protection System component(s) owned by another entity contributed to the Misoperation, the investigating entity shall notify the owner of that Protection System component(s) and provide any pertinent information.”
No
In general, AEP supports the idea of time limits in regards to R1, R2, and R3. However, though these proposed limits might be reasonable and attainable under normal operating conditions, the proposed time limits for R1 and R3 would not likely be reasonable during major distubances and significant events. The volume of analysis required in these situations is simply too great and complex to complete in the time limits proposed. Either the time limits proposed need to be extended to accommodate analysis during major distubances, or else there must be provisions for granting time extensions when major events occur. For example, if there was an event that was in scope under EOP-004 disturbance reporting, that entity could be afforded the flexibility to work out the allowed time limits with their Regional Entity. In addition, an entity’s allowed time window to repond should not begin until it has officially received notification.
No
Please see our response to Question 2 where we suggest changes to R1 regarding such situations.
Yes
We encourage the SDT to ensure this form is consistent with SPCS form.
No
The R1 VSL's should use percentages to determine the severity level. As written, a utility performing 99% of the identification, review, notification, designation and documentation correctly would receive a severe violation. In the R4 VSL's, "The responsible entity failed to maintain records of a CAP or action plan" should be moved from severe to medium. The penalty for failing to document should be less than the penalty for failing to implement.
Yes
No
AEP does not have problem with the implementation plan; however, the implementation duration of six months is not consistent with the response in the SDT’s Consideration of Comments which indicate it is 12 months.
The following excerpts from the "Consideration of Comments" document should be added to item "(3)" of the "Guidelines and Technical Basis" section to clarify the intent of the "Slow Trip" category: “In many cases high speed protection is installed as part of the utilities standard practice without having the need for high speed protection for meeting TPL requirements. A slow trip of this protection system would not negatively impact the BES, so it does not need to be reported. However, even if high speed clearing is not required, the Protection Systems must coordinate between zones to prevent a Misoperation (e.g. an over trip).” Facilities 4.2 - Should the text “Also see Guidelines and Technical Basis section for detailed examples” be taken out of 4.2.3.1 and applied more broadly to the standard? In the first bullet of R2, may an evaluation of the CAP's applicability to the entity's

Protection System at other locations result in no additional actions being taken? Is the "evaluation of the CAP's applicability to the entity's Protection System at other locations" part of the quarterly reporting?

ReliabilityFirst
No
ReliabilityFirst Abstains and offers the following comments for consideration: 1. Requirement R1 and subsequent requirements a. ReliabilityFirst believes Requirement R1 and subsequent requirements rely on the operation of an interrupting device and the identification by its owner that a Protection System operated and whether it may have operated due to a Misoperation. There are two issues with using this as the focal point of the actions within the standard. First, the owner of the interrupting device may not be in the best position to decide why the device operated, if a Protection System was involved and if a Protection System component contributed to a Misoperation. The requirement circumvents what may be a natural process of investigating the operation by its individual owners separately or collectively. The requirement may create a weak link in a chain because of its reliance on the interrupting device owner to start the identification and review process. Second, not all Misoperations result in an interrupting device operation particularly if no Fault occurred or the Fault is a high impedance transient Fault. The owner of the Protection System that failed to operate would not be required to investigate it. 2. Requirement R1, Part 1.1 a. ReliabilityFirst believes the second sentence in Part 1.1 is a separate thought and recommends removing it and creating a new Part 1.2. ReliabilityFirst recommends the following for consideration for the new Part 1.2: “Notify the owner of that Protection System component and provide any requested investigative information if the entity suspects a Protection System component(s) owned by another entity contributed to a Misoperation.”
No
ReliabilityFirst Abstains and offers the following comments for consideration: 3. Requirement R2 a. ReliabilityFirst believes the phrase “Within 60 calendar days of identifying the cause(s) of each Misoperation” relates to the designation of the cause of each Misoperation as identified in Requirement R1, Part 1.3 or as identified through implementation of the action plan per Requirement 4, Part 4.1? If so, ReliabilityFirst recommends add the parenthetical “(per Requirement R1, Part 1.3 or Requirement R4, Part 4.1)” to Requirement R2 in order to further clarify when the timing of the 60 calendar day window begins.
ReliabilityFirst Abstains and offers the following additional comments for consideration: a. ReliabilityFirst believes there are extra and unneeded deadlines in the standard that do not provide a reliability benefit. b. ReliabilityFirst believes there is a potential for late identification of Misoperations which will result in violations even if they are not particularly significant to grid reliability. For example, capacitor bank trips occur every day as part of normal switching. It may not be obvious if it was by a Protection System Misoperation, particularly if a relay is used for multiple purposes like ON/OFF switching control and protection. c. ReliabilityFirst has a concern that there is no maximum time to complete CAPs listed in the draft standard. Of particular concern is failure to trip (- during Fault) type Misoperations. The cause should be either mitigated or the CAP completed in something like 6 – 12 month time period.

We need some clarification around section 3 Slow Trip During Fault. Is this intended to address the future changes around the Upcoming TPL standards? We need clarification on what is meant by referencing the TPL performance Standards in this section.
No
We would like some clarification on the review identified in R1. Based on the type of review that 120 days may or may not be enough time. We would request some example(s) be added in the Guidelines and technical reference that outline what is meant for the review in R1. Based on the examples the drafting team develops we can determine if the 120 days is appropriate. We also don't agree that 120 days is enough time for those instances when major disturbances IE storms hurricanes tornadoes. This needs to be addressed in the requirement itself and would request that there be an extension that could be requested for those types of events reported in DOE 417 and EOP 004.
No
See above comment. For those Major disturbances there needs to be a mechanism for extending the time frames without being penalized. Additionally 60 days might not be enough time to procure funds for the CAP. We are OK with the time requirement on R3.
No
There is an issue with the timing and requesting data from these other entities that own part of the protection system. There isn't a time frame for the other entity to return the data requested and seems like this could cause an entity to not meet the time frames specified in the requirements. Also going back to the Major disturbance if multiple entities are hit then they will be busy taking care of their own operations and may not have time to coordinate the data request in a timely manner.
Yes
No
Most entities will be compliant or not. We don't agree that the severity level needs to be raised based on being an additional 10 days late. We would suggest revisiting this section and possibly make the interval 30 days in between a severity increase. The high VRF in requirement R4 applies to both 4.1 and 4.2. We agree that 4.1 should be a high VRF since it has to do with the actual implementation. On the other hand 4.2 seems to be purely administrative dealing only with maintaining implementation records. We don't agree that this is a high VRF. In fact we question if it should even be included in this requirement and should fall under the Paragraph 81 project that is ongoing.
Yes
Yes

Can Attachment 1 be tabbed format or something easier to use than the long spreadsheet provided? Also we don't agree that the quarterly interval and if this is in conjunction with TADS and GADS then both of these are only reported annually. In R2 under the first bullet the way it reads it would seem that you have to look at your entire system for a single misoperation. In example if you had the wrong setting on a single 421 do you have to go and look at every 421 on your system. This seems overly burdensome and could lead to someone constantly looking at the system. If you had a certain relay failure at one location do you go to all other locations that have that relay? If so then would you have to prove that at other locations you don't have this particular relay? The team may want to look at rewording this bullet maybe taking a sample of equipment or adding an additional bullet and gather all the CAPS for the year and review the system over a 24 month period, but doing this all the time seems overly burdensome. Under the Application Guidelines generator protection section it has some language that is conflicting with section 6 of the proposed definition. We would suggest that the reference in the guidelines be removed. This could cause confusion with the industry and lead to mis classification of misoperations. Protection System operations which occur with the protected Element out of service, that trip any in-service Elements are Misoperations. Unnecessary Trip - Other Than Fault - A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate, and is unrelated to on-site maintenance, testing, construction or commissioning activities.

Yes
This standard revision is solid and specific, and should be MUCH more straightforward to audit/enforce, since it specifically requires the analysis of all operations. A comment is needed concerning the lack of any exceptions to the analysis of operations that are caused by unusual weather events. Large scale high wind events, extreme seismic events, hurricanes, tornadoes, ice storms, etc. can cause huge numbers of protection system operations of BES facilities. Many of these operations are momentary in nature and are caused by debris, out-of-right-of-way vegetation, and other line situations that are beyond established design limits for the lines and structures. Even the sustained outages may have been the result of a number of different causes, and a solid determination of the correctness of the operation may be impractical. The result of not having an exception for unusual conditions is that Transmission Owners would be spending protection personnel resources on non-productive documentation and processes, and not on maintaining and improving the reliability of the BES.
Yes
The standard should recognize the need for exceptions to the analysis of operations that are caused by unusual weather events. Large scale high wind events, extreme seismic events, hurricanes, tornadoes, ice storms, etc. can cause huge numbers of protection system operations of BES facilities. Many of these operations are momentary in nature and are caused by debris, out-of-right-of-way vegetation, and other line situations that are beyond established design limits for the lines and structures. Even the sustained outages may have been the result of a number of different causes, and a solid determination of the correctness of the operation may be impractical. No, Dteroit Edison disagrees with "Slow Trip - Other than Fault." We feel that the SDT should consider, with respect to many of the Generating Unit trip conditions that are given, that there may not be adequate resolution of time and current\voltage\etc. monitoring. If monitoring with as fine a resolution as is required to analyize speed of operation, it should not be considered a misoperation.
Yes
Yes
Yes
Yes - SDT did an excellent job with joint ownership issues.

Yes
Yes
Yes
Overall, the draft standard is good and we already comply with most of the requirements as a general practice. The concern is around ability to properly anazlize and determine of operations, specifically around generation, would be considered slow. As of today, there is not adequate monitoring (and many of the conditions are far too dynamic to properly determine what the proper operating time should have been) to determine how quickly a relay responded to a "other than fault" condition. Would recommend a "yes" vote if there was wording stating that it is not a misoperation if the data that exists is not of a fine enough resolution to prove a relay was slow.

Managing multiple deadlines based upon event date is difficult and does not align with quarterly reporting requirements (also see response to question 5). If more stringent deadlines are to be applied, there should be separate deadlines for identification of misoperations (less than 120 days) and identification of the cause (more than 120 days). Complex events affecting multiple work groups or entities as well as those involving equipment failure may result in entities taking more than 120 days to determine the Root Cause. Often misoperations result in the need to send protective relays back to the manufacturer, but relay manufacturers have no requirement to meet these deadlines. Not allowing sufficient time to determine the Root Cause will result in more events being referred to R3 (no identified cause) or CAPs being developed based upon incorrect causes. Complex events affecting multiple work groups or equipment failure may result in an entity taking more than 60 days to develop a CAP even after a cause is identified. Not allowing sufficient time could result in less than desirable CAPs.
No
There is a requirement to notify another entity if their component is suspected of contributing to a misoperation, but there is no requirement to respond to such notifications. Accountability to report back to the entity providing the notification should be included to ensure that entity can maintain its own compliance. Events involving transfer trip on interconnections, for example, could involve misoperations of equipment owned by both entities and require significant cooperation during the investigation phase.
No
The fields listed in Attachment 1 are sufficient. However, the quarterly reporting requirement is buried under the Compliance Monitoring Process, but should be a clear separate requirement for the registered entities under the standard. The reporting requirement R2 of UVLS standard PRC-022 is slated to be retired per Project 2013-02, but 4.2.2 specifically excludes UVLS from this standard. This could result in UVLS misoperations not being reported.
No
Severe VSLs should not be applied for lateness, only for failure to perform the required activity.
Yes

Yes
First comment: 4.2.2 excludes UVLS from this standard due to the existence of PRC-022, but it is expected that PRC-022 will be superseded much like its UF counterpart PRC-009. Rather than requiring a revision of PRC-004, 4.2.2 should be worded such that UVLS schemes would be covered by PRC-004-3 at such time as PRC-022 is retired. Second comment: Additional resources and signification database modifications will be required to ensure proper documentation of compliance.

No
For the R2 time basis, the 60 day period for developing a CAP is reasonable; however, identifying the specific date the cause was identified could be subjective and could lead to an unnecessary violation due to a simple clerical error. We would recommend stating the CAP should be developed within 180 days of the interrupting device operation (the event). We do not view R3 as being necessary and could even put an entity at conflict with R1 and R2 (i.e. the cause has not been determined within 120 days; however, the investigation continues and at day 140 the cause is determined and the entity is now in violation of R1) An entity should be able to complete all investigations within R1 requirements of 120 days, even if the finding is unknown. There is no benefit to extending the investigation out 180 days and beyond. Similarly, for an unknown cause a corrective action plan to plan and install controls to monitor the relay scheme to identify the cause of a repeat failure can be planned and executed within the requirements of R2 and R4.
Yes
Yes
No
For R1, R2 and R3, we do not believe it is appropriate to increase the violation severity level based on the number of days beyond the required completion date. A company could have a great process and record of analyzing and correcting misoperations and receive a severe violation for a clerical error. Any potential violations in this area related to documentation and/or timing may fall into the “Find, Fix, and Track” category, and the VRF and VSL levels ought to be set in order to allow for the FFT process to apply. It would be more appropriate to issue a lower VSL for a single instance of missing the required completion date or lacking documentation for a single event. A moderate or high VSL should be issued for missing multiple completion dates or lacking documentation in several areas. A severe VSL should be issued for not having a program or any evidence of achieving the requirement. We have no suggested change for R4.

Ingleside Cogeneration LP
Yes

Ingleside Cogeneration LP believes that the modification is an improvement over the previous draft. However, we still would like to see a commitment from the ERO-Reliability Assessment and Performance Analysis (RAPA) Group that they will align their definition when PRC-004-3 takes effect. Although the differences are minor, a difference in the criteria may require the industry to make two separate determinations on whether a relay-related event should be identified as a Misoperation.
No
Ingleside Cogeneration LP sees this requirement as specifying “how” to identify a Misoperation, not “what” comprises a Misoperation. Although, we understand that a robust process would include a prefunctory review of every relay operation, the need to capture and document each one in a manner satisfactory to an auditor adds no reliability benefit in our view. In fact, the vast majority of relay operations are NOT Misoperations and have a well-understood cause that is known immediately (e.g.; equipment fault). Based upon this thinking, PRC-004-3 R1 should only require an event be captured that is (a) known to be a Misoperation at the time of the relay action, or (b) the cause remains unknown an hour afterwards. This should greatly reduce the number of incidents that need to be recorded – and allows focus on those which do not have a simple resolution.
Yes
Ingleside Cogeneration believes that 120 days is generally sufficient to determine the root cause of most Misoperations – or to have evaluated and documented multiple possible causes if the source of the Misoperation cannot be determined. The additional 60 days to develop a corrective action plan time frame is acceptable to us as well.
No
It is not clear to Ingleside Cogeneration LP how a situation is resolved where interconnected Protection System owners disagree with the causes or mitigation of a Misoperation. We can easily envision a scenario where we have been informed by a neighbor that one of our relays contributed to a Misoperation – which we do not find to be the case. This seems like it could result in an audit finding that we did not report a Misoperation based upon someone else’s evaluation. There may be recourse in existing escalation procedures to engage the Regional Entity and even NERC at some point to resolve a conflict of this nature. Whatever the solution, we firmly believe that this pathway to resolution must be made clear as part of this project. If left open, the most subtle interaction issues will result in finger pointing in all directions – an unproductive use of everyone’s time. Furthermore, problems of this nature are likely to identify previously unknown failure mechanisms, which could help all industry stakeholders. The Regions may have access to technical specialists who are best positioned to assist with an evaluation of this level of complexity.
Yes
Ingleside Cogeneration LP agrees that the data listing is generally consistent with the existing process.

It is still not completely clear what is meant by ‘intended’? The wording for Slow Trip – During Fault is awkward. For example, consider changing “...if high-speed performance is required to meet the performance requirements of the TPL standards or by coordination requirements with other Protection Systems” to “...if high-speed performance is required to meet the performance requirements of the TPL standards or coordination requirements with other Protection Systems”; in other words, remove ‘by.’ Under the proposed, revised definition of a Mis-operation, it is unclear if a Mis-operation resulting from mis-coordinated relays would normally be categorized as Slow Trip or Unnecessary Trip. What is meant by ‘on-site,’ as in the definition of Unnecessary Trip – Other Than Fault? Specifically, what if a remote terminal is inadvertantly tripped by means of a communications system during maintenance, testing, construction, or commissioning activities; technically, the interrupting device that operated is not “on-site.” Additionally, what if an operation occurs during initial energization or loading following maintenance, testing, constuction, or commissioning; it seems that because the operation occurs with personnel still on site that this should not be considered a reportable Mis-operation, especially since the Element is just being returned to service.
Yes
The general approach and intent is supported. However, how can an entity prove that it identified all BES Protection System operations? While processes should be in place to promptly identify all BES Protection System operations, it is feared that significant cost and resources will be required to “ensure” that all BES Protection System operations are identified, which could divert staff from key reliability activities. A similar concern exists for identifying all Mis-operations. Recognizing that even the proposed, revised definition of a Mis-operation could be interpreted in different ways in some cases, it is conceivable that some entities could begin over-reporting possible Mis-operations out of an abundance of caution. It should also be recognized that not all Mis-operations are of equal impact to the reliability of the BES. Over-reporting by entities to avoid even the possibility of sanctions could pose a burden on Regional Entities and NERC and might distract the industry from correcting the key Mis-operations impacting BES reliabity.
Yes
No
Remove the second sentence under R1.1. At minimum, consider moving this sentence to R1.3 or creating a new R1.4. As written, this sentence is included in a sub-requirement that, in the overall process, has not yet even required designation of any Mis-operations. Presumably, at least part of the reason that this sentence was included was to mitigate any concerns that Entity A will wait before notifying Entity B, such that Entity B has little time to investigate before the deadline. However, as written, R1.1 would still permit Entity A to notify Entity B within 120 calendar days of the interrupting

device operation, which would leave Entity B no time to investigate before becoming non-compliant, since per R1 the clock for investigation starts when the interrupting device operated. The bottom line is that, if Entity A suspects that a component owned by Entity B contributed to a Mis-operation, it is in Entity A's interest to take action; it is recommended that there be no explicit regulaotory requirement for notification.
No
Why does an entity need to provide the Date Reported? It seems like the Regional Entity could provide this information based upon when they receive it. The person assembling the reporting data may not be the one actually submitting it to the Regional Entity, and the submittal date may not coincide with dated that the reporting data is assembled. Therefore, two individuals may need to be involved. While not a lot of extra work, it is an additional administrative step in the process that seems to provide little value to reliability. Additional information, or at least a reference to additional information, should be provided to describe TADS and GADS reportable events. It seems like the following fields could be consolidated into one: Event Description/Analysis and Protection Systems/Components that Misoperated. What penalties would be likely if an entity, acting in good faith, provides information that is later determined to be incorrect and is then updated in another reporting period? Do all Mis-operations need to be submmitted with Submittal Type entered as 'Remove' before they no longer need to be resubmitted? Or, does the final submittal only need to have one of the following in the Resolution Status field, even if the Submittal Type is 'New' or 'Update': 'Corrective Action Plan – Completed,' 'Action Plan – Completed,' or 'Declaration – Completed.' If a declaration is made, or an action plan is completed, and reported (submitted), does the associated Mis-operation need to be continually re-submitted while the status is 'Declaration – Completed' or 'Action Plan – Completed'? It seems like these two statuses are still somewhat open-ended. Remove double slash in "Corrective Action Plan//Declaration Development Date."
No
Under the Lower and Moderate VSLs for R3, the description ends with "...following the associated interrupting device operation " Under the High and Severe VSLs, the description ends with "...following the completion of the investigation." Was this difference intended? It seems that there should be consistency.
No
Referring to M4, change "...that must include..." to "...that may include..." Referring to Evidence Retention, the first paragraph appears to conflict with the second. In the first paragraph, the draft standard says, "For instances where the evidence retention period specified below is shorter than the time since the last audit..." However, in the second paragraph, the draft standard says "...shall keep data or evidence to show compliance with...since the last audit..." Given the language in the second paragraph, how can the evidence retention period be less than the time since the last audit, as the first paragraph suggests may be possible?
Yes
Under Applicability (comment box to side), change 'RMS' to 'RAS.' Why does "(e.g., data collection)" need to be included under 4.2.3.2? Data collection does not operate anything. Referring to the second bullet of page 5 (red-line version), change "...Misoperations Protection..." to "...Misoperations of Protection..."
Individual
Mark F. Draper
Exelon Corp.
Yes
• Exelon would like to see stronger wording to very clearly state that the protection system is to be evaluated as a composite system (primary and backup are part of a single composite system). • Under the Misoperation definition section: a. Item 1 Failure to Trip – During Fault ... change "for an Element" to "for the Element". b. Item 2 Failure to Trip – Other Than Fault ... change "for an Element" to "for the Element". c. Item 6 "Unnecessary Trip - Other Than Fault" - needs more clarification as to whether or not this includes personnel error (e.g. open test switches inadvertently).
Yes

• The Application Guidelines should be part of the Standard because they provide better clarification of the activities and timelines associated with R1, R2 and R3. • For R2: Replace “Explain in a declaration why corrective actions are beyond the entity’s control or would reduce BES reliability” with “Explain in a declaration if no further corrective actions are required and your rationale.” “beyond the entity’s control” may be subjective. • Suggest including the following statement based on wording in the Application Guidelines concerning a no CAP declaration: “A condition identified during an investigation that is addressed by existing maintenance activities would be justification for taking no additional corrective action.” • Exelon comments: Suggest revising the time limit verbiage as follows in order to provide more clarity: R1 Within 120 days of the event, review to determine whether the operation was correct. For any misoperation, identify and document the cause. R2a If after the initial 120 days a cause is determined for the misoperation, within 60 days - Develop a corrective action plan for the identified protection system component Or Explain in a declaration if no further corrective actions are required and your rationale R2b If after the initial 120 days no cause was determined for the misoperation, within 60 days - Develop an action plan that identifies additional investigative actions to determine the cause Or Explain in a declaration why no further action will be taken R3 Within 60 days of determining a cause under requirement R2b – Develop a corrective action plan for the identified protection system component Or Explain in a declaration if no further corrective actions are required and your rationale.
Yes
• The standard needs to make it clear that an entity needs to provide information to another entity within a specified time period, e.g., a TO needs to provide information to a GO on a transmission line trip, within limitations of the FERC Standards of Conduct.
No
• The list is good for a 50,000 foot level view of analysis results. Protection Systems are too complex and dissimilar to obtain meaningful analyses at the level of the Attachment. Also, understand that the purpose of Attachment 1 is not to trouble-shoot misoperation, only to provide a database of types of misoperations as a performance indicator. • Item C1.4 - Additional Compliance Information requires the quarterly Misoperation Data - Attachment 1 to be submitted within two calendar months following the end of each calendar quarter. This does not allow for the time limits specified in requirements R1, R2, and R3 for investigating, identifying and creating a CAP for the associated misoperation.
Yes
• Please confirm that the Application Guidelines material will be kept with the standard. One example of why this is important is so that the statement regarding natural disasters and extenuating circumstances is included. Specifically, the Application Guidelines currently contain the following: “In the event of a natural disaster, note that the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.”
No
• Measure M4 – change “must include” to “could include“. So the new wording is as follows: “Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R4 that could include, but is not limited to, dated electronic or hard copy records which document the implementation of each CAP and action plan, completion of actions and revisions for each CAP or action plan; dated work management program records, dated work orders, or dated maintenance records.”
No
• Implementation date: This standard is to go into effect on the first day of the first calendar quarter, 3 months after Board of Trustees adoption. This does not allow adequate time for the necessary programmatic and procedural changes required for a large organization. Suggest more time be allowed – such as one year after Board of Trustees adoption.
• In the Introduction section, Applicability includes Distribution Provider. If this standard is for Protection Systems that are part of the BES, does a DP belong in the list of Functional Entities? • To what extent would an entity have to defend a determination that a system operation is considered to be a correct operation, if there is limited data to make the determination? This should be addressed in the Application Guide. • The Application Guidelines state that reverse power relay operations used for

control of a generator (when a reverse power relay is used to trip a breaker during generator shutdown) are “not included in the definition of Misoperation and its operation would not be reviewed under this standard.” Since it can be debated whether a reverse power relay is used for control or generator protection, the Application Guidelines should remove the verbiage about the “control” aspect of this relay. The Application Guidelines should just state that “expected reverse power relay operations, such as those encountered when a generator comes off-line, would not be required to be reviewed under this standard.” This comment is not intended to remove the entire Application Guidelines discussion on control aspects of relays being excluded from needing a review under this standard. Rather, the intent of this comment is to revise the Application Guidelines so as to preclude any discussion over whether a reverse power relay is a control device or a protective device – and just list the exclusions for this relay, and any similar generator relays. • Exelon requests that the SDT clarify within the Standard that the interrupting device itself referenced in the Standard draft is also considered an element of the Bulk Electric System. Specifically, please clarify that a device on a radial line that does not affect the BES is excluded from this requirement. Suggest that this clarification be added to the Application Guidelines. • PRC-004 Requirement R1 requires that each Generator Owner identify and review each Protection System operation associated with an interrupting device operation. The SDT should re-evaluate this requirement as it implies that all generating facilities have established monitoring systems that will capture such events. Although some generating units do have existing monitoring systems (such as Disturbance Monitoring Equipment) not all generating units have such capability nor are they all required to install such monitoring equipment in accordance with existing FERC approved Standards. • Exelon agrees with the SDT revision to remove the requirement in R1 that an entity shall have and implement a "procedure" to identify and address all Protection System Misoperations within its system and that an existing Corrective Action Program will meet the intent of the Standard; however, the SDT response to the Exelon and Constellation comments submitted in the previous draft (Consideration of Comments in response to the 6/10/11 – 7/11/11 draft) is inaccurate and warrants clarification. The original Exelon comment was: “Nuclear GO/GOPs have an existing Corrective Action Program that is required by 10 CFR 50 Appendix B Criterion XVI (quoted below). This regulatory requirement and associated mandatory implementation of a Corrective Action Program by a Nuclear GO/GOP fully envelopes the intent of the draft revision to PRC-004. An additional "procedure" to identify and address all Protection System Misoperations with set timelines and attributes is not necessary."XVI. Corrective Action Measures shall be established to assure that conditions adverse to quality, such as failures, malfunctions, deficiencies, deviations, defective material and equipment, and non-conformances are promptly identified and corrected. In the case of significant conditions adverse to quality, the measures shall assure that the cause of the condition is determined and corrective action taken to preclude repetition. The identification of the significant condition adverse to quality, the cause of the condition, and the corrective action taken shall be documented and reported to appropriate levels of management." The SDT response documented is as follows: “Thank you for your comments. These requirements cannot be used as a substitute for PRC-004-3 since they do not apply to Protection Systems on the electrical side of nuclear plants. In Order 706-B, FERC stated that much of a nuclear plant does not fall under the rules of the NRC. The NRC rules are applicable to the portions of the nuclear plant related to handling of radiological fuel, security and safety. NERC rules apply to the portion of the plant not under the rules of the NRC. BES electrical Protection Systems do not fall under the rules of the NRC.” As a point of clarification, the SDT response that references Order 706-B indicates that BES electrical systems would not fall under NRC regulation. In summary, FERC Order 706-B “clarifies that the facilities within a nuclear generation plant in the United States that are not regulated by the U.S. Nuclear Regulatory Commission are subject to compliance with the eight mandatory ‘CIP’ Reliability Standards approved in Commission Order No. 706.” In November 2010 FERC and the Nuclear Regulatory Commission (NRC) came to understand that because changes in electrical power output affect nuclear reactor core reactivity, NRC would have oversight of these “balance of plant” systems. FERC formalized this understanding in FERC Order issued March 10, 2011, Docket No. RM06-22-014, “...we find that the NRC’s cyber security rule appears to cover all balance of plant, and no balance of plant at a U.S. nuclear power plant has been found to be subject to NERC’s CIP Standards.” It should be noted that the NRC required Corrective Action Program (regulatory requirement information as documented above) applies to all systems, structures and components of a nuclear generating unit and therefore should be an acceptable method of complying with the revised Standard.

El Paso Electric
Yes
El Paso Electric Company (EPE) agrees with the definition with a slight change to the wording of the titles of "Failure to Trip – Other than Fault" and "Slow to Trip – Other than Fault". EPE believes in these applications the titles should read Failure to Operate – Other than Fault and Slow to Operate – Other than Fault. There are scenarios, in the case of a power swing, where a device or element may be set to block a trip.
No
EPE believes more clarity is needed in this requirement as to responses required by other owners when their component may have contributed to the misoperation of the Protection System. For example, Entity A's protection system operates, however Entity B's component contributed to the misoperation. Entity A notifies Entity B of such component failure. There isn't a specified timeline, within the 120 days, requiring Entity B to notify Entity A of its information regarding such component, allowing Entity A to timely complete its analysis and report of the operation of its Protection System. Additionally, what would Entity A's response be if Entity B doesn't acknowledge their component's contribution to the misoperation?
No
See EPE's comment in Question 2.
No
See EPE's comment in Question 2.
No
EPE believes the columns in Attachment 1 requesting Event Analysis Completion Date; Corrective Action Plan/Declaration Development Date; or Action Plan/Declaration Development Date does not contribute to improving protection system performance.
No
Based on the NERC's definition of High – Violation Risk Factor, EPE believes the assignment of High Risk to R4 does not seem to be warranted. R4 combines the implementing and documentation of any corrective actions in connection with a misoperation, and does not impact the reliability of the BES. EPE believes a separation of the implementing process and documentation requirements may provide a solution.
EPE believes additional clarity under the "Additional Compliance" section would be helpful as it relates to reporting misoperation data. EPE believes the insertion of some additional language may provide clarity, such as "…..shall submit data identified on Attachment 1 for misoperations identified within a quarter…"

Comments: The requirement to review and document each Protection System Operation is overly burdensome to those utilities with heavy lightning exposure. TVA has approximately 400 interruptions a year due to lightning. To review, verify, and document each one of these to ensure whether or not a misoperation occurred within 120 days, especially during the spring-summer storm season and then find a cause for each misoperation can be overwhelming. For example, the April 27, 2011 storms took months of restoration before investigation of possible misoperations could begin. That particular storm caused about 20 misoperations. TVA would like to see the window of time extended to 180 days.
No
The time limits do not allow for equipment that is difficult to get out of service to allow testing/troubleshooting to investigate and develop a CAP. Often transmission line of transformer bank outages can only be obtained during very limited time frames or must be scheduled months in advance. Only after the investigation is complete can the final CAP be confirmed, depending on what is found during investigative outages. The 180 days in some cases may need to be at least 270 or more for some investigations.
Yes
Yes
No
The limits and time horizons are too restrictive and do not take into account if an entity is making a good faith attempt to investigate a misoperation and for reasons outside of its control, cannot meet the arbitrary numbers in this draft. There needs to be exemptions made for the safe operation of the transmission system to override the limits. Maybe some sort of deferral process with proposed dates to replace the time horizons when system conditions cannot support the necessary work required to investigate and correct.

No
The SDT should clarify whether UFLS is or is not covered by this standard. The “Consideration of Comments” indicates that it is. If so, it is suggested that the SDT consider adding underfrequency to the list of non-Fault conditions listed in items 2. and 4. in the Misoperation definition. If not, it would help to clearly state that it is “excluded” in Section 4.2.2.
No
Additional clarification should be provided regarding the statement in R1.1 to “identify and review each Protection System operation”. As currently written, it is unclear how an entity would comply with R1.1 in the event that an incident involves multiple breaker operations with automatic reclosing, but were the result of a single cause. In such a scenario, would the entity be required to maintain separate documentation for investigation, designation, etc for each breaker operation?
No

R1 requires the identification and review of an operation, as well as the designation and investigation of a Misoperation, all within 120 days whereas R2 requires the development of a corrective action plan within 60 days of identifying the cause of a Misoperation. It is a concern that these proposed timeframes will create a disincentive for early identification of Misoperations. As an example, if a Misoperation is identified on day 2 after the incident, the corrective action plan must be developed no later than day 62 following the incident. However if an entity were to delay identification of the Misoperation until day 120 after the incident, the corrective action plan would not have to be developed until day 180. To prevent deterring entities from identifying Misoperations sooner, it suggested the drafting team consider requiring the corrective action plan by day 180 regardless of when the misoperation cause was officially identified. Doing so would avoid entities having to worry about the official date of Misoperation identification.
Yes
Yes
Yes

The SDT should clarify whether UFLS is or is not covered by this standard.
No
It is unclear on what “Designate each Misoperation” means. Designate a relay operation as a Misoperation or designate an identified Misoperation to a specific class or category. This part needs to be expanded.
No
Comments: We agree review of each Protection System operation is important, however, there could be voluminous events from a natural event that may be burdensome on entities to provide reports within the allotted time frame. Priroritization should be given for events that are suspected to be misoperations based on the entities’ judgment.
No
It is unclear whether or not Attachment 1 is part of the standard that must be complied with. The SDT should clarify whether the misoperation information listed in Attachment 1 must be provided as specified. If that is the expectation, then the data requirements must be stipulated as a Requirement. As an Attachment without associated Requirements, we interpret that data submission as not mandatory.
No
As a general comment on VRFs and VSLs, there does not seem to be a correlation between how a lack of address of a particular protection system operation is tied to how severe an impact it had or may have on the reliability of the BES.

Clarification should be provided of what approvals or coordination the identitfied responsible entities need to undertake if a Corrective Action Plan (CAP) includes some operational solutions provided by a system operator.

While the purpose of the clarifications in the misoperation definition is understood, the proposed definition seems to use the term “non-fault condition” differently in different sections. For items 2 and 4, it says “a non-Fault condition for which the Protection System was intended to operate, such as a power swing, under-voltage, overexcitation, or loss-of-excitation.” Similar wording is used in 4 “such as a power swing, under-voltage, overexcitation, or loss-of-excitation. However, in 6, the terms “other than fault” and “non-fault condition” are also used, but, it would be expected that the definition here should be broader than in 2 and 4, to include when a misoperation occurs for no reason (no abnormal condition). It seems like this could lead to a misinterpretation of number 6, since it uses the same term “non-fault condition” as in 2 and 4. We suggest having the following 4 categories, which would still ensure that the “non-fault conditions” are still included: 1. Failure to Trip – A failure of a Protection System to operate for a Fault within the zone it is designed to protect or for a non-fault condition (such as a power swing, under-voltage, over excitation, or loss of excitation) for which the Protection System was intended to operate. 2. Slow Trip – A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect or for a non-Fault condition such as a power swing, under-voltage, over excitation, or loss of excitation. 3. Unnecessary Trip – A Protection System operation for a Fault or for a non-fault condition (such as a power swing, under-voltage, over excitation, or loss of excitation) for which the Protection System is not intended to operate. This excludes any remote Protection System operation that resulted from a failure to trip or slow trip of a local Protection System in a faulted adjacent zone. 4. Unnecessary Trip – Normal system conditions - A Protection System operation when no fault or non-fault conditions are present (such as a power swing, under-voltage, over excitation, or loss of excitation). There may be other appropriate wordings for number 4.
Yes
No
We agree with the need for NERC and the regions to review the timeliness of the analysis of misoperations. However, the regional entities, based on the RAPA template for reporting misoperations and the quarterly reporting of these misoperations, already are getting dates from the entities for the date of the misoperation, the date the corrective action was completed or, if not complete, the expected completion date. Without any additional administrative manpower commitments, the regions can already assess through the spreadsheet how long each misoperation took to completion and question anywhere timeliness seems to be a factor. They can even assess the timeliness of the original analysis of the operation (and identification of any misoperations) by checking when a new misoperation is reported against the reporting period it should have occurred in. Therefore, it seems counterproductive to prescribe timelines per misoperation, that will mean that entities have new much larger administrative burdens put on their technical staff just to document that each analysis of each operation and misoperation meet the number of days allowed. There could still be a maximum limit of what is allowed time-wise without having all of the individual date requirements. For example, additional documentation could be tied to, say, if the corrective action is not complete after the 2nd quarter that the misoperation was submitted to the regional entity. This will allow the finer detail focus of both the individual companies and the regions to be the more complicated and longer timeframe misoperations, while still supplying data (but not more than is needed to find and correct the misoperation) about the other misoperations that occur.
No
Initially, the investigation/reporting burden should fall on the owner of the interrupting device.

However, once it is determined which entity’s equipment caused the misoperation, the burden of reporting should shift to that entity.
No
The Incorrect Setting/Logic/Design Errors category needs to be split into separate categories to improve the data analysis. As relays get more complex, more of the protection system is becoming internal to the relay, and so this has become a disproportionately large category.
No
As stated in Question 3, we do not feel the timetables involved are needed for ensuring operations and misoperations are handled appropriately. That being said, for R1 and R3, 30 days is a quick change from Lower to Severe. Suggest making the change for R1 and R3 should be proportionate to R2 (about 50%).
Yes
Yes
Need to clarify how misoperations that are still not completed are going to be transitioned.
1) R2 states that the CAP applies to the identified Protection System component(s). But then goes on to say the CAP “includes an evaluation of the CAP’s applicability to the entity’s Protection Systems at other locations.” As it is presently handled, the entity can complete the CAP when the work at the place the misoperation took place is complete, and then the entity is responsible for its assessment/implementation at other locations (implementation of which may take a lot longer). However, the new standard needs to clearly state if this expectation is still the case, or if something different is now warranted. 2) Application Guidelines – Reporting section on page 20 states ‘…the fourth ranked initiating cause of BES outages not related to weather was “Failed Protection System Equipment.” Given the high ranking of this metric, it is appropriate to collect data on Protection System Misoperations for analysis to drive improvements in Protection System reliability.’ While this may be true in terms of number of events, it sensationalizes the Failed Protection System Equipment cause. In fact Failed Protection System Equipment is a very minor cause of unavailability. For full context, please also state: a) the total number of non-weather related causes; b) the top three non-weather related causes; and c) its rank in terms of BES unavailability. 3) All references to an investigation report should be changed to read “Misoperation investigation report” or “investigation report due to misoperations”. Without this change it could be interpreted that all operations require an investigation report. This section is a very good description of what data may be used in an investigation report, but, for clarity of compliance purposes, it should be a little more defined as to which part of this is compliance-related and which parts are just informative. Suggest having a more general statement such as “A misoperation investigation report should be of sufficient detail to either ascertain the cause of the misoperation or else describe the work performed/being performed to analyze the misoperation.” For example, if you find a piece of equipment failed (powered down), a sequence of events or DME records are not needed to figure out the cause, and so should not be required in the Misoperation investigation report. Along those same lines, we suggest adding a “may” and an “or” to the third sentence of page 18 “The initial evidence, which may also be documented separately, may contain the sequence of events, relay targets, and/or a summary of Disturbance Monitoring Equipment (DME) records.”

a). Under Definitions of Terms Used in the Standard, #3 indicates that delayed clearing of a high speed protection system is a Misoperation if it does not meet TPL requirements or coordination requirements. The specific requirements being referred to are unclear and non specific. Is the intent to report failure of high speed tripping for those Protection Systems that impact system stability? Suggest that more clarity be given to the requirement references. b). Under Definitions of Terms Used in the Standard, #5 change definition to read – Unnecessary Trip – During Fault – A Protection System operation for a Fault for which the Protection System is not intended to operate, excluding properly coordinated remote trips when the local Protection System fails to clear the Fault. c). In the Application Guide – Guidelines and Technical Basis, under the definitions there appears to be more emphasis on Generation related examples. Recommend a balance of both Generation and Transmission examples in this guide.
Yes
No
a). R1 introduces a 120 day requirement in order for a correct and consistent review, and classification of, Misoperations. By introducing individual time requirements, this places unnecessary burden on entities to track dates associated with each phase of a Misoperation investigation and review. Dominion recommends an approach similar to that recently taken in COM 003, through the development of a requirement to have a process and plan in place to address Misoperations according to regional entity guidance and oversight. Many entities currently respond to misoperations in a timely manner and adding additional tracking and time requirements does not place the priority on addressing reliability, it places the focus on data collection and date recording. In the event the SDT cannot accept Regional Entity oversight, then an overall time limit should be stipulated versus the current language in the standard that includes 120 and 60 day requirements. Suggest using a 180 day overall time from the Misoperation date to finish one of these: 1)develop CAP, or 2)develop action plan or 3)develop declaration. Changes to the quarterly reporting template to remove and rename date fields will be needed and are included under question 5 comments. b). Revisions should be made to the Misoperations reporting template to capture requirements not currently covered in the template. For example, R2 introduces the option of a “declaration”. The template should include a feature to record a declaration. Entities should not be required to use multiple tracking tools or techniques to document the various requirements. One tool should exist to do this and currently all entities use the reporting template. c). All references to an investigation report should be changed to read “Misoperation investigation report” or “investigation report due to misoperations”. Without this change it could be interpreted that all operations require an investigation report. d) R3 introduces an undefined term – an ”action plan” for those misoperations without an identified cause. There is a concern that entities will be confused with Corrective Action Plan and action plan terminology. Suggest changing R3 to read “For each Misoperation without an identified, the Registered Entity

cause(s), the Transmission Owner, Generator Owner, or Distribution Provider shall, within 180 calendar days of the Misoperation, identify any additional investigative actions and/or Protection System modifications., including a work timetable, or document why no further investigation or actions will be taken.
No
a). Subpart 1.1 does not provide for a clear hand-off when another entity’s Protection System component contributed to a Misoperation of the first party. Specifically, it appears that the first party will have to develop its CAP to include a component owned by another entity and for which it has no control. The Application Guideline speaks to the need for various component owners to cooperate in the investigation and contact the Regional Entity should there be a lack of cooperation. This guidance needs to be clarified in the Requirement as compliance is measured against the Requirement, not guidance. Suggest adding Subpart 1.2 to state: “If notified by an entity that a Protection System component contributed to that entity’s Misoperation, than It is expected that all the owners will communicate with each other, sharing any information freely, so that operations can be analyzed, Misoperations identified and corrective actions taken.” If adopted by the SDT, then renumber existing Subparts 1.2 and 1.3 to 1.3 and 1.4 respectively. b). R1 correctly requires the interrupting device owner to initiate the investigation, but when the Protection System interconnects with another entity and there are indications that the other entity Protection System components misoperated (ie. Other entity sends a spurious DTT), then once the location of the Misoperation is agreed to by the various Protection System owners, then it should be the responsibility of the owner of the Protection System that misoperated to report thus removing the burden of reporting from the interrupted device owner. In some cases there may be several devices interrupted which are owned by different owners and the Protection System failure was due to a Protection System failure by an entity that had no devices that were interrupted at the location where the Misoperation occurred. Under the present PRC-004-2a, there is confusion on this distinction. The process (especially reporting process and resubmittals) is simplified when the owner of the Protection System that misoperated is responsible for: interfacing with others to analyze, developing CAP, implementing CAP and reporting. c). There is also a suggestion that multiple entities utilize a joint investigation report. Again, the burden of reporting should lie on the entity that had the Protection System Misoperation to initiate reports and communicate other entity actions.
No
a). Eliminate the field “Additional BES Interruptions”. This places unnecessary burden on entities to report interruptions that may not be associated with a Power System Misoperation. There is no need to track or collect this additional input. b). Instruction for Attachment 1 needs to include specific information as to when to fill out specific data in this field. The template currently requires a brief description in the Event Description field and details in the Corrective Action field when classified as Corrective Action in Progress. Once the Corrective Action Plan is completed, the instructions say to clear this field (which we disagree with) and input cause information under the Event Description field. Recommend renaming this field from Event Description/Analysi to Event Description. c). d). There should be a means to separate Generation and Transmission. This approach doesn’t appear to give entities the option of separating reports. e). Please split Incorrect Setting/Logic/Design Errors into three separate categories to improve the usefulness of the metrics regarding Protection System performance. Provide examples how to separate settings from logic when it’s all part of a smart relay setting. f). Please split Communication Failure into two separate categories, one for ‘Power Line Carrier’ and one for ‘non-Carrier’ to improve the usefulness of the metrics regarding Protection System performance. g). Please eliminate the TADS and GADS information. TADS only counts lines and transformers that operate, not any other equipment. Instead request the total number of operations at each Equipment Voltage level because this is a more effective means of gathering the information for all Protection System operations. However the definition of an operation and rules for determining the number of operations will need some clarity. h). Drop the word “general” in the field name Misoperation General Cause”. No need to introduce another undefined descriptive word. i). Remove the following fields: ”Event Analysis Completion Date”, “Corrective Action Plan/Declaration Development Date”, and “Action Plan/Declaration Development Date”. j). Revise “Target Resolution Completion Date” to “Resolution Target Date”. k). Revise “Actual Resolution Completion Date” to “Resolution Completion Date”. l). Prevent entry of data into a field that was made not applicable by a previous field selection.
No

a). For R1 and R3 the escalation from Lower to Severe VSL in just 30 days is too short. Please make them more consistent with the requirement duration. As a comparison R2 escalates in 30 days, which is 50% of the time limit. We recommend keeping the 50% consistent for escalation to Severe with a limit of 210 days for R1 and 270 days for R3. b). By having specific 60 and 120 day requirements, this brings additional violation complexity to the process and is unnessary. As stated previously, use same approach as COM 003 and eliminate the daily requirements. c). VSLs will need to address when a Misoperation is caused by an entity having no equipment operations where initial analysis is by first party and remainder of requirements apply to second party. (See comments to Question 4)
No
(If requirements change, measures need to change also. See comments to Question 4)
No
a). Must include a specific plan of transitioning open investigations or CAPs to new standard requirements and reporting requirements. b). Specifically state when all other requirements are effective.
R2 introduces the idea of a CAP “that includes an evaluation of the CAP’s applicability to the entity’s Protections Systems at other locations”. R4 states “maintain detailed implementation records of CAP including dated information surrounding any revision(s) and completion”. With all this said, is the CAP complete once we evaluate “identify every location where a similar problem may exist” or is the CAP only complete when all locations are fixed? There is no need to log revision(s) to the CAP. Having a current CAP available at any point in time should be sufficient without tracking CAP changes. In the Rationale for R4 it states “fully implemented”. We interpret this to mean fully evaluated and not fully fixed at all other locations?

I recommend adding the underlined text to the misoperation definitions for items: Slow Trip - During Fault - A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. (Delayed Fault clearing associated with an installed high-speed protection scheme is a Misoperation if the high-speed performance is required to meet the performance requirements of the TPL standards or by coordination requirements with other Protection systems for a reasonable number of system contingencies. Unnecessary Trip - During Fault - A Protection System operation for a Fault for which the Protection System is not intended to operate for a reasonable number of system contingencies, excluding any remote Protection System operation that resulted from a failure to trip or slow trip of a local Protection System in a faulted adjacent zone. Perhaps the number of contingencies should be a set number such as one so that for non standard system configurations where coordination may be lost. For example, such as multiple ground sources being out of service causing ground overcurrent miscoordination in part of the system.
Yes
No
For R1 there is 120 days to identify, review, designate, correspond with associated etitites and investigate a misoperation to determine the cause. For R2 there is 60 days to develop a CAP once a cause is determined. This seems somewhat confusing in it may cut in to the 4 month time frame for R1. Perhaps it would be better to just state that a corrective action plan shall be developed within 6 months as in R3. This would be 6 months to create a CAP as the maximum interval or declare why a CAP is not needed. This may also be easier to audit since documenting when the cause is determined

to start the time line would not be required. The VSL could then be updated and be simplified.
No
I have concerns with the requirement R1.1 and M1 related “demonstrating transmittal and receipt of information” such as saving correspondence or communications (notifications) with other entities as part of the analysis and corrective actions with this standard. The misoperation is identified and fixed (or not fixed) by means necessary for the involved entities following the other requirements. This requirement will add time burden for tracking communications that takes away from the goal to fix the issue. It also confuses the issue on who is responsible if a “receipt” of notification cannot be obtained. This would increase the difficulty for auditing as well and adds a subjective nature to what is considered acceptable correspondence. I recommend this part of R1 be removed or the proof that a transmitted notification was received by another entity not be required since that is not under the control of the sending entity. Also, rather than tracking numerous emails and notifications the option for lack of response is to appeal to the RE for help as stated in the application guidelines. It may be wise to have a contact/process at the RE assigned to follow up on these types of requests especially if the associated entity is not registerd.
No
Need clarification on these items: For Registered Entity ID#: What is the option to fill in the field if the portion of the protection system that misoperated is owned by a non registered entity? The fields Event Analysis Completion Date, Corrective Action Plan/Declaration Development Date, Action Plan/Declaration Development Date seem like they would not have much metric value and add extraneous information. These should be removed. For the Reported By, Phone Number, and E-mail Address line items is this the compliance contact # for a utility or a specific person writing the report? Using specific names, email, and phone numbers can create issues either way. Perhaps it would be best to use more general contact information for the entities or a single point of contact so these line items would stay more constant.
No
Other comments and concerns stated for R1.1 would need to be addressed and modified in the VSLs. The severe violation for failure to notifiy and provide requested investigative information should be removed. This will be difficult to audit and has a subjective nature. It also puts a burden on the sending utitilty where all aspects are not under their control especially if the receiver does not want to cooperate.
No
As mentioned above there are concerns with requirement R1.1 and M1. See comments for question 5.
Yes
It sounds like a CAP is a case by case document for each misoperation and does not need to be a formal CAP process document that explains the steps that will be followed for all misoperation investigations. Is this correct? I have concerns with the open ended nature of the statement in R2 “Develop and document a Corrective Action Plan (CAP) for the identified Protection System component(s) that includes an evaluation of the CAP’s applicability to the entity’s Protection Systems at other locations”. Specifically my concerns are with the last part referring to “at other locations”. I am curious how the STD would consider if a miscoordination resulting in a misoperation were to happen on their system. Would they consider reviewing the coordination for every relay at every substation on their system? This requirement has value yet also opens the door to unreasonable CAPs as well. This requirement also seems quite subjective in how it could be audited as well. Does the STD share this concern? Will the registration criteria or BES definition be referenced to set generation sizes for reporting misoperations? The application guidelines are verfy helpful in explaining the SDT expectations and should continue to be part of the standard for guideance.

R1/R2: Regarding the proposed timeframes for completion of R1 and R2 as 120 days and 60 days respectively, PNMR suggests that the drafting team amend the requirements such that the combination of the two requirements not exceed 180 days, but allow for flexibility in either the analysis of the operation and/or the development of the CAP such that either one could be extended if needed but the entire timeframe allowed for both would not exceed the proposed timeframes as originally drafted. R1: PNMR proposes that an exception to the timeframe in R1 be allowed for complex failure to trip scenarios which are less frequent but can be difficult to recognize. PNMR requests that the time clock start from the time of discovery rather than the time of the operation. The requirement would instead read: “R1. Within 120 calendar days of discovery of an interrupting device operation in its Facility caused by a Protection System operation,…” Alternatively, PNMR suggests that there be an exception granted for certain failures to operate that are discovered after-the-fact.
Yes
Yes
Yes
Yes
Yes
R3 as drafted could be difficult to audit. PNMR suggests additional clarity be provided around what would be an acceptable criteria to invoke “A declaration explaining why no further actions will be taken.” As the standard is written now it appears that an RE could just declare a misop as having an unquantifiable cause and then declare that no further action is warranted or will be taken.

(1) Failure to Trip During Fault: The statement “(The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for an Element is correct.) “ is somewhat vague and open to interpretation. We understand the purpose of this language as stated in the Guidelines and Technical Basis, i.e. when a high speed zone element trips faster than a high speed pilot system. However, we have had instances in our Region where a high speed pilot system fails and the fault is subsequently cleared by a time-delayed zone element, typically in 30-45 cycles rather than in 5 cycles or less. This instance could be interpreted as “correct overall performance” by the entity and not reportable. Is this the intent of the SDT? Or should this instance be recorded as a “Failure to Trip” or “Slow Trip During Fault”? The Guidelines and Technical Basis section offers some good examples, however, it should possibly be expanded to provide more discrete cases. (2) Failure to Trip Other than Fault: See comments under Failure to Trip During Fault (3) Slow Trip During Fault: See comments under Failure to Trip During Fault
No
(1) It is not clear who is responsible for compliance with R1. Who must “identify and review”, “designate” and “investigate”? Is it the owner of the interrupting device that operated, or is it the owner of a component that caused or contributed to the Misoperation? This will be difficult to enforce without clearly assigning responsibility. (2) The requirement and the VSL assume that there are two steps in identifying a Misoperation: “determining” that an operation is a Misoperation, and then “designating” the operation as a Misoperation. There is no requirement that an entity diligently and correctly “determine” that a Misoperation occurred during its review of an operation, and there is no VSL that applies when an entity incorrectly fails to “determine” that a Misoperation occurred.
Yes
We generally agree with the deadlines, but we have questions about how they apply in a multi-party situation. If a Protection System Misoperation is determined and an entity (“Entity A”) determines that the cause of the Misoperation is due to a component owned by another entity (Entity B”), how does the 120 day time period apply? What if Entity A does not start its review until 60 days after the operation and tells Entity B on the 90th day? Entity A has identified the cause (Entity B component) but what timeframe is Entity B under to determine the Misoperation cause for the component? What exactly is Entity A’s mandatory obligation, and what is Entity B’s mandatory obligation, and what are the applicable deadlines?
No
(1) We voted “no” on this draft because it is unclear who is responsible for various actions in multi-

owner situations. The requirements need to clearly state who is responsible for compliance with each step of the identification, investigation, correction and reporting process. (2) We suggest that the team consider a solution such as: (a) the owner of the interrupting device should be required to identify the Misoperation and the suspected component that caused it, and then (b) the owner of the suspected component should be required to take the further steps to investigate and correct the problem and to submit the required reports. (3) Additional language is needed to clarify that, for Misoperation investigation and reporting purposes, the entity that owns the component that misoperated is required to submit the reports. Also, any CAP's should include the review of coordination issues between entities involved in the Misoperation.
No
(1) Is Attachment 1 considered to be part of the Standard? If so, then future modifications to Attachment 1 would have to go through through the SDT process and would entail extensive time and effort to make. (2) Under current practice, in many cases there is insufficient detail provided by the entities involved in a Misoperation to understand the root cause. There has been some discussion with the Protection System Misoperation Task Force (PSMTF) that additional data would be helpful in categorizing misoperations. In particular, it would be helpful to add subcategories below the misoperation general cause codes (i.e. Incorrect settings/logic design could have subcategories such as modeling errors, calculation errors, etc.). (3) The Periodic Data Submittal requirements and the template should be flexible enough to permit Regional Entities to collect additional information which may be beyond the scope of the PRC-004 Standard, if deemed necessary based on regional needs. For example, in ERCOT, the current regional rules for misoperation reporting also include failure to reclose, reporting the generator trips < 100kV, sudden pressure relay misoperations, SPS misoperations based on a regional definition, etc. These are included in the current template to streamline the reporting process for the Registered Entities, rather than requiring multiple reports. Since this information is outside the PRC-004 applicability, it is removed from the quarterly Misoperation reports by Texas RE before data is submitted to NERC. The previous draft of PRC-004-3 had flexibility in the periodic data submission language to allow this ("using the format specified by the ERO"), but that language was removed in the current draft.
Yes
We generally agree, however the Severe VSL for R1 includes "and failed to notify and provide requested investigative information" but it doesn't address the situation where the entity provided notification, but failed to provide "requested investigative information." Also, the R1 VSL is overly complicated, perhaps showing that there are too many different elements in R1.
(1) R2 assumes that one or more "Protection System component(s)" has previously been "identified", but there is no preceding requirement that requires any such identification of components. R2 seems to infer that it is the owner of the component that caused the Misoperation who must act, but it is not expressly stated who is responsible for this requirement. (2) We agree with the approach of R2, however, we would suggest the following changes to wording to clarify this requirement by requiring certain elements in each Corrective Action Plan: R2. Within 60 calendar days of identifying the cause(s) of each Misoperation, each applicable Entity shall: • Develop and document a Corrective Action Plan (CAP) and work timetable to resolve the cause(s) of the Misoperation that includes the following: 1. Interim corrective actions (if any), 2. Final corrective actions, 3. An evaluation of the CAP's applicability to the entity's Protection Systems at other Facilities, 4. An evaluation of the CAP's applicability to Protection System component(s) owned by another Registered Entity (if applicable for the specific event), or • Explain in a declaration why corrective actions are either beyond the entity's control, applicable to another Registered Entity, or would reduce BES reliability. (3) In R4: Implementation of the CAP should include a time limit. We suggest re-wording R4.1 to say "Implement the CAP or action plan within 180 calendar days after developing the CAP or action plan, or per the CAP or action plan timetable, whichever is longer."
Individual

HHWP
Agree
NAGF I wanted to provide additional comment related to the implementation plan and was unable to

undue the "Agree" radio button We believe that the six-month implementation timeline is insufficient for many small entities to revise existing misoperations identification and analysis procedures and provide appropriate training to relevant staff. We also would like to see all implementation plans include training key Standard requirements or changes, and CEA expectations for basic compliance.
Group
Luminant
Brenda Hampton
Luminant Energy Company LLC
No
Misoperations categorized in line items #3 and #4 are subjective and left up to varying interpretation for protective systems on generator applications. Unlike the definition for “Slow Trip – During Fault”, Transmission Owners are provided with criteria that define a slow operation while generation owners do not have similar established criteria for trips involved in items #3 or #4. Luminant recommends line item #4 be removed since it is subject to varying interpretations and item #3 be only applicable to Transmission.
Yes
Luminant agrees with the approach but suggests the following improvements to R1 and sub-requirements. 1) R1 should address the interrupting device as a “BES” interrupting device. 2) Luminant recommends that the concept of ownership be continued from the main requirement to each sub-requirement. For example, in 1.1, it would be written as follows: “Identify and review each of its applicable Protection System operations.”
No
The time frames and activities in R1-R3 are confusing and can be simplified. Luminant suggests that R1, 2, 3 be revised to allow owners 180 days from the time of the BES interrupting device operation to investigate, determine the cause, and develop a CAP (cause known) or action plan (cause unknown). An action plan can result in identifying a cause and should include a CAP. If a cause cannot be determined, the investigation is closed. Below is our recommendation for R1-R3: R1. Within 180 calendar days of a BES interrupting device operation in its Facility caused by a Protection System operation, the applicable Transmission Owner, Generator Owner, and Distribution provider shall: [Violation Risk factor: Medium}{Time Horizon: Operations Assessment, Operations Planning] 1.1 Identify and review each of its applicable Protection System operations. 1.2 For its Protection System operations that are interdependent with the Protection Systems of another owner, the entity shall notify the owner of the interdependent Protection System. 1.3 Identify each of its Protection System misoperations, determine a cause (if known), and develop a Corrective Action Plan (CAP). R2. For misoperations where the cause cannot be determined within 180 days of the BES interrupting device operation, the applicable Transmission Owner, Generator Owner, and Distribution Provider shall develop an action plan to: [Violation Risk factor: Medium}{Time Horizon: Operations Assessment, Operations Planning] o Develop a CAP within 60 days after identifying the cause of the misoperation for the Protection System component(s). o Where applicable, explain in a declaration why corrective actions are beyond the entity’s control or would reduce BES reliability and close the investigation. R3. Each Transmission Owner, Generator Owner, or Distribution Provider shall implement its CAP according to the established timetable. [Violation Risk factor: Medium}{Time Horizon: Operations Assessment, Operations Planning].
No
Luminant disagrees with the concept of “If an entity suspects …” phrase. Luminant suggests that the data exchange between entities with “interpendent System protection Systems” be as follows: “…For its Protection System operations that are interdependent with the Protection Systems of another owner, the entity shall notify the owner of the interdependent Protection System.” The owner of other components in the Protection System may request information in performing their investigation.
No
The data provided by the quarterly report would have little, if any, reliability benefit to the BES due to the limited technical information provided in the Attachment. Luminant recommends that a report be provided on an annual basis.
No

Change accordingly to the response to Q2 and Q3.
No
Measure M1 should not be written to include “all interrupting device operations must be logged”. Luminant recommends that the measure for Part 1.1 be revised from “each interrupting device” to “each applicable interrupting device”. M1 measures for part 1.2 and 1.3 would be “Acceptable evidence for Part 1.2 may include, but is not limited to, electronic or written documents that indicate the owner of was notified of the event associated with the operation. Acceptable evidence for Part 1.3 may include, but is not limited to, a copy of a dated investigation report or documented findings for Misoperation.”
Yes
Luminant does not agree with Requirement R3 of the standard since there is an apparent conflict or double jeopardy with the draft standard on generator relay loadability (PRC-025-1). Luminant recommends that R3 of PRC-025-2 be removed and any event from a generator load responsive relay for review be in the draft PRC-004 standard that operates an interrupting device. The chairmen of both SDT’s should consult with one another to remove any conflicts.

UI does not agree with including any of the reporting process in the PRC-004 standard or its attachments. The information to report does not require Ballot Body Approval initially or each time a field is to be modified.
Yes
Yes
No
The implementation plan should recognize that the Requirements will be applied to the first protection system operation that occurs AFTER the effective dates. Any operations or misoperations or corrective action plans being implemented are not subject to this Standard.
R2 should not specify that the CAP contains an activity to evaluate applicability to all of the entity’s Protection System. It could create a situation where check-sheets are required with sign-offs for review of all systems. R4.2 is of concern with the requirement to maintain detail implementation records of each CAP or action plan. Detail is an ambiguous word that can not be complied to. The compliance burden to provide detailed implementation records is excessive. A Transmision Owner is audited every 6 years. A TO will need to provide detailed records of CAP’s and action plans for 6 years. The only organization receiving a benefit from this requirement is the NERC Audit team. All that should be required by the Standard is the date of completion on the CAP implementation. Additionally, There should be no requirement to record revisions to the CAP.

Yes
No
PacifiCorp is concerned that the 120-day time limit in R1 is insufficient. When two registered entities are involved in the interrupting device operation, 120 days is not enough time for both entities to complete the activities required by the requirement. PacifiCorp proposes an increase to 90 days for each entity to complete their respective activities in sequence. This would increase the total from 120 to 180 days under R1.
No
See comment #3
No
PacifiCorp is concerned that the VSLs are not commensurate with the reliability risk of the associated violations. In many cases, the difference between a “Lower” and a “Severe” VSL is an arbitrary additional number of days during which the reporting or documentation requirement was not satisfied. The fact that a report is an additional 30 days late should not increase the VSL from “Lower” to “Severe.” A later report does not increase the likelihood of additional adverse impact to the BES. A registered entity’s failure to remediate a protection issue is much more critical. A more reasonable timeframe for the VSLs would be 20 days per severity level instead of the proposed 10 days.

Including the TADS information provided under the NERC Rules of Procedure is in conflict with this standard. TADS' reporting is on an annual basis. By including the TADS event ID, the standard would require quarterly reporting of the TADs event. The inclusion introduces the conflict between the rules of procedure and a standard. Including the quarterly reporting as part of the compliance information is not consistent with standard requirements. There is requirement VRF or VSL assigned to the reporting and therefore no compliance violation can be assessed for failure to respond. The reporting information is not subject to a requirement per Commission guidance since it is only for metrics and administrative purposes per the SDT. The information collected under this standard is inconsistent with the information collected for Transmission system events. TADs event data is collected under the NERC Rules of Procedures. The standard should be modified to remove the reference to the additional compliance information and have the information collected under the NERC Rules of Procedures.

No
We have divided R1 into two requirements (R1 and R2) below to clarify what occurs when a Misoperation occurs on a Protection System component owned by one entity and that Misoperation causes another entity's interrupting device to operate. Under the new R1 below, the interrupting device owner must first determine, within 90 days, if a Misoperation occurred and whose Protection System component was responsible. If another entity is responsible, that entity is notified. Under R2, the entity whose Protection System component misoperated must do the completed a Misoperation analysis within 210 days of when the Misoperation was identified. See below: R1. Within 90 calendar days of an interrupting device operation in its Facility, each Transmission Owner, Generator Owner, and Distribution Provider shall determine if its Protection System (a) operated properly, or (b) had a Misoperation, or (c) operated properly with indications that Protection System component(s) owned by another entity had a Protection System malfunction that caused the interrupting device operation and, if applicable, shall complete part 1.1. [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning] o If condition (b) is the findings, the interrupting device owner shall be responsible for the investigation in Requirement R2. o If condition (c) is the findings, the

other Protection System owner shall be responsible for the investigation in Requirement R2. 1.1 For a condition (c) finding, the interrupting device owner shall notify the owner of that Protection System component(s) and provide any available investigative information that is requested by that owner in writing. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-Term Planning.] o In the event that the owner of the interrupting device and the owner of the other Protection System component(s) disagree on the interrupting device owner's determination in R1, the Regional Entity shall investigate and make a determination as to which entity is responsible for the investigation in Requirement R2, and the identification of a Misoperation will be considered completed when Regional Entity's decision is rendered. M1. For R1, each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence of the date of the interruption device operation and the date it completed its review of each interrupting device operation, including its associated determinations. Evidence for Part 1.1 includes documentation of written transmittals to the other Protection System owner (notifications and requested information) including, but not limited to, transmittal e-mails, log entries, or letters. R2. Within 210 calendar days after identifying a Misoperation per R1, the responsible Transmission Owner, Generator Owner, and Distribution Provider shall complete an investigation report of each Misoperation that state the Misoperation category and cause. If no cause is determined, the report shall state that. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-Term Planning] M2. Acceptable evidence for Requirement R2 may include, but is not limited to, a copy of a dated investigation report with documented findings for each Misoperation, including a description of the equipment involved in the Misoperation.
No
In addition to the new R1 and R2 above, R3 through R4 below are an alternative to replace the proposed R1 through R3. R3. If the cause(s) for a Misoperation is identified in Requirement R2, the Transmission Owner, Generator Owner, and Distribution Provider shall, within 270 days of identifying a Misoperation per R1: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-Term Planning] o Develop and document a Corrective Action Plan (CAP) for the identified Protection System component(s) that includes an evaluation of the CAP's applicability to the entity's Protection Systems at other locations, or o Explain in a declaration why corrective actions are beyond the entity's control or would reduce BES reliability. M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R2 that must include a dated CAP or a dated declaration explaining why there is no need to develop a CAP. R4. If the cause for a Misoperation is undetermined in Requirement R2, the Transmission Owner, Generator Owner, and Distribution Provider shall, within 270 calendar days of identifying a Misoperation per R1, complete: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-Term Planning] o Development of an action plan that identifies any additional investigative actions and/or Protection System modifications, including an estimated timetable, or o A declaration explaining why no further actions will be taken. M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R5 that must include a dated action plan or a dated declaration explaining why no further action will be taken.
No
We believe that our alternative language in #2 and #3 above is clearer. In addition, a Misoperation analysis is required even when a cause cannot be determined. After that analysis is completed, an entity either develops a CAP or an action plan.
Yes
Metrics can be developed, but the team should describe what metrics it envisions and how those metric will be used.
We did not focus on the VRFs and VSLs and have no comments
No
We have proposed alternative Measures in #2 and #3 above and in #9 below. The Data Retention language is acceptable.
Yes
No comments.
We have provided new language below that continues after our R4 above. R5 addresses implementation of the CAP or action plan. R6 requires reporting of data in Attachment 1. We believe that providing the data in Attachment 1 should be a requirement instead of being addressed in the "Additional Compliance Information" section. R5. For each CAP or action plan, the Transmission

Owner, Generator Owner, and Distribution Provider shall implement the CAP or action plan. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Long-Term Planning] M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R5 that includes dated records which document the implementation of each CAP and action plan, such as work orders or maintenance records that document the completion of work or maintenance, including documentation of revisions for each CAP or action plan. R6. Each Transmission Owner, Generator Owner, or Distribution Provider shall submit PRC-004 – Attachment 1 to its Regional Entity within two calendar months following the end of each calendar quarter. [Violation Risk Factor: Low] [Time Horizon: Operations Planning, Long-Term Planning] M6. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R6 that it transmitted PRC-004-3 – Attachment 1 to its Regional Entities within two calendar months following the end of each calendar quarter. We have also addressed the “Facilities” portion of the standard in the “Applicability” section and suggest the language below, parts of which were taken from PRC-005-2. The Protection Systems in 4.2.1 and 4.2.2 provide protective functions. Section 4.2.3.3 excludes UFLS systems whose operation is evaluated in PRC-009-0. While it is clear that the team wanted to exclude relays such as reveres power relays for generators, their description of these as providing “non-protective functions” is inaccurate since they prevent a generator from motoring during shutdown. They protect the generator. We have excluded those applications in our Section 4.2.3.4 because the operation of an interrupting device caused by a reverse power relay is associated with a normal generator shutdown. The Misoperation of such a relay results in the motoring of a generator, and while that can create a serious problem for a Generator Owner who is incented to evaluate such Misoperations absent a standard, it does not create a BES reliability issue. 4.2. Facilities 4.2.1 Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.) or abnormal conditions. 4.2.2 Protection Systems for generator Facilities that are part of the BES for the purpose of detecting faults or abnormal conditions, including: 4.2.2.1 Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays. 4.2.2.2 Protection Systems for generator step-up transformers for generators that are part of the BES. 4.2.2.3 Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind-farms to the BES). 4.2.2.4 Protection Systems for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays. 4.2.3 Facilities not included 4.2.3.1 Special Protection Systems (SPS) or Remedial Action Schemes (RAS) 4.2.3.2 Undervoltage load shedding (UVLS) systems 4.2.3.3 Underfrequency load shedding (UFLS) systems 4.2.3.4 Relays that operate for the normal shutdown of an Element. Finally, we believe in the Application Guideline, the third sentence in the first paragrqaph on p. 18 of 22 is written too restrictley. We suggest this language instead: The initial evidence, which may also be documented separately, MAY CONTAIN [delete “contains.”] the sequence of events, relay targets and a summary of Disturbance Monitoring Equipment (DME) records, TO THE EXTENT AVAILABLE.
Individual

Liberty Electric Power LLC
No
The "unnecessary trip- other than fault" should be removed. Standards should not cover balance of plant issues, which could be trip causes. While trip analysis is a best practice, it should not be a required, zero tolerance element of the NERC standards. For example, a turbine vibration fault could use the same 86 relay as the generator protection relay, which would make that 86 part of the protection system. Vibration trips of that 86 relay would then fall under the program, causing unneeded effort for compliance documentation of a straightforward balance of plant issue. The definitions themselves are overly complex, and could be combined in many cases.
No
See comments in Q1. In addition, the standard needs to specifically exclude reverse power relay activations from misoperations analysis, as these activations are a normal event in the shutdown of many units.
Yes

Yes
No
Limit resolution status to "work in progress" and "complete". Forms are too complex, with many elements not used by generator operators (example:TADS), or not known by GOPs ("Other BED elements", etc.)
No
Suggest removing R4 lower - too subjective.
No
Disagree with the requirement for "each interrupting device activation" list - some activations are normal shutdown activations.

1) What influence do the Application Guidelines have on the CEA? For example, the Application Guidelines clearly and correctly explain "…such as when a reverse power relay is used to trip a breaker during generator shutdown, the operation of the control component or the function when not providing protection is not included in the definition of Misoperation and its operation would not be reviewed under this standard." A narrow reading of R1 without this explanation could result in either frivolous violations or an entity expending considerable resources to document that every normal shutdown of a generator is a correct operation. 2) Clarify the Rationale consistent with Technical Basis page 17, by clearly stating that "the interrupting device owner is responsible to investigate operations initiated by a Protection System." 3) Augment the Rationale by adding at the end, "…and submit Attachment 1 data to the CEA per section C.1.4 Additional Compliance Information." A fair number of Misoperations trip another entity's interrupting device (e.g. DTT). R1 correctly requires the interrupting device owner to initiate the investigation, but, once the Protection System component causing the Misoperation is identified, it becomes that Protection System owner's responsibility to report the Misoperation. Under the present PRC-004-2a, there is confusion on this distinction. 4) Change R1 1.2 to "Designate each operation as correct or a Misoperation. Group Misoperations for the same interrupting device that occur within 5 minutes for subsequent steps." IEEE 1366 defines 5 minutes as the demarcation between momentary and sustained events. Grouping multiple like kind operations into a single investigation / action plan / CAP is more efficient and avoids distorting statistics. It also improves BES availability and reliability by correctly reinforcing the appropriate use of automatic reclosing.
No
1. SERC objects to the timetables and the compliance burden it places on entities: There is no evidence or indication that entities are not doing due diligence in reviewing operations. Quarterly reporting schedules help drives closure. 2. R1 correctly requires the interrupting device owner to initiate the investigation, but when the Protection System interconnects with another entity and there are indications that the other entity's Protection System components misoperated (i.e. Other entity

sends a spurious DTT), then, once the cause of the Misoperation is determined, it should be the responsibility of the owner of the Protection System that misoperated to report; thus removing the burden of reporting from the interrupted device owner. In some cases there may be several devices interrupted which are owned by different entities and the Protection System failure resulted from an entity that had no devices that were interrupted or affected at the location where the Misoperation occurred. Under the present PRC-004-2a, there is confusion on this distinction. 3. R1 introduces a 120 day requirement for performing a correct and consistent review and classification of Misoperations. By introducing individual time requirements, this places an unnecessary burden on entities to track and document each phase of investigation and review of a Misoperation. Similar to the approach taken in COM 003 recently which included a requirement to have a process and plan to address Misoperations according to regional entity guidance and oversight. Many entities currently respond to misoperations in a timely manner and to add additional tracking and time requirements does not place the priority on addressing reliability, it places the focus on data collection and documentation. In the event the SDT cannot accept Regional Entity oversight, then an overall time limit should be stipulated versus the current verbiage in the standard referencing the 120 and 60 day requirements. 4. All references to an investigation report should be changed to read “Misoperation investigation report” or “investigation report due to misoperations”. Without this change it could be interpreted that all operations require an investigation report.
No
1. Please refer to comments in #2 above (SERC comments 2 and 3). Also, consider the following: a). R1 correctly requires the interrupting device owner to initiate the investigation, but when the Protection System interconnects with another entity and there are indications that the other entity’s Protection System components misoperated (i.e. Other entity sends a spurious DTT), then once the cause of the Misoperation is determined, it should be the responsibility of the Protection System owner that misoperated to report; thus removing the burden of reporting from the interrupted device owner. In some cases there may be several devices interrupted which are owned by different entities and the Protection System failure resulted from an entity that had no devices that were interrupted or affected at the location where the Misoperation occurred. Under the present PRC-004-2a, there is confusion on this distinction. b). There is also a suggestion that multiple entities utilize a joint investigation report. Again, the burden of reporting should lie on the entity that owns the Protection System that caused the Misoperation and they should initiate reporting and communicating other entity actions to correct the problem.
No
1) Please change ‘Time Zone’ Field Value to prevailing time (e.g. CPT for Central Prevailing Time) to make reporting more efficient. 2) Please split Incorrect Setting/Logic/Design Errors into three separate categories to improve the usefulness of the metrics regarding Protection System performance. 3) Please split Communication Failure into two separate categories, one for ‘Carrier’ and one for ‘non-Carrier’ to improve the usefulness of the metrics regarding Protection System performance. 4) Please eliminate the TADS and GADS data submittals. Instead request the total number of operations at each Equipment Voltage level because this is a more effective means of gathering the information for all Protection System operations. The SERC PCS recommends that the rules for determining an “operation” be consistent between TADS and PRC-004 reporting. Also need to coalesce data systems (GADS, TADS , PRC-004, etc.)
No
While the SERC PCS does not see the need for timetables (see comment under #3), if they are put in place, we offer the following recommendations: 1) For R1 and R3 the escalation from Lower to Severe VSL in just 30 days is too short. Please make them more consistent with the requirement duration. As a comparison, R2 escalates in 30 days, which is 50% of the time limit. We recommend keeping the 50% consistent for escalation to Severe with a limit of 210 days for R1 and 270 days for R3. 2) R2 VRF measures duration from ‘completion of the investigation or receiving notification’ but R2 itself measures from ‘identifying the cause(s) of each Misoperation’. Please change the VRF language to match R2 itself. The only notification we see is in R1, and it is inappropriate to measure CAP development duration from the time a component is only suspected.
Yes
1) Please clarify that an entity is to retain evidence for all Misoperations with an open investigation, action plan, or CAP since the last audit even if the interrupting device operation occurred before the

last audit.
Yes
Are Misoperations with open CAP to be transitioned from PRC-004-2a to PRC-004-3 as ‘Update’ Submittal Type once it becomes effective?
1) R2 states that the CAP applies to the identified Protection System component(s). But then goes on to say the CAP “includes an evaluation of the CAP’s applicability to the entity’s Protection Systems at other locations.” It is unclear whether the entity is required to take corrective actions at those other locations in order to complete the CAP. Our reading and expectation is that the entity completes the CAP, when they complete the identified work at the location of this Misoperation. We would expect the entity to initiate a program to address the other locations over some reasonable time period. 2) Please reword C.1.4 from “Each Transmission Owner, Generator Owner, and Distribution Provider that owns BES protection Systems will submit the data identified in PRC-004 - Attachment 1 to the CEA…” to “For Misoperation(s) caused by BES Protection System it owns, each Transmission Owner, Generator Owner, and Distribution Provider will submit the data identified in PRC-004 - Attachment 1 to the CEA…” This clarifies who is responsible for submitting when multiple entities are involved. 3) Application Guidelines – Reporting section on page 20 states ‘…the fourth ranked initiating cause of BES outages not related to weather was “Failed Protection System Equipment.” Given the high ranking of this metric, it is appropriate to collect data on Protection System Misoperations for analysis to drive improvements in Protection System reliability.’ While this may be true in terms of number of events, it sensationalizes the Failed Protection System Equipment cause. In fact Failed Protection System Equipment is a very minor cause of unavailability. For full context, please also state: a) the total number of non-weather related causes; b) the top three non-weather related causes; and c) its rank in terms of BES unavailability. 4) A significant effort has been expended in developing the current PRC-004 misoperations template. The SERC PCS recommends that the SDT leverage this effort in consideration of misoperations reporting (Atta 1). 5) The SERC PCS recommends that the application guidelines be used for assessing misoperations and not for operations. 6) All references to an investigation report should be changed to read “Misoperation investigation report” or “investigation report due to misoperations”. Without this change it could be interpreted that all operations require an investigation report. This section is a very good description of what data may be used in an investigation report, but, for clarity of compliance purposes, it should be a little more defined as to which part of this is compliance-related and which parts are just informative. Suggest having a more general statement such as “A misoperation investigation report should be of sufficient detail to either ascertain the cause of the misoperation or else describe the work performed/being performed to analyze the misoperation.” For example, if you find a piece of equipment failed (powered down), a sequence of events or DME records are not needed to figure out the cause, and so should not be required in the Misoperation investigation report. Along those same lines, we suggest adding a “may” and an “or” to the third sentence of page 18 “The initial evidence, which may also be documented separately, may contain the sequence of events, relay targets, and/or a summary of Disturbance Monitoring Equipment (DME) records.”

Yes
The definition and its rationale seem reasonable. One observation is to shorten the language of each category of Misoperations. Generally, detailed definitions cause more problems in compliance than short and concise definitions. We had one question for the SDT regarding the definition – is breaker failure considered a Misoperation?
No
There is not a NERC glossary term for “interrupting device.” The SDT should consider proposing a new glossary term to clarify what Protection System equipment is included in order to properly analyze all applicable equipment. Does the SDT intend interrupting devices to include switching equipment capable of interrupting a fault or would the team also include switching equipment capable of interrupting load? This term could include more than is intended and additional clarity is needed.
No
The SDT should consider providing an exception process if there are unforeseen delays that inhibit an investigation to occur within 120 days. For instance, there could be difficulties with coordination for multiple interrupting device owners. There are numerous reasons that could cause a delay to go beyond the 120 days, so there should be some sort of time allowance to provide extra time if the excuse is justified and reasonable.
No
(1) There is no justification in the Rationale for R1 or in the Application Guidelines to show statistics that this scenario would occur regularly. The supplemental documents do not explain why the SDT felt that adding this provision to the standard was necessary. This concept seems to be a rare instance without a basis for adding it as a requirement. Considering that this requirement is on a timeline for which compliance would be measured. (2) The requirement’s wording is subjective in nature and would be very difficult to provide documentation for “suspecting” another entity’s component contributed to the Misoperation. Also, R1.1 seems to skip a step – first the entity identifies and reviews all operations but the next step should be to identify Misoperations. Once Misoperations are identified, then the investigation for the cause of the Misoperation would occur. The investigation step is when an entity would consider if another entity’s components or equipment would have been the cause to the Misoperation. Therefore, we recommend striking the second sentence of 1.1.
Yes
No
(1) We agree with the classification of the VRFs. (2) The time horizons for R2, R3, and R4 are Long-term Planning, which is a planning horizon of one year or longer. There is a gap in the time horizons – the 180 day mark is longer than seasonal but shorter than 1 year. We recommend classifying these standards as Operations Planning, which would be consistent with R1. (3) The violation severity level for R1 increases based on arbitrary timelines. It is conceivable that an entity could identify and review a Misoperation on day 150 (which would be a severe VSL) and complete the CAP 20 days after, which would still be within the 180 day timeframe (established by R1 with R2). The VSLs do not reflect the spirit of the standard and need to be revised with reasonable timelines. If R1 was not complete within 180 days, then that would be more justifiable for a high VSL and if an entity did not do anything that would be a reasonable justification for severe. (4) Also in R1 VSL, the second paragraph in the Lower section is almost identical to the second paragraph in severe, which is confusing and could lead to inconsistent application. We recommend revising the R1 VSLs for clarity and would like the SDT to consider creating VSLs that determine the severity level if R1 and R2 are not completed in a certain

period of time. (5) Our concerns with the R2 VSL are similar to paragraph (3) above. It is conceivable that an entity could identify and review a Misoperation on day 30 and complete the CAP 70 days after (which would be a severe VSL), and would still be well within the total 180 day timeframe (established by R1 with R2). The VSLs do not reflect the spirit of the standard and need to be revised with reasonable timelines. If R1 was not complete within 180 days, then that would be more justifiable for a high VSL and not doing anything would be a reasonable justification for severe.
No
The SDT referenced NERC Rules of Procedure, Appendix 4C (CMEP), Section 3.1.4.2 Period Covered for compliance data retention to begin with the day after the prior Compliance Audit and ending with the End Date for the Compliance Audit. However, the SDT did not include the final two sentences in Section 3.1.4.2, which states: "However, if a Reliability Standard specifies a document retention period that does not cover the entire period described above, the Registered Entity will not be found in noncompliance solely on the basis of the lack of specific information that has rightfully not been retained based on the retention period specified in the Reliability Standard. However, in such cases, the Compliance Enforcement Authority will require the Registered Entity to demonstrate compliance through other means." Six years is excessive to maintain records for Corrective Action Plans. The SDT is within the bounds of the NERC Rules of Procedure to shorten that amount of time. We recommend three years for data retention for Correction Action Plans.
Yes
Why is UFLS not excluded when UVLS is? Also, are registered entities required to perform the 120-day assessment at least once before the enforceable date? Please refer to CAN-0012, which provides that if the standard is silent to performing a periodic activity, the entity can perform the first activity after the enforceable date.
(1) There is ambiguity in R4, part 4.2, “maintaining detailed implementation records,” which could be interpreted in different ways by auditors as to the degree of detail that is needed for implementation records. The measures give examples of acceptable methods to achieve compliance and therefore we recommend striking the word “detailed” from part 4.2. Further 4.2 is strictly a data retention requirement, which is administrative in nature and should be removed. This is the type of requirement that Paragraph 81 is currently in the process of retiring. (2) In part 4.2.3 of the applicability section, the SDT needs to emphasize that relay functions are not included in the definition of Protection Systems. By explicitly stating that certain non-protective functions that may be embedded within a Protection System are excluded, it could be interpreted that anything else that was not explicitly mentioned in the requirement could be included, such as sudden pressure relays. We recommend adding additional detail to this section for clarity. (3) Does the SDT intend to remove the old definition of Misoperations from the background section? It does not need to remain as supplemental information with the passing of the new definition. We understand that certain aspects of the standard would be removed, such as the rationale boxes, but there is no mention that background section would be removed. (4) In the application guideline, Requirement R3 section, first paragraph first sentence – “If the Misoperation cause is not identified within 120 days, and reasonable investigative actions have not been exhausted, Protection System owners are expected to exercise due diligence in the development and implementation of an action plan for additional investigation.” This sentence needs to clarify what reasonable means. It appears from this statement that if you did not exhaust all reasonable investigations, then you should continue additional investigations, but at that point, you would be in violation of R1. The SDT needs to consider rewording this sentence, possibly striking the underlined portion of the sentence. (5) In the application guideline, Requirement R4 section, second paragraph – this paragraph is discussing the goals of R3 and we recommend moving this paragraph to the R3 section. Thank you for the opportunity to comment.

No
In regards to R2, the 60-day period for developing a CAP seems to be reasonable; however, this period starts from the date the cause of Misoperation is identified. “Date of cause” could be subjective and can potentially generate confusion and unnecessary violations. LADWP recommends using the date of “device interruption operation” and change “60 days” to “180 days.”

The way R1 currently reads, investigations would be required for planned work (e.g., full function trip testing). Language should be “Within 120 calendar days of an unplanned interrupting device operation in its Facility caused by a Protection System operation, each Transmission Owner, Generator Owner, and Distribution Provider shall:”. The “unplanned” should apply to the interrupting device operation, vice Protection System operation, so that an investigation is required for misoperations during testing.
Yes
Yes
No
Attachment 1 does not describe data that is appropriate for metric analysis for a couple reasons: (1) This standard applies to both Generation Owners (GOs) and Transmission Owners (TOs); however, GOs are not in a position to respond to the last item on page 1, "Additional BES Interruptions." GOs are responsible for BES equipment in their plants and are not responsible for BES equipment belonging to TOs. Therefore, GOs should not be responsible for determining any BES interruptions outside of the plants. We recommend removing the section, “Additional BES Interruptions”. (2) If TADS/GADS data is required for metric analysis, then an explanation should be provided for why the data is required. We recommend that NERC or the Regional Entity provide an explanation for the relevance of the TADS/GADS data to the metric analysis.
Yes
Yes
Yes
We understand that this was an arduous standard to develop, and it required extensive explanations for requirements and measurements. We agree with the concepts presented in PRC-004-3, and we

believe it was very well-written. We appreciate the effort that went into developing and reviewing this revision. However, frequent revisions of standards, coupled with frequent revisions of definitions, do not help to maintain consistent procedures for ensuring the reliability of our protection systems. We suggest that national standards only require what is deemed absolutely necessary on a national level. Any further requirements and recommendations should be provided by Regional Entities. This will mitigate misinterpretations of the standard and lessen the amount of revisions to the standard.

The description of "unnecessary trip", the exclusion of remote protection System operation is not accurate because such operation is actually necessary (not "unnecessary") and it is intended to operate for failure or slow operation of Local Protection Systems. The description for a remote back-up system operation and limiting that to only the "adjacent" zone is not appropriate. There are cases when the appropriate protection system operation may not be from the "adjacent" zone of protection. Also, the term "zone of protection" is not defined, e.g., are zone 1, zone 2 and zone 3 distance relays different "zones of protection". If a zone 3 relay covers two transmission facilities, is that one and the same "zone of protection"? Or does the SDT intend a zone to be breaker-to-breaker? How is a Circuit Switcher treated when defining a zone of protection>? Etc. The description of a "slow trip" as "operation slower than intended" without some sort of quantification of how much slower than intended is ambiguous (e.g., is one cycle longer delay than expected a misoperation?), unless the intent is to establish an operating time as the slowest intended operating time. Even so, measurability becomes a concern.
No
The standards takes a zero defect approach, especially in R1 which requires investigating every protection system operation; hence, if one protection system operation is missed, a violation occurs. We are, not in favor of a zero defect approach, especially when most relay operations operate correctly. We recommend using approaches similar to what the COM-003 and CIP v5 teams are considering. R1 does not work well with the definition of Misoperation. In other words, in order to "(d)esignate each Misoperation" as required, the entity will need to have evidence that a fault actually existed. This can be quite difficult, especially for a protection system operation with a successful reclose (e.g., due to lightning strike for instance), how is an entity to prove that the fault existed? In addition, measuring clearing time can be quite problematic, especially for electromechanical relays. How is an entity to gather evidence that relay operation was "slow" or not, and hence identify a misoperation due to slow operation? Does this require installation of equipment to be able to gather sequence of events evidence? It would seem to us that a focus on internal controls for R1 is more appropriate to resolve some of these issues and challenges than the approach the SDT proposes.
No
We believe there ought to be exceptions for an "Act of Nature", e.g., event like a hurricane, that can result in a great many protection system operations but still require investigation of all of them within 4 months.

Applicability of 4.2.1 "Protection Systems for Facilities that are part of the BES" is not consistent with the interpretation of PRC-004-1 Attachment 1 nor the applicability of PRC-005-2. We recommend using the FERC approved interpretation of PRC-004-1 Attachment 1. R3 is not needed, is administrative in nature, and provides no reliability benefit. R2 should be modified to be applicable only to misoperations where cause(s) were identified. R4.2 is administrative in nature, is a Measure, not a requirement, and should be deleted.

Protection Systems can be and are designed to provide remote backup protection for adjacent zones. In many instances, these zones are owned and operated by other entities. As worded, part 1 of the definition says “failure…to operate for a Fault within the zone it is designed to protect.” If entity A has a Protection System that is designed to provide remote backup protection for entity B and entity B has a Fault on that Element, but does not notify entity A of said Fault, then without an interrupting device operation, entity A has no way of knowing if their Protection System should have operated or not. Proposed solution: Failure to Trip – During Fault – A failure of a Protection System to operate for a Fault within the zone it is designed to be the primary protection.
Yes
Yes
No
R1.1 seems to be intending that the owner of the interrupting device perform the intial investigation. If a Misoperation is identified and the Protection System is owned by another entity, the wording of the standard is not clear about which entity should be responsible for the CAP, etc. The rationale paragraph covers this, but of course won’t be included once the standard is finalized. Are both entities responsible for documenting the operation/Misoperation?
Yes
Yes
Yes
Yes
The quarterly reporting of Misoperations provides no benefit to the reliability of the Bulk Electric System and the entities are required to spend additional resources to develop these quarterly reports instead of focusing on the actual reliable operation of the BES. Performance metrics can be determined on a yearly basis, through annual reporting.
Individual

Cogentrix Energy, LLC
No
The proposed definitions are unneccisarily complicated. Also, the "catch all" category "Unnecessary Tip - Other Than Fault" will cause entities to analyze, document and report events that may occur but were not due to issues in engineering, design, or relay settings, thus providing little to no benefit to industry to learn from the event. For example, a control wire that was chewed by a mouse and led to a line tripping out.
Yes
The overwhelming majority of investigations by Generation Owners under the requirement in PRC-004-3 to review each Protection System operation (R1) will be for reverse power trips during normal stop events. It is understood that the Application Guidelines specifically states that reverse power relay operations be not considered as Misoperations because the operation is a "control function" within the protective relay. But a reverse power relay is not a control device. It is a protective device. Its purpose is to protect the generator in the event the generator loses its prime mover and it begins to motor. This form of protection is more "visible" during a normal stop event, but a reverse power

relay is providing this protection at all times. It is unclear as to whether the Application Guidelines is an enforcement "tool" and guidance provided in within may be used by the CEA to determine compliance by a Generation Owners. Since it is unknown, it should be explicitely stated that reverse power trips during a normal stop event be not considered as Misoperations. It is understood that the Application Guidelines stand separate from PRC-004-3 per se, but the former document will likely be used by auditors in determining whether or not investigations were thorough enough to identify Misoperations. We therefore expect it to be obligatory, if the standard is passed in its present form, to document the, “sequence of events, relay targets and a summary of Disturbance Monitoring Equipment (DME) records,” for each normal stop (ref. the "Requirement R1" section of the Application Guidelines), including determining whether or not the Protection System operation was slower than expected ref. (items 2 and 3 in the "Guidelines and Technical Basis" section). The number of such events can be extremely large, since peaking units often stop and start daily (or even several times per day) in high-demand seasons. Retrieving such data would be extremely time-consuming; since, where DME exists (our RRO’s standard for PRC-002 has a minimum size threshold), GOs often do not have the centralized data collection facilities of TOs. Event analysis personnel may need to spend extreme amounts of time traveling to and from jobsites, since some peaking stations are unmanned or only minimally staffed. All this effort would result in no associated benefit regarding BES reliability. Reverse power relays are counted (perhaps inappropriately) as being part of the Protection System, but these devices do not trip in response to something having gone wrong. It is intended that negative current be experienced at some point as the unit unloads, and subsequent actuation of the reverse power relay is normal and expected. Notes should therefore be added to R1 and to the Application Guidelines, stating that tripping of the reverse power relay during a normal stop event does not indicate a Fault, and a detailed investigation, DME downloading, speed-of-response analysis and the like are therefore required only if DME is present and if the reverse power relay failed to function.
Yes
Yes
No
There are too many classification choices in the “Resolution Status” field of the report form. An equally effective status report can be delivered using three choices: 1) Analysis In Progress [Still Under Investigation]; 2) Analysis Completed – Corrective Action Plan Pending; 3) Corrective Action Completed [Investigation Complete, Corrective Action Complete] The form for GOs should differ from that for TOs, for the following reasons: a. GOs are not in a position to respond to the last item on p.1, “Additional BES Interruptions.” We know only what happens in our plants, not repercussions on the grid. b. The “slow trip” entries in the “Misoperations Category” do not apply for the majority of Misoperations reported by GOs. The presence of such categories in the draft standard appears to derive from the belief that millisecond-resolution records of Misoperations are always available from DME; but, when this equipment is present at generation plants, it is installed only at the GSU and (if the GO is the owner) the yard breaker – that is, on high-side equipment. The DME is consequently not expected to yield any useful information for Faults occurring at the generator or other low-side components. Notes should be added to PRC-004-3 and the Application Guidelines to the effect that DME downloading and speed-of-response analysis pertain at generation Facilities only when DME is present and only to incoming Faults from the grid. Further, the current draft standard does not dictate whether quarterly reporting to the CEA is required and enforceable, as it is currently (the term "will" as opposed to "shall"). Additionally, there is no reference to reporting in a manner outlined by the CEA/RRO. The use of a common "form" is needed to achieve the usefulness and effectiveness of these data submittals.
No
Better clarity for the lower VSL associated with R4 should be provided. The term "incomplete" is too ambiguous. The current language leaves determination of "completeness" of documentation up to the auditor.
No
M1 generically references lists, logs and databases, while the Application Guidelines cite much more specific evidence (sequence of events, relay targets, summary of DME records). These two documents

should be in seamless agreement; we need to know specifically what will and will not be required when our records are audited, as opposed to being told when it's too late to do anything about it that our lists, logs etc do not constitute sufficient evidence.
Yes
Compliance section C1.4 contains a requirement to report to the RE – this needs to be in the requirement section of the standard.

The Applications Guidelines section of the proposed standard is invaluable in clarifying the requirements. We propose that some of this information be directly added to the associated standards. This includes statements in items (2) and (6).
Yes
While an entity can transmit information regarding a possible misoperation to another entity, the initiating entity cannot force a response. An entity which receives a transmittal is responsible for a response.
Yes
Yes
An entity cannot be held responsible for another entity's failure to respond or act upon notice of a suspected misoperation.
Yes
No
The metrics seem arbitrary and not linked to possible risk to the BES.
Yes
Yes
We agree that these are good business practices and, in fact, we are currently performing these practices already. However, we have a great deal of concern that the documentation burden required to meet compliance continues to increase exponentially. We would like to point out that the current documentation requirements are diverting a significant portion of our resources away from system improvements. Please add the following items (found in the Applications Guidelines) directly into the standard requirements: • Delayed fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high speed performance is not required by planning studies associated with the TPL standards or by coordination requirements with other Protection Systems. • An unintended operation as a result of on-site maintenance, testing, construction or commissioning is not a Misoperation. • In some cases, where zones of protection overlap, the owner of BES Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element. • Failure to automatically reclose after a Fault is not included as a Misoperation because reclosing equipment is not included under the definition of Protection Systems.

Yes
No
The overwhelming majority of investigations by Generation Owners under the requirement in PRC-004-3 to review each Protection System operation (R1) will be for reverse power trips during normal stop events. The SDT evidently meant to prevent this circumstance from posing an unwarranted

burden by stating in the Application Guidelines that, “...in cases where a component of the Protection System or a function of a component within the Protection System is used for control of a generator, such as when a reverse power relay is used to trip a breaker during generator shutdown, the operation of the control component or the function when not providing protection is not included in the definition of Misoperation and its operation would not be reviewed under this standard.” The line of demarcation between the protection and control functions of reverse power relays is not at all clear, however. We typically have for example a primary reverse power relay that trips the breaker 3 seconds after detection of motoring if all MS and HRH valves are indicating closed, and 27 seconds later regardless of valve position if it is not already offline, plus a backup relay that acts one minute after the start of motoring regardless of valve position. We take the 3-sec action as being a control function, while the other timers are protective in nature. What they protect is the low-pressure turbines from windage (high temperature) damage, however, not the generator. The reverse power function is consequently in the same class as a low lube oil pressure switch, and should not be in the scope of Protection Systems. PRC-004-3 as presently written though appears to require analysis of every reverse power trip that is not caused by the 3-second function described above, which may occur quite often given that valve position indicators are not high-reliability instruments. Each such investigation would involve documenting the, “sequence of events, relay targets and a summary of Disturbance Monitoring Equipment (DME) records,” for each normal stop (ref. the "Requirement R1" section of the Application Guidelines) and determining whether or not the Protection System operation was slower than expected (ref. items 2 and 3 in the "Guidelines and Technical Basis" section). The number of such events can be extremely large, since peaking units often stop and start daily (or even several times per day) in high-demand seasons. Retrieving such data would be extremely time-consuming; since, where DME exists (our RRO’s standard for PRC-002 has a minimum size threshold), GOs often do not have the centralized data collection facilities of TOs. Event analysis personnel may need to spend extreme amounts of time traveling to and from jobsites, since some peaking stations are unmanned or only minimally staffed. All this effort would result in no associated benefit regarding BES reliability. Reverse power relays are counted (inappropriately, we believe) as being part of the Protection System, but these devices do not trip in response to something having gone wrong, nor do they protect the generator. It is intended that negative current be experienced at some point as the unit unloads; and subsequent actuation of the reverse power relay is normal, expected and a mechanical (turbine) protection function. Requirement R1 and to the Application Guidelines should be modified to state that investigation of reverse power relay events is not part of the Protection System and PRC-004-3 consequently does not apply to such devices or, alternatively, is required only if the relay failed to function.
Yes
Yes
No
a. GOs are not in a position to respond to the last item on p.1, “Additional BES Interruptions.” We know only what happens in our plants, not repercussions on the grid. b. The “slow trip” entries in the “Misoperations Category” do not apply for the majority of Misoperations reported by GOs. The presence of such categories in the draft standard appears to derive from the belief that millisecond-resolution records of Misoperations are always available from DME; but, when this equipment is present at generation plants, it is installed only at the GSU and (if the GO is the owner) the yard breaker – that is, on high-side equipment. The DME is consequently not expected to yield any useful information for Faults occurring at the generator or other low-side components. Notes should be added to PRC-004-3 and the Application Guidelines to the effect that DME downloading and speed-of-response analysis pertain at generation Facilities only when DME is present and only to incoming Faults from the grid.
Yes
No
M1 generically references lists, logs and databases, while the Application Guidelines cite much more specific evidence (sequence of events, relay targets, summary of DME records). By including different wording for a requirement in two separate documents, it creates ambiguity as to what is required by

the Reliability Standard to demonstrate compliance. These two documents should be in seamless agreement.

Group
Duke Energy
Greg Rowland
Duke Energy
No
Duke Energy does not agree with the wording in Part 3 of the definition of Misoperation. "3. Slow Trip – During Fault" identifies "Delayed Fault clearing associated with an installed high speed protection scheme" as a Misoperation, "if the high-speed performance is required to meet the performance requirements of the TPL standards". The TPL standards do not currently contain any high-speed performance requirements, and Transmission Planners must plan to meet Category C "Single Line to Ground Faults" with delayed clearing. We suggest the following alternative wording which removes the linkage to TPL standards, and puts "3. Slow Trip – During Fault" on the same footing as "1. Failure to Trip – During Fault" and "2. Failure to Trip – Other Than Fault": "3. Slow Trip – During Fault - A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. (Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation as long as the overall performance of the Protection System for an Element is acceptable, and the high-speed performance is not required for coordination with other Protection Systems.)

Yes
We agree with the definition intent to provided a distinction between protection systems intended to isolate faulted elements and protection systems intented to operate for other system conditions. For

the latter category, we are concerned that listing the possible causes for the “other than fault” conditions may be interpreted as the only ones to watch for. Therefore we suggest that the definition should clarify that these possible conditions are not limited to those listed in the definition
No
It is unclear on what “Designate each Misoperation” in R1.2 means. If could mean identitying that it was indeed a case of protection system misoperation, or designate a relay operation as a Misoperation or designate an identified Misoperation to a specific class or category. This part needs to be expanded.
Yes
Yes
No
We have a difficulty determining whether or not Attachment 1 is part of the standard and therefore must be complied with. As presented, Attachment 1 is referenced under Section C 1.4, Additional Compliance Information. Section C specifies the compliance monitoring/audit evidence requirements and which are not regarded as a standard Requirement that must be complied with to achieve a reliability outcome. Further, as with the list of evidence presented in CANs and RSAWs, the information/record presented in these documents are examples of acceptable evidence. Deviations from the specified information are acceptable for so long as the information provided can demonstrate compliance with the Requirements. If the SDT holds the position that the misoperation information listed in Attachment 1 must be provided as specified, then the data requirements must be stipulated in a Requirement. Having data requirement not stipulated in a Requirement will render that data submission not mandatory.
No
We agree with the VRFs, VSLs and Time Horizons for R1, R2 and R3 but do not agree with the VRF and VSL for R4. We fully endorse the concept that a CAP needs to be implemented to ensure correct operations of the protective relay in question. However, not complying with R1 or R2 will result in not having a CAP to begin with. For this reason, we are unable to support a resulting requirement (R4) having a higher VRF than the prerequisite requirement at the front end. We therefore suggest to change the VRF for R4 to a MEDIUM. We also disagree with “The responsible entity failed to maintain records of a CAP or action plan.” in R4 to be assigned a SEVERE VSL. The main intent of R4 is to implement the CAP, whose non-compliance warrants a SEVERE VSL. However, having implemented the CAP meets the main intent of R4 and hence missing the needed documentation does not contribute to adverse reliability impact. We therefore suggest the VSL for Part 4.2 to be a LOWER, or a MEDIUM at most.
Yes
Yes
(1) There is no specific mention of UFLS and hence it is assumed that this standard applies to UFLS as well. However, there is no basis on why UFLS is included but UVLS is excluded in the Section A – 4.2 “Applicability”. There is also an apparent inconsistency between “Facilities not included” listed in section A.4.2.2 and definition related to under-voltage protection systems. The provision under 4.2 excludes the UVLS and capacitor switching from the applicability of the standard, and at the same time the definition (paragraph 2) gives as example of “other than fault”conditions the misoperation of under-voltage protection systems. (2) In the Background Section, a NOPR is mentioned but there is no specific information as to which NOPR it references. Need to add the relevant information. (3) The word “of” is missing from the bullet at the top of P.5 of the clean version.

No
We agree Misoperations should be identified and their causes corrected. However, it is an administrative burden requiring entities to keep lists of ALL operations to prove compliance that EVERY operation was reviewed. It is strongly encouraged to model compliance requirements after the Internal Controls model currently be implemented in other standard projects rather than creating requirements that subject an entity to be in violation for missing documentation of a single review.
No
We urge the Drafting Team to address the time limits and report requirements utilizing the Internal Controls Process thereby eliminating the 'zero-defect' language found in the requirements. While we agree with time limits to finalize any findings we disagree with the multiple date requirements. We believe that an internal control process should be identified by the entity that eliminates the potential for administrative errors. This would allow the entity to perform necessary actions and reporting in accordance to their policy specifically on facilities determined to be critical. Where an entity has a 'no-touch' in effect of certain facilities this method would allow them to evaluate the relays off the critical period.
Yes
No
We feel the data is appropriate. However, we feel the trending data is more appropriately collected thru NERC's Section 1600 process. As no clear information is provided how the data is to be utilized we don't believe it should identified nor included as a compliance component. Further, national trending may inappropriate skew information that may be region specific diluting the results. Also, including the attachment in the standard would require a drafting team for any changes for requested data.
Yes
Yes
SMUD also encourages the development and concurrent posting of the Reliability Standard Audit Worksheet with the next standard posting.
Yes
SMUD agrees with the concepts for addressing misoperations presented in this draft PRC-004 standard. We do have concerns with the 'zero-defect' approach and urge the Standard Drafting Team to embrace the integration of Internal Controls into this reliability standard to help the entity achieve the standard's reliability objectives. This would better align the standard with ongoing activities such as the FFTR, Paragraph 81 and other tasks underway. We thank you for considering all of our comments in Questions 1 – 9 on this standard.

CenterPoint Energy
No
CenterPoint Energy recommends additional clarification be included in Item 5 ‘Unnecessary Trip – During Fault’ to address interrupter device problems that result in what is commonly referred to as a “stuck breaker”. The proposed definition provides only for excluding remote tripping from a failure to trip or slow trip of a Protection System; however, interrupting device problems - other that trip coils - can also result in a failure to trip or slow trip event. Remote tripping is commonly utilized for local breaker failure schemes and for remote backup clearing for such stuck breaker events. CenterPoint Energy recommends adding wording at the end of Item 5, resulting in the following wording for ‘Unnecessary Trip - During Fault’: “A Protection System operation for a Fault for which the Protection System is not intended to operate, excluding any remote Protection System operation that resulted from a failure to trip or slow trip of a local Protection System in a faulted adjacent zone or from a failure to trip or slow trip of an interrupting device.”
(a) A misoperation can result in the tripping of multiple interrupting devices that can be owned by more than one entity. Also, the various components of a Protection System, such as current transformers, dc control wiring, and dc supply, can be owned by different entities. Instead of the owner of the interrupting devices that operate, CenterPoint Energy believes the owner of the protective relays should have the sole responsibility for reviewing interrupting device operations and reporting any Protection System misoperations. This would provide more consistent reporting and eliminate any duplicative responsibilities and efforts. CenterPoint Energy recommends establishing the applicability to the owner of the protective relays. (b) With the responsibility of reporting misoperations on protective relays they own, including those that are categorized as ‘Other than Fault’, the owner of the relays must review interrupting device operations whether or not they own the interrupting devices. With such a performance-based requirement, CenterPoint Energy believes it is unnecessary to establish a requirement, such as R1.1, to “Identify and review each Protection System operation”. CenterPoint Energy recommends R1 maintain only the wording from R1.3, resulting in the following wording for R1: “Investigate each Misoperation (if any) and document the findings including a cause for each Misoperation, if identified.”
No
Instead of requiring a Corrective Action Plan be developed within 60 days of identifying the root cause, as provided for in R2, CenterPoint Energy recommends the timeframe be 180 days after the date of the misoperation. Requiring a Corrective Action Plan to be developed within 60 days of identifying a root cause would create a new, additional date that must be tracked. To facilitate the ease of tracking, as well as auditing, CenterPoint Energy recommends using the following for developing a Corrective Action Plan: “For each Misoperation with an identified cause, within 180 days after the date of the misoperation, the Transmission Owner, Generator Owner, or Distribution Provider shall:”.
No
(a) CenterPoint Energy recommends deleting the second sentence in R1.1 that states: “If the entity suspects a Protection System component(s) owned by another entity contributed to a Misoperation,

notify the owner of that Protection System component and provide any requested investigative information." CenterPoint Energy believes it is unnecessary to have a requirement to force entities to coordinate on misoperation analysis and corrective action, as there are existing avenues that are available, if necessary. (b) The CenterPoint Energy comments in Question 2 are related to this question. Establishing the applicability to the owner of the protective relays would establish the entity responsible for misoperations reporting. CenterPoint Energy recommends R1 maintain only the wording from R1.3, resulting in the following wording for R1: "Investigate each Misoperation (if any) and document the findings including a cause for each Misoperation, if identified."
No
(a) CenterPoint Energy is concerned that the 'Slow Trip – During Fault' misoperation example that is used in Attachment 1 may be misleading and could result in incorrect reporting; therefore, we recommend developing another example, such as, an 'Unnecessary Trip - During Fault' misoperation which is a more commonplace. Although there may not enough information included for the proposed example to know for certain, CenterPoint Energy suspects that there may have been a non-communications-based, directional time-overcurrent relay, which was part of the Protection System, which ultimately tripped the transmission line. Such a scenario may not be a reportable misoperation, as the proposed Misoperation definition for 'Slow Trip – During Fault' includes the following clarification: "Delayed Fault clearing associated with an installed high-speed protection scheme is a Misoperation if the high-speed performance is required to meet the performance requirements of the TPL standards or by coordination requirements with other Protection Systems." In other words, the following is stated in the Guidelines and Technical Basis: "Delayed fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high speed performance is not required by planning studies associated with the TPL standards or by coordination requirements with other Protection Systems." (b) The 'Equipment Voltage (kV)' field in Attachment A states: "Enter the system voltage of the BES equipment associated with the Protection System that Misoperated. For transformers, use the high side voltage." While using the high side voltage could be appropriate for generator step-up transformers, CenterPoint Energy recommends the system voltage for autotransformers be based on the low side voltage, in order to provide consistency with other NERC criteria, including Reliability Standards, such as, PRC-023 Transmission Relay Loadability.
CenterPoint Energy recommends deleting R4.2 which states the following: "Maintain detailed implementation records of each CAP or action plan including dated information surrounding any revision(s) and completion." With R4.1 being a performance-based requirement to "Implement the CAP or action plan", CenterPoint Energy believes it is unnecessary to establish a requirement related to documentation needs.

Yes
BPA thanks the drafting team for their efforts as this standard has improved significantly over the previous version. While BPA believes the standard is on the right track, clarification needs to be made to a few key area's listed throughout comments below. A fair number of inadvertent operations are caused by accidental jarring of a relay panel. Since the jarring might not be due to maintenance, testing, construction, or commissioning activities, it isn't clear if it should be excluded from the definition of a misoperation by item 6. BPA suggests adding "accidental jarring" to the exclusions in item 6.
No
BPA believes requirement R1 needs to provide more clarity about which entity is required to review a protection system operation. R1 requires TO's, GO's, and DP's to review the protection system operation for an "interrupting device operation in its Facility". This is not necessarily the same thing as the owner of the interrupting device, which is who the Application Guidelines places the

responsibility on. The use of “Facility” seems inconsistent with the NERC definition of Facility: A set of electrical equipment that operates as a single BES Element. It is not clear what “in its Facility” means. The SDT appears to be using “Facility” in place of “substation”. The Rationale for R1 (blue box) mentions the owner of the interrupting device, but like R1, the rationale does not make it clear who is responsible for reviewing the protection system operation. It isn’t clear if the Rationale for R1 and the Application Guidelines are an official part of the standard, so while they might offer additional information, it is important that Requirement R1 can stand on its own and make it clear who is responsible to review the protection system operation. As presently written, BPA infers that this is not the case. Because the owner of the protective relays has the best access to the information that would be first reviewed, BPA believes that the owner of the protective relays should be required to initiate the review. From that initial review, the owner of the protective relays can then request information from other entities involved, if there are any, such as the owner of the communication system or the owner of the interrupting device. If there are different owners of the protective relays at the different terminals of an element, they should each initiate a review of their own protective relays. Requirements R2 and R3 are also unclear about who is responsible for fulfilling the requirement. Both of these specify the TO, GO, or DP as responsible for the requirement, but since there are often multiple TO’s, GO’s, or DP’s involved, which one is responsible? The Application Guideline for R2 specifies the protection system owner as being responsible. This information should be included in the Requirement itself, not just in the Application Guide. BPA believes that the owner(s) of the protection system component(s) that are identified as the cause of the misoperation in the review conducted per R1, should be responsible for R2. If there is no identified cause, the owner of the protective relay should be responsible for R3.
No
The time limits associated with R1, R2, and R3 are acceptable. Under the Compliance section, 1.4 requires a report to be submitted to the CEA within two calendar months following the end of each quarter. For an operation of an interrupting device at the end of a yearly quarter, the report will need to be submitted no more than 2 months after the operation. This will not allow the 120 days for review given by R1, nor the 60 days to develop the corrective action plan allowed by R2. BPA believes that the 2 month limit after the end of the yearly quarter to submit the report should be extended to agree with the 120 day limit of R1 and the 60 day limit of R2.
No
BPA believes the standard does not provide enough clarity for dealing with the different ownership arrangements. In addition, BPA prefers not to be required to notify other owners of misoperations in their protection systems, as each owner should be responsible for reviewing the operations on their own equipment.
No
BPA believes the data needed for metric analysis depends on what NERC hopes to learn from the data.
No
The time limits between the different VSL’s are arbitrary. For example, if an operation is analyzed within 120 days there is no violation, but if it is analyzed after more than 150 days, only 25% later, it is a severe violation. BPA believes it would be more appropriate to have only a single violation severity level of low or moderate after the 120 day deadline.
No
The language of M4 is that the evidence for R4 must include a list of five items, and the last item in the list is linked with “or”. It is not clear if the evidence must include all five items in the list, or if only one item is required. Please clarify.
Yes
Section 4.2 is titled Facilities. The NERC definition of facility is a set of electrical equipment that operates as a single BES element. The NERC definition of element is any electrical device with terminals that may be connected to other electrical devices, such as a generator, transformer, circuit breaker, bus section, or transmission line. Based on these definitions, it would seem that a protection system is not an element or a facility. BPA suggests renaming Section 4.2 to “Equipment” or “Systems”. Section 4.2.2 should be renamed from “Facilities not included” to “Protection Systems not

included" or something similar. The last paragraph of Section A.5, Background notes that PRC-004-WECC-1 overlaps with this standard and says that entities are expected to comply with the more stringent standard. Rather than leave it up to the entity to determine which of the standards is more stringent, BPA suggests simply stating which of the standards takes precedence and which can be ignored.

Rationale for R1: State that the interrupting device owner is responsible to investigate operations initiated by a Protection System, to be consistent with the Technical Basis. For Misoperations that occur when one entity's system trips another entity's interrupting device (e.g. DTT). R1 correctly requires the interrupting device owner to initiate the investigation, but once the Protection System component causing the Misoperation is identified, it becomes that Protection System owner's responsibility to report the Misoperation. Under the present PRC-004-2a, there is confusion on this distinction.
No
GTC does not agree to the timetables and the compliance burden it places on entities: While the intent is correct, to insure that all operations are being reviewed and misoperations are found and

corrected, the quarterly reporting that we are already doing is more than sufficient. Additionally, the NERC Standards Committee approved the draft SAR for Project 2013-02 “Paragraph 81” which identifies criteria for retiring or modifying existing Reliability Standards. The proposed time limits appear to conflict with the initial criteria identified via the P81 initiative. The dated limits would likely encourage entities to shift focus on closing out documents instead of spending the appropriate time studying the operation event to determine true root cause and development of an appropriate corrective action plan. Ultimately, the introduction of time limits would have little to no impact to the protection or reliable operation of the BES, and will likely find their way to the FFT process…and thus a future candidate for elimination via P81. GTC recommends the SDT to remove these introduced limits and refine focus to results-based to achieve the desired reliability result of analyzing operations to identify misoperations and implementing corrective actions to prevent future occurrences.
No
a). R1 correctly requires the interrupting device owner to initiate the investigation, but when the Protection System interconnects with another entity and there are indications that the other entity Protection System components misoperated (ie. Other entity sends a spurious DTT), then once the cause of the Misoperation is determined, then it should be the responsibility of the Protection System owner that caused the misoperation to report thus removing the burden of reporting from the interrupted device owner. In some cases there may be several devices interrupted which are owned by different entities and the Protection System failure was due to a Protection System failure by an entity that had no equipment that was interrupted or affected at the location where the Misoperation originated. Under the present PRC-004-2a, there is confusion on this distinction. b). There is also a suggestion that multiple entities utilize a joint investigation report. Again, the burden of reporting should lie on the entity that owns the Protection System that caused the Misoperation and they should initiate reporting and communicating other entity actions to correct the problem.
No
1) Please change ‘Time Zone’ Field Value to prevailing time (e.g. CPT for Central Prevailing Time) to make reporting more efficient. 2) Please split Incorrect Setting/Logic/Design Errors into three separate categories to improve the usefulness of the metrics regarding Protection System performance. 3) Please split Communication Failure into two separate categories, one for ‘Carrier’ and one for ‘non-Carrier’ to improve the usefulness of the metrics regarding Protection System performance.
No
GTC does not agree with VSL R4 Lower VSL – Concerned statement “records were incomplete” is an opened quantifier and is not auditable, leaves to much room for interpretation for auditor. Request statement like “did not contain signed-off evidence of any revision(s) or completion of defined actionable items defined in document”.
Yes
Yes
1.)Why are UFLS schemes included in this standard but UVLS schemes are omitted? GTC recommends the addition UFLS be added to the list under Applicability section 4.2.2 (ex. 4.2.2.3). 2.)Lastly, the overall tone of the document drives entities to focusing more labor and work on the documentation of an event than completion of a correctable action. In addition, the dates for requirements and implementation seem to be defining how entities must perform work and does not give flexibility for entity to respond appropriately to problems. Possible to drive entities to provide a quick fix so they can close out documents instead of spending the appropriate time studying the event and define true root cause. Standard needs to measure performance by documenting events as misoperations with defining root cause. Should not cover expectations of an entity and drive them to a patricular performance which may drastically change their business model and performance.

This standard is for identifying and correcting Protection System misoperations. By requiring the identifying and reviewing of all interurupting device operations caused by a Protection System operation and then having the enity be found non-compliant to a requirement within this standard for not doing these actions, the SDT has made this an interrupting device operation tracking standard along with identifying and correcting misoperations. IMPA does not agree with this approach. IMPA does support the recommendation from Florida Municipal Power Agency in using the zero defect approach. In additoin, Indiana Municipal Power Agency agrees with the additional comments submitted by Florida Municipal Power Agency (FMPA)for this question.
No
Indiana Municipal Power Agency agrees with the comments submitted by Florida Municipal Power Agency (FMPA).

In the Application Guidelines, page 18 of 22, the following statement is made: "The initial evidence, which may also be documented separately, contains the sequence of events, relay targets and a summary of Disturbance Monitoring Equipment (DME) records." By making this statement in the Application Guidelines, it seems to be requiring entities to have sequence of events AND Disturbance Monitoring Equipment records. IMPA believes that this is not the intent of the SDT and recommends using the words "may contain the sequence of events, relay targets,..." In addition, IMPA agrees with the comments that Florida Municipal Power Agency submitted for this question.

It is unclear on what “Designate each Misoperation” means. Designate a relay operation as a Misoperation or designate an identified Misoperation to a specific class or category. This part needs to be expanded.
No
We agree review of each Protection System operation is important, however, there could be voluminous events from a natural event that may be burdensome on entities to provide reports within the allotted time frame. Prirorititization should be given for events that are suspected to be misoperations based on the entities’ judgment.
No
It is unclear whether or not Attachment 1 is part of the standard that must be complied with. The SDT should clarify whether the misoperation information listed in Attachment 1 must be provided as specified. If that is the expectation, then the data requirements must be stipulated as a Requirement. As an Attachment without associated Requirements, we interpret that data submission as not mandatory.
No
As a general comment on VRFs and VSLs, there does not seem to be a correlation between how a lack of address of a particular protection system operation is tied to how severe an impact it had or may have on the reliability of the BES. For example, an operation of an auxililary tripping relay for tap configuration substation does not have the same BES impact as a bus differential relay scheme in a full ring configuration substation.
The SRC seeks clarification of what approvals or coordination the identitfied responsible entities need to undertake if a Corrective Action Plan (CAP) includes some operational solutions provided by a system operator.

The description of “unnecessary trip”, the exclusion of remote protection System operation is not accurate because such operation is actually necessary (not “unnecessary”) and it is intended to operate for failure or slow operation of local Protection Systems. The description for a remote back-up system operation and limimting that to only the “adjacent” zone is not appropriate. There are cases when the appropriate protection system operation may not be from the “adjacent” zone of protection. Also, the term “zone of protection” is not defined, e.g., are zone 1, zone 2 and zone 3 distance relays

different “zones of protection”. If a zone 3 relay covers two transmission facilities, is that one and the same “zone of protection”? Or does the SDT intend a zone to be breaker-to-breaker? How is a circuit swithcher treated when defining a zone of protection>? Etc. The description of a “slow trip” as “operation slower than intended” without some sort of quantification of how much slower than intended is ambiguous (e.g., is one cycle longer delay than expected a misoperation?), unless the intent is to establish an operating time as the slowest intended operating time. Even so, measurability becomes a concern.
No
The standards takes a zero defect approach, especially in R1 which requires investigating every protection system operation; hence, if one protection system operation is missed, a violation occurs. TEC is not in favor of a zero defect approach especially when most relay operations operate correctly. TEC recommends using approaches similar to what the COM-003 and CIP v5 teams are considering. R1 does not work well with the definition of Misoperation. In other words, in order to “(d)esignate each Misoperation” as required, the entity will need to have evidence that a fault actually existed. This can be quite difficult, especially for a protection systyem operation with a successful reclose (e.g., due to lightning strike for instance), how is an entity to prove that the fault existed? In addition, measuring clearing time can be quite problematic, especially for electromechanical relays. How is an entity to gather evidence that relay operation was “slow” or not, and hence identify a misoperation due to slow operation? Does this require installation of equipment to be able to gather sequence of events evidence? It would seem to TEC that a focus on internal controls for R1 is more appropriate to resolve some of these issues and challenges than the approach the SDT proposes.
No
TEC believes there ought to be exceptions for an “Act of Nature”, e.g., event like a hurricane, that can result in a great many protection system operations but still require investigation of all of them within 4 months.
Applicability of 4.2.1 “Protection Systems for Facilities that are part of the BES” is not consistent with the interpretation of PRC-004-1 Attachment 1 nor the applicability of PRC-005-2. TEC recommends using the FERC approved interpretation of PRC-004-1 Attachment 1. R3 is not needed, is administrative in nature, and provides no reliability benefit. R2 should be modified to be applicable only to misoperations where cause(s) were identified. R4.2 is administrative in nature, is a Measure, not a requirement, and should be deleted. The big change that I see for us is significantly increased documentation. Currently all of our documentation is in a database including a brief description of the corrective action plan. It seems to satisfy the new standard we would need a separate CAP document to capture all of the additional info they are asking for, we may be able to link the CAP document to our database. The standard asks for documented proof that the work associated with the CAP was actually done (data from work management system, work order etc.). Presently we just log the completion date in our database we don’t capture any proof that the work was done. Fortunately we typically only have a few misoperations per year so the volume of work will not be huge but it is just another ratcheting up of the documentation requirements. TEC doesn’t see the increased documentation requirements doing anything to increase our reliability.

NextEra Energy Inc.
Yes
Yes
No

NextEra Energy Inc. (NextEra) disagrees that 120 days provides sufficient time to investigate all types of misoperations. For example, NextEra does not agree with the rationale that 120 days is sufficient time to account for outage constraints. This timeframe is particularly troubling in the context of nuclear power plants that generally do not schedule a switchyard outage unless it is consistent with its refueling outage – which can be as long as 18 months apart. Thus, NextEra recommends that R1.3 be revised as follows to provide a clearer process and more flexibility: 1.3 Investigate each potential Misoperation and document the findings. The cause of a Misoperation may be initially listed as “Unknown/unexplainable” and the Analysis and Corrective Action Status listed as “Analysis – In Progress”. The entity should continue their normal process of investigation and after a cause is determined resubmit the Misoperation to update the information.
Yes
Yes
NextEra has no issue with the information requested or the format, but requests that NERC and the regions all use the same form for the collection of misoperation data.
No
NextEra disagrees with the approach taken in the VSLs that provides a range of days to determine the severity of the violation. The importance of investing and implementing a correct action plan for a misoperation varies on the type of misoperation and the need or not to implement a corrective action to address reliability. NextEra favors all aspects of the Reliability Standards moving to a risk, results based approach, including VSLs. Thus, the VSLs should be re-drafted to measure whether an entity has timely implemented a corrective action plan for misoperations that pose a risk to reliability, with consideration of the level of the risk and other factors such as complexity of the issue, costs and outages, etc.
No
NextEra disagrees with the data retention periods, given that it is also submitting quarterly reports. Specifically, from a monitoring and compliance perspective, there should be no need to maintain all data in between audits if the entity is also submitting quarterly reports. Instead, the entity should only be required to maintain one years worth of data. Since, at any time, a regional entity can via a spot check or a compliance audit review data to access compliance, it seems redundant and onerous to require that the entity stockpile three to six years of data related to misoperatrions depending on their audit cycle. Moreover, such a data retention requirement seems to be inconsistent with NERC’s movement to a risk and results based approach rather than a review of past evidence and a check list approach to compliance. Accordingly, NextEra requests that the data retention be reduced to only one year.
Yes
NextEra encourages the Standards Drafting Team to improve the wording used in R2. At this time, the wording appears to apply to all situations without qualification and does not consider several situations that may relevant. To clarify the language, NextEra recommends the following changes to R2. “R2. Within 60 calendar days of identifying the cause(s) of each Misoperation pursuant to R1.3, the Transmission Owner, Generator Owner, or Distribution Provider shall: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-Term Planning] o Draft a Corrective Action Plan (CAP) for the identified Protection System component(s), including, if applicable, the following: (i) an evaluation of the CAP’s applicability to the entity’s other Protection Systems, and (ii) an explanation of why corrective actions are either: (i) beyond the entity’s control; (ii) cost prohibitive/significantly impacted by cost considerations; (iii) not to be implemented for over 5 years or (iv) would reduce BES reliability.” Similar to the re-write of R2, NextEra does not see the need for a “declaration” in R3. Thus, NextEra recommends that the second bullet in R3 be redrafted to read: “o An explanation of why no further actions will be taken.” NextEra opposes the use of “detailed” in R4.2 as unnecessary, subjective and onerous. PRC-004-3 should not be written so that an entity can be found in violation because of subjective judgments on what is or what is not detailed. Further, NextEra finds that the clarity of R4.2 may be improved. Thus, NextEra recommends that R4.2 be redrafted as follows: “4.2 Maintain implementation records for each CAP and action plan, including the dates of any revision(s) and completion.” Lastly, for clarity, NextEra also believes there should be linkage between R2 and R4 on the issue of applicability to other Protection Systems at other locations, and, thus, suggests the

following changes to R4.1. “4.1 Implement the CAP or action plan, including, as applicable, the entity’s Protection Systems at other locations that were identified in R2.”

No
(1) We suggest, In #3 Slow Trip, to replace “or by coordination requirements with other Protection Systems” with “or to meet the coordination requirements with other Protection Systems in accordance with applicable PRC standards.” For example, entities regularly install one pilot relaying system on a line for other reasons, such as end use power quality. The failure of such a pilot relaying system to trip high speed should not be classified as a Misoperation. (2) We suggest to insert “the operation” to clarify #6 yielding “Unnecessary Trip - Other Than Fault - A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate, and the operation is unrelated to on-site maintenance, testing, construction or commissioning activities.”
Yes
(1) What influence do the Application Guidelines have on the CEA? For example, the Application Guidelines clearly and correctly explain “…such as when a reverse power relay is used to trip a breaker during generator shutdown, the operation of the control component or the function when not providing protection is not included in the definition of Misoperation and its operation would not be reviewed under this standard.” A narrow interpretation of R1 without this explanation could result in either frivolous violations or an entity expending considerable resources to document that every normal shutdown of a generator is a correct operation. (2) Clarify that the rationale is consistent with the Technical Basis page 17, by clearly stating that “the interrupting device owner is responsible to investigate operations initiated by a Protection System.” (3) We suggest to augment the Rationale by adding at the end, “…and submit Attachment 1 data to the CEA per section C.1.4 Additional Compliance Information.” A fair number of Misoperations trip another entity’s interrupting device (e.g. DTT). R1 correctly requires the interrupting device owner to initiate the investigation, but once the Protection System component causing the Misoperation is identified, it becomes that Protection System owner’s responsibility to report the Misoperation. We believe that under the present PRC-004-2a, there is confusion on this distinction. (4) We suugest to change R1 1.2 to “Designate each operation as correct or a Misoperation. Group Misoperations for the same interrupting device that occur within 5 minutes for subsequent steps.” IEEE 1366 (GUIDE FOR ELECTRIC POWER DISTRIBUTION RELIABILITY INDICES) defines 5 minutes as the demarcation between momentary and sustained events. Grouping multiple like kind operations into a single investigation / action plan / CAP is more efficient and avoids distorting statistics. It also improves BES availability and reliability by correctly reinforcing the appropriate use of automatic reclosing.
No
(1) We suggest that “cause(s)” be changed to “cause” in R2 to avoid time limit confusion, and be consistent with the use of “cause” throughout the rest of this standard. (2) Although wording is clear that R2 be completed within 60 days of identifying the cause, some entities may incur violations by glibly adding the 120 days in R1 to the 60 days in R2. We suggest pointing out that the entity will have to intentionally record and track when they’ve identified the cause, and providing an example in the Application Guidelines for R2 on page 18 will provide better clarity. For example, if the entity identifies the cause on 3/31 for a 3/1 Misoperation, they must develop and document R2 CAP by 5/30 (not 8/29). (3) We agree with the SERC PCS that introducing time limits is unwarranted and burdensome. Regional Entities now get quarterly Misoperation and CAP status reports and have sufficient information to monitor progress. At most, a one year time limit for CAP completion or explanation of CAP duration could be used. A small number of CAPs will extend beyond one year due

to their scope or outage restrictions. SERC has used a two year limit then requiring a formal explanation, and very, very few have reached this time limit.
Yes
Yes, as long as the R1 rationale is augmented to clarify reporting responsibility as we recommend in items 2 and 3 of question 2 above.
No
We suggest to (1) change 'Time Zone' Field Value to prevailing time (e.g. CPT for Central Prevailing Time) to make reporting more efficient. (2) split Incorrect Setting/Logic/Design Errors into three separate categories to improve the usefulness of the metrics regarding Protection System performance. (3) split Communication Failure into two separate categories, one for 'Carrier' and one for 'non-Carrier' to improve the usefulness of the metrics regarding Protection System performance. (4) eliminate the TADS and GADS data submittals. Instead request the total number of operations at each Equipment Voltage level because this is a more effective means of gathering the information for all Protection System operations. (5) Align Attachment 1 with the present reporting template to ease burden on entities. We also believe that (a) Declarations should be included in the Attachment 1 reporting template and (b) The reporting template should be contrived so that it automatically documents and thus provides much of the evidence required by the standard.
No
(1) For R1 and R3 the escalation from Lower to Severe VSL in just 30 days is too short. We suggest that the SDT make them more consistent with the requirement duration. As a comparison R2 escalates in 30 days, which is 50% of the time limit. We recommend keeping the 50% consistent for escalation to Severe with a limit of 210 days for R1 and 270 days for R3. (2) R2 VRF measures duration from 'completion of the investigation or receiving notification' but R2 itself measures from 'identifying the cause(s) of each Misoperation'. We suggest t that the SDT change the VRF language to match R2 itself. The only notification we see is in R1, and it is inappropriate to measure CAP development duration from the time a component is only suspected.
Yes
We suggest that the SDT clarify that an entity is to retain evidence for all Misoperations with an open investigation, action plan, or CAP since the last audit even if the interrupting device operation occurred before the last audit.
Yes
(1) Are Misoperations with open CAP to be transitioned from PRC-004-2a to PRC-004-3 as Update Submittal Type once it becomes effective? (2) Six months after approval may be too short a time to modify processes and software to efficiently meet the PRC-004-3 requirements and supporting evidence.
(1) R2 states that the CAP applies to the identified Protection System component(s). But then goes on to say the CAP "includes an evaluation of the CAP's applicability to the entity's Protection Systems at other locations." It is unclear whether the entity is required to take corrective actions at those other locations in order to complete the CAP. Our reading and expectation is that the entity completes the CAP, when they complete the identified work at the location of this Misoperation. We would expect the entity to initiate a program to address the other locations over some reasonable time period. (2) We suggest that the SDT reword C.1.4 from "Each Transmission Owner, Generator Owner, and Distribution Provider that owns BES protection Systems will submit the data identified in PRC-004 - Attachment 1 to the CEA..." to "For Misoperation(s) caused by BES Protection System it owns, each Transmission Owner, Generator Owner, and Distribution Provider will submit the data identified in PRC-004 - Attachment 1 to the CEA..." This clarifies who is responsible for submitting when multiple entities are involved. (3) Attachment 1 "Action Plan/Declaration Development Date" example data should be "N/A". (4) Application Guidelines – Reporting section on page 20 states '...the fourth ranked initiating cause of BES outages not related to weather was "Failed Protection System Equipment." Given the high ranking of this metric, it is appropriate to collect data on Protection System Misoperations for analysis to drive improvements in Protection System reliability.' While this may be true in terms of number of events, is sensationalizes the Failed Protection System Equipment cause. In fact Failed Protection System Equipment is a very minor cause of unavailability. For full context, we suggest that the SDT also state: (a) the total number of non-weather related causes; b) the total number of causes; (c) its rank when BES outages related to weather are included; d) the top three non-weather related causes; (e) its rank in terms of BES unavailability; and f) the % of unavailability

caused by Failed Protection System Equipment. (5) M4 on page 8: We suggest t that the SDT replace 'must include' with 'may include' because some items do not apply to every CAP or action plan. Clearly the entity must document the implementation of each CAP and action plan, beyond that the range of documentation will vary depending on the situation. (6) Ameren agrees with and supports the comments of the SERC Protection & Control Subcommittee. (7) We suggest that the SDT augment the Application Guidelines Requirement 2 examples on page 17 to include "an evaluation of the CAP's applicability to the entity's Protection Systems at other locations." (8) We suggest that the SDT modify the Application Guidelines Requirement 1 wording on top of page 18 to make it clear that the suggested information should only be included as appropriate. The cause of some Misoperations is quite obvious and does not need copious tests, DFR records, and the like. For example, carrier switch may've been in the wrong position. (9) Editorial comments: a) p4 Applicability box – replace 'RMS' with 'RAS'; b) p5 Background 3rd line – Misoperation should be singular.

Operations Compliance
No
• Instead of clarification and specification, the objective of the change to the definition should be simplification. A simpler definition could be: Failure of a Protection System to operate as intended, evidenced by it not operating when it should have, operating when it should not have, or operating slower than it was intended to operate. • If the definition remains in the present form, we would suggest slight changes to language on #1 and #2: (The failure of……..of the Protection System for the element it is designed to protect is correct.) • Suggest slight changes to language on #3: (Delayed Fault clearing ……..high-speed performance has been identified as required……) • Please clarify why # 3 and # 4 are not a subset of # 1.If not, it should be made clear in the verbiage.
No
• The question is missing a key component: Requirement R1 requires the responsible entities to identify and review each Protection System operation that operates the entity's interrupting device, designate each Misoperation, and investigate each misoperation and document the findings… The first two items are reasonable; however, the 120 days to 'and investigate each misoperation and document the findings…' can be problematic and creates a documentation requirement for something that is still under investigation. See Comment below about timeframes. • The requirement says entities will "review each Protection System operation that operates the entity's interrupting device…". In R1, the requirement to "designate" is not defined. Is this a classification of each operation as a correct operation or a misoperation (as indicated by the VSL)? Or is this an annotation of each operation per Attachment 1? Or is this a declaration of which type of misoperation this is? Or other? Would a spreadsheet with each operation listed with an indication of correct or incorrect with a date noted be sufficient; or is other docuemtnation required? • What influence do the Application Guidelines have on the CEA? For example, the Application Guidelines clearly and correctly explain "…such as when a reverse power relay is used to trip a breaker during generator shutdown, the operation of the control component or the function when not providing protection is not included in the definition of Misoperation and its operation would not be reviewed under this standard." A narrow reading of R1 without this explanation could result in either frivolous violations or an entity expending considerable resources to document that every normal shutdown of a generator is a correct operation. • In addition, under R1.1, the second requirement associated with notification of another entity should be stated as a separate subrequirement.
No
• We do not agree with the introduction of the noted timeframes. There is no indication that the extremely large percentage of entities have not been doing due diligence in analyzing operations, identifying misopertions, and taking appropriate actions to prevent reoccurrence all of which are inherent to the existing Standard. If the only reason to place these time limits is to have a basis for compliance (i.e. you can't require someone to do something unless you tell him how long he has, because he can always say 'I was going to do it tomorrow); then, the time limits should be removed. We offer two potential suggestions for improvement: o R1 should not be changed from the previous posting. The requirement should be that the entity has a procedure and process. Compliance can be

gauged based on an entities compliance culture, oversight and review of processes and procedures. The SDT should utilize the approached introduced in their recently posted- COM-3. or o It is suggested that all Protection System operations for a given quarter are reviewed, analyzed, classified before the reporting due date to the RE (at the end of two calendar months following the quarter) – this will cover all of the deadlines found in requirements R1, R2, and R3. Also, we believe that any required CAP should be developed and documented by this same date. Placing the 120 day and 60 day time frames for each Prot Sys operation unnecessarily complicates the evaluation, resolution, tracking, and documentation of each misoperation. For a large entity with many operations per quarter, the multiple time frames for R1, R2, and R3 are unecessarily overbearing. • Requirement R3 should be combined with Requirement R2. A CAP developed and documented as described in R2 can address resolving identified causes of misoperations as well as addressing additional investigative plans for determining a cause. Misoperations with no identified cause can be handled as described in the draft standard.
No
• It is noted in the Rational box for R1 that the owner of the component that cause the misop will create the CAP, etc. As such it is not clear who will report the Misoperation. i.e. If Owner A has a breaker open for a fault outside the zone due to a carrier that failed to send a block signal. Is an entities only responsibility to communicate to the other owner that his equipment didn’t operate correctly? If so how do they know he ever reported it and/or did anything to correct the problem. It seems that the misoperation should be reported by the entities whose interrupting device opened in error. • Please clarify the statement in the Rational Box for R1: “The initial investigation documentation should be provided to the owner of the Protection System component(s) that contributed to the Misoperation, upon request.
No
• This list is not inclusive of the present RAPA form. The SDT should insure that the RAPA form is modified to only include the data specified in the Standard. • The TADS information should be removed since there are plans to start reporting # of operations thereby allowing appropriate metric analysis • However, we have a number of recommendations intended to improve the structure and clarity of the standard and Attachment 1: a) The requirement for reporting should be in the Requirements and Measures section as a requirement rather than in the Compliance section C1.4. Attachment 1 needs to be part of the standard since it is referenced in the standard. b) The Registered Entity ID # is not needed as the data submission occurs via web based portals and the RE knows who is submitting the data based on the log in credentials of the submitter. This information is superfluous. c) The "Event Analysis Completion Date" and "Corrective Action Plan/Declaration Development Date" fields are not required if the combined R1 & R2 suggestion is implemented along with the deadline for these requirements being the report date to the RE. d) There are too many classification choices in the "Resolution Status" field. One of three choices should be adequate to tell the RE what stage of evaluation/resolution is active: 1) Analysis – In Progress, which means [Still Under Investigation]; 2) Analysis – Completed – Corrective Action Plan Pending; 3) Corrective Action – Completed, which means [Investigation Complete, Corrective Action Complete] e) Both the "Target Resolution Completion Date" and the "Actual Resolution Completion Date" fields are not needed. We suggest using only the "Target" date field and have the RE look at the Resolution Status field to determine if the Action Plan is Completed. We believe that all of these reporting dates are not necessary. f) The "Date Reported" field is not needed - the submission due dates are fixed by the RE (and have been repeated on page 21 of the Clean draft standard dated 6 Jul 2012. g) We believe that a linkage to GADS reporting is not necessary. In the many years we have been processing relay operations, we have had no reason to review any GADS information. The mis-opeation reporting and resolutino can be processed without the addition of non-useful information.
No
a)VSLsfor the draft R1 and R2 should change based on the new time frame suggested in our response to Q2 and Q3. For the CAP development and documentation, keep only the "failed to develop..." as a VSL. b) The VSL shown for R3 reveals that R3 is not needed - the development and documentation of the CAP is the subject of the drafted R2, and the implementation of a CAP is the subject of the drafted R4. c) The severe VSL for R3 incorrectly lists implementation of the CAP as a measure - implementation of the CAP is the subject of the draft Requirement 4. d) We suggest that the Severe VSL for R4 be the only VSL for that requirement. e) The VRF for R4 is too high. It should match the other requirements - if the CAP is not implemented, there is no additional risk than if a

Protection System operation is not reviewed. A new requirement for reporting to the RE should carry a low VRF.
No
• The first paragraph of compliance Section 1.2 Evidence Retention is not needed and should be removed. (It is redundant to the second paragraph.) • M1 generically references lists, logs and databases, while the Application Guidelines cite much more specific evidence (sequence of events, relay targets, summary of DME records). These two documents should be in seamless agreement; we need to know specifically what will and will not be required when our records are audited, as opposed to being told when it's too late to do anything about it that our lists, logs etc do not constitute sufficient evidence.
Yes
• There needs to be some consistency between the proposed PRC-004, and PRC-005. How can one say a given Protection System needs to be maintained for the BES Reliability, but not necessarily operations analyzed. o The Applicability of PRC-004: Protection Systems for Facilities that are part of the BES. o The Applicability of PRC-005-2: 4.2.1 Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.) • Please clarify the PRC-004 Applicability related to generators. It would indicate that all protection systems at a generating plant that is part of the BES would be included. Is that the intent or is it only the Protection Systems associated with the protection of the Generator and/or step-up bank? • We suggest separating the Guideline and Technical Basis document from the remainder of the standard so that the document is less overbearing. • As stated in the responses to several earlier questions, we recommend combining R2 with R1 and making the deadline for each the date of reporting to the RE, eliminating R3, renumbering R4 to R2, adding the reviesd version of Attachment 1 to the standard, and adding a new requirement which specifies the reporting responsibilities that are contained in the Compliance section C1.4. Based on our experience as a large utility in investigating, tracking, and reporting relay operations and misoperations, we believe these changes will be simpler, more efficient, more cost effective to implement while still achieving the desired goals.
Group
JEA
Tom McElhinney
JEA
No
JEA suggests a shorter definition such as: either the operation of a protection system when it should not or the failure to operate when it should.
No
It does not appear to be cost effective to identify and review each PS operation. Also, as time goes on and issues are found and resolved this standard becomes even less beneficial because of the ever decreasing percentage of misoperations that should result from the standard.
No
If outages are necessary to properly examine and test protection system components 120 days may be too short especially during storm season. We recommend this be increased to 180 days. R1 also needs exceptions for major system events and natural disasters. The R2 time frame of 60 days to develop a corrective Action Plan for the components of Protection misoperations is insufficient to consider applicability to other protection systems, different options and their cost/benefit scenarios, coordinate resources, develop schedules, and procure funding. Since the clock starts ticking as soon as the cause is identified, this should be extended to 180 days. Again it seems prudent to have an exception for major system events and natural disasters. If R1 & R2 timeframes were increased as suggested above this should result in an increase in this area also since the 180 day time frame was arrived at by adding the two preceding time frames. The new resulting time frame should be 360 days.
No
R1.1 requires that if an entity suspects a Protection System component(s) owned by another entity

contributed to a Misoperation then we are to notify the owner of that Protection System component and provide any requested investigative information. We recommend to add language such as the notified entity must provide any requested information.
No
Attachment 1 Field Name: Misoperational General Cause Field Value: Incorrect settings/Logical Design Errors are not a misoperation since the protection system operated exactly as it was programmed. Improper setting should be handled in PRC-005 (maintenance and testing). If we are going to include things that cause a protection system to not protect then there is little justification for not considering other equally as destructive problems such as the breaker opening slowly. It is inconsistent to send the message that human error is a problem but mechanical error is not. Also by excluding human error they could better correlate with TADS, since TADS excludes human error for relay settings. Section 1.4 clearly shows this is a requirement and so if it is required then make it a requirement and if it is not required then delete it.
No
This increases from low to severe by 10 day increments so if it takes you 5 months instead of 4 you are at a severe VSL. Also missing just one review results in a severe level. Also not notifying an adjacent entity that you think they may have contributed to the problem is a severe violation – the severity should be based on the number of occurances. We think that 30 day increments are appropriate and severity levels should also be based on the percentage of missed reviews such as 1%, 2%, 5%.
We believe this would be a good candidate for the new cost benefit approach. Also we believe that this is the wrong approach. NERC should focus on fixing the problem (PRC003 not being approved) by working on PRC003 instead of changing PRC004 to address deficiencies caused by lack of an approved PRC003 standard.
Individual

Essential Power, LLC
No
The proposed definitions are unnecessarily complicated. Also, the "catch all" category "Unnecessary Trip - Other Than Fault" will cause entities to analyze, document and report events that may occur but were not due to issues in engineering, design, or relay settings, thus providing little to no benefit to industry to learn from the event. For example, a control wire that was chewed by a mouse and led to a line tripping out. We would also like to see language that addresses an “Unnecessary Trip-During Fault – A Protection System operation for a Fault for which the Protection System is intended to operate, but operates prior to the required element setting.”
No
In R1, the requirement to “designate” is not defined. The overwhelming majority of investigations by Generation Owners under the requirement in PRC-004-3 to review each Protection System operation (R1) will be for reverse power trips during normal stop events. It is understood that the Application Guidelines specifically states that reverse power relay operations be not considered as Misoperations because the operation is a "control function" within the protective relay. But a reverse power relay is not a control device. It is a protective device. Its purpose is to protect the generator in the event the generator loses its prime mover and it begins to motor. This form of protection is more "visible" during a normal stop event, but a reverse power relay is providing this protection at all times. It is unclear as to whether the Application Guidelines is an enforcement "tool" and guidance provided in within may be used by the CEA to determine compliance by a Generation Owners. Since it is unknown, it should be explicitly stated that reverse power trips during a normal stop event be not considered as Misoperations. It is understood that the Application Guidelines stand separate from PRC-004-3 per se, but the former document will likely be used by auditors in determining whether or not investigations were thorough enough to identify Misoperations. We therefore expect it to be obligatory, if the standard is passed in its present form, to document the, “sequence of events, relay targets and a summary of Disturbance Monitoring Equipment (DME) records,” for each normal stop

(ref. the "Requirement R1" section of the Application Guidelines), including determining whether or not the Protection System operation was slower than expected ref. (items 2 and 3 in the "Guidelines and Technical Basis" section). The number of such events can be extremely large, since peaking units often stop and start daily (or even several times per day) in high-demand seasons. Retrieving such data would be extremely time-consuming; since, where DME exists (our RRO's standard for PRC-002 has a minimum size threshold), GOs often do not have the centralized data collection facilities of TOs. Event analysis personnel may need to spend extreme amounts of time traveling to and from jobsites, since some peaking stations are unmanned or only minimally staffed. All this effort would result in no associated benefit regarding BES reliability. Reverse power relays are counted (perhaps inappropriately) as being part of the Protection System, but these devices do not trip in response to something having gone wrong. It is intended that negative current be experienced at some point as the unit unloads, and subsequent actuation of the reverse power relay is normal and expected. Notes should therefore be added to R1 and to the Application Guidelines, stating that tripping of the reverse power relay during a normal stop event does not indicate a Fault, and a detailed investigation, DME downloading, speed-of-response analysis and the like are therefore required only if DME is present and if the reverse power relay failed to function.
Yes
Yes
No
There are too many classification choices in the "Resolution Status" field of the report form. An equally effective status report can be delivered using three choices: 1) Analysis In Progress [Still Under Investigation]; 2) Analysis Completed – Corrective Action Plan Pending; 3) Corrective Action Completed [Investigation Complete, Corrective Action Complete] The form for GOs should differ from that for TOs, for the following reasons: a. GOs are not in a position to respond to the last item on p.1, "Additional BES Interruptions." We know only what happens in our plants, not repercussions on the grid. b. The "slow trip" entries in the "Misoperations Category" do not apply for the majority of Misoperations reported by GOs. The presence of such categories in the draft standard appears to derive from the belief that millisecond-resolution records of Misoperations are always available from DME; but, when this equipment is present at generation plants, it is installed only at the GSU and (if the GO is the owner) the yard breaker – that is, on high-side equipment. The DME is consequently not expected to yield any useful information for Faults occurring at the generator or other low-side components. Notes should be added to PRC-004-3 and the Application Guidelines to the effect that DME downloading and speed-of-response analysis pertain at generation Facilities only when DME is present and only to incoming Faults from the grid. Further, the current draft standard does not dictate whether quarterly reporting to the CEA is required and enforceable, as it is currently (the term "will" as opposed to "shall"). Additionally, there is no reference to reporting in a manner outlined by the CEA/RRO. The use of a common "form" is needed to achieve the usefulness and effectiveness of these data submittals.
No
Better clarity for the lower VSL associated with R4 should be provided. The term "incomplete" is too ambiguous. The current language leaves determination of "completeness" of documentation up to the auditor.
No
M1 generically references lists, logs and databases, while the Application Guidelines cite much more specific evidence (sequence of events, relay targets, summary of DME records). These two documents should be in seamless agreement; we need to know specifically what will and will not be required when our records are audited, as opposed to being told when it's too late to do anything about it that our lists, logs etc do not constitute sufficient evidence.
Yes
Compliance section C1.4 contains a requirement to report to the RE – this needs to be in the requirement section of the standard.
Individual

Darryl Curtis
Oncor Electric Delivery
Yes
No
The proposed R1 obligates the Transmission Owner or Generation Owner to now provide notification, coordinate communication and maintain documentation follow up with neighboring entities. It appears to misalign with the NERC Event Analysis program. In addition, the Regional Entities have been tasked with designing a misoperations procedure for all Registered Entities in their respective area which appears to overlap this Requirement. Oncor recommends the appropriate NERC/Regional Entity subgroups revaluate to align NERC misoperations reporting which will ensure streamlined processes for Registered Entities.

R1 requires detailed investigation of every protection system operation. If operational data indicates that only the intended breakers operated for a fault on a specific protected line and a fault record from any monitoring device in the area indicates the fault was cleared in the intended time then no detailed review of the protection system operation is required.
No
R2 requires development of a CAP and evaluation of CAP applicability to other locations. I recommend development of a CAP in 60 days for the specific location where the misoperation occurred. CAP applicability to other locations may require more time depending on what the CAP involves. CAP applicability to other locations should be allowed a longer time frame such as 12 months. R3 requires development of an action plan for misoperations with an unknown cause. Depending on the type of protection equipment in place it may not be possible to always determine the cause of every misoperation. For example electromechanical relays only provide targets and event reports may not be available. R3 seems to require that EM relays be changed out to digital relays in order to monitor for the next misoperation. The standard should not require this and R3 should be deleted.

1) Regarding R1.1, it is not clear which entity would report the Misoperation, or be responsible for the remaining requirements. Would it be a joint responsibility? Please consider revising the requirement to indicate that the entities must agree on which one would handle the misoperation process, while the other would support as needed. 2) Consider including RAS/SPS, UVLS, UFLS under the applicability and eliminating the standards associated with misoperations on those specific types of protection systems.

Consideration of Comments

Project 2010-05.1 Protection Systems: Phase 1 (Misoperations)

The Protection Systems: Phase 1 (Misoperations) Drafting Team thanks all commenters who submitted comments on the second draft of the PRC-004-3 standard for Protection System Misoperations. These standards were posted for a 45-day public comment period from July 25, 2012 through September 7, 2012. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 95 sets of comments, including comments from approximately 230 different people from approximately 145 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary Consideration of all Comments Received

Definition

The drafting team made several changes to the definition. The term 'composite Protection System' was incorporated into the introductory sentence of the definition to indicate that a Misoperation pertains to the 'composite Protection System' and clarify that only the overall performance of the Protection System is considered when determining a Misoperation. The definition categories were edited and revised to provide more specificity and clarity.

Applicability

The drafting team revised the Facilities portion of the Applicability section to provide more specificity. Facilities 'included' are stated in 4.2.1 and 4.2.2, and facilities excluded are stated in 4.2.3 and 4.2.4. The Applicability text box provides explanation for the exclusion of the facilities listed in 4.2.3 and 4.2.4.

Requirements

The drafting team revised Requirement R1 to provide more clarity regarding the responsibilities of the BES interrupting device owner and the Protection System owner (if they are different entities) when a Protection System operation occurs.

The drafting team revised Requirement R4, removing the parts to eliminate the administrative aspects.

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

Measures

The drafting team modified the measures to complement the revised requirements.

Compliance

C 1.2 Evidence Retention – The following sentence was added for clarity: "The Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System shall retain evidence for all Misoperations with an open investigation, action plan, or CAP even if the BES interrupting device operation occurred prior to the current audit period."

The boiler plate language was modified for clarity.

C 1.4 Additional Compliance Information – The language was removed. All reporting obligations have been removed from the standard.

VLSs

Complementary changes were made to the VSLs in conjunction with the revised requirements.

Guidelines and Technical Basis

Complementary changes were made to the Guidelines and Technical Basis corresponding to all changes to the standard. More supporting discussions, explanations, and examples for all aspects of the standard were provided.

Implementation Plan

The Effective Date was revised from six months to twelve months following applicable regulatory approvals. Other complementary changes were made to the Implementation Plan.

Unresolved Minority Views

- A few commenters expressed concern about the 120 day timeframe to review Protection System operations. The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. This 120 day time frame takes into account the seasonal nature of Protection System operations as well as outage constraints for investigative purposes. If the investigation doesn't reveal a cause within this timeframe, the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation.

- A few commenters felt having formal notification to another entity of an operation was unnecessary. The drafting team disagreed and clarified Requirement R1 to show that the interrupting device owner will do the initial investigation and will contact other Protection System owners only if a correct operation cannot be determined. In this case, the investigative information is passed from the interrupting device owner to the other owners. If the investigation doesn't reveal a cause within this timeframe, the notified entity has the remainder of the 120-day period, and if needed can establish an action plan (per Requirement R3) with its own time table for further investigation to determine whether their component operated correctly.

- Several commenters asked the drafting team to combine all or parts of Requirements R1, R2 and R3 into one requirement with one timeframe. The drafting team believes an overall time limit for Requirements R1, R2 and R3 is not practical as many factors can delay the investigative findings in Requirement R1 or Requirement R4 (action plan) such as outage constraints and resource limitations. The sequential nature of the 60 days in Requirement R2 is important as Requirement R2 could follow either a Misoperation cause found in Requirement R1 or a Misoperation cause found in Requirement R4 via an 'action plan' execution. If the cause is found via an 'action plan', the entity may likely need an additional 60 days to create a CAP and is now beyond the 180 days. The Guidelines and Technical Basis section of the standard has been revised to add clarity for the independent 120 and 60 day timeframes.

- A large percentage of the entities that commented stated that the 10-day intervals between severity levels for Requirements R1, R2, or R3 were too short. The drafting team used the NERC guideline: "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended." However, based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.

Index to Questions, Comments, and Responses

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

1. **The definition of "Misoperation" has been revised from the initial posting. Do you agree with the revised definition? If not, please provide specific suggestions for improvement.**

Summary Consideration:

Several commenters asked the drafting team to define and use the term 'composite Protection System' in the standard. To address these comments, the drafting team clarified the Misoperation definition by modifying the introductory sentence of the definition to indicate that a Misoperation pertains to the 'composite Protection System'. The Guidelines and Technical Basis section of the draft standard was also updated to explain that the 'composite Protection System' for an Element is its total complement of protection.

Several commenters suggested that the parenthetical phrases were subordinate in the categories listed in the Misoperation definition. The drafting team responded by removing the parentheses around the exclusionary phrases.

Several commenters questioned the range of activities included in the reference to "on-site" activities as used in the definition. In regards to part 6 of the definition (Unnecessary Trip - Other Than Fault), the drafting team explained that "on-site" refers to on-going activities at BES Facilities. However, it was made clear that once the activities have been completed and the equipment released from service, the exclusion regarding "on-site" activities no longer applies regardless of the presence of personnel at the location. "Inspection" was added to the list of "on-site" activities that could initiate an operation but should exclude it from being considered a Misoperation.

Some commenters questioned category 5 of the definition (Unnecessary Trip - During Fault). These commenters asked for clarity on the exclusionary phrase and suggested that the word "adjacent" be removed or replaced. The drafting team revised category 5 of the Misoperation definition to remove mention of exclusions.

One commenter asked for the exclusionary phrase in category 3 of the definition (Slow Trip - During Fault) to be expressed in a way that was more consistent with the rest of the definition. The drafting team revised category 3 to be similar to the first two parts of the definition.

A few commenters questioned whether Underfrequency Load Shedding (UFLS) was covered by the standard. The drafting team clarified the issue by modifying the 'included' Facilities portion of the Applicability section to specifically include Underfrequency Load Shedding (UFLS) that trips a BES Element.

Several commenters asked for clarification regarding the phrase "slower than intended" in categories 3 and 4 of the definition. The drafting team explained that the phrase means that the Protection System operated slower than the objective of the owner(s).

Several commenters questioned the reference to the TPL standards in the definition. The drafting team explained that the reference (made in category 3 of the definition) to the TPL standards is meant to place some bounds on the time to clear a Fault and prevent

dynamic instability. The performance requirements in the TPL standards indicate stability, thermal and voltage limits and loss of Demand impacts for contingencies and are found in Table 1 of those standards.

Some commenters expressed concerns regarding the extent of non-Fault conditions. The drafting team advised that the examples used in categories 2 and 4 of the definition were not meant to be an all-inclusive list.

Several commenters preferred a shorter, simpler definition. The drafting team declined to make the suggested changes because a brief definition could be open to varying interpretations due to lack of detail.

Several commenters asked to exclude weather events and other unusual conditions from consideration. The drafting team explained that it would not be prudent to simply ignore operations that occurred during large storms. Further, the Sanction Guidelines of the North American Electric Reliability Corporation allows the entity to be afforded more time for unusual events.

Organization	Yes or No	Question 1 Comment
Western Small Entity Comment Group	No	The comment group is concerned with the use of the phrase “slower than intended” in definition 4. The actual intended speed of operation is/was in the mind of the protection engineer who may not necessarily be available to testify regarding his intent for every fault. Settings documentation generally does not show speed of operation, only set points and manufacturer curves. A speed of operation may be derived from these settings right down to the millisecond, but the protection engineer did likely count on this level of precision after considering CT and relay measurement error and coordinating margin. Lacking a tolerance, the documented settings do not fully show the “intent.” In addition the documentation itself may be in error and possibly be the cause of a misoperation (although not by this definition if we use the document to gage intent). Entities and Compliance Enforcement will need more guidance from the drafting team on just how to measure “slower than intended”, and to understand just how slow that is. In the end, however, it is not the intended speed that matters, it is the result. The parenthetical suggests it is the result that counts, but we don’t see the parenthetical overruling the “slower than intended” language. Slow Trip - During Fault - A slow Protection System

Organization	Yes or No	Question 1 Comment
		operation for a Fault within the zone it is designed to protect, resulting in miscoordination with other Protection Systems or failure to meet the performance requirements of the TPL standards.
Response: Thank you for your comments. **The phrase "slower than intended" in parts 3 and 4 of the definition mean that the Protection System operated slower than the objective of the owner(s). It would be impossible to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent any additional harm, and ultimately be able to decide whether the speed or outcome of its Protection System was adequate. The parenthetical phrases are part of the definition and meant to clarify parts of the definition. The parentheses will be removed so that these phrases are not seen as subordinate to other parts of the definition. The suggested change to part 3 of the definition changes the meaning by overstating the intent of the exclusionary phrases. This would weaken the language and allow the failure of certain required high-speed Protection Systems to be not classified as a Misoperation.**		
Pepco Holdings Inc & Affiliates	No	The existing definition of misoperation in the NERC Glossary of Terms indicates that if any individual component of a Protection System fails it is considered a misoperation. This new PRC-004-3 proposed definition modifies the definition by treating the primary and back-up protection schemes protecting a circuit element as a composite protective system. Individual component failures would not be considered a misoperation if the "overall performance of the composite Protective System for an element is correct." We support this intent, but feel that the present wording in the proposed misoperation definition is not clear enough to adequately emphasize this distinction. The capitalized term Protection System, which is a NERC defined term, is used throughout this standard. However, the applicability of the proposed misoperation definition applies to the "Composite Protective System", and not to each of the primary and backup Protection Systems individually. This point must be made very clear in the misoperation definition, since it is the foundation of the

Organization	Yes or No	Question 1 Comment
		requirements in PRC-003-4. As such, either a new term "Composite Protective System" needs to be defined and the language in the misoperation definition and PRC-004-3 changed to reference this term; OR a qualifying paragraph could be included within the misoperation definition that states that "In the context of this misoperation definition a Protective System is considered to be the entire complement of protective system components (including both primary and backup protection systems) designed to protect a circuit Element."
Response: Thank you for your comments. **It is preferable not to add more definitions to the NERC Glossary of Terms, instead the drafting team modified the Guidelines and Technical Basis section to include the following: "The composite Protection System in the context of this standard is the total complement of protection for a system Element (line, bus, transformer, generator, etc). Primary and secondary protection of a given Element is considered as the composite Protection System, not two separate Protection Systems." The drafting team also changed the introductory sentence of the definition to the following based on your comment: "The failure of an Element's composite Protection System to operate as intended."**		
Souhwest Power Pool Reliability Standards Development Team	No	We need some clarification around section 3 Slow Trip During Fault. Is this intended to address the future changes around the Upcoming TPL standards? We need clarification on what is meant by referencing the TPL performance Standards in this section.
Response: Thank you for your comments. **No, the reference to the TPL standards is not related to the upcoming changes to these standards. The reference to the TPL standards is meant to place some bounds on the time to clear a Fault and prevent dynamic instability.**		
Detroit Edison	No	No, Dteroit Edison disagrees with "Slow Trip - Other than Fault." We feel that the SDT should consider, with respect to many of the Generating Unit trip conditions that are given, that there may not be adequate resolution of time and current\voltage\etc. monitoring. If monitoring with as fine a

Organization	Yes or No	Question 1 Comment
		resolution as is required to analyze speed of operation, it should not be considered a misoperation.
Response: Thank you for your comments. **The standard and Misoperation definition do not require any additional monitoring be installed. Each entity must review each of its Protection System operations and determine whether the operation should be categorized as a slow trip - other than Fault Misoperation based on its available information.**		
Tacoma Power	No	1) It is still not completely clear what is meant by 'intended'? 2) The wording for Slow Trip - During Fault is awkward. For example, consider changing "...if high-speed performance is required to meet the performance requirements of the TPL standards or by coordination requirements with other Protection Systems" to "...if high-speed performance is required to meet the performance requirements of the TPL standards or coordination requirements with other Protection Systems"; in other words, remove 'by.' 3) Under the proposed, revised definition of a Mis-operation, it is unclear if a Mis-operation resulting from mis-coordinated relays would normally be categorized as Slow Trip or Unnecessary Trip. 4) What is meant by 'on-site,' as in the definition of Unnecessary Trip - Other Than Fault? Specifically, what if a remote terminal is inadvertantly tripped by means of a communications system during maintenance, testing, construction, or commissioning activities; technically, the interrupting device that operated is not "on-site." 5) Additionally, what if an operation occurs during initial energization or loading following maintenance, testing, constuction, or commissioning; it seems that because the operation occurs with personnel still on site that this should not be considered a reportable Mis-operation, especially since

Organization	Yes or No	Question 1 Comment
		the Element is just being returned to service.

Response: Thank you for your comments.

1) The word "intended" as used in the definition refers to whether the Protection System performance met the objectives of the owner(s).

2) Removing the word "by" does not improve the wording. If the word "by" is removed, other wording would need to be changed. An alternative could be the following: "…if high-speed performance is required to meet the performance requirements of the TPL standards or to coordinate with other Protection Systems."

3) It depends on the miscoordination. If the Misoperation occurred because the Protection System for the faulted Element operated slower than intended, then it is a Slow Trip – During Fault. If the Misoperation occurred because a Protection System for another Element operated faster than intended, then it is an Unnecessary Trip – During Fault.

4) "On-site" refers to on-going activities at BES Facilities. This is the opposite of "as left" conditions where some activities were completed and personnel left the Facilities. The inadvertent operation to a remote terminal via communications would be the result of an "on-site" activity.

5) Once the equipment has been returned or released to service, or the inspection has been completed, it would be considered a Misoperation regardless of the presence of the technical personnel.

Organization	Yes or No	Question 1 Comment
Santee Cooper	No	While the purpose of the clarifications in the misoperation definition is understood, the proposed definition seems to use the term "non-fault condition" differently in different sections. For items 2 and 4, it says "a non-Fault condition for which the Protection System was intended to operate, such as a power swing, under-voltage, overexcitation, or loss-of-excitation." Similar wording is used in 4 "such as a power swing, under-voltage, overexcitation, or loss-of-excitation. However, in 6, the terms "other than fault" and "non-fault condition" are also used, but, it would be expected that the definition here should be broader than in 2 and 4, to include when a misoperation occurs for no reason (no abnormal condition). It seems like this could lead to a misinterpretation of number 6, since it uses the same

Organization	Yes or No	Question 1 Comment
		term “non-fault condition” as in 2 and 4.We suggest having the following 4 categories, which would still ensure that the “non-fault conditions” are still included:1. Failure to Trip - A failure of a Protection System to operate for a Fault within the zone it is designed to protect or for a non-fault condition (such as a power swing, under-voltage, over excitation, or loss of excitation) for which the Protection System was intended to operate.2. Slow Trip - A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect or for a non-Fault condition such as a power swing, under-voltage, over excitation, or loss of excitation.3. Unnecessary Trip - A Protection System operation for a Fault or for a non-fault condition (such as a power swing, under-voltage, over excitation, or loss of excitation) for which the Protection System is not intended to operate. This excludes any remote Protection System operation that resulted from a failure to trip or slow trip of a local Protection System in a faulted adjacent zone.4. Unnecessary Trip - Normal system conditions - A Protection System operation when no fault or non-fault conditions are present (such as a power swing, under-voltage, over excitation, or loss of excitation).There may be other appropriate wordings for number 4.
Response: Thank you for your suggestion. **The drafting team believes the non-Fault condition phrase is used consistently in categories 2, 4, and 6. The non-Fault conditions cited in categories 2 and 4 are examples and do not constitute an all inclusive list.**		
Dominion	No	a). Under Definitions of Terms Used in the Standard, #3 indicates that delayed clearing of a high speed protection system is a Misoperation if it does not meet TPL requirements or coordination requirements. The specific requirements being referred to are unclear and non specific. Is the intent to report failure of high speed tripping for those Protection Systems that impact system stability? Suggest that more clarity be given to the requirement references.

Organization	Yes or No	Question 1 Comment
		b). Under Definitions of Terms Used in the Standard, #5 change definition to read - Unnecessary Trip - During Fault - A Protection System operation for a Fault for which the Protection System is not intended to operate, excluding properly coordinated remote trips when the local Protection System fails to clear the Fault. c). In the Application Guide - Guidelines and Technical Basis, under the definitions there appears to be more emphasis on Generation related examples. Recommend a balance of both Generation and Transmission examples in this guide.
Response: Thank you for your comments. **a) The performance requirements in the TPL standards are found in Table 1. While system stability is often the primary concern, there are thermal and voltage limits and loss of Demand impacts that need to be met as well. The coordination requirements with other Protection Systems does not refer to requirements listed in standards but the need to ensure that relaying operates in the proper or planned sequence (i.e. the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).** **b) The drafting team modified category 5 of the definition and believes it addresses your concern.** **c) A review of the examples shows that they are evenly split between Generation and Transmission examples. Categories 2 and 4 of the definition which involve failure to trip and slow trip during non-Fault conditions are somewhat more relevant to generators as line and transformer protection is predominately for detecting Faults.**		
Luminant	No	Misoperations categorized in line items #3 and #4 are subjective and left up to varying interpretation for protective systems on generator applications. Unlike the definition for “Slow Trip - During Fault”, Transmission Owners are provided with criteria that define a slow operation while generation owners do not have similar established criteria for trips involved in items #3 or #4. Luminant recommends line item #4 be removed since it is subject to varying interpretations and item #3 be only applicable to Transmission.

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comments. **The drafting team does not believe that categories 3 and 4 are subjective. It is true that entities will have varying capabilities in determining whether an operation was slow or not but that is not a subjective issue. The standard and Misoperation definition do not require any additional monitoring to be installed. Each entity must review each of its Protection System operations and determine whether an operation is a Misoperation based on the available information. The drafting team believes that it does not serve the interest of BES reliability by basing analysis capabilities on the minimum monitoring that any entity may have at its disposal. The criteria for category 3 are also applicable to Generation Owners. In particular, the Protection Systems for a generation Facility need to coordinate with other Protection Systems. The phrase “slower than intended” in categories 3 and 4 of the definition mean that the Protection System operated slower than the objective of the owner(s). It would be impossible to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent any additional harm, and ultimately be able to decide whether the speed or outcome of its Protection System was adequate. The drafting team will enhance the Guidelines and Technical Basis section with this information.**		
Florida Municipal Power Agency	No	1) The description of “unnecessary trip”, the exclusion of remote protection System operation is not accurate because such operation is actually necessary (not “unnecessary”) and it is intended to operate for failure or slow operation of local Protection Systems. 2) The description for a remote back-up system operation and limimting that to only the “adjacent” zone is not appropriate. There are cases when the appropriate protection system operation may not be from the “adjacent” zone of protection. 3) Also, the term “zone of protection” is not defined, e.g., are zone 1, zone 2 and zone 3 distance relays different “zones of protection”. If a zone 3 relay covers two transmission facilities, is that one and the same “zone of protection”? Or does the SDT intend a zone to be breaker-to-breaker? How is a circuit swithcher treated when defining a zone of protection>? Etc.

Organization	Yes or No	Question 1 Comment
		4) The description of a "slow trip" as "operation slower than intended" without some sort of quantification of how much slower than intended is ambiguous (e.g., is one cycle longer delay than expected a misoperation?), unless the intent is to establish an operating time as the slowest intended operating time. Even so, measurability becomes a concern.
Response: Thank you for your comments. **1) The drafting team revised category 5 of the Misoperation definition to remove mention of exclusions.** **2) The drafting team agrees. In most cases a proper remote backup operation is in an adjacent zone. The language in Category 5 was changed to cover non-adjacent operations.** **3) The term "zone of protection" is not used in the definition. This widely used term has been defined by other literature and does not require further clarification in this standard. A reference the commenter can use to clarify the term is the "IEEE Guide for Protective Relay Applications to Transmission Lines", IEEE Std C37.113-1999 (or later revisions if available).** **4) The phrase "slower than intended" in categories 3 and 4 of the definition mean that the Protection System operated slower than the objective of the owner(s). It would be impossible to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent any additional harm, and ultimately be able to decide whether the speed or outcome of its Protection System was adequate.**		
Duke Energy	No	Duke Energy does not agree with the wording in Part 3 of the definition of Misoperation. "3. Slow Trip - During Fault" identifies "Delayed Fault clearing associated with an installed high speed protection scheme" as a Misoperation, "if the high-speed performance is required to meet the performance requirements of the TPL standards". The TPL standards do not currently contain any high-speed performance requirements, and Transmission Planners must plan to meet Category C "Single Line to Ground Faults" with delayed clearing. We suggest the following alternative wording which removes the linkage to TPL standards, and puts "3. Slow Trip - During

Organization	Yes or No	Question 1 Comment
		Fault" on the same footing as "1. Failure to Trip - During Fault" and "2. Failure to Trip - Other Than Fault":"3. Slow Trip - During Fault - A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. (Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation as long as the overall performance of the Protection System for an Element is acceptable, and the high-speed performance is not required for coordination with other Protection Systems.)
Response: Thank you for your comments. **The drafting team disagrees with your suggested wording because there is no indication as to what is considered acceptable performance. The performance requirements in the TPL standards are found in Table 1 are applicable to all contingencies mentioned for Type A, B and C contingencies and state: System Stable and both Thermal and Voltage Limits within Applicable Rating Specifically, the performance requirements are dynamic performance requirements and are typically met by requiring installation of high-speed protection.**		
JEA	No	JEA suggests a shorter definition such as: either the operation of a protection system when it should not or the failure to operate when it should.
Response: Thank you for your comments. **The drafting team believes the existing definition sufficiently describes the term of Misoperation providing enough detail to be unambiguous. For example, by using the word "when" it is not clear whether an operation is a Misoperation if it was slow or just whether it did or didn't operate. The proposed definition also provides none of the specific exceptions that have been cited in the 6 categories. Unfortunately, the brief definition leaves it open to interpretations because of its lack of detail.**		
Nebraska Public Power District	No	I recommend adding the underlined text to the misoperation definitions for items: Slow Trip - During Fault - A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. (Delayed Fault clearing associated with an installed high-speed protection

Organization	Yes or No	Question 1 Comment
		scheme is a Misoperation if the high-speed performance is required to meet the performance requirements of the TPL standards or by coordination requirements with other Protection systems for a reasonable number of system contingencies. Unnecessary Trip - During Fault - A Protection System operation for a Fault for which the Protection System is not intended to operate for a reasonable number of system contingencies, excluding any remote Protection System operation that resulted from a failure to trip or slow trip of a local Protection System in a faulted adjacent zone. Perhaps the number of contingencies should be a set number such as one so that for non standard system configurations where coordination may be lost. For example, such as multiple ground sources being out of service causing ground overcurrent miscoordination in part of the system.
Response: Thank you for your comments. **Unfortunately, a "reasonable number of system contingencies" is ambiguous and its use in the standards would complicate enforcement. It would also be difficult to decide on a single number that would be appropriate for all cases.**		
Southern Company	No	1) Instead of clarification and specification, the objective of the change to the definition should be simplification. A simpler definition could be: Failure of a Protection System to operate as intended, evidenced by it not operating when it should have, operating when it should not have, or operating slower than it was intended to operate. 2) If the definition remains in the present form, we would suggest slight changes to language on #1 and #2: (The failure of........of the Protection System for the element it is designed to protect is correct.) 3) Suggest slight changes to language on #3: (Delayed Fault clearing ....high-speed performance has been identified as required......) 4) Please clarify why # 3 and # 4 are not a subset of # 1.If not, it should be

Organization	Yes or No	Question 1 Comment
		made clear in the verbiage.
Response: Thank you for your comments. 1) **Although a shorter definition has many advantages, it has significant shortfalls. For example, by using the word "when" it is not clear whether an operation is a Misoperation if it was slow or just whether it did or didn't operate. The proposed definition also provides none of the specific exceptions that have been cited in the 6 categories. Unfortunately, the brief definition leaves it open to interpretations because of its lack of detail.** 2) **The drafting team agrees and believes the suggested change adds clarity, the definition was changed.** 3) **The drafting team agrees and believes the suggested change adds clarity, the definition was changed.** 4) **Categories 3 and 4 are slow trips, not a failure to trip. For example, the local Protection System may have operated and initiated a trip but not before a remote Protection System operated. Also category 4 is for a non-Fault condition where category 1 is specifically for a Fault condition.**		
ITC	No	1) For 1 through 3, The definitions should be revised to remove the need for the clarifications in parenthesis. One such revision should include clarifying the scope of a 'Protection System.' It is not clear whether multiple protection schemes for a single element would be considered one 'Protection System' or if each scheme is considered a 'Protection System'. It may require clarifying the definition of 'Protection System' within NERC Glossary or addressing directly in this standard. 2) What is the definition of 'slow?' Is it only defined by TPL standards or expected operation time designed into the 'Protection System?'
Response: Thank you for your comments. 1) **The parentheses have been removed per comments received. The drafting team changed the introductory sentence of the definition to the following based on comments and should address the multiple schemes issue that you brought up: "The failure of an Element's composite Protection System to operate as intended."** 2) **The term "slow" is not defined in this or the TPL standards or the NERC Glossary of Terms. In the definition, it is stated that**		

Organization	Yes or No	Question 1 Comment
"…operation that is slower than intended…" The phrase "slower than intended" means that the Protection System operated slower than the objective of the owner(s). It would be impossible to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent any additional harm, and ultimately be able to decide whether the speed or outcome of its Protection System was adequate.		
Cleco Corporation	No	Need clarification on what is meant by referencing the TPL performance standards in section 3.
Response: Thank you for your comment. The reference to the TPL standards is meant to place some bounds on the time to clear a Fault. The performance requirements in the TPL standards are found in Table 1 are applicable to all contingencies mentioned for Type A, B and C contingencies and state: System Stable and both Thermal and Voltage Limits within Applicable Rating Specifically, the performance requirements are dynamic performance requirements and are typically met by requiring installation of high-speed protection.		
Manitoba Hydro	No	1) Although we agree with most components of the definition, it is not clear to us what constitutes a "Failure to Trip". For example, in cases of redundant "A" and "B" protection systems, if the "A" protection trips, but the "B" protection does not trip, would this be a misoperation reportable as a "Failure to Trip"? 2) The first sentence of the second last paragraph of section A is not clear:"Misoperation of or associated with Special Portection schemes ...."
Response: Thank you for your comments. 1) No, because there is redundancy in the composite Protection System, the overall performance would not be impacted. 2) The sentence is simply indicating that the Misoperations of SPSs, RASs and UVLSs are not addressed in this version of the standard.		

Organization	Yes or No	Question 1 Comment
Tri-State G&T	No	1) We understand why the parenthetical expressions are included in the first two parts of the definition since they clarify what is excluded from the definition. However, the parenthetical phrase in the third part of the definition seems to be another expression of what is to be considered a Misoperation, but it is not consistent with the non-parenthetical definition. We suggest changing it to “Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high-speed performance is not used to meet the performance requirements of the TPL standards nor is it required to ensure coordination with other Protection Systems.” 2) We have a question regarding the phrasing “required to meet the performance requirements of the TPL standards” (changed in our recommended language). Does this mean that a simulation has been performed that determines that high speed protection is required to meet TPL standard requirements? Or does it apply to the slower clearing if the reduced performance results in a failure to meet the requirements of the TPL standards regardless of whether it had been discovered and documented? 3) While we did not base our “No” answer on the following, our belief is that the exclusions of individual Protection System component failures as long as the total Protection System operates to clear the Fault in the time and zone for which it was designed may lead to a reduced level of reliability to the BES. Failures of components may be easily overlooked if the entity doesn’t review the event closely enough to discover misoperating components because the aggregate system operated correctly. But we recognize that there is unclarity regarding the definition of Protection System and that unclarity could lead to considering the overall performance of the aggregate Protection System, which was the interpretation used by the drafting team.

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comments. **1) The drafting team made the suggested change to promote consistency in the definition.** **2) The drafting team revised Category 3 based on comments to clarify that high-speed performance has been identified.** **3) The exclusions of component failures as long as the total Protection System operates correctly were based on recommendations by the NERC SPCS. Entities still need to review each Protection System operation. The difficulty in requiring the investigation of component failures and the development and completion of associated CAPs is the additional administrative burden for a type of failure that had no immediate reliability impact for an event that revealed it.**		
Flathead Electric Cooperative, Inc.	No	We are concerned about what "Slow" is and if the drafting committee is creating a new kind of misoperation or whether this is something that might just be found as a result an investigation of an existing type of misoperation.
Response: Thank you for your comments. **The IEEE/PSRC I3 Working Group on 'Transmission Protective Relay System Performance Measuring Methodology' developed categories of Relay System Misoperation including "Slow Trip" in 1999. Most of the Regional Entities did have a category of Misoperation called "Slow Trip." So, the terminology has existed for some time. All Misoperations require some amount of investigation. It is also likely that some investigation would be required to determine, for example, if the local protection was slow or the remote protection tripped unnecessarily (because it was too fast or did not receive a blocking signal, etc.).**		
Dairyland Power Cooperative	No	The SDT should clarify whether UFLS is or is not covered by this standard. The "Consideration of Comments" indicates that it is. If so, it is suggested that the SDT consider adding underfrequency to the list of non-Fault conditions listed in items 2. and 4. in the Misoperation definition. If not, it would help to clearly state that it is "excluded" in Section 4.2.2.
Response: Thank you for your comments. **UFLS that trip the BES are covered by PRC-004-3. For clarity, the drafting team added the following in the included Facilities**		

Organization	Yes or No	Question 1 Comment
portion of the Applicability section 4.2.2 in the draft standard "Underfrequency Load Shedding (UFLS) that trips a BES Element". UFLS events can be triggered by Faults or non-Fault conditions. Not all non-Fault conditions are (or probably could be listed) with the examples in categories 2 and 4 of the Misoperation definition.		
MISO	No	The SDT should clarify whether UFLS is or is not covered by this standard.
Response: Thank you for your comments. **UFLS that trip the BES are covered by PRC-004-3. For clarity, the drafting team added the following in the included Facilities portion of the Applicability section 4.2.2 in the draft standard "Underfrequency Load Shedding (UFLS) that trips a BES Element". UFLS events can be triggered by Faults or non-Fault conditions. Not all non-Fault conditions are (or probably could be listed) with the examples in categories 2 and 4 of the Misoperation definition.**		
City of Austin dba Austin Energy	No	The parenthetical at the end of the two "Failure to Trip" categories is not clear. Austin Energy requests the SDT to consider including some of the detail in the Guidelines and Technical Basis section on page 15 of the clean draft.
Response: Thank you for your comments. **The parentheses were removed and the language was further modified for clarity. The exclusions of component failures as long as the total Protection System operates correctly were based on recommendations by the NERC SPCS. The drafting team believes the Applications Guide section is the proper location to document drafting team intent.**		
Texas Reliability Entity	No	(1) Failure to Trip During Fault: The statement "(The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for an Element is correct.) " is somewhat vague and open to interpretation. We understand the purpose of this language as stated in the Guidelines and Technical Basis, i.e. when a high speed zone element trips faster than a high speed pilot system. However, we have had instances in our Region where a high speed pilot system fails and the fault is subsequently cleared by a time-delayed zone

Organization	Yes or No	Question 1 Comment
		element, typically in 30-45 cycles rather than in 5 cycles or less. This instance could be interpreted as "correct overall performance" by the entity and not reportable. Is this the intent of the SDT? Or should this instance be recorded as a "Failure to Trip" or "Slow Trip During Fault"? The Guidelines and Technical Basis section offers some good examples, however, it should possibly be expanded to provide more discrete cases.(2) Failure to Trip Other than Fault: See comments under Failure to Trip During Fault(3) Slow Trip During Fault: See comments under Failure to Trip During Fault
Response: Thank you for your comments. **The exclusions of component failures as long as the total Protection System operates correctly were based on recommendations by the NERC SPCS. Entities still need to review each Protection System operation. The difficulty in requiring the investigation of component failures and the development and completion of associated CAPs is the additional administrative burden for a type of failure that had no immediate reliability impact for an event that revealed it. For the example cited, it appears that the operation would not be a Misoperation unless high-speed performance (as stated in category 3 of the definition) was required. If high-speed performance was required, then it would be an instance of "Slow Trip – During Fault".**		
Liberty Electric Power LLC	No	The "unnecessary trip- other than fault" should be removed. Standards should not cover balance of plant issues, which could be trip causes. While trip analysis is a best practice, it should not be a required, zero tolerance element of the NERC standards. For example, a turbine vibration fault could use the same 86 relay as the generator protection relay, which would make that 86 part of the protection system. Vibration trips of that 86 relay would then fall under the program, causing unneeded effort for compliance documentation of a straightforward balance of plant issue. The definitions themselves are overly complex, and could be combined in many cases.
Response: Thank you for your comments. **The drafting team Believes "Unnecessary Trip - Other Than Fault" should be kept to capture Protection System Misoperations that**		

Organization	Yes or No	Question 1 Comment
occur during non-fault conditions. Excluding this type of Misoperation would cause a reliability gap. PRC-004-3 requires any Protection System operation be reviewed to determine whether the Protection System operated as intended to isolate the generating unit from the BES. The activation of the vibration sensor is not required to be reviewed because only protective relays that respond to electrical quantities are included in the "Protection System" as defined in the NERC Glossary of Terms.		
City of Jacksonville Beach, FL dba/ Beaches Energy Services	No	1) The description of "unnecessary trip", the exclusion of remote protection System operation is not accurate because such operation is actually necessary (not "unnecessary") and it is intended to operate for failure or slow operation of Local Protection Systems. 2) The description for a remote back-up system operation and limiting that to only the "adjacent" zone is not appropriate. There are cases when the appropriate protection system operation may not be from the "adjacent" zone of protection. 3) Also, the term "zone of protection" is not defined, e.g., are zone 1, zone 2 and zone 3 distance relays different "zones of protection". If a zone 3 relay covers two transmission facilities, is that one and the same "zone of protection"? Or does the SDT intend a zone to be breaker-to-breaker? How is a Circuit Switcher treated when defining a zone of protection>? Etc. 4) The description of a "slow trip" as "operation slower than intended" without some sort of quantification of how much slower than intended is ambiguous (e.g., is one cycle longer delay than expected a misoperation?), unless the intent is to establish an operating time as the slowest intended operating time. Even so, measurability becomes a concern.
Response: Thank you for your comments. **1) The point the exclusion in category 5 was making is that the remote operation was necessary and, therefore, should not be consider a Misoperation. However, it would be clearer if this item was broken into two sentences to better emphasize your concern. The exclusionary phrase has been replaced with the following second sentence: "The operation of a remote**		

Organization	Yes or No	Question 1 Comment
Protection System is not a Misoperation if it operated as intended as a result of an interrupting device failure, or a failure to trip, or slow trip of a local Protection System for a faulted Element." **2) The drafting team agrees. In most cases a proper remote backup operation is in an adjacent zone. The language in Category 5 was changed to cover non-adjacent operations.** **3) The term "zone of protection" is not used in the definition. This widely used term has been defined by other literature and does not require further clarification in this standard. A reference the commenter can use to clarify the term is the "IEEE Guide for Protective Relay Applications to Transmission Lines", IEEE Std C37.113-1999 (or later revisions if available).** **4) The phrase "slower than intended" in categories 3 and 4 of the definition mean that the Protection System operated slower than the objective of the owner(s). It would be impossible to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent any additional harm, and ultimately be able to decide whether the speed or outcome of its Protection System was adequate.**		
Consumers Energy	No	Protection Systems can be and are designed to provide remote backup protection for adjacent zones. In many instances, these zones are owned and operated by other entities. As worded, part 1 of the definition says "failure...to operate for a Fault within the zone it is designed to protect." If entity A has a Protection System that is designed to provide remote backup protection for entity B and entity B has a Fault on that Element, but does not notify entity A of said Fault, then without an interrupting device operation, entity A has no way of knowing if their Protection System should have operated or not.Proposed solution: Failure to Trip - During Fault - A failure of a Protection System to operate for a Fault within the zone it is designed to be the primary protection.
Response: Thank you for your comments. **The failure to trip of remote backup protection would be expected to result in a cascading outage or in equipment damage. PRC-004-3 would require the Protection System operations to be investigated by the owners, and would require the Misoperations to be mitigated. Excluding remote backup protection from PRC-004-3 would introduce a reliability gap. In your example, entity A**		

Organization	Yes or No	Question 1 Comment
would not be required to investigate the operation since they did not have an interrupting device operation unless entity B or some other entity notified them of a suspected Misoperation (see Requirement R1 part 1.1).		
Cogentrix Energy, LLC	No	The proposed definitions are unneccisarily complicated. Also, the "catch all" category "Unnecessary Tip - Other Than Fault" will cause entities to analyze, document and report events that may occur but were not due to issues in engineering, design, or relay settings, thus providing little to no benefit to industry to learn from the event. For example, a control wire that was chewed by a mouse and led to a line tripping out.
Response: Thank you for your comments. **The drafting team believes the existing definition sufficiently describes the term of Misoperation providing enough detail to be unambiguous. The drafting team believes "Unnecessary Trip - Other Than Fault" should be kept to capture Protection System Misoperations that occur during non-fault conditions. Excluding this type of Misoperation would introduce a reliability gap.**		
CenterPoint Energy	No	CenterPoint Energy recommends additional clarification be included in Item 5 ‘Unnecessary Trip - During Fault’ to address interrupter device problems that result in what is commonly referred to as a “stuck breaker”. The proposed definition provides only for excluding remote tripping from a failure to trip or slow trip of a Protection System; however, interrupting device problems - other that trip coils - can also result in a failure to trip or slow trip event. Remote tripping is commonly utilized for local breaker failure schemes and for remote backup clearing for such stuck breaker events. CenterPoint Energy recommends adding wording at the end of Item 5, resulting in the following wording for ‘Unnecessary Trip - During Fault’: “A Protection System operation for a Fault for which the Protection System is not intended to operate, excluding any remote Protection System operation that resulted from a failure to trip or slow trip of a local Protection System in a faulted adjacent zone or from a failure to trip or slow trip of an interrupting device.”

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comments. **Category 5 of the definition was modified as follows and should address your comments: "Unnecessary Trip - During Fault - A Protection System operation for a Fault for which the Protection System is not intended to operate. The operation of a remote Protection System is not a Misoperation if it operated as intended as a result of an interrupting device failure, a failure to trip of a local Protection System or slow trip of a local Protection System for a faulted Element."**		
City of Tallahassee	No	The comment 'The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for an Element is correct' could be clearer. Perhaps stating 'The failure of a Protection System component is not a Misoperation as long as the Protection System operated for the fault within the zone it is designed to protect. Also, a distinction should be made whether a misoperation that only interrupts distribution and not transmission is a reportable misoperation. Example of what I am referring to is if a transformer relay trips a high side breaker but does not interrupt the BES, only distribution load.
Response: Thank you for your comments. **The exclusions of component failures as long as the total Protection System operates correctly were based on recommendations by the NERC SPCS. Entities still need to review each Protection System operation. The difficulty in requiring the investigation of component failures and the development and completion of associated CAPs is the additional administrative burden for a type of failure that had no immediate reliability impact for an event that revealed it. Section 4.2.1 of the Applicability section specifies that PRC-004-3 is applicable only to Protection Systems for Facilities that are part of the BES. PRC-004-3 is not applicable in the cited transformer relaying event because the transformer relay tripped only non-BES Elements.**		
Indiana Municipal Power Agency	No	Indiana Municipal Power Agency agrees with the comments submitted by Florida Municipal Power Agency (FMPA).
Response: Please see the responses to comments by FMPA.		

Organization	Yes or No	Question 1 Comment
Tampa Electric Company	No	1) The description of “unnecessary trip”, the exclusion of remote protection System operation is not accurate because such operation is actually necessary (not “unnecessary”) and it is intended to operate for failure or slow operation of local Protection Systems. 2) The description for a remote back-up system operation and limimting that to only the “adjacent” zone is not appropriate. There are cases when the appropriate protection system operation may not be from the “adjacent” zone of protection. 3) Also, the term “zone of protection” is not defined, e.g., are zone 1, zone 2 and zone 3 distance relays different “zones of protection”. If a zone 3 relay covers two transmission facilities, is that one and the same “zone of protection”? Or does the SDT intend a zone to be breaker-to-breaker? How is a circuit swithcher treated when defining a zone of protection>? Etc. 4) The description of a “slow trip” as “operation slower than intended” without some sort of quantification of how much slower than intended is ambiguous (e.g., is one cycle longer delay than expected a misoperation?), unless the intent is to establish an operating time as the slowest intended operating time. Even so, measurability becomes a concern.

Response: Thank you for your comments.

1) **The drafting team revised category 5 of the Misoperation definition to remove mention of exclusions.**
2) **The drafting team agrees. In most cases a proper remote backup operation is in an adjacent zone. The language in Category 5 was changed to cover non-adjacent operations.**
3) **The term “zone of protection” is not used in the definition. This widely used term has been defined by other literature and does not require further clarification in this standard. A reference the commenter can use to clarify the term is the “IEEE Guide for Protective Relay Applications to Transmission Lines”, IEEE Std C37.113-1999 (or later revisions if available).**

Organization	Yes or No	Question 1 Comment
4) The phrase "slower than intended" in categories 3 and 4 of the definition mean that the Protection System operated slower than the objective of the owner(s). It would be impossible to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent any additional harm, and ultimately be able to decide whether the speed or outcome of its Protection System was adequate.		
Ameren Services	No	(1) We suggest, In #3 Slow Trip, to replace "or by coordination requirements with other Protection Systems" with "or to meet the coordination requirements with other Protection Systems in accordance with applicable PRC standards." For example, entities regularly install one pilot relaying system on a line for other reasons, such as end use power quality. The failure of such a pilot relaying system to trip high speed should not be classified as a Misoperation. (2) We suggest to insert "the operation" to clarify #6 yielding "Unnecessary Trip - Other Than Fault - A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate, and the operation is unrelated to on-site maintenance, testing, construction or commissioning activities."
Response: Thank you for your comments. **1. The need to coordinate Protection Systems is not limited to requirements in the PRC standards. The drafting team does not believe there is a need to reference the PRC standards. The drafting team agrees with you that in the example you cite, a failure of the pilot relaying system would not be a Misoperation as it was not required to meet TPL performance requirements.** **2. The drafting team does not believe the insertion of the words "the operation" adds additional clarity to category 6.**		
Essential Power, LLC	No	1) The proposed definitions are unnecessarily complicated. 2) Also, the "catch all" category "Unnecessary Trip - Other Than Fault" will cause entities to analyze, document and report events that may occur but were not due to issues in engineering, design, or relay settings, thus

Organization	Yes or No	Question 1 Comment
		providing little to no benefit to industry to learn from the event. For example, a control wire that was chewed by a mouse and led to a line tripping out. 3) We would also like to see language that addresses an "Unnecessary Trip-During Fault - A Protection System operation for a Fault for which the Protection System is intended to operate, but operates prior to the required element setting."
Response: Thank you for your comments. **1) The drafting team believes the existing definition sufficiently describes the term of Misoperation providing enough detail to be unambiguous.** **2) The drafting team believes "Unnecessary Trip - Other Than Fault" should be kept to capture Protection System Misoperations that occur during non-fault conditions. Excluding this type of Misoperation would introduce a reliability gap.** **3) The drafting team believes that the types of Misoperations that are included in the definition are sufficient. Assuming the drafting team is correcting interpreting what you are asking, an operation that occurs prior to an element setting may not be a Misoperation. If a remote Protection System operated for a Fault that should have been cleared by a local Protection System due to a coordination error at the remote terminal (set too fast), then it is an "Unnecessary Trip" at the remote location. If the coordination error was at the local terminal (set too slow), then it is a "Slow Trip" at the local location.**		
El Paso Electric	Yes	El Paso Electric Company (EPE) agrees with the definition with a slight change to the wording of the titles of "Failure to Trip - Other than Fault" and "Slow to Trip - Other than Fault". EPE believes in these applications the titles should read Failure to Operate - Other than Fault and Slow to Operate - Other than Fault. There are scenarios, in the case of a power swing, where a device or element may be set to block a trip.
Response: Thank you for your comments. **While the drafting team agrees with your logic and sentiment, we prefer to stay as close as possible to the legacy language used by the IEEE and several Regional Entities. The slight change could confuse many in the industry into thinking that new**		

Organization	Yes or No	Question 1 Comment
Misoperation types are being created.		
ACES Power Marketing Standards Collaborators	Yes	The definition and its rationale seem reasonable. One observation is to shorten the language of each category of Misoperations. Generally, detailed definitions cause more problems in compliance than short and concise definitions. We had one question for the SDT regarding the definition - is breaker failure considered a Misoperation?
Response: Thank you for your comments. **The drafting team believes the existing definition sufficiently describes the term of Misoperation providing enough detail to be unambiguous and preventing interpretations due to lack of detail. The breaker excluding its trip coils is not part of a Protection System; so, if the breaker itself physically fails to interrupt current, that failure by itself is not a Misoperation. However, if breaker failure protection falsely operates unnecessarily tripping adjacent breakers, then this false operation is a Misoperation (either category 5 or 6 depending whether a Fault existed at the time).**		
Bonneville Power Administration	Yes	BPA thanks the drafting team for their efforts as this standard has improved significantly over the previous version. While BPA believes the standard is on the right track, clarification needs to be made to a few key area's listed throughout comments below. A fair number of inadvertent operations are caused by accidental jarring of a relay panel. Since the jarring might not be due to maintenance, testing, construction, or commissioning activities, it isn't clear if it should be excluded from the definition of a misoperation by item 6. BPA suggests adding "accidental jarring" to the exclusions in item 6.
Response: Thank you for your comment. **Inadvertent operations that occur due to on-site activity are included. However, the term "accidental jarring" is too non-specific. The drafting team added "inspection" to the list of activities in category 6.**		
Western Area Power Administration	Yes	The Applications Guidelines section of the proposed standard is invaluable in clarifying the requirements. We propose that some of this information

Organization	Yes or No	Question 1 Comment
		be directly added to the associated standards. This includes statements in items (2) and (6).
Response: Thank you for your comment. **The Guidelines and Technical Basis section provides specific examples to further clarify the definition and standard. The drafting team believes the existing definition sufficiently describes the term of Misoperation providing enough detail to be unambiguous and preventing interpretations due to lack of detail. The drafting team believes the Guidelines and Technical Basis section is the proper location to document drafting team intent.**		
Utility System Efficiencies, Inc.	Yes	This standard revision is solid and specific, and should be MUCH more straightforward to audit/enforce, since it specifically requires the analysis of all operations. A comment is needed concerning the lack of any exceptions to the analysis of operations that are caused by unusual weather events. Large scale high wind events, extreme seismic events, hurricanes, tornadoes, ice storms, etc. can cause huge numbers of protection system operations of BES facilities. Many of these operations are momentary in nature and are caused by debris, out-of-right-of-way vegetation, and other line situations that are beyond established design limits for the lines and structures. Even the sustained outages may have been the result of a number of different causes, and a solid determination of the correctness of the operation may be impractical. The result of not having an exception for unusual conditions is that Transmission Owners would be spending protection personnel resources on non-productive documentation and processes, and not on maintaining and improving the reliability of the BES.
Response: Thank you for your comments. **All protection operations need to be reviewed. If a Misoperation is suspected, it must be investigated. Misoperations can be revealed at any time and are most likely to manifest themselves during system events. Therefore, it would not be prudent to simply ignore operations that occurred during large storms. As pointed out in the Guidelines and Technical Basis section, in the event of a natural disaster, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15,**		

Organization	Yes or No	Question 1 Comment
2008 provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard. This guideline allows the entity to be afforded more time for unusual events.		
Idaho Power Co.	Yes	We believe the previous comment period has produced a thorough definition of a Misoperation.
Response: Thank you for your comment and support.		
Ingleside Cogeneration LP	Yes	Ingleside Cogeneration LP believes that the modification is an improvement over the previous draft. However, we still would like to see a commitment from the ERO-Reliability Assessment and Performance Analysis (RAPA) Group that they will align their definition when PRC-004-3 takes effect. Although the differences are minor, a difference in the criteria may require the industry to make two separate determinations on whether a relay-related event should be identified as a Misoperation.
Response: Thank you for your comment. **The present Quarterly Misoperation Reporting Form is in a state of change as the NERC SPCS attempts to provide proper data for ALR4-1 metrics and PRC-004-3 requirements. Some changes cannot be made on the reporting form until the standard is formally approved. Until then, the drafting team will forward industry comments to the NERC SPCS so that the categories of the Misoperation definition included in Quarterly Misoperation Reporting Form agree with the definition of Misoperation included in the approved Reliability Standard PRC-004-3.**		
Exelon Corp.	Yes	1) Exelon would like to see stronger wording to very clearly state that the protection system is to be evaluated as a composite system (primary and backup are part of a single composite system). 2) Under the Misoperation definition section:a. Item 1 Failure to Trip - During Fault ... change “for an Element” to “for the Element”. 3) b. Item 2 Failure to Trip - Other Than Fault ... change “for an Element” to “for the Element”.

Organization	Yes or No	Question 1 Comment
		4) c. Item 6 "Unnecessary Trip - Other Than Fault" - needs more clarification as to whether or not this includes personnel error (e.g. open test switches inadvertently).
Response: Thank you for your comments. 1) **The drafting team changed the introductory sentence of the definition to the following based on comments and should address the multiple schemes issue that you brought up: "The failure of an Element's composite Protection System to operate as intended."** 2) **The drafting team agrees and believes the suggested change adds clarity, the definition was changed.** 3) **The drafting team agrees and believes the suggested change adds clarity, the definition was changed.** 4) **The drafting team believes the language "unrelated to on-site maintenance, testing, inspection, construction or commissioning activities" clearly indicates that "personnel error (e.g. open test switches inadvertently)" is excluded from consideration as a Misoperation as long as it is related to on-site activities. Once the equipment has been returned or released to service, or the inspection has been completed, it would be considered a Misoperation regardless of the presence of the technical personnel.**		
Independent Electricity System Operator	Yes	We agree with the definition intent to provided a distinction between protection systems intended to isolate faulted elements and protection systems intented to operate for other system conditions. For the latter category, we are concerned that listing the possible causes for the "other than fault" conditions may be interpreted as the only ones to watch for. Therefore we suggest that the definition should clarify that these possible conditions are not limited to those listed in the definition
Response: Thank you for your comments. **The drafting team believes that the words "such as" before the causes are adequate to indicate that these do not purport to be an all-inclusive list.**

2. **Requirement R1 requires the responsible entities to identify and review each Protection System operation that operates the entity's interrupting device, and designate each Misoperation. Do you agree with this approach? If you do not agree, please provide specific alternatives.**

Summary Consideration:

Several commenters asked to exclude major weather events and other unusual conditions from consideration as it may not be possible to analyze operations to determine Misoperations in the given timeframes. The drafting team explained that it would not be prudent to simply ignore operations that occurred during large storms. Further, the Sanction Guidelines of the North American Electric Reliability Corporation allows the entity to be afforded more time for unusual events.

Many commenters noted confusion in the requirements in Requirement R1 surrounding accountabilities of the Protection System owner and the owner of the interrupting device. The drafting team revised Requirement R1 to provide clarity in situations where the Protection System owner is also the interrupting device owner and in situations where there are multiple owners of Protection System components of a Protection System involved in a Misoperation.

Several commenters did not understand what the phrase "designate each Misoperation" was intended to mean. The drafting team replaced "designate each Misoperation" with "determine if it (the operation) was a correct operation or a Misoperation" in Requirement R1.

Several commenters expressed concern that BES interrupting device trips resulting from control actions, especially when that function found in a protection relay, is not explicitly excluded from PRC-004-3. Although this was noted in the Guidelines and Technical Basis of the draft standard and excluded in the Facilities section of the original posting, the drafting team revised Section 4.2.4 of the Facilities section of the standard to say "Non-protective functions that may be imbedded within a Protection System are excluded". The drafting team originally listed example functions but did not want to give the impression this list was all inclusive. Further clarity on this subject remains in the Guidelines and Technical Basis.

Several commenters questioned the reasoning in Requirement R1 on why all Protection System operations need to be reviewed and found the requirement to be unnecessarily onerous. The drafting team declined to make the recommended change to because reviews of all Protection System operations are important to ensure all portions of the protection scheme are functioning as intended and to confirm that the operation was correct.

A few commenters questioned what constituted a Protection System "review" of operations of interrupting devices. The drafting team is not being prescriptive about what a Protection System operation review entails. It is left to the entity to determine what method is used to perform and document the review for the purpose of classifying an operation as normal operation or Misoperation.

A few commenters expressed concern about the 120 day timeframe to review Protection System operations. The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. This 120 day time frame takes into account the seasonal nature of Protection System operations as well as outage constraints for investigative purposes. If the investigation doesn't reveal a cause within this timeframe, the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation.

A few commenters noted that the focus of PRC-004-3 should be on a standard that emphasizes internal controls over an entity's process rather than actual work execution. The drafting team declined to make this change and believes the current approach meets the reliability objectives established in the SAR for this project.

Several commenters had concerns that the standard implied additional monitoring equipment must be installed. The drafting team responded with the following: The standard does not require any additional monitoring equipment to be installed. Each responsible entity must review each of its Protection System operations and determine whether the operation should be categorized as a Misoperation based on its available information. The entity will use whatever means at their disposal in order to determine whether the operation was correct or not which may include available Disturbance Monitoring Equipment.

A few commenters thought the Protection System owner should be accountable for reviewing the Protection System operation. The drafting team did make changes to R1 to reflect the intent that the owner of the BES interrupting device would be in the best position to initiate the investigation of that operation. If it was determined that another entity's Protection System component appeared to cause the Misoperation then the burden shifts to the owner of that component. R1 was re-written to ensure this was clear.

One commenter was concerned that an entity can transmit information regarding a Misoperation but cannot force a response from the entity they sent the information to. The drafting team agreed and re-worded Measure M1 to read "Acceptable evidence for the notification required by Requirement R1, Part 1.1 may include, but is not limited to, emails, electronic files, or hard copy records demonstrating transmittal of information."

One commenter expressed concern about being able to prove it identified all BES Protection System operations. As indicated in Measure M1, an entity may use any number of means to prove it has logged interrupting device operations and the drafting team believes most entities are already saving this information.

One commenter requested clarity be provided in the rationale box for Requirement R1, that the interrupting device owner is responsible for initiating an investigation. The drafting team added the following statement to the rationale box for Requirement R1: "Requirement R1 places the responsibility on the BES interrupting device owner to investigate operations initiated by a Protection System."

A few commenters asked whether a single CAP or action plan can address multiple similar Misoperations. The drafting team believes that a single CAP or action plan can address multiple similar events.

One commenter requested that Requirement R1 be clarified by adding "unplanned" to "Within 120 days of an interrupting device operation. The drafting team pointed out that this exception is provided in the definition of Misoperations and is also referenced in the Guidelines and Technical Basis section for category 6 of the Misoperations definition. It states: "Finally, an example of an operation that is not a Misoperation under this category is an unintended operation as a result of on-site maintenance, testing, inspection, construction or commissioning."

<tr><td>Northeast Power Coordinating Council</td><td>No</td><td>1. Requirement R1 (as well as the other Requirements in the Standard) should be formatted to start with "Each...". For consistency with the preferred format of all NERC Standards, a Requirement should start with the responsible entities, followed by under under what conditions, and then what they have to do.
2. The use of the words "in its Facility" should be changed to reflect what is being protected. Suggested wording for consideration:R1. Each Transmission Owner, Generator Owner, and Distribution Provider within 120 calendar days of a Protection System Misoperation initiating an interrupting device operation in its system shall have and implement a procedure to identify and address all Protection System Misoperations within its system.
3. Closure is also needed in the procedure to ensure a definitive corrective response to a misoperation to prevent its recurrence.</td></tr>
<tr><td colspan="3">Response: Thank you for your comments.
1. The drafting team made the suggested change.
2. The term Facility is a defined term in the NERC Glossary of Terms and captures the intent of the drafting team.
3. The closure is covered by Requirements R2 and R4 with the development and implementation of the CAP.</td></tr>
<tr><td>Western Small Entity Comment Group</td><td>No</td><td>The comment group does not agree that every operation needs to be reviewed; only those that are clearly misoperations or are suspected to be misoperations should</td></tr>
</table>

Organization	Yes or No	Question 2 Comment
		need to be reviewed. Reviewing and documenting the review of proper operations provides no reliability benefit and may cause a detriment to reliability by directing resources away from where they might make a difference.
Response: Thank you for your comments. **The drafting team believes all Protection System operations must be reviewed to ensure Misoperations are identified. The drafting team further believes the review of all operations is required to ensure that all portions of the protection scheme are functioning as intended, and because Misoperations are sometimes not obvious or "clear".**		
Pepco Holdings Inc & Affiliates	No	1. The responsibility for R1 through R4 should be on the owner of the Protection System which initiated the interruption of a BES facility and not the owner of the interrupting device. The one who owns the interrupting device is not necessarily the one who owns the Protective System. For example, it is not uncommon for a generator to be interconnected to a TO switchyard, where the TO owns the breakers (interrupting devices) in the switchyard but the GO owns the Protection Systems protecting his generator unit. The GO Protection Systems trip the TO's breakers to isolate the unit from the system. The way the present standard is written the TO would be responsible for also reviewing all GO protection initiated trips because the TO owns the interrupting device. This is unreasonable. The party who owns the Protective System(s) that protect the BES facility that was interrupted should be the one responsible for reviewing those Protective System operations and for developing any appropriate corrective action plans. Because of compliance implications the standard must make a very clear division of compliance responsibilities between the parties when interconnected Protective Systems are involved. The owner of the Protective System(s) that initiated the trip of the BES facility should be the one responsible for reviewing the operation for correctness (R1). The owner of the Protective System(s) whose misoperation led to the interruption of a BES Facility should be the one responsible for identifying the cause and developing and implementing a corrective action plan (R2, R3, and R4). To make this perfectly clear we suggest re-wording

Organization	Yes or No	Question 2 Comment
		Requirements R1, R2, R3, and R4 as follows:R1. Within 120 calendar days of an operation of an interrupting device which interrupts a BES Facility that was caused by a Protective System operation, each Transmission Owner, Generator Owner, and Distribution Provider, who owns a Protective System which protects the BES Facility that was interrupted shall: ...R2. Within 60 calendar days of identifying the cause(s) of each Misoperation, the Transmission Owner, Generation Owner, or Distribution Provider, whose Protection System misoperated, shall...R3. For each misoperation without an identified cause(s), the Transmission Owner, Generation Owner, or Distribution Provider, whose Protection System misoperated, shall...R4. For each CAP or action plan, the Transmission Owner, Generation Owner, or Distribution Provider, whose Protection System misoperated, shall.... 2. What does R1.2 “Designate each misoperation” mean? Perhaps a more descriptive phrase would be “Designate which operations involve a Protective System Misoperation” OR “Identify and document each Protective System Misoperation”.
Response: Thank you for your comments. **1) The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1.** **2) The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1.**		
Souhwest Power Pool Reliability Standards Development Team	No	We would like some clarification on the review identified in R1. Based on the type of review that 120 days may or may not be enough time. We would request some example(s) be added in the Guidelines and technical reference that outline what is meant for the review in R1. Based on the examples the drafting team develops we can determine if the 120 days is appropriate. We also don’t agree that 120 days is enough time for those instances when major disturbances IE storms hurricanes tornadoes. This needs to be addressed in the requirement itself and would request that there be an extension that could be requested for those types of events

Organization	Yes or No	Question 2 Comment
		reported in DOE 417 and EOP 004.
Response: Thank you for your comments. **The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. If the investigation doesn't reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R2) to continue the investigation.** **The drafting team agrees with your comment about instances when major disturbances occur. As noted in the Guidelines and Technical Basis Section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.**		
El Paso Electric	No	EPE believes more clarity is needed in this requirement as to responses required by other owners when their component may have contributed to the misoperation of the Protection System. For example, Entity A's protection system operates, however Entity B's component contributed to the misoperation. Entity A notifies Entity B of such component failure. There isn't a specified timeline, within the 120 days, requiring Entity B to notify Entity A of its information regarding such component, allowing Entity A to timely complete its analysis and report of the operation of its Protection System. Additionally, what would Entity A's response be if Entity B doesn't acknowledge their component's contribution to the misoperation?
Response: Thank you for your comments. **The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1. The new Requirement R1 requires notification of all Protection System component owners (entity B in your example). There is no further action required by entity A in your example.**		
SERC Protection and Control Subcommittee (PCS)	No	1) What influence do the Application Guidelines have on the CEA? For example, the Application Guidelines clearly and correctly explain "...such as when a reverse power

Organization	Yes or No	Question 2 Comment
		relay is used to trip a breaker during generator shutdown, the operation of the control component or the function when not providing protection is not included in the definition of Misoperation and its operation would not be reviewed under this standard." A narrow reading of R1 without this explanation could result in either frivolous violations or an entity expending considerable resources to document that every normal shutdown of a generator is a correct operation. 2) Clarify the Rationale consistent with Technical Basis page 17, by clearly stating that "the interrupting device owner is responsible to investigate operations initiated by a Protection System." 3) Augment the Rationale by adding at the end, "...and submit Attachment 1 data to the CEA per section C.1.4 Additional Compliance Information." A fair number of Misoperations trip another entity's interrupting device (e.g. DTT). R1 correctly requires the interrupting device owner to initiate the investigation, but, once the Protection System component causing the Misoperation is identified, it becomes that Protection System owner's responsibility to report the Misoperation. Under the present PRC-004-2a, there is confusion on this distinction. 4) Change R1 1.2 to "Designate each operation as correct or a Misoperation. Group Misoperations for the same interrupting device that occur within 5 minutes for subsequent steps." IEEE 1366 defines 5 minutes as the demarcation between momentary and sustained events. Grouping multiple like kind operations into a single investigation / action plan / CAP is more efficient and avoids distorting statistics. It also improves BES availability and reliability by correctly reinforcing the appropriate use of automatic reclosing.

Response: Thank you for your comments.

1. **The Guidelines and Technical Basis section of the standard supplies the drafting team's reasoning and basis for writing the requirements. Consequently, the Guidelines and Technical Basis section provides background information for auditors and those responsible for implementing the standard. The Applicability Section 4.2.4.1 specifically excludes control operations such as reverse power relays. In addition further guidance on this is provided in the Guidelines and Technical Basis section.**

Organization	Yes or No	Question 2 Comment
The standard includes all protective functions of reverse power relays and excludes any control operations even if those functions are embedded in a protection device. **2. The SDT agrees. Wording has been changed in the rationale box for clarity.** **3. The reporting obligations have been removed from the standard.** **4. The drafting team revised Requirement R1. Please review the new Requirement R1. The drafting team believes that a single CAP or action plan can address multiple similar events.**		
ACES Power Marketing Standards Collaborators	No	There is not a NERC glossary term for "interrupting device." The SDT should consider proposing a new glossary term to clarify what Protection System equipment is included in order to properly analyze all applicable equipment. Does the SDT intend interrupting devices to include switching equipment capable of interrupting a fault or would the team also include switching equipment capable of interrupting load? This term could include more than is intended and additional clarity is needed.
Response: Thank you for your comments. **For purposes of this standard, the drafting team intends "interrupting devices" to include circuit breakers and circuit switchers. The drafting team does not believe it is necessary to add this term to the NERC Glossary of Terms but will add this language to the Guidelines and Technical Basis section of the standard.**		
Colorado Springs Utilities	No	The way R1 currently reads, investigations would be required for planned work (e.g., full function trip testing). Language should be "Within 120 calendar days of an unplanned interrupting device operation in its Facility caused by a Protection System operation, each Transmission Owner, Generator Owner, and Distribution Provider shall:". The "unplanned" should apply to the interrupting device operation, vice Protection System operation, so that an investigation is required for misoperations during testing.
Response: Thank you for your comments. **This exception is provided in the definition of Misoperations in the standard and is also referenced in the Guidelines and Technical**		

Organization	Yes or No	Question 2 Comment
Basis section for category 6 of the Misoperations definition. It states: "Finally, an example of an operation that is not a Misoperation under this category is an unintended operation as a result of on-site maintenance, testing, construction or commissioning."		
Florida Municipal Power Agency	No	1. The standards takes a zero defect approach, especially in R1 which requires investigating every protection system operation; hence, if one protection system operation is missed, a violation occurs. FMPA is not in favor of a zero defect approach especially when most relay operations operate correctly. FMPA recommends usin g approaches similar to what the COM-003 and CIP v5 teams are considering. 2. R1 does not work well with the definition of Misoperation. In other words, in order to "(d)esignate each Misoperation" as required, the entity will need to have evidence that a fault actually existed. This can be quite difficult, especially for a protection systyem operation with a successful reclose (e.g., due to lightning strike for instance), how is an entity to prove that the fault existed? 3. In addition, measuring clearing time can be quite problematic, especially for electromechanical relays. How is an entity to gather evidence that relay operation was "slow" or not, and hence identify a misoperation due to slow operation? Does this require installation of equipment to be able to gather sequence of events evidence? It would seem to FMPA that a focus on internal controls for R1 is more appropriate to resolve some of these issues and challenges than the approach the SDT proposes.
Response: Thank you for your comments. **1. The standard is worded very specifically to ensure that the operation of an interrupting device triggers the beginning of an investigation. The entity will use whatever means at their disposal in order to determine whether the operation was correct or not which may include available Disturbance Monitoring Equipment.** **2. The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1.** **3. The phrase "slower than intended" in parts 3 and 4 of the definition mean that the Protection System operated slower than**		

Organization	Yes or No	Question 2 Comment
the objective of the owner(s). It would be impossible to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent any additional harm, and ultimately be able to decide whether the speed or outcome of its Protection System was adequate.		
PPL Corporation NERC Registered Affiliates	No	The overwhelming majority of investigations by Generation Owners under the requirement in PRC-004-3 to review each Protection System operation (R1) will be for reverse power trips during normal stop events. The SDT evidently meant to prevent this circumstance from posing an unwarranted burden by stating in the Application Guidelines that, "...in cases where a component of the Protection System or a function of a component within the Protection System is used for control of a generator, such as when a reverse power relay is used to trip a breaker during generator shutdown, the operation of the control component or the function when not providing protection is not included in the definition of Misoperation and its operation would not be reviewed under this standard." The line of demarcation between the protection and control functions of reverse power relays is not at all clear, however.We typically have for example a primary reverse power relay that trips the breaker 3 seconds after detection of motoring if all MS and HRH valves are indicating closed, and 27 seconds later regardless of valve position if it is not already offline, plus a backup relay that acts one minute after the start of motoring regardless of valve position. We take the 3-sec action as being a control function, while the other timers are protective in nature. What they protect is the low-pressure turbines from windage (high temperature) damage, however, not the generator. The reverse power function is consequently in the same class as a low lube oil pressure switch, and should not be in the scope of Protection Systems.PRC-004-3 as presently written though appears to require analysis of every reverse power trip that is not caused by the 3-second function described above, which may occur quite often given that valve position indicators are not high-reliability instruments. Each such investigation would involve documenting the, "sequence of events, relay targets and a summary of Disturbance Monitoring Equipment (DME) records," for each normal stop (ref. the

Organization	Yes or No	Question 2 Comment
		"Requirement R1" section of the Application Guidelines) and determining whether or not the Protection System operation was slower than expected (ref. items 2 and 3 in the "Guidelines and Technical Basis" section).The number of such events can be extremely large, since peaking units often stop and start daily (or even several times per day) in high-demand seasons. Retrieving such data would be extremely time-consuming; since, where DME exists (our RRO's standard for PRC-002 has a minimum size threshold), GOs often do not have the centralized data collection facilities of TOs. Event analysis personnel may need to spend extreme amounts of time traveling to and from jobsites, since some peaking stations are unmanned or only minimally staffed. All this effort would result in no associated benefit regarding BES reliability. Reverse power relays are counted (inappropriately, we believe) as being part of the Protection System, but these devices do not trip in response to something having gone wrong, nor do they protect the generator. It is intended that negative current be experienced at some point as the unit unloads; and subsequent actuation of the reverse power relay is normal, expected and a mechanical (turbine) protection function. Requirement R1 and to the Application Guidelines should be modified to state that investigation of reverse power relay events is not part of the Protection System and PRC-004-3 consequently does not apply to such devices or, alternatively, is required only if the relay failed to function.
Response: Thank you for your comments. **Applicability section 4.2.4.1 specifically excludes control operations such as reverse power relays. In addition further guidance on this is provided in the Guidelines and Technical Basis section. The standard includes all protective functions of reverse power relays and excludes any control operations even if those functions are embedded in a protection device. It is incorrect to equate the reverse power protection function with a low lube oil pressure switch. The latter is excluded because it operates on a non-electrical quantity whereas the former operates on an electrical quantity. These longer delayed reverse power functions are not considered a control function and so do not come under that exclusion.**		
Bonneville Power Administration	No	BPA believes requirement R1 needs to provide more clarity about which entity is required to review a protection system operation. R1 requires TO's, GO's, and DP's

Organization	Yes or No	Question 2 Comment
		to review the protection system operation for an “interrupting device operation in its Facility”. This is not necessarily the same thing as the owner of the interrupting device, which is who the Application Guidelines places the responsibility on. The use of “Facility” seems inconsistent with the NERC definition of Facility: A set of electrical equipment that operates as a single BES Element. It is not clear what “in its Facility” means. The SDT appears to be using “Facility” in place of “substation”. The Rationale for R1 (blue box) mentions the owner of the interrupting device, but like R1, the rationale does not make it clear who is responsible for reviewing the protection system operation. It isn’t clear if the Rationale for R1 and the Application Guidelines are an official part of the standard, so while they might offer additional information, it is important that Requirement R1 can stand on its own and make it clear who is responsible to review the protection system operation. As presently written, BPA infers that this is not the case.Because the owner of the protective relays has the best access to the information that would be first reviewed, BPA believes that the owner of the protective relays should be required to initiate the review. From that initial review, the owner of the protective relays can then request information from other entities involved, if there are any, such as the owner of the communication system or the owner of the interrupting device. If there are different owners of the protective relays at the different terminals of an element, they should each initiate a review of their own protective relays.Requirements R2 and R3 are also unclear about who is responsible for fulfilling the requirement. Both of these specify the TO, GO, or DP as responsible for the requirement, but since there are often multiple TO’s, GO’s, or DP’s involved, which one is responsible? The Application Guideline for R2 specifies the protection system owner as being responsible. This information should be included in the Requirement itself, not just in the Application Guide.BPA believes that the owner(s) of the protection system component(s) that are identified as the cause of the misoperation in the review conducted per R1, should be responsible for R2. If there is no identified cause, the owner of the protective relay should be responsible for R3.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comments. **The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1. The closure is covered by Requirements R2 and R4 with the development and implementation of the CAP.**		
GTC	No	Rationale for R1: State that the interrupting device owner is responsible to investigate operations initiated by a Protection System, to be consistent with the Technical Basis. For Misoperations that occur when one entity's system trips another entity's interrupting device (e.g. DTT). R1 correctly requires the interrupting device owner to initiate the investigation, but once the Protection System component causing the Misoperation is identified, it becomes that Protection System owner's responsibility to report the Misoperation. Under the present PRC-004-2a, there is confusion on this distinction.
Response: Thank you for your comments. **The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1.**		
ISO/RTO Standards Review Committee	No	It is unclear on what "Designate each Misoperation" means. Designate a relay operation as a Misoperation or designate an identified Misoperation to a specific class or category. This part needs to be expanded.
Response: Thank you for your comments. **The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1.**		
JEA	No	It does not appear to be cost effective to identify and review each PS operation. Also, as time goes on and issues are found and resolved this standard becomes even less beneficial because of the ever decreasing percentage of misoperations that should result from the standard.
Response: Thank you for your comments.		

Organization	Yes or No	Question 2 Comment
The drafting team believes that all Protection System operations must be reviewed to ensure all Misoperations are identified.		
TVA Transmission Operations and Maintenance	No	Comments: The requirement to review and document each Protection System Operation is overly burdensome to those utilities with heavy lightning exposure. TVA has approximately 400 interruptions a year due to lightning. To review, verify, and document each one of these to ensure whether or not a misoperation occurred within 120 days, especially during the spring-summer storm season and then find a cause for each misoperation can be overwhelming. For example, the April 27, 2011 storms took months of restoration before investigation of possible misoperations could begin. That particular storm caused about 20 misoperations. TVA would like to see the window of time extended to 180 days.
Response: Thank you for your comments. **The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. This 120 day time frame takes into account the seasonal nature of Protection System operations. Both the volume of Protection System operations as well as outage constraints for investigative purposes can be seasonal. If the investigation doesn't reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R2) to continue the investigation.** **As noted in the Guidelines and Technical Basis Section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.**		
Southern Company	No	1. The question is missing a key component: Requirement R1 requires the responsible entities to identify and review each Protection System operation that operates the entity's interrupting device, designate each Misoperation, and investigate each misoperation and document the findings...The first two items are reasonable; however, the 120 days to 'and investigate each misoperation and document the findings...' can be problematic and creates a documentation requirement for something that is still under investigation. See Comment below

Organization	Yes or No	Question 2 Comment
		about timeframes. 2. The requirement says entities will “review each Protection System operation that operates the entity’s interrupting device...”. In R1, the requirement to “designate” is not defined. Is this a classification of each operation as a correct operation or a misoperation (as indicated by the VSL)? Or is this an annotation of each operation per Attachment 1? Or is this a declaration of which type of misoperation this is? Or other? Would a spreadsheet with each operation listed with an indication of correct or incorrect with a date noted be sufficient; or is other docuemtnation required? 3. What influence do the Application Guidelines have on the CEA? For example, the Application Guidelines clearly and correctly explain “...such as when a reverse power relay is used to trip a breaker during generator shutdown, the operation of the control component or the function when not providing protection is not included in the definition of Misoperation and its operation would not be reviewed under this standard.” A narrow reading of R1 without this explanation could result in either frivolous violations or an entity expending considerable resources to document that every normal shutdown of a generator is a correct operation. 4. In addition, under R1.1, the second requirement associated with notification of another entity should be stated as a separate subrequirement.

Response: Thank you for your comments.

1. **The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. This 120 day time frame takes into account the seasonal nature of Protection System operations. Both the volume of Protection System operations as well as outage constraints for investigative purposes can be seasonal. If the investigation doesn’t reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R2) to continue the investigation.**

2. **The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1.**

Organization	Yes or No	Question 2 Comment
3. The revised Applicability section 4.2.4.1 specifically excludes control operations such as reverse power relays. In addition further guidance on this is provided in the Guidelines and Technical Basis section. The standard excludes any control operations even if those functions are embedded in a protection device. **4. The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1.**		
ITC	No	Requirement R1 states that all operations need to be identified and reviewed. This requirement should clarified to exempt out-of-service equipment.
Response: Thank you for your comments. **Protection System operations which occur with the protected Element already out of service, that do not trip any in-service Elements, cannot be Misoperations.**		
Cleco Corporation	No	Please add some example(s) in the Guidelines and technical reference that outline what is meant for the review in R1. Does a review require a detailed report or could a simple check box be used for a review?
Response: Thank you for your comments. **The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1. A review is an initial investigation to determine whether an operation is correct or a Misoperation. The drafting team is not being prescriptive as to what a review entails; both of your suggestions would suffice. It is left to the entity to determine what method is used to perform and document the review for the purpose of classifying an operation as normal operation or Misoperation.**		
Wisconsin Electric	No	1. In R1, the existing wording begins with: "Within 120 calendar days of an interrupting device operation ...". This wording does not specifically require a review in situations where an interrupting device fails to operate for a fault or abnormal condition. Perhaps the wording should be expanded to include these non-operations in the requirement as well.
Response: Thank you for your comments.		

Organization	Yes or No	Question 2 Comment
The drafting team believes that in the case where an interrupting device fails to operate for a fault or abnormal condition, in all but rare conditions a back-up protection will eventually operate an interrupting device triggering the start of an investigation. The drafting team believes these rare conditions would not affect BES reliability.		
Manitoba Hydro	No	The wording of this requirement is not clear enough for us to determine if we agree with it. Specifically, in R1.1 it is not clear how extensive the review of each Protection System operation should be. In reading the words of the Requirement versus the words in the associated Measures, the review process seems a lot less onerous in the wording of the requirements versus the wording of the measure. Perhaps adding additional wording to the requirement, listing the steps that should to be undertaken during the review, or even providing a review template would provide additional clarity and consistency. An entity cannot be found non-compliant with a measure, only a requirement, so the requirement should be clear when read on its own without the measure.
Response: Thank you for your comments **The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1. The drafting team is not being prescriptive about what a review entails, it can be as detailed as the entity deems necessary to indicate it has examined the operation to determine whether it was a correct operation or a Misoperation.**		
American Electric Power	No	AEP believes that PRC-001, rather than PRC-004, is the most appropriate standard to address an entity being required to notify another entity of protection system disturbances involving Misoperations or otherwise. If the drafting insists adding such requirements to PRC-004, we recommend making the following changes to R1:a) For 1.1, striking the language "If the entity suspects a Protection System component(s) owned by another entity contributed to a Misoperation, notify the owner of that Protection System component and provide any requested investigative information" so that it simply reads " Identify and review each Protection System operation." b) Inserting an additional requirement inbetween 1.2 and 1.3 that simply states "If the investigating entity determines Protection System component(s) owned by another

NERC

Organization	Yes or No	Question 2 Comment
		entity contributed to the Misoperation, the investigating entity shall notify the owner of that Protection System component(s) and provide any pertinent information.”
Response: Thank you for your comments. **The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1. This standard addresses correcting the causes of Protection System Misoperations and in recognition of the fact that many Protection Systems contain components shared between entities, it will be necessary for those entities to cooperate in order to execute a CAP to correct Misoperations.**		
ReliabilityFirst	No	ReliabilityFirst Abstains and offers the following comments for consideration: 1. Requirement R1 and subsequent requirementsa. ReliabilityFirst believes Requirement R1 and subsequent requirements rely on the operation of an interrupting device and the identification by its owner that a Protection System operated and whether it may have operated due to a Misoperation. There are two issues with using this as the focal point of the actions within the standard. First, the owner of the interrupting device may not be in the best position to decide why the device operated, if a Protection System was involved and if a Protection System component contributed to a Misoperation. The requirement circumvents what may be a natural process of investigating the operation by its individual owners separately or collectively. The requirement may create a weak link in a chain because of its reliance on the interrupting device owner to start the identification and review process. 2. Second, not all Misoperations result in an interrupting device operation particularly if no Fault occurred or the Fault is a high impedance transient Fault. The owner of the Protection System that failed to operate would not be required to investigate it. 3. Requirement R1, Part 1.1a. ReliabilityFirst believes the second sentence in Part 1.1 is a separate thought and recommends removing it and creating a new Part 1.2. ReliabilityFirst recommends the following for consideration for the new Part 1.2: “Notify the owner of that Protection System component and provide any

Organization	Yes or No	Question 2 Comment
		requested investigative information if the entity suspects a Protection System component(s) owned by another entity contributed to a Misoperation.”
Response: Thank you for your comments. 1. **The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1.** 2. **The drafting team believes that in the case where an interrupting device fails to operate for a fault or abnormal condition, in all but rare conditions a back-up protection will eventually operate an interrupting device triggering the start of an investigation. The drafting team believes these rare conditions would not affect BES reliability.** 3. **The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1.**		
Ingleside Cogeneration LP	No	Ingleside Cogeneration LP sees this requirement as specifying “how” to identify a Misoperation, not “what” comprises a Misoperation. Although, we understand that a robust process would include a prefunctory review of every relay operation, the need to capture and document each one in a manner satisfactory to an auditor adds no reliability benefit in our view. In fact, the vast majority of relay operations are NOT Misoperations and have a well-understood cause that is known immediately (e.g.; equipment fault). Based upon this thinking, PRC-004-3 R1 should only require an event be captured that is (a) known to be a Misoperation at the time of the relay action, or (b) the cause remains unknown an hour afterwards. This should greatly reduce the number of incidents that need to be recorded - and allows focus on those which do not have a simple resolution.
Response: Thank you for your comments. **The drafting team believes that all Protection System operations must be reviewed to ensure all Misoperations are identified. The drafting team is not being prescriptive about what a review entails, it can be as detailed as the entity deems necessary to indicate it has examined the operation to determine whether it was a correct operation or a Misoperation.**		
Dairyland Power Cooperative	No	Additional clarification should be provided regarding the statement in R1.1 to “identify and review each Protection System operation”. As currently written, it is

Organization	Yes or No	Question 2 Comment
		unclear how an entity would comply with R1.1 in the event that an incident involves multiple breaker operations with automatic reclosing, but were the result of a single cause. In such a scenario, would the entity be required to maintain separate documentation for investigation, designation, etc for each breaker operation?
Response: Thank you for your comments **The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1. An event continues through the last automatic reclosing shot initiated by the composite Protection System(s). Therefore, if a Protection System Misoperated multiple times during a system event, then it is only counted as one Misoperation. The drafting team believes that a single CAP or action plan can address multiple similar events in the event of a Misoperation however each operation must be reviewed to determine whether it was correct.**		
MISO	No	It is unclear on what "Designate each Misoperation" means. Designate a relay operation as a Misoperation or designate an identified Misoperation to a specific class or category. This part needs to be expanded.
Response: Thank you for your comment. **The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1.**		
Texas Reliability Entity	No	(1) It is not clear who is responsible for compliance with R1. Who must "identify and review", "designate" and "investigate"? Is it the owner of the interrupting device that operated, or is it the owner of a component that caused or contributed to the Misoperation? This will be difficult to enforce without clearly assigning responsibility.(2) The requirement and the VSL assume that there are two steps in identifying a Misoperation: "determining" that an operation is a Misoperation, and then "designating" the operation as a Misoperation. There is no requirement that an entity diligently and correctly "determine" that a Misoperation occurred during its review of an operation, and there is no VSL that applies when an entity incorrectly fails to "determine" that a Misoperation occurred.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comments. **1. The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1.** **2. It is implicit in Requirement R1 that each entity must analyze each operation and exercise due diligence to determine whether a Misoperation has occurred. The drafting team revised Requirement R1, the new Requirement R1 now states: "…determine if it was a correct operation or a Misoperation."**		
PSEG	No	We have divided R1 into two requirements (R1 and R2) below to clarify what occurs when a Misoperation occurs on a Protection System component owned by one entity and that Misoperation causes another entity's interrupting device to operate. Under the new R1 below, the interrupting device owner must first determine, within 90 days, if a Misoperation occurred and whose Protection System component was responsible. If another entity is responsible, that entity is notified. Under R2, the entity whose Protection System component misoperated must do the completed a Misoperation analysis within 210 days of when the Misoperation was identified. See below: R1. Within 90 calendar days of an interrupting device operation in its Facility, each Transmission Owner, Generator Owner, and Distribution Provider shall determine if its Protection System (a) operated properly, or (b) had a Misoperation, or (c) operated properly with indications that Protection System component(s) owned by another entity had a Protection System malfunction that caused the interrupting device operation and, if applicable, shall complete part 1.1. [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning] o If condition (b) is the findings, the interrupting device owner shall be responsible for the investigation in Requirement R2.o If condition (c) is the findings, the other Protection System owner shall be responsible for the investigation in Requirement R2.1.1 For a condition (c) finding, the interrupting device owner shall notify the owner of that Protection System component(s) and provide any available investigative information that is requested by that owner in writing. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-Term Planning.]o In the event that the owner of the interrupting device and the owner of the other

Organization	Yes or No	Question 2 Comment
		Protection System component(s) disagree on the interrupting device owner's determination in R1, the Regional Entity shall investigate and make a determination as to which entity is responsible for the investigation in Requirement R2, and the identification of a Misoperation will be considered completed when Regional Entity's decision is rendered.M1. For R1, each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence of the date of the interruption device operation and the date it completed its review of each interrupting device operation, including its associated determinations. Evidence for Part 1.1 includes documentation of written transmittals to the other Protection System owner (notifications and requested information) including, but not limited to, transmittal e-mails, log entries, or letters.R2. Within 210 calendar days after identifying a Misoperation per R1, the responsible Transmission Owner, Generator Owner, and Distribution Provider shall complete an investigation report of each Misoperation that state the Misoperation category and cause. If no cause is determined, the report shall state that. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-Term Planning]M2. Acceptable evidence for Requirement R2 may include, but is not limited to, a copy of a dated investigation report with documented findings for each Misoperation, including a description of the equipment involved in the Misoperation.
Response: Thank you for your comments. **The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1. The drafting team believes it would be cumbersome to create 2 requirements for this step and disagrees with the suggested timelines. Please see the rationale boxes and the Guidelines and Technical Basis section of the standard for the drafting team's thoughts on timelines.**		
Liberty Electric Power LLC	No	See comments in Q1.In addition, the standard needs to specifically exclude reverse power relay activations from misoperations analysis, as these activations are a normal event in the shutdown of many units.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comments. **Section 4.2.4.1 specifically excludes non-protective relay functions (such as control functions associated with reverse power relays) that may be imbedded within a Protection System. In addition further guidance on this is provided in the Guidelines and Technical Basis section.**		
City of Jacksonville Beach, FL dba/ Beaches Energy Services	No	1.The standards takes a zero defect approach, especially in R1 which requires investigating every protection system operation; hence, if one protection system operation is missed, a violation occurs. We are, not in favor of a zero defect approach, especially when most relay operations operate correctly. We recommend using approaches similar to what the COM-003 and CIP v5 teams are considering. 2.R1 does not work well with the definition of Misoperation. In other words, in order to “(d)esignate each Misoperation” as required, the entity will need to have evidence that a fault actually existed. This can be quite difficult, especially for a protection system operation with a successful reclose (e.g., due to lightning strike for instance), how is an entity to prove that the fault existed? 3.In addition, measuring clearing time can be quite problematic, especially for electromechanical relays. How is an entity to gather evidence that relay operation was “slow” or not, and hence identify a misoperation due to slow operation? Does this require installation of equipment to be able to gather sequence of events evidence?It would seem to us that a focus on internal controls for R1 is more appropriate to resolve some of these issues and challenges than the approach the SDT proposes.
Response: Thank you for your comments. **1. The drafting team revised the standard to include the approach you suggest above.** **2. The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1. The entity will use whatever means at their disposal in order to determine whether the operation was correct or not which may include available DISTURBANCE MONITORING EQUIPMENT.**		

Organization	Yes or No	Question 2 Comment
3. The phrase "slower than intended" in parts 3 and 4 of the definition mean that the Protection System operated slower than the objective of the owner(s). It would be impossible to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent any additional harm, and ultimately be able to decide whether the speed or outcome of its Protection System was adequate.		
Independent Electricity System Operator	No	It is unclear on what "Designate each Misoperation" in R1.2 means. If could mean identitying that it was indeed a case of protection system misoperation, or designate a relay operation as a Misoperation or designate an identified Misoperation to a specific class or category. This part needs to be expanded.
Response: Thank you for your comment. **The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1.**		
Sacramento Municipal Utility District	No	We agree Misoperations should be identified and their causes corrected. However, it is an administrative burden requiring entities to keep lists of ALL operations to prove compliance that EVERY operation was reviewed. It is strongly encouraged to model compliance requirements after the Internal Controls model currently be implemented in other standard projects rather than creating requirements that subject an entity to be in violation for missing documentation of a single review.
Response: Thank you for your comment. **The drafting team believes the current approach meets the reliability objectives established in the SAR for this project.**		
City of Tallahassee	No	1.2 requires we 'Designate each Misoperation'. I disagree with this requirement as it is inherent with the investigation that a SME will designate without it being a requirement and the need to track it.
Response: Thank you for your comment. **The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1.**		

Organization	Yes or No	Question 2 Comment
Requirement R1.2 is written specifically to ensure each Protection System operation is reviewed to identify a Misoperation. The point of the standard is to identify and correct Misoperations and this is the first necessary step to accomplish that goal.		
Indiana Municipal Power Agency	No	1. This standard is for identifying and correcting Protection System misoperations. By requiring the identifying and reviewing of all interurupting device operations caused by a Protection System operation and then having the enity be found non-compliant to a requirement within this standard for not doing these actions, the SDT has made this an interrupting device operation tracking standard along with identifying and correcting misoperations. IMPA does not agree with this approach. 2. IMPA does support the recommendation from Florida Municipal Power Agency in using the zero defect approach.In additoin, Indiana Municipal Power Agency agrees with the additional comments submitted by Florida Municipal Power Agency (FMPA)for this question.
Response: Thank you for your comments. **1. The drafting team believes the automatic operation of the interrupting device is the most logical way to start the process of having the owner of that device analyze the Protection System operation to ensure it was correct. There is no other way to detect each Misoperation other than to analyze every Protection System operation.** **2. Please see the drafting team's responses to FMPA's comments.**		
Tampa Electric Company	No	1. The standards takes a zero defect approach, especially in R1 which requires investigating every protection system operation; hence, if one protection system operation is missed, a violation occurs. TEC is not in favor of a zero defect approach especially when most relay operations operate correctly. TEC recommends using approaches similar to what the COM-003 and CIP v5 teams are considering. 2. R1 does not work well with the definition of Misoperation. In other words, in order to "(d)esignate each Misoperation" as required, the entity will need to have evidence that a fault actually existed. This can be quite difficult, especially for a protection

		systyem operation with a successful reclose (e.g., due to lightning strike for instance), how is an entity to prove that the fault existed? 3. In addition, measuring clearing time can be quite problematic, especially for electromechanical relays. How is an entity to gather evidence that relay operation was “slow” or not, and hence identify a misoperation due to slow operation? Does this require installation of equipment to be able to gather sequence of events evidence?It would seem to TEC that a focus on internal controls for R1 is more appropriate to resolve some of these issues and challenges than the approach the SDT proposes.
Response: Thank you for your comments. 1. **The drafting team believes the current approach meets the reliability objectives established in the SAR for this project.** 2. **The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1. The entity will use whatever means at their disposal in order to determine whether the operation was correct or not which may include available Disturbance Monitoring Equipment.** 3. **The phrase “slower than intended” in parts 3 and 4 of the definition mean that the Protection System operated slower than the objective of the owner(s). It would be impossible to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should have an understanding of the objectives of its Protection Systems, whether those systems operated fast enough to prevent any additional harm, and ultimately be able to decide whether the speed or outcome of its Protection System was adequate.**		
Essential Power, LLC	No	In R1, the requirement to “designate” is not defined.The overwhelming majority of investigations by Generation Owners under the requirement in PRC-004-3 to review each Protection System operation (R1) will be for reverse power trips during normal stop events. It is understood that the Application Guidelines specifically states that reverse power relay operations be not considered as Misoperations because the operation is a "control function" within the protective relay. But a reverse power relay is not a control device. It is a protective device. Its purpose is to protect the generator in the event the generator loses its prime mover and it begins to motor.

Organization	Yes or No	Question 2 Comment
		This form of protection is more "visible" during a normal stop event, but a reverse power relay is providing this protection at all times. It is unclear as to whether the Application Guidelines is an enforcement "tool" and guidance provided in within may be used by the CEA to determine compliance by a Generation Owners. Since it is unknown, it should be explicitly stated that reverse power trips during a normal stop event be not considered as Misoperations.It is understood that the Application Guidelines stand separate from PRC-004-3 per se, but the former document will likely be used by auditors in determining whether or not investigations were thorough enough to identify Misoperations. We therefore expect it to be obligatory, if the standard is passed in its present form, to document the, “sequence of events, relay targets and a summary of Disturbance Monitoring Equipment (DME) records,” for each normal stop (ref. the "Requirement R1" section of the Application Guidelines), including determining whether or not the Protection System operation was slower than expected ref. (items 2 and 3 in the "Guidelines and Technical Basis" section).The number of such events can be extremely large, since peaking units often stop and start daily (or even several times per day) in high-demand seasons. Retrieving such data would be extremely time-consuming; since, where DME exists (our RRO’s standard for PRC-002 has a minimum size threshold), GOs often do not have the centralized data collection facilities of TOs. Event analysis personnel may need to spend extreme amounts of time traveling to and from jobsites, since some peaking stations are unmanned or only minimally staffed. All this effort would result in no associated benefit regarding BES reliability. Reverse power relays are counted (perhaps inappropriately) as being part of the Protection System, but these devices do not trip in response to something having gone wrong. It is intended that negative current be experienced at some point as the unit unloads, and subsequent actuation of the reverse power relay is normal and expected. Notes should therefore be added to R1 and to the Application Guidelines, stating that tripping of the reverse power relay during a normal stop event does not indicate a Fault, and a detailed investigation, DME downloading, speed-of-response analysis and the like are therefore required only if DME is present and if the reverse power relay failed to

Organization	Yes or No	Question 2 Comment
		function.
Response: Thank you for your comment. **Applicability section 4.2.4.1 specifically excludes control operations such as reverse power relays. In addition further guidance on this is provided in the Guidelines and Technical Basis section. The standard includes all protective functions of reverse power relays and excludes any control operations even if those functions are embedded in a protection device.**		
Oncor Electric Delivery	No	1. The proposed R1 obligates the Transmission Owner or Generation Owner to now provide notification, coordinate communication and maintain documentation follow up with neighboring entities. It appears to misalign with the NERC Event Analysis program. 2. In addition, the Regional Entities have been tasked with designing a misoperations procedure for all Registered Entities in their respective area which appears to overlap this Requirement. Oncor recommends the appropriate NERC/Regional Entity subgroups revaluate to align NERC misoperations reporting which will ensure streamlined processes for Registered Entities.
Response: Thank you for your comments. **1. The NERC Event Analysis program and this standard do not overlap. The NERC Event Analysis program is in place to provide a coordinated response to a limited number of significant events as defined in Appendix E of the ERO Event Analysis Process document. If an event occurs that would fall into one of those categories then the entity would be expected to follow the ERO Event Analysis Process.** **2. PRC-003-1 will be retired with the approval of PRC-004-3; consequently, there will be no overlap after PRC-004-3 becomes effective.**		
Kansas City Power & Light	No	R1 requires detailed investigation of every protection system operation. If operational data indicates that only the intended breakers operated for a fault on a specific protected line and a fault record from any monitoring device in the area indicates the fault was cleared in the intended time then no detailed review of the

Organization	Yes or No	Question 2 Comment
		protection system operation is required.
Response: Thank you for your comment. **Every Protection System operation must be reviewed to determine whether or not a Misoperation occurred. The standard does not specify how the review is conducted but rather depends on the due diligence of the entity to analyze the Protection System operation thoroughly enough to determine if a Misoperation occurred.**		
CenterPoint Energy		1. A misoperation can result in the tripping of multiple interrupting devices that can be owned by more than one entity. Also, the various components of a Protection System, such as current transformers, dc control wiring, and dc supply, can be owned by different entities. Instead of the owner of the interrupting devices that operate, CenterPoint Energy believes the owner of the protective relays should have the sole responsibility for reviewing interrupting device operations and reporting any Protection System misoperations. This would provide more consistent reporting and eliminate any duplicative responsibilities and efforts. CenterPoint Energy recommends establishing the applicability to the owner of the protective relays. 2. With the responsibility of reporting misoperations on protective relays they own, including those that are categorized as 'Other than Fault', the owner of the relays must review interrupting device operations whether or not they own the interrupting devices. With such a performance-based requirement, CenterPoint Energy believes it is unnecessary to establish a requirement, such as R1.1, to "Identify and review each Protection System operation". CenterPoint Energy recommends R1 maintain only the wording from R1.3, resulting in the following wording for R1: "Investigate each Misoperation (if any) and document the findings including a cause for each Misoperation, if identified."
Response: Thank you for your comments. **1. The drafting team disagrees and believes the owner of the interrupting device is in the best position to initiate the**		

Organization	Yes or No	Question 2 Comment
investigation of the Protection System operation. **2. The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1. The drafting team believes every Protection System operation must be reviewed to determine whether or not a Misoperation occurred.**		
Associated Electric Cooperative Inc - JRO00088	Yes	Requirement R1.1.2 Replace: “Designate each Misoperation (if any)."With: “Designate each Misoperation (if any) in order to facilitate the reporting requirements in C-1.4 .”Rationale: Add clarityConcern: While AECI believes it understands the reason for R1.1.2's "Designation" existence, we question whether it can withstand the test of time and particularly hold-up to the proposed criteria within the "NERC Paragraph 81 Project".
Response: Thank you for your comments. **The reporting obligations of C 1.4 have been removed. The focus of the standard is to identify Misoperations and subsequently establish CAPs to correct them. Requirement R1 has been revised. Please review the new Requirement R1.**		
Tacoma Power	Yes	1. The general approach and intent is supported. However, how can an entity prove that it identified all BES Protection System operations? While processes should be in place to promptly identify all BES Protection System operations, it is feared that significant cost and resources will be required to “ensure” that all BES Protection System operations are identified, which could divert staff from key reliability activities. 2. A similar concern exists for identifying all Mis-operations. Recognizing that even the proposed, revised definition of a Mis-operation could be interpreted in different ways in some cases, it is conceivable that some entities could begin over-reporting possible Mis-operations out of an abundance of caution. It should also be recognized that not all Mis-operations are of equal impact to the reliability of the BES. Over-reporting by entities to avoid even the possibility of sanctions could pose a burden on Regional Entities and NERC and might distract

Organization	Yes or No	Question 2 Comment
		the industry from correcting the key Mis-operations impacting BES reliabity.
Response: Thank you for your comments. **1. The drafting team believes all Protection System operations must be reviewed to determine if a Misoperation occurred.** **2. The goal of this standard is not to qualify the severity of the Misoperation but rather ensure that the cause of every Misoperation is identified and corrected as stated in the Purpose.**		
Luminant	Yes	Luminant agrees with the approach but suggests the following improvements to R1 and sub-requirements. 1) R1 should address the interrupting device as a “BES” interrupting device. 2) Luminant recommends that the concept of ownership be continued from the main requirement to each sub-requirement. For example, in 1.1, it would be written as follows: “Identify and review each of its applicable Protection System operations.”
Response: Thank you for your comments. **1. The drafting team revised Requirement R1 to reference BES interrupting device.** **2. The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1.**		
Western Area Power Administration	Yes	While an entity can transmit information regarding a possible misoperation to another entity, the initiating entity cannot force a response. An entity which receives a transmittal is responsible for a response.
Response: Thank you for your comment. **The drafting team agrees with your observation. Requirement 1, Part 1.2 has been modified, Requirement 1, Part 1.2 now states that the receiving entity is required to investigate and document the findings for each Misoperation within the same 120 day period. Wording in M1 has been modified to read “Acceptable evidence for the notification required by Part 1.1 may include, but is not limited to, emails, electronic files, or hard copy records demonstrating transmittal of information.” This would ensure the entity transmitting information to another entity about a potential Misoperation provided proper notification to the owner of the**		

Organization	Yes or No	Question 2 Comment
suspected component that contributed to the Misoperation.		
Utility System Efficiencies, Inc.	Yes	The standard should recognize the need for exceptions to the analysis of operations that are caused by unusual weather events. Large scale high wind events, extreme seismic events, hurricanes, tornadoes, ice storms, etc. can cause huge numbers of protection system operations of BES facilities. Many of these operations are momentary in nature and are caused by debris, out-of-right-of-way vegetation, and other line situations that are beyond established design limits for the lines and structures. Even the sustained outages may have been the result of a number of different causes, and a solid determination of the correctness of the operation may be impractical. The result of not having an exception for unusual conditions is that Transmission Owners would be spending protection personnel resources on non-productive documentation and processes, and not on maintaining and improving the reliability of the BES.
Response: Thank you for your comment. **As noted in the Guidelines and Technical Basis Section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.**		
Idaho Power Co.	Yes	Yes, it makes sense that the owners of the interrupting device and protection equipment should be the lead on the investigation.
Response: Thank you for your comment.		
Cogentrix Energy, LLC	Yes	The overwhelming majority of investigations by Generation Owners under the requirement in PRC-004-3 to review each Protection System operation (R1) will be for reverse power trips during normal stop events. It is understood that the Application Guidelines specifically states that reverse power relay operations be not considered

Organization	Yes or No	Question 2 Comment
		as Misoperations because the operation is a "control function" within the protective relay. But a reverse power relay is not a control device. It is a protective device. Its purpose is to protect the generator in the event the generator loses its prime mover and it begins to motor. This form of protection is more "visible" during a normal stop event, but a reverse power relay is providing this protection at all times. It is unclear as to whether the Application Guidelines is an enforcement "tool" and guidance provided in within may be used by the CEA to determine compliance by a Generation Owners. 		relay during a normal stop event does not indicate a Fault, and a detailed investigation, DME downloading, speed-of-response analysis and the like are therefore required only if DME is present and if the reverse power relay failed to function.
Response: Thank you for your comments. **Applicability Section 4.2.4.1 specifically excludes control operations such as reverse power relays. In addition further guidance on this is provided in the Guidelines and Technical Basis section. The standard includes all protective functions of reverse power relays and excludes any control operations even if those functions are embedded in a protection device.**		
Ameren Services	Yes	(1) What influence do the Application Guidelines have on the CEA? For example, the Application Guidelines clearly and correctly explain "...such as when a reverse power relay is used to trip a breaker during generator shutdown, the operation of the control component or the function when not providing protection is not included in the definition of Misoperation and its operation would not be reviewed under this standard." A narrow interpretation of R1 without this explanation could result in either frivolous violations or an entity expending considerable resources to document that every normal shutdown of a generator is a correct operation. (2) Clarify that the rationale is consistent with the Technical Basis page 17, by clearly stating that "the interrupting device owner is responsible to investigate operations initiated by a Protection System." (3) We suggest to augment the Rationale by adding at the end, "...and submit Attachment 1 data to the CEA per section C.1.4 Additional Compliance Information." A fair number of Misoperations trip another entity's interrupting device (e.g. DTT). R1 correctly requires the interrupting device owner to initiate the investigation, but once the Protection System component causing the Misoperation is identified, it becomes that Protection System owner's responsibility to report the Misoperation. We believe that under the present PRC-004-2a, there is confusion on this distinction. (4) We suugest to change R1 1.2 to "Designate each operation as correct or a

Organization	Yes or No	Question 2 Comment
		Misoperation. Group Misoperations for the same interrupting device that occur within 5 minutes for subsequent steps." IEEE 1366 (GUIDE FOR ELECTRIC POWER DISTRIBUTION RELIABILITY INDICES) defines 5 minutes as the demarcation between momentary and sustained events. Grouping multiple like kind operations into a single investigation / action plan / CAP is more efficient and avoids distorting statistics. It also improves BES availability and reliability by correctly reinforcing the appropriate use of automatic reclosing.
Response: Thank you for your comments. 1. **The Application Guidelines and Technical Basis section of the standard supplies the drafting team's reasoning and basis for writing the requirements. Consequently, the Guidelines and Technical Basis section provides background information for auditors and those responsible for implementing the standard. The Applicability Section 4.2.4.1 specifically excludes control operations such as reverse power relays. In addition further guidance on this is provided in the Guidelines and Technical Basis section. The standard includes all protective functions of reverse power relays and excludes any control operations even if those functions are embedded in a protection device.** 2. **The wording in the Rationale box has been revised.** 3. **The reporting obligations have been removed from the standard.** 4. **The drafting team revised Requirement R1. Please review the new Requirement R1. The drafting team believes that a single CAP or action plan can address multiple similar events. The scenario you describe is being reviewed by various groups to determine its impact on metrics.**

3. **Requirements R1, R2, and R3 introduce time limits associated with identifying, investigating, and addressing Misoperations. Do you agree with these time limits? If not, please provide specific reasons why not and alternative recommendations.**

Summary Consideration:

Numerous commenters asked to clarify the time requirements under Requirement R1 when an entity cannot investigate due to extenuating circumstances and during extreme weather events. The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. This 120 day time frame takes into account the seasonal nature of Protection System operations. Both the volume of Protection System operations as well as outage constraints for investigative purposes can be seasonal. If the investigation doesn't reveal a cause within this timeframe, the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation.

As noted in the Guidelines and Technical Basis Section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

Several commenters asked the drafting team to combine all or parts of Requirements R1, R2 and R3 into one requirement with one timeframe. The drafting team believes an overall time limit for Requirements R1, R2 and R3 is not practical as many factors can delay the investigative findings in Requirement R1 or Requirement R4 (action plan) such as outage constraints and resource limitations. The sequential nature of the 60 days in Requirement R2 is important as Requirement R2 could follow either a Misoperation cause found in Requirement R1 or a Misoperation cause found in Requirement R4 via an 'action plan' execution. If the cause is found via an 'action plan', the entity may likely need an additional 60 days to create a CAP and is now beyond the 180 days. The Guidelines and Technical Basis section of the standard has been revised to add clarity for the independent 120 and 60 day timeframes.

Some commenters noted that the focus of the standard should be on requirements that emphasize internal controls over an entity's process rather than actual work execution. The drafting team believes the current approach meets the reliability objectives established in the SAR for this project.

A few commenters requested the drafting team eliminate the "procurement of funds" wording in the Requirement R1 Rationale as capital budget cycles can expand through multiple calendar years. The drafting team agreed and revised the Requirement R2 Rationale to remove the "procurement of funds" reference.

A number of commenters suggested the quarterly reporting through the Regional Entities is sufficient for addressing the time requirements for handling Misoperations. The drafting team disagreed and responded with the following: "The requirements and associated timeframes ensure that the responsible entities are diligent about Misoperation response, CAP creation and completion."

Numerous commenters were confused about which entity was responsible for what actions when multiple owners were involved in an operation. The drafting team revised Requirement R1 to clarify that only the owner of a Protection System component that Misoperated is responsible for documenting the findings, and developing a CAP or action plan.

Numerous commenters proposed various changes to the time requirements in Requirements R1, R2 and R3. The drafting team appreciates the suggested revisions to the standard but believes that the time requirements are appropriate. No changes were made to the draft standard.

Organization	Yes or No	Question 3 Comment
Northeast Power Coordinating Council	No	1. As with R1, Requirements R2 and R3 should be formatted to start with "Each...". For consistency with the preferred format of all NERC Standards, a Requirement should start with the responsible entities, followed by under under what conditions, and then what they have to do. 2. The time limits specified are excessive for plans that do not include correcting the problem. Correction of Misoperations is extremely important to reliability because the Misoperation may indicate a defect that could have significant consequences. The time limit for R1 should be 15 calendar days, an additional 15 calendar days for R2, and 15 days for R3. 3. A definite completion time period for correcting the Misoperation should also be specified. Sixty days would not be an excessive time assuming outages may be needed, hardware ordered, etc. to prevent a recurrence.

Response: Thank you for your comments.

1. **The drafting team believes made the suggested changes.**
2. **The drafting team believes the timeframes are reasonable considering the variety of possible system events, coordinating response crews and allocating resources, etc.**
3. **The timeframe for completing the CAP cannot be prescribed in a standard due to external factors such as outage restrictions, availability of parts, capital allocation and other circumstances that can cause a CAP to be delayed. The drafting team believes entities can reliably manage and assure CAP completions.**

Organization	Yes or No	Question 3 Comment
Souhwest Power Pool Reliability Standards Development Team	No	1. See above comment. 2. For those Major disturbances there needs to be a mechanism for extending the time frames without being penalized. 3. Additionally 60 days might not be enough time to procure funds for the CAP. 4. We are OK with the time requirement on R3.
Response: Thank you for your comments. **1. Please see the response to your comment on Question 2.** **2. The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. This 120 day time frame takes into account the seasonal nature of Protection System operations. Both the volume of Protection System operations as well as outage constraints for investigative purposes can be seasonal. If the investigation doesn't reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation. As noted in the Guidelines and Technical Basis Section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.** **3. The drafting team revised the Requirement R2 rationale based upon yours and other comments. The "procurement of funds" reference has been eliminated in the Requirement R2 rationale as it is not necessarily pertinent to the requirement.** **4. Thank you for the approval.**		
El Paso Electric	No	See EPE's comment in Question 2.
Response: Thank you for the comments. **Please see the response to EPE's comment in Question 2.**		
Santee Cooper	No	We agree with the need for NERC and the regions to review the timeliness of the

Organization	Yes or No	Question 3 Comment
		analysis of misoperations. However, the regional entities, based on the RAPA template for reporting misoperations and the quarterly reporting of these misoperations, already are getting dates from the entities for the date of the misoperation, the date the corrective action was completed or, if not complete, the expected completion date. Without any additional administrative manpower commitments, the regions can already assess through the spreadsheet how long each misoperation took to completion and question anywhere timeliness seems to be a factor. They can even assess the timeliness of the original analysis of the operation (and identification of any misoperations) by checking when a new misoperation is reported against the reporting period it should have occurred in. Therefore, it seems counterproductive to prescribe timelines per misoperation, that will mean that entities have new much larger administrative burdens put on their technical staff just to document that each analysis of each operation and misoperation meet the number of days allowed. There could still be a maximum limit of what is allowed time-wise without having all of the individual date requirements. For example, additional documentation could be tied to, say, if the corrective action is not complete after the 2nd quarter that the misoperation was submitted to the regional entity. This will allow the finer detail focus of both the individual companies and the regions to be the more complicated and longer timeframe misoperations, while still supplying data (but not more than is needed to find and correct the misoperation) about the other misoperations that occur.
Response: Thank you for the comments. **The drafting team disagrees. The requirements and associated timeframes ensure that the responsible entities are diligent about Misoperation response, CAP creation and completion.**		
Dominion	No	1. R1 introduces a 120 day requirement in order for a correct and consistent review, and classification of, Misoperations. By introducing individual time requirements, this places unnecessary burden on entities to track dates associated with each phase of a Misoperation investigation and review. Dominion recommends an

Organization	Yes or No	Question 3 Comment
		approach similar to that recently taken in COM 003, through the development of a requirement to have a process and plan in place to address Misoperations according to regional entity guidance and oversight. Many entities currently respond to misoperations in a timely manner and adding additional tracking and time requirements does not place the priority on addressing reliability, it places the focus on data collection and date recording. 2. In the event the SDT cannot accept Regional Entity oversight, then an overall time limit should be stipulated versus the current language in the standard that includes 120 and 60 day requirements. Suggest using a 180 day overall time from the Misoperation date to finish one of these: 1)develop CAP, or 2)develop action plan or 3)develop declaration. Changes to the quarterly reporting template to remove and rename date fields will be needed and are included under question 5 comments. 3. Revisions should be made to the Misoperations reporting template to capture requirements not currently covered in the template. For example, R2 introduces the option of a “declaration”. The template should include a feature to record a declaration. Entities should not be required to use multiple tracking tools or techniques to document the various requirements. One tool should exist to do this and currently all entities use the reporting template. 4. All references to an investigation report should be changed to read “Misoperation investigation report” or “investigation report due to misoperations”. Without this change it could be interpreted that all operations require an investigation report. 5. R3 introduces an undefined term - an “action plan” for those misoperations without an identified cause. There is a concern that entities will be confused with Corrective Action Plan and action plan terminology. Suggest changing R3 to read “For each Misoperation without an identified, the Registered Entity cause(s), the Transmission Owner, Generator Owner, or Distribution Provider shall, within 180 calendar days of the Misoperation, identify any additional investigative actions

Organization	Yes or No	Question 3 Comment
		and/or Protection System modifications., including a work timetable, or document why no further investigation or actions will be taken.

Response: Thank you for the comments.

1. **The drafting team believes the current approach meets the reliability objectives established in the SAR for this project. The drafting team believes the timeframes are sufficient and necessary and they will remain in the new standard.**
2. **An overall time limit for Requirements R1, R2 and R3 is not practical as many factors can delay the investigative findings in Requirement R1 or Requirement R4 (action plan) such as outage constraints and resource limitations. The sequential nature of the 60 days in Requirement R2 is important as Requirement R2 could follow either a Misoperation cause found in Requirement R1 or a Misoperation cause found in Requirement R4 via an 'action plan' execution. If the cause is found via an 'action plan', the entity may likely need an additional 60 days to create a CAP and is now beyond the 180 days. The Technical Guidelines area has been revised to add clarity for the independent 120 and 60 day timeframes.**
3. **The NERC System Protection and Control Subcommittee (SPCS) is the group responsible for the Misoperations reporting template. The drafting team is forwarding all comments to the SPCS for consideration.**
4. **The drafting team agrees and added "Misoperation" to "investigation report" for clarity.**
5. **The term 'action plan' was utilized to allow for references within the standard for the activities that occur within Requirement R3 including references in Measures M3 and M4 as-well-as Requirement R4. While the term is not defined in the NERC Glossary, the drafting team believes there is sufficient clarity for use within the standard and modified the rationale box and the Guidelines and Technical Basis section of the standard.**

Organization	Yes or No	Question 3 Comment
Luminant	No	The time frames and activities in R1-R3 are confusing and can be simplified. Luminant suggests that R1, 2, 3 be revised to allow owners 180 days from the time of the BES interrupting device operation to investigate, determine the cause, and develop a CAP (cause known) or action plan (cause unknown). An action plan can result in identifying a cause and should include a CAP. If a cause cannot be determined, the investigation is closed. Below is our recommendation for R1-R3: R1. Within 180 calendar days of a BES interrupting device operation in its Facility caused by a Protection System operation, the applicable Transmission Owner, Generator

Organization	Yes or No	Question 3 Comment
		Owner, and Distribution provider shall: [Violation Risk factor: Medium}{Time Horizon: Operations Assessment, Operations Planning]1.1 Identify and review each of its applicable Protection System operations. 1.2 For its Protection System operations that are interdependent with the Protection Systems of another owner, the entity shall notify the owner of the interdependent Protection System.1.3 Identify each of its Protection System misoperations, determine a cause (if known), and develop a Corrective Action Plan (CAP).R2. For misoperations where the cause cannot be determined within 180 days of the BES interrupting device operation, the applicable Transmission Owner, Generator Owner, and Distribution Provider shall develop an action plan to: [Violation Risk factor: Medium}{Time Horizon: Operations Assessment, Operations Planning]o Develop a CAP within 60 days after identifying the cause of the misoperation for the Protection System component(s).o Where applicable, explain in a declaration why corrective actions are beyond the entity's control or would reduce BES reliability and close the investigation.R3. Each Transmission Owner, Generator Owner, or Distribution Provider shall implement its CAP according to the established timetable. [Violation Risk factor: Medium}{Time Horizon: Operations Assessment, Operations Planning].
Response: Thank you for the comments. **An overall time limit for Requirements R1, R2 and R3 is not practical as many factors can delay the investigative findings in Requirement R1 or Requirement R4 (action plan) such as outage constraints and resource limitations. The sequential nature of the 60 days in Requirement R2 is important as Requirement R2 could follow either a Misoperation cause found in Requirement R1 or a Misoperation cause found in Requirement R4 via an 'action plan' execution. If the cause is found via an 'action plan', the entity may likely need an additional 60 days to create a CAP and is now beyond the 180 days. The Guidelines and Technical Basis section has been revised to add clarity for the independent 120 and 60 day timeframes.**		
SERC Protection and Control Subcommittee (PCS)	No	1. SERC objects to the timetables and the compliance burden it places on entities: There is no evidence or indication that entities are not doing due diligence in reviewing operations. Quarterly reporting schedules help drives closure. 2. R1 correctly requires the interrupting device owner to initiate the investigation,

Organization	Yes or No	Question 3 Comment
		but when the Protection System interconnects with another entity and there are indications that the other entity's Protection System components misoperated (i.e. Other entity sends a spurious DTT), then, once the cause of the Misoperation is determined, it should be the responsibility of the owner of the Protection System that misoperated to report; thus removing the burden of reporting from the interrupted device owner. In some cases there may be several devices interrupted which are owned by different entities and the Protection System failure resulted from an entity that had no devices that were interrupted or affected at the location where the Misoperation occurred. Under the present PRC-004-2a, there is confusion on this distinction. 3. R1 introduces a 120 day requirement for performing a correct and consistent review and classification of Misoperations. By introducing individual time requirements, this places an unnecessary burden on entities to track and document each phase of investigation and review of a Misoperation. Similar to the approach taken in COM 003 recently which included a requirement to have a process and plan to address Misoperations according to regional entity guidance and oversight. Many entities currently respond to misoperations in a timely manner and to add additional tracking and time requirements does not place the priority on addressing reliability, it places the focus on data collection and documentation. 4. In the event the SDT cannot accept Regional Entity oversight, then an overall time limit should be stipulated versus the current verbiage in the standard referencing the 120 and 60 day requirements. 5. All references to an investigation report should be changed to read "Misoperation investigation report" or "investigation report due to misoperations". Without this change it could be interpreted that all operations require an investigation report.

Response: Thank you for the comments.

1. The requirements and associated timeframes ensure that the responsible entities are diligent about Misoperation response,

Organization	Yes or No	Question 3 Comment
CAP creation and completion. The drafting team believes the timetables make the requirements measurable. 2. The drafting team revised Requirement R1 based on yours and others comments. Please review the new Requirement R1. 3. The drafting team believes the current approach meets the reliability objectives established in the SAR for this project. The drafting team believes the timeframes are sufficient and necessary and they will remain in the new standard. 4. An overall time limit for Requirements R1, R2 and R3 is not practical as many factors can delay the investigative findings in Requirement R1 or Requirement R4 (action plan) such as outage constraints and resource limitations. The sequential nature of the 60 days in Requirement R2 is important as Requirement R2 could follow either a Misoperation cause found in Requirement R1 or a Misoperation cause found in Requirement R4 via an 'action plan' execution. If the cause is found via an 'action plan', the entity may likely need an additional 60 days to create a CAP and is now beyond the 180 days. 5. The drafting team agrees and added "Misoperation" to "investigation report" for clarity.		
ACES Power Marketing Standards Collaborators	No	The SDT should consider providing an exception process if there are unforeseen delays that inhibit an investigation to occur within 120 days. For instance, there could be difficulties with coordination for multiple interrupting device owners. There are numerous reasons that could cause a delay to go beyond the 120 days, so there should be some sort of time allowance to provide extra time if the excuse is justified and reasonable.
Response: Thank you for the comments. **The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. If the investigation doesn't reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation.** **The drafting team agrees with your comment about instances when major disturbances occur. As noted in the Guidelines and Technical Basis Section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.**		

Organization	Yes or No	Question 3 Comment
Florida Municipal Power Agency	No	FMPA believes there ought to be exceptions for an “Act of Nature”, e.g., event like a hurricane, that can result in a great many protection system operations but still require investigation of all of them within 4 months.
Response: Thank you for the comments. **The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. If the investigation doesn’t reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation.** **The drafting team agrees with your comment about instances when major disturbances occur. As noted in the Guidelines and Technical Basis section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.**		
Bonneville Power Administration	No	The time limits associated with R1, R2, and R3 are acceptable. Under the Compliance section, 1.4 requires a report to be submitted to the CEA within two calendar months following the end of each quarter. For an operation of an interrupting device at the end of a yearly quarter, the report will need to be submitted no more than 2 months after the operation. This will not allow the 120 days for review given by R1, nor the 60 days to develop the corrective action plan allowed by R2. BPA believes that the 2 month limit after the end of the yearly quarter to submit the report should be extended to agree with the 120 day limit of R1 and the 60 day limit of R2.
Response: Thank you for the comments. **The reporting obligations have been removed from the standard.**		
GTC	No	GTC does not agree to the timetables and the compliance burden it places on entities: While the intent is correct, to insure that all operations are being reviewed and misoperations are found and corrected, the quarterly reporting that we are

Organization	Yes or No	Question 3 Comment
		already doing is more than sufficient. Additionally, the NERC Standards Committee approved the draft SAR for Project 2013-02 "Paragraph 81" which identifies criteria for retiring or modifying existing Reliability Standards. The proposed time limits appear to conflict with the initial criteria identified via the P81 initiative. The dated limits would likely encourage entities to shift focus on closing out documents instead of spending the appropriate time studying the operation event to determine true root cause and development of an appropriate corrective action plan. Ultimately, the introduction of time limits would have little to no impact to the protection or reliable operation of the BES, and will likely find their way to the FFT process...and thus a future candidate for elimination via P81. GTC recommends the SDT to remove these introduced limits and refine focus to results-based to achieve the desired reliability result of analyzing operations to identify misoperations and implementing corrective actions to prevent future occurrences.
Response: Thank you for the comments. **The drafting team disagrees. The requirements and associated timeframes ensure that the responsible entities are diligent about Misoperation response, CAP creation and completion. Consequently, the drafting team does not believe the timelines are administrative or detract from the reliable operation of the BES; instead they add measurability to the goal of determining cause and developing appropriate corrective actions.**		
ISO/RTO Standards Review Committee	No	We agree review of each Protection System operation is important, however, there could be voluminous events from a natural event that may be burdensome on entities to provide reports within the allotted time frame. Priroritization should be given for events that are suspected to be misoperations based on the entities' judgment.
Response: Thank you for the comments. **The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. If the investigation doesn't reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the**		

Organization	Yes or No	Question 3 Comment
investigation. **All protection operations need to be reviewed. If a Misoperation is suspected, it must be investigated. Misoperations can be revealed at any time and are most likely to manifest themselves during system events. Therefore, it would not be prudent to simply ignore operations that occurred during large storms. As pointed out in the Guidelines and Technical Basis section of the standard, in the event of a natural disaster, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard. This guideline allows the entity to be afforded more time for unusual events.**		
JEA	No	1. If outages are necessary to properly examine and test protection system components 120 days may be too short especially during storm season. We recommend this be increased to 180 days. R1 also needs exceptions for major system events and natural disasters. 2. The R2 time frame of 60 days to develop a corrective Action Plan for the components of Protection misoperations is insufficient to consider applicability to other protection systems, different options and their cost/benefit scenarios, coordinate resources, develop schedules, and procure funding. Since the clock starts ticking as soon as the cause is identified, this should be extended to 180 days. Again it seems prudent to have an exception for major system events and natural disasters. If R1 & R2 timeframes were increased as suggested above this should result in an increase in this area also since the 180 day time frame was arrived at by adding the two preceding time frames. The new resulting time frame should be 360 days.
Response: Thank you for the comments. **1. The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. If the investigation doesn't reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation.**		

Organization	Yes or No	Question 3 Comment
2. All protection operations need to be reviewed. If a Misoperation is suspected, it must be investigated. Misoperations can be revealed at any time and are most likely to manifest themselves during system events. Therefore, it would not be prudent to simply ignore operations that occurred during large storms. As pointed out in the Guidelines and Technical Basis section of the standard, in the event of a natural disaster, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard. This guideline allows the entity to be afforded more time for unusual events. **3. The drafting team believes that 60 days is an appropriate timeframe for creation of a CAP including consideration of items mentioned in your comments. The completion of the CAP is determined by the timeframes identified by the entity in the CAP and should consider such things as available resources and outage schedules.**		
Operational Compliance	No	Distinguishing between NERC and WECC time requirements and deciding which is "more stringent" is too confusing and time-consuming. WECC requirements should fully complement and enhance NERC requirements. The WECC quarterly reporting system already in place is essentially a good one. In a nutshell: Q1. W/in 60 days of end of Q1 - elements of PRC-004-3.R1, Q2. W/in 60 days of end of Q2 - CAP created and documented, Q3. W/in 60 days of end of Q3 - CAP in place or reason for no CAP.
Response: Thank you for the comments. **The Project 2010-05.1 drafting team has no control over the WECC standards. Regional standards must be more stringent than the Continent-wide NERC standard. The drafting team included the following in the Background section of the draft standard: "Note that the WECC Regional Reliability Standard PRC-004-WECC-1 relates to the reporting of Misoperations for a limited set of WECC Paths and Remedial Action Schemes. In those cases where PRC-004-WECC-1 overlaps with the Continent-wide standard, entities are expected to comply with the more stringent standard." The reporting obligations have been removed from PRC-004-3.**		
TVA Transmission Operations and Maintenance	No	The time limits do not allow for equipment that is difficult to get out of service to allow testing/troubleshooting to investigate and develop a CAP. Often transmission line of transformer bank outages can only be obtained during very limited time frames or must be scheduled months in advance. Only after the investigation is complete can the final CAP be confirmed, depending on what is found during

Organization	Yes or No	Question 3 Comment
		investigative outages. The 180 days in some cases may need to be at least 270 or more for some investigations.
Response: Thank you for the comments. **The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. If the investigation doesn't reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation.**		
Nebraska Public Power District	No	For R1 there is 120 days to identify, review, designate, correspond with associated etitites and investigate a misoperation to determine the cause. For R2 there is 60 days to develop a CAP once a cause is determined. This seems somewhat confusing in it may cut in to the 4 month time frame for R1. Perhaps it would be better to just state that a corrective action plan shall be developed within 6 months as in R3. This would be 6 months to create a CAP as the maximum interval or declare why a CAP is not needed. This may also be easier to audit since documenting when the cause is determined to start the time line would not be required. The VSL could then be updated and be simplified.
Response: Thank you for the comments. **An overall time limit for Requirements R1, R2 and R3 is not practical as many factors can delay the investigative findings in Requirement R1 or Requirement R4 (action plan) such as outage constraints and resource limitations. The sequential nature of the 60 days in Requirement R2 is important as Requirement R2 could follow either a Misoperation cause found in Requirement R1 or a Misoperation cause found in Requirement R4 via an 'action plan' execution. If the cause is found via an 'action plan', the entity may likely need an additional 60 days to create a CAP and is now beyond the 180 days.**		
PacifiCorp	No	PacifiCorp is concerned that the 120-day time limit in R1 is insufficient. When two registered entities are involved in the interrupting device operation, 120 days is not enough time for both entities to complete the activities required by the requirement. PacifiCorp proposes an increase to 90 days for each entity to complete their

Organization	Yes or No	Question 3 Comment
		respective activities in sequence. This would increase the total from 120 to 180 days under R1.
Response: Thank you for the comments. **The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. If the investigation doesn't reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation.**		
Southern Company	No	1. We do not agree with the introduction of the noted timeframes. There is no indication that the extremely large percentage of entities have not been doing due diligence in analyzing operations, identifying misopertions, and taking appropriate actions to prevent reoccurrence all of which are inherent to the existing Standard. If the only reason to place these time limits is to have a basis for compliance (i.e. you can't require someone to do something unless you tell him how long he has, because he can always say 'I was going to do it tomorrow); then, the time limits should be removed. We offer two potential suggestions for improvement: 2. R1 should not be changed from the previous posting. The requirement should be that the entity has a procedure and process. Compliance can be gauged based on an entities compliance culture, oversight and review of processes and procedures. The SDT should utilize the approached introduced in their recently posted- COM-3. or 3. It is suggested that all Protection System operations for a given quarter are reviewed, analyzed, classified before the reporting due date to the RE (at the end of two calendar months following the quarter) - this will cover all of the deadlines found in requirements R1, R2, and R3. Also, we believe that any required CAP

Organization	Yes or No	Question 3 Comment
		should be developed and documented by this same date. Placing the 120 day and 60 day time frames for each Prot Sys operation unnecessarily complicates the evaluation, resolution, tracking, and documentation of each misoperation. For a large entity with many operations per quarter, the multiple time frames for R1, R2, and R3 are unecessarily overbearing. 4. Requirement R3 should be combined with Requirement R2. A CAP developed and documented as described in R2 can address resolving identified causes of misoperations as well as addressing additional investigative plans for determining a cause. Misoperations with no identified cause can be handled as described in the draft standard.
Response: Thank you for the comments. **1. The requirements and associated timeframes ensure that the responsible entities are diligent about Misoperation response, CAP creation and completion. The drafting team believes the timetables add measurability to the goal of determining cause and developing appropriate corrective actions.** **2. The drafting team believes the current approach meets the reliability objectives established in the SAR for this project. The drafting team believes the timeframes are sufficient and necessary and they will remain in the new standard.** **3. An overall time limit for Requirements R1, R2 and R3 is not practical as many factors can delay the investigative findings in Requirement R1 or Requirement R4 (action plan) such as outage constraints and resource limitations. The sequential nature of the 60 days in Requirement R2 is important as Requirement R2 could follow either a Misoperation cause found in Requirement R1 or a Misoperation cause found in Requirement R4 via an 'action plan' execution. If the cause is found via an 'action plan', the entity may likely need an additional 60 days to create a CAP and is now beyond the 180 days.** **4. Requirement R3 covers cases where there are significant challenges determining the Misoperation cause(s) such as outage constraints and multiple entity coordination. The 'action plan' developed in Requirement R3 establishes the course of action and the associated work timetable. While Requirement R3 (action plan) may appear similar to the Requirement R2 (CAP), its intent is different.**		
ITC	No	R1, 120 calendar days may not be enough time for those instances when multiple

Organization	Yes or No	Question 3 Comment
		outages occur during large storms such as hurricanes, tornadoes, etc. This needs to be addressed in R1 and should allow that an extension can be requested for those types of events reported in DOE 417 and EOP 004.
Response: Thank you for the comments. **The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. If the investigation doesn't reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation.** **The drafting team agrees with your comment about instances when major disturbances occur. As noted in the Guidelines and Technical Basis Section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.**		
seattle city light	No	Seattle City Light (SCL) does not agree with the time limits. SCL agrees that it is important for reliability that Misoperation CAPs be created and implemented within a reasonable time, but does not believe that the reliability benefit that might possibility accrue from meeting staged interim deadlines for analysis and for creating a CAP outweighs the administrative compliance burden created to document that each interim deadline has been met. SCL instead recommends that a single time limit be required for implementing an appropriate CAP following each Misoperation. Furthermore, SCL recommends a somewhat longer period, of either 240 or 365 days, to accommodate seasonal constraints. For SCL, elements associated with a Misoperation occurring in October at the beginning of the winter storm season might, in a heavy winter, not be available for operational analyses and testing until the following March or April, a length of time that could exceed 180 days. Such seasonal constraints are not unique to SCL, but also exist in summer for entities in the southern parts of North America.

Organization	Yes or No	Question 3 Comment
Response: Thank you for the comments. **An overall time limit for Requirements R1, R2 and R3 is not practical as many factors can delay the investigative findings in Requirement R1 or Requirement R4 (action plan) such as outage constraints and resource limitations. The sequential nature of the 60 days in Requirement R2 is important as Requirement R2 could follow either a Misoperation cause found in Requirement R1 or a Misoperation cause found in Requirement R4 via an 'action plan' execution. If the cause is found via an 'action plan', the entity may likely need an additional 60 days to create a CAP and is now beyond the 180 days. The Guidelines and Technical Basis section of the standard has been revised to add clarity for the independent 120 and 60 day timeframes.** **The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. Technical Basis section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard. **2. The drafting team revised the R2 Rationale and removed the "procurement of funds" reference in the Requirement R2.** **3. Thank you.**		
Manitoba Hydro	No	The time limit for R2 should be changed from "60 calendar days of identifying the cause" to "180 calendar days from the misoperation". Requiring the entity to track both the date of the operation (for R1) and the date the cause was identified (R2) seems like unnecessary work. This suggestion does not change the maximum time to complete R2.
Response: Thank you for the comments. **An overall time limit for Requirements R1, R2 and R3 is not practical as many factors can delay the investigative findings in Requirement R1 or Requirement R4 (action plan) such as outage constraints and resource limitations. The sequential nature of the 60 days in Requirement R2 is important as Requirement R2 could follow either a Misoperation cause found in Requirement R1 or a Misoperation cause found in Requirement R4 via an 'action plan' execution. If the cause is found via an 'action plan', the entity may likely need an additional 60 days to create a CAP and is now beyond the 180 days. The Technical Guidelines area has been revised to add clarity for the independent 120 and 60 day timeframes.**		
NorthWestern Energy	No	We have a concern on R2 on the 60 calendar days to make a CAP (corrective action Plan). Making a plan with a timeline in 60 days poses an issue where budgeting is required to perform a major relay upgrade to fix a problem. We fear this wording could expose us to potential penalties for not meeting a CAP's stated time line that would be made before the budgeting approval and scheduling process is completed.
Response: Thank you for the comments. **The drafting team understands that the capital budgeting cycle for many entities can extend for many months however the drafting team believes there is sufficient latitude in the standard to revise a CAP and associated timeframes as needed by the**		

Organization	Yes or No	Question 3 Comment
entity. The entity can set the work timetable as identified in Requirement R2 and the Guidelines and Technical Basis section "Deferrals or other relevant changes to the CAP or action plan need to be documented so that the record includes not only what was planned, but what was implemented." Allowances for changes to a CAP are accounted for in the standard.		
American Electric Power	No	1. In general, AEP supports the idea of time limits in regards to R1, R2, and R3. However, though these proposed limits might be reasonable and attainable under normal operating conditions, the proposed time limits for R1 and R3 would not likely be reasonable during major distubances and significant events. The volume of analysis required in these situations is simply too great and complex to complete in the time limits proposed. Either the time limits proposed need to be extended to accommodate analysis during major distubances, or else there must be provisions for granting time extensions when major events occur. For example, if there was an event that was in scope under EOP-004 disturbance reporting, that entity could be afforded the flexibility to work out the allowed time limits with their Regional Entity. 2. In addition, an entity's allowed time window to repond should not begin until it has officially received notification.
Response: Thank you for the comments. **1. The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. If the investigation doesn't reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation.** **The drafting team agrees with your comment about instances when major disturbances occur. As noted in the Guidelines and Technical Basis section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.** **2. The drafting team revised Requirement R1 based; please review the new Requirement R1. The notified entity has the remainder of the 120 day period per Requirement R1 to determine the cause of the Misoperation; then has at least 60 days to**		

Organization	Yes or No	Question 3 Comment
create a CAP or an action plan as stated in Requirements R2 and R3.		
ReliabilityFirst	No	ReliabilityFirst Abstains and offers the following comments for consideration:3. Requirement R2a. ReliabilityFirst believes the phrase "Within 60 calendar days of identifying the cause(s) of each Misoperation" relates to the designation of the cause of each Misoperation as identified in Requirement R1, Part 1.3 or as identified through implementation of the action plan per Requirement 4, Part 4.1? If so, ReliabilityFirst recommends add the parenthetical "(per Requirement R1, Part 1.3 or Requirement R4, Part 4.1)" to Requirement R2 in order to further clarify when the timing of the 60 calendar day window begins.
Response: Thank you for the comments. **The drafting team revised the rationale boxes for Requirements R2, R3, and R4 based on your suggestion.**		
Portland General Electric Company	No	1. Managing multiple deadlines based upon event date is difficult and does not align with quarterly reporting requirements (also see response to question 5). If more stringent deadlines are to be applied, there should be separate deadlines for identification of misoperations (less than 120 days) and identification of the cause (more than 120 days). Complex events affecting multiple workgroups or entities as well as those involving equipment failure may result in entities taking more than 120 days to determine the Root Cause. Often misoperations result in the need to send protective relays back to the manufacturer, but relay manufacturers have no requirement to meet these deadlines. Not allowing sufficient time to determine the Root Cause will result in more events being referred to R3 (no identified cause) or CAPs being developed based upon incorrect causes. 2. Complex events affecting multiple work groups or equipment failure may result in an entity taking more than 60 days to develop a CAP even after a cause is identified. Not allowing sufficient time could result in less than desirable CAPs.

Organization	Yes or No	Question 3 Comment
Response: Thank you for the comments. 1. **The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages or coordinating with outside entities. If the investigation doesn't reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation.** **The drafting team agrees with your comment about instances when major disturbances occur. As noted in the Guidelines and Technical Basis section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.** 2. **The drafting team disagrees. The team believes that 60 days is adequate to develop and document a CAP once the cause has been identified. The completion of the CAP, including any revisions, is completely under the control of the entity.**		
LCRA Transmission Services Corporation	No	1. For the R2 time basis, the 60 day period for developing a CAP is reasonable; however, identifying the specific date the cause was identified could be subjective and could lead to an unnecessary violation due to a simple clerical error. We would recommend stating the CAP should be developed within 180 days of the interrupting device operation (the event). 2. We do not view R3 as being necessary and could even put an entity at conflict with R1 and R2 (i.e. the cause has not been determined within 120 days; however, the investigation continues and at day 140 the cause is determined and the entity is now in violation of R1) An entity should be able to complete all investigations within R1 requirements of 120 days, even if the finding is unknown. There is no benefit to extending the investigation out 180 days and beyond. Similarly, for an unknown cause a corrective action plan to plan and install controls to monitor the relay scheme to identify the cause of a repeat failure can be planned and executed within the requirements of R2 and R4.
Response: Thank you for the comments.		

Organization	Yes or No	Question 3 Comment
1. An overall time limit for Requirements R1, R2 and R3 is not practical as many factors can delay the investigative findings in Requirement R1 or Requirement R4 (action plan) such as outage constraints and resource limitations. The sequential nature of the 60 days in Requirement R2 is important as Requirement R2 could follow either a Misoperation cause found in Requirement R1 or a Misoperation cause found in Requirement R4 via an 'action plan' execution. If the cause is found via an 'action plan', the entity may likely need an additional 60 days to create a CAP and is now beyond the 180 days. The Guidelines and Technical Basis section of the standard has been revised to add clarity for the independent 120 and 60 day timeframes. **2. Requirement R1 does not require an entity to have a cause identified within 120 days. The standard includes Requirement R3 to address those instances where there are significant challenges to determining a Misoperation cause such as multiple entity coordination, outage constraints, availability of parts and resource allocation. The action plan developed in Requirement R3 allows the entity to set the work timetable and revise that timetable as required. Implementation of the action plan in Requirement 4, Part 4.1 will lead the entity to a cause or to a declaration that a cause cannot be determined on the entity's work timetable.**		
Dairyland Power Cooperative	No	R1 requires the identification and review of an operation, as well as the designation and investigation of a Misoperation, all within 120 days whereas R2 requires the development of a corrective action plan within 60 days of identifying the cause of a Misoperation. It is a concern that these proposed timeframes will create a disincentive for early identification of Misoperations. As an example, if a Misoperation is identified on day 2 after the incident, the corrective action plan must be developed no later than day 62 following the incident. However if an entity were to delay identification of the Misoperation until day 120 after the incident, the corrective action plan would not have to be developed until day 180. To prevent deterring entities from identifying Misoperations sooner, it suggested the drafting team consider requiring the corrective action plan by day 180 regardless of when the misoperation cause was officially identified. Doing so would avoid entities having to worry about the official date of Misoperation identification.
Response: Thank you for the comments. **An overall time limit for Requirements R1, R2 and R3 is not practical as many factors can delay the investigative findings in Requirement R1 or Requirement R4 (action plan) such as outage constraints and resource limitations. The sequential nature of**		

Organization	Yes or No	Question 3 Comment
the 60 days in Requirement R2 is important as Requirement R2 could follow either a Misoperation cause found in Requirement R1 or a Misoperation cause found in Requirement R4 via an 'action plan' execution. If the cause is found via an 'action plan', the entity may likely need an additional 60 days to create a CAP and is now beyond the 180 days. The Guidelines and Technical Basis section of the standard has been revised to add clarity for the independent 120 and 60 day timeframes.		
MISO	No	Comments: We agree review of each Protection System operation is important, however, there could be voluminous events from a natural event that may be burdensome on entities to providereports within the allotted time frame. Priroritization should be given for events that are suspected to be misoperations based on the entities' judgment.
Response: Thank you for the comments. **The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages and other factors. If the investigation doesn't reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation.** **The drafting team agrees with your comment about instances when major disturbances occur. As noted in the Guidelines and Technical Basis section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.**		
Public Service Company of New Mexico	No	1. R1/R2: Regarding the proposed timeframes for completion of R1 and R2 as 120 days and 60 days respectively, PNMR suggests that the drafting team amend the requirements such that the combination of the two requirements not exceed 180 days, but allow for flexibility in either the analysis of the operation and/or the development of the CAP such that either one could be extended if needed but the entire timeframe allowed for both would not exceed the proposed timeframes as originally drafted.R1: PNMR proposes that an exception to the timeframe in R1 be allowed for complex failure to trip scenarios which are less frequent but can be difficult to recognize. PNMR requests that the time clock

Organization	Yes or No	Question 3 Comment
		start from the time of discovery rather than the time of the operation. The requirement would instead read: “R1. Within 120 calendar days of discovery of an interrupting device operation in its Facility caused by a Protection System operation,...” 2. Alternatively, PNMR suggests that there be an exception granted for certain failures to operate that are discovered after-the-fact.
Response: Thank you for the comments. **1. An overall time limit for Requirements R1, R2 and R3 is not practical as many factors can delay the investigative findings in Requirement R1 or Requirement R4 (action plan) such as outage constraints and resource limitations. The sequential nature of the 60 days in Requirement R2 is important as Requirement R2 could follow either a Misoperation cause found in Requirement R1 or a Misoperation cause found in Requirement R4 via an ‘action plan’ execution. If the cause is found via an ‘action plan’, the entity may likely need an additional 60 days to create a CAP and is now beyond the 180 days. The Technical Guidelines area has been revised to add clarity for the independent 120 and 60 day timeframes.** **The standard includes Requirement R3 to address those instances where there are significant challenges to determining a Misoperation cause such as multiple entity coordination, outage constraints, availability of parts and resource allocation. The action plan developed in Requirement R3 allows the entity to set the work timetable and revise that timetable as required.** **2. The drafting team revised the standard to eliminate the need for exceptions. Please see the revised standard.**		
City of Austin dba Austin Energy	No	Given the length of the summer season in some parts of the country, Austin Energy requests an adjustment to the time limits to sufficiently account for outage constraints for investigative purposes. AE requests that R1 allow for 180 calendar days and R3 allow for 240 calendar days. (These comments are similar to those submitted by Seattle City Light which, due to the length of the winter season in their part of the world, they also requested a longer period).
Response: Thank you for the comments. **The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and**		

Organization	Yes or No	Question 3 Comment
investigate the Misoperations with consideration given to obtaining appropriate outages. If the investigation doesn't reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation. **The drafting team agrees with your comment about instances when major disturbances occur. As noted in the Guidelines and Technical Basis section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.**		
Modesto Irrigation District	No	1. Standardize a single time frame for evaluation and remidiation. Keep it simple. 2. Also recommend longer time period for completion of remidiation, such as 240 days.
Response: Thank you for the comments. **1. An overall time limit for Requirements R1, R2 and R3 is not practical as many factors can delay the investigative findings in Requirement R1 or Requirement R4 (action plan) such as outage constraints and resource limitations. The sequential nature of the 60 days in Requirement R2 is important as Requirement R2 could follow either a Misoperation cause found in Requirement R1 or a Misoperation cause found in Requirement R4 via an 'action plan' execution. If the cause is found via an 'action plan', the entity may likely need an additional 60 days to create a CAP and is now beyond the 180 days. The Technical Guidelines area has been revised to add clarity for the independent 120 and 60 day timeframes.** **2. The Corrective Action Plan (CAP) planned completion date is determined by the entity.**		
PSEG	No	In addition to the new R1 and R2 above, R3 through R4 below are an alternative to replace the proposed R1 through R3. R3. If the cause(s) for a Misoperation is identified in Requirement R2, the Transmission Owner, Generator Owner, and Distribution Provider shall, within 270 days of identifying a Misoperation per R1: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-Term Planning] o Develop and document a Corrective Action Plan (CAP) for the identified Protection System component(s) that includes an evaluation of the CAP's applicability to the entity's Protection Systems at other locations, or o Explain in a declaration why

Organization	Yes or No	Question 3 Comment
		corrective actions are beyond the entity's control or would reduce BES reliability. M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R2 that must include a dated CAP or a dated declaration explaining why there is no need to develop a CAP.R4. If the cause for a Misoperation is undetermined in Requirement R2, the Transmission Owner, Generator Owner, and Distribution Provider shall, within 270 calendar days of identifying a Misoperation per R1, complete: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-Term Planning] o Development of an action plan that identifies any additional investigative actions and/or Protection System modifications, including an estimated timetable, or o A declaration explaining why no further actions will be taken. M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R5 that must include a dated action plan or a dated declaration explaining why no further action will be taken.
Response: Thank you for the comments. **The drafting team appreciates your efforts and suggested revisions to the standard but declines to make the suggested changes.**		
Los Angeles Department of Water and Power	No	In regards to R2, the 60-day period for developing a CAP seems to be reasonable; however, this period starts from the date the cause of Misoperation is identified. "Date of cause" could be subjective and can potentially generate confusion and unnecessary violations. LADWP recommends using the date of "device interruption operation" and change "60 days" to "180 days."
Response: Thank you for the comments. **An overall time limit for Requirements R1, R2 and R3 is not practical as many factors can delay the investigative findings in Requirement R1 or Requirement R4 (action plan) such as outage constraints and resource limitations. The sequential nature of the 60 days in Requirement R2 is important as Requirement R2 could follow either a Misoperation cause found in Requirement R1 or a Misoperation cause found in Requirement R4 via an 'action plan' execution. If the cause is found via an 'action plan', the entity may likely need an additional 60 days to create a CAP and is now beyond the 180 days. The Guidelines and Technical Basis**		

Organization	Yes or No	Question 3 Comment
section of the standard has been revised to add clarity for the independent 120 and 60 day timeframes.		
City of Jacksonville Beach, FL dba/ Beaches Energy Services	No	We believe there ought to be exceptions for an "Act of Nature", e.g., event like a hurricane, that can result in a great many protection system operations but still require investigation of all of them within 4 months.
Response: Thank you for the comments. **The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. If the investigation doesn't reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation.** **The drafting team agrees with your comment about instances when major disturbances occur. As noted in the Guidelines and Technical Basis section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.**		
Sacramento Municipal Utility District	No	We urge the Drafting Team to address the time limits and report requirements utilizing the Internal Controls Process thereby eliminating the 'zero-defect' language found in the requirements. While we agree with time limits to finalize any findings we disagree with the multiple date requirements. We believe that an internal control process should be identified by the entity that eliminates the potential for administrative errors. This would allow the entity to perform necessary actions and reporting in accordance to their policy specifically on facilities determined to be critical. Where an entity has a 'no-touch' in effect of certain facilities this method would allow them to evaluate the relays off the critical period.
Response: Thank you for the comments. **The drafting team believes the current approach meets the reliability objectives established in the SAR for this project. The drafting team believes the timeframes are sufficient and necessary and they will remain in the new standard.**		

Organization	Yes or No	Question 3 Comment
CenterPoint Energy	No	Instead of requiring a Corrective Action Plan be developed within 60 days of identifying the root cause, as provided for in R2, CenterPoint Energy recommends the timeframe be 180 days after the date of the misoperation. Requiring a Corrective Action Plan to be developed within 60 days of identifying a root cause would create a new, additional date that must be tracked. To facilitate the ease of tracking, as well as auditing, CenterPoint Energy recommends using the following for developing a Corrective Action Plan: "For each Misoperation with an identified cause, within 180 days after the date of the misoperation, the Transmission Owner, Generator Owner, or Distribution Provider shall:".
Response: Thank you for the comments. **An overall time limit for Requirements R1, R2 and R3 is not practical as many factors can delay the investigative findings in Requirement R1 or Requirement R4 (action plan) such as outage constraints and resource limitations. The sequential nature of the 60 days in Requirement R2 is important as Requirement R2 could follow either a Misoperation cause found in Requirement R1 or a Misoperation cause found in Requirement R4 via an 'action plan' execution. If the cause is found via an 'action plan', the entity may likely need an additional 60 days to create a CAP and is now beyond the 180 days. The Guidelines and Technical Basis section of the standard has been revised to add clarity for the independent 120 and 60 day timeframes.**		
Indiana Municipal Power Agency	No	Indiana Municipal Power Agency agrees with the comments submitted by Florida Municipal Power Agency (FMPA).
Response: Thank you for the comments. **Please see the drafting team's response to FMPA.**		
Tampa Electric Company	No	TEC believes there ought to be exceptions for an "Act of Nature", e.g., event like a hurricane, that can result in a great many protection system operations but still require investigation of all of them within 4 months.
Response: Thank you for the comments.		

Organization	Yes or No	Question 3 Comment
The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. If the investigation doesn't reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation. **The drafting team agrees with your comment about instances when major disturbances occur. As noted in the Guidelines and Technical Basis section of the standard, in the event of such natural disasters, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.**		
NextEra Energy Inc.	No	NextEra Energy Inc. (NextEra) disagrees that 120 days provides sufficient time to investigate all types of misoperations. For example, NextEra does not agree with the rationale that 120 days is sufficient time to account for outage constraints. This timeframe is particularly troubling in the context of nuclear power plants that generally do not schedule a switchyard outage unless it is consistent with its refueling outage - which can be as long as 18 months apart. Thus, NextEra recommends that R1.3 be revised as follows to provide a clearer process and more flexibility:1.3 Investigate each potential Misoperation and document the findings. The cause of a Misoperation may be initially listed as "Unknown/unexplainable" and the Analysis and Corrective Action Status listed as "Analysis - In Progress". The entity should continue their normal process of investigation and after a cause is determined resubmit the Misoperation to update the information.
Response: Thank you for the comments. **The drafting team believes that 120 days is adequate to review the operations to determine if they are Misoperations and investigate the Misoperations with consideration given to obtaining appropriate outages. If the investigation doesn't reveal a cause within this timeframe, then the entity is provided another 60 days to develop an action plan (per Requirement R3) to continue the investigation.**		
Ameren Services	No	1. We suggest that "cause(s)" be changed to "cause" in R2 to avoid time limit confusion, and be consistent with the use of "cause" throughout the rest of this

Organization	Yes or No	Question 3 Comment
		standard. 2. Although wording is clear that R2 be completed within 60 days of identifying the cause, some entities may incur violations by glibly adding the 120 days in R1 to the 60 days in R2. We suggest pointing out that the entity will have to intentionally record and track when they've identified the cause, and providing an example in the Application Guidelines for R2 on page 18 will provide better clarity. For example, if the entity identifies the cause on 3/31 for a 3/1 Misoperation, they must develop and document R2 CAP by 5/30 (not 8/29). 3. We agree with the SERC PCS that introducing time limits is unwarranted and burdensome. Regional Entities now get quarterly Misoperation and CAP status reports and have sufficient information to monitor progress. 4. At most, a one year time limit for CAP completion or explanation of CAP duration could be used. A small number of CAPs will extend beyond one year due to their scope or outage restrictions. SERC has used a two year limit then requiring a formal explanation, and very, very few have reached this time limit.
Response: Thank you for the comments. **1. The drafting team revised Requirement R2 based on your suggestion and modified the Guidelines and Technical Basis section of the standard associated with Requirements R1 and R2.** **2. The drafting team believes the wording is sufficiently clear.** **3. The drafting team disagrees. The drafting team believes the timelines add measurability to the goal of determining cause and developing appropriate corrective actions.** **4. The timeframe for completing the CAP cannot be prescribed in a standard due to external factors such as outage restrictions, availability of parts, capital allocation and other circumstances that can cause a CAP to be delayed. The drafting team believes that entities can reliably manage and assure CAP completions.**		
Kansas City Power & Light	No	1. R2 requires development of a CAP and evaluation of CAP applicability to other locations. I recommend development of a CAP in 60 days for the specific location

Organization	Yes or No	Question 3 Comment
		where the misoperation occurred. CAP applicability to other locations may require more time depending on what the CAP involves. CAP applicability to other locations should be allowed a longer time frame such as 12 months. 2. R3 requires development of an action plan for misoperations with an unknown cause. Depending on the type of protection equipment in place it may not be possible to always determine the cause of every misoperation. For example electromechanical relays only provide targets and event reports may not be available. R3 seems to require that EM relays be changed out to digital relays in order to monitor for the next misoperation. The standard should not require this and R3 should be deleted.
Response: Thank you for the comments. **1. Requirement R2 specifies a CAP "for the identified Protection System component(s)" and doesn't specify required timeframes for CAP completion which is determined by the entity. It only requires consideration of the Misoperation cause at other locations. It is responsibility of the entity to define when and where to apply a CAP (or not) at "the entity's Protection Systems at other locations." A CAP can be revised to reflect changes in scope and completion date.** **2. Requirement R3 (bullet 1) doesn't require Protection System modifications but rather the development of an action plan which *could* include Protection System modifications to aid further investigation. Requirement R3 (bullet 1) doesn't specify replacement of electromechanical relays with microprocessor-based devices. The standard includes Requirement R3 to address those instances where there are significant challenges to determining a Misoperation cause and propose other investigative actions. The action plan developed in Requirement R3 allows the entity to set the work timetable and revise that timetable as required.**		
Exelon Corp.		1. The Application Guidelines should be part of the Standard because they provide better clarification of the activities and timelines associated with R1, R2 and R3. 2. For R2: Replace "Explain in a declaration why corrective actions are beyond the entity's control or would reduce BES reliability" with "Explain in a declaration if no further corrective actions are required and your rationale." "beyond the entity's control" may be subjective. Suggest including the following statement based on

Organization	Yes or No	Question 3 Comment
		wording in the Application Guidelines concerning a no CAP declaration: "A condition identified during an investigation that is addressed by existing maintenance activities would be justification for taking no additional corrective action." 3. Exelon comments: Suggest revising the time limit verbiage as follows in order to provide more clarity:R1 Within 120 days of the event, review to determine whether the operation was correct. For any misoperation, identify and document the cause. R2a If after the initial 120 days a cause is determined for the misoperation, within 60 days - Develop a corrective action plan for the identified protection system componentOrExplain in a declaration if no further corrective actions are required and your rationale R2b If after the initial 120 days no cause was determined for the misoperation, within 60 days - Develop an action plan that identifies additional investigative actions to determine the causeOrExplain in a declaration why no further action will be taken R3 Within 60 days of determining a cause under requirement R2b - Develop a corrective action plan for the identified protection system componentOrExplain in a declaration if no further corrective actions are required and your rationale.
Response: Thank you for the comments. **1. The Guidelines and Technical Basis section will be filed as part of the approved standard.** **2. The drafting team has revised the Guidelines and Technical Basis section of the standard for Requirement R2 to include examples of what is meant by "beyond the entity's control".** **3. The drafting team appreciates your suggested revisions to the standard but declines to make the changes.**		
Pepco Holdings Inc & Affiliates	Yes	The timeframes for R1, R2 & R3 are acceptable, since Requirement R3 provides a reasonable alternative if the investigation cannot be completed within the allotted 120 days in R1 (due to outage constraints, severe weather, resources, etc.). However, the commentary in the Rationale for R2 is misleading and incorrect with regard to the statement that 60 days is reasonable for the procurement of funds for a

Organization	Yes or No	Question 3 Comment
		CAP. Capital dollars needed to fund larger CAP's (like other capital improvement projects) are budgeted for during a yearly budget cycle, usually in the fall of the preceding budget year. As such, unless the CAP was small and can be funded by an emergency blanket project it could take up to a year to get the necessary funding approved. We would suggest removing the procurement of funds from the R2 Rationale since it is not a pre-requisite for developing a CAP.
Response: Thank you for the comments. **The drafting team revised the Requirement R2 rationale based upon yours and other comments. The drafting team revised the R2 rationale and removed the "procurement of funds" reference in the Requirement R2.**		
Southwest Power Pool Regional Entity	Yes	With the proposed time limits, NERC may have to clarify how and when entities submit to the RE database misoperations that are still under investigation.
Response: Thank you for the comments. The reporting obligations have been removed from the standard.		
Utility System Efficiencies, Inc.	Yes	See previous comments for questions 1 and 2.
Response: Thank you for the comments. **Please see the responses to your comments on Questions 1 and 2.**		
Idaho Power Co.	Yes	Yes, they seem reasonable.
Response: Thank you.		
Ingleside Cogeneration LP	Yes	Ingleside Cogeneration believes that 120 days is generally sufficient to determine the root cause of most Misoperations - or to have evaluated and documented multiple possible causes if the source of the Misoperation cannot be determined. The additional 60 days to develop a corrective action plan time frame is acceptable to us as well.

Organization	Yes or No	Question 3 Comment
Response: Thank you for the comment.		
Texas Reliability Entity	Yes	We generally agree with the deadlines, but we have questions about how they apply in a multi-party situation. If a Protection System Misoperation is determined and an entity ("Entity A") determines that the cause of the Misoperation is due to a component owned by another entity (Entity B"), how does the 120 day time period apply? What if Entity A does not start its review until 60 days after the operation and tells Entity B on the 90th day? Entity A has identified the cause (Entity B component) but what timeframe is Entity B under to determine the Misoperation cause for the component? What exactly is Entity A's mandatory obligation, and what is Entity B's mandatory obligation, and what are the applicable deadlines?
Response: Thank you for the comments. **The drafting team revised Requirement R1 based; please review the new Requirement R1. The notified entity has the remainder of the 120 day period per Requirement R1 to determine the cause of the Misoperation; then has at least 60 days to create a CAP or an action plan as stated in Requirements R2 and R3. The drafting team has clarified Requirement R1 to show that the interrupting device owner will do the initial investigation and will contact other Protection System owners only if a correct operation cannot be determined. In this case, the investigative information is passed from the interrupting device owner to the other owners. The standard requires all owners to confirm whether their portions of the Protection System operated correctly or not within 120 days of the interrupting device operation. As stated in the Guidelines and Technical Basis section of the standard, the drafting team expects all owners to work jointly in making these determinations, freely sharing information with each other. Only the owner of a Protection System component that misoperated is responsible for documenting the findings, developing a CAP or action plan and reporting.**		
City of Tallahassee	Yes	In lieu of R3, I agree with this.
Response: Thank you.

4. **The team has modified the standard to address Misoperations when two or more entities own separate components in a Protection System. Do you agree that the standard adequately deals with this situation? If not, please provide specific reasons why not and alternative recommendations.**

Summary Consideration:

Numerous commenters were confused about which entity was responsible for what actions when multiple owners were involved in an operation. The drafting team revised Requirement R1 to clarify that only the owner of a Protection System component that Misoperated is responsible for documenting the findings, and developing a CAP or action plan.

A few commenters were concerned about meeting the requirements when a major disturbance occurs, such as a storm. The drafting team believes this issue is covered by the NERC Sanction Guidelines as discussed in the Guidelines and Technical Basis section of the draft standard. No changes to the standard were made to specifically address this issue.

A few commenters were concerned about ensuring cooperation between entities. The drafting team believes this issue is adequately addressed in the Guidelines and Technical Basis section of the draft standard. No changes to the standard were made to specifically address this issue.

A few commenters felt having formal notification to another entity of an operation was unnecessary. The drafting team disagreed and clarified Requirement R1 to show that the interrupting device owner will do the initial investigation and will contact other Protection System owners only if a correct operation cannot be determined. In this case, the investigative information is passed from the interrupting device owner to the other owners.

A few commenters were concerned with the definition of "suspects" in triggering notification. The drafting team revised Requirement R1 to eliminate "suspects". The trigger for notification is now if the interrupting device owner cannot determine that an operation is correct.

A few commenters wanted a time period for a notified entity to do its own investigation. The drafting team declined to make this change. The notified entity has the remainder of the 120 day period, and if needed can establish an action plan with its own time table for further investigation to determine whether their component operated correctly.

A few commenters were concerned with the burden of tracking notifications, especially involving "receipts" from other entities. The drafting team revised Measure M1 to eliminate "receipts".

Organization	Yes or No	Question 4 Comment

Organization	Yes or No	Question 4 Comment
Pepco Holdings Inc & Affiliates	No	The responsibility for R1 through R4 should be on the owner of the Protection System which initiated the interruption of a BES facility and not the owner of the interrupting device. See extensive comments on this subject in our response to Question 2 (Requirement R1).
Response: Thank you for your comment. **Please see our response in Question #2.**		
Southwest Power Pool Reliability Standards Development Team	No	1) There is an issue with the timing and requesting data from these other entities that own part of the protection system. There isn't a time frame for the other entity to return the data requested and seems like this could cause an entity to not meet the time frames specified in the requirements. 2) Also going back to the Major disturbance if multiple entities are hit then they will be busy taking care of their own operations and may not have time to coordinate the data request in a timely manner.
Response: Thank you for your comment. **1) The drafting team has clarified Requirement R1 to show that the interrupting device owner will do the initial investigation and will contact other Protection System owners only if a correct operation cannot be determined. In this case, the investigative information is passed from the interrupting device owner to the other owners. The standard requires all owners to confirm whether their portions of the Protection System operated correctly or not within 120 days of the interrupting device operation. As stated in the Application and Guidelines section, the drafting team expects all owners to work jointly in making these determinations, freely sharing information with each other. Only the owner of a Protection System component that Misoperated is responsible for documenting the findings, developing a CAP or action plan and reporting.** **2) The drafting team agrees with your comment about instances when major disturbances occur. As noted in the Guidelines and Technical Basis section of the standard, in the event of such major disturbances, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.**		

Organization	Yes or No	Question 4 Comment
Tacoma Power	No	Remove the second sentence under R1.1. At minimum, consider moving this sentence to R1.3 or creating a new R1.4. As written, this sentence is included in a sub-requirement that, in the overall process, has not yet even required designation of any Mis-operations. Presumably, at least part of the reason that this sentence was included was to mitigate any concerns that Entity A will wait before notifying Entity B, such that Entity B has little time to investigate before the deadline. However, as written, R1.1 would still permit Entity A to notify Entity B within 120 calendar days of the interrupting device operation, which would leave Entity B no time to investigate before becoming non-compliant, since per R1 the clock for investigation starts when the interrupting device operated. The bottom line is that, if Entity A suspects that a component owned by Entity B contributed to a Mis-operation, it is in Entity A's interest to take action; it is recommended that there be no explicit regulaotory requirement for notification.
Response: Thank you for your comment. **The drafting team revised Requirement R1; please review the new Requirement R1. The notified entity has the remainder of the 120 day period per Requirement R1 to determine the cause of the Misoperation; then has at least 60 days to create a CAP or an action plan as stated in Requirements R2 and R3. The drafting team believes notification is needed to formally involve other Protection System component owners in resolving a potential Misoperation.**		
El Paso Electric	No	See EPE's comment in Question 2.
Response: Thank you for your comment. **Please see our response in Question #2**		
Santee Cooper	No	Initially, the investigation/reporting burden should fall on the owner of the interrupting device. However, once it is determined which entity's equipment caused the misoperation, the burden of reporting should shift to that entity.

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comment. **The drafting team agrees with your comment and revised Requirement R1 for clarity.**		
Dominion	No	a). Subpart 1.1 does not provide for a clear hand-off when another entity's Protection System component contributed to a Misoperation of the first party. Specifically, it appears that the first party will have to develop its CAP to include a component owned by another entity and for which it has no control. The Application Guideline speaks to the need for various component owners to cooperate in the investigation and contact the Regional Entity should there be a lack of cooperation. This guidance needs to be clarified in the Requirement as compliance is measured against the Requirement, not guidance. Suggest adding Subpart 1.2 to state: "If notified by an entity that a Protection System component contributed to that entity's Misoperation, than It is expected that all the owners will communicate with each other, sharing any information freely, so that operations can be analyzed, Misoperations identified and corrective actions taken." If adopted by the SDT, then renumber existing Subparts 1.2 and 1.3 to 1.3 and 1.4 respectively. b). R1 correctly requires the interrupting device owner to initiate the investigation, but when the Protection System interconnects with another entity and there are indications that the other entity Protection System components misoperated (ie. Other entity sends a spurious DTT), then once the location of the Misoperation is agreed to by the various Protection System owners, then it should be the responsibility of the owner of the Protection System that misoperated to report thus removing the burden of reporting from the interrupted device owner. In some cases there may be several devices interrupted which are owned by different owners and the Protection System failure was due to a Protection System failure by an entity that had no devices that were interrupted at the location where the Misoperation occurred. Under the present PRC-004-2a, there is confusion on this distinction. The process (especially reporting process and resubmittals) is simplified when the owner of the Protection System that misoperated is responsible for: interfacing with others

Organization	Yes or No	Question 4 Comment
		to analyze, developing CAP, implementing CAP and reporting. c). There is also a suggestion that multiple entities utilize a joint investigation report. Again, the burden of reporting should lie on the entity that had the Protection System Misoperation to initiate reports and communicate other entity actions.
Response: Thank you for your comment. **1) The drafting team has clarified Requirement R1. Only the owner of a Protection System component that Misoperated is responsible for documenting the findings, and developing a CAP or action plan. The drafting team believes the wording in the Guidelines and Technical Basis section of the standard is sufficient.** **2) The drafting team agrees with your comment and has revised Requirement R1 for clarity.** **3) The drafting team agrees with your comment. Entities may work together to create a single investigation report. Only the owner of a Protection System component that Misoperated is responsible for documenting the findings, developing a CAP or action plan and reporting. The drafting team clarified this in the Guidelines and Technical Basis section of the standard.**		
Luminant	No	Luminant disagrees with the concept of "If an entity suspects ..." phrase. Luminant suggests that the data exchange between entities with "interpendent System protection Systems" be as follows: "...For its Protection System operations that are interdependent with the Protection Systems of another owner, the entity shall notify the owner of the interdependent Protection System." The owner of other components in the Protection System may request information in performing their investigation.
Response: Thank you for your comment. **The drafting team believes notifying every owner every time an operation occurred, especially when the interrupting device owner knows the operation is correct, would be burdensome. The drafting team does agree "suspects" is vague and has changed Requirement R1 to make the notification trigger clearer.**		
SERC Protection and Control	No	1. Please refer to comments in #2 above (SERC comments 2 and 3). Also, consider the following:a). R1 correctly requires the interrupting device owner to initiate the

Organization	Yes or No	Question 4 Comment
Subcommittee (PCS)		investigation, but when the Protection System interconnects with another entity and there are indications that the other entity's Protection System components misoperated (i.e. Other entity sends a spurious DTT), then once the cause of the Misoperation is determined, it should be the responsibility of the Protection System owner that misoperated to report; thus removing the burden of reporting from the interrupted device owner. In some cases there may be several devices interrupted which are owned by different entities and the Protection System failure resulted from an entity that had no devices that were interrupted or affected at the location where the Misoperation occurred. Under the present PRC-004-2a, there is confusion on this distinction. b). There is also a suggestion that multiple entities utilize a joint investigation report. Again, the burden of reporting should lie on the entity that owns the Protection System that caused the Misoperation and they should initiate reporting and communicating other entity actions to correct the problem.
Response: Thank you for your comment. For your comments in Q2, Please see our response in Question #2. **a) The drafting team agrees with your comment and has revised Requirement R1 for clarity.** **b) The drafting team agrees with your comment. Entities may work together to create a single investigation report. Only the owner of a Protection System component that misoperated is responsible for documenting the findings, developing a CAP or action plan and reporting. The drafting team clarified this in the Guidelines and Technical Basis section of the standard.**		
ACES Power Marketing Standards Collaborators	No	(1) There is no justification in the Rationale for R1 or in the Application Guidelines to show statistics that this scenario would occur regularly. The supplemental documents do not explain why the SDT felt that adding this provision to the standard was necessary. This concept seems to be a rare instance without a basis for adding it as a requirement. Considering that this requirement is on a timeline for which compliance would be measured. (2) The requirement's wording is subjective in nature and would be very difficult to provide documentation for "suspecting" another entity's component contributed to the Misoperation. Also, R1.1 seems to

Organization	Yes or No	Question 4 Comment
		skip a step - first the entity identifies and reviews all operations but the next step should be to identify Misoperations. Once Misoperations are identified, then the investigation for the cause of the Misoperation would occur. The investigation step is when an entity would consider if another entity's components or equipment would have been the cause to the Misoperation. Therefore, we recommend striking the second sentence of 1.1.
Response: Thank you for your comment. **1) The drafting team is aware of multiple instances where the components of a Protection System are shared. The interface between TOs and GOs at a switchyard is a very common example. Requirement R1 was written to address these kinds of issues.** **2) The drafting team does agree "suspects" is vague and has changed Requirement R1 for clarity.**		
Bonneville Power Administration	No	1. BPA believes the standard does not provide enough clarity for dealing with the different ownership arrangements. 2. In addition, BPA prefers not to be required to notify other owners of misoperations in their protection systems, as each owner should be responsible for reviewing the operations on their own equipment.
Response: Thank you for your comment. **1. The drafting team agrees with your comments and revised Requirement R1 for clarity.** **2. Interrupting device owners will notify other entities only if they are unable to determine if an operation was correct. Each owner is responsible for determining if their equipment functioned correctly.**		
GTC	No	a). R1 correctly requires the interrupting device owner to initiate the investigation, but when the Protection System interconnects with another entity and there are indications that the other entity Protection System components misoperated (ie. Other entity sends a spurious DTT), then once the cause of the Misoperation is determined, then it should be the responsibility of the Protection System owner that

Organization	Yes or No	Question 4 Comment
		caused the misoperation to report thus removing the burden of reporting from the interrupted device owner. In some cases there may be several devices interrupted which are owned by different entities and the Protection System failure was due to a Protection System failure by an entity that had no equipment that was interrupted or affected at the location where the Misoperation originated. Under the present PRC-004-2a, there is confusion on this distinction. b). There is also a suggestion that multiple entities utilize a joint investigation report. Again, the burden of reporting should lie on the entity that owns the Protection System that caused the Misoperation and they should initiate reporting and communicating other entity actions to correct the problem.
Response: Thank you for your comment. For your comments in Question #2, please see our response in Question #2. **a) The drafting team agrees with your comment and has revised Requirement R1 for clarity.** **b) The drafting team agrees with your comment. Entities may work together to create a single investigation report. Only the owner of a Protection System component that Misoperated is responsible for documenting the findings, developing a CAP or action plan and reporting. The drafting team clarified this in the Guidelines and Technical Basis section of the standard.**		
JEA	No	R1.1 requires that if an entity suspects a Protection System component(s) owned by another entity contributed to a Misoperation then we are to notify the owner of that Protection System component and provide any requested investigative information. We recommend to add language such as the notified entity must provide any requested information.
Response: Thank you for your comment. **The drafting team believes that such language is not necessary. It is expected that all the owners will communicate with each other, sharing any information freely, so that operations can be analyzed, Misoperations identified and corrective actions taken. Please see the Guidelines and Technical Basis section of the standard for Requirement R1. The drafting team believes the initial notification was necessary to ensure all Protection System component owners were aware that an operation took place and that**		

Organization	Yes or No	Question 4 Comment
these owners needed to investigate the operation of their components for correctness.		
Southwest Power Pool Regional Entity	No	If Owner A notifies Owner B that Owner B's component contributed to a misoperation, after being notified, Owner B should be responsible for performing misoperations analysis and reporting. The way the standard reads, there is no responbility for Owner B to investigate a component that didn't operate but did contribute to a misoperation.
Response: Thank you for your comment. **The drafting team has revised Requirement R1 to clarify the overall process. Each owner is responsible for determining if their equipment functioned correctly.**		
Nebraska Public Power District	No	I have concerns with the requirement R1.1 and M1 related "demonstrating transmittal and receipt of information" such as saving correspondence or communications (notifications) with other entities as part of the analysis and corrective actions with this standard. The misoperation is identified and fixed (or not fixed) by means necessary for the involved entities following the other requirements. This requirement will add time burden for tracking communications that takes away from the goal to fix the issue. It also confuses the issue on who is responsible if a "receipt" of notification cannot be obtained. This would increase the difficulty for auditing as well and adds a subjective nature to what is considered acceptable correspondence. I recommend this part of R1 be removed or the proof that a transmitted notification was received by another entity not be required since that is not under the control of the sending entity. Also, rather than tracking numerous emails and notifications the option for lack of response is to appeal to the RE for help as stated in the application guidelines. It may be wise to have a contact/process at the RE assigned to follow up on these types of requests especially if the associated entity is not registerd.
Response: Thank you for your comment.		

Organization	Yes or No	Question 4 Comment
The requirement only specifies tracking the initial notification. Measure M1 was revised to remove "and receipt". This notification is required only in cases where the interrupting device owner cannot determine if an operation is correct. The drafting team believes the number of potentially incorrect operations would be small enough that it should not be a burden.		
PacifiCorp	No	See comment #3
Response: Thank you for your comment. Please see our response in Question #3		
Southern Company	No	o It is noted in the Rational box for R1 that the owner of the component that cause the misop will create the CAP, etc. As such it is not clear who will report the Misoperation. i.e. If Owner A has a breaker open for a fault outside the zone due to a carrier that failed to send a block signal. Is an entities only responsibility to communicate to the other owner that his equipment didn't operate correctly? If so how do they know he ever reported it and/or did anything to correct the problem. It seems that the misoperation should be reported by the entities whose interrupting device opened in error. o Please clarify the statement in the Rational Box for R1: "The initial investigation documentation should be provided to the owner of the Protection System component(s) that contributed to the Misoperation, upon request.
Response: Thank you for your comment. The drafting team revised Requirement R1 and its rationale box to more clearly indicate who is responsible for what actions. Only the owner of a Protection System component that misoperated is responsible for documenting the findings, developing a CAP or action plan and reporting.		
ITC	No	1. It is unclear between R1 and R4 who needs to report the misoperation. R4 should specify the owner of the component that initiated the misoperation as the reporter so that a single misoperation is not reported by multiple entities. 2. In 1.1 once notified, the other entity should be allowed additional time (possibly another 120 days?) to analyze the Protection System operation to determine the

Organization	Yes or No	Question 4 Comment
		component that malfunctioned. As written there is only a single timeframe beginning with the outage.The word ‘necessary’ should be included between ‘any’ and ‘requested’ in R1.1.
Response: Thank you for your comment. 1. **The drafting team revised Requirement R1 to more clearly indicate who is responsible for what actions. Only the owner of a Protection System component that misoperated is responsible for documenting the findings, developing a CAP or action plan and reporting.** 2. **The drafting team revised Requirement R1 based; please review the new Requirement R1. The notified entity has the remainder of the 120 day period per Requirement R1 to determine the cause of the Misoperation; then has at least 60 days to create a CAP or an action plan as stated in Requirements R2 and R3.**		
Cleco Corporation	No	1) There is an issue with the timing and requesting data from these other entities that own part of the protection system. There isn’t a timeframe for the other entity to return the data requested and seems like this could cause an entity to not meet the timeframes specified in the requirements. 2) Also going back to the Major disturbance if multiple entities are hit then they will be busy taking care of their own operations and may not have time to coordinate the data request in a timely maner.
Response: Thank you for your comment. 1. **The drafting team has clarified Requirement R1 to show that the interrupting device owner will do the initial investigation and will contact other Protection System owners only if a correct operation cannot be determined. In this case, the investigative information is passed from the interrupting device owner to the other owners. The standard requires all owners to confirm whether their portions of the Protection System operated correctly or not within 120 days of the interrupting device operation. As stated in the Guidelines and Technical Basis section of the standard, the drafting team expects all owners to work jointly in making these determinations, freely sharing information with each other. Only the owner of a Protection System component that misoperated is responsible for documenting the findings, developing a CAP or action plan and reporting.**		

Organization	Yes or No	Question 4 Comment
2. The drafting team agrees with your comment about instances when major disturbances occur. As noted in the Guidelines and Technical Basis section of the standard, in the event of such major disturbances, the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 includes the provision that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.		
Tri-State G&T	No	It is not clear how the owner of the interrupting device that operates can designate and investigate the Misoperation of a Protection System component owned another entitity, but that seems to be what Parts 1.2 and 1.3 require. One solution would be to divide Requirement R1 into two requirements as described below."R1. Within 120 calendar days of an interrupting device operation in its Facility caused by a Protection System operation, each Transmission Owner, Generator Owner, and Distribution Provider shall identify and review each Protection System operation. If the entity suspects a Misoperation of a Protection System component owned by another entity caused an unnecessary interrupting device operation, notify the owner of that Protection System component and provide any requested investigative information.""R2. The owner of any Protection System identified as misoperating in Requirement R1 shall: 2.1 Designate each Misoperation. 2.2 Investigate each Misoperation and document the findings including a cause for each Misoperation, if identified. 2.3 Provide its Corrective Action Plan (CAP) to the other entity and notify the other entity upon completion of the CAP if the Protection System that Misoperated caused that other entity's interrupting device to operate."
Response: Thank you for your comment. **The drafting team has clarified Requirement R1 to show that the interrupting device owner will do the initial investigation and will contact other Protection System owners only if a correct operation cannot be determined. In this case, the investigative information is passed from the interrupting device owner to the other owners. The standard requires all owners to confirm whether their portions of the Protection System operated correctly or not within 120 days of the interrupting device operation. As stated in the Guidelines and Technical Basis section of the standard, the drafting team expects all owners to work jointly in making these determinations, freely sharing information with each other. Only the owner of a Protection System component that**		

Organization	Yes or No	Question 4 Comment
misoperated is responsible for documenting the findings, developing a CAP or action plan and reporting.		
American Electric Power	No	Please see our response to Question 2 where we suggest changes to R1 regarding such situations.
Response: Thank you for your comment. **Please see our response in Question #2.**		
Portland General Electric Company	No	There is a requirement to notify another entity if their component is suspected of contributing to a misoperation, but there is no requirement to respond to such notifications. Accountability to report back to the entity providing the notification should be included to ensure that entity can maintain its own compliance. Events involving transfer trip on interconnections, for example, could involve misoperations of equipment owned by both entities and require significant cooperation during the investigation phase.
Response: Thank you for your comment. **It is expected that all the owners will communicate with each other, sharing any information freely, so that operations can be analyzed, Misoperations identified and corrective actions taken. Please see the Guidelines and Technical Basis section of the standard for Requirement R1. The drafting team believes the initial notification was necessary to ensure all Protection System component owners were aware that an operation took place and that these owners needed to investigate the operation of their components for correctness. Only the owner of a Protection System component that misoperated is responsible for documenting the findings, developing a CAP or action plan and reporting.**		
Ingleside Cogeneration LP	No	It is not clear to Ingleside Cogeneration LP how a situation is resolved where interconnected Protection System owners disagree with the causes or mitigation of a Misoperation. We can easily envision a scenario where we have been informed by a neighbor that one of our relays contributed to a Misoperation - which we do not find to be the case. This seems like it could result in an audit finding that we did not report a Misoperation based upon someone else's evaluation.There may be recourse

Organization	Yes or No	Question 4 Comment
		in existing escalation procedures to engage the Regional Entity and even NERC at some point to resolve a conflict of this nature. Whatever the solution, we firmly believe that this pathway to resolution must be made clear as part of this project. If left open, the most subtle interaction issues will result in finger pointing in all directions - an unproductive use of everyone's time. Furthermore, problems of this nature are likely to identify previously unknown failure mechanisms, which could help all industry stakeholders. The Regions may have access to technical specialists who are best positioned to assist with an evaluation of this level of complexity.
Response: Thank you for your comment. **As stated in the Guidelines and Technical Basis section of the standard, the drafting team expects all owners to work jointly in making these determinations, freely sharing information with each other. The drafting team believes that owners almost always work together to resolve these issues. If an entity cannot reach agreement, but believes a Misoperation has occurred, it may involve its Regional Entity for help resolving the Misoperation.**		
Texas Reliability Entity	No	(1) We voted "no" on this draft because it is unclear who is responsible for various actions in multi-owner situations. The requirements need to clearly state who is responsible for compliance with each step of the identification, investigation, correction and reporting process. (2) We suggest that the team consider a solution such as: (a) the owner of the interrupting device should be required to identify the Misoperation and the suspected component that caused it, and then (b) the owner of the suspected component should be required to take the further steps to investigate and correct the problem and to submit the required reports. (3) Additional language is needed to clarify that, for Misoperation investigation and reporting purposes, the entity that owns the component that misoperated is required to submit the reports. Also, any CAP's should include the review of coordination issues between entities involved in the Misoperation.
Response: Thank you for your comment. **The drafting team has revised Requirement R1 to clarify who is responsible for what actions. Only the owner of a Protection**		

Organization	Yes or No	Question 4 Comment
System component that misoperated is responsible for documenting the findings, developing a CAP or action plan and reporting.		
PSEG	No	We believe that our alternative language in #2 and #3 above is clearer. In addition, a Misoperation analysis is required even when a cause cannot be determined. After that analysis is completed, an entity either develops a CAP or an action plan.
Response: Thank you for your comment. **Please see our response in Questions #2 & #3. The drafting team agrees that an analysis is required and the findings must be documented every time a Misoperation occurs, whether or not a cause is found.**		
Consumers Energy	No	R1.1 seems to be intending that the owner of the interrupting device perform the intial investigation. If a Misoperation is identified and the Protection System is owned by another entity, the wording of the standard is not clear about which entity should be responsible for the CAP, etc. The rationale paragraph covers this, but of course won't be included once the standard is finalized. Are both entities responsible for documenting the operation/Misoperation?
Response: Thank you for your comment. **The drafting team revised Requirement R1 to clarify who is responsible for what actions. Only the owner of a Protection System component that misoperated is responsible for documenting the findings, developing a CAP or action plan and reporting.**		
CenterPoint Energy	No	(a) CenterPoint Energy recommends deleting the second sentence in R1.1 that states: "If the entity suspects a Protection System component(s) owned by another entity contributed to a Misoperation, notify the owner of that Protection System component and provide any requested investigative information." CenterPoint Energy believes it is unnecessary to have a requirement to force entities to coordinate on misoperation analysis and corrective action, as there are existing avenues that are available, if necessary.(b) The CenterPoint Energy comments in Question 2 are related to this question. Establishing the applicability to the owner of the protective relays would establish the entity responsible for misoperations

Organization	Yes or No	Question 4 Comment
		reporting. CenterPoint Energy recommends R1 maintain only the wording from R1.3, resulting in the following wording for R1: "Investigate each Misoperation (if any) and document the findings including a cause for each Misoperation, if identified."
Response: Thank you for your comments. a) **The drafting team believes it is necessary to require communication in the standard. It is possible the owner of the Protection system component that misoperated will not be in a position to know that a Misoperation has occurred. Since they must meet the requirements in this standard, requiring communication ensures they will know they need to investigate.** b) **See our response in Question #2. The drafting team agrees that the owner of the Protection System component that misoperated is responsible for the CAP or action plan and reporting. The drafting team has revised Requirement R1 for clarity.**		
Detroit Edison	Yes	Yes - SDT did an excellent job with joint ownership issues.
Response: Thank you.		
Western Area Power Administration	Yes	An entity cannot be held responsible for another entity's failure to respond or act upon notice of a suspected misoperation.
Response: Thank you for your comment. **The drafting team revised Requirement R1 and Measure M1. Only the owner of a Protection System component that misoperated is responsible for documenting the findings, developing a CAP or action plan and reporting.**		
Exelon Corp.	Yes	o The standard needs to make it clear that an entity needs to provide information to another entity within a specified time period, e.g., a TO needs to provide information to a GO on a transmission line trip, within limitations of the FERC Standards of Conduct.
Response: Thank you for your comment. **Requirement R1 mandates all investigative work, including the passing of investigative information, be performed within 120 days**		

Organization	Yes or No	Question 4 Comment
of the interrupting device operation.		
Ameren Services	Yes	Yes, as long as the R1 rationale is augmented to clarify reporting responsibility as we recommend in items 2 and 3 of question 2 above.
Response: Thank you for your comment. **Please see our responses in Questions 2.**

5. **Attachment 1 lists and describes the data to be included in the quarterly reporting. Do you believe this data is appropriate for metric analysis? If not, please provide specific suggestions for improvement.**

Summary Consideration:

After consultation with NERC Legal staff and NERC's ERO Reliability Assessment and Performance Analysis group, the drafting team is removing the reporting obligations from the draft standard. The language in Compliance Section C 1.4 - Additional Compliance Information of the draft standard referencing reporting and Attachment 1 has been deleted. Also, because Attachment 1 was a reference document associated with the Quarterly Misoperation Reporting Form, it will not be posted with the draft standard. The removal of the reporting obligation from the draft standard does not result in a reduction of reliability. Compliance Section C 1.2 - Evidence Retention portion of the draft standard requires entities to retain evidence of compliance for audit and compliance purposes. Reporting is enforceable under NERC's Rules of Procedure, and NERC is currently in the process of preparing a data request under Section 1600 of the NERC Rules of Procedure. NERC would analyze the data collected pursuant to the data request, if approved, to develop meaningful metrics, identify trends in Protection System performance that negatively impact reliability, to identify remediation techniques, and publicize lessons learned for the industry. The data submitted as part of the proposed Section 1600 data request would not be used for compliance or enforcement purposes.

Organization	Yes or No	Question 5 Comment
Northeast Power Coordinating Council	No	An additional field should be added to improve the metric analysis of microprocessor relay malfunctions. For example, the field value for a microprocessor relay malfunction could include the following:Setting Error-Incorrect Numerical Input SpecifiedSetting Error-Incorrect User-Programmed Custom LogicIncorrect Design-Incorrect User ApplicationIncorrect Design-WiringFirmware Version Mismatch by UserOthers
Response: Thank you for your comment. **Please read the Summary Consideration for Question 5.**		
Tacoma Power	No	1) Why does an entity need to provide the Date Reported? It seems like the Regional Entity could provide this information based upon when they receive it. The person assembling the reporting data may not be the one actually submitting

Organization	Yes or No	Question 5 Comment
		it to the Regional Entity, and the submittal date may not coincide with dated that the reporting data is assembled. Therefore, two individuals may need to be involved. While not a lot of extra work, it is an additional administrative step in the process that seems to provide little value to reliability. 2) Additional information, or at least a reference to additional information, should be provided to describe TADS and GADS reportable events. 3) It seems like the following fields could be consolidated into one: Event Description/Analysis and Protection Systems/Components that Misoperated. 4) What penalties would be likely if an entity, acting in good faith, provides information that is later determined to be incorrect and is then updated in another reporting period? 5) Do all Mis-operations need to be submmitted with Submittal Type entered as 'Remove' before they no longer need to be resubmitted? Or, does the final submittal only need to have one of the following in the Resolution Status field, even if the Submittal Type is 'New' or 'Update':'Corrective Action Plan - Completed,' 'Action Plan - Completed,' or 'Declaration - Completed.'If a declaration is made, or an action plan is completed, and reported (submitted), does the associated Mis-operation need to be continually re-submitted while the status is 'Declaration - Completed' or 'Action Plan - Completed'? It seems like these two statuses are still somewhat open-ended. 6) Remove double slash in "Corrective Action Plan//Declaration Development Date."
Response: Thank you for your comments. **Please read the Summary Consideration for Question 5.**		
El Paso Electric	No	EPE believes the columns in Attachment 1 requesting Event Analysis Completion Date; Corrective Action Plan/Declaration Development Date; or Action Plan/Declaration Development Date does not contribute to improving protection system performance.

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comment. **Please read the Summary Consideration for Question 5.**		
Santee Cooper	No	The Incorrect Setting/Logic/Design Errors category needs to be split into separate categories to improve the data analysis. As relays get more complex, more of the protection system is becoming internal to the relay, and so this has become a disproportionately large category.
Response: Thank you for your comment. **Please read the Summary Consideration for Question 5.**		
Dominion	No	a). Eliminate the field "Additional BES Interruptions". This places unnecessary burden on entities to report interruptions that may not be associated with a Power System Misoperation. There is no need to track or collect this additional input. b). Instruction for Attachment 1 needs to include specific information as to when to fill out specific data in this field. The template currently requires a brief description in the Event Description field and details in the Corrective Action field when classified as Corrective Action in Progress. Once the Corrective Action Plan is completed, the instructions say to clear this field (which we disagree with) and input cause information under the Event Description field. Recommend renaming this field from Event Description/Analysi to Event Description.c). d). There should be a means to separate Generation and Transmission. This approach doesn't appear to give entities the option of separating reports. e). Please split Incorrect Setting/Logic/Design Errors into three separate categories to improve the usefulness of the metrics regarding Protection System performance. Provide examples how to separate settings from logic when it's all part of a smart relay setting. f). Please split Communication Failure into two separate categories, one for 'Power

Organization	Yes or No	Question 5 Comment
		Line Carrier' and one for 'non-Carrier' to improve the usefulness of the metrics regarding Protection System performance. g). Please eliminate the TADS and GADS information. TADS only counts lines and transformers that operate, not any other equipment. Instead request the total number of operations at each Equipment Voltage level because this is a more effective means of gathering the information for all Protection System operations. However the definition of an operation and rules for determining the number of operations will need some clarity. h). Drop the word "general" in the field name Misoperation General Cause". No need to introduce another undefined descriptive word. i). Remove the following fields: "Event Analysis Completion Date", "Corrective Action Plan/Declaration Development Date", and "Action Plan/Declaration Development Date". j). Revise "Target Resolution Completion Date" to "Resolution Target Date". k). Revise "Actual Resolution Completion Date" to "Resolution Completion Date". l). Prevent entry of data into a field that was made not applicable by a previous field selection.
Response: Thank you for your comments. **Please read the Summary Consideration for Question 5.**		
Luminant	No	1) The data provided by the quarterly report would have little, if any, reliability benefit to the BES due to the limited technical information provided in the Attachment. 2) Luminant recommends that a report be provided on an annual basis.
Response: Thank you for your comments.		

Organization	Yes or No	Question 5 Comment
Please read the Summary Consideration for Question 5.		
SERC Protection and Control Subcommittee (PCS)	No	1) Please change 'Time Zone' Field Value to prevailing time (e.g. CPT for Central Prevailing Time) to make reporting more efficient. 2) Please split Incorrect Setting/Logic/Design Errors into three separate categories to improve the usefulness of the metrics regarding Protection System performance. 3) Please split Communication Failure into two separate categories, one for 'Carrier' and one for 'non-Carrier' to improve the usefulness of the metrics regarding Protection System performance. 4) Please eliminate the TADS and GADS data submittals. Instead request the total number of operations at each Equipment Voltage level because this is a more effective means of gathering the information for all Protection System operations. The SERC PCS recommends that the rules for determining an "operation" be consistent between TADS and PRC-004 reporting. Also need to coalesce data systems (GADS, TADS , PRC-004, etc.)
Response: Thank you for your comments. Please read the Summary Consideration for Question 5.		
Colorado Springs Utilities	No	Attachment 1 does not describe data that is appropriate for metric analysis for a couple reasons: (1) This standard applies to both Generation Owners (GOs) and Transmission Owners (TOs); however, GOs are not in a position to respond to the last item on page 1, "Additional BES Interruptions." GOs are responsible for BES equipment in their plants and are not responsible for BES equipment belonging to TOs. Therefore, GOs should not be responsible for determining any BES interruptions outside of the plants. We recommend removing the section, "Additional BES Interruptions". (2) If TADS/GADS data is required for metric analysis, then an explanation should be

Organization	Yes or No	Question 5 Comment
		provided for why the data is required. We recommend that NERC or the Regional Entity provide an explanation for the relevance of the TADS/GADS data to the metric analysis.
Response: Thank you for your comments. **Please read the Summary Consideration for Question 5.**		
PPL Corporation NERC Registered Affiliates	No	a. GOs are not in a position to respond to the last item on p.1, "Additional BES Interruptions." We know only what happens in our plants, not repercussions on the grid. b. The "slow trip" entries in the "Misoperations Category" do not apply for the majority of Misoperations reported by GOs. The presence of such categories in the draft standard appears to derive from the belief that millisecond-resolution records of Misoperations are always available from DME; but, when this equipment is present at generation plants, it is installed only at the GSU and (if the GO is the owner) the yard breaker - that is, on high-side equipment. The DME is consequently not expected to yield any useful information for Faults occurring at the generator or other low-side components. Notes should be added to PRC-004-3 and the Application Guidelines to the effect that DME downloading and speed-of-response analysis pertain at generation Facilities only when DME is present and only to incoming Faults from the grid.
Response: Thank you for your comments. **Please read the Summary Consideration for Question 5.**		
Bonneville Power Administration	No	BPA believes the data needed for metric analysis depends on what NERC hopes to learn from the data.
Response: Thank you for your comment.		

Organization	Yes or No	Question 5 Comment
Please read the Summary Consideration for Question 5.		
GTC	No	1) Please change 'Time Zone' Field Value to prevailing time (e.g. CPT for Central Prevailing Time) to make reporting more efficient. 2) Please split Incorrect Setting/Logic/Design Errors into three separate categories to improve the usefulness of the metrics regarding Protection System performance. 3) Please split Communication Failure into two separate categories, one for 'Carrier' and one for 'non-Carrier' to improve the usefulness of the metrics regarding Protection System performance.
Response: Thank you for your comments. Please read the Summary Consideration for Question 5.		
ISO/RTO Standards Review Committee	No	It is unclear whether or not Attachment 1 is part of the standard that must be complied with. The SDT should clarify whether the misoperation information listed in Attachment 1 must be provided as specified. If that is the expectation, then the data requirements must be stipulated as a Requirement. As an Attachment without associated Requirements, we interpret that data submission as not mandatory.
Response: Thank you for your comment. Please read the Summary Consideration for Question 5.		
JEA	No	1) Attachment 1 Field Name: Misoperational General Cause Field Value: Incorrect settings/Logical Design Errors are not a misoperation since the protection system operated exactly as it was programmed. Improper setting should be handled in PRC-005 (maintenance and testing). If we are going to include things that cause a protection system to not protect then there is little justification for not considering other equally as destructive problems such as the breaker opening slowly. It is inconsistent to send the message that human error is a problem but

Organization	Yes or No	Question 5 Comment
		mechanical error is not. Also by excluding human error they could better correlate with TADS, since TADS excludes human error for relay settings. 2) Section 1.4 clearly shows this is a requirement and so if it is required then make it a requirement and if it is not required then delete it.
Response: Thank you for your comments. **Please read the Summary Consideration for Question 5.**		
Nebraska Public Power District	No	1) Need clarification on these items:For Registered Entity ID#: What is the option to fill in the field if the portion of the protection system that misoperated is owned by a non registered entity? 2) The fields Event Analysis Completion Date, Corrective Action Plan/Declaration Development Date, Action Plan/Declaration Development Date seem like they would not have much metric value and add extraneous information. These should be removed. 3) For the Reported By, Phone Number, and E-mail Address line items is this the compliance contact # for a utility or a specific person writing the report? Using specific names, email, and phone numbers can create issues either way. Perhaps it would be best to use more general contact information for the entities or a single point of contact so these line items would stay more constant.
Response: Thank you for your comments. **Please read the Summary Consideration for Question 5.**		
Southern Company	No	1) This list is not inclusive of the present RAPA form. The SDT should insure that the RAPA form is modified to only include the data specified in the Standard. 2) o The TADS information should be removed since there are plans to start reporting # of operations thereby allowing appropriate metric analysis o 3) However, we have a number of recommendations intended to improve the structure and clarity of the standard and Attachment 1: a) The requirement

Organization	Yes or No	Question 5 Comment
		for reporting should be in the Requirements and Measures section as a requirement rather than in the Compliance section C1.4.â€, Attachment 1 needs to be part of the standard since it is referenced in the standard. 4) b) The Registered Entity ID # is not needed as the data submission occurs via web based portals and the RE knows who is submitting the data based on the log in credentials of the submitter. This information is superfluous. 5) c) The "Event Analysis Completion Date" and "Corrective Action Plan/Declaration Development Date" fields are not required if the combined R1 & R2 suggestion is implemented along with the deadline for these requirements being the report date to the RE. 6) d) There are too many classification choices in the "Resolution Status" field. One of three choices should be adequate to tell the RE what stage of evaluation/resolution is active: 1) Analysis - In Progress, which means [Still Under Investigation]; 2) Analysis - Completed - Corrective Action Plan Pending; 3) Corrective Action - Completed, which means [Investigation Complete, Corrective Action Complete] 7) e) Both the "Target Resolution Completion Date" and the "Actual Resolution Completion Date" fields are not needed. We suggest using only the "Target" date field and have the RE look at the Resolution Status field to determine if the Action Plan is Completed. We believe that all of these reporting dates are not necessary. 8) f) The "Date Reported" field is not needed - the submission due dates are fixed by the RE (and have been repeated on page 21 of the Clean draft standard dated 6 Jul 2012. 9) g) We believe that a linkage to GADS reporting is not necessary. In the many years we have been processing relay operations, we have had no reason to review any GADS information. The mis-opeation reporting and resolutino can be processed without the addition of non-useful information.
Response: Thank you for your comments.		

Organization	Yes or No	Question 5 Comment
Please read the Summary Consideration for Question 5.		
ITC	No	If an entity is required to report a misoperation due to a malfunction of another entity's component, then there should be a space for the other Registered Entity's name.
Response: Thank you for your comment. **Please read the Summary Consideration for Question 5.**		
seattle city light	No	1) I) There are too many classification choices in the "Resolution Status" field of the report form. An equally effective status report can be delivered using three choices: 1) Analysis In Progress [Still Under Investigation]; 2) Analysis Completed - Corrective Action Plan Pending; 3) Corrective Action Completed [Investigation Complete, Corrective Action Complete] 2) II) The form for GOs should differ from that for TOs, for the following reasons: a. GOs are not in a position to respond to the last item on p.1, "Additional BES Interruptions." We know only what happens in our plants, not repercussions on the grid. 3) b. The "slow trip" entries in the "Misoperations Category" do not apply for the majority of Misoperations reported by GOs. The presence of such categories in the draft standard appears to derive from the belief that millisecond-resolution records of Misoperations are always available from DME; but, when this equipment is present at generation plants, it is installed only at the GSU and (if the GO is the owner) the yard breaker - that is, on high-side equipment. The DME is consequently not expected to yield any useful information for Faults occurring at the generator or other low-side components. Notes should be added to PRC-004-3 and the Application Guidelines to the effect that DME downloading and speed-of-response analysis pertain at generation Facilities only when DME is present and only to incoming Faults from the grid.

Response: Thank you for your comments. **Please read the Summary Consideration for Question 5.**		
Cleco Corporation	No	Our issue is not with the requested data but how the data is submitted. The current spreadsheet is very cubersome and needs to be reformatted.
Response: Thank you for your comment. **Please read the Summary Consideration for Question 5.**		
Wisconsin Electric	No	Under Equipment Type: Add an equipment Type, such as "Generator Tie Line", to indicate the conductors from the generator step-up transformer high-voltage terminals to the substation/switchyard bus. These conductors are not considered transmission Lines, so the "Line" equipment type designation would not be appropriate for these.
Response: Thank you for your comment. **Please read the Summary Consideration for Question 5.**		
Portland General Electric Company	No	1) The fields listed in Attachment 1 are sufficient. However, the quarterly reporting requirement is buried under the Compliance Monitoring Process, but should be a clear separate requirement for the registered entities under the standard. 2) The reporting requirement R2 of UVLS standard PRC-022 is slated to be retired per Project 2013-02, but 4.2.2 specifically excludes UVLS from this standard. This could result in UVLS misoperations not being reported.
Response: Thank you for your comments. **Please read the Summary Consideration for Question 5.**		
New York Power Authority	No	Need to explain the relevance of the TADS and GADS data to the calculation of the

Organization	Yes or No	Question 5 Comment
		metric.
Response: Thank you for your comment. **Please read the Summary Consideration for Question 5.**		
Exelon Corp.	No	1) o The list is good for a 50,000 foot level view of analysis results. Protection Systems are too complex and dissimilar to obtain meaningful analyses at the level of the Attachment. Also, understand that the purpose of Attachment 1 is not to trouble-shoot misoperation, only to provide a database of types of misoperations as a performance indicator. 2) o Item C1.4 - Additional Compliance Information requires the quarterly Misoperation Data - Attachment 1 to be submitted within two calendar months following the end of each calendar quarter. This does not allow for the time limits specified in requirements R1, R2, and R3 for investigating, identifying and creating a CAP for the associated misoperation.
Response: Thank you for your comments. **Please read the Summary Consideration for Question 5.**		
MISO	No	It is unclear whether or not Attachment 1 is part of the standard that must be complied with. The SDT should clarify whether the misoperation information listed in Attachment 1 must be provided as specified. If that is the expectation, then the data requirements must be stipulated as a Requirement. As an Attachment without associated Requirements, we interpret that data submission as not mandatory.
Response: Thank you for your comment. **Please read the Summary Consideration for Question 5.**		
Texas Reliability Entity	No	(1) Is Attachment 1 considered to be part of the Standard? If so, then future modifications to Attachment 1 would have to go through through the SDT process

Organization	Yes or No	Question 5 Comment
		and would entail extensive time and effort to make. (2) Under current practice, in many cases there is insufficient detail provided by the entities involved in a Misoperation to understand the root cause. There has been some discussion with the Protection System Misoperation Task Force (PSMTF) that additional data would be helpful in categorizing misoperations. In particular, it would be helpful to add subcategories below the misoperation general cause codes (i.e. Incorrect settings/logic design could have subcategories such as modeling errors, calculation errors, etc.). (3) The Periodic Data Submittal requirements and the template should be flexible enough to permit Regional Entities to collect additional information which may be beyond the scope of the PRC-004 Standard, if deemed necessary based on regional needs. For example, in ERCOT, the current regional rules for misoperation reporting also include failure to reclose, reporting the generator trips < 100kV, sudden pressure relay misoperations, SPS misoperations based on a regional definition, etc. These are included in the current template to streamline the reporting process for the Registered Entities, rather than requiring multiple reports. Since this information is outside the PRC-004 applicability, it is removed from the quarterly Misoperation reports by Texas RE before data is submitted to NERC. The previous draft of PRC-004-3 had flexibility in the periodic data submission language to allow this ("using the format specified by the ERO"), but that language was removed in the current draft.
Response: Thank you for your comments. **Please read the Summary Consideration for Question 5.**		
The United Illuminating Company	No	UI does not agree with including any of the reporting process in the PRC-004 standard or its attachments. The information to report does not require Ballot Body Approval initially or each time a field is to be modified.
Response: Thank you for your comment.		

Organization	Yes or No	Question 5 Comment
Please read the Summary Consideration for Question 5.		
Modesto Irrigation District	No	Resolution Status has too many options. Keep it simple. Suggest 1) Evaluation underway, 2) Evaluation Completed, Remediation activity begun, 3) Remediation activity complete.
Response: Thank you for your comment. **Please read the Summary Consideration for Question 5.**		
Liberty Electric Power LLC	No	Limit resolution status to "work in progress" and "complete".Forms are too complex, with many elements not used by generator operators (example:TADS), or not known by GOPs ("Other BED elements", etc.)
Response: Thank you for your comment. **Please read the Summary Consideration for Question 5.**		
Cogentrix Energy, LLC	No	1) There are too many classification choices in the “Resolution Status” field of the report form. An equally effective status report can be delivered using three choices:1) Analysis In Progress [Still Under Investigation]; 2) Analysis Completed - Corrective Action Plan Pending; 3) Corrective Action Completed [Investigation Complete, Corrective Action Complete] 2) The form for GOs should differ from that for TOs, for the following reasons:a. GOs are not in a position to respond to the last item on p.1, “Additional BES Interruptions.” We know only what happens in our plants, not repercussions on the grid. 3) b. The “slow trip” entries in the “Misoperations Category” do not apply for the majority of Misoperations reported by GOs. The presence of such categories in the draft standard appears to derive from the belief that millisecond-resolution records of Misoperations are always available from DME; but, when this equipment is present at generation plants, it is installed only at the GSU and (if

Organization	Yes or No	Question 5 Comment
		the GO is the owner) the yard breaker - that is, on high-side equipment. The DME is consequently not expected to yield any useful information for Faults occurring at the generator or other low-side components. Notes should be added to PRC-004-3 and the Application Guidelines to the effect that DME downloading and speed-of-response analysis pertain at generation Facilities only when DME is present and only to incoming Faults from the grid. 4) Further, the current draft standard does not dictate whether quarterly reporting to the CEA is required and enforceable, as it is currently (the term "will" as opposed to "shall"). 5) Additionally, there is no reference to reporting in a manner outlined by the CEA/RRO. The use of a common "form" is needed to achieve the usefulness and effectiveness of these data submittals.
Response: Thank you for your comments. **Please read the Summary Consideration for Question 5.**		
Independent Electricity System Operator	No	We have a difficulty determining whether or not Attachment 1 is part of the standard and therefore must be complied with. As presented, Attachment 1 is referenced under Section C 1.4, Additional Compliance Information. Section C specifies the compliance monitoring/audit evidence requirements and which are not regarded as a standard Requirement that must be complied with to achieve a reliability outcome. Further, as with the list of evidence presented in CANs and RSAWs, the information/record presented in these documents are examples of acceptable evidence. Deviations from the specified information are acceptable for so long as the information provided can demonstrate compliance with the Requirements. If the SDT holds the position that the misoperation information listed in Attachment 1 must be provided as specified, then the data requirements must be stipulated in a Requirement. Having data requirement not stipulated in a Requirement will render that data submission not mandatory.

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comments. **Please read the Summary Consideration for Question 5.**		
Sacramento Municipal Utility District	No	We feel the data is appropriate. 1) However, we feel the trending data is more appropriately collected thru NERC's Section 1600 process. As no clear information is provided how the data is to be utilized we don't believe it should identified nor included as a compliance component. Further, national trending may inappropriate skew information that may be region specific diluting the results. 2) Also, including the attachment in the standard would require a drafting team for any changes for requested data.
Response: Thank you for your comments. **Please read the Summary Consideration for Question 5.**		
CenterPoint Energy	No	(a) CenterPoint Energy is concerned that the 'Slow Trip - During Fault' misoperation example that is used in Attachment 1 may be misleading and could result in incorrect reporting; therefore, we recommend developing another example, such as, an 'Unnecessary Trip - During Fault' misoperation which is a more commonplace. Although there may not enough information included for the proposed example to know for certain, CenterPoint Energy suspects that there may have been a non-communications-based, directional time-overcurrent relay, which was part of the Protection System, which ultimately tripped the transmission line. Such a scenario may not be a reportable misoperation, as the proposed Misoperation definition for 'Slow Trip - During Fault' includes the following clarification: "Delayed Fault clearing associated with an installed high-speed protection scheme is a Misoperation if the high-speed performance is required to meet the performance requirements of the TPL standards or by coordination requirements with other Protection Systems." In other words, the following is stated in the Guidelines and Technical Basis: "Delayed

Organization	Yes or No	Question 5 Comment
		fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high speed performance is not required by planning studies associated with the TPL standards or by coordination requirements with other Protection Systems." (b) The 'Equipment Voltage (kV)' field in Attachment A states: "Enter the system voltage of the BES equipment associated with the Protection System that Misoperated. For transformers, use the high side voltage." While using the high side voltage could be appropriate for generator step-up transformers, CenterPoint Energy recommends the system voltage for autotransformers be based on the low side voltage, in order to provide consistency with other NERC criteria, including Reliability Standards, such as, PRC-023 Transmission Relay Loadability.
Response: Thank you for your comments. **Please read the Summary Consideration for Question 5.**		
Ameren Services	No	We suggest to (1) change 'Time Zone' Field Value to prevailing time (e.g. CPT for Central Prevailing Time) to make reporting more efficient. (2) split Incorrect Setting/Logic/Design Errors into three separate categories to improve the usefulness of the metrics regarding Protection System performance. (3) split Communication Failure into two separate categories, one for 'Carrier' and one for 'non-Carrier' to improve the usefulness of the metrics regarding Protection System performance. (4) eliminate the TADS and GADS data submittals. Instead request the total number of operations at each Equipment Voltage level because this is a more effective means of gathering the information for all Protection System operations. (5) Align Attachment 1 with the present reporting template to ease burden on entities. (6) We also believe that (a) Declarations should be included in the Attachment 1

Organization	Yes or No	Question 5 Comment
		reporting template and (7) (b) The reporting template should be contrived so that it automatically documents and thus provides much of the evidence required by the standard.
Response: Thank you for your comments. **Please read the Summary Consideration for Question 5.**		
Essential Power, LLC	No	1) There are too many classification choices in the "Resolution Status" field of the report form. An equally effective status report can be delivered using three choices:1) Analysis In Progress [Still Under Investigation]; 2) Analysis Completed - Corrective Action Plan Pending; 3) Corrective Action Completed [Investigation Complete, Corrective Action Complete] 2) The form for GOs should differ from that for TOs, for the following reasons:a. GOs are not in a position to respond to the last item on p.1, "Additional BES Interruptions." We know only what happens in our plants, not repercussions on the grid.b. The "slow trip" entries in the "Misoperations Category" do not apply for the majority of Misoperations reported by GOs. The presence of such categories in the draft standard appears to derive from the belief that millisecond-resolution records of Misoperations are always available from DME; but, when this equipment is present at generation plants, it is installed only at the GSU and (if the GO is the owner) the yard breaker - that is, on high-side equipment. The DME is consequently not expected to yield any useful information for Faults occurring at the generator or other low-side components. Notes should be added to PRC-004-3 and the Application Guidelines to the effect that DME downloading and speed-of-response analysis pertain at generation Facilities only when DME is present and only to incoming Faults from the grid. 3) Further, the current draft standard does not dictate whether quarterly reporting to the CEA is required and enforceable, as it is currently (the term "will" as opposed to "shall"). 4) Additionally, there is no reference to reporting in a manner outlined by the

Organization	Yes or No	Question 5 Comment
		CEA/RRO. The use of a common "form" is needed to achieve the usefulness and effectiveness of these data submittals.

6. **The team has included VRFs, VSLs, and Time Horizons with this posting. Do you agree with the assignments that have been made? If not, please provide specific reasons why not and alternative recommendations and justifications.**

Summary Consideration:

A large percentage of the entities that commented stated that the 10-day intervals between severity levels for Requirements R1, R2, or R3 were too short. The drafting team used the NERC guideline: "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its "Violation Severity Level Guidelines." However, based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.

Several commenters questioned the 'High' VRF for Requirement R4 because Part 4.2 appeared to be administrative. The drafting team revised Requirement R4 to eliminate the Parts and remove the administrative aspects from the requirement. The VRF was not changed.

Several commenters noted that the VSLs for Requirements R2, R3, and R4 were not always consistent with the language in the requirements and the drafting team corrected these inconsistencies.

A few commenters suggested that the VSLs for Requirement R1 should be based on multiple operations or a percentage of operations missed rather than the amount of time by which they were missed. The drafting team responded that: "Pursuant to Guideline 4 in FERC's Order on Violation Severity Levels document, "Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations."

A couple of commenters were concerned that the requirements didn't consider the varying level of impact that different types of Misoperations can have on the BES. The drafting team responded that the NERC Sanction Guidelines allow NERC or the regional entity to consider the specific circumstances of the violator to determine if the violation of the requirement in question actually produced the degree of risk or harm anticipated by the Violation Risk Factor when evaluating a violation.

Organization	Yes or No	Question 6 Comment
Northeast Power Coordinating Council	No	There should be no respopnse to this question. I can't deselect either "Yes" or "No".
Response: Thank you for your comment.		
Western Small Entity Comment Group	No	Violation risk factors should be entity specific based on the equipment owned and their place in the system and not on the requirement alone.
Response: Thank you for your comment. **The FERC-approved description of "Violation Risk Factor" is "Each requirement must have an associated violation risk factor (High, Medium, or Lower). The risk factor is one of several elements used to determine an appropriate sanction when the associated requirement is violated. The risk factor assesses the impact to reliability of violating a specific requirement." As the description indicates, each VRF is associated with a requirement and not on the equipment owned and their place in the system.**		
Associated Electric Cooperative Inc - JRO00088	No	On Page 11, the Severe VSL column's phrase containing "OR The responsible entity completed its review of a Protection System operation that operated one of its interrupting devices in 120 calendar days and determined the operation was a Misoperation and failed to designate the operation as a Misoperation in accordance with Requirement R1, Part 1.2. ":Append: "and the Responsible entity failed to perform the subsequent R1 Part 1.3 as well."Rationale: We fail to see the reason for severity of impact otherwise.
Response: Thank you for your comment. **The drafting team revised Requirement R1 and the associated VSLs.**		
Pepco Holdings Inc & Affiliates	No	The language in the VSL's for Requirement R2 should be changed to match the language in the Requirement. The present language uses the phrase "...following the completion of the investigation or receiving notification." That phrase should be eliminated and instead the phrase "...after the cause of the misoperation has been

Organization	Yes or No	Question 6 Comment
		identified" should be inserted.
Response: Thank you for your comment. **The drafting team modified each VSL to end with the phrase "following the identification of the cause of the Misoperation."**		
Souhwest Power Pool Reliability Standards Development Team	No	Most entities will be compliant or not. 1. We don't agree that the severity level needs to be raised based on being an additional 10 days late. We would suggest revisiting this section and possibly make the interval 30 days in between a severity increase. 2. The high VRF in requirement R4 applies to both 4.1 and 4.2. We agree that 4.1 should be a high VRF since it has to do with the actual implementation. On the other hand 4.2 seems to be purely administrative dealing only with maintaining implementation records. We don't agree that this is a high VRF. In fact we question if it should even be included in this requirement and should fall under the Paragraph 81 project that is ongoing.
Response: Thank you for your comments. **1. The drafting team used the NERC-recommended "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its Violation Severity Level Guidelines. Based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.** **2. Based on comments, the drafting team revised Requirement R4 to eliminate the Parts and remove the administrative aspects from the requirement. The associated VSLs were also revised.**		
Tacoma Power	No	Under the Lower and Moderate VSLs for R3, the description ends with "...following the associated interrupting device operation " Under the High and Severe VSLs, the description ends with "...following the completion of the investigation." Was this

Organization	Yes or No	Question 6 Comment
		difference intended? It seems that there should be consistency.
Response: Thank you for your comment. **The drafting team modified the High and Severe VSLs to be consistent with the Lower and Moderate VSLs.**		
El Paso Electric	No	Based on the NERC's definition of High - Violation Risk Factor, EPE believes the assignment of High Risk to R4 does not seem to be warranted. R4 combines the implementing and documentation of any corrective actions in connection with a misoperation, and does not impact the reliability of the BES. EPE believes a separation of the implementing process and documentation requirements may provide a solution.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement R4 to eliminate the Parts and remove the administrative aspects from the requirement. The associated VSLs were also revised.**		
Santee Cooper	No	As stated in Question 3, we do not feel the timetables involved are needed for ensuring operations and misoperations are handled appropriately. That being said, for R1 and R3, 30 days is a quick change from Lower to Severe. Suggest making the change for R1 and R3 should be proportionate to R2 (about 50%).
Response: Thank you for your comment. **The drafting team used the NERC-recommended "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its "Violation Severity Level Guidelines." Based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.**		

Organization	Yes or No	Question 6 Comment
Dominion	No	a). For R1 and R3 the escalation from Lower to Severe VSL in just 30 days is too short. Please make them more consistent with the requirement duration. As a comparison R2 escalates in 30 days, which is 50% of the time limit. We recommend keeping the 50% consistent for escalation to Severe with a limit of 210 days for R1 and 270 days for R3. b). By having specific 60 and 120 day requirements, this brings additional violation complexity to the process and is unessary. As stated previously, use same approach as COM 003 and eliminate the daily requirements. c). VSLs will need to address when a Misoperation is caused by an entity having no equipment operations where initial analysis is by first party and remainder of requirements apply to second party. (See comments to Question 4)
Response: Thank you for your comments. **a). The drafting team used the NERC-recommended "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its Violation Severity Level Guidelines. Based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.** **b). Thank you for your comment.** **c). The drafting team believes the revised requirements, measures and VSLs adequately address your concern.**		
Luminant	No	Change accordingly to the response to Q2 and Q3.
Response: Thank you for your comment. **The VSLs were adjusted to be congruent with the revised requirements.**		

Organization	Yes or No	Question 6 Comment
SERC Protection and Control Subcommittee (PCS)	No	While the SERC PCS does not see the need for timetables (see comment under #3), if they are put in place, we offer the following recommendations: 1) For R1 and R3 the escalation from Lower to Severe VSL in just 30 days is too short. Please make them more consistent with the requirement duration. As a comparison, R2 escalates in 30 days, which is 50% of the time limit. We recommend keeping the 50% consistent for escalation to Severe with a limit of 210 days for R1 and 270 days for R3. 2) R2 VRF measures duration from 'completion of the investigation or receiving notification' but R2 itself measures from 'identifying the cause(s) of each Misoperation'. Please change the VRF language to match R2 itself. The only notification we see is in R1, and it is inappropriate to measure CAP development duration from the time a component is only suspected.
Response: Thank you for your comments. **1) The drafting team used the NERC-recommended "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its Violation Severity Level Guidelines. Based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.** **2) Based on comments, the drafting team modified the Requirement R2 VSLs to be measured from the date of "identifying the cause(s) of each Misoperation."**		
ACES Power Marketing Standards Collaborators	No	(1) We agree with the classification of the VRFs. (2) The time horizons for R2, R3, and R4 are Long-term Planning, which is a planning horizon of one year or longer. There is a gap in the time horizons - the 180 day mark is longer than seasonal but shorter than 1 year. We recommend classifying these standards as Operations Planning, which would be consistent with R1.

Organization	Yes or No	Question 6 Comment
		(3) The violation severity level for R1 increases based on arbitrary timelines. It is conceivable that an entity could identify and review a Misoperation on day 150 (which would be a severe VSL) and complete the CAP 20 days after, which would still be within the 180 day timeframe (established by R1 with R2). The VSLs do not reflect the spirit of the standard and need to be revised with reasonable timelines. If R1 was not complete within 180 days, then that would be more justifiable for a high VSL and if an entity did not do anything that would be a reasonable justification for severe. (4) Also in R1 VSL, the second paragraph in the Lower section is almost identical to the second paragraph in severe, which is confusing and could lead to inconsistent application. We recommend revising the R1 VSLs for clarity and would like the SDT to consider creating VSLs that determine the severity level if R1 and R2 are not completed in a certain period of time. (5) Our concerns with the R2 VSL are similar to paragraph (3) above. It is conceivable that an entity could identify and review a Misoperation on day 30 and complete the CAP 70 days after (which would be a severe VSL), and would still be well within the total 180 day timeframe (established by R1 with R2). The VSLs do not reflect the spirit of the standard and need to be revised with reasonable timelines. If R1 was not complete within 180 days, then that would be more justifiable for a high VSL and not doing anything would be a reasonable justification for severe.

Response: Thank you for your comments.

(1) Thank you for your support.

(2) Requirements R2, R3, and R4 have dual Time Horizons of Operations Planning and Long-Term Planning. The drafting team recognizes that there is a gap in the VSL time frames, but addressing the timeframe gap is outside the scope of the drafting team.

(3) The drafting team believes the timeframes in the requirements are not arbitrary, but were established considering the impacts of seasonal weather-related operations. The timeframe associated with each VSL pertains to the individual requirement, and do not relate to the actions of other requirements and their associated VSLs.

Organization	Yes or No	Question 6 Comment
(4) The drafting team believes the two VSLs are sufficiently different such that no inconsistent application will occur. **(5) The timeframe associated with each VSL pertains to the individual requirement, and does not relate to the actions of other requirements and their associated VSLs.**		
Bonneville Power Administration	No	The time limits between the different VSL's are arbitrary. For example, if an operation is analyzed within 120 days there is no violation, but if it is analyzed after more than 150 days, only 25% later, it is a severe violation. BPA believes it would be more appropriate to have only a single violation severity level of low or moderate after the 120 day deadline.
Response: Thank you for your comments. **The NERC Violation Severity Guidelines do not allow for a single VSL that is Lower or Moderate; from page 2 "Requirements: If the requirement is a "pass or fail" type requirement or when any degree of noncompliant performance would result in totally or mostly missing the reliability intent of the requirement, then the single VSL must be "Severe". (This is not the same as saying that the requirement is really important and any noncompliance would have an adverse reliability impact – the impact to reliability should be addressed through the VRF, not the VSL.)"** **The drafting team used the NERC-recommended "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its Violation Severity Level Guidelines. Based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.**		
GTC	No	GTC does not agree with VSL R4 Lower VSL - Concerned statement "records were incomplete" is an opened quantifier and is not auditable, leaves to much room for interpretation for auditor. Request statement like "did not contain signed-off evidence of any revision(s) or completion of defined actionable items defined in document".

Organization	Yes or No	Question 6 Comment
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement R4 to eliminate the Parts and remove the administrative aspects from the requirement. The associated VSLs were also revised.**		
ISO/RTO Standards Review Committee	No	As a general comment on VRFs and VSLs, there does not seem to be a correlation between how a lack of address of a particular protection system operation is tied to how severe an impact it had or may have on the reliability of the BES. For example, an operation of an auxililary tripping relay for tap configuration substation does not have the same BES impact as a bus differential relay scheme in a full ring configuration substation.
Response: Thank you for your comment. **The FERC-approved description of "Violation Risk Factor" is "Each requirement must have an associated violation risk factor (High, Medium, or Lower). The risk factor is one of several elements used to determine an appropriate sanction when the associated requirement is violated. The risk factor assesses the impact to reliability of violating a specific requirement."** **However, the NERC Sanction Guidelines state that "Violation Risk Factors are assigned to standards' requirements as indicators of the expected risk or harm to the bulk power system posed by the violation of a requirement by a typical or median entity that is required to comply. NERC or the regional entity may consider the specific circumstances of the violator to determine if the violation of the requirement in question actually produced the degree of risk or harm anticipated by the Violation Risk Factor. If that expected risk or harm was not or would not have been produced, NERC or the regional entity may set the Base Penalty Amount to a value it (i) deems appropriate and (ii) is within the initial value range set above pursuant to Section 4.1." The drafting team believes that the NERC Sanction Guidelines address your comment.**		
JEA	No	1. This increases from low to severe by 10 day increments so if it takes you 5 months instead of 4 you are at a severe VSL. 2. Also missing just one review results in a severe level. Also not notifying an adjacent entity that you think they may have contributed to the problem is a severe violation - the severity should be based on the number of occurances. We think that 30 day increments are appropriate and severity levels should also be

Organization	Yes or No	Question 6 Comment
		based on the percentage of missed reviews such as 1%, 2%, 5%.
Response: Thank you for your comments. 1. **The drafting team used the NERC-recommended "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its Violation Severity Level Guidelines. Based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.** 2. **Pursuant to Guideline 4 in FERC's Order on Violation Severity Levels document, "Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the NERC Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations."**		
TVA Transmission Operations and Maintenance	No	The limits and time horizons are too restrictive and do not take into account if an entity is making a good faith attempt to investigate a misoperation and for reasons outside of its control, cannot meet the arbitrary numbers in this draft. There needs to be exemptions made for the safe operation of the transmission system to override the limits. Maybe some sort of deferral process with proposed dates to replace the time horizons when system conditions cannot support the necessary work required to investigate and correct.
Response: Thank you for your comments. **The drafting team used the NERC-recommended "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its Violation Severity Level Guidelines. Based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.**		

Organization	Yes or No	Question 6 Comment
Please note that the timeframes for the Corrective Action Plan or action plan are for development only and not for implementation.		
Nebraska Public Power District	No	1. Other comments and concerns stated for R1.1 would need to be addressed and modified in the VSLs. 2. The severe violation for failure to notifiy and provide requested investigative information should be removed. This will be difficult to audit and has a subjective nature. It also puts a burden on the sending utitilty where all aspects are not under their control especially if the receiver does not want to cooperate.
Response: Thank you for your comments. **1. The VSLs were adjusted to be congruent with the revised requirements.** **2. The drafting team believes that the VSLs for Requirement 1, Part 1.1 regarding the notification to the other entity and the response to the other entity are appropriate. No change was made based on this comment.**		
PacifiCorp	No	PacifiCorp is concerned that the VSLs are not commensurate with the reliability risk of the associated violations. In many cases, the difference between a "Lower" and a "Severe" VSL is an arbitrary additional number of days during which the reporting or documentation requirement was not satisfied. The fact that a report is an additional 30 days late should not increase the VSL from "Lower" to "Severe." A later report does not increase the likelihood of additional adverse impact to the BES. A registered entity's failure to remediate a protection issue is much more critical. A more reasonable timeframe for the VSLs would be 20 days per severity level instead of the proposed 10 days.
Response: Thank you for your comment. **The drafting team used the NERC-recommended "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL.**		

Organization	Yes or No	Question 6 Comment
To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its Violation Severity Level Guidelines. Based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.		
Western Area Power Administration	No	The metrics seem arbitrary and not linked to possible risk to the BES.
Response: Thank you for your comment. **The FERC-approved description of "Violation Risk Factor" is "Each requirement must have an associated violation risk factor (High, Medium, or Lower). The risk factor is one of several elements used to determine an appropriate sanction when the associated requirement is violated. The risk factor assesses the impact to reliability of violating a specific requirement."** **However, the NERC Sanction Guidelines states that "Violation Risk Factors are assigned to standards' requirements as indicators of the expected risk or harm to the bulk power system posed by the violation of a requirement by a typical or median entity that is required to comply. NERC or the regional entity may consider the specific circumstances of the violator to determine if the violation of the requirement in question actually produced the degree of risk or harm anticipated by the Violation Risk Factor. If that expected risk or harm was not or would not have been produced, NERC or the regional entity may set the Base Penalty Amount to a value it (i) deems appropriate and (ii) is within the initial value range set above pursuant to Section 4.1." The drafting team believes the NERC Sanction Guidelines address your comment.**		
Southern Company	No	a)VSLsfor the draft R1 and R2 should change based on the new time frame suggested in our response to Q2 and Q3. For the CAP development and documentation, keep only the "failed to develop..." as a VSL. b) The VSL shown for R3 reveals that R3 is not needed - the development and documentation of the CAP is the subject of the drafted R2, and the implementation of a CAP is the subject of the drafted R4. c) The severe VSL for R3 incorrectly lists implementation of the CAP as a measure - implementation of the CAP is the subject of the draft Requirement 4.â€‚â€‚ d) We suggest that the Severe VSL for R4 be the only VSL for that requirement.

Organization	Yes or No	Question 6 Comment
		e) The VRF for R4 is too high. It should match the other requirements - if the CAP is not implemented, there is no additional risk than if a Protection System operation is not reviewed. f) A new requirement for reporting to the RE should carry a low VRF.
Response: Thank you for your comment. **a) The VSLs were adjusted to be congruent with the revised requirements. The drafting team believes that a time frame for development of the Corrective Action Plan or action plan is appropriate to include in the VSLs.** **b) The drafting team disagrees. Requirement R3 is associated with an "action plan" that is required when a specific cause of the Misoperation is not discovered and not based on a Corrective Action Plan as defined in the NERC Glossary of Terms.** **c) Based on your comment, the drafting team removed the implementation component of the action plan from the Severe VSL for Requirement R3.** **d) Based on comments, the drafting team revised Requirement R4 to eliminate the Parts and remove the administrative aspects from the requirement. The associated VSLs were also revised.** **e) The FERC-approved description of "Violation Risk Factor" is "Each requirement must have an associated violation risk factor (High, Medium, or Lower). The risk factor is one of several elements used to determine an appropriate sanction when the associated requirement is violated. The risk factor assesses the impact to reliability of violating a specific requirement."** **However, the NERC Sanction Guidelines states that "Violation Risk Factors are assigned to standards' requirements as indicators of the expected risk or harm to the bulk power system posed by the violation of a requirement by a typical or median entity that is required to comply. NERC or the regional entity may consider the specific circumstances of the violator to determine if the violation of the requirement in question actually produced the degree of risk or harm anticipated by the Violation Risk Factor. If that expected risk or harm was not or would not have been produced, NERC or the regional entity may set the Base Penalty Amount to a value it (i) deems appropriate and (ii) is within the initial value range set above pursuant to Section 4.1." The drafting team believes the NERC Sanction Guidelines address your comment.** **f) The reporting obligations have been removed from the standard..**		
Okanogan PUD	No	In the VSL for R4 this is listed as a High Severity. We feel that small entities which are

Organization	Yes or No	Question 6 Comment
		on a 6 year audit cycle could have issues with document retention. Small entities 6 year entities do not have the resources to have the backup systems that larger entities. Also 6 year entities do not have the space and budget to ensure all documents are retained.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement R4 to eliminate the Parts and remove the administrative aspects from the requirement. The associated VSLs were also revised. The difference in audit cycles for different sized entities is outside the scope of the drafting team.**		
ITC	No	1. The interval between severity levels should be 30 days instead of 10 days. 2. For the lower severity level associated with R4, the standard of 'incomplete records' is subjective unless M4 is revised.
Response: Thank you for your comments. **1. The drafting team used the NERC-recommended "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its Violation Severity Level Guidelines. Based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.** **2. Based on comments, the drafting team revised Requirement R4 to eliminate the Parts and remove the administrative aspects from the requirement. The associated VSLs were also revised.**		
seattle city light	No	1. For R1, R2 and R3, SCL does not believe it is appropriate to increase the violation severity level based on the number of days beyond the required completion date. A company could have a great process and record of analyzing and correcting misoperations and receive a severe violation for a clerical error. Any potential violations in this area related to documentation and/or timing may fall into the "Find,

Organization	Yes or No	Question 6 Comment
		Fix, and Track" category or non-zero-defect treatment, and the VRF and VSL levels ought to be set in order to allow for the FFT process to apply. 2. It would be more appropriate to issue a lower VSL for a single instance of missing the required completion date or lacking documentation for a single event. A moderate or high VSL should be issued for missing multiple completion dates or lacking documentation in several areas. A severe VSL should be issued for not having a program or any evidence of achieving the requirement.
Response: Thank you for your comment. 1. **The drafting team used the NERC-recommended "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its "Violation Severity Level Guidelines." Based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.** 2. **Pursuant to Guideline 4 in FERC's Order on Violation Severity Levels document, "Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the NERC Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations."**		
Cleco Corporation	No	It seems to us the SDT spends too much time on the VRFs and VSLs. An Entity is either compliant or not and verifying whether you are within so many days seems perculiar. 1. Why was ten days choosen and not 30 or 45 days? 2. The high VRF in requirement R4 applies to both 4.1 and 4.2. We agree that 4.1 should be a high VRF since it has to do with the actual implementation. On the other hand 4.2 seems to be purely administrative dealing only with maintaining implementation records. We don't agree that this is a high VRF. In fact we question if it should even be included in this requirement and should fall under the Paragraph

Organization	Yes or No	Question 6 Comment
		81 project that is ongoing.
Response: Thank you for your comments. **1. The drafting team used the NERC-recommended "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its Violation Severity Level Guidelines. Based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.** **2. Based on comments, the drafting team revised Requirement R4 to eliminate the Parts and remove the administrative aspects from the requirement. The associated VSLs were also revised.**		
Wisconsin Electric	No	We suggest that the Time Horizon for all four Requirements should be the same, "Operations Planning, Long-Term Planning". R1 is presently listed as Operations Assessment, Operations Planning.
Response: Thank you for your comment. **The drafting team believes depending on the impact of the operation, this requirement may fall under the Operations Assessment time horizon and as such, no change was made to the standard.**		
Manitoba Hydro	No	Many of the requirements in this standard appear to be administrative or documentation based. It is therefore surprising to us that the VRFs and VSLs would be so high. As we understood it, NERC would like to eliminate documentation-based requirements. Was that not the purpose of Project 2013-02 Paragraph 81? For documentation-based requirements, the VSLs appear to have very little leeway. 1. For example, in R1 if an entity is 20 days late the VSL jumps to High. This seems disproportionate in comparison to the insignificant reliability impact that delaying the review by 20 days will have on the BES. An entity should be late by significantly more time to warrant going up to a High or Severe VSL.

Organization	Yes or No	Question 6 Comment
		2. In terms of the VRFs, we do not agree that structured misoperation reporting will reduce misoperations and therefore feel that the VRFs should be lowered from Medium (R1, R2, R3) and High (R4) to Low and Medium. 3. VSLs - R2 - The time frames should run from the 'identification of the cause(s) of each Misoperation' rather than completion of the investigation or receiving notification to be consistent with the requirement language. 4. VSLs - R3 - High VSL and Severe VSL - the timeframes should run from the 'associated interrupting device operation' not the completion of the investigation to be consistent with the requirement language. 5. Severe VSL - the word 'in' is missing from the first paragraph in describing more than 210 calendar days. 'Implement' should be removed from the second paragraph as this is not required in the language of the requirement; the 'ed' should be removed from documented.

Response: Thank you for your comments.

1. **The drafting team used the NERC-recommended "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its Violation Severity Level Guidelines. Based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.**
2. **The reporting obligations have been removed from the standard and no changes were made to the Violation Risk Factors.**
3. **Based on comments, the drafting team modified the Requirement R2 VSLs to be measured from the date of "identifying the cause(s) of each Misoperation."**
4. **The drafting team modified the High and Severe VSLs to be consistent with the Lower and Moderate VSLs in Requirement R3.**
5. **The drafting team made the suggested changes.**

Organization	Yes or No	Question 6 Comment
American Electric Power	No	1. The R1 VSL's should use percentages to determine the severity level. As written, a utility performing 99% of the identification, review, notification, designation and documentation correctly would receive a severe violation. 2. In the R4 VSL's, "The responsible entity failed to maintain records of a CAP or action plan" should be moved from severe to medium. The penalty for failing to document should be less than the penalty for failing to implement.
Response: Thank you for your comments. 1. **Pursuant to Guideline 4 in FERC's Order on Violation Severity Levels document, "Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the NERC Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations."** 2. **Based on comments, the drafting team revised Requirement R4 to eliminate the Parts and remove the administrative aspects from the requirement. The associated VSLs were also revised.**		
Portland General Electric Company	No	Severe VSLs should not be applied for lateness, only for failure to perform the required activity.
Response: Thank you for your comment. **The drafting team used the NERC-recommended "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its Violation Severity Level Guidelines. Based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.**		
LCRA Transmission Services Corporation	No	1. For R1, R2 and R3, we do not believe it is appropriate to increase the violation severity level based on the number of days beyond the required completion date. A company could have a great process and record of analyzing and correcting

Organization	Yes or No	Question 6 Comment
		misoperations and receive a severe violation for a clerical error. Any potential violations in this area related to documentation and/or timing may fall into the “Find, Fix, and Track” category, and the VRF and VSL levels ought to be set in order to allow for the FFT process to apply. It would be more appropriate to issue a lower VSL for a single instance of missing the required completion date or lacking documentation for a single event. A moderate or high VSL should be issued for missing multiple completion dates or lacking documentation in several areas. A severe VSL should be issued for not having a program or any evidence of achieving the requirement. We have no suggested change for R4.
Response: Thank you for your comment. **The drafting team used the NERC-recommended “Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended” description that is in its Violation Severity Level Guidelines. Based on stakeholder comments, the drafting team modified the tardiness time period in the ‘LOWER’ VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.**		
MISO	No	As a general comment on VRFs and VSLs, there does not seem to be a correlation between how a lack of address of a particular protection system operation is tied to how severe an impact it had or may have on the reliability of the BES.
Response: Thank you for your comment. **The FERC-approved description of “Violation Risk Factor” is “Each requirement must have an associated violation risk factor (High, Medium, or Lower). The risk factor is one of several elements used to determine an appropriate sanction when the associated requirement is violated. The risk factor assesses the impact to reliability of violating a specific requirement.”** **However, the NERC Sanction Guidelines states that “Violation Risk Factors are assigned to standards’ requirements as indicators of the expected risk or harm to the bulk power system posed by the violation of a requirement by a typical or median entity that is required to comply. NERC or the regional entity may consider the specific circumstances of the violator to determine if the**		

Organization	Yes or No	Question 6 Comment
violation of the requirement in question actually produced the degree of risk or harm anticipated by the Violation Risk Factor. If that expected risk or harm was not or would not have been produced, NERC or the regional entity may set the Base Penalty Amount to a value it (i) deems appropriate and (ii) is within the initial value range set above pursuant to Section 4.1." The drafting team believes the NERC Sanction Guidelines address your comment.		
Modesto Irrigation District	No	VSL levels should comport with the amount of errors/missed completions discovered, not time delay for a single missed completion.
Response: Thank you for your comment. **The drafting team used the NERC-recommended "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its Violation Severity Level Guidelines. Based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.**		
Liberty Electric Power LLC	No	Suggest removing R4 lower - too subjective.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement R4 to eliminate the Parts and remove the administrative aspects from the requirement. The associated VSLs were also revised.**		
Cogentrix Energy, LLC	No	Better clarity for the lower VSL associated with R4 should be provided. The term "incomplete" is too ambiguous. The current language leaves determination of "completeness" of documentation up to the auditor.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement R4 to eliminate the Parts and remove the administrative aspects from the requirement. The associated VSLs were also revised.**		

Organization	Yes or No	Question 6 Comment
Independent Electricity System Operator	No	We agree with the VRFs, VSLs and Time Horizons for R1, R2 and R3 but do not agree with the VRF and VSL for R4.We fully endorse the concept that a CAP needs to be implemented to ensure correct operations of the protective relay in question. However, not complying with R1 or R2 will result in not having a CAP to begin with. For this reason, we are unable to support a resulting requirement (R4) having a higher VRF than the prerequisite requirement at the front end. 1. We therefore suggest to change the VRF for R4 to a MEDIUM. 2. We also disagree with "The responsible entity failed to maintain records of a CAP or action plan." in R4 to be assigned a SEVERE VSL. The main intent of R4 is to implement the CAP, whose non-compliance warrants a SEVERE VSL. However, having implemented the CAP meets the main intent of R4 and hence missing the needed documentation does not contribute to adverse reliability impact. We therefore suggest the VSL for Part 4.2 to be a LOWER, or a MEDIUM at most.

Response: Thank you for your comment.

1. **The drafting team disagrees and declines to make the suggested change. The FERC-approved description of "Violation Risk Factor" is "Each requirement must have an associated violation risk factor (High, Medium, or Lower). The risk factor is one of several elements used to determine an appropriate sanction when the associated requirement is violated. The risk factor assesses the impact to reliability of violating a specific requirement."**

   However, the NERC Sanction Guidelines states that "Violation Risk Factors are assigned to standards' requirements as indicators of the expected risk or harm to the bulk power system posed by the violation of a requirement by a typical or median entity that is required to comply. NERC or the regional entity may consider the specific circumstances of the violator to determine if the violation of the requirement in question actually produced the degree of risk or harm anticipated by the Violation Risk Factor. If that expected risk or harm was not or would not have been produced, NERC or the regional entity may set the Base Penalty Amount to a value it (i) deems appropriate and (ii) is within the initial value range set above pursuant to Section 4.1." The drafting team believes the NERC Sanction Guidelines address your comment.

2. **Based on comments, the drafting team revised Requirement R4 to eliminate the Parts and remove the administrative aspects**

Organization	Yes or No	Question 6 Comment
from the requirement. The associated VSLs were also revised.		
NextEra Energy Inc.	No	NextEra disagrees with the approach taken in the VSLs that provides a range of days to determine the severity of the violation. The importance of investing and implementing a correct action plan for a misoperation varies on the type of misoperation and the need or not to implement a corrective action to address reliability. NextEra favors all aspects of the Reliability Standards moving to a risk, results based approach, including VSLs. Thus, the VSLs should be re-drafted to measure whether an entity has timely implemented a corrective action plan for misoperations that pose a risk to reliability, with consideration of the level of the risk and other factors such as complexity of the issue, costs and outages, etc.
Response: Thank you for your comment. **The drafting team used the NERC-recommended "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its Violation Severity Level Guidelines. Based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.**		
Ameren Services	No	(1) For R1 and R3 the escalation from Lower to Severe VSL in just 30 days is too short. We suggest that the SDT make them more consistent with the requirement duration. As a comparison R2 escalates in 30 days, which is 50% of the time limit. We recommend keeping the 50% consistent for escalation to Severe with a limit of 210 days for R1 and 270 days for R3. (2) R2 VRF measures duration from 'completion of the investigation or receiving notification' but R2 itself measures from 'identifying the cause(s) of each Misoperation'. We suggest t that the SDT change the VRF language to match R2 itself. The only notification we see is in R1, and it is inappropriate to measure CAP development duration from the time a component is only suspected.

Organization	Yes or No	Question 6 Comment
Response: Thank you for your comments. **(1) The drafting team used the NERC-recommended "Increments for Tardiness - Where there is a requirement with timing as an element that includes the number of days for delivering a product, identify a reasonable delay in delivering that product that would have only a minor impact on achieving the intent of the requirement and use that as the starting point for the Lower VSL. To develop the Moderate, High, and Severe VSLs, 10-day increments are recommended" description that is in its Violation Severity Level Guidelines. Based on stakeholder comments, the drafting team modified the tardiness time period in the 'LOWER' VSLs for Requirements R1 and R3 to 30 days and kept the 10-day increments for the increasing VSLs.** **(2) Based on comments, the drafting team modified Requirement R2 VSLs to be measured from the date of "identifying the cause(s) of each Misoperation."**		
Essential Power, LLC	No	Better clarity for the lower VSL associated with R4 should be provided. The term "incomplete" is too ambiguous. The current language leaves determination of "completeness" of documentation up to the auditor.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement R4 to eliminate the Parts and remove the administrative aspects from the requirement. The associated VSLs were also revised.**		
PSEG		We did not focus on the VRFs and VSLs and have no comments
Response: Thank you.		
City of Jacksonville Beach, FL dba/ Beaches Energy Services		(No Comment.)
Response: Thank you.		
Exelon Corp.	Yes	o Please confirm that the Application Guidelines material will be kept with the standard. One example of why this is important is so that the statement regarding

Organization	Yes or No	Question 6 Comment
		natural disasters and extenuating circumstances is included. Specifically, the Application Guidelines currently contain the following: “In the event of a natural disaster, note that the Sanction Guidelines of the North American Electric Reliability Corporation effective January 15, 2008 provides that the Compliance Monitor will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.”
Response: Thank you for your comment. **This material will be retained in the Guidelines and Technical Basis section of the standard.**		
Texas Reliability Entity	Yes	We generally agree, however the Severe VSL for R1 includes “and failed to notify and provide requested investigative information” but it doesn’t address the situation where the entity provided notification, but failed to provide “requested investigative information.” Also, the R1 VSL is overly complicated, perhaps showing that there are too many different elements in R1.
Response: Thank you for your comment. **Based on the comment, the drafting team modified the Severe VSL for Requirement R1 to state “…and failed to notify or provide requested investigative information…”**

7. **The team has included Measures and Data Retention with this posting. Do you agree with the assignments that have been made? If not, please provide specific suggestions for improvement.**

Summary Consideration:

Several commenters suggested that Measure 1 should align more with the reference information contained in the Guidelines and Technical Basis section of the standard. The drafting team responded by modifying Measure M1 for clarity and affirming that the Guidelines and Technical Basis section of the standard is not mandatory or enforceable and serves only as additional reference information.

Some commenters were confused by the boiler plate language in the Evidence Retention section while other commenters wanted the evidence retention periods shortened. The drafting team responded by removing the boiler plate sentence from the standard (first paragraph of C 1.2 Evidence Retention) that appeared to conflict with the "since the last audit" language in the second paragraph. The drafting team also reiterated that the evidence retention period should begin with the completion of the last audit period.

Some commenters in general believed Measures M1 and M4 were too restrictive. The drafting team revised the measures such that they list the minimum evidence required (if any) and provide examples of other acceptable evidence.

A few commenters requested more clarity regarding evidence retention for circumstances that crossed audit periods. The drafting team responded by adding the following language to Section C 1.2 "The Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System shall retain evidence for all Misoperations with an open investigation, action plan, or CAP even if the interrupting device operation occurred prior to the current audit period."

Organization	Yes or No	Question 7 Comment
Western Small Entity Comment Group	No	We disagree with M1 for the same reason we disagree with R1 in Q2 above.

Response: Thank you for your comment.

The drafting team believes that reviewing every operation is the only way to be sure that Misoperations are not missed. The extent of the review should be relevant to the operation.

Organization	Yes or No	Question 7 Comment
Pepco Holdings Inc & Affiliates	No	1. The proposed data retention requirements seem reasonable. However, the following comments are offered in order to improve clarity and avoid confusion regarding the wording of Measures M1 and M2. 1) The wording on Measure M1 should be revised to substitute Requirement numbers in place of Part numbers. For example, it should read “shall have evidence for Requirement R1.1 that....” Instead of “shall have evidence for Part 1.1 that....” 2. In addition, because the list of evidence is not all inclusive it should end with the phrase “or other records”. For example, “but is not limited to dated lists, logs, databases, or other records, that document...” 3. Measurement M2 requires evidence which must include a “dated CAP”. It is unclear what a “dated CAP” means. Does it refer to the date the CAP was developed; the date the CAP is proposed to be completed by; or both? This needs to be clarified.
Response: Thank you for your comments. **1. The drafting team is using the current NERC format, there are Requirements and Parts.** **2. The drafting team included the lead in statement “that may include, but is not limited to” to allow for inclusion of other types of acceptable evidence.** **3. The drafting team intends this to be the date the CAP development was formalized.**		
Tacoma Power	No	1. Referring to M4, change “...that must include...” to “...that may include...” 2. Referring to Evidence Retention, the first paragraph appears to conflict with the second. In the first paragraph, the draft standard says, “For instances where the evidence retention period specified below is shorter than the time since the last audit...” However, in the second paragraph, the draft standard says “...shall keep data or evidence to show compliance with...since the last audit...” Given the language in the second paragraph, how can the evidence retention period be less

Organization	Yes or No	Question 7 Comment
		than the time since the last audit, as the first paragraph suggests may be possible?
Response: Thank you for your comments. 1. **The drafting team revised Measure M4 such that it lists the minimum evidence required and provides examples of other acceptable evidence.** 2. **The drafting team removed the boiler plate sentence from the standard that appeared to conflict with the "since the last audit" language in the second paragraph.**		
Dominion	No	(If requirements change, measures need to change also. See comments to Question 4)
Response: Thank you for your comment.		
Luminant	No	1. Measure M1 should not be written to include "all interrupting device operations must be logged". Luminant recommends that the measure for Part 1.1 be revised from "each interrupting device" to "each applicable interrupting device". 2. M1 measures for part 1.2 and 1.3 would be "Acceptable evidence for Part 1.2 may include, but is not limited to, electronic or written documents that indicate the owner of was notified of the event associated with the operation. Acceptable evidence for Part 1.3 may include, but is not limited to, a copy of a dated investigation report or documented findings for Misoperation."
Response: Thank you for your comments. 1. **The drafting team made the suggested change to Measure M1.** 2. **The drafting team modified Measure M1.**		
ACES Power Marketing Standards Collaborators	No	The SDT referenced NERC Rules of Procedure, Appendix 4C (CMEP), Section 3.1.4.2 Period Covered for compliance data retention to begin with the day after the prior Compliance Audit and ending with the End Date for the Compliance Audit. However,

Organization	Yes or No	Question 7 Comment
		the SDT did not include the final two sentences in Section 3.1.4.2, which states: "However, if a Reliability Standard specifies a document retention period that does not cover the entire period described above, the Registered Entity will not be found in noncompliance solely on the basis of the lack of specific information that has rightfully not been retained based on the retention period specified in the Reliability Standard. However, in such cases, the Compliance Enforcement Authority will require the Registered Entity to demonstrate compliance through other means." Six years is excessive to maintain records for Corrective Action Plans. The SDT is within the bounds of the NERC Rules of Procedure to shorten that amount of time. We recommend three years for data retention for Correction Action Plans.
Response: Thank you for your comment. **The drafting team believes the evidence retention period should begin with the completion of the last audit period. The drafting team removed the boiler plate sentence from the standard that appeared to conflict with the "since the last audit" language in the second paragraph.**		
PPL Corporation NERC Registered Affiliates	No	M1 generically references lists, logs and databases, while the Application Guidelines cite much more specific evidence (sequence of events, relay targets, summary of DME records). By including different wording for a requirement in two separate documents, it creates ambiguity as to what is required by the Reliability Standard to demonstrate compliance. These two documents should be in seamless agreement.
Response: Thank you for your comment. **The drafting team modified Measure M1 for clarity. The Guidelines and Technical Basis section of the standard is not mandatory or enforceable and serves only as additional reference information.**		
Project 2010-05.1	No	For M4, FE would prefer to rewrite to the following: "Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R4 that may include, but is not limited to, "

Organization	Yes or No	Question 7 Comment
Response: Thank you for your comment. **The drafting team revised Measure M4 such that it lists the minimum evidence required and provides examples of other acceptable evidence.**		
Bonneville Power Administration	No	The language of M4 is that the evidence for R4 must include a list of five items, and the last item in the list is linked with "or". It is not clear if the evidence must include all five items in the list, or if only one item is required. Please clarify.
Response: Thank you for your comment. **The drafting team revised Measure M4 such that it lists the minimum evidence required and provides examples of other acceptable evidence.**		
Nebraska Public Power District	No	As mentioned above there are concerns with requirement R1.1 and M1. See comments for question 5.
Response: Thank you for your comment. **See our response for question 5.**		
Southern Company	No	1. The first paragraph of compliance Section 1.2 Evidence Retention is not needed and should be removed. (It is redundant to the second paragraph.) 2. M1 generically references lists, logs and databases, while the Application Guidelines cite much more specific evidence (sequence of events, relay targets, summary of DME records). These two documents should be in seamless agreement; we need to know specifically what will and will not be required when our records are audited, as opposed to being told when it's too late to do anything about it that our lists, logs etc do not constitute sufficient evidence.
Response: Thank you for your comments.		

Organization	Yes or No	Question 7 Comment
1. **The drafting team removed the boiler plate sentence from the standard that appeared to conflict with the "since the last audit" language in the second paragraph.** 2. **The drafting team modified Measure M1 for clarity. The Guidelines and Technical Basis section of the standard is not mandatory or enforceable and serves only as additional reference information.**		
Okanogan PUD	No	As stated in Questin 6, we feel that a 6 year data retention policy could prove onerous to small entities. We would prefer a much smaller data retention policy, such as 3 years (which would be the retetion period of large entities.
Response: Thank you for your comment. **The drafting team believes the evidence retention period should begin with the completion of the last audit period.**		
ITC	No	M1, M2, M3 seem sufficient. M4 is unclear. Please clarify. The following would be clearer. M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R4 that must include dated electronic or hard copy records that document the implementation, completion and any revision to each CAP or action plan. Acceptable records include, but are not limited to:- Dated work management program records- Dated Work orders- Dated Maintenance Records
Response: Thank you for your comment. **The drafting team revised Measure M4 such that it lists the minimum evidence required and provides examples of other acceptable evidence.**		
Wisconsin Electric	No	In M1, the acceptable evidence for Parts 1.1 and 1.2 should also include "electronic or hard copy records", as it does for the notification required by Part 1.1.
Response: Thank you for your comment. **The drafting team modified Measure M1 as requested.**		

Organization	Yes or No	Question 7 Comment
Manitoba Hydro	No	1. In R1 and its associated measure, the measure implies that more work needs to be done in terms of the level of review that the requirement itself. The requirement is vague and could be interpreted differently by different people. This requirement and measure should both be re-worded to be more clear and consistent. (See related comments under Question 2.) 2. Since for each Protection System operation, either R2 or R3 would apply, the words “As Applicable” should be added to these measures. 3. Also, in M1 the wording “Part 1.1” is used. This should say “Requirement R1.1”.
Response: Thank you for your comments. **1. The drafting team revised Requirement R1 and Measure M1. Please review the new requirement and measure.** **2. The lead in statement in each requirement gives the conditions when that requirement is applicable. The measure is associated with each requirement so if the requirement is not applicable then the measure is not applicable.** **3. The drafting team is using the current NERC format, there are Requirements and Parts.**		
Exelon Corp.	No	1. Measure M4 - change “must include” to “could include”. So the new wording is as follows: “Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R4 that could include, but is not limited to, dated electronic or hard copy records which document the implementation of each CAP and action plan, completion of actions and revisions for each CAP or action plan; dated work management program records, dated work orders, or dated maintenance records.”
Response: Thank you for your comment. **The drafting team revised Measure M4 such that it lists the minimum evidence required and provides examples of other acceptable evidence.**		

Organization	Yes or No	Question 7 Comment
City of Austin dba Austin Energy	No	The phrase “must include” in measure 4 should likely be “may include.”
Response: Thank you for your comment. **The drafting team revised Measure M4 such that it lists the minimum evidence required and provides examples of other acceptable evidence.**		
PSEG	No	We have proposed alternative Measures in #2 and #3 above and in #9 below. The Data Retention language is acceptable.
Response: Thank you for your comment. **See our responses to the associated questions.**		
Liberty Electric Power LLC	No	Disagree with the requirement for "each interrupting device activation" list - some activations are normal shutdown activations.
Response: Thank you for your comment. **The existing phrase “caused by a Protection System operation” excludes operation of devices initiated by operators. The use of reverse power relays for generator shutdown is excluded from the operations review. See the Guidelines and Technical Basis section of the standard referencing category (6) of the definition of Misoperation.**		
Cogentrix Energy, LLC	No	M1 generically references lists, logs and databases, while the Application Guidelines cite much more specific evidence (sequence of events, relay targets, summary of DME records). These two documents should be in seamless agreement; we need to know specifically what will and will not be required when our records are audited, as opposed to being told when it’s too late to do anything about it that our lists, logs etc do not constitute sufficient evidence.
Response: Thank you for your comment.		

Organization	Yes or No	Question 7 Comment
The drafting team modified Measure M1 for clarity. The Guidelines and Technical Basis section of the standard is not mandatory or enforceable and serves only as additional reference information.		
City of Tallahassee	No	I do not see any reference to Data Retention.
Response: Thank you for your comment. **See Section C 1.2 of the draft standard.**		
NextEra Energy Inc.	No	NextEra disagrees with the data retention periods, given that it is also submitting quarterly reports. Specifically, from a monitoring and compliance perspective, there should be no need to maintain all data in between audits if the entity is also submitting quarterly reports. Instead, the entity should only be required to maintain one years worth of data. Since, at any time, a regional entity can via a spot check or a compliance audit review data to access compliance, it seems redundant and onerous to require that the entity stockpile three to six years of data related to misoperatrions depending on their audit cycle. Moreover, such a data retention requirement seems to be inconsistent with NERC's movement to a risk and results based approach rather than a review of past evidence and a check list approach to compliance. Accordingly, NextEra requests that the data retention be reduced to only one year.
Response: Thank you for your comment. **The reporting obligations have been removed from the standard. The drafting team believes the evidence retention period should begin with the completion of the last audit period.**		
Essential Power, LLC	No	M1 generically references lists, logs and databases, while the Application Guidelines cite much more specific evidence (sequence of events, relay targets, summary of DME records). These two documents should be in seamless agreement; we need to know specifically what will and will not be required when our records are audited, as opposed to being told when it's too late to do anything about it that our lists, logs etc

Organization	Yes or No	Question 7 Comment
		do not constitute sufficient evidence.
Response: Thank you for your comment. **The drafting team modified Measure M1 for clarity. The Guidelines and Technical Basis section of the standard is not mandatory or enforceable and serves only as additional reference information.**		
City of Jacksonville Beach, FL dba/ Beaches Energy Services		(No Comment.)
Response: Thank you.		
SERC Protection and Control Subcommittee (PCS)	Yes	1) Please clarify that an entity is to retain evidence for all Misoperations with an open investigation, action plan, or CAP since the last audit even if the interrupting device operation occurred before the last audit.
Response: Thank you for your comment. **The drafting team added the following language to Section C 1.2 to address your concern "The Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System shall retain evidence for all Misoperations with an open investigation, action plan, or CAP even if the interrupting device operation occurred prior to the current audit period."**		
Southwest Power Pool Regional Entity	Yes	In Section C 1.2, the following sentence does not seem to make sense because there are no shorter time periods specified: "For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit."
Response: Thank you for your comment. **The drafting team believes the evidence retention period should begin with the completion of the last audit period. The drafting team removed the boiler plate sentence from the standard that appeared to conflict with the "since the last audit" language in the**		

Organization	Yes or No	Question 7 Comment
second paragraph.		
Sacramento Municipal Utility District	Yes	SMUD also encourages the development and concurrent posting of the Reliability Standard Audit Worksheet with the next standard posting.
Response: Thank you for your comment. **Your comment was forwarded to NERC staff.**		
Ameren Services	Yes	We suggest that the SDT clarify that an entity is to retain evidence for all Misoperations with an open investigation, action plan, or CAP since the last audit even if the interrupting device operation occurred before the last audit.
Response: Thank you for your comment. **The drafting team added the following language to Section C 1.2 to address your concern "The Transmission Owner, Generator Owner and Distribution Provider that owns a BES Protection System shall retain evidence for all Misoperations with an open investigation, action plan, or CAP even if the interrupting device operation occurred prior to the current audit period."**

8. The team has included an Implementation Plan with this posting. Do you agree with the changes? If not, please provide specific suggestions for improvement.

Summary Consideration:

Numerous commenters pointed out that the Implementation Plan did not reflect the twelve month implementation period established with the July posting. The drafting team modified the effective date to be "twelve months beyond the date that this standard is approved..."

Numerous commenters questioned how Protection System operations, Misoperations, CAPs, and reporting requirements will be transitioned from PRC-004-2a to PRC-004-3. The drafting team responded that the Implementation Plan provides entities 12 months to transition to the new requirements and compliance to PRC-004-3 is not required prior to the effective date of PRC-004-3. The reporting obligations have been removed from the standard, and the drafting team modified the Implementation Plan to distinguish between Protection System operations that occur before and after the effective date of the new standard.

Organization	Yes or No	Question 8 Comment
Pepco Holdings Inc & Affiliates	No	We agree with the timetable associated with the implementation of the new definition of a misoperation and for implementing the requirements in PRC-004-3. However, the following changes in the commentary included in the Implementation Plan should be made: 1) Re-word the definition of misoperation in accordance with the comments that we provided in Question 1 in this form. 2) Modify the list of "Facilities not included" to add Underfrequency Load Shedding (UFLS). 3) Modify the list of "Facilities not included" to expand on the Control section as follows: "Control (e.g. controlled shutdown of generators, capacitor bank switching, and SVC, FACTS and HVDC control system actions. Also see Guidelines and Technical Basis section for detailed examples)" Although the list is not intended to be all inclusive, mentioning the most frequently used control systems negates the need to

Organization	Yes or No	Question 8 Comment
		have to refer to the additional Guidelines and Technical Basis for most applications.
Response: Thank you for your comments. 1. **See our response to your comment in Question 1. The Implementation Plan will reflect any changes to definitions or the standard.** 2. **Misoperation of Underfrequency Load shedding is not handled by any other NERC standard so therefore must remain part of this standard. The drafting team clarified this by adding clause 4.2.2 to Applicability Section 4.2 of the draft standard.** 3. **The drafting team modified clause 4.2.4 of Applicability Section 4.2 to state: "Non-protective functions that may be imbedded within a Protection System are excluded."**		
Dominion	No	1.) Must include a specific plan of transitioning open investigations or CAPs to new standard requirements and reporting requirements. 2.) Specifically state when all other requirements are effective.
Response: Thank you for your comments. 1. **The Implementation Plan provides entities 12 months to transition to the new requirements and compliance to PRC-004-3 is not required prior to the effective date of PRC-004-3. The reporting obligations have been removed from the standard, and the drafting team modified the Implementation Plan to distinguish between Protection System operations that occur before and after the effective date of the new standard.** 2. **The section "Implementation Plan for Requirements R1, R2, R3 and R4" states the effective date for each requirement.**		
Operational Compliance	No	Establishing the "most stringent" standard between WECC & NERC requirements will be difficult and time-consuming. Regional standards should fully complement and enhance NERC Standards. To that end, the NERC standard PRC-004 should be written such that the related WECC standards CAN fully complement and enhance it.
Response: Thank you for your comment. **Regional standards must be more stringent than the Continent-wide NERC standard. The drafting team included the following in**		

Organization	Yes or No	Question 8 Comment
the Background section of the draft standard: "Note that the WECC Regional Reliability Standard PRC-004-WECC-1 relates to the reporting of Misoperations for a limited set of WECC Paths and Remedial Action Schemes. In those cases where PRC-004-WECC-1 overlaps with the Continent-wide standard, entities are expected to comply with the more stringent standard."		
American Electric Power	No	AEP does not have problem with the implementation plan; however, the implementation duration of six months is not consistent with the response in the SDT's Consideration of Comments which indicate it is 12 months.
Response: Thank you for your comment. **The effective date in the Implementation Plan has been changed to "twelve months beyond the date that PRC-004-3 is approved..." as previously stated in the last Consideration of Comments.**		
Exelon Corp.	No	o Implementation date: This standard is to go into effect on the first day of the first calendar quarter, 3 months after Board of Trustees adoption. This does not allow adequate time for the necessary programmatic and procedural changes required for a large organization. Suggest more time be allowed - such as one year after Board of Trustees adoption.
Response: Thank you for your comment. **The effective date in the Implementation Plan has been changed to "twelve months beyond the date that PRC-004-3 is approved..."**		
The United Illuminating Company	No	The implementation plan should recognize that the Requirements will be applied to the first protection system operation that occurs AFTER the effective dates. Any operations or misoperations or corrective action plans being implemented are not subject to this Standard.
Response: Thank you for your comment. **The Implementation Plan provides entities 12 months to transition to the new requirements and compliance to PRC-004-3 is not required prior to the effective date of PRC-004-3. The drafting team modified the Implementation Plan to distinguish between**		

Organization	Yes or No	Question 8 Comment
Protection System operations that occur before and after the effective date of the new standard.		
PSEG	Yes	No comments.
Ameren Services	Yes	(1) Are Misoperations with open CAP to be transitioned from PRC-004-2a to PRC-004-3 as Update Submittal Type once it becomes effective? (2) Six months after approval may be too short a time to modify processes and software to efficiently meet the PRC-004-3 requirements and supporting evidence.
Response: Thank you for your comments. **1. The Implementation Plan provides entities 12 months to transition to the new requirements and compliance to PRC-004-3 is not required prior to the effective date of PRC-004-3. The reporting obligations have been removed from the standard, and the drafting team modified the Implementation Plan to distinguish between Protection System operations that occur before and after the effective date of the new standard.** **2. The effective date in the Implementation Plan has been changed to "twelve months beyond the date that PRC-004-3 is approved..."**		
SERC Protection and Control Subcommittee (PCS)	Yes	Are Misoperations with open CAP to be transitioned from PRC-004-2a to PRC-004-3 as 'Update' Submittal Type once it becomes effective?
Response: Thank you for your comment. **The Implementation Plan provides entities 12 months to transition to the new requirements and compliance to PRC-004-3 is not required prior to the effective date of PRC-004-3. The reporting obligations have been removed from the standard, and the drafting team modified the Implementation Plan to distinguish between Protection System operations that occur before and after the effective date of the new standard.**		
ACES Power Marketing Standards Collaborators	Yes	1. Why is UFLS not excluded when UVLS is? 2. Also, are registered entities required to perform the 120-day assessment at least once before the enforceable date? Please refer to CAN-0012, which provides that if

Organization	Yes or No	Question 8 Comment
		the standard is silent to performing a periodic activity, the entity can perform the first activity after the enforceable date.
Response: Thank you for your comments. 1. **Misoperation of Underfrequency load shedding is not addressed by any other NERC standard so therefore must remain part of this standard. UVLS Misoperations are addressed in PRC-022-1.** 2. **Compliance to PRC-004-3 will not be required before the effective date of PRC-004-3.**		
Santee Cooper	Yes	Need to clarify how misoperations that are still not completed are going to be transitioned.
Response: Thank you for your comment. **The Implementation Plan provides entities 12 months to transition to the new requirements and compliance to PRC-004-3 is not required prior to the effective date of PRC-004-3. The reporting obligations have been removed from the standard, and the drafting team modified the Implementation Plan to distinguish between Protection System operations that occur before and after the effective date of the new standard.**

9. **If you have any other comments on this Standard that you have not already provided in response to the prior questions, please provide them here.**

Summary Consideration:

Many commenters had questions surrounding the completion of a CAP when evaluating the possibility of a similar Misoperation at other locations. The drafting team responded with the following: "An evaluation of the CAP's applicability at other locations is intended to encourage diligence to prevent the same cause from creating another misoperation and having an adverse effect on reliability. It is the responsibility of the Protection System owner to determine how wide spread the situation is and include the appropriate actions in its CAP. The CAP is complete when the evaluation and all actions specified by the entity in the CAP are complete. The evaluation in Requirement R2 does not require prescribing actions at other locations. If the entity prescribes actions at other locations in its CAP then the CAP is not complete until all the specified actions are completed."

A few commenters had questions surrounding the time limits associated with the requirements. An overall time limit for Requirements R1, R2 and R3 is not practical as many factors can delay the investigative findings in Requirement R1 or Requirement R4 (action plan) such as outage constraints and resource limitations. The sequential nature of the 60 days in Requirement R2 is important as Requirement R2 could follow either a Misoperation cause found in Requirement R1 or a Misoperation cause found in Requirement R4 via an 'action plan' execution. If the cause is found via an 'action plan', the entity may likely need an additional 60 days to create a CAP and is now beyond the 180 days. The Guidelines and Technical Basis section of the draft standard has been revised to add clarity for the independent 120 and 60 day timeframes.

A few commenters had questions surrounding the time limits associated with CAP duration and completion. The drafting team responded with the following: Establishing fixed time limits for the completion of CAPs is impractical because of the wide spectrum of Misoperation causes and the variety of corrective actions. A schedule or timetable is required to be included in the CAP.

A few commenters questioned the difference between a CAP and an action plan. The drafting team explained that a CAP is developed when the cause of the Misoperation and corrective actions have been determined. In instances where the entity's initial investigations do not determine the cause of the Misoperation; the entity would develop an action plan to perform more in-depth investigations. If the investigation does not provide direction for identifying the cause, then pursuing further action is not warranted. In these cases, documenting the reasons is essential for justifying the close out of the Misoperation investigation process and for future reference.

Several commenters had concerns with the amount of administrative burden. To eliminate some of the administrative burden, the drafting team revised Requirement R4 and Measure M4 removing the revision tracking for a CAP or an action plan. The requirements

and associated documentation help ensure the responsible entities are diligent about Misoperation response, CAP creation and completion. Consequently, the drafting team does not believe this documentation detracts from the reliable operation of the BES.

Several commenters had concerns that the standard implied additional monitoring equipment must be installed. The drafting team responded with the following: The standard does not require any additional monitoring equipment to be installed. Each responsible entity must review each of its Protection System operations and determine whether the operation should be categorized as a Misoperation based on its available information. The entity will use whatever means at their disposal in order to determine whether the operation was correct or not which may include available Disturbance Monitoring Equipment.

Several commenters had concerns about the consistency of the Facilities section of the draft standard with regards to the Facilities Section of PRC-005-2, as well as the interpretation attached to the existing standard PRC-004-2a. In response, the drafting team revised the Facilities section by: 1) revising 4.2.1 to read: Protection Systems for BES Elements; 2) adding 4.2.2 which reads: Underfrequency Load Shedding (UFLS) that trips a BES Element; 3) restructuring 4.2.3 to read: Special Protection Systems (SPS), Remedial Action Schemes (RAS), and Undervoltage Load Shedding (UVLS) are excluded; and 4) revising 4.2.4 to read: Non-protective functions that may be imbedded within a Protection System are excluded.

Organization	Yes or No	Question 9 Comment
Cogentrix Energy, LLC		1. Compliance section C1.4 contains a requirement to report to the RE - this needs to be in the requirement section of the standard.
Response: Thank you for your response. **Please see the drafting team's decision surrounding 'reporting' in the Summary Consideration for Question 5 on Page 141 of this document.**		
Dominion		1. R2 introduces the idea of a CAP "that includes an evaluation of the CAP's applicability to the entity's Protections Systems at other locations". R4 states "maintain detailed implementation records of CAP including dated information surrounding any revision(s) and completion". With all this said, is the CAP complete once we evaluate "identify every location where a similar problem may exist" or is the CAP only complete when all locations are fixed? 2. There is no need to log revision(s) to the CAP. Having a current CAP available at

Organization	Yes or No	Question 9 Comment
		any point in time should be sufficient without tracking CAP changes. 3. In the Rationale for R4 it states “fully implemented”. We interpret this to mean fully evaluated and not fully fixed at all other locations?
Response: Thank you for your comment. **1 An evaluation of the CAP’s applicability at other locations is intended to encourage diligence to prevent the same root cause from creating another misoperation and having an adverse effect on reliability. It is the responsibility of the Protection System owner to determine how wide spread the situation is and include the appropriate actions in its CAP. The CAP is complete when the evaluation and all actions specified by the entity in the CAP are complete.** **2 The drafting team revised Requirement R4 to eliminate the tracking aspects for CAP revisions.** **3 ‘Fully implemented’ was intended to mean all steps of the CAP or action plan have been completed. The drafting team replaced the term ‘fully implemented’ with ‘completed.’ The evaluation in Requirement R2 does not require prescribing actions at other locations. If the entity prescribes actions at other locations in its CAP then the CAP is not complete until all the specified actions are complete.**		
Texas Reliability Entity		(1) R2 assumes that one or more “Protection System component(s)” has previously been “identified”, but there is no preceding requirement that requires any such identification of components. R2 seems to infer that it is the owner of the component that caused the Misoperation who must act, but it is not expressly stated who is responsible for this requirement. (2) We agree with the approach of R2, however, we would suggest the following changes to wording to clarify this requirement by requiring certain elements in each Corrective Action Plan: R2. Within 60 calendar days of identifying the cause(s) of each Misoperation, each applicable Entity shall: o Develop and document a Corrective Action Plan (CAP) and work timetable to resolve the cause(s) of the Misoperation that includes the following: 1. Interim corrective actions (if any),

Organization	Yes or No	Question 9 Comment
		2. Final corrective actions, 3. An evaluation of the CAP's applicability to the entity's Protection Systems at other Facilities, 4. An evaluation of the CAP's applicability to Protection System component(s) owned by another Registered Entity (if applicable for the specific event),or o Explain in a declaration why corrective actions are either beyond the entity's control, applicable to another Registered Entity, or would reduce BES reliability. (3) In R4: Implementation of the CAP should include a time limit. We suggest re-wording R4.1 to say "Implement the CAP or action plan within 180 calendar days after developing the CAP or action plan, or per the CAP or action plan timetable, whichever is longer."

Response: Thank you for your comment.

1 **The drafting team has clarified Requirement R1 to show that the interrupting device owner will do the initial investigation and will contact other Protection System owners only if a correct operation cannot be determined. In this case, the investigative information is passed from the interrupting device owner to the other owners. The standard requires all owners to confirm whether their portions of the Protection System operated correctly or not within 120 days of the interrupting device operation. As stated in the Guidelines and Technical Basis section of the standard, the drafting team expects all owners to work jointly in making these determinations, freely sharing information with each other. Only the owner of a Protection System component that Misoperated is responsible for documenting the findings, developing a CAP or action plan.**

2 **The drafting team believes the existing wording of Requirement R2 provides adequate clarity and allows an entity to determine its appropriate response based on each individual event.**

3 **A part of each CAP or action plan is its timetable. It is the responsibility of each entity to follow the timetable once they have established it. The drafting team recognizes that during the implementation process it might be necessary to modify the original timetable and Requirement R4 allows for this. The 180 day criteria proposed would only impact a CAP or action plan with an implementation timetable of less than 180 days. If an entity discovers it is unable to meet the initial timetable they can modify their schedule to a date they can meet even if it exceeds the 180 days, making the proposed criteria unnecessary.**

Organization	Yes or No	Question 9 Comment
Ameren Services		(1) R2 states that the CAP applies to the identified Protection System component(s). But then goes on to say the CAP “includes an evaluation of the CAP’s applicability to the entity’s Protection Systems at other locations.” It is unclear whether the entity is required to take corrective actions at those other locations in order to complete the CAP. Our reading and expectation is that the entity completes the CAP, when they complete the identified work at the location of this Misoperation. We would expect the entity to initiate a program to address the other locations over some reasonable time period. (2) We suggest that the SDT reword C.1.4 from “Each Transmission Owner, Generator Owner, and Distribution Provider that owns BES protection Systems will submit the data identified in PRC-004 - Attachment 1 to the CEA...” to “For Misoperation(s) caused by BES Protection System it owns, each Transmission Owner, Generator Owner, and Distribution Provider will submit the data identified in PRC-004 - Attachment 1 to the CEA...” This clarifies who is responsible for submitting when multiple entities are involved. (3) Attachment 1 “Action Plan/Declaration Development Date” example data should be “N/A”. (4) Application Guidelines - Reporting section on page 20 states ‘...the fourth ranked initiating cause of BES outages not related to weather was “Failed Protection System Equipment.” Given the high ranking of this metric, it is appropriate to collect data on Protection System Misoperations for analysis to drive improvements in Protection System reliability.’ While this may be true in terms of number of events, is sensationalizes the Failed Protection System Equipment cause. In fact Failed Protection System Equipment is a very minor cause of unavailability. For full context, we suggest that the SDT also state: (a) the total number of non-weather related causes; b) the total number of causes; (c) its rank when BES outages related to weather are included; d) the top three non-weather related causes; (e) its rank in terms of BES unavailability; and f) the % of unavailability caused by Failed Protection

Organization	Yes or No	Question 9 Comment
		System Equipment. (5) M4 on page 8: We suggest t that the SDT replace 'must include' with 'may include' because some items do not apply to every CAP or action plan. Clearly the entity must document the implementation of each CAP and action plan, beyond that the range of documentation will vary depending on the situation. (6) Ameren agrees with and supports the comments of the SERC Protection & Control Subcommittee. (7) We suggest that the SDT augment the Application Guidelines Requirement 2 examples on page 17 to include "an evaluation of the CAP's applicability to the entity's Protection Systems at other locations." (8) We suggest that the SDT modify the Application Guidelines Requirement 1 wording on top of page 18 to make it clear that the suggested information should only be included as appropriate. The cause of some Misoperations is quite obvious and does not need copious tests, DFR records, and the like. For example, carrier switch may've been in the wrong position. (9) Editorial comments: a) p4 Applicability box - replace 'RMS' with 'RAS'; b) p5 Background 3rd line - Misoperation should be singular.

Response: Thank you for your comment.

1 **An evaluation of the CAP's applicability at other locations is intended to encourage diligence to prevent the same root cause from creating another misoperation and having an adverse effect on reliability. It is the responsibility of the Protection System owner to determine how wide spread the situation is and include the appropriate actions in its CAP. The CAP is complete when the evaluation and all actions specified by the entity in the CAP are complete.**

2 **The reporting obligations have been removed from the standard. Please see the drafting team's decision surrounding 'reporting' in the Summary Consideration for Question 5 on Page 141 of this document.**

3 **The drafting team will forward these comments to the NERC Protection System Misoperations Task Force and the NERC System Protection and Control Subcommittee for content consideration.**

Organization	Yes or No	Question 9 Comment
4 Providing all the suggested detail would not improve the standard. The drafting team revised the text to minimize the emphasis. **5 The drafting team retained the 'must include' because it is the minimum evidence required for a CAP or action plan but modified the second sentence to state 'may also include.'** **6 Please see the drafting team responses to the SERC PCS comments.** **7 This type of evaluation would include items such as a relay firmware revision or an error found in an entity's "standard" protection logic that has been deployed at multiple locations. It is the responsibility of the Protection System owner to determine how wide spread the situation is and take the appropriate corrective actions. The drafting team has added example language to the Guidelines and Technical Basis section of the standard.** **8 Text revised to read '…contains the sequence of events, relay targets and a summary and Disturbance Monitoring Equipment (DME) records as appropriate.'** **9 The drafting team made the corrections.**		
ACES Power Marketing Standards Collaborators		(1) There is ambiguity in R4, part 4.2, "maintaining detailed implementation records," which could be interpreted in different ways by auditors as to the degree of detail that is needed for implementation records. The measures give examples of acceptable methods to achieve compliance and therefore we recommend striking the word "detailed" from part 4.2. Further 4.2 is strictly a data retention requirement, which is administrative in nature and should be removed. This is the type of requirement that Paragraph 81 is currently in the process of retiring. (2) In part 4.2.3 of the applicability section, the SDT needs to emphasize that relay functions are not included in the definition of Protection Systems. By explicitly stating that certain non-protective functions that may be embedded within a Protection System are excluded, it could be interpreted that anything else that was not explicitly mentioned in the requirement could be included, such as sudden pressure relays. We recommend adding additional detail to this section for clarity. (3) Does the SDT intend to remove the old definition of Misoperations from the

Organization	Yes or No	Question 9 Comment
		background section? It does not need to remain as supplemental information with the passing of the new definition. We understand that certain aspects of the standard would be removed, such as the rationale boxes, but there is no mention that background section would be removed. (4) In the application guideline, Requirement R3 section, first paragraph first sentence - "If the Misoperation cause is not identified within 120 days, and reasonable investigative actions have not been exhausted, Protection System owners are expected to exercise due diligence in the development and implementation of an action plan for additional investigation." This sentence needs to clarify what reasonable means. It appears from this statement that if you did not exhaust all reasonable investigations, then you should continue additional investigations, but at that point, you would be in violation of R1. The SDT needs to consider rewording this sentence, possibly striking the underlined portion of the sentence. (5) In the application guideline, Requirement R4 section, second paragraph - this paragraph is discussing the goals of R3 and we recommend moving this paragraph to the R3 section. Thank you for the opportunity to comment.

Response: Thank you for your comment.

1. **Based on comments, the drafting team revised Requirement R4 to eliminate the Parts and remove the administrative aspects from the requirement.**
2. **The drafting team revised the Facilities section of the standard based on yours and others comments.**
3. **The Background section is included in the final version of the approved standard.**
4. **Not determining a cause within 120 days would not be a violation of Requirement R1. If a cause has not been determined within the 120 days then Requirement R3 comes into play and the owner needs to develop an action plan or a declaration explaining why no further actions will be taken. The word "reasonable" is not in the requirement and is not mandatory or enforceable. The Guidelines and Technical Basis section of the standard provides information only.**
5. **The paragraph referenced in the comment discusses the action plan once it has been created in accordance with Requirement**

Organization	Yes or No	Question 9 Comment
R3. The bulk of the paragraph discusses Requirement R4 and calls for implementing the action plan and developing a CAP or declaration based on the determination of a cause via the action plan. The drafting team believes the paragraph is in the appropriate location.		
Independent Electricity System Operator		(1) There is no specific mention of UFLS and hence it is assumed that this standard applies to UFLS as well. However, there is no basis on why UFLS is included but UVLS is excluded in the Section A - 4.2 “Applicability”. There is also an apparent inconsistency between “Facilities not included” listed in section A.4.2.2 and definition related to under-voltage protection systems. The provision under 4.2 excludes the UVLS and capacitor switching from the applicability of the standard, and at the same time the definition (paragraph 2) gives as example of “other than fault”conditions the misoperation of under-voltage protection systems. (2) In the Background Section, a NOPR is mentioned but there is no specific information as to which NOPR it references. Need to add the relevant information. (3) The word “of” is missing from the bullet at the top of P.5 of the clean version.
Response: Thank you for your comment. 1 UFLS that trips a BES Element are covered by PRC-004-3. For clarity, the drafting team added the following in the included Facilities portion of the Applicability section 4.2.2 in the draft standard “Underfrequency Load Shedding (UFLS) that trips a BES Element”. The example of under-voltage does not refer to UVLS. 2 Based on your comment, the drafting team removed the reference to the NOPR and replaced it with FERC Order No. 693. 3 The drafting team corrected the error.		
Pepco Holdings Inc & Affiliates		1) In Section 4.1.3 the wording should be changed to “Distribution Provider that owns a transmission Protection System”. This makes it consistent with the wording from previous versions of PRC-004, which recognized that it only applies to owners of Protection Systems that are applied to protect BES facilities. 2) A new Section 4.2.2.3 “Underfrequency Load Shedding (UFLS)” should be added

Organization	Yes or No	Question 9 Comment
		under the Applicability Section “Facilities not included.” Although UFLS schemes are Protection Systems covered under PRC-005 and are installed to preserve the BES from system underfrequency disturbances, they should not be included in this standard. Failing to specifically exclude them from this standard may lead to the assumption that they are by omission, included. Performance of UFLS schemes during system events are already covered in PRC-009, and as such do not need to be included in PRC-004-3. 3) Modify the list of “Facilities not included” to expand on the Control section as follows: “Control (e.g. controlled shutdown of generators, capacitor bank switching, and SVC, FACTS and HVDC control system actions. Also see Guidelines and Technical Basis section for detailed examples)” Although the list is not intended to be all inclusive, mentioning the most frequently used control systems negates the need to have to refer to the additional Guidelines and Technical Basis for most applications. 4) On page 6 of the Background section of PRC-004-3 there is a typographical error on the second bulleted item, “Analyze Misoperations of Protective Systems for Facilities ....” The word “of” is missing. 5) Also in the Background section the reason for the exclusion of UFLS should be addressed. 6) In Requirement R2 first bullet item remove the phrase “for the identified Protection System component(s)”. The term “component” should not be used, as it may lead to confusion. Individual Protection System component failures do not require a CAP unless the overall performance of the Composite Protection System for an Element was compromised. The bullet should instead read: “Develop and document a Corrective Action Plan (CAP) to address the identified misoperation that includes...”. 7) By NERC definition each CAP must contain a timeline for implementation. Requirement R4.1 requires you to complete the CAP. Does that mean that to be fully compliant the CAP must be completed within the proposed timeline stated in the

Organization	Yes or No	Question 9 Comment
		CAP? If so, there needs to be a mechanism to revise the proposed completion date when circumstances arise that prevent implementation in accordance with the originally proposed timeline (denial of facility outages, equipment delivery problems, major storm events, etc.) without being held non-compliant. 8) R4.2 “implies” that the CAP can be revised (presumably including the proposed completion date) as long as it is documented. If this is a correct interpretation of R4.2 then there is a mechanism to revise a CAP’s proposed completion date. On the other hand, this would allow the implementation of a CAP to be extended indefinitely by continuing to revise the proposed completion date. We doubt this is what the Standard Drafting Team intended. As such, the SDT may want to revisit the language dealing with revisions to a CAP.

Response: Thank you for your comment.

1 **The drafting team believes the Applicability section is clear and retains the intent of previous versions of PRC-004. In PRC-004-3, the functional entities are specified in Applicability section 4.1 and the Facilities are specified in Applicability section 4.2.**

2 **UFLS that trips a BES Element are covered by PRC-004-3. For clarity, the drafting team added the following in the included Facilities portion of the Applicability section 4.2.2 in the draft standard “Underfrequency Load Shedding (UFLS) that trips a BES Element”.**

3 **The drafting team revised the Applicability section and included the examples of non-protective functions in the Guidelines and Technical Basis section of the standard.**

4 **The drafting team corrected the error.**

5 **UFLS that trips a BES Element are covered by PRC-004-3.**

6 **Requirement R2 deals with an operation that has been determined to be a Misoperation and the cause was identified. This stage would not be reached unless the overall performance of the composite Protection System for an Element was compromised.**

7 **The drafting team agrees and revised Requirement R4.**

8 **The drafting team believes the Protection System owner should be allowed the freedom to draft and modify the CAP. The**

Organization	Yes or No	Question 9 Comment
Protection System owner has the option of writing a declaration explaining why no further action will be taken.		
Santee Cooper		1) R2 states that the CAP applies to the identified Protection System component(s). But then goes on to say the CAP "includes an evaluation of the CAP's applicability to the entity's Protection Systems at other locations." As it is presently handled, the entity can complete the CAP when the work at the place the misoperation took place is complete, and then the entity is responsible for its assessment/implementation at other locations (implementation of which may take a lot longer). However, the new standard needs to clearly state if this expectation is still the case, or if something different is now warranted. 2) Application Guidelines - Reporting section on page 20 states '...the fourth ranked initiating cause of BES outages not related to weather was "Failed Protection System Equipment." Given the high ranking of this metric, it is appropriate to collect data on Protection System Misoperations for analysis to drive improvements in Protection System reliability.' While this may be true in terms of number of events, it sensationalizes the Failed Protection System Equipment cause. In fact Failed Protection System Equipment is a very minor cause of unavailability. For full context, please also state: a) the total number of non-weather related causes; b) the top three non-weather related causes; and c) its rank in terms of BES unavailability. 3) All references to an investigation report should be changed to read "Misoperation investigation report" or "investigation report due to misoperations". Without this change it could be interpreted that all operations require an investigation report. This section is a very good description of what data may be used in an investigation report, but, for clarity of compliance purposes, it should be a little more defined as to which part of this is compliance-related and which parts are just informative. 4) Suggest having a more general statement such as "A misoperation investigation report should be of sufficient detail to either ascertain the cause of the misoperation or else describe the work performed/being performed to analyze the misoperation." For example, if you find a piece of equipment failed (powered down), a sequence of

Organization	Yes or No	Question 9 Comment
		events or DME records are not needed to figure out the cause, and so should not be required in the Misoperation investigation report. Along those same lines, we suggest adding a "may" and an "or" to the third sentence of page 18 "The initial evidence, which may also be documented separately, may contain the sequence of events, relay targets, and/or a summary of Disturbance Monitoring Equipment (DME) records."
Response: Thank you for your comment. 1 An evaluation of the CAP's applicability at other locations is intended to encourage diligence to prevent the same root cause from creating another misoperation and having an adverse effect on reliability. It is the responsibility of the Protection System owner to determine how wide spread the situation is and include the appropriate actions in its CAP. The CAP is complete when the evaluation and all actions specified by the entity in the CAP are complete. The evaluation in Requirement R2 does not require prescribing actions at other locations. If the entity prescribes actions at other locations in its CAP then the CAP is not complete until all the specified actions are complete. 2 Providing all the suggested detail would not improve the standard. The drafting team revised the text to minimize the emphasis. 3 The drafting team agrees and made the suggested change. 4 Text revised to read '…contains the sequence of events, relay targets and a summary and Disturbance Monitoring Equipment (DME) records as appropriate.'		
SERC Protection and Control Subcommittee (PCS)		1) R2 states that the CAP applies to the identified Protection System component(s). But then goes on to say the CAP "includes an evaluation of the CAP's applicability to the entity's Protection Systems at other locations." It is unclear whether the entity is required to take corrective actions at those other locations in order to complete the CAP. Our reading and expectation is that the entity completes the CAP, when they complete the identified work at the location of this Misoperation. We would expect the entity to initiate a program to address the other locations over some reasonable time period.

Organization	Yes or No	Question 9 Comment
		2) Please reword C.1.4 from "Each Transmission Owner, Generator Owner, and Distribution Provider that owns BES protection Systems will submit the data identified in PRC-004 - Attachment 1 to the CEA..." to "For Misoperation(s) caused by BES Protection System it owns, each Transmission Owner, Generator Owner, and Distribution Provider will submit the data identified in PRC-004 - Attachment 1 to the CEA..." This clarifies who is responsible for submitting when multiple entities are involved. 3) Application Guidelines - Reporting section on page 20 states '...the fourth ranked initiating cause of BES outages not related to weather was "Failed Protection System Equipment." Given the high ranking of this metric, it is appropriate to collect data on Protection System Misoperations for analysis to drive improvements in Protection System reliability.' While this may be true in terms of number of events, it sensationalizes the Failed Protection System Equipment cause. In fact Failed Protection System Equipment is a very minor cause of unavailability. For full context, please also state: a) the total number of non-weather related causes; b) the top three non-weather related causes; and c) its rank in terms of BES unavailability. 4) A significant effort has been expended in developing the current PRC-004 misoperations template. The SERC PCS recommends that the SDT leverage this effort in consideration of misoperations reporting (Atta 1). 5) The SERC PCS recommends that the application guidelines be used for assessing misoperations and not for operations. 6) All references to an investigation report should be changed to read "Misoperation investigation report" or "investigation report due to misoperations". Without this change it could be interpreted that all operations require an investigation report. This section is a very good description of what data may be used in an investigation report, but, for clarity of compliance purposes, it should be a little more defined as to which part of this is compliance-related and which parts are just informative. (7) Suggest having a more general statement such as "A misoperation investigation

Organization	Yes or No	Question 9 Comment
		report should be of sufficient detail to either ascertain the cause of the misoperation or else describe the work performed/being performed to analyze the misoperation." For example, if you find a piece of equipment failed (powered down), a sequence of events or DME records are not needed to figure out the cause, and so should not be required in the Misoperation investigation report. Along those same lines, we suggest adding a "may" and an "or" to the third sentence of page 18 "The initial evidence, which may also be documented separately, may contain the sequence of events, relay targets, and/or a summary of Disturbance Monitoring Equipment (DME) records."

Response: Thank you for your comment.

1. **An evaluation of the CAP's applicability at other locations is intended to encourage diligence to prevent the same root cause from creating another misoperation and having an adverse effect on reliability. It is the responsibility of the Protection System owner to determine how wide spread the situation is and include the appropriate actions in its CAP. The CAP is complete when the evaluation and all actions specified by the entity in the CAP are complete. The evaluation in Requirement R2 does not require prescribing actions at other locations. If the entity prescribes actions at other locations in its CAP then the CAP is not complete until all the specified actions are complete.**
2. **The reporting obligations have been removed from the standard. Please see the drafting team's decision surrounding 'reporting' in the Summary Consideration for Question 5 on Page 141 of this document.**
3. **Providing all the suggested detail would not improve the standard. The drafting team revised the text to minimize the emphasis.**
4. **The drafting team will forward these comments to the NERC Protection System Misoperations Task Force and the NERC System Protection and Control Subcommittee for content consideration.**
5. **There are examples in the Guidelines and Technical Basis section of the standard for accessing what is considered a misoperation and what is not considered a misoperation. The Guidelines and Technical Basis section of the standard provides information only.**
6. **The drafting team agrees and made the suggested change.**

Organization	Yes or No	Question 9 Comment
7 Text revised to read '…contains the sequence of events, relay targets and a summary and Disturbance Monitoring Equipment (DME) records as appropriate.'		
Xcel Energy		1) Regarding R1.1, it is not clear which entity would report the Misoperation, or be responsible for the remaining requirements. Would it be a joint responsibility? Please consider revising the requirement to indicate that the entities must agree on which one would handle the misoperation process, while the other would support as needed. 2) Consider including RAS/SPS, UVLS, UFLS under the applicability and eliminating the standards associated with misoperations on those specific types of protection systems.
Response: Thank you for your comment. **(1) The drafting team has clarified Requirement R1 to show that the interrupting device owner will do the initial investigation and will contact other Protection System owners only if a correct operation cannot be determined. In this case, the investigative information is passed from the interrupting device owner to the other owners. The standard requires all owners to confirm whether their portions of the Protection System operated correctly or not within 120 days of the interrupting device operation. As stated in the Guidelines and Technical Basis section of the standard, the drafting team expects all owners to work jointly in making these determinations, freely sharing information with each other. Only the owner of a Protection System component that Misoperated is responsible for documenting the findings, developing a CAP or action plan.** **(2) RAS and SPS will be addressed in Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS. It is beyond the scope of this team to eliminate existing standards other than PRC-003-1 and PRC-004-2a. UFLS that trips a BES Element are covered by PRC-004-3.**		
GTC		1) Why are UFLS schemes included in this standard but UVLS schemes are omitted? GTC recommends the addition UFLS be added to the list under Applicability section 4.2.2 (ex. 4.2.2.3). 2) Lastly, the overall tone of the document drives entities to focusing more labor and work on the documentation of an event than completion of a correctable action. In

Organization	Yes or No	Question 9 Comment
		addition, the dates for requirements and implementation seem to be defining how entities must perform work and does not give flexibility for entity to respond appropriately to problems. Possible to drive entities to provide a quick fix so they can close out documents instead of spending the appropriate time studying the event and define true root cause. Standard needs to measure performance by documenting events as misoperations with defining root cause. Should not cover expectations of an entity and drive them to a particular performance which may drastically change their business model and performance.
Response: Thank you for your comment. **(1) UFLS that trips a BES Element are covered by PRC-004-3. See the revised Facilities 4.2.2. The performance of UVLS schemes is covered by PRC-022-1.** **(2) The standard provides flexibility to the Protection System owners to set the timetables within their CAPs or action plans. There are also provisions to revise the timetables if the situation warrants.**		
Exelon Corp.		1) In the Introduction section, Applicability includes Distribution Provider. If this standard is for Protection Systems that are part of the BES, does a DP belong in the list of Functional Entities? 2) To what extent would an entity have to defend a determination that a system operation is considered to be a correct operation, if there is limited data to make the determination? This should be addressed in the Application Guide. 3) The Application Guidelines state that reverse power relay operations used for control of a generator (when a reverse power relay is used to trip a breaker during generator shutdown) are "not included in the definition of Misoperation and its operation would not be reviewed under this standard." Since it can be debated whether a reverse power relay is used for control or generator protection, the Application Guidelines should remove the verbiage about the "control" aspect of this relay. The Application Guidelines should just state that "expected reverse power relay operations, such as those encountered when a generator comes off-line, would

Organization	Yes or No	Question 9 Comment
		not be required to be reviewed under this standard." This comment is not intended to remove the entire Application Guidelines discussion on control aspects of relays being excluded from needing a review under this standard. Rather, the intent of this comment is to revise the Application Guidelines so as to preclude any discussion over whether a reverse power relay is a control device or a protective device - and just list the exclusions for this relay, and any similar generator relays. 4) Exelon requests that the SDT clarify within the Standard that the interrupting device itself referenced in the Standard draft is also considered an element of the Bulk Electric System. Specifically, please clarify that a device on a radial line that does not affect the BES is excluded from this requirement. Suggest that this clarification be added to the Application Guidelines. 5) PRC-004 Requirement R1 requires that each Generator Owner identify and review each Protection System operation associated with an interrupting device operation. The SDT should re-evaluate this requirement as it implies that all generating facilities have established monitoring systems that will capture such events. Although some generating units do have existing monitoring systems (such as Disturbance Monitoring Equipment) not all generating units have such capability nor are they all required to install such monitoring equipment in accordance with existing FERC approved Standards. 6) Exelon agrees with the SDT revision to remove the requirement in R1 that an entity shall have and implement a "procedure" to identify and address all Protection System Misoperations within its system and that an existing Corrective Action Program will meet the intent of the Standard; however, the SDT response to the Exelon and Constellation comments submitted in the previous draft (Consideration of Comments in response to the 6/10/11 - 7/11/11 draft) is inaccurate and warrants clarification. The original Exelon comment was: "Nuclear GO/GOPs have an existing Corrective Action Program that is required by 10 CFR 50 Appendix B Criterion XVI (quoted below). This regulatory requirement and associated mandatory implementation of a Corrective Action Program by a Nuclear GO/GOP fully envelopes the intent of the

Organization	Yes or No	Question 9 Comment
		draft revision to PRC-004. An additional "procedure" to identify and address all Protection System Misoperations with set timelines and attributes is not necessary."XVI. Corrective Action Measures shall be established to assure that conditions adverse to quality, such as failures, malfunctions, deficiencies, deviations, defective material and equipment, and non-conformances are promptly identified and corrected. In the case of significant conditions adverse to quality, the measures shall assure that the cause of the condition is determined and corrective action taken to preclude repetition. The identification of the significant condition adverse to quality, the cause of the condition, and the corrective action taken shall be documented and reported to appropriate levels of management." The SDT response documented is as follows: "Thank you for your comments. These requirements cannot be used as a substitute for PRC-004-3 since they do not apply to Protection Systems on the electrical side of nuclear plants. In Order 706-B, FERC stated that much of a nuclear plant does not fall under the rules of the NRC. The NRC rules are applicable to the portions of the nuclear plant related to handling of radiological fuel, security and safety. NERC rules apply to the portion of the plant not under the rules of the NRC. BES electrical Protection Systems do not fall under the rules of the NRC." As a point of clarification, the SDT response that references Order 706-B indicates that BES electrical systems would not fall under NRC regulation. In summary, FERC Order 706-B "clarifies that the facilities within a nuclear generation plant in the United States that are not regulated by the U.S. Nuclear Regulatory Commission are subject to compliance with the eight mandatory 'CIP' Reliability Standards approved in Commission Order No. 706." In November 2010 FERC and the Nuclear Regulatory Commission (NRC) came to understand that because changes in electrical power output affect nuclear reactor core reactivity, NRC would have oversight of these "balance of plant" systems. FERC formalized this understanding in FERC Order issued March 10, 2011, Docket No. RM06-22-014, "...we find that the NRC's cyber security rule appears to cover all balance of plant, and no balance of plant at a U.S. nuclear power plant has been found to be subject to NERC's CIP Standards." It should be noted that the NRC required Corrective Action Program (regulatory requirement

Organization	Yes or No	Question 9 Comment
		information as documented above) applies to all systems, structures and components of a nuclear generating unit and therefore should be an acceptable method of complying with the revised Standard.

Response: Thank you for your comment.

1 **Distribution Providers that own Protection Systems that protect Facilities that are part of the BES are and should be included as applicable entities in this standard.**

2 **The entity will use whatever means at their disposal in order to determine whether the operation was correct or not which may include available DISTURBANCE MONITORING EQUIPMENT.**

3 **The section in the Guidelines and Technical Basis section of the standard concerning reverse power relays states "…the operation of the control component or the function when not providing protection is not included in the definition of Misoperation and its operation would not be reviewed under this standard." The drafting team declines to make the suggested change.**

4 **Protection Systems for Facilities that are part of the BES are included in the standard. The Applicability section, 4.2 Facilities 4.2.1 states this. The drafting team believes this adequately exempts non-BES equipment.**

5 **The standard does not require any additional monitoring equipment to be installed. Each Generator Owner must review each of its Protection System operations and determine whether the operation should be categorized as a Misoperation based on its available information. The entity will use whatever means at their disposal in order to determine whether the operation was correct or not which may include available DISTURBANCE MONITORING EQUIPMENT.**

6 **The drafting team continues to believe that our previous response is correct and the NERC standard does apply.**

Organization	Yes or No	Question 9 Comment
Southern Company		1) There needs to be some consistency between the proposed PRC-004, and PRC-005. How can one say a given Protection System needs to be maintained for the BES Reliability, but not necessarily operations analyzed. The Applicability of PRC-004: Protection Systems for Facilities that are part of the BES. The Applicability of PRC-005-2: 4.2.1 Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.) 2) Please clarify the PRC-004 Applicability related to generators. It would indicate that

Organization	Yes or No	Question 9 Comment
		all protection systems at a generating plant that is part of the BES would be included. Is that the intent or is it only the Protection Systems associated with the protection of the Generator and/or step-up bank? 3) We suggest separating the Guideline and Technical Basis document from the remainder of the standard so that the document is less overbearing. â€,â€, 4) As stated in the responses to several earlier questions, we recommend combining R2 with R1 and making the deadline for each the date of reporting to the RE, eliminating R3, renumbering R4 to R2, adding the revised version of Attachment 1 to the standard, and adding a new requirement which specifies the reporting responsibilities that are contained in the Compliance section C1.4. Based on our experience as a large utility in investigating, tracking, and reporting relay operations and misoperations, we believe these changes will be simpler, more efficient, more cost effective to implement while still achieving the desired goals.

Response: Thank you for your comments.

(1) The drafting team believes there is appropriate consistency between PRC-004-3 and PRC-005-2. The Protection Systems that are described in the 4.2 Facilities section of PRC-005-2 but are not covered in the PRC-004-3 Facilities description are excluded because either there is a plan to include them in the next phase of this project, they are already addressed by another standard, or they are automation and control functions that are not protection specific.

(2) Protection Systems that protect Facilities that are part of the BES and respond to electrical quantities such as overcurrent, loss of excitation, generator differential, step-up transformer differential and so forth. Trips such as turbine trips, fuel system trips, or boiler trips are not covered.

(3) The "Guidelines and Technical Basis" is reference information.

(4) The drafting team appreciates your suggestions and realizes there are other ways of structuring the standard; however, the posted version was developed and modified based on stakeholder comments. The drafting team declines to make the changes regarding the requirements. The reporting obligations have been removed from the standard. Please see the drafting team's decision surrounding 'reporting' in the Summary Consideration for Question 5 on Page 141 of this document.

Organization	Yes or No	Question 9 Comment
City of Jacksonville Beach, FL dba/ Beaches Energy Services		1) Applicability of 4.2.1 “Protection Systems for Facilities that are part of the BES” is not consistent with the interpretation of PRC-004-1 Attachment 1 nor the applicability of PRC-005-2. We recommend using the FERC approved interpretation of PRC-004-1 Attachment 1. 2) R3 is not needed, is administrative in nature, and provides no reliability benefit. 3) R2 should be modified to be applicable only to misoperations where cause(s) were identified. 4) R4.2 is administrative in nature, is a Measure, not a requirement, and should be deleted.
Response: Thank you for your comments. **(1) The drafting team believes there is no conflict between PRC-004-3 and the interpretation of the phrase ‘transmission Protection System.’ The Applicability Section of PRC-004-3 includes: Protection Systems for Facilities that are part of the BES, and Requirement R1 stipulates: ‘…a BES interrupting device operation in its Facility caused by a Protection System operation…’ The drafting team believes these are consistent with the interpretation. The drafting team also believes there is appropriate consistency between PRC-004-3 and PRC-005-2. The Protection Systems that are described in the 4.2 Facilities section of PRC-005-2 but are not covered in the PRC-004-3 Facilities description are excluded because either there is a plan to include them in the next phase of this project, they are already addressed by another standard, or they are automation and control functions that are not protection specific.** **(2) The drafting team believes Requirement R3 is essential because it provides a path to resolution if a Misoperation is identified but no cause is determined within the first 120 days.** **(3) Requirement R2 states: Within 60 calendar days of identifying the cause of each Misoperation…** **(4) The drafting team agrees and revised Requirement R4 to eliminate the Parts.**		
Florida Municipal Power Agency		1) Applicability of 4.2.1 “Protection Systems for Facilities that are part of the BES” is not consistent with the interpretation of PRC-004-1 Attachment 1 nor the applicability of PRC-005-2. FMAP recommends using the FERC approved

		interpretation of PRC-004-1 Attachment 1. 2) R3 is not needed, is administrative in nature, and provides no reliability benefit. 3) R2 should be modified to be applicable only to misoperations where cause(s) were identified. 4) R4.2 is administrative in nature, is a Measure, not a requirement, and should be deleted.
Response: Thank you for your comments. **(1) The drafting team believes there is no conflict between PRC-004-3 and the interpretation of the phrase 'transmission Protection System.' The Applicability Section of PRC-004-3 includes: Protection Systems for Facilities that are part of the BES, and Requirement R1 stipulates: '…a BES interrupting device operation in its Facility caused by a Protection System operation…' The drafting team believes these are consistent with the interpretation. The drafting team also believes there is appropriate consistency between PRC-004-3 and PRC-005-2. The Protection Systems that are described in the 4.2 Facilities section of PRC-005-2 but are not covered in the PRC-004-3 Facilities description are excluded because either there is a plan to include them in the next phase of this project, they are already addressed by another standard, or they are automation and control functions that are not protection specific.** **(2) The drafting team believes Requirement R3 is essential because it provides a path to resolution if a Misoperation is identified but no cause is determined within the first 120 days.** **(3) Requirement R2 states: Within 60 calendar days of identifying the cause of each Misoperation…** **(4) The drafting team agrees and revised Requirement R4 to eliminate the Parts.**		
Tampa Electric Company		1) Applicability of 4.2.1 "Protection Systems for Facilities that are part of the BES" is not consistent with the interpretation of PRC-004-1 Attachment 1 nor the applicability of PRC-005-2. TEC recommends using the FERC approved interpretation of PRC-004-1 Attachment 1. 2) R3 is not needed, is administrative in nature, and provides no reliability benefit. 3) R2 should be modified to be applicable only to misoperations where cause(s) were

Organization	Yes or No	Question 9 Comment
		identified. 4) R4.2 is administrative in nature, is a Measure, not a requirement, and should be deleted. 5) The big change that I see for us is significantly increased documentation. Currently all of our documentation is in a database including a brief description of the corrective action plan. It seems to satisfy the new standard we would need a separate CAP document to capture all of the additional info they are asking for, we may be able to link the CAP document to our database. The standard asks for documented proof that the work associated with the CAP was actually done (data from work management system, work order etc.). Presently we just log the completion date in our database we don't capture any proof that the work was done. Fortunately we typically only have a few misoperations per year so the volume of work will not be huge but it is just another ratcheting up of the documentation requirements. TEC doesn't see the increased documentation requirements doing anything to increase our reliability.

Response: Thank you for your comments.

(1) The drafting team believes there is no conflict between PRC-004-3 and the interpretation of the phrase 'transmission Protection System.' The Applicability Section of PRC-004-3 includes: Protection Systems for Facilities that are part of the BES, and Requirement R1 stipulates: '…a BES interrupting device operation in its Facility caused by a Protection System operation…' The drafting team believes these are consistent with the interpretation. The drafting team also believes there is appropriate consistency between PRC-004-3 and PRC-005-2. The Protection Systems that are described in the 4.2 Facilities section of PRC-005-2 but are not covered in the PRC-004-3 Facilities description are excluded because either there is a plan to include them in the next phase of this project, they are already addressed by another standard, or they are automation and control functions that are not protection specific.

(2) The drafting team believes Requirement R3 is essential because it provides a path to resolution if a Misoperation is identified but no cause is determined within the first 120 days.

(3) Requirement R2 states: Within 60 calendar days of identifying the cause of each Misoperation…

Organization	Yes or No	Question 9 Comment
(4) The drafting team agrees and revised Requirement R4 to eliminate the Parts. **(5) The drafting team modified Measure M4 to read: '…The evidence <u>may</u> also include dated work management program records, dated work orders, or dated maintenance records.'**		
Orange and Rockland Utilities		As a result of the new BES Definition (100 kV Bright-line), some new BES assets could be identified. The timeline proposed in R1, R2, and R3 in this Standard should not apply to the newly identified BES assets.
Response: Thank you for your comment. **The Implementation plan for the definition of BES states: Compliance obligations for Elements included by the definition shall begin 24 months after the applicable effective date of the definition. The drafting team believes that the 24 months allowed with the BES definition provides ample time to implement all of the requirements of PRC-004-3.**		
ITC		1) Based on the specified time intervals quarterly reports will likely hinder the process, suggest changing the data submittal to semiannual and for it to be submitted within 90 days following the end of the first or second half of the year. This comment was provided in July 2011, but the response did not explain the reason for quarterly reports. If the SDT feels it should remain, than please provide a technical justification for this decision. 2) Has the "Application Guidelines" been thoroughly reviewed? Why haven't there been any questions regarding what is in these guidelines? None of the Requirements, Measures or Compliance sections mentions it, so it should be treated only as a reference-guide. 3) R2, first bullet point requires an entity to analyze the applicability of a CAP to other protection systems. This should be removed as it exceeds the scope of this standard.
Response: Thank you for your comment. **1) The drafting team has removed all reporting obligations from the draft standard.**		

Organization	Yes or No	Question 9 Comment
2) Application Guidelines are included as part of the NERC "Results Based Standard" format. They contain no requirements or measures, and are intended to be a reference. **3) An evaluation of the CAP's applicability at other locations is intended to encourage diligence to prevent the same root cause from creating another misoperation and having an adverse effect on reliability. It is the responsibility of the Protection System owner to determine how wide spread the situation is and include the appropriate actions in its CAP.**		
Souhwest Power Pool Reliability Standards Development Team		1) Can Attachment 1 be tabbed format or something easier to use than the long spreadsheet provided? 2) Also we don't agree that the quarterly interval and if this is in conjunction with TADS and GADS then both of these are only reported annually. 3) In R2 under the first bullet the way it reads it would seem that you have to look at your entire system for a single misoperation. In example if you had the wrong setting on a single 421 do you have to go and look at every 421 on your system. This seems overly burdensome and could lead to someone constantly looking at the system. If you had a certain relay failure at one location do you go to all other locations that have that relay? If so then would you have to prove that at other locations you don't have this particular relay? The team may want to look at rewording this bullet maybe taking a sample of equipment or adding an additional bullet and gather all the CAPS for the year and review the system over a 24 month period, but doing this all the time seems overly burdensome. 4) Under the Application Guidelines generator protection section it has some language that is conflicting with section 6 of the proposed definition. We would suggest that the reference in the guidelines be removed. This could cause confusion with the industry and lead to miss classification of misoperations. Protection System operations which occur with the protected Element out of service, that trip any in-service Elements are Misoperations. Unnecessary Trip - Other Than Fault - A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate, and is unrelated to on-site maintenance, testing,

Organization	Yes or No	Question 9 Comment
		construction or commissioning activities.
Response: Thank you for your comment. 1) **The Quarterly Protection System Misoperation Reporting Template is reviewed annually by the ERO-RAPA group and the NERC System Protection and Control Subcommittee. Attachment 1 provides field descriptions and sample data for completing the reporting template.** 2) **The drafting team has removed all reporting obligations from the draft standard.** 3) **An evaluation of the CAP's applicability at other locations is intended to encourage diligence to prevent the same root cause from creating another misoperation and having an adverse effect on reliability. It is the responsibility of the Protection System owner to determine how wide spread the situation is and include the appropriate actions in its CAP.** 4) **The drafting team revised the Application Guideline to read: Protection System operations unrelated to on-site maintenance, testing, inspection, construction or commissioning activities which occur with the protected Element out of service, that trip any in-service Elements are Misoperations.**		
CenterPoint Energy		CenterPoint Energy recommends deleting R4.2 which states the following: "Maintain detailed implementation records of each CAP or action plan including dated information surrounding any revision(s) and completion." With R4.1 being a performance-based requirement to "Implement the CAP or action plan", CenterPoint Energy believes it is unnecessary to establish a requirement related to documentation needs.
Response: Thank you for your comment. **The drafting team agrees and revised Requirement R4 to eliminate the Parts.**		
MISO		Clarification should be provided of what approvals or coordination the identified responsible entities need to undertake if a Corrective Action Plan (CAP) includes some operational solutions provided by a system operator.

Organization	Yes or No	Question 9 Comment
Response: Thank you for your comment. **The interaction between the Protection System owner and their system operator must be worked out between the two. It should be indicated in the CAP how operating instructions were modified to prevent a Misoperation from recurring.**		
Essential Power, LLC		Compliance section C1.4 contains a requirement to report to the RE – this needs to be in the requirement section of the standard.
Response: Thank you for your comment. **The drafting team has removed all reporting obligations from the draft standard.**		
Modesto Irrigation District		Concept of standard is generally very good. Please remember to keep overall reliability goals in mind, and not have entities (especially small ones like ours) get bogged down in paper-trail activities.
Response: Thank you for your comment. **Results Based Standards are intended to focus on what is beneficial to the reliability of the BES.**		
Manitoba Hydro		1) Effective Date - The language regarding the effective date needs to contemplate that Manitoba Hydro, like some other Canadian jurisdictions, will not have effective dates that are tied to Board of Trustees approval. We assuming that is what the proposed reference to 'laws applicable to such ERO governmental authorities' means but this is somewhat confusing. It would be more accurate to refer to the laws applicable to such functional entities. 2) Background - We are not clear on whether the 'Background' section of the proposed standard becomes part of the standard when final or if it's just included at this stage when the proposed language is being circulated. Assuming it does become part of the standard, there are several issues with this section as drafted. There needs to be some sort of introductory sentence at the beginning of the paragraph that explains that PRC-004-3 is designed to replace PRC-004-2a and PRC-003-0

Organization	Yes or No	Question 9 Comment
		because otherwise there is no context for why these two standards are being discussed. The full name of the standard should be used in the fourth line (missing the words “Identification and Correction”). The NOPR is discussed without any explanation of what it is - the full name, date published, by FERC etc is needed. The same can be said for the reference to the SAR further down the page. The words 'by requiring applicable entities to' would make sense after the words "The proposed requirements of the revised Reliability Standard PRC-004-3 meets the following objectives". The terms Special Protection Systems, Remedial Action Schemes and Under-Voltage Load Shedding are used at the end of the Background section when these terms have already had acronyms attached to them above. 3) R2 - More details should be provided regarding what level of detail is required when developing a CAP. Perhaps a template could be developed and attached to this standard. 4) Also, the wording of R2 should be made more consistent with the wording of R3. R2 implies that a cause will always be identified. We suggest the words “For each Misoperation with an identified cause(s)” be added at the beginning of R2. 5) R3 - The second bullet regarding the declaration should be re-worded to be consistent with the wording in R2. 6) C. Compliance - (i) An acronym is assigned to CEA in 1.1, but it is used in full in 1.2. This is not necessary. (ii) The term “BES Protection Systems” is used in C. Section 1.2. It would be more accurate to use the term given in 4. Applicability, Section 4.2.1 “Protection Systems for Facilities that are part of the BES”. (iii) C. Section 1.4 refers to PRC-004. It should refer to PRC-004-3. 7) Technical Guidelines - Proper and complete references to document they refer to should be provided. For example, the July 2011 Risk Assessment doesn't indicate who published this or conducted this, where it is available, etc.

Response: Thank you for your comment.

Organization	Yes or No	Question 9 Comment
1) The language used for the Effective Date description is boiler plate language used in all NERC Reliability standards. 2) The Background section is included in the final version of the approved standard. The drafting team included the full name of the standard. The drafting team removed the reference to the NOPR and replaced it with FERC Order No. 693. 3) The drafting team believes the Protection System owner should be allowed the freedom to draft each CAP based on the aspects of each Misoperation. 4) The Requirement R2 wording directs the Protection System owner to develop a CAP if a Misoperation cause is identified. The drafting team declines to make the suggested change. 5) The declaration from Requirement R2 applies when a cause has been identified but there are specific reasons why corrective actions cannot or should not be performed. The declaration from the second bullet of Requirement R3 applies when a cause has been not identified and there are specific reasons why the investigation is going to be terminated. Consistent wording would blur the distinction between them. 6) The drafting team made the suggested changes other than the BES Protection System recommendation. 7) The drafting team has added a link to the referenced document in a footnote.		
Entergy Services, Inc. (Transmission)		Entergy is concerned with the lack of definition surrounding the statement "review each Protection System operation" in R1.
Response: Thank you for your comment. The level of scrutiny required to designate if an operation of a Protection System was proper or not is left to the Protection System owner to determine. Each entity must review each of its Protection System operations and determine whether the operation should be categorized as a Misoperation based on its available information.		
El Paso Electric		EPE believes additional clarity under the “Additional Compliance” section would be helpful as it relates to reporting misoperation data. EPE believes the insertion of some additional language may provide clarity, such as “.....shall submit data identified on Attachment 1 for misoperations identified within a quarter...”

Organization	Yes or No	Question 9 Comment
Response: Thank you for your comment. **The drafting team declines to make the suggested change.**		
Portland General Electric Company		1) 4.2.2 excludes UVLS from this standard due to the existence of PRC-022, but it is expected that PRC-022 will be superseded much like its UF counterpart PRC-009. Rather than requiring a revision of PRC-004, 4.2.2 should be worded such that UVLS schemes would be covered by PRC-004-3 at such time as PRC-022 is retired. 2) Additional resources and signification database modifications will be required to ensure proper documentation of compliance.
Response: Thank you for your comment. **1) The drafting team must work within the constraints of the project's SAR.** **2) The drafting team believes the proposed level of documentation is appropriate.**		
Clark Public Utilities		I am confused on the requirement to provide a quarterly report. In the current draft the reference to this requirement appears in Section 1.4 of the Compliance Monitoring Process. This requirement does not appear to be in the Requirements and Measures section. The quarterly reporting also does not appear to be in the Violation Severity Levels. So it appears that in this draft, there is no real "Requirement" that a quarterly report be submitted and there is no assignment of a violation to those TOs, GOs, and DPs that do not submit a quarterly report. Is that so or am I missing something? This seems odd. If TOs, GOs, and DPs are supposed to submit a quarterly report, why isn't this included in the Requirements? Please eliminate this ambiguity. Either add the reporting to a Requirements provision or get rid of the reference to the reporting requirement in the Compliance Monitoring section.
Response: Thank you for your comment. **The drafting team has removed all reporting obligations from the draft standard.**		

Organization	Yes or No	Question 9 Comment
Cleco Corporation		1) In R2 under the first bullet the way it reads it would seem that you have to look at your entire system for a single misoperation. In example if you had the wrong setting on a single 421 do you have to go and look at every 421 on your system. This seems overly burdensome and could lead to someone constantly looking at the system. If you had a certain relay failure at one location do you go to all other locations that have that relay? If so then would you have to prove that at other locations you don't have this particular relay? The team may want to look at rewording this bullet maybe taking a sample of equipment or adding an additional bullet and gather all the CAPS for the year and review the system over a 24 month period, but doing this all the time seems overly burdensome. 2) Under the Application Guidelines generator protection section it has some language that is conflicting with section 6 of the proposed definition. We would suggest that the reference in the guidelines be removed. This could cause confusion with the industry and lead to miss classification of misoperations.
Response: Thank you for your comment. **1) An evaluation of the CAP's applicability at other locations is intended to encourage diligence to prevent the same root cause from creating another misoperation and having an adverse effect on reliability. It is the responsibility of the Protection System owner to determine how wide spread the situation is and include the appropriate actions in its CAP.** **2) The drafting team revised the Application Guideline to read: Protection System operations unrelated to on-site maintenance, testing, inspection, construction or commissioning activities which occur with the protected Element out of service, that trip any in-service Elements are Misoperations.**		
Wisconsin Electric		In the Applicability section, in 4.2.3 relay functions not included, under 4.2.3.1 Control: add "Generator Excitation controls/limiters and turbine controls" to the existing exclusions list. The revised wording suggested is: "4.2.3.1 Control (e.g. controlled shutdown of generators, generator excitation controls/limiters, turbine controls, capacitor or reactor bank switching".

Organization	Yes or No	Question 9 Comment
Response: Thank you for your comment. **The drafting team revised the Applicability Section 4.2.4 to read: Non-protective functions that may be imbedded within a Protection System are not included (see Guidelines and Technical Basis section for detailed examples).**		
City of Austin dba Austin Energy		In the Applicability text box, the following phrase “of the automation portion” should likely be “or the automation portion.”
Response: Thank you for your comment. **The drafting team corrected the typographical error.**		
Indiana Municipal Power Agency		1) In the Application Guidelines, page 18 of 22, the following statement is made: "The initial evidence, which may also be documented separately, contains the sequence of events, relay targets and a summary of Disturbance Monitoring Equipment (DME) records." By making this statement in the Application Guidelines, it seems to be requiring entities to have sequence of events AND Disturbance Monitoring Equipment records. IMPA believes that this is not the intent of the SDT and recommends using the words "may contain the sequence of events, relay targets,... 2) "In addition, IMPA agrees with the comments that Florida Municipal Power Agency submitted for this question.
Response: Thank you for your comment. **1) The standard does not require any additional monitoring equipment to be installed. Each TO or GO must review each of its Protection System operations and determine whether the operation should be categorized as a Misoperation based on its available information. The entity will use whatever means at their disposal in order to determine whether the operation was correct or not which may include available DISTURBANCE MONITORING EQUIPMENT. The drafting team modified the sentence in the Application Guidelines to address your concern. The Application Guidelines are reference information only and are not mandatory and enforceable.** **2) Please see the drafting team’s response to Florida Municipal Power Agency.**		

Organization	Yes or No	Question 9 Comment
US Bureau of Reclamation		Including the TADS information provided under the NERC Rules of Procedure is in conflict with this standard. TADS' reporting is on an annual basis. By including the TADS event ID, the standard would require quarterly reporting of the TADs event. The inclusion introduces the conflict between the rules of procedure and a standard. Including the quarterly reporting as part of the compliance information is not consistent with standard requirements. There is requirement VRF or VSL assigned to the reporting and therefore no compliance violation can be assessed for failure to respond. The reporting information is not subject to a requirement per Commission guidance since it is only for metrics and administrative purposes per the SDT. The information collected under this standard is inconsistent with the information collected for Transmission system events. TADs event data is collected under the NERC Rules of Procedures. The standard should be modified to remove the reference to the additional compliance information and have the information collected under the NERC Rules of Procedures.
Response: Thank you for your comment. **The drafting team has removed all reporting obligations from the draft standard.**		
Nebraska Public Power District		1) It sounds like a CAP is a case by case document for each misoperation and does not need to be a formal CAP process document that explains the steps that will be followed for all misoperation investigations. Is this correct? 2) I have concerns with the open ended nature of the statement in R2 "Develop and document a Corrective Action Plan (CAP) for the identified Protection System component(s) that includes an evaluation of the CAP's applicability to the entity's Protection Systems at other locations". Specifically my concerns are with the last part referring to "at other locations". I am curious how the STD would consider if a miscoordination resulting in a misoperation were to happen on their system. Would they consider reviewing the coordination for every relay at every substation on their system? This requirement has value yet also opens the door to unreasonable CAPs as

Organization	Yes or No	Question 9 Comment
		well. This requirement also seems quite subjective in how it could be audited as well. Does the STD share this concern? 3) Will the registration criteria or BES definition be referenced to set generation sizes for reporting misoperations? The application guidelines are very helpful in explaining the SDT expectations and should continue to be part of the standard for guidance.
Response: Thank you for your comment. **1) The drafting team concurs. As defined in the NERC Glossary of Terms, a Corrective Action Plan (CAP) is defined as: A list of actions and an associated timetable for implementation to remedy a specific problem.** **2) An evaluation of the CAP's applicability at other locations is intended to encourage diligence to prevent the same root cause from creating another misoperation and having an adverse effect on reliability. It is the responsibility of the Protection System owner to determine how wide spread the situation is and include the appropriate actions in its CAP.** **3) The Applicability Section, 4.2 Facilities 4.2.1 states: Protection Systems for BES Elements. The Application Guidelines are a permanent part of the standard.**		
Luminant		Luminant does not agree with Requirement R3 of the standard since there is an apparent conflict or double jeopardy with the draft standard on generator relay loadability (PRC-025-1). Luminant recommends that R3 of PRC-025-2 be removed and any event from a generator load responsive relay for review be in the draft PRC-004 standard that operates an interrupting device. The chairmen of both SDT's should consult with one another to remove any conflicts.
Response: Thank you for your comment. **This issue has been addressed by the PRC-025-1 drafting team.**		
Northeast Power Coordinating Council		1) Measurement M1 has that "Acceptable evidence for Part 1.3 may include, but is not limited to, a copy of dated investigation report or documented findings for each Misoperation." This provides a choice in a document type with either

Organization	Yes or No	Question 9 Comment
		a formal report or other method of documenting the findings. On page 22 of 28 of PRC-004-3, in the Application Guidelines section, it states "An investigation report may include...” which dictates the use of an investigation report, and eliminates the choice between a formal report or other method of documenting findings as stated in M1. The Application Guidelines should be consistent with the standard portion of the document. 2) There is a typographical error on the first bulleted item on page 6 of the standard. This item should read: Analyze Misoperations of Protection Systems for Facilities that are part of the BES to determine the cause(s).
Response: Thank you for your comments. **1) The drafting team revised the Application Guideline to address your concern.** **2) The drafting team corrected the text.**		
NextEra Energy Inc.		1) NextEra encourages the Standards Drafting Team to improve the wording used in R2. At this time, the wording appears to apply to all situations without qualification and does not consider several situations that may be relevant. To clarify the language, NextEra recommends the following changes to R2. ”R2. Within 60 calendar days of identifying the cause(s) of each Misoperation pursuant to R1.3, the Transmission Owner, Generator Owner, or Distribution Provider shall: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-Term Planning] o Draft a Corrective Action Plan (CAP) for the identified Protection System component(s), including, if applicable, the following: (i) An evaluation of the CAP’s applicability to the entity’s other Protection Systems (ii) An explanation of why corrective actions are either: (i) Beyond the entity’s control; (ii) Cost prohibitive/significantly impacted by cost considerations;

Organization	Yes or No	Question 9 Comment
		(iii) Not to be implemented for over 5 years (iv) Would reduce BES reliability." 2) Similar to the re-write of R2, NextEra does not see the need for a "declaration" in R3. Thus, NextEra recommends that the second bullet in R3 be redrafted to read:" o An explanation of why no further actions will be taken." 3) NextEra opposes the use of "detailed" in R4.2 as unnecessary, subjective and onerous. PRC-004-3 should not be written so that an entity can be found in violation because of subjective judgments on what is or what is not detailed. 4) Further, NextEra finds that the clarity of R4.2 may be improved. Thus, NextEra recommends that R4.2 be redrafted as follows:" 4.2 Maintain implementation records for each CAP and action plan, including the dates of any revision(s) and completion." 5) Lastly, for clarity, NextEra also believes there should be linkage between R2 and R4 on the issue of applicability to other Protection Systems at other locations, and, thus, suggests the following changes to R4.1. "4.1 Implement the CAP or action plan, including, as applicable, the entity's Protection Systems at other locations that were identified in R2."

Response: Thank you for your comments.

1) **The drafting team declines to make the suggested changes.**

2) **The drafting team declines to make the suggested changes.**

3) **The drafting team revised Requirement R4 to eliminate the Parts.**

4) **The drafting team revised Requirement R4 to eliminate the Parts.**

Organization	Yes or No	Question 9 Comment
5) An evaluation of the CAP's applicability at other locations is intended to encourage diligence to prevent the same root cause from creating another misoperation and having an adverse effect on reliability. It is the responsibility of the Protection System owner to determine how wide spread the situation is and include the appropriate actions in its CAP.		
Detroit Edison		Overall, the draft standard is good and we already comply with most of the requirements as a general practice. The concern is around ability to properly analyze and determine iof operations, specifically around generation, would be considered slow. As of today, there is not adequate monitoring (and many of the conditions are far too dynamic to properly determine what the proper operating time should have been) to determine how quickly a relay responded to a "other than fault" condition. Would recommend a "yes" vote if there was wording stating that it is not a misoperation if the data that exists is not of a fine enough resolution to prove a relay was slow.
Response: Thank you for your comments. **The standard does not require any additional monitoring equipment to be installed. Each TO or GO must review each of its Protection System operations and determine whether the operation should be categorized as a Misoperation based on its available information. The entity will use whatever means at their disposal in order to determine whether the operation was correct or not which may include available DISTURBANCE MONITORING EQUIPMENT.**		
Associated Electric Cooperative Inc - JRO00088		Page 6, Line 1,Replace: "Analyze Misoperations Protection Systems"With: "Analyze Misoperations of Protection Systems" Rationale: Grammar and alignment with phrase from preceding bullet
Response: Thank you for your comments. **The drafting team corrected the text.**		
Dairyland Power Cooperative		1) R2 and R3 the second bullet is administrative and redundant, and does not aid in the protection of the BES. Recommend removing the second bullet from R2 and R3. This is captured within the first bulleted item.

Organization	Yes or No	Question 9 Comment
		2) R4.2 is administrative and does not aid on the protection the BES. Recommend removing R4.2
Response: Thank you for your comments. **1) The drafting team declines to make the suggested changes. A declaration provides a means of closing unresolved Misoperations where corrective actions are beyond the entity's control or would reduce BES reliability, or where no further actions can be taken.** **2) The drafting team agrees and revised Requirement R4 to eliminate the Parts.**		
The United Illuminating Company		1) R2 should not specify that the CAP contains an activity to evaluate applicability to all of the entity's Protection System. It could create a situation where check-sheets are required with sign-offs for review of all systems. 2) R4.2 is of concern with the requirement to maintain detail implementation records of each CAP or action plan. Detail is an ambiguous word that cannot be complied to. The compliance burden to provide detailed implementation records is excessive. A Transmission Owner is audited every 6 years. A TO will need to provide detailed records of CAP's and action plans for 6 years. The only organization receiving a benefit from this requirement is the NERC Audit team. All that should be required by the Standard is the date of completion on the CAP implementation. 3) Additionally, There should be no requirement to record revisions to the CAP.
Response: Thank you for your comments. **1) An evaluation of the CAP's applicability at other locations is intended to encourage diligence to prevent the same root cause from creating another misoperation and having an adverse effect on reliability. It is the responsibility of the Protection System owner to determine how wide spread the situation is and include the appropriate actions in its CAP.** **2) The drafting team revised Requirement R4 to eliminate the Parts.** **3) The drafting team revised Requirement R4 to eliminate the Parts.**		

Organization	Yes or No	Question 9 Comment
Public Service Company of New Mexico		R3 as drafted could be difficult to audit. PNMR suggests additional clarity be provided around what would be an acceptable criteria to invoke “A declaration explaining why no further actions will be taken.” As the standard is written now it appears that an RE could just declare a misop as having an unquantifiable cause and then declare that no further action is warranted or will be taken.
Response: Thank you for your comments. **Measure M3 states the entity must have evidence that includes a dated action plan or a dated declaration. A "no action plan” declaration would typically include any investigative actions taken to determine the cause (along with the date performed), and justification for taking no additional investigative actions.**		
ReliabilityFirst		ReliabilityFirst Abstains and offers the following additional comments for consideration: 1) ReliabilityFirst believes there are extra and unneeded deadlines in the standard that do not provide a reliability benefit. 2) ReliabilityFirst believes there is a potential for late identification of Misoperations which will result in violations even if they are not particularly significant to grid reliability. For example, capacitor bank trips occur every day as part of normal switching. It may not be obvious if it was by a Protection System Misoperation, particularly if a relay is used for multiple purposes like ON/OFF switching control and protection. 3) ReliabilityFirst has a concern that there is no maximum time to complete CAPs listed in the draft standard. Of particular concern is failure to trip (- during Fault) type Misoperations. The cause should be either mitigated or the CAP completed in something like 6 - 12 month time period.
Response: Thank you for your comments. **1) The reliability of the system relies on prompt discovery, investigation and mitigation of any Misoperation to avoid**		

Organization	Yes or No	Question 9 Comment
reoccurrence or occurrence in other Protection Systems. 2) The drafting team believes 120 days is an adequate amount of time to review Protection System operations and identify any Misoperations. 3) Establishing fixed time limits for the conclusion of CAP is impractical because of the wide spectrum of Misoperation causes and the variety of corrective actions. A schedule or timetable is required to be included in the CAP.		
Bonneville Power Administration		Section 4.2 is titled Facilities. The NERC definition of facility is a set of electrical equipment that operates as a single BES element. The NERC definition of element is any electrical device with terminals that may be connected to other electrical devices, such as a generator, transformer, circuit breaker, bus section, or transmission line. Based on these definitions, it would seem that a protection system is not an element or a facility. 1) BPA suggests renaming Section 4.2 to "Equipment" or "Systems". 2) Section 4.2.2 should be renamed from "Facilities not included" to "Protection Systems not included" or something similar. 3) The last paragraph of Section A.5, Background notes that PRC-004-WECC-1 overlaps with this standard and says that entities are expected to comply with the more stringent standard. Rather than leave it up to the entity to determine which of the standards is more stringent, BPA suggests simply stating which of the standards takes precedence and which can be ignored.
Response: Thank you for your comments. 1) Section 4.2 Facilities is a part of the NERC results based standard template. It is beyond the scope of the drafting team to modify the template. 2) The drafting team revised Section 4.2.3 (the former 4.2.2) to eliminate the term 'Facilities' by incorporating the subsections into the 4.2.3. 3) Regional standards are required to be more stringent than the continent-wide NERC Reliability Standards. Entities are required to comply with both the continent-wide NERC Reliability Standards and any Regional standards issued by their		

Organization	Yes or No	Question 9 Comment
Region.		
Sacramento Municipal Utility District		SMUD agrees with the concepts for addressing misoperations presented in this draft PRC-004 standard. We do have concerns with the 'zero-defect' approach and urge the Standard Drafting Team to embrace the integration of Internal Controls into this reliability standard to help the entity achieve the standard's reliability objectives. This would better align the standard with ongoing activities such as the FFTR, Paragraph 81 and other tasks underway. We thank you for considering all of our comments in Questions 1 - 9 on this standard.
Response: Thank you for your supportive comments. **The drafting team believes the current approach meets the reliability objectives established in the SAR for this project.**		
American Electric Power		1) The following excerpts from the "Consideration of Comments" document should be added to item "(3)" of the "Guidelines and Technical Basis" section to clarify the intent of the "Slow Trip" category: "In many cases high speed protection is installed as part of the utilities standard practice without having the need for high speed protection for meeting TPL requirements. A slow trip of this protection system would not negatively impact the BES, so it does not need to be reported. However, even if high speed clearing is not required, the Protection Systems must coordinate between zones to prevent a Misoperation (e.g. an over trip). 2) "Facilities 4.2 - Should the text "Also see Guidelines and Technical Basis section for detailed examples" be taken out of 4.2.3.1 and applied more broadly to the standard? 3) In the first bullet of R2, may an evaluation of the CAP's applicability to the entity's Protection System at other locations result in no additional actions being taken? 4) Is the "evaluation of the CAP's applicability to the entity's Protection System at other locations" part of the quarterly reporting?

Organization	Yes or No	Question 9 Comment
Response: Thank you for your comments. **1) The drafting team revised the Application Guideline as suggested.** **2) The drafting team revised the Facilities Section 4.2 and eliminated 4.2.3.1. The Application Guidelines do expound on the non-protective functions of relays excluded from the standard.** **3) Yes. It is left to the entity to determine the range and impact of the problem. An evaluation of the CAP's applicability at other locations is intended to encourage diligence to prevent the same root cause from creating another Misoperation and having an adverse effect on reliability. It is the responsibility of the Protection System owner to determine how wide spread the situation is and include the appropriate actions in its CAP.** **4) The drafting team has removed all reporting obligations from the draft standard.**		
Consumers Energy		The quarterly reporting of Misoperations provides no benefit to the reliability of the Bulk Electric System and the entities are required to spend additional resources to develop these quarterly reports instead of focusing on the actual reliable operation of the BES. Performance metrics can be determined on a yearly basis, through annual reporting.
Response: Thank you for your comments. **The drafting team has removed all reporting obligations from the draft standard.**		
ISO/RTO Standards Review Committee		The SRC seeks clarification of what approvals or coordination the identified responsible entities need to undertake if a Corrective Action Plan (CAP) includes some operational solutions provided by a system operator.
Response: Thank you for your comment. **The interaction between the Protection System owner and their system operator must be worked out between the two. It should be indicated in the CAP how operating instructions were modified to prevent a Misoperation from recurring.**		
Tacoma Power		1) Under Applicability (comment box to side), change 'RMS' to 'RAS.'

Organization	Yes or No	Question 9 Comment
		2) Why does "(e.g., data collection)" need to be included under 4.2.3.2? Data collection does not operate anything. 3) Referring to the second bullet of page 5 (red-line version), change "...Misoperations Protection..." to "...Misoperations of Protection..."
Response: Thank you for your comments. **1) The drafting team made the correction.** **2) The drafting team revised the Facilities Section of the standard and eliminated 4.2.3.2.** **3) The drafting team made the correction.**		
Western Area Power Administration		We agree that these are good business practices and, in fact, we are currently performing these practices already. 1) However, we have a great deal of concern that the documentation burden required to meet compliance continues to increase exponentially. We would like to point out that the current documentation requirements are diverting a significant portion of our resources away from system improvements. 2) Please add the following items (found in the Applications Guidelines) directly into the standard requirements: a) Delayed fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high speed performance is not required by planning studies associated with the TPL standards or by coordination requirements with other Protection Systems. b) An unintended operation as a result of on-site maintenance, testing, construction or commissioning is not a Misoperation. c) In some cases, where zones of protection overlap, the owner of BES Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element. d) Failure to automatically reclose after a Fault is not included as a Misoperation because reclosing equipment is not included under the definition of Protection

Organization	Yes or No	Question 9 Comment
		Systems.
Response: Thank you for your comments. **1) The requirements and associated documentation ensure that the responsible entities are diligent about Misoperation response, CAP creation and completion. Consequently, the drafting team does not believe this documentation detracts from the reliable operation of the BES.** **2a & b) These statements are included in the definition of Misoperation.** **2c &d) The drafting team believes these statements belong in the Application Guidelines rather than the requirements and declines to make the suggested changes.**		
JEA		We believe this would be a good candidate for the new cost benefit approach. Also we believe that this is the wrong approach. NERC should focus on fixing the problem (PRC003 not being approved) by working on PRC003 instead of changing PRC004 to address deficiencies caused by lack of an approved PRC003 standard.
Response: Thank you for your comments. **The drafting team disagrees and believes this approach is the best way to address the investigations of Misoperations uniformly. Furthermore, the drafting team is bound by the scope of the SAR associated with this project and does not have the latitude to follow your suggestion.**		
PSEG		We have provided new language below that continues after our R4 above. R5 addresses implementation of the CAP or action plan. R6 requires reporting of data in Attachment 1. We believe that providing the data in Attachment 1 should be a requirement instead of being addressed in the "Additional Compliance Information" section. 1) R5. For each CAP or action plan, the Transmission Owner, Generator Owner, and Distribution Provider shall implement the CAP or action plan. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Long-Term Planning] M5. Each Transmission Owner, Generator Owner, and

Organization	Yes or No	Question 9 Comment
		Distribution Provider shall have evidence for Requirement R5 that includes dated records which document the implementation of each CAP and action plan, such as work orders or maintenance records that document the completion of work or maintenance, including documentation of revisions for each CAP or action plan. 2) R6. Each Transmission Owner, Generator Owner, or Distribution Provider shall submit PRC-004 - Attachment 1 to its Regional Entity within two calendar months following the end of each calendar quarter. [Violation Risk Factor: Low] [Time Horizon: Operations Planning, Long-Term Planning] M6. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R6 that it transmitted PRC-004-3 - Attachment 1 to its Regional Entities within two calendar months following the end of each calendar quarter. 3) We have also addressed the “Facilities” portion of the standard in the “Applicability” section and suggest the language below, parts of which were taken from PRC-005-2. The Protection Systems in 4.2.1 and 4.2.2 provide protective functions. Section 4.2.3.3 excludes UFLS systems whose operation is evaluated in PRC-009-0. While it is clear that the team wanted to exclude relays such as reveres power relays for generators, their description of these as providing “non-protective functions” is inaccurate since they prevent a generator from motoring during shutdown. They protect the generator. We have excluded those applications in our Section 4.2.3.4 because the operation of an interrupting device caused by a reverse power relay is associated with a normal generator shutdown. The Misoperation of such a relay results in the motoring of a generator, and while that can create a serious problem for a Generator Owner who is incented to evaluate such Misoperations absent a standard, it does not create a BES reliability issue. 4.2. Facilities 4.2.1 Protection Systems that are installed for the purpose of

Organization	Yes or No	Question 9 Comment
		detecting Faults on BES Elements (lines, buses, transformers, etc.) or abnormal conditions. 4.2.2 Protection Systems for generator Facilities that are part of the BES for the purpose of detecting faults or abnormal conditions, including: 4.2.2.1 Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays. 4.2.2.2 Protection Systems for generator step-up transformers for generators that are part of the BES. 4.2.2.3 Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind-farms to the BES). 4.2.2.4 Protection Systems for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays. 4.2.3 Facilities not included 4.2.3.1 Special Protection Systems (SPS) or Remedial Action Schemes (RAS) 4.2.3.2 Undervoltage load shedding (UVLS) systems 4.2.3.3 Underfrequency load shedding (UFLS) systems 4.2.3.4 Relays that operate for the normal shutdown of an Element. 4) Finally, we believe in the Application Guideline, the third sentence in the first paragrgaph on p. 18 of 22 is written too restrictley. We suggest this language instead: The initial evidence, which may also be documented separately, MAY CONTAIN [delete “contains.”] the sequence of events, relay targets and a summary of Disturbance Monitoring Equipment (DME) records, TO THE EXTENT AVAILABLE.
Response: Thank you for your comments.		

Organization	Yes or No	Question 9 Comment
1) The drafting team revised Requirement R4 and it is similar to your suggested Requirement R5. 2) The drafting team has removed all reporting obligations from the draft standard. 3) The drafting team revised the Facilities Section 4.2 but declined your suggestions. 4) The drafting team revised the text to read '…contains the sequence of events, relay targets and a summary and Disturbance Monitoring Equipment (DME) records as appropriate.'		
Colorado Springs Utilities		We understand that this was an arduous standard to develop, and it required extensive explanations for requirements and measurements. We agree with the concepts presented in PRC-004-3, and we believe it was very well-written. We appreciate the effort that went into developing and reviewing this revision. However, frequent revisions of standards, coupled with frequent revisions of definitions, do not help to maintain consistent procedures for ensuring the reliability of our protection systems. We suggest that national standards only require what is deemed absolutely necessary on a national level. Any further requirements and recommendations should be provided by Regional Entities. This will mitigate misinterpretations of the standard and lessen the amount of revisions to the standard.
Response: Thank you for your comments.		
Seattle City Light		While Seattle City Light generally agrees with the concepts presented in the draft Standard and appreiates the effort required to develop and review Standards, SCL finds the reliability improvements promised by the draft to be diluted with unnecessary backwards-looking compliance activities. 1) The draft appears tone-deaf to the changes at NERC regarding purely administrative tasks (e.g., Paragraph 81 effort to remove them, whereas this draft adds several such as R4.2 and the second bullets of R2 and R3). One example is the emphasis on meeting and documenting multiple dates for each

Organization	Yes or No	Question 9 Comment
		Misoperation. Another is a need to document completion of each Misoperation CAP almost as if it were a Mitigation Plan to correct a Self-Reported violation, rather than, for example, relying primarily on the corrective action documentation already reported for GADS and TADS. 2) The draft also would benefit from application of the non-zero-defect concepts introduced with the latest draft of CIP version 5. Changes such as these will minimize the need to revise the Standard yet again to align with present directions.
Response: Thank you for your comments. **1) The requirements and associated documentation ensure that the responsible entities are diligent about Misoperation response, CAP creation and completion. Consequently, the drafting team does not believe this documentation detracts from the reliable operation of the BES.** **2) The drafting team believes the current approach meets the reliability objectives established in the SAR for this project.**		
New York Power Authority		None.
Response: Thank you.		

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SC authorized moving the SAR forward to standard development at the June 9, 2011 meeting.
2. The SAR posted for informal comment June 10 – July 11, 2011.
3. Draft 1 of PRC-004-3 was posted for a 30-day comment period from June 10 – July 11, 2011.
4. Draft 2 of PRC-004-3 was posted for a 45-day concurrent comment and initial ballot period from July 25 – September 7, 2012.

Description of Current Draft

Draft 3 of PRC-004-3 posted for a 30-day formal comment period with parallel successive ballot.

Anticipated Actions	Anticipated Date
30-day Formal Comment Period with Successive Ballot	January, 2013
Recirculation ballot	February, 2013
BOT Approval	May, 2013

Effective Dates: First day of the first calendar quarter that is twelve months beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Version History

Version	Date	Action	Change Tracking

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Misoperation:

The failure of an Element's composite Protection System to operate as intended.

Any of the following is considered a Misoperation:

1. **Failure to Trip - During Fault** - A failure of a Protection System to operate for a Fault within the zone it is designed to protect. The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for the Element it is designed to protect is correct.

2. **Failure to Trip - Other Than Fault** - A failure of a Protection System to operate for a non-Fault condition for which the Protection System was intended to operate, such as a power swing, under-voltage, over excitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the overall performance of the Protection System for the Element it is designed to protect is correct.

3. **Slow Trip - During Fault** - A Protection System operation that is slower than intended for a Fault within the zone it is designed to protect. Delayed Fault clearing associated with an installed high-speed protection scheme is not a Misoperation if the high-speed performance has not been identified to meet the dynamic stability performance requirements of the TPL standards nor is it required to ensure coordination with other Protection Systems.

4. **Slow Trip - Other Than Fault** - A Protection System operation that is slower than intended for a non-Fault condition such as a power swing, under-voltage, over excitation, or loss of excitation for which the Protection System was intended to operate.

5. **Unnecessary Trip - During Fault** - A Protection System operation for a Fault for which the Protection System is not intended to operate.

6. **Unnecessary Trip - Other Than Fault** - A Protection System operation for a non-Fault condition for which the Protection System is not intended to operate, and is unrelated to on-site maintenance, testing, inspection, construction or commissioning activities.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Protection System Misoperation Identification and Correction**
2. **Number:** PRC-004-3
3. **Purpose:** Identify and correct the causes of Misoperations of Bulk Electric System (BES) Protection Systems.
4. **Applicability:**

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2. Facilities

4.2.1 Protection Systems for BES Elements

4.2.2 Underfrequency Load Shedding (UFLS) that trips a BES Element

4.2.3 Special Protection Systems (SPS), Remedial Action Schemes (RAS), and Undervoltage Load Shedding (UVLS) are excluded

4.2.4 Non-protective functions that may be imbedded within a Protection System are excluded

> **Applicability:** Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are not included in this version of the standard because they will be handled in the second phase of this project. UVLS is covered by PRC-022-1. Some functions of relays are not used as protection but as control function or for automation, therefore, any operation of the control function portion or the automation portion of relays are excluded from this standard. See the Guidelines and Technical Basis section of the standard for detailed examples of non-protective functions.

5. **Background**:

A key element for BES reliability is the correct performance of Protection Systems. Monitoring BES Protection System events, as well as identifying and correcting the causes of Misoperations, will improve Protection System performance. PRC-004-3 Protection System Misoperation Identification and Correction is a revision of PRC-004-2a Analysis and Mitigation of Transmission and Generation Protection System Misoperations with the stated purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated. PRC-003-1 Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems required the Regions to establish procedures for analysis of Misoperations. In FERC Order No. 693, the Commission identified PRC-003-0 as a fill-in-the-blank standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional procedures to support the requirements of PRC-004-2a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2a.

This project includes revising the existing definition of Misoperation, which reads:

Misoperation

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity

In general, this definition needs more specificity and clarity. The terms “specified time” and “abnormal condition” are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical yet explainable condition is a Misoperation.

The SAR for this project also includes clarifying reporting requirements. Misoperation data, as currently collected and reported, is not usable to establish consistent metrics for measuring Protection System performance. As such, the drafting team is removing the data obligation from the standard and is developing a data request under Section 1600 of the NERC Rules of Procedure. NERC will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. The data submitted as part of the data request will not be used for compliance or enforcement purposes. The removal of the data collection from the standard does not result in a reduction of reliability as Responsible Entities are required to retain evidence of compliance for audit and compliance purposes under the Compliance Section C 1.2 Evidence Retention portion of the standard.

The proposed requirements of the revised Reliability Standard PRC-004-3 meet the following objectives:

- Review all Protection System operations on the BES to identify those that are Misoperations of Protection Systems for Facilities that are part of the BES.
- Analyze Misoperations of Protection Systems for Facilities that are part of the BES to determine the cause(s).
- Develop and implement Corrective Action Plans to address the cause(s) of Misoperations of Protection Systems for Facilities that are part of the BES.

Misoperations of or associated with Special Protection Schemes, Remedial Action Schemes, and Under-Voltage Load Shedding are not addressed in this standard due to their inherent complexities. NERC intends to address these areas through future projects.

Note that the WECC Regional Reliability Standard PRC-004-WECC-1 relates to the reporting of Misoperations for a limited set of WECC Paths and Remedial Action Schemes. In those cases where PRC-004-WECC-1 overlaps with the Continent-wide standard, entities are expected to comply with the more stringent standard.

B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*

1.1 Within 120 calendar days of a BES interrupting device operation in its Facility caused by a Protection System operation, identify and review each Protection System operation.

- If the entity owns both the BES interrupting device and the Protection System, determine if it was a correct operation or a Misoperation.

Rationale for R1: This requirement is the first step to ensuring that practices for reviewing and classifying Protection System operations and correcting Misoperations are consistently employed. The drafting team believes 120 calendar days takes into account the seasonal nature of Protection System operations; both the volume of Protection System operations as well as outage constraints for investigative purposes can be seasonal. This requirement mandates entities identify and review Protection System operations. Risks to the BES caused by Misoperations are reduced by reviewing all Protection System operations and investigating any Misoperations to find their cause(s). Requirement R1 places the responsibility on the BES interrupting device owner to investigate operations initiated by a Protection System. The initial investigation documentation should be provided to the owner of the Protection System component(s) that contributed to the Misoperation, upon request. The owner of the interrupting device and the entity that owned the component that contributed to the Misoperation should be communicating about the operation before this notification is transmitted. The owner of the component that contributed to the Misoperation will create the CAP, action plan or declaration required by Requirements R2 and R3.

- If the entity owns the BES interrupting device but does not own all of the Protection System and cannot determine that the Protection System operation was correct, then notify the other owner(s) of the Protection System component(s) and provide any requested investigative information.
    - The Protection System component owner(s) that was notified by the BES interrupting device owner shall determine if there was a correct operation or a Misoperation of their component.

1.2 Within the same 120 day period of a BES interrupting device operation caused by a Protection System operation, the owner of the Protection System component identified as contributing to the Misoperation shall investigate and document the findings for each Misoperation including a cause, if identified.

M1. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Part 1.1 that may include, but is not limited to, dated lists, logs, or a database (electronic or hard copy format) that documents the date and time of each applicable interrupting device operation and indicates when each related Protection System operation was reviewed. Acceptable evidence for the notification required by Part 1.1 may include, but is not limited to, emails, electronic files, or hard copy records demonstrating transmittal of information. Acceptable evidence for Part 1.2 may include, but is not limited to, dated lists, logs, or a database (electronic or hard copy format) that documents the date, time, Facility and equipment name associated with each Misoperation, a copy of a dated Misoperation investigation report or documented findings, which may include sequence of events, relay targets, summary of DME records for each Misoperation.

Rationale for R2: A formal CAP is a proven tool for resolving operational problems. Based on industry experience and operational coordination timeframes, the SDT believes 60 calendar days is reasonable for considering such things as alternative solutions, coordination of resources, or development of a schedule for a CAP. When the cause of a Misoperation is determined from implementing an action plan in accordance with Requirement R4, a CAP must be developed in accordance with Requirement R2.

In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, documenting the reasons for taking no corrective actions is essential for justifying the close of the Misoperation investigation process and for future reference.

R2. Each Transmission Owner, Generator Owner, or Distribution Provider shall, within 60 calendar days of identifying the cause of each Misoperation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s) that includes an evaluation of the CAP's applicability to the entity's Protection Systems at other locations, or
- Explain in a declaration why corrective actions are beyond the entity's control or would reduce BES reliability.

M2. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R2 that must include a dated CAP or a dated declaration explaining why there is no need to develop a CAP.

R3. Each Transmission Owner, Generator Owner, or Distribution Provider shall, within 180 calendar days of the associated BES interrupting device operation, complete for each Misoperation without an identified cause: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]

- Development of an action plan that identifies any additional investigative actions and/or Protection System modifications, including a work timetable, or
- A declaration explaining why no further actions will be taken.

Rationale for R3: Where a Misoperation cause is not determined during the initial investigation; implementing an action plan of additional investigation/monitoring may determine a cause and lead to the development of a CAP in accordance with Requirement R2. The 180 calendar day period is the sum of 120 calendar days (investigative period in Requirement R1) and a 60 calendar day period (similar timeframe as in Requirement R2 for developing a CAP.)

If the action plan completion does not provide direction for identifying the cause, then pursuing further action is not warranted. In these cases, documenting the reasons is essential for justifying the close of the Misoperation investigation process and for future reference.

M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence for Requirement R3 that must include a dated action plan or a dated declaration.

R4. Each Transmission Owner, Generator Owner, or Distribution Provider shall implement each CAP or action plan, and revise as needed through completion. [*Violation Risk Factor: High] [Time Horizon: Operations Planning, Long-Term Planning]*
