Rationale: Requirement R2 from IRO-002-3 has been deleted because approved EOP-008-1, Requirement R1, part 1.6.2 addresses redundancy and back-up concerns for outages of analysis tools. New Requirement R4 has been added to address NOPR paragraphs 96 and 97: *"…As we explain above, the reliability coordinator's obligation to monitor SOLs is important to reliability because a SOL can evolve into an IROL during deteriorating system conditions, and for potential system conditions such as this, the reliability coordinator's monitoring of SOLs provides a necessary backup function to the transmission operator…."*

R3. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

M3. Each Reliability Coordinator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitored Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

Rationale for Requirement R4: Requirement R4 added back from approved IRO-002-2 as the SDT found no proposed requirements that covered the issues.

R4. Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M4. The Reliability Coordinator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitoring systems consistent with the requirement.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes:

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Reliability Coordinator shall retain its current, in force document and any documents in force for the current year and previous calendar year for Requirements R1, R2, and R3 and Measures M1, M2, and M3.

The Reliability Coordinator shall keep data or evidence for Requirement R4 and Measure M4 for the current calendar year and one previous calendar year.

If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning, Same-Day Operations, Real-time Operations	High	The Reliability Coordinator did not have data exchange capabilities with one applicable entity, or 5% or less of the applicable entities, whichever is less.	The Reliability Coordinator did not have data exchange capabilities with two applicable entities, or more than 5% or less than or equal to 10% of the applicable entities, whichever is less.	The Reliability Coordinator did not have data exchange capabilities with three applicable entities, or more than 10% or less than or equal to 15% of the applicable entities, whichever is less.	The Reliability Coordinator did not have data exchange capabilities with four or more applicable entities or greater than 15% of the applicable entities, whichever is less.
R2	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator failed to provide its System Operator with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities.
R3	Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator did not monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
R4	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator did not have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure.

D. Regional Variances

Development Steps Completed

SAR posted February 21, 2014 – March 24, 2014

First posting May 19, 2014 – July 2, 2014

Description of Current Draft

This is the ~~first~~second posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date
~~Additional ballot~~	~~August 2014~~
Final ballot	October 2014
BOT	November 2014

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
2		Deleted R2, M3 and associated compliance elements Replaced Levels of Non-compliance with the Feb 28, BOT approved Violation Severity Levels (VSLs) Corrected typographical errors in BOT approved version of VSLs	Revised
2	October 17, 2008	Adopted by NERC Board of Trustees	Revised
2	March 17, 2011	Order issued by FERC approving IRO-002-2 (approval effective 5/23/11)	FERC approval
2	February 24, 2014	Updated VSLs based on June 24, 2013 approval.	VSLs revised
3	July 25, 2011	Revised under Project 2006-06	Revised
3	August 4, 2011	Approved by Board of Trustees	
4	April 2014	Revisions as per Project 2014-03	Revised
~~2~~	~~October 17, 2008~~	~~Adopted by NERC Board of Trustees~~	
~~2~~	~~March 17, 2011~~	~~Order issued by FERC approving IRO-002-2 (approval effective 5/23/11)~~	
~~2~~	~~February 24, 2014~~	~~Updated VSLs based on June 24, 2013 approval.~~	
~~3~~	~~August 4, 2011~~	~~Approved by Board of Trustees~~	
~~4~~	~~April 2014~~	~~Revisions as per Project 2014-03~~	

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

~~**There are no new or revised definitions proposed in this standard revision.**~~

Real-time Assessment: An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through ~~contracted~~third-party services.)

Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through ~~contracted~~third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Reliability Coordination – Monitoring and Analysis**

2. **Number:** IRO-002-4

3. **Purpose:** Provide System Operators with the capabilities necessary to monitor and analyze data needed to perform their reliability functions.

4. **Applicability**

   4.1. Reliability Coordinator

5. **Effective Date:**

   The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

6. **Background:**

   ~~On April 16, 2013, NERC submitted two petitions requesting Commission approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) to replace six currently-effective IRO standards.~~

   ~~On November 21, 2013, the Commission issued a NOPR proposing to remand these TOP and IRO Standards, stating that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." For example, the Commission cites the fact that the proposed TOP Standards do not require Transmission Operators to plan and operate within all System Operating Limits ("SOLs"), which is a requirement in the currently-effective standards.~~

   ~~On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the~~

~~opportunity to thoroughly examine the technical concerns raised in the NOPR and afford time to review the proposed TOP and IRO Standards through the NERC standards development process to ensure that a technically justified set of solutions is in place for reliability. That motion to defer action was granted on January 14, 2014.~~

~~On February 12, 2014, the Standards Committee appointed a Standard Drafting Team to take on the task of revising the aforementioned standards in response to the NOPR issues and the recommendations made by the Independent Expert Review Panel, the IRO FYRT, and the SW Outage Report.~~ See the Project 2014-03 project page.

B. Requirements and Measures

Rationale: Requirements R1 and R2 from IRO-002-2 have been added back into IRO-002-4 in order to ensure that there is no reliability gap. The SDT found no proposed requirements in the current project that covered the issues. The currently-effective requirement in IRO-002-2 has been separated into two parts (Requirements R1 and R2 below) to distinguish voice and data requirements. Staffing of communications and facilities in corresponding requirements from IRO-002-2 is addressed in approved PER-004-2, Requirement R1 and has been deleted from this draft.

R1. ~~Each Reliability Coordinator shall have voice communications facilities with Transmission Operators, Balancing Authorities, and Generator Operators within its Reliability Coordinator Area and with neighboring Reliability Coordinators.~~ ~~*[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*~~

M1. ~~Each Reliability Coordinator shall have and provide upon request, evidence that could include, but is not limited to, a document that lists its voice communications facilities with Transmission Operators, Balancing Authorities, and Generator Operators within its Reliability Coordinator Area and with neighboring Reliability Coordinators.~~

R2. Each Reliability Coordinator shall have data ~~links~~exchange capabilities with Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. ~~with Balancing Authorities, Planning Coordinators, Transmission Planners, Generator Owners, Generator Operators, Load-Serving Entities, Transmission Operators, Transmission Owners, and Distribution Providers within its Reliability Coordinator Area and with neighboring Reliability Coordinators.~~ *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M2. Each Reliability Coordinator shall have and provide upon request, evidence that could include~~,~~ but is not limited to~~,~~ a document that lists its data ~~links~~exchange capabilities with Balancing Authorities~~, Planning Coordinators, Transmission Planners, Generator Owners, Generator Operators, Load-Serving Entities,~~ and Transmission Operators, ~~Transmission Owners, and Distribution Providers~~ and with other entities it deems necessary, for it to perform its operational Planning Analyses, Real-time monitoring, and real-time Assessments.~~within its Reliability Coordinator Area and with neighboring Reliability Coordinators.~~

R3. Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M3. Each Reliability Coordinator shall have and provide upon request evidence that could include~~,~~ but is not limited to~~,~~ a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities.

Rationale: Requirement R2 from IRO-002-3 has been deleted because approved EOP-008-1, Requirement R1, part 1.6.2 addresses redundancy and back-up concerns for outages of analysis tools. New Requirement R4 has been added to address NOPR paragraphs 96 and 97: *"…As we explain above, the reliability coordinator's obligation to monitor SOLs is important to reliability because a~~n~~ SOL can evolve into an IROL during deteriorating system conditions, and for potential system conditions such as this, the reliability coordinator's monitoring of SOLs provides a necessary backup function to the transmission operator…."*

R4. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to ~~determine~~identify any ~~potential~~ System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area~~, including sub-100 kV facilities needed to make this determination and the status of Special Protection Systems in its Reliability Coordinator Area~~. *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

M4. Each Reliability Coordinator shall have, and provide upon request, evidence that could include~~,~~ but is not limited to~~,~~ Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitored Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to ~~determine~~identify any ~~potential~~ System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area~~, including sub-100 kV facilities~~

~~needed to make this determination and the status of Special Protection Systems in its Reliability Coordinator Area~~.

Rationale for Requirement R5: Requirement R5 added back from approved IRO-002-2 as the SDT found no proposed requirements that covered the issues.

R5. Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant ~~and highly reliable~~ infrastructure. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M5. The Reliability Coordinator shall have, and provide upon request, evidence that could include~~,~~ but is not limited to~~,~~ Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitoring systems consistent with the requirement.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and ~~Enforcement~~Assessment Processes:

~~Compliance Audits~~

~~Self-Certifications~~

~~Spot Checking~~

~~Compliance Violation Investigation~~

~~Self-Reporting~~

~~Complaints~~

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Reliability Coordinator shall retain its current, in force document and any documents in force for the current year and previous calendar year for Requirements R1, R2, and R3 and Measures M1, M2, and M3.

The Reliability Coordinator shall keep data or evidence for Requirements R4 and R5 and Measures M4 and M5 for the current calendar year and one previous calendar year.

If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	~~Operations Planning, Same-Day Operations, Real-time Operations~~	~~High~~	~~N/A~~ ~~The Reliability Coordinator did not have voice communication facilities with one applicable entity, or 5% or less of the applicable entities, whichever is less, as specified in Requirement R1.~~	~~N/A~~ ~~The Reliability Coordinator did not have voice communication facilities with two applicable entities, or more than 5% and less than or equal to 10% of the applicable entities, whichever is less, as specified in Requirement R1.~~	~~N/A~~ ~~The Reliability Coordinator did not have voice communication facilities with three applicable entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is less, as specified in Requirement R1.~~	~~The Reliability Coordinator doesdid not have voice communication facilities with Transmission Operators, Balancing Authorities, and Generator Operators within its Reliability Coordinator Area or with neighboring Reliability Coordinators four or more applicable entities, or more than 15% of the entities, whichever is less, as specified in Requirement R1.~~
R2	Operations Planning, Same-Day Operations, Real-time Operations	High	~~N/A~~ The Reliability Coordinator did not have data exchange capabilities with one applicable entity, or 5% or less of the applicable entities, whichever is less.	~~N/A~~ The Reliability Coordinator did not have data exchange capabilities with two applicable entity~~y~~ies, or more than 5% or less than or equal to 10% of the applicable entities, whichever is less.	~~N/A~~ The Reliability Coordinator did not have data exchange capabilities with three applicable entity~~y~~ies, or more than 10% or less than or equal to 15% of the applicable entities, whichever is less.	The Reliability Coordinator ~~does~~did not have data ~~link facilities~~exchange capabilities with ~~Balancing Authorities, Planning Coordinators, Transmission Planners, Generator Owners, Generator Operators, Load-Serving Entities, Transmission Operators, Transmission Owners, and Distribution Providers within its Reliability Coordinator Area or with neighboring Reliability~~

First posting from May 19, 2014 to July 2, 2014

Proposed Action Plan and Description of Current Draft

This is the second posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date
Final ballot	October 2014
BOT	November 2014

Version History

Version	Date	Action	Change Tracking
1	October 17, 2008	Adopted by NERC Board of Trustees	
1	March 17, 2011	Order issued by FERC approving IRO-008-1 (approval effective 5/23/11)	
1	February 28, 2014	Updated VSLs and VRF's based on June 24, 2013 approval.	
2	TBD	Revisions under Project 2014-03	Revised

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Real-time Assessment: An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

A. Introduction

1. **Title**: Reliability Coordinator Operational Analyses and Real-time Assessments
2. **Number:** IRO-008-2
3. **Purpose:** Perform analyses and assessments to prevent instability, uncontrolled separation, or Cascading.
4. **Applicability**

   4.1. Reliability Coordinator.
5. **Proposed Effective Date:**

   The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
6. **Background**

   See Project 2014-03 project page.

B. Requirements and Measures

Rationale for Requirement R1: Revised in response to NOPR paragraph 96 on the obligation of Reliability Coordinators to monitor SOLs. Measure M1 revised for consistency with TOP-003-3, Measure M1.

R1. Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area. [*Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M1. Each Reliability Coordinator shall have evidence of a completed Operational Planning Analysis. Such evidence could include but is not limited to dated power flow study results.

Rationale for Requirements R2 and R3: In response to IERP and SW Outage Report recommendations concerning the coordination and review of plans.

R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. [*Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M2. Each Reliability Coordinator shall have evidence that it has a coordinated Operating Plan for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of the Operational Planning Analysis performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. Such evidence could include but is not limited to plans for precluding operating in excess of each SOL and IROL that were identified as a result of the Operational Planning Analysis.

R3. Each Reliability Coordinator shall notify impacted entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in those plan(s). *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Each Reliability Coordinator shall have evidence that it notified impacted entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in the plan(s). Such evidence could include but is not limited to dated operator logs, or e-mail records.

R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. *[Violation Risk Factor: High] [Time Horizon: Same-day Operations, Real-time Operations]*

M4. Each Reliability Coordinator shall have, and make available upon request, evidence to show it ensured that a Real-time Assessment is performed at least once every 30 minutes. This evidence could include but is not limited to dated computer logs showing times the assessment was conducted, dated checklists, or other evidence.

Rationale for Requirements R5 and R6: In Requirements R5 and R6 the use of the term ‘impacted’ and the tie to the Operating Plan where notification protocols will be set out should minimize the volume of notifications.

R5. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted

Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Reliability Coordinator Wide Area. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]*

M5. Each Reliability Coordinator shall make available upon request, evidence that it informed impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, of its actual or expected operations that result in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Reliability Coordinator may provide an attestation.

R6. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been prevented or mitigated. *[Violation Risk Factor: Medium] [Time Horizon: Same-Day Operations, Real-time Operations]*

M6. Each Reliability Coordinator shall make available upon request, evidence that it informed impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been prevented or mitigated. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Reliability Coordinator may provide an attestation.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Reliability Coordinator shall keep data or evidence to show compliance for Requirements R1 through R3, R5, and R6 and Measures M1 through M3, M5, and M6 for a rolling 90 calendar days period for analyses, the most recent 90 calendar days for voice recordings, and 12 months for operating logs and e-mail records unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

Each Reliability Coordinator shall each keep data or evidence for Requirement R4 and Measure M4 for a rolling 30 calendar day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

F. Associated Documents

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific SOL or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures, including electronic data exchange, which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator's disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific SOL or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible SOL or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those SOLs or IROLs, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day SOL or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of "the Operating Plan document" for compliance purposes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted for comment February 21, 2014 to March 24, 2014

First posting from May 19, 2014 to July 2, 2014

Proposed Action Plan and Description of Current Draft

This is the ~~first~~second posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date
~~Additional ballot~~	~~August 2014~~
Final ballot	October 2014
BOT	November 2014

Version History

Version	Date	Action	Change Tracking
1	October 17, 2008	Adopted by NERC Board of Trustees	
1	March 17, 2011	Order issued by FERC approving IRO-008-1 (approval effective 5/23/11)	
1	February 28, 2014	Updated VSLs and VRF's based on June 24, 2013 approval.	
2	~~April 2014~~TBD	~~Changes pursuant to~~Revisions under Project 2014-03	Revised

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

~~**There are no new or revised definitions proposed in this standard revision.**~~

Real-time Assessment: An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through ~~contracted~~third-party services.)

Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through ~~contracted~~third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

A. Introduction

1. **Title**: Reliability Coordinator Operational Analyses and Real-time Assessments
2. **Number:** IRO-008-2
3. **Purpose:** Perform analyses and assessments to prevent instability, uncontrolled separation, or Cascading.
4. **Applicability**

   4.1. Reliability Coordinator.
5. **Proposed Effective Date:**

   The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
6. **Background**

   ~~On April 16, 2013, NERC submitted two petitions requesting Commission approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) to replace six currently-effective IRO standards.~~

   ~~On November 21, 2013, the Commission issued a NOPR proposing to remand these TOP and IRO Standards, stating that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." For example, the Commission cites the fact that the proposed TOP Standards do not require Transmission Operators to plan and operate within all System Operating Limits ("SOLs"), which is a requirement in the currently-effective standards.~~

   ~~On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR and afford time to review the proposed TOP and IRO Standards through the NERC standards development process to ensure that a technically justified set of solutions is in place for reliability. That motion to defer action was granted on January 14, 2014.~~

~~On February 12, 2014, the Standards Committee appointed a Standard Drafting Team to take on the task of revising the aforementioned standards in response to the NOPR issues and the recommendations made by the Independent Expert Review Panel, the IRO FYRT, and the SW Outage Report.~~See Project 2014-03 project page.

B. Requirements and Measures

Rationale for Requirement R1: Revised in response to NOPR paragraph 96 on the obligation of Reliability Coordinators to monitor SOLs. Measure M1 revised for consistency with TOP-003-3, Measure M1.

R1. Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) ~~or~~and Interconnection Operating Reliability Limits (IROLs) within its ~~Reliability Coordinator~~ Wide Area. [*Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M1. Each Reliability Coordinator shall have evidence of a completed Operational Planning Analysis. Such evidence could include~~,~~ but is not limited to~~,~~ dated power flow study results.

Rationale for Requirements ~~R2,~~ R3~~,~~ and R4: In response to IERP and SW Outage Report recommendations concerning the coordination and review of plans.

R2. ~~Each Reliability Coordinator shall review the Operating Plans for next-day operations provided by its Transmission Operators and Balancing Authorities. [*Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*~~

M2. ~~Each Reliability Coordinator shall have evidence that it reviewed the Operating Plans for next-day operations provided by its Transmission Operators and Balancing Authorities. Such evidence could include, but is not limited to, dated e-mail messages.~~

R3. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as ~~required~~performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. [*Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Each Reliability Coordinator shall have evidence that it has a coordinated Operating Plan for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of the Operational Planning Analysis performed in Requirement R1 ~~and that~~while consider~~s~~ing the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. Such evidence could include~~,~~ but is not limited to~~,~~ plans for precluding operating in excess of each SOL and IROL that were identified as a result of the Operational Planning Analysis.

R4. Each Reliability Coordinator shall notify impacted ~~NERC registered~~ entities identified in the Operating Plan(s) cited in Requirement R3 as to their role in those plan(s). *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M4. Each Reliability Coordinator shall have evidence that it notified impacted ~~NERC registered~~ entities identified in the Operating Plan(s) cited in Requirement R3 as to their role in the plan(s). Such evidence could include but is not limited to dated operator logs, or e-mail records.

R5. Each Reliability Coordinator shall ~~perform~~ensure that a Real-time Assessment is performed at least once every 30 minutes. *[Violation Risk Factor: High] [Time Horizon: Same-day Operations, Real-time Operations]*

M5. Each Reliability Coordinator shall have, and make available upon request, evidence to show it ~~conducted~~ensured that a Real-~~T~~time Assessment is performed at least once every 30 minutes. This evidence could include~~,~~ but is not limited to~~,~~ dated computer logs showing times the assessment was conducted, dated checklists, or other evidence.

Rationale for Requirements R5 and R6: ~~Language changed from IROL exceedance to Emergency, as Emergency is a stronger term which includes IROL exceedance and thus raises the bar for this requirement. Requirement R7 is the extension of Requirement R6 ensuring actions are taken to deal with the Emergency.~~ In Requirements ~~R6~~ R5 and ~~R8~~ R6 the use of the term 'impacted' and the tie to the Operating Plan where notification protocols will be set out should minimize the volume of notifications.

R6. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Reliability Coordinator Wide Area. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]*

M6. Each Reliability Coordinator shall make available upon request, evidence that it informed impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, of its actual or expected operations that result in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance. Such evidence could include~~,~~ but is not limited to~~,~~ dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Reliability Coordinator may provide an attestation.

R7. ~~Each Reliability Coordinator shall issue Operating Instructions, as necessary, to ensure that actions are taken to deal with the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6.~~ ~~*[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]*~~

M7. ~~Each Reliability Coordinator shall have evidence that it issued Operating Instructions, as necessary, to ensure that actions were taken to deal with the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6. Such evidence could include, but is not limited to, dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation.~~

R8. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been prevented or mitigated. *[Violation Risk Factor: Medium] [Time Horizon: Same-Day Operations, Real-time Operations]*

M8. Each Reliability Coordinator shall make available upon request, evidence that it informed impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been prevented or mitigated. Such evidence could include~~,~~ but is not limited to~~,~~ dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Reliability Coordinator may provide an attestation.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and ~~Enforcement~~Assessment Processes

~~Compliance Audits~~

~~Self-Certifications~~

~~Spot Checking~~

~~Compliance Violation Investigation~~

~~Self-Reporting~~

~~Complaints~~

~~Exception Reporting~~

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Reliability Coordinator shall keep data or evidence to show compliance for Requirements R1 through R~~4~~3, R~~6~~5, and R6 ~~through R8~~ and Measures M1 through M~~4~~3, M~~6~~5, and M6 ~~through M8~~ for a rolling ~~six month~~ 90 calendar days period for analyses, the most recent ~~three months~~ 90 calendar days for voice recordings, and 12 months for operating logs and e-mail records unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

Each Reliability Coordinator shall each keep data or evidence for Requirement R~~5~~4 and Measure M~~5~~4 for ~~the current calendar year and one previous calendar year, with the exception of voice recordings which shall be retained for a minimum of ninety calendar days~~ a rolling 30 calendar day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific SOL or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures, including electronic data exchange, which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator's disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific SOL or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible SOL or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those SOLs or IROLs, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day SOL or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of "the Operating Plan document" for compliance purposes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted February 21, 2014 – March 24, 2014

First posting May 19, 2014 – July 2, 2014

Description of Current Draft

This is the second posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date
Final ballot	October 2014
BOT	November 2014

Version History

Version	Date	Action	Change Tracking
1	October 17, 2008	Adopted by Board of Trustees	New
1a	August 5, 2009	Added Appendix 1: Interpretation of R1.2 and R3 as approved by Board of Trustees	Addition
1a	March 17, 2011	Order issued by FERC approving IRO-010-1a (approval effective 5/23/11)	
1a	November 19, 2013	Updated VRFs based on June 24, 2013 approval.	
2	April 2014	Revisions pursuant to Project 2014-03	

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Real-time Assessment: An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

A. Introduction

1. **Title:** Reliability Coordinator Data Specification and Collection

2. **Number:** IRO-010-2

3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact reliability, by ensuring the Reliability Coordinator has the data it needs to monitor and assess the operation of its Reliability Coordinator Area.

> **Rationale for Applicability changes:** Changes were made to applicability based on IRO FYRT recommendation to address the need for UVLS and UFLS information in the data specification.
>
> The Interchange Authority was removed because activities in the Coordinate Interchange standards are performed by software systems and not a responsible entity. The software, not a functional entity, performs the task of accepting and disseminating interchange data between entities. The Balancing Authority is the responsible functional entity for these tasks.
>
> The Planning Coordinator and Transmission Planner were removed from Draft 2 as those entities would not be involved in a data specification concept as outlined in this standard.

4. **Applicability**

   4.1. Reliability Coordinator.

   4.2. Balancing Authority.

   4.3. Generator Owner.

   4.4. Generator Operator.

   4.5. Load-Serving Entity.

   4.6. Transmission Operator.

   4.7. Transmission Owner.

   4.8. Distribution Provider.

5. **Proposed Effective Date:**

   Requirement R1 and R2 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R1 and R2 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

6. Background

See Project 2014-03 project page.

B. Requirements

Rationale:

Proposed Requirement R1, Part 1.1 is in response to issues raised in NOPR paragraph 67 on the need for obtaining sub-100 kV and external network data necessary for the Reliability Coordinator to fulfill its responsibilities.

Proposed Requirement R1, Part 1.2 is in response to NOPR paragraph 78 on relay data.

Proposed Requirement R3, Part 3.3 is in response to NOPR paragraph 92 where concerns were raised about data exchange through secured networks.

Corresponding changes have been made to proposed TOP-003-3.

R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data, as deemed necessary by the Reliability Coordinator.

1.2. Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.

1.3. A periodicity for providing data.

1.4. The deadline by which the respondent is to provide the indicated data.

M1. The Reliability Coordinator shall make available its dated, current, in force documented specification for data.

R2. The Reliability Coordinator shall distribute its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

M2. The Reliability Coordinator shall make available evidence that it has distributed its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. This evidence could include but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

R3. Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications using: *(Violation Risk Factor: Medium) (Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations)*

3.1 A mutually agreeable format

3.2 A mutually agreeable process for resolving data conflicts

3.3 A mutually agreeable security protocol

M3. The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall make available evidence that it satisfied the obligations of the documented specification using the specified criteria. Such evidence could include but is not limited to electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2 Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Reliability Coordinator shall retain its dated, current, in force documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R1, Measure M1 as well as any documents in force since the last compliance audit.

The Reliability Coordinator shall keep evidence for three calendar years that it has distributed its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R2, Measure M2.

Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R3 and Measurement M3.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R#	Time Horizon	VRF	Violation Severity Levels			
			Lower	Moderate	High	Severe
R1	Operations Planning	Low	The Reliability Coordinator did not include one of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include two of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include three of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include any of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Reliability Coordinator did not have a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time

R#	Time Horizon	VRF	Violation Severity Levels			
			Lower	Moderate	High	Severe
						monitoring, and Real-time Assessments.
For the Requirement R2 VSLs only, the intent of the SDT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.						
R2	Operations Planning	Low	The Reliability Coordinator did not distribute its data specification as developed in Requirement R1 to one entity, or 5% or less of the entities, whichever is less, that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-	The Reliability Coordinator did not distribute its data specification as developed in Requirement R1 to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is less, that have data required by the Reliability Coordinator's	The Reliability Coordinator did not distribute its data specification as developed in Requirement R1 to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is less, that have data required by the Reliability	The Reliability Coordinator did not distribute its data specification as developed in Requirement R1 to four or more entities, or more than 15% of the entities, whichever is less, that have data required by the Reliability Coordinator's Operational

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted February 21, 2014 – March 24, 2014

First posting May 19, 2014 – July 2, 2014

Description of Current Draft

This is the ~~first~~second posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date
~~Additional ballot~~	~~August 2014~~
Final ballot	October 2014
BOT	November 2014

Version History

Version	Date	Action	Change Tracking
1	October 17, 2008	Adopted by Board of Trustees	New
1a	August 5, 2009	Added Appendix 1: Interpretation of R1.2 and R3 as approved by Board of Trustees	Addition
1a	March 17, 2011	Order issued by FERC approving IRO-010-1a (approval effective 5/23/11)	
1a	November 19, 2013	Updated VRFs based on June 24, 2013 approval.	
2	~~April 2014~~TBD	Revisions ~~pursuant to~~under Project 2014-03	Revised

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

~~**There are no new or revised definitions proposed in this standard revision.**~~

Real-time Assessment: An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through ~~contracted~~third-party services.)

Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through ~~contracted~~third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

A. Introduction

1. **Title:** Reliability Coordinator Data Specification and Collection
2. **Number:** IRO-010-2
3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact reliability, by ensuring the Reliability Coordinator has the data it needs to monitor and assess the operation of its Reliability Coordinator Area.
4. **Applicability**
   - **4.1.** Reliability Coordinator.
   - **4.2.** Balancing Authority.
   - **4.3.** ~~Planning Coordinator.~~
   - **4.4.** ~~Transmission Planner.~~
   - **4.5.** Generator Owner.
   - **4.6.** Generator Operator.
   - **4.7.** Load-Serving Entity.
   - **4.8.** Transmission Operator.
   - **4.9.** Transmission Owner.
   - **4.10.** Distribution Provider.

Rationale for Applicability changes: Changes to applicability were made based on the IRO FYRT recommendation to address the need for UVLS and UFLS information in the data specification.

The Interchange Authority was removed activities assigned to the Interchange Authority in the Coordinate Interchange standards are performed by software systems and not a responsible entity. The software, not a functional entity, performs the task of accepting and disseminating interchange data between entities. The Balancing Authority is the responsible functional entity for these tasks.

The Planning Coordinator and Transmission Planner were removed from Draft 2 as those entities would not be involved in a data specification concept as outlined in this standard. ~~The Interchange Authority activities in the Coordinate Interchange standards are performed by software systems and not a responsible entity. The software, not a functional entity, performs the task of accepting and disseminating interchange data between entities. The Balancing Authority is the responsible functional entity for these tasks.~~

5. **Proposed Effective Date:**

Requirement R1 and R2 shall become effective on the first day of the first calendar quarter that is ~~ten (10)~~nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R1 and R2 shall become effective on the first day of the first calendar quarter that is ~~ten (10)~~nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

6. Background

~~On April 16, 2013, NERC submitted two petitions requesting Commission approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) to replace six currently-effective IRO standards.~~

~~On November 21, 2013, the Commission issued a NOPR proposing to remand these TOP and IRO Standards, stating that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." For example, the Commission cites the fact that the proposed TOP Standards do not require Transmission Operators to plan and operate within all System Operating Limits ("SOLs"), which is a requirement in the currently-effective standards.~~

~~On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR and afford time to review the proposed TOP and IRO Standards through the NERC standards development process to ensure that a technically justified set of solutions is in place for reliability. That motion to defer action was granted on January 14, 2014.~~

~~On February 12, 2014, the Standards Committee appointed a Standard Drafting Team to take on the task of revising the aforementioned standards in response to the NOPR~~

~~issues and the recommendations made by the Independent Expert Review Panel, the IRO FYRT, and the SW Outage Report.~~See Project 2014-03 project page.

B. Requirements

Rationale ~~for Requirement R1~~:

Proposed Requirement R1, ~~p~~Part 1.1 is in response to issues raised in NOPR paragraph 67 on the need for obtaining sub-100 kV and external network data necessary for the Reliability Coordinator to fulfill its responsibilities.

Proposed Requirement R1, ~~p~~Part 1.2 is in response to NOPR paragraph 78 on relay data.

Proposed Requirement R~~1~~3, ~~p~~Part ~~1.7~~3.3 is in response to NOPR paragraph 92 where concerns were raised about data exchange through secured networks.

Corresponding changes have been made to proposed TOP-003-3.

R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: *(Violation Risk Factor: ~~Medium~~Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data, as deemed necessary by the Reliability Coordinator.

1.2. Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.

1.3. A periodicity for providing data.

1.4. The deadline by which the respondent is to provide the indicated data.

M1. The Reliability Coordinator shall make available its dated, current, in force documented specification for data.

R2. The Reliability Coordinator shall distribute its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *(Violation Risk Factor: ~~Medium~~Low) (Time Horizon: Operations Planning)*

M2. The Reliability Coordinator shall make available evidence that it has distributed its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. This evidence could include~~,~~ but is not limited to~~,~~ web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

R3. Each Reliability Coordinator, Balancing Authority, ~~Planning Coordinator, Transmission Planner,~~ Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications using: *(Violation Risk Factor: Medium) (Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations)*

3.1 A mutually agreeable format

3.2 A mutually agreeable process for resolving data conflicts

3.3 A mutually agreeable security protocol

M3. The Reliability Coordinator, Balancing Authority, ~~Planning Coordinator, Transmission Planner,~~ Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall make available evidence that it satisfied the obligations of the documented specification using the specified criteria. Such evidence could include~~,~~ but is not limited to~~,~~ electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2 Compliance Monitoring and ~~Enforcement~~Assessment Processes

~~Compliance Audits~~

~~Self-Certifications~~

~~Spot Checking~~

~~Compliance Violation Investigations~~

~~Self-Reporting~~

~~Complaints~~

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Reliability Coordinator shall retain its dated, current, in force documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R1, Measure M1 as well as any documents in force since the last compliance audit.

The Reliability Coordinator shall keep evidence for three calendar years that it has distributed its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R2, Measure M2.

Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R3 and Measurement M3.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R#	Time Horizon	VRF	Violation Severity Levels			
			Lower	Moderate	High	Severe
R1	Operations Planning	~~Medium~~Low	The Reliability Coordinator did not include one of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include two of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include three of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include ~~four or more~~any of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Reliability Coordinator did not have a documented specification for the data necessary for it to perform its Operational Planning Analyses,

R#	Time Horizon	VRF	Violation Severity Levels			
			Lower	Moderate	High	Severe
						Real-time monitoring, and Real-time Assessments.
For the Requirement R2 VSLs only, the intent of the SDT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.						
R2	Operations Planning	~~Medium~~Low	The Reliability Coordinator did not distribute its data specification as developed in Requirement R1 to one entity, or 5% or less of the entities, whichever is less, that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time	The Reliability Coordinator did not distribute its data specification as developed in Requirement R1 to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is less, that have data required by the Reliability	The Reliability Coordinator did not distribute its data specification as developed in Requirement R1 to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is less, that have data required by the	The Reliability Coordinator did not distribute its data specification as developed in Requirement R1 to four or more entities, or more than 15% of the entities, whichever is less, that have data required by the Reliability Coordinator's

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted February 21, 2014 – March 24, 2014

First posting May 19, 2014 – July 2, 2014

Description of Current Draft

This is the second posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date
Final ballot	October 2014
BOT	November 2014

Version History

Version	Date	Action	Change Tracking
Version 1	08/10/05	1. Changed incorrect use of certain hyphens (-) to "en dash (–)." 2. Hyphenated "30-day" when used as adjective. 3. Changed standard header to be consistent with standard "Title." 4. Initial capped heading "Definitions of Terms Used in Standard." 5. Added "periods" to items where appropriate. 6. Changed "Timeframe" to "Time Frame" in item D, 1.2. 7. Lower cased all words that are not "defined" terms — drafting team, self-certification. 8. Changed apostrophes to "smart" symbols. 9. Added comma in all word strings "Procedures, Processes, or Plans," etc. 10. Added hyphens to "Reliability Coordinator-to-Reliability Coordinator" where used as adjective. 11. Removed comma in item 2.1.2. 12. Removed extra spaces between words where appropriate.	01/20/06
2		Revised under Project 2006-06	Revised
2	August 4, 2011	Adopted by Board of Trustees	Revised
4	TBD	Revisions under Project 2014-03	Revised

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

There are no new or revised definitions proposed in this standard revision.

A. Introduction

1. **Title:** Coordination Among Reliability Coordinators

2. **Number:** IRO-014-3

3. **Purpose:** To ensure that each Reliability Coordinator's operations are coordinated such that they will not adversely impact other Reliability Coordinator Areas and to preserve the reliability benefits of interconnected operations.

4. **Applicability:**

   4.1. Reliability Coordinator

5. **Effective Date**

   The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

6. **Background:**

   On April 16, 2013, NERC submitted two petitions requesting Commission approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) to replace six currently-effective IRO standards.

   On November 21, 2013, the Commission issued a NOPR proposing to remand these TOP and IRO Standards, stating that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." For example, the Commission cites the fact that the proposed TOP Standards do not require Transmission Operators to plan and operate within all System Operating Limits ("SOLs"), which is a requirement in the currently-effective standards.

   On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR and afford time to review the proposed TOP and IRO Standards through the NERC standards development process to ensure that a technically justified set of solutions is in place for reliability. That motion to defer action was granted on January 14, 2014.

On February 12, 2014, the Standards Committee appointed a Standard Drafting Team to take on the task of revising the aforementioned standards in response to the NOPR issues and the recommendations made by the Independent Expert Review Panel, the IRO FYRT, and the SW Outage Report.

B. Requirements and Measures

Rationale for Requirement R1: Grammatical changes for consistency with defined terms to Requirement R1.

Deletions are due to duplication with proposed IRO-008-2, Requirements R4 and R6 and proposed IRO-010-3.

Other changes are grammatical for clarity.

R1. Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations]*

1.1. Criteria and processes for notifications .

1.2. Energy and capacity shortages.

1.3. Control of voltage, including the coordination of reactive resources.

1.4. Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and Real-time Assessments.

1.5. Provisions for periodic communications to support reliable operations.

M1. Each Reliability Coordinator shall have available the latest approved documented version of its Operating Procedures, Operating Processes, and Operating Plans that require notifications, or the coordination of actions among impacted Reliability Coordinators for conditions or activities that impact adjacent Reliability Coordinator Areas. This documentation shall include dated, current in force documentation with the specified elements, and notes from periodic communications.

R2. Each Reliability Coordinator shall maintain its Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 as follows: *[Violation Risk Factor: Low] [Time Horizon: Operations Planning, Same-Day Operations]*

2.1. Review and update annually with no more than 15 months between reviews.

2.2. Obtain written agreement from all of the Reliability Coordinators required to take the indicated action(s) for each update.

2.3. Distribute to all Reliability Coordinators that are required to take the indicated action(s) within 30 days of an update.

M2. Each Reliability Coordinator shall have dated evidence that the Operating Procedures, Operating Processes, and Operating Plans that require one or more other Reliability Coordinators to take action were maintained as specified. This evidence may include but is not limited to dated documentation with confirmation of receipt, dated notice of acceptance or agreement to take specified actions, or dated electronic communications with confirmation of receipt and acceptance or agreement to take specified actions.

Rationale: Terminology changed from Adverse Reliability Impact to Emergency for consistency amongst standards. Emergency is a more inclusive term.

R3. Each Reliability Coordinator, upon identification of an expected or actual Emergency in its Reliability Coordinator Area, shall notify other impacted Reliability Coordinators. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same Day Operations, Real-time Operations]*

M3. Each Reliability Coordinator shall have and provide evidence which may include but is not limited to operator logs, voice recordings, or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it, upon identification of an expected or actual Emergency in its Reliability Coordinator Area, notified other impacted Reliability Coordinators.

R4. Each impacted Reliability Coordinator shall operate as though the Emergency exists during each instance where Reliability Coordinators disagree on the existence of an Emergency. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M4. Each Reliability Coordinator shall have and provide evidence which may include but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it operated as though an Emergency existed during each instance where Reliability Coordinators disagreed on the existence of an Emergency.

R5. Each Reliability Coordinator that identified an Emergency in its Reliability Coordinator Area shall develop an action plan to resolve the Emergency during those instances where impacted Reliability Coordinators disagree on the existence of an Emergency. *[Violation Risk Factor: High][Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M5. Each Reliability Coordinator that identified an Emergency in its Reliability Coordinator Area shall have evidence that it developed an action plan during those instances where impacted Reliability Coordinators disagreed on the existence of an Emergency. This evidence may include but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation.

R6. Each impacted Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identified the Emergency during those instances where Reliability Coordinators disagree on the existence of an Emergency, unless such actions would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High][Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M6. Each impacted Reliability Coordinator shall have and provide evidence which may include but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it implemented the action plan developed by the Reliability Coordinator who has identified the Emergency when Reliability Coordinators disagree on the existence of an Emergency unless such actions would have violated safety, equipment, regulatory, or statutory requirements.

Rationale for Requirement R7: Language added for consistency with proposed TOP-001-3, Requirement R7.

R7. Each Reliability Coordinator shall assist Reliability Coordinators, if requested and able, provided that the requesting Reliability Coordinator has implemented its emergency procedures, unless such actions cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M7. Each Reliability Coordinator shall make available upon request, evidence that requested assistance was provided, if able, to requesting Reliability Coordinators unless such actions could not be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. If such a situation has not occurred, the Reliability Coordinator may provide an attestation.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes:

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Each Reliability Coordinator shall retain its current, in force document and any documents in force since the last compliance audit for Requirements R1 and R2 and Measures M1 and M2.
- Each Reliability Coordinator shall retain its most recent 12 months of evidence for Requirement R5 and Measure M5.
- Each Reliability Coordinator shall retain 3-calendar years plus current calendar year of evidence for Requirements R6 and R8 and Measures M6 and M8.
- Each Reliability Coordinator shall retain evidence for 90-calendar days for operator logs and voice recordings and for the period since the last compliance audit for other evidence for Requirements R7 and R9 and Measures M7 and M9.

If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant, or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4 Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning, Same-Day Operations	Medium	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification or coordination of actions with impacted adjacent Reliability Coordinators to support Interconnection reliability but failed to address one of the topical areas identified in Parts 1.1 through 1.5.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, or coordination of actions with impacted adjacent Reliability Coordinators to support Interconnection reliability but failed to address two of the topical areas identified in Parts 1.1 through 1.5.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, or coordination of actions with impacted adjacent Reliability Coordinators to support Interconnection reliability but failed to address three of the topical areas identified in Parts 1.1 through 1.5.	The Reliability Coordinator failed to have Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, or coordination of actions with impacted adjacent Reliability Coordinators to support Interconnection reliability. OR, The Reliability Coordinator failed to implement its Operating Procedures, Operating processes, or Operating Plans when activities required notification, or coordination of actions with impacted adjacent Reliability Coordinators to support

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						Interconnection reliability.
R2	Operations Planning, Same-Day Operations	Lower	N/A	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 but failed to meet one of the criteria specified in Requirement R2.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 but failed to meet two of the criteria specified in Requirement R2.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 but failed to meet all three of the criteria specified in Requirement R2.
For the Requirement R5 VSLs only, the intent of the SDT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size. If a Reliability Coordinator has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.						
R3	Operations Planning, Same-Day Operations, Real-time Operations	Medium	The Reliability Coordinator did not notify one other impacted Reliability Coordinator upon identification of an expected or actual Emergency in its Reliability Coordinator Area.	The Reliability Coordinator did not notify two other impacted Reliability Coordinators upon identification of an expected or actual Emergency in its Reliability Coordinator Area.	The Reliability Coordinator did not notify three other impacted Reliability Coordinators upon identification of an expected or actual Emergency in its Reliability Coordinator Area.	The Reliability Coordinator did not notify four or more other impacted Reliability Coordinators upon identification of an expected or actual Emergency in its Reliability Coordinator Area.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator failed to operate as though the Emergency existed during an instance where Reliability Coordinators disagreed on the existence of an Emergency.
R5	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator that identified the Emergency in its Reliability Coordinator Area failed to develop an action plan to resolve the Emergency during an instance where impacted Reliability Coordinators disagreed on the existence of Emergency.
R6	Real-time Operations, Same-Day Operations	High	N/A	N/A	N/A	The impacted Reliability Coordinator failed to implement the action plan developed by the Reliability Coordinator that identified the

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						Emergency during an instance where Reliability Coordinators disagreed on the existence of the Emergency.
R7	Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator did not provide assistance to Reliability Coordinators, if requested and able, provided that the requesting Reliability Coordinator has implemented its emergency procedures, unless such actions could not physically be implemented or would violate safety, equipment, regulatory, or statutory requirements.

D. Regional Variances

F. Associated Documents

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific SOL or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures, including electronic data exchange, which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator's disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific SOL or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible SOL or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those SOLs or IROLs, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day SOL or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of "the Operating Plan document" for compliance purposes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

There are no new or revised definitions proposed in this standard revision.

A. Introduction

1. **Title:** Coordination Among Reliability Coordinators

2. **Number:** IRO-014-3

3. **Purpose:** To ensure that each Reliability Coordinator's operations are coordinated such that they will not adversely impact other Reliability Coordinator Areas and to preserve the reliability benefits of interconnected operations.

4. **Applicability:**

   4.1. Reliability Coordinator

5. **Effective Date**

   The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

6. **Background:**

   ~~On April 16, 2013, NERC submitted two petitions requesting Commission approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) to replace six currently-effective IRO standards.~~

   ~~On November 21, 2013, the Commission issued a NOPR proposing to remand these TOP and IRO Standards, stating that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." For example, the Commission cites the fact that the proposed TOP Standards do not require Transmission Operators to plan and operate within all System Operating Limits ("SOLs"), which is a requirement in the currently-effective standards.~~

   ~~On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR and afford time to review the proposed TOP and IRO Standards through the NERC~~

~~standards development process to ensure that a technically justified set of solutions is in place for reliability. That motion to defer action was granted on January 14, 2014.~~

~~On February 12, 2014, the Standards Committee appointed a Standard Drafting Team to take on the task of revising the aforementioned standards in response to the NOPR issues and the recommendations made by the Independent Expert Review Panel, the IRO FYRT, and the SW Outage Report.~~See Project 2014-03 project page.

B. Requirements and Measures

Rationale for Requirement R1: Grammatical changes for consistency with defined terms to Requirement R1.

Deletions are due to duplication with proposed IRO-008-2, Requirements R4 and R6 and proposed IRO-010-3.

Other changes are grammatical for clarity.

R1. Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact ~~other~~adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations]*

1.1. ~~Communications and nN~~ Criteria and processes for notifications~~, and the process to follow in making those notifications~~.

1.2. Energy and capacity shortages.

1.3. Control of voltage, including the coordination of reactive resources.

1.4. Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and Real-time Assessments.

1.5. ~~Authority to act to prevent and mitigate system conditions which could adversely impact other Reliability Coordinator Areas.~~

1.6. Provisions for ~~weekly conference calls~~ periodic communications to support reliable operations.

M1. Each Reliability Coordinator shall have available the latest approved documented version of its Operating Procedures, Operating Processes, and Operating Plans that require notifications, or the coordination of actions among impacted Reliability Coordinators for conditions or activities that impact ~~other~~adjacent Reliability Coordinator Areas. This documentation shall include dated, current in force documentation with the specified elements, and notes from periodic communications.

R2. Each Reliability Coordinator shall maintain its Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 as follows: *[Violation Risk Factor: Low~~er~~] [Time Horizon: Operations Planning, Same-Day Operations]*

2.1. Review and update annually with no more than 15 months between reviews.

2.2. Obtain written agreement from all of the Reliability Coordinators required to take the indicated action(s) for each update.

2.3. Distribute to all Reliability Coordinators that are required to take the indicated action(s) within 30 days of an update.

M2. Each Reliability Coordinator shall have dated evidence that the Operating Procedures, Operating Processes, and Operating Plans that require one or more other Reliability Coordinators to take action were maintained as specified. This evidence may include~~,~~ but is not limited to~~,~~ dated documentation with confirmation of receipt, dated notice of acceptance or agreement to take specified actions, or dated electronic communications with confirmation of receipt and acceptance or agreement to take specified actions.

~~**R3.** Each Reliability Coordinator shall make notifications and exchange reliability–related information with other impacted Reliability Coordinators in accordance with the Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1. *[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*~~

~~**R4.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it made notifications and exchanged reliability–related information with impacted Reliability Coordinators in accordance with the Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1.~~

~~**R5.** Each Reliability Coordinator shall participate in agreed upon conference calls, at least weekly (per Requirement R1, Part 1.6) with other Reliability Coordinators within the same Interconnection. *[Violation Risk Factor: Lower][Time Horizon: Same-Day Operations]*~~

~~**R6.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it participated in agreed upon (at least weekly) conference calls with other Reliability Coordinators within the same Interconnection.~~

Rationale: Terminology changed from Adverse Reliability Impact to Emergency for consistency amongst standards. Emergency is a more inclusive term.

~~R7.~~R3. Each Reliability Coordinator, upon identification of an expected or actual Emergency in its Reliability Coordinator Area, shall notify other impacted Reliability Coordinators. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same Day Operations, Real-time Operations]*

M3. Each Reliability Coordinator shall have and provide evidence which may include~~,~~ but is not limited to~~,~~ operator logs, voice recordings, or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it, upon identification of an expected or actual Emergency in its Reliability Coordinator Area, notified other impacted Reliability Coordinators.

~~R8.~~R4. Each impacted Reliability Coordinator shall operate as though the ~~problem~~Emergency exists during each instance where Reliability Coordinators disagree on the existence of an Emergency. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M4. Each Reliability Coordinator shall have and provide evidence which may include~~,~~ but is not limited to~~,~~ operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it operated as though an Emergency existed during each instance where Reliability Coordinators disagreed on the existence of an Emergency.

~~R9.~~R5. Each Reliability Coordinator that identified an Emergency in its Reliability Coordinator Area shall develop an action plan to resolve the Emergency during those instances where impacted Reliability Coordinators disagree on the existence of an Emergency. *[Violation Risk Factor: High][Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M5. Each Reliability Coordinator that identified an Emergency in its Reliability Coordinator Area shall have evidence that it developed an action plan during those instances where impacted Reliability Coordinators disagreed on the existence of an Emergency. This evidence may include~~,~~ but is not limited to~~,~~ operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation.

~~R10.~~R6. Each impacted Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identified the Emergency during those instances where Reliability Coordinators disagree on the existence of an Emergency, unless such actions would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High][Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M6. Each impacted Reliability Coordinator shall have and provide evidence which may include~~,~~ but is not limited to~~,~~ operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it implemented the action plan developed by the Reliability Coordinator who has identified the Emergency when Reliability

Rationale for Requirement R9: Language added for consistency with proposed TOP-001-3, Requirement R7.

Coordinators disagree on the existence of an Emergency unless such actions would have violated safety, equipment, regulatory, or statutory requirements.

~~**R9**~~**R7**. Each Reliability Coordinator shall assist Reliability Coordinators, if requested and able, provided that the requesting ~~entity~~Reliability Coordinator has implemented its emergency procedures, unless such actions cannot be physically ~~be~~ implemented or would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M7. Each Reliability Coordinator shall make available upon request, evidence that requested assistance was provided, if able, to requesting Reliability Coordinators unless such actions could not be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. Such evidence could include~~,~~ but is not limited to~~,~~ dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. If such a situation has not occurred, the Reliability Coordinator may provide an attestation.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and ~~Enforcement~~Assessment Processes:

~~Compliance Audits~~

~~Self-Certifications~~

~~Spot Checking~~

~~Compliance Violation Investigation~~

~~Self-Reporting~~

~~Complaints~~

~~Exception Reporting~~

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Each Reliability Coordinator shall retain its current, in force document and any documents in force since the last compliance audit for Requirements R1 and R2~~, and R9~~ and Measures M1 and M2~~, and M9~~.
- Each Reliability Coordinator shall retain its most recent 12 months of evidence for Requirement~~s R3, R4, and~~ R5 and Measure~~s M3, M4, and~~ M5.
- Each Reliability Coordinator shall retain 3-~~-~~calendar years plus current calendar year of evidence for Requirements R6~~, R7,~~ and R8 and Measures M6~~, M7,~~ and M8.
- Each Reliability Coordinator shall retain evidence for 90-calendar days for operator logs and voice recordings and for the period since the last compliance audit for other evidence for Requirements R7 and R9 and Measures M7 and M9.

If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant, or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4 Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning, Same-Day Operations	Medium	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification or coordination of actions with impacted adjacent Reliability Coordinators to support Interconnection reliability but failed to address one of the topical areas identified in Parts 1.1 through 1.~~6~~5.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, or coordination of actions with impacted adjacent Reliability Coordinators to support Interconnection reliability but failed to address two of the topical areas identified in Parts 1.1 through 1.~~6~~5.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, or coordination of actions with impacted adjacent Reliability Coordinators to support Interconnection reliability but failed to address three of the topical areas identified in Parts 1.1 through 1.~~6~~5.	The Reliability Coordinator failed to have Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, or coordination of actions with impacted adjacent Reliability Coordinators to support Interconnection reliability. OR, The Reliability Coordinator failed to implement its Operating Procedures, Operating processes, or Operating Plans when activities required notification, or coordination of actions with impacted adjacent Reliability Coordinators to support

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						Interconnection reliability.
R2	Operations Planning, Same-Day Operations	Lower	~~The Reliability Coordinator has the Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 but failed to meet one of the criteria.~~ N/A	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 but failed to meet ~~two~~one of the criteria specified in Requirement R2.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 but failed to meet ~~three~~two of the criteria specified in Requirement R2.	~~The Reliability Coordinator does not have Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1.~~ The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 but failed to meet all three of the criteria specified in Requirement R2.
For the Requirement~~s R3 and~~ R5 VSLs only, the intent of the SDT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size. If a Reliability Coordinator has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.						
R3	~~Operations Planning, Same-Day Operations,~~	~~Medium~~	~~The Reliability Coordinator did not make notifications and exchange reliability-related information with~~	~~The Reliability Coordinator did not make notifications and exchange reliability-related information with~~	~~The Reliability Coordinator did not make notifications and exchange reliability-related information with~~	~~The Reliability Coordinator did not make notifications and exchange reliability-related information with~~

E. Interpretations

None.

F. Associated Documents

~~None.~~

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific SOL or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures, including electronic data exchange, which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator's disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific SOL or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible SOL or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those SOLs or IROLs, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day SOL or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of "the Operating Plan document" for compliance purposes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted for comment February 21, 2014 to March 24, 2014

Version	Date	Action	Change Tracking
1	April 2014	New standard developed by Project 2014-03	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

There are no new or revised definitions proposed in this standard revision.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Outage Coordination**
2. **Number: IRO-017-1**
3. **Purpose:** To ensure that outages are properly coordinated in the Operations Planning time horizon and Near-Term Transmission Planning Horizon.
4. **Applicability:**
   - **4.1.** Reliability Coordinator
   - **4.2.** Transmission Operator
   - **4.3.** Balancing Authority
   - **4.4.** Planning Coordinator
   - **4.5.** Transmission Planner
5. **Effective Date:**

   The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
6. **Background:**

   See Project 2014-03 project page.

B. Requirements and Measures

Rationale: This standard is in response to issues raised in NOPR paragraph 90 and recommendations made by the Independent Expert Review Panel and SW Outage Report on the need for an outage coordination standard. It allows for one cohesive standard to address all outage coordination concerns as opposed to having multiple requirements spread throughout the various standards.

Time Horizon: The official definition of the Operations Planning Time Horizon is: "operating and resource plans from day-ahead up to and including seasonal." The SDT equates 'seasonal' as being up to one year out and that these requirements covers the period from day-ahead to one year out.

R1. Each Reliability Coordinator shall develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area. The outage coordination process shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. Identify applicable roles and reporting responsibilities including:

1.1.1. Development and communication of outage schedules.

1.1.2. Assignment of coordination responsibilities for outage schedules between Transmission Operator(s) and Balancing Authority(s).

1.2. Specify outage submission timing requirements.

1.3. Define the process to evaluate the impact of Transmission and generator outages within its Wide Area.

1.4. Define the process to coordinate the resolution of identified outage conflicts with its Transmission Operators and Balancing Authorities, and other Reliability Coordinators.

M1. Each Reliability Coordinator shall make available its dated, current, in force outage coordination process for generation and Transmission outages within its Reliability Coordinator Area.

R2. Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator outage coordination process. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M2. Each Transmission Operator and Balancing Authority shall provide evidence upon request that it performed the functions specified in its Reliability Coordinator outage coordination process. Such evidence could include but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

Rationale for Requirement R3: Planning Assessment is a defined term and a document that Planning Coordinators and Transmission Planners already have to produce for approved TPL-001-4. It is not a compilation of load flow studies but a textual summary of what was found in those studies including rationales and assumptions.

R3. Each Planning Coordinator and Transmission Planner shall provide its Planning Assessment to impacted Reliability Coordinators. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Each Planning Coordinator and Transmission Planner shall provide evidence upon request showing that it provided its Planning Assessment to impacted Reliability Coordinators. Such evidence could include but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

Rationale for Requirement R4: The SDT has re-written Requirement R4 to show that the process starts with the Planning Assessments created by the Planning Coordinator and Transmission Planner and then those Planning Assessments are reviewed and reconciled as needed with the Reliability Coordinator. This is in response to comments in paragraph 90 of the FERC NOPR about directly involving the Reliability Coordinator in the planning process for periods beyond the present one year outreach. The re-write should not be construed as relieving the Reliability Coordinator of responsibilities in this area but simply as a reflection of how the process actually starts.

In the future, the SDT believes that such coordination should take place in the TPL standards and to support that position, the SDT has created an item in a draft SAR for TPL-001-4 that would revise Requirement R8 to make the Reliability Coordinator an explicit party in the review process described there.

In addition, the SDT will submit a request to the Functional Model Working Team to adjust the roles and responsibilities of the Reliability Coordinator to this new paradigm.

R4. Each Planning Coordinator and Transmission Planner shall jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator, and Transmission Planner shall provide evidence upon request showing that it jointly developed solutions with its respective Reliability Coordinator(s) for identified issues or conflicts with planned outages in its Planning Assessment for the Near-term Transmission Planning Horizon. Such evidence could include but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Process

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each responsible entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

Each Reliability Coordinator shall retain its dated, current, in force, outage coordination process in accordance with Requirement R1 and Measurement M1 as well as any documents in force since the last compliance audit.

Each Transmission Operator and Balancing Authority shall retain evidence for three calendar years that it followed its Reliability Coordinator outage coordination process in accordance with Requirement R2 and Measurement M2.

Each Planning Coordinator and Transmission Planner shall retain evidence for three calendar years that it has its Planning Assessment to impacted Reliability Coordinators in accordance with Requirement R3 and Measurement M3.

Each Reliability Coordinator, Planning Coordinator, and Transmission Planner shall retain evidence for three calendar years that it has coordinated solutions within the Reliability Coordinator Area for identified issues or conflicts with planned outages in the Planning Assessment in accordance with Requirement R4 and Measurement M4.

If a responsible entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning	Medium	The Reliability Coordinator did develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area but it was missing one of the parts specified in Requirement R1 (Parts 1.1 – 1.4).	The Reliability Coordinator did develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area but it was missing two of the parts specified in Requirement R1 (Parts 1.1 – 1.4).	The Reliability Coordinator did develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area but it was missing three of the parts specified in Requirement R1 (Parts 1.1 – 1.4).	The Reliability Coordinator did develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area but it was missing all four of the parts specified in Requirement R1 (Parts 1.1 – 1.4). OR, The Reliability Coordinator did not develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area.
R2	Operations Planning	Medium	N/A	N/A	N/A	The Transmission Operator or Balancing Authority did not perform the functions specified in its Reliability Coordinator outage coordination process.
R3	Operations Planning	Medium	N/A	N/A	N/A	The Planning Coordinator or Transmission Planner did not provide its Planning Assessment to impacted Reliability Coordinators.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	Operations Planning	Medium	N/A	N/A	N/A	The Planning Coordinator or Transmission Planner did not jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts with planned outages in its Planning Assessment for the Near-term Transmission Planning Horizon.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

There are no new or revised definitions proposed in this standard revision.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Outage Coordination**

2. **Number: IRO-017-1**

3. **Purpose:** To ensure that outages are properly coordinated in the Operations Planning time horizon and Near-Term Transmission Planning Horizon.

4. **Applicability:**

   4.1. Reliability Coordinator

   4.2. Transmission Operator

   4.3. Balancing Authority

   4.4. Planning Coordinator

   4.5. Transmission Planner

5. **Effective Date:**

   The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

6. **Background:**

   ~~On April 16, 2013, NERC submitted two petitions requesting Commission approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) to replace six currently-effective IRO standards.~~

   ~~On November 21, 2013, the Commission issued a NOPR proposing to remand these TOP and IRO Standards, stating that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." For example, the Commission cites the fact that~~

~~the proposed TOP Standards do not require Transmission Operators to plan and operate within all System Operating Limits ("SOLs"), which is a requirement in the currently-effective standards.~~

~~On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR and afford time to review the proposed TOP and IRO Standards through the NERC standards development process to ensure that a technically justified set of solutions is in place for reliability. That motion to defer action was granted on January 14, 2014.~~

~~On February 12, 2014, the Standards Committee appointed a Standard Drafting Team to take on the task of revising the aforementioned standards in response to the NOPR issues and the recommendations made by the Independent Expert Review Panel and the SW Outage Report.~~See Project 2014-03 project page.

B. Requirements and Measures

Rationale: This standard is in response to issues raised in NOPR paragraph 90 and recommendations made by the Independent Expert Review Panel and SW Outage Report on the need for an outage coordination standard. It allows for one cohesive standard to address all outage coordination concerns as opposed to having multiple requirements spread throughout the various standards.

Time Horizon: The official definition of the Operations Planning Time Horizon is: "operating and resource plans from day-ahead up to and including seasonal." The SDT equates 'seasonal' as being up to one year out and that these requirements covers the period from day-ahead to one year out.

R1. Each Reliability Coordinator shall develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area. The outage coordination process shall: *[Violation Risk Factor: ~~Lower~~Medium] [Time Horizon: Operations Planning]*

1.1. Identify applicable roles and reporting responsibilities including:

1.1.1. Development and communication of outage schedules.

1.1.2. Assignment of coordination responsibilities for outage schedules between Transmission Operator(s) and Balancing Authority(s)~~ prior to submitting to Reliability Coordinators~~.

1.2. Specify outage submission timing requirements.

1.3. Define the process to evaluate the impact of Transmission and generator outages within its ~~Reliability Coordinator~~ Wide Area.

1.4. Define the process to coordinate the resolution of identified outage conflicts with its Transmission Operators and Balancing Authorities, and other Reliability Coordinators.

Note on part 1.5 ~~– Operations planning horizon is next-day to one year out. This requirement part will allow for Reliability Coordinators to request seasonal planning assessments if so desired.~~ After reviewing industry comments, the SDT does not believe this is needed for seasonal assessments. The Reliability Coordinator can always request seasonal assessments if it believes they are necessary for reliability.

1.5. ~~Document and maintain the specifications for outage analysis during the operations planning horizon.~~

M1. Each Reliability Coordinator shall make available its dated, current, in force outage coordination process for generation and Transmission outages within its Reliability Coordinator Area.

R2. Each Transmission Operator and Balancing Authority shall perform the functions specified in ~~follow~~ its Reliability Coordinator outage coordination process. *[Violation Risk Factor: ~~Low~~Medium] [Time Horizon: Operations Planning]*

M2. Each Transmission Operator and Balancing Authority shall provide evidence upon request that it performed the functions specified in ~~followed~~ its Reliability Coordinator outage coordination process. Such evidence could include~~,~~ but is not limited to~~,~~ web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

Rationale for Requirement R3: Planning Assessment is a defined term and a document that Planning Coordinators and Transmission Planners already have to produce for approved TPL-001-4. It is not a compilation of load flow studies but a textual summary of what was found in those studies including rationales and assumptions.

R3. Each Planning Coordinator and Transmission Planner shall provide its Planning Assessment to impacted Reliability Coordinators. *[Violation Risk Factor: ~~Low~~Medium] [Time Horizon: Operations Planning]*

M3. Each Planning Coordinator and Transmission Planner shall provide evidence upon request showing that it provided its Planning Assessment to impacted Reliability Coordinators. Such evidence could include~~,~~ but is not limited to~~,~~ web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

Rationale for Requirement R4: The SDT has re-written Requirement R4 to show that the process starts with the Planning Assessments created by the Planning Coordinator and Transmission Planner and then those Planning Assessments are reviewed and reconciled as needed with the Reliability Coordinator. This is in response to comments in paragraph 90 of the FERC NOPR about directly involving the Reliability Coordinator in the planning process for periods beyond the present one year outreach. The re-write should not be construed as relieving the Reliability Coordinator of responsibilities in this area but simply as a reflection of how the process actually starts.

In the future, the SDT believes that such coordination should take place in the TPL standards and to support that position, the SDT has created an item in a draft SAR for TPL-001-4 that would revise Requirement R8 to make the Reliability Coordinator an explicit party in the review process described there.

In addition, the SDT will submit a request to the Functional Model Working Team to adjust the roles and responsibilities of the Reliability Coordinator to this new paradigm.

R4. Each ~~Reliability Coordinator,~~ Planning Coordinator~~,~~ and Transmission Planner shall ~~coordinate~~jointly develop solutions with~~in~~ ~~the~~its respective Reliability Coordinator(s) ~~Area~~ for identified issues or conflicts with planned outages in ~~the~~its Planning Assessment for the Near-Term Transmission Planning Horizon. *[Violation Risk Factor: Medium] [Time Horizon: ~~Operations Planning~~ Long-term Planning]*

M4. Each ~~Reliability Coordinator,~~ Planning Coordinator, and Transmission Planner shall provide evidence upon request showing that it ~~coordinated~~jointly developed solutions with~~in~~ ~~the~~its respective Reliability Coordinator(s) ~~Area~~ for identified issues or conflicts with planned outages in ~~the~~its Planning Assessment for the Near-term Transmission Planning Horizon. Such evidence could include~~,~~ but is not limited to~~,~~ web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Process

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and ~~Enforcement~~Assessment Processes

~~Compliance Audit~~

~~Self-Certification~~

~~Spot Checking~~

~~Compliance Investigation~~

~~Self-Reporting~~

~~Complaint~~

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each responsible entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

Each Reliability Coordinator shall retain its dated, current, in force, outage coordination process in accordance with Requirement R1 and Measurement M1 as well as any documents in force since the last compliance audit.

Each Transmission Operator and Balancing Authority shall retain evidence for three calendar years that it followed its Reliability Coordinator outage coordination process in accordance with Requirement R2 and Measurement M2.

Each Planning Coordinator and Transmission Planner shall retain evidence for three calendar years that it has its Planning Assessment to impacted Reliability Coordinators in accordance with Requirement R3 and Measurement M3.

Each Reliability Coordinator, Planning Coordinator, and Transmission Planner shall retain evidence for three calendar years that it has coordinated solutions within the Reliability Coordinator Area for identified issues or conflicts with planned outages in the Planning Assessment in accordance with Requirement R4 and Measurement M4.

If a responsible entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning	~~Low~~Medium	~~N/A~~ The Reliability Coordinator did develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area but it was missing one of the parts specified in Requirement R1 (Parts 1.1 – 1.4).	~~N/A~~ The Reliability Coordinator did develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area but it was missing two of the parts specified in Requirement R1 (Parts 1.1 – 1.4).	~~N/A~~ The Reliability Coordinator did develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area but it was missing three of the parts specified in Requirement R1 (Parts 1.1 – 1.4).	The Reliability Coordinator did develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area but it was missing all four of the parts specified in Requirement R1 (Parts 1.1 – 1.4). OR, The Reliability Coordinator did not develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area.
R2	Operations Planning	~~Low~~Medium	N/A	N/A	N/A	The Transmission Operator or Balancing Authority did not perform the functions specified in ~~follow~~ its Reliability Coordinator outage coordination process.
R3	Operations Planning	~~Low~~Medium	N/A	N/A	N/A	The Planning Coordinator or Transmission Planner did not provide its

R #	Time Horizon	VRF	Violation Severity Levels

						Planning Assessment to impacted Reliability Coordinators.
R4	Operations Planning	~~Low~~Medium	N/A	N/A	N/A	The ~~Reliability Coordinator,~~ Planning Coordinator~~,~~ or Transmission Planner did not ~~coordinate~~jointly develop solutions with~~in~~ ~~the~~its respective Reliability Coordinator(s) ~~Area~~ for identified issues or conflicts with planned outages in ~~the~~its Planning Assessment for the Near-term Transmission Planning Horizon.

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

Time Horizon: The official definition of the Operations Planning Time Horizon is: "operating and resource plans from day-ahead up to and including seasonal." The SDT equates 'seasonal' as being up to one year out and that these requirements covers the period from day-ahead to one year out.

Definitions

Project 2014-03 Revisions to TOP/IRO Reliability Standards

As part of the work in Project 2014-03 Revisions to TOP/IRO Reliability Standards, the SDT is proposing changes to two existing definitions: Operational Planning Analysis and Real-time Assessment.

The currently-effective definition of Operational Planning Analysis is: "*An analysis of the expected system conditions for the next day's operation. (That analysis may be performed either a day ahead or as much as 12 months ahead.) Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).*"

The proposed version of the definition of Operational Planning Analysis is: "*An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)*"

The currently-effective definition of Real-time Assessment is: "*An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.*"

The proposed version of the definition of Real-time Assessment is: "*An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)*"

The definitions were revised in response to issues raised in NOPR paragraphs 55, 73, and 74 on analysis and monitoring of SOLs in all time horizons, NOPR paragraph 70 (updating study results in Real-time), and NOPR paragraph 78 (Protection System coordination). The phase angle item was added in response to SW Outage Report recommendation 27.

The two definitions are also employed in the following proposed project standards: TOP-001-3, TOP-002-4, TOP-003-3, IRO-002-4, IRO-008-2, and IRO-010-2. These definitions are not used in any other standards, either currently-effective or in development in any other project.

Project 2014-03 Revisions to TOP/IRO Reliability Standards

As part of the work in Project 2014-03 Revisions to TOP/IRO Reliability Standards, the SDT is proposing changes to two existing definitions: Operational Planning Analysis and Real-time Assessment.

The currently-effective definition of Operational Planning Analysis is: "*An analysis of the expected system conditions for the next day's operation. (That analysis may be performed either a day ahead or as much as 12 months ahead.) Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).*"

The proposed version of the definition of Operational Planning Analysis is: "*An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through ~~contracted~~third-party services.)*"

The currently-effective definition of Real-time Assessment is: "*An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.*"

The proposed version of the definition of Real-time Assessment is: "*An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through ~~contracted~~third-party services.)*"

The definitions were revised in response to issues raised in NOPR paragraphs 55, 73, and 74 on analysis and monitoring of SOLs in all time horizons, NOPR paragraph 70 (updating study results in Real-time), and NOPR paragraph 78 (Protection System coordination). The phase angle item was added in response to SW Outage Report recommendation 27.

The two definitions are also employed in the following proposed project standards: TOP-001-3, TOP-002-4, TOP-003-3, IRO-002-4, IRO-008-2, and IRO-010-2. These definitions are not used in any other standards, either currently-effective or in development in any other project.

Implementation Plan

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Requested Approvals

- TOP-001-3 Transmission Operations
- TOP-002-4 Operations Planning
- TOP-003-3 Operational Reliability Data
- IRO-001-4 Reliability Coordination - Responsibilities and Authorities
- IRO-002-4 Reliability Coordination — Analysis Tools
- IRO-008-2 Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-010-2 Reliability Coordinator Data Specification and Collection
- IRO-014-3 Coordination Among Reliability Coordinators
- IRO-017-1 Outage Coordination

Requested Retirements (two groups of standards)

1. **Existing Approved Standards**
    - TOP-001-1a Reliability Responsibilities and Authorities
    - TOP-002—2.1b Normal Operations Planning
    - TOP-003-1 Planned Outage Coordination
    - TOP-004-2 Transmission Operations
    - TOP-005-2a Operational Reliability Information
    - TOP-006-2 Monitoring System Conditions
    - TOP-007-0 Reporting System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) Violations
    - TOP-008-1 Response to Transmission Limit Violations
    - IRO-001-1.1 Reliability Coordination — Responsibilities and Authorities
    - IRO-002-2 Reliability Coordination — Facilities
    - IRO-003-2 Reliability Coordination – Wide Area View
    - IRO-004-2 Reliability Coordination – Operations Planning
    - IRO-005-3.1a Reliability Coordination — Current Day Operations
    - IRO-008-1 Reliability Coordinator Operational Analyses and Real-time Assessments
    - IRO-010-1a Reliability Coordinator Data Specification and Collection
    - IRO-014-1 Coordination Among Reliability Coordinators
    - IRO-015-1 Notifications and Information Exchange Between Reliability Coordinators
    - IRO-016-1 Coordination of Real-time Activities Between Reliability Coordinators
    - PER-001-0.2 Operating Personnel Responsibility and Authority

2. **Filed with FERC but not approved** – these standards were filed with FERC but never approved and will be retired as part of this project. Upon Board approval of replacement standards, NERC will request the Board to rescind its approval of these standards and petition FERC to withdraw its petition for approval of these standards:
   - TOP-001-2 Transmission Operations
   - TOP-002-3 Operations Planning
   - TOP-003-2 Operational Reliability Data
   - IRO-001-3 Reliability Coordination - Responsibilities and Authorities
   - IRO-002-3 Reliability Coordination — Analysis Tools
   - IRO-005-4 Reliability Coordination — Current Day Operations
   - IRO-014-2 Coordination Among Reliability Coordinators
   - PRC-001-2 System Protection Coordination

Prerequisite Approvals[1]

Definition of Operating Instruction (filed with proposed COM-002-4).
COM-001-2 – Communications (filed with proposed COM-002-4)

Revisions to Defined Terms in the NERC Glossary

The Standards Drafting Team proposes retiring the following Board-approved definitions:	
Reliability Directive	Original definition – approved by the Board but never adopted by FERC; will be withdrawn as part of this project, consistent with the approach for the standards that were filed with FERC and not approved. Definition: *A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impacts.*
The Standards Drafting Team proposes revising the following Board-approved definitions:	
Operational Planning Analysis	**Original definition**: *An analysis of the expected system conditions for the next day's operation. (That analysis may be performed either a day ahead or as much as 12 months ahead.) Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).* **Revised definition**: *An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels;*

[1] In the event approval of COM-001-2 and the definition of Operating Instruction do not occur prior to the approval of the standards and definitions revised or developed in Project 2014-03, the currently enforceable standards and definitions would remain effective until those approvals have occurred, and the new or revised standards in Project 2014-03 shall become effective concurrent with the effective date of COM-001-2 and the definition of Operating Instruction.

	Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
Real-time Assessment	**Original definition**: *An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.* **Revised definition**: *An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)*

The definitions were revised in response to issues raised in NOPR paragraphs 55, 73, and 74 on analysis and monitoring of SOLs in all time horizons, NOPR paragraph 70 (updating study results in Real-time), and NOPR paragraph 78 (Protection System coordination). The phase angle item was added in response to SW Outage Report recommendation 27.

Background

On April 16, 2013, NERC submitted two petitions requesting Commission approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) (collectively, the "TOP Standards") to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) (collectively, the "IRO Standards") to replace six currently-effective IRO standards.

On November 21, 2013, the Commission issued a NOPR in response to these petitions. The NOPR proposed to remand the proposed TOP and IRO Standards. In the NOPR, the Commission raises a concern that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." For example, the Commission cites the fact that the proposed TOP standards do not require Transmission Operators to plan and operate within all System Operating Limits ("SOLs"), which is a requirement in the currently effective standards.

On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR. This deferral would provide an opportunity for the industry, NERC, and FERC to work toward a common understanding and afford time to review the proposed TOP and IRO standards through the NERC standards development process to address the concerns set forth in the NOPR. That motion to defer action was granted by the Commission on January 14, 2014.

On February 12, 2014, the Standards Committee appointed a Standard Drafting Team to take on the task of revising the aforementioned standards in response to the NOPR issues and the recommendations made by the Independent Expert Review Panel, the IRO FYRT, and the SW Outage Report and this implementation plan is developed from the changes made to the standards revised by that project.

General Considerations

The twelve month implementation period for all of the standards except TOP-003-3 and IRO-010-2 is intended to allow time for entities to update processes and train operators on the revised requirements. All of the Requirements in proposed TOP-003-3 and IRO-010-2 except TOP-003-3, Requirements R5 and IRO-010-2, Requirement R3 become effective three months earlier, in order to provide recipients of data requests from their Reliability Coordinators, Transmission Operators, and/or Balancing Authorities time to respond to the request for data.

Applicable Entities

- Reliability Coordinator
- Balancing Authority
- Transmission Owner
- Transmission Operator
- Distribution Provider
- Generator Owner
- Generator Operator
- Load-Serving Entity
- Planning Coordinator
- Transmission Planner

Effective Date for Standards

1. **If the Prerequisite Approvals occur on or before Approval of the standards in Project 2014-03:**

- **For all standards except proposed TOP-003-3 and proposed IRO-010-2:**
  The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

- **For proposed TOP-003-3:**
  All requirements except Requirement R5 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

  Requirement R5 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

  The reason for the difference in effective dates for proposed TOP-003-3 is to allow applicable entities to have time to properly respond to the data specification requests.

- **For proposed IRO-010-2:**
  Requirement R1 and R2 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R1 and R2 shall become

effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

The reason for the difference in effective dates for proposed IRO-010-2 is to allow applicable entities to have time to properly respond to the data specification requests.

2. If the approval of the standards in Project 2014-03 occurs concurrent with or before the Prerequisite Approvals:

- **For all standards except proposed TOP-003-3 and proposed IRO-010-2:**
  The standard shall become effective concurrently with COM-001-2 and the definition of Operating Instruction.

- **For proposed TOP-003-3:**
  All requirements except Requirement R5 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the definition of Operating Instruction is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date COM-001-2 is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

  Requirement R5 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the definition of Operating Instruction is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the definition of Operating Instruction is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

The reason for the difference in effective dates for proposed TOP-003-3 is to allow applicable entities to have time to properly respond to the data specification requests.

- **For proposed IRO-010-2:**
  Requirement R1 and R2 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the definition of Operating Instruction is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R1 and R2 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
  Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the definition of Operating Instruction is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

- **Standards for Retirement:**
  Midnight of the day before the first day of the first calendar quarter that is twelve (12) months after the date that the standards in Project 2014-03 are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standards shall be retired at midnight of the day before the first day of the first calendar quarter that is twelve (12) months after the date the standards in Project 2014-03 are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

- **Definition of Reliability Directive:**
  Midnight of the day before the first day of the first calendar quarter that is twelve (12) months after the date that the standards in Project 2014-03 are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the definition shall be retired at midnight of the day before the first day of the first calendar quarter that is twelve (12) months after the date the standards in Project 2014-03 are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for Definitions

The definitions of Operational Planning Analysis and Real-time Assessment shall become effective on the first day of the first calendar quarter that is ten (10) months after the date that the definitions are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a definitions to go into effect. Where approval by an applicable governmental authority is not required, the definitions shall become effective on the first day of the first calendar quarter that is ten (10) months after the date the definitions are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

The definitions are used in proposed IRO-010-2, Requirements R1 and R2 and in proposed TOP-003-3, Requirements R1 and R3 so it is necessary that the definitions become effective concurrent with those requirements.

The two definitions are also employed in the following proposed project standards: TOP-001-3, TOP-002-4, and IRO-008-2. These definitions are not used in any other standards, either approved or in development in any other project.

Implementation Plan

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Requested Approvals

- TOP-001-3 Transmission Operations
- TOP-002-4 Operations Planning
- TOP-003-3 Operational Reliability Data
- IRO-001-4 Reliability Coordination - Responsibilities and Authorities
- IRO-002-4 Reliability Coordination — Analysis Tools

- IRO-005-4 Reliability Coordination — Current Day Operations
- IRO-014-2 Coordination Among Reliability Coordinators
- PRC-001-2 System Protection Coordination

Prerequisite Approvals[1]

Definition of Operating Instruction (filed with proposed COM-002-4).
COM-001-2 – Communications (filed with proposed COM-002-4)

Revisions to Defined Terms in the NERC Glossary

The Standards Drafting Team proposes retiring the following Board-approved definitions:	
Reliability Directive	Original definition – approved by the Board but never adopted by FERC; will be withdrawn as part of this project, consistent with the approach for the standards that were filed with FERC and not approved. Definition: *A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impacts.*
The Standards Drafting Team proposes revising the following Board-approved definitions:	
Operational Planning Analysis	**Original definition**: *An analysis of the expected system conditions for the next day's operation. (That analysis may be performed either a day ahead or as much as 12 months ahead.) Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).* **Revised definition**: *An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels;*

[1] In the event approval of COM-001-2 and the definition of Operating Instruction do not occur prior to the approval of the standards and definitions revised or developed in Project 2014-03, the ~~intent is that the~~ currently enforceable standards and definitions would remain effective until those approvals ha~~d~~ve occurred, and the new or revised standards in Project 2014-03 ~~would~~shall become effective concurrent with the effective date of COM-001-2 and the definition of Operating Instruction.

	Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through ~~contracted~~third-party services.)
Real-time Assessment	**Original definition**: *An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.* **Revised definition**: *An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through ~~contracted~~third-party services.)*

The definitions were revised in response to issues raised in NOPR paragraphs 55, 73, and 74 on analysis and monitoring of SOLs in all time horizons, NOPR paragraph 70 (updating study results in Real-time), and NOPR paragraph 78 (Protection System coordination). The phase angle item was added in response to SW Outage Report recommendation 27.

Background

On April 16, 2013, NERC submitted two petitions requesting Commission approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) (collectively, the “TOP Standards”) to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) (collectively, the “IRO Standards”) to replace six currently-effective IRO standards.

On November 21, 2013, the Commission issued a NOPR in response to these petitions. The NOPR proposed to remand the proposed TOP and IRO Standards. In the NOPR, the Commission raises a concern that NERC “has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards.” For example, the Commission cites the fact that the proposed TOP standards do not require Transmission Operators to plan and operate within all System Operating Limits ("SOLs"), which is a requirement in the currently effective standards.

On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR. This deferral would provide an opportunity for the industry, NERC, and FERC to work toward a common understanding and afford time to review the proposed TOP and IRO standards through the NERC standards development process to address the concerns set forth in the NOPR. That motion to defer action was granted by the Commission on January 14, 2014.

On February 12, 2014, the Standards Committee appointed a Standard Drafting Team to take on the task of revising the aforementioned standards in response to the NOPR issues and the recommendations made by the Independent Expert Review Panel, the IRO FYRT, and the SW Outage Report and this implementation plan is developed from the changes made to the standards revised by that project.

General Considerations

The twelve month implementation period for all of the standards except TOP-003-3 and IRO-010-2 is intended to allow time for entities to update processes and train operators on the revised requirements. All of the Requirements in proposed TOP-003-3 and IRO-010-2 except TOP-003-3, Requirements R5 and IRO-010-2, Requirement R3 become effective ~~two~~three months earlier, in order to provide recipients of data requests from their ~~RCs~~Reliability Coordinators, ~~TOPs~~Transmission Operators, and/or ~~BAs~~Balancing Authorities time to respond to the request for data.

Applicable Entities

- Reliability Coordinator
- Balancing Authority
- ~~Interchange Authority~~
- Transmission Owner
- Transmission Operator
- Distribution Provider
- Generator Owner
- Generator Operator
- Load-Serving Entity
- ~~Transmission Service Provider~~
- Planning Coordinator
- Transmission Planner

Effective Date for Standards

1. ~~I~~If the Prerequisite Approvals occur on or before Approval of the standards in Project 2014-03:

- **For all standards except proposed TOP-003-3 and proposed IRO-010-2:**
  The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

- **For proposed TOP-003-3:**
  All requirements except Requirement R5 shall become effective on the first day of the first calendar quarter that is ~~ten (10)~~nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is ~~ten (10)~~nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

  Requirement R5 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

  The reason for the difference in effective dates for proposed TOP-003-3 is to allow applicable entities to have time to properly respond to the data specification requests.

- **For proposed IRO-010-2:**
  Requirement R1 and R2 shall become effective on the first day of the first calendar quarter that is ~~ten (10)~~nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R1 and R2 shall become

effective on the first day of the first calendar quarter that is ~~ten (10)~~nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

The reason for the difference in effective dates for proposed IRO-010-2 is to allow applicable entities to have time to properly respond to the data specification requests.

2. If the approval of the standards in Project 2014-03 occurs concurrent with or before the Prerequisite Approvals:

- **For all standards except proposed TOP-003-3 and proposed IRO-010-2:**
  The standard shall become effective concurrently with COM-001-2 and the definition of Operating Instruction.

- **For proposed TOP-003-3:**
  All requirements except Requirement R5 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the definition of Operating Instruction is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date COM-001-2 is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

  Requirement R5 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the definition of Operating Instruction is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the definition of Operating Instruction is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Formatted: Font: Bold

The reason for the difference in effective dates for proposed TOP-003-3 is to allow applicable entities to have time to properly respond to the data specification requests.

- **For proposed IRO-010-2:**
  Requirement R1 and R2 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the definition of Operating Instruction is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R1 and R2 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
  Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the definition of Operating Instruction is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

- **Standards for Retirement:**
  Midnight of the day before the first day of the first calendar quarter that is twelve (12) months after the date that the standards in Project 2014-03 are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standards shall be retired at midnight of the day before the first day of the first calendar quarter that is twelve (12) months after the date the standards in Project 2014-03 are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~day immediately prior to the Effective Date in the particular jurisdiction in which the new standard or definition is becoming effective.~~

- **Definition of Reliability Directive:**
  Midnight of the day before the first day of the first calendar quarter that is twelve (12) months after the date that the standards in Project 2014-03 are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the definition ~~standards~~ shall be retired at midnight of the day before the first day of the first calendar quarter that is twelve (12) months after the date the standards in Project 2014-03 are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Formatted: Font: Not Bold
Formatted: Font: Not Bold
Formatted: Font: Not Bold
Formatted: Font: Not Bold
Formatted: Font: Not Bold

Implementation Plan for Definitions

The definitions of Operational Planning Analysis and Real-time Assessment shall become effective on the first day of the first calendar quarter that is ten (10) months after the date that the definitions are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a definitions to go into effect. Where approval by an applicable governmental authority is not required, the definitions shall become effective on the first day of the first calendar quarter that is ten (10) months after the date the definitions are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

The definitions are used in proposed IRO-010-2, Requirements R1 and R2 and in proposed TOP-003-3, Requirements R1 and R3 so it is necessary that the definitions become effective concurrent with those requirements.

The two definitions are also employed in the following proposed project standards: TOP-001-3, TOP-002-4, and IRO-008-2. These definitions are not used in any other standards, either approved or in development in any other project.

Standards Authorization Request Form

When completed, email this form to:
Laura.Hussey@nerc.net

For questions about this form or for assistance in completing the form, call Laura Hussey at 404-446-2579.

NERC welcomes suggestions for improving the reliability of the Bulk-Power System through improved Reliability Standards. Please use this form to submit your proposal for a new NERC Reliability Standard or a revision to an existing standard.

Request to propose a new or a revision to a Reliability Standard			
Proposed Standard:	Project 2014-03 Revisions to the TOP/IRO Reliability Standards		
Date Submitted:	February 12, 2014		
SAR Requester Information			
Name:	David Souder		
Organization:	PJM		
Telephone:	610-666-4795	E-mail:	souder@pjm.com
SAR Type (Check as many as applicable)			
☒ New Standard		☐ Withdrawal of existing Standard	
☒ Revision to existing Standard		☐ Urgent Action	

SAR Information

Industry Need (What is the industry problem this request is trying to solve?):

On April 16, 2013, NERC submitted two petitions requesting Commission approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) (collectively, the “TOP Standards”) to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) (collectively, the “IRO Standards”) to replace six currently-effective IRO standards.

On November 21, 2013, the Commission issued a NOPR in response to these petitions. The NOPR proposed to remand the proposed TOP and IRO Standards. In the NOPR, the Commission raises a concern that NERC “has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards.” For example, the Commission cites the fact that the proposed TOP standards do not require Transmission Operators to plan and operate within all System Operating Limits (“SOLs”), which is a requirement in the currently effective standards.

On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR. This deferral would provide an opportunity for the industry, NERC, and FERC to work toward a common understanding and afford time to review the proposed TOP and IRO standards through the NERC standards development process to address the concerns set forth in the NOPR. That motion to defer action was granted by the Commission on January 14, 2014.

SAR Information

Purpose or Goal (How does this request propose to address the problem described above?):

The primary goal of this SAR is to allow the Standard Drafting Team (SDT) for Project 2014-03 Revisions to TOP/IRO Reliability Standards to address the concerns expressed in the NOPR while fulfilling the goals of the original projects: Project 2006-06 Reliability Coordination and Project 2007-03 Real-time Operations. In addition, the SDT should review the goals of Project 2009-02 Real-time Monitoring and Analysis Capabilities and consider whether to incorporate revisions to the TOP and/or IRO standards to address those goals in Project 2014-03.

SAR Information
Identify the Objectives of the proposed standard's requirements (What specific reliability deliverables are required to achieve the goal?):
Provide clear, unambiguous requirements and standards to allow Reliability Coordinators, Transmission Operators, and Balancing Authorities to operate the interconnected transmission system in a safe and reliable manner.
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The SDT shall modify the TOP and IRO Reliability Standards to address the issues raised in the NOPR, while ensuring that the revisions continue to address directives previously assigned to the TOP and IRO standards under Projects 2007-03 and 2006-06. If it is decided to handle the goals of Project 2009-02 within Project 2014-03, then the directives assigned to Project 2009-02 will be addressed as well. In addition, the recommendations from the Independent Expert Review Project and the SW Outage Report will be reviewed, a directive dealing with monitoring responsibilities for the Reliability Coordinator will be resolved, and other IRO standards will be examined for consistency purposes.
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
The SDT shall: 1. Revise the TOP/IRO Reliability Standards to address concerns expressed in the NOPR a. Consider the inputs from technical conferences 2. Consider the recommendations in the Independent Expert Review Report and the SW Outage Report 3. Review the IRO Reliability Standards not included in the original Project 2006-06 for coordination with any changes made for this project (see list of related standards) 4. Preserve the intent of the reliability objectives in the current, approved standards so that no reliability gaps are created 5. Decide whether to handle the goals of Project 2009-02 within Project 2014-03; and if it does so decide, then also address the directives assigned to Project 2009-02. 6. Address the directives from Order 693 originally assigned to Projects 2006-06 and 2007-03.

SAR Information

7. Address the following directive from Order 693, paragraph 1855:
“Since a reliability coordinator is the highest level of authority overseeing the reliability of the Bulk-Power System, the Commission believes that it is important to include the reliability coordinator as an applicable entity to assure that adequate voltage and reactive resources are being maintained. As MISO points out, other Reliability Standards address responsibilities of reliability coordinators, but we agree with EEI that it is important to include reliability coordinators in VAR-001-1 as well. Reliability coordinators have responsibilities in the IRO and TOP Reliability Standards, but not the specific responsibilities for voltage levels and reactive resources addressed by VAR-001-1, which have a great impact on system reliability. For example, voltage levels and reactive resources are important factors to ensure that IROLs are valid and operating voltages are within limits, and that reliability coordinators should have responsibilities in VAR-001-1 to monitor that sufficient reactive resources are available for reliable system operations. Accordingly, the ERO should modify VAR-001-1 to include reliability coordinators as applicable entities and include a new requirement(s) that identifies the reliability coordinator’s monitoring responsibilities.”
8. Modify the measures, Violation Risk Factors (VRF), and Violation Severity Levels (VSL) as necessary to address modified requirements.
9. Address the issue of outage coordination as pointed out by the Independent Experts Review Panel through the creation of a new standard.
10. Address the recommendations of the IRO Five Year Review Team (Project 2012-09) for the IRO standards revised in this project.

Reliability Functions

The Standard will Apply to the Following Functions (Check each one that applies.)	
☐ Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.

Reliability Functions		
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☒	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☒	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☒	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☒	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.

Reliability Functions	
☒ Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Project 2014-03 – Revisions to TOP and IRO Reliability Standards

Mapping Document | Updated August 2014

This mapping document showing the translation of Requirements in the following currently-enforceable standards to revised or new standards developed in Project 2014-03:

- IRO-001-1.1 — Reliability Coordination - Responsibilities and Authorities
- IRO-002-2 — Reliability Coordination - Facilities
- IRO-003-2 — Reliability Coordination – Wide-Area View
- IRO-004-2 — Reliability Coordination — Operations Planning
- IRO-005-3.1a — Reliability Coordination - Current Day Operations
- IRO-008-1 — Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-010-1a — Reliability Coordinator Data Specification and Collection
- IRO-014-1 — Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators
- IRO-015-1 — Notifications and Information Exchange Between Reliability Coordinators
- IRO-016-1 — Coordination of Real-time Activities Between Reliability Coordinators
- PER-001-0.2 — Operating Personnel Responsibility and Authority
- TOP-001-1a — Reliability Responsibilities and Authorities
- TOP-002-2.1b — Normal Operations Planning
- TOP-003-1 — Planned Outage Coordination
- TOP-004-2 — Transmission Operations
- TOP-005-2a — Operational Reliability Information
- TOP-006-3 — Monitoring System Conditions[1]
- TOP-007-0 — Reporting System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) Violations
- TOP-008-1 — Response to Transmission Limit Violations

---

[1] TOP-006-2 is the currently enforceable version of this standard; TOP-006-3 was developed in response to a request for interpretation seeking clarification of Requirement R1 and does not substantively change the Requirements of TOP-006-2. In its NOPR proposing to remand the TOP and IRO standard, FERC proposed to approve TOP-006-3. The drafting team has mapped the Requirements in the new standards to TOP-006-3 because the Parts of Requirement R1 in TOP-006-3 more clearly delineate which entity has responsibility.

Standard IRO-001-1.1 — Reliability Coordination - Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Regional Reliability Organization, subregion, or interregional coordinating group shall establish one or more Reliability Coordinators to continuously assess transmission reliability and coordinate emergency operations among the operating entities within the region and across the regional boundaries.	The SDT proposes retiring the requirement as it is addressed in the NERC Rules of Procedure, January 30, 2014: **Section 503.2 (2.1)** "Regional Entities shall verify that all Reliability Coordinators, Balancing Authorities, and Transmission Operators meet the Registration requirements of Section 501(1.4)." **Section 501 (1.4)** "**1.4** For all geographical or electrical areas of the Bulk Power System, the Registration process shall ensure that (1) no areas are lacking any entities to perform the duties and tasks identified in and required by the Reliability Standards to the fullest extent practical, and (2) there is no unnecessary duplication of such coverage or of required oversight of such coverage. In particular the process shall: **1.4.1** Ensure that all areas are under the oversight of one and only one Reliability Coordinator. **1.4.2** Ensure that all Balancing Authorities and Transmission operator entities are under the responsibility of one and only one Reliability Coordinator. **1.4.3** Ensure that all transmission Facilities of the Bulk Power System are the responsibility and under the control of one and only one Transmission Planner, Planning Authority, and Transmission Operator. **1.4.4** Ensure that all loads and generators are under the responsibility and control of one and only one Balancing Authority."
R2. The Reliability Coordinator shall comply with a regional reliability plan approved by the NERC Operating Committee.	**The SDT is proposing to retire this requirement.** Reliability Coordinators must comply with mandatory approved standards. The SDT proposes retiring the requirement, consistent with P81, as it is addressed in the NERC Rules of Procedure, January 30, 2014: **Section 503.2 (2.1)** "Regional Entities shall verify that all Reliability Coordinators, Balancing Authorities, and Transmission Operators meet the Registration requirements of Section 501(1.4)." **Section 501 (1.4)** "**1.4** For all geographical or electrical areas of the Bulk Power System, the Registration process shall ensure that (1) no areas are lacking any entities to perform the duties and tasks identified in and

Standard IRO-001-1.1 — Reliability Coordination - Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	required by the Reliability Standards to the fullest extent practical, and (2) there is no unnecessary duplication of such coverage or of required oversight of such coverage. In particular the process shall: **1.4.1** Ensure that all areas are under the oversight of one and only one Reliability Coordinator. **1.4.2** Ensure that all Balancing Authorities and Transmission Operator entities are under the responsibility of one and only one Reliability Coordinator. **1.4.3** Ensure that all transmission Facilities of the Bulk Power System are the responsibility and under the control of one and only one Transmission Planner, Planning Authority, and Transmission Operator. **1.4.4** Ensure that all loads and generators are under the responsibility and control of one and only one Balancing Authority."
R3. The Reliability Coordinator shall have clear decision-making authority to act and direct actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities and Purchasing-Selling Entities within its Reliability Coordinator Area to preserve the integrity and reliability of the Bulk Electric System. These actions shall be taken without delay, but no longer than 30 minutes.	**This requirement is replaced by proposed IRO-001-4, Requirements R1 and R2.** The SDT does not believe that there is a need for a decision-making authority requirement as the decision-making authority is inherent when the requirement states that the Reliability Coordinator must act, or direct others to act. **Proposed IRO-001-4, Requirements R1 and R2:** **R1**. Each Reliability Coordinator shall act, or direct others to act by issuing Operating Instructions, to ensure the reliability of its Reliability Coordinator Area. **R2.** Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with its Reliability Coordinator's Operating Instructions unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements.
R4. Reliability Coordinators that delegate tasks to other entities shall have formal operating agreements with each entity to which tasks are delegated. The Reliability Coordinator shall verify that all delegated tasks are understood, communicated, and addressed within its Reliability	**The SDT is proposing to retire this requirement.** The SDT contends that approved IRO-001-1.1, Requirement R4 is redundant with NERC Rules of Procedure, Section 500 (January 30, 2014) and should be retired from the standard. **(Section 501)** "The purpose of the Organization Registration Program is to clearly identify those entities that are responsible for compliance with the FERC approved Reliability Standards. Organizations that are

Standard IRO-001-1.1 — Reliability Coordination - Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
Coordinator Area. All responsibilities for complying with NERC and regional standards applicable to Reliability Coordinators shall remain with the Reliability Coordinator.	registered are included on the NERC Compliance Registry (NCR) and are responsible for knowing the content of and for complying with all applicable Reliability Standards." **(Section 508)** Provisions Relating to Coordinated Functional Registration (CFR) Entities In addition to registering as an entity responsible for all functions that it performs itself, multiple entities may each register using a CFR for one or more Reliability Standard(s) and/or for one or more Requirements/sub-Requirements within particular Reliability Standard(s) applicable to a specific function. The CFR submission must include a written agreement that governs itself and clearly specifies the entities' respective compliance responsibilities. The Registration of the CFR is the complete Registration for each entity. Additionally, each entity shall take full compliance responsibility for those Reliability Standards and/or Requirements/sub-Requirements it has registered for in the CFR. Neither NERC nor the Regional Entity shall be parties to any such agreement, nor shall NERC or the Regional Entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the CFR.
R5. The Reliability Coordinator shall list within its reliability plan all entities to which the Reliability Coordinator has delegated required tasks.	The SDT is proposing to retire this requirement consistent with Paragraph 81 criteria as it is strictly administrative in nature.
R6. The Reliability Coordinator shall verify that all delegated tasks are carried out by NERC-certified Reliability Coordinator operating personnel.	The SDT is proposing to retire this requirement. The Reliability Coordinator may delegate tasks but cannot delegate the responsibility for these tasks. Therefore, it is not necessary to mandate that delegated tasks must be carried out by certified personnel as it is the responsibility of the Reliability Coordinator to ensure that the task is carried out.
R7. The Reliability Coordinator shall have clear, comprehensive coordination agreements with adjacent Reliability Coordinators to ensure that System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) violation mitigation requiring actions in adjacent Reliability Coordinator Areas are coordinated.	This requirement is replaced by proposed IRO-014-3, Requirement R1. **Proposed IRO-014-3, Requirement R1:** **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability.
R8: Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall comply with Reliability	This requirement is replaced by proposed IRO-001-4, Requirements R2 and R3.

Standard IRO-001-1.1 — Reliability Coordination - Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
Coordinator directives unless such actions would violate safety, equipment, or regulatory or statutory requirements. Under these circumstances, the Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, Load-Serving Entity, or Purchasing-Selling Entity shall immediately inform the Reliability Coordinator of the inability to perform the directive so that the Reliability Coordinator may implement alternate remedial actions.	**Proposed IRO-001-4, Requirements R2 and R3:** **R2.** Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with its Reliability Coordinator's Operating Instructions unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements. **R3.** Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall inform its Reliability Coordinator upon recognition of its inability to perform an Operating Instruction in accordance with Requirement R2.
R9. The Reliability Coordinator shall act in the interests of reliability for the overall Reliability Coordinator Area and the Interconnection before the interests of any other entity.	The SDT is proposing to retire this requirement as it is redundant with the definition of Reliability Coordinator in Functional Model v5. The NERC Functional Model Version 5 defines the Reliability Coordinator function as follows: "The functional entity that maintains the Real-time operating reliability of the Bulk Electric System within a Reliability Coordinator Area." An entity performing Reliability Coordinator services must meet this definition.

Standard IRO-002-2 — Reliability Coordination – Facilities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Reliability Coordinator shall have adequate communications facilities (voice and data links) to appropriate entities within its Reliability Coordinator Area. These communications facilities shall be staffed and available to act in addressing a real-time emergency condition.	The first sentence of this requirement is replaced by proposed COM-001-2 Requirement R1 for voice links and proposed IRO-002-2 Requirement R1 for data links. The second sentence of this requirement is covered by approved PER-004-2 Requirement R1 so to eliminate redundancy, that part of the requirement is not proposed to be replaced. **Proposed COM-001-2, Requirement R1:** **R1.** Each Reliability Coordinator shall have Interpersonal Communication capability with the following entities (unless the Reliability Coordinator detects a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): 1.1 All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area. 1.2 Each adjacent Reliability Coordinator within the same Interconnection. **Proposed IRO-002-4, Requirement R1:** **R1.** Each Reliability Coordinator shall have data exchange capabilities with Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Approved PER-004-2, Requirement R1:** **R1.** Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.
R2. Each Reliability Coordinator — or its Transmission Operators and Balancing Authorities — shall provide, or arrange provisions for, data exchange to other Reliability Coordinators or Transmission Operators and Balancing Authorities via a secure network.	This requirement is replaced by proposed IRO-010-2, Requirements R1 and R3, Part 3.3. **Proposed IRO-010-2, Requirements R1 and R3, Part 3.3:** **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **R3.** Part 3.3. A mutually agreeable security protocol
R3. Each Reliability Coordinator shall have multi-directional communications capabilities with its Transmission Operators and Balancing Authorities, and with neighboring Reliability	This requirement is replaced by proposed COM-001-2 Requirement R1 and proposed IRO-002-4 Requirement R2. **Proposed COM-001-2, Requirement R1:**

Standard IRO-002-2 — Reliability Coordination – Facilities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
Coordinators, for both voice and data exchange as required to meet reliability needs of the Interconnection.	**R1.** Each Reliability Coordinator shall have Interpersonal Communication capability with the following entities (unless the Reliability Coordinator detects a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): 1.1 All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area. 1.2 Each adjacent Reliability Coordinator within the same Interconnection. **Proposed IRO-002-4, Requirement R2:** **R2**. Each Reliability Coordinator shall have data exchange capabilities with Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R4. Each Reliability Coordinator shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas to ensure that potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations are identified. Each Reliability Coordinator shall have monitoring systems that provide information that can be easily understood and interpreted by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant and highly reliable infrastructure.	This requirement is replaced by proposed IRO-002-4, Requirements R4 and R5. **Proposed IRO-002-4, Requirements R3 and R4:** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **R4.** Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure.
R5. Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to	This requirement is replaced by proposed IRO-002-4, Requirement R3. **Proposed IRO-002-4, Requirement R3:** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to

Standard IRO-002-2 — Reliability Coordination – Facilities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area.	identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
R6. Each Reliability Coordinator shall have adequate analysis tools such as state estimation, pre- and post-contingency analysis capabilities (thermal, stability, and voltage), and wide-area overview displays.	This requirement is replaced by proposed IRO-008-5, Requirement R5 and the proposed definition of Real-time Assessment. **Proposed IRO-008, Requirement R4:** **R4**. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Proposed definition:** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)
R7. Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area. Each Reliability Coordinator shall have provisions for backup facilities that shall be exercised if the main monitoring system is unavailable. Each Reliability Coordinator shall ensure SOL and IROL monitoring and derivations continue if the main monitoring system is unavailable.	This requirement is replaced by proposed IRO-002-4, Requirement R3 and approved EOP-008-1, Requirement R1, Part 1.6.2. **Proposed IRO-002-4, Requirement R3:** **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Approved EOP-008-1, Requirement R1, Part 1.6.2:** **R1. Part 1.6.2**. Actions to manage the risk to the BES during the transition from primary to backup functionality as well as during outages of the primary or backup functionality.
R8. Each Reliability Coordinator shall control its Reliability Coordinator analysis tools, including approvals for planned maintenance. Each Reliability Coordinator shall have	This requirement is replaced by proposed IRO-002, Requirement R2 and approved EOP-008-1, Requirement R1, Part 1.6.2. **Proposed IRO-002-4, Requirement R2:**

Standard IRO-002-2 — Reliability Coordination – Facilities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
procedures in place to mitigate the effects of analysis tool outages.	**R2.** Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance of its telecommunications, monitoring and analysis capabilities. **Approved EOP-008-1, Requirement R1, Part 1.6.2:** **R1. Part 1.6.2.** Actions to manage the risk to the BES during the transition from primary to backup functionality as well as during outages of the primary or backup functionality.

Standard IRO-003-2 — Reliability Coordination - Wide-Area View	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.	Replaced with proposed IRO-002-4, Requirement R3. **Proposed IRO-002-4, Requirement R3:** **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
R2. Each Reliability Coordinator shall know the current status of all critical facilities whose failure, degradation or disconnection could result in an SOL or IROL violation. Reliability Coordinators shall also know the status of any facilities that may be required to assist area restoration objectives.	Replaced with proposed IRO-002-4, Requirement R3 and revised definitions of Operational Planning Analysis and Real-time Assessment. **Proposed IRO-002-4, Requirement R3:** **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed definition:** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day

Standard IRO-003-2 — Reliability Coordination - Wide-Area View	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition:** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Standard IRO-004-2 — Reliability Coordination - Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Transmission Operator, Balancing Authority, and Transmission Service Provider shall comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events.	Addition of Transmission Service Provider to proposed IRO-001-4, Requirements R2 and R3 allows for the retirement of this requirement. **Proposed IRO-001-4, Requirement R2:** R2. Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with its Reliability Coordinator's Operating Instructions unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements. **Proposed IRO-001-4, Requirement R3:** R3. Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall inform its Reliability Coordinator of its inability to perform the Operating Instruction issued by its Reliability Coordinator in Requirement R2 citing one of the specific reasons shown in Requirement R2.

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following: **R1.1** Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading. **R1.2.** Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope. **R1.3.** Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope. **R1.4.** System real and reactive reserves (actual versus required). **R1.5**. Capacity and energy adequacy conditions. **R1.6.** Current ACE for all its Balancing Authorities. **R1.7**. Current local or Transmission Loading Relief procedures in effect. **R1.8.** Planned generation dispatches. **R1.9.** Planned transmission or generation outages. **R1.10.** Contingency events.	Replaced by proposed IRO-002-4, Requirements R3 and R4. **Proposed IRO-002-4, Requirement R3:** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed IRO-002-4, Requirement R4:** **R4**. Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure.
R2. Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard (CPS) and	The first sentence is replaced by proposed IRO-002-4, Requirement R3. The second sentence is covered by approved EOP-002-3.1a, Requirement R8 and can be retired. **Proposed IRO-002-4 Requirement, R3**:

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
Disturbance Control Standard (DCS) requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.	**R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Approved EOP-002-3.1a, Requirement R8:** **R8.** A Reliability Coordinator that has any Balancing Authority within its Reliability Coordinator area experiencing a potential or actual Energy Emergency shall initiate an Energy Emergency Alert as detailed in Attachment 1-EOP-002 “Energy Emergency Alerts.” The Reliability Coordinator shall act to mitigate the emergency condition, including a request for emergency assistance if required.
R3. Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.	The SDT proposes retiring this requirement as it has been superseded by approved EOP-010-1, Requirements R1 through R3. **Approved EOP-010-1, Requirements R1 to R3:** **R1** Each Reliability Coordinator shall develop, maintain, and implement a GMD Operating Plan that coordinates GMD Operating Procedures or Operating Processes within its Reliability Coordinator Area. At a minimum, the GMD Operating Plan shall include: **1.1** A description of activities designed to mitigate the effects of GMD events on the reliable operation of the interconnected transmission system within the Reliability Coordinator Area. **1.2** A process for the Reliability Coordinator to review the GMD Operating Procedures or Operating Processes of Transmission Operators within its Reliability Coordinator Area. **R2.** Each Reliability Coordinator shall disseminate forecasted and current space weather information to functional entities identified as recipients in the Reliability Coordinator's GMD Operating Plan. **R3.** Each Transmission Operator shall develop, maintain, and implement a GMD Operating Procedure or Operating Process to mitigate the effects of GMD events on the reliable

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	operation of its respective system. At a minimum, the Operating Procedure or Operating Process shall include: **3.1.** Steps or tasks to receive space weather information. **3.2**. System Operator actions to be initiated based on predetermined conditions. **3.3**. The conditions for terminating the Operating Procedure or Operating Process.
R4. The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.	This requirement has been replaced by proposed IRO-008-2, Requirements R3, R5 and R6. **Proposed IRO-008-2, Requirement R3:** **R3.** Each Reliability Coordinator shall notify impacted entities identified in the Operating Plan(s) cited in Requirement R3 as to their role in those plan(s). **Proposed IRO-008-2, Requirement R5:** **R5.** Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area and other impacted Reliability Coordinators when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Reliability Coordinator Wide Area. **Proposed IRO-008-2, Requirement R6:** **R6.** Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been prevented or mitigated.
R5. Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.	This requirement is replaced by proposed IRO-001-4, Requirement R1 and proposed IRO-002-34 Requirements R3 and R4. **Proposed IRO-001-4, Requirement R1:** **R1.** Each Reliability Coordinator shall act, or direct others to act by issuing Operating Instructions, to ensure the reliability of its Reliability Coordinator Area. **Proposed IRO-002-4, Requirement R3:**

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R3. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed IRO-002-4, Requirement R4:** **R4.** Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure.
R6. The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, IROL, CPS or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.	The first sentence is replaced with proposed IRO-008-2, Requirement R2. The issue of CPS and DCS is covered in approved EOP-002-3.1, Requirements R6, R7, and R8. The second sentence is replaced by the proposed IRO-017-1, Requirement R1 as well as through the proposed definitions of Operational Planning Analysis and Real-time Assessments. Generator Operators are not included in proposed IRO-017-1 as the SDT believes that Generator Operator outage information will be sent to the respective Transmission Operators and Balancing Authorities and then sent on to the Reliability Coordinators through those entities. **Proposed IRO-008-2, Requirement R2:** **R2**. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. **Proposed definition:** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition:** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed IRO-017-1, Requirement R1:** **R1.** Each Reliability Coordinator shall develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area. **Approved EOP-002-3.1, Requirements R6, R7, and R8:** **R6.** If the Balancing Authority cannot comply with the Control Performance and Disturbance Control Standards, then it shall immediately implement remedies to do so. These remedies include, but are not limited to: R6.1. Loading all available generating capacity. **R6.2**. Deploying all available operating reserve. **R6.3.** Interrupting interruptible load and exports. **R6.4.** Requesting emergency assistance from other Balancing Authorities. **R6.5**. Declaring an Energy Emergency through its Reliability Coordinator; and **R6.6.** Reducing load, through procedures such as public appeals, voltage reductions, curtailing interruptible loads and firm loads.

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R7. Once the Balancing Authority has exhausted the steps listed in Requirement 6, or if these steps cannot be completed in sufficient time to resolve the emergency condition, the Balancing Authority shall: R7.1. Manually shed firm load without delay to return its ACE to zero; and **R7.2**. Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002 "Energy Emergency Alerts." **R8.** A Reliability Coordinator that has any Balancing Authority within its Reliability Coordinator area experiencing a potential or actual Energy Emergency shall initiate an Energy Emergency Alert as detailed in Attachment 1-EOP-002 "Energy Emergency Alerts." The Reliability Coordinator shall act to mitigate the emergency condition, including a request for emergency assistance if required.
R8. The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.	The first sentence is replaced by proposed IRO-002-4, Requirements R3 and R4. The second sentence is replaced by proposed IRO-001-4, Requirement R1. **Proposed IRO-002-4, Requirement R3:** **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed IRO-002-4, Requirement R4:** **R4.** Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure. **Proposed IRO-001-4, Requirement R1:** **R1.** Each Reliability Coordinator shall act, or direct others to act by issuing Operating Instructions, to ensure the reliability of its Reliability Coordinator Area.
R9. Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator	The first sentence is replaced by proposed IRO-002-4, Requirements R3 and R4. The second sentence is replaced by proposed IRO-010-2, Requirements R1, Part 1.2, and R3.

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.	**Proposed IRO-002-4, Requirement R3:** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed IRO-002-4, Requirement R4:** **R4.** Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure. **Proposed IRO-010-4, Requirement R1, Part 1.2:** **R1**. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: **1.2** Provisions for notification of current Protection System and Special Protection System status, failure, or degradation that impacts System reliability. **Proposed IRO-010-4, Requirement R3:** **R3**. Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications.
R10. In instances where there is a difference in derived limits, the Reliability Coordinator and its Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.	For Reliability Coordinators, this requirement is replaced by approved IRO-009-1, Requirement R5. For Transmission Operators, Balancing Authorities, and Generator Operators, this requirement is replaced by proposed TOP-001-3, Requirement R18. The Transmission Service Provider and Purchasing-Selling Entity will receive instructions on limits from the previously cited entities and can thus be deleted from the requirement. **Approved IRO-009-1, Requirement R5:**

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. The Reliability Coordinator shall notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem has been mitigated.	**R3.** Each Reliability Coordinator shall notify impacted entities identified in the Operating Plan(s) cited in Requirement R3 as to their role in those plan(s). **Proposed IRO-008-2, Requirement R5:** **R5**. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area and other impacted Reliability Coordinators when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Reliability Coordinator Wide Area. **Proposed IRO-008-2, Requirement R6:** **R6**. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been prevented or mitigated.

IRO-008-1 Reliability Coordination Operational Analyses and Real-time Assessments	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Reliability Coordinator shall perform an Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions.	This requirement is replaced by proposed IRO-008-2, Requirement R1. **Proposed IRO-008-2, Requirement R1:** **R1.** Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area.
R2. Each Reliability Coordinator shall perform a Real-Time Assessment at least once every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs.	This requirement is replaced by proposed IRO-008-2, Requirement R4. **Proposed IRO-008-2, Requirement R4:** **R4.** Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
R3. When a Reliability Coordinator determines that the results of an Operational Planning Analysis or Real-Time Assessment indicates the need for specific operational actions to prevent or mitigate an instance of exceeding an IROL, the Reliability Coordinator shall share its results with those entities that are expected to take those actions.	This requirement is replaced by proposed IRO-008-2, Requirements R3 and R5. **Proposed IRO-008-2, Requirements R3 and R5:** **R3.** Each Reliability Coordinator shall notify impacted entities identified in the Operating Plan(s) cited in Requirement R3 as to their role in those plan(s). Proposed IRO-008-2, R6: **R5**. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area and other impacted Reliability Coordinators when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Reliability Coordinator Wide Area.

Standard IRO-010-1a Reliability Coordinator Data Specification and Collection	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following: **R1.1.** List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. **R1.2.** Mutually agreeable format. **R1.3.** Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses). **R1.4.** Process for data provision when automated Real-Time system operating data is unavailable.	This requirement is replaced by proposed IRO-010-2, Requirements R1 and R3. **Proposed IRO-010-2, Requirement R1:** **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: **1.1** A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data, as deemed necessary by the Reliability Coordinator. **1.2** Provisions for notification of current Protection System and Special Protection System status, failure, or degradation that impacts System reliability. **1.3** A periodicity for providing data. **1.4** The deadline by which the respondent is to provide the indicated data. **Proposed IRO-010-2, Requirement R3:** **R3.** Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications using: **3.1** A mutually agreeable format **3.2** A mutually agreeable process for resolving data conflicts **3.3** A mutually agreeable security protocol
R2. The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.	This requirement is replaced by proposed IRO-010-2, Requirement R2. **Proposed IRO-010-2, Requirement R2:** **R2.** The Reliability Coordinator shall distribute its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

Standard IRO-010-1a Reliability Coordinator Data Specification and Collection	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship.	This requirement is replaced by proposed IRO-010-2, Requirement R3. **Proposed IRO-010-2, Requirement R3:** **R3.** Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications using: **3.1** A mutually agreeable format **3.2** A mutually agreeable process for resolving data conflicts **3.3** A mutually agreeable security protocol

Standard IRO-014-1 — Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. The Reliability Coordinator shall have Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with one or more other Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall address Scenarios that affect other Reliability Coordinator Areas as well as those developed in coordination with other Reliability Coordinators **R1.1** These Operating Procedures, Processes, or Plans shall collectively address, as a minimum, the following: **R1.1.1** Communications and notifications, including the conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and	This requirement is replaced by proposed IRO-014-3, Requirement R1. Data is covered in proposed IRO-010-2, Requirement R1. **Proposed IRO-014-3, Requirement R1:** **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: **1.1** Communications and notifications, and the process to follow in making those notifications. **1.2** Energy and capacity shortages. **1.3** Control of voltage, including the coordination of reactive resources. **1.4** Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and Real-time Assessments.

Standard IRO-014-1 — Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
information to be exchanged with other Reliability Coordinators. **R1.1.2** Energy and capacity shortages. **R1.1.3** Planned or unplanned outage information. **R1.1.4** Voltage control, including the coordination of reactive resources for voltage control. **R1.1.5** Coordination of information exchange to support reliability assessments. **R1.1.6** Authority to act to prevent and mitigate instances of causing Adverse Reliability Impacts to other Reliability Coordinator Areas.	**1.5** Authority to act to prevent and mitigate system conditions which could adversely impact other Reliability Coordinator Areas. **1.6** Provisions for weekly conference calls. **Proposed IRO-010-2, Requirement R1:** **R1**. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R2. Each Reliability Coordinator's Operating Procedure, Process, or Plan that requires one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) shall be: **R2.1.** Agreed to by all the Reliability Coordinators required to take the indicated action(s). **R2.2**. Distributed to all Reliability Coordinators that are required to take the indicated action(s).	This requirement is replaced by proposed IRO-014-3, Requirement R2. **Proposed IRO-014-3, Requirement R2:** **R2.** Each Reliability Coordinator shall maintain its Operating Procedure, Operating Process, or Operating Plan identified in Requirement R1 as follows: **2.1** Review and update annually with no more than 15 months between reviews. **2.2** Obtain written agreement from all of the Reliability Coordinators required to take the indicated action(s) for each update. **2.3** Distribute to all Reliability Coordinators that are required to take the indicated action(s) within 30 days of an update.
R3. A Reliability Coordinator's Operating Procedures, Processes, or Plans developed to support a Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan shall include: **R3.1.** A reference to the associated Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan.	R3.1 is a strictly administrative requirement with no reliability benefit and is proposed to be retired under the P81 criteria. R3.2 is replaced by proposed IRO-014-3, Requirement R1, Part 1.5. **Proposed IRO-014-3, Requirement R1**: **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection

Standard IRO-014-1 — Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R3.2. The agreed-upon actions from the associated Reliability Coordinator-to- Reliability Coordinator Operating Procedure, Process, or Plan.	reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: **1.1** Criteria and processes for notifications. **1.2** Energy and capacity shortages. **1.3** Control of voltage, including the coordination of reactive resources. **1.4** Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and Real-time Assessments. **1.5** Provisions for periodic communications to support reliable operations.
R4. Each of the Operating Procedures, Processes, and Plans addressed in Reliability Standard IRO-014 Requirement 1 and Requirement 3 shall: **R4.1.** Include version control number or date. **R4.2.** Include a distribution list. **R4.3**. Be reviewed, at least once every three years, and updated if needed	This requirement is proposed to be retired as it is strictly an administrative requirement with no reliability benefit.

Standard IRO-015-1 - Notifications and Information Exchange Between Reliability Coordinators	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. The Reliability Coordinator shall follow its Operating Procedures, Processes, or Plans for making notifications and exchanging reliability-related information with other Reliability Coordinators. **R1.1** The Reliability Coordinator shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas.	This requirement is replaced by proposed IRO-014-3, Requirement R1. **Proposed IRO-014-3, Requirement R1:** **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following:
R2. The Reliability Coordinator shall participate in agreed upon conference calls and other communication forums with adjacent Reliability Coordinators. **R2.1** The frequency of these conference calls shall be agreed upon by all involved Reliability Coordinators and shall be at least weekly.	This requirement is replaced by proposed IRO-014-3, Requirement R1, Part 1.5. **Proposed IRO-014-3, Requirement R1, Part 1.5:** **R1, Part 1.5:** Provisions for periodic communications to support reliable operations.
R3. A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows. **R3.1**. Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority. **R3.2.** Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.	This requirement is replaced by approved PRC-001-1.1, Requirement R3. **Approved PRC-001-1.1, Requirement R3:** **R3.** A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows. **3.1** Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority. **3.2** Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.

Standard IRO-016-1 - Coordination of Real-time Activities Between Reliability Coordinators	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. The Reliability Coordinator that identifies a potential, expected, or actual problem that requires the actions of one or more other Reliability Coordinators shall contact the other Reliability Coordinator(s) to confirm that there is a problem and then discuss options and decide upon a solution to prevent or resolve the identified problem. **R1.1** If the involved Reliability Coordinators agree on the problem and the actions to take to prevent or mitigate the system condition, each involved Reliability Coordinator shall implement the agreed-upon solution, and notify the involved Reliability Coordinators of the action(s) taken. **R1.2** If the involved Reliability Coordinators cannot agree on the problem(s) each Reliability Coordinator shall re-evaluate the causes of the disagreement (bad data, status, study results, tools, etc.). **R1.2.1** If time permits, this re-evaluation shall be done before taking corrective actions. **R1.2.2** If time does not permit, then each Reliability Coordinator shall operate as though the problem(s) exist(s) until the conflicting system status is resolved **R1.3** If the involved Reliability Coordinators cannot agree on the solution, the more conservative solution shall be implemented.	Proposed IRO-014-3, Requirements R3 through R6 are revised versions of approved IRO-016-1, Requirement R1 and its sub-requirements. **Proposed IRO-014-3, Requirement R3:** **R3.** Each Reliability Coordinator, upon identification of an expected or actual Emergency in its Reliability Coordinator Area, shall notify other impacted Reliability Coordinators. **Proposed IRO-014-3, Requirement R4:** **R4.** Each impacted Reliability Coordinator shall operate as though the Emergency exists during each instance where Reliability Coordinators disagree on the existence of an Emergency. **Proposed IRO-014-3, Requirement R5:** **R5**. Each Reliability Coordinator that identified an Emergency in its Reliability Coordinator Area shall develop an action plan to resolve the Emergency during those instances where impacted Reliability Coordinators disagree on the existence of an Emergency. **Proposed IRO-014-3, Requirement R6:** **R6.** Each impacted Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identified the Emergency during those instances where Reliability Coordinators disagree on the existence of an Emergency, unless such actions would violate safety, equipment, regulatory, or statutory requirements.
R2. The Reliability Coordinator shall document (via operator logs or other data sources) its actions taken for either the event or for the disagreement on the problem(s) or for both.	This retirement of this Requirement was approved by FERC effective January 21, 2014 as part of the Paragraph 81 Project.

Standard PER-001-0.2 – Operating Personnel Responsibility and Authority	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Transmission Operator and Balancing Authority shall provide operating personnel with the responsibility and authority to implement real-time actions to ensure the stable and reliable operation of the Bulk Electric System	The SDT is proposing to retire this requirement. In FERC Order 693a, paragraph 112, the Commission clarifies that a Reliability Coordinator's authority to issue directives arises out of the Commission's approval of Reliability Standards that mandate compliance with such directives. The SDT reasonably applied this same logic to Transmission Operators and Balancing Authorities and that makes this requirement superfluous and thus it can be deleted. FERC Order 693a, paragraph 112: In response to Avista, the Commission clarifies that a reliability coordinator's authority to issue directives arises out of the Commission's approval of Reliability Standards that mandate compliance with such directives. Avista is correct that contracts are unnecessary to authorize reliability coordinators to issue directives. Under the voluntary reliability scheme in place prior to section 215 of the FPA, a contractual basis was needed to assure that entities would comply with a reliability coordinator's directive. Pursuant to the current, mandatory reliability scheme established by statute, contracts are no longer needed. We view the concerns raised by Avista as part of the transition from a voluntary to mandatory scheme. Although, as noted by Avista, IRO-001-1 retains references to contracts, we view these as vestiges of an earlier program that no longer control given the current, mandatory mechanism.

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Transmission Operator shall have the responsibility and clear decision-making authority to take whatever actions are needed to ensure the reliability of its area and shall exercise specific authority to alleviate operating emergencies.	This is a generic requirement that is no longer necessary since there are now specific requirements that cover all needed reliability actions. Deletion of this requirement doesn't alleviate responsibility for actions as each individual requirement in the Reliability Standards now specifies an action and a responsible entity. These needed actions required for reliability of the Bulk Power System have been more clearly laid out in revised standards. (See FERC Order 693a, paragraph 112.) The requirement is also non-specific, ambiguous, and not performance oriented. If an entity doesn't perform as specified in an individual requirement, then they are held accountable at that level. All of this makes this requirement redundant. The overall reliability of the Bulk Power System is not adversely affected by the deletion of this requirement. In FERC Order 693a, paragraph 112, the Commission clarifies that a Reliability Coordinator's authority to issue directives arises out of the Commission's approval of Reliability Standards that mandate compliance with such directives. The SDT believes that this same logic applies to Transmission Operators and Balancing Authorities, makes this requirement superfluous, and, thus, it can be deleted. FERC Order 693a, paragraph 112: "In response to Avista, the Commission clarifies that a reliability coordinator's authority to issue directives arises out of the Commission's approval of Reliability Standards that mandate compliance with such directives. Avista is correct that contracts are unnecessary to authorize reliability coordinators to issue directives. Under the voluntary reliability scheme in place prior to section 215 of the FPA, a contractual basis was needed to assure that entities would comply with a reliability coordinator's directive. Pursuant to the current, mandatory reliability scheme established by statute, contracts are no longer needed. We view the concerns raised by Avista as part of the transition from a voluntary to mandatory scheme. Although, as noted by Avista, IRO-001-1 retains references to contracts, we view these as vestiges of an earlier program that no longer control given the current, mandatory mechanism.
R2. Each Transmission Operator shall take immediate actions to alleviate operating emergencies including curtailing transmission service or energy schedules, operating	This requirement replaced by proposed TOP-001-3, Requirements R12 and R14. **Proposed TOP-001-3, Requirement R12:**

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
equipment (e.g., generators, phase shifters, breakers), shedding firm load, etc.	**R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall comply with reliability directives issued by the Reliability Coordinator, and each Balancing Authority and Generator Operator shall comply with reliability directives issued by the Transmission Operator, unless such actions would violate safety, equipment, regulatory or statutory requirements. Under these circumstances the Transmission Operator, Balancing Authority or Generator Operator shall immediately inform the Reliability Coordinator or Transmission Operator of the inability to perform the directive so that the Reliability Coordinator or Transmission Operator can implement alternate remedial actions.	This requirement replaced by proposed IRO-001-2, Requirements R2 and R3 and proposed TOP-001-3, Requirements R3 and R4. Proposed IRO-001-2, R2: **Proposed IRO-001-2, Requirement R2:** **R2.** Each Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, and Distribution Provider shall comply with its Reliability Coordinator's Operating Instructions unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements. **Proposed IRO-001-2, Requirement R3:** **R3.** Each Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, and Distribution Provider shall inform its Reliability Coordinator upon recognition of its inability to perform an Operating Instruction in accordance with Requirement R2. **Proposed TOP-001-3, Requirement R3:** **R3.** Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. **Proposed TOP-001-3, Requirement R4:** **R4.** Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Transmission Operator of its inability to perform an Operating Instruction issued by that Transmission Operator in Requirement R3.

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R4. Each Distribution Provider and Load Serving Entity shall comply with all reliability directives issued by the Transmission Operator, including shedding firm load, unless such actions would violate safety, equipment, regulatory or statutory requirements. Under these circumstances, the Distribution Provider or Load Serving Entity shall immediately inform the Transmission Operator of the inability to perform the directive so that the Transmission Operator can implement alternate remedial actions.	This requirement replaced by proposed TOP-001-3, Requirements R3 and R4. **Proposed TOP-001-3, Requirements R3 and R4:** **R3.** Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. Proposed TOP-001-3, R4: **R4.** Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Transmission Operator of its inability to perform an Operating Instruction issued by that Transmission Operator in Requirement R3.
R5. Each Transmission Operator shall inform its Reliability Coordinator and any other potentially affected Transmission Operators of real time or anticipated emergency conditions, and take actions to avoid, when possible, or mitigate the emergency.	This requirement replaced by proposed TOP-001-3, Requirements R8, R12, and R14. **Proposed TOP-001-3, Requirement R8:** **R8**. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known other impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
R6. Each Transmission Operator, Balancing Authority, and Generator Operator shall render all available emergency assistance to others as requested, provided that the requesting entity has implemented its comparable emergency procedures, unless such actions would violate safety, equipment, or regulatory or statutory requirements.	The Generator Operator was deleted from this requirement since it will only respond to such requests if they were in the form of an Operating Instruction from its Transmission Operator or Balancing Authority which is covered in proposed TOP-001-3, Requirements R3, R4, R5 and R6. Assistance is provided through proposed TOP-001-3, Requirement R7. 'Emergency' deleted as the assistance is assistance in response to the other entities' emergency.

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed TOP-001-3, Requirement R3: **R3.** Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. **Proposed TOP-001-3, Requirement R4:** R4. Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Transmission Operator of its inability to perform an Operating Instruction issued by that Transmission Operator in Requirement R3. **Proposed TOP-001-3, Requirement R5:** **R5.** Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Balancing Authority, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. **Proposed TOP-001-3, Requirement R6:** **R6.** Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Balancing Authority of its inability to perform an Operating Instruction issued by that Balancing Authority. **Proposed TOP-001-3, Requirement R7:** **R7.** Each Transmission Operator shall assist other Transmission Operators, if requested and available, provided that the requesting entity has implemented its emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements.
R7. Each Transmission Operator and Generator Operator shall not remove Bulk Electric System facilities from service if removing those facilities would burden neighboring systems unless:	The Generator Operator can't know if their actions will burden neighboring systems since they do not have reliability data. The Transmission Operator will know if the Generator Operator actions will burden neighboring systems and will receive this data through proposed TOP-003-3, Requirements R1 and R5 and is required to act on this information as

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R7.1 For a generator outage, the Generator Operator shall notify and coordinate with the Transmission Operator. The Transmission Operator shall notify the Reliability Coordinator and other affected Transmission Operators, and coordinate the impact of removing the Bulk Electric System facility. **R7.2** For a transmission facility, the Transmission Operator shall notify and coordinate with its Reliability Coordinator. The Transmission Operator shall notify other affected Transmission Operators, and coordinate the impact of removing the Bulk Electric System facility. **R7.3** When time does not permit such notifications and coordination, or when immediate action is required to prevent a hazard to the public, lengthy customer service interruption, or damage to facilities, the Generator Operator shall notify the Transmission Operator, and the Transmission Operator shall notify its Reliability Coordinator and adjacent Transmission Operators, at the earliest possible time.	per proposed TOP-001-3, Requirement R8. Proposed IRO-010-2, Requirements R1 and R3 handle the notifications from the Transmission Operator to the Reliability Coordinator. **Proposed TOP-001-3, Requirement R8**: **R8.** Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known other impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. **Proposed TOP-003-3, Requirement R1:** **R1**. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications … **Proposed IRO-010-2, Requirement R1:** **R1**. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed IRO-010-2, Requirement R3:** **R3.** Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications …
R8. During a system emergency, the Balancing Authority and Transmission Operator shall immediately take action to restore the Real and Reactive Power Balance. If the Balancing Authority or Transmission Operator is unable to restore Real and Reactive Power Balance it shall request emergency	First sentence – real power: For the Balancing Authority part of the requirement, replaced by approved EOP-002-2.1, Requirement R6. The Transmission Operator does not balance real power so that part of the sentence can be deleted per the NERC Functional Model V5.

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
assistance from the Reliability Coordinator. If corrective action or emergency assistance is not adequate to mitigate the Real and Reactive Power Balance, then the Reliability Coordinator, Balancing Authority, and Transmission Operator shall implement firm load shedding.	First sentence – reactive power: Replaced by approved VAR-001-3, Requirement R8 for the Transmission Operator which covers reactive power requirements and the meaning of balancing reactive power for the Transmission Operator. The Balancing Authority must be told by the Transmission Operator to take actions regarding reactive power per the NERC Functional Model V5 and therefore the Balancing Authority can be deleted from this part of the requirement. Second sentence – The Balancing Authority must be told by the Transmission Operator to take actions regarding reactive power and thus the Balancing Authority is not necessary. Replaced by approved VAR-001-3, Requirements R1, R8, and R12 for the Transmission Operator. Third sentence – Replaced by approved IRO-009-1, Requirements R1 and R2 for the Reliability Coordinator. Replaced by approved EOP-003-2, Requirement R1 for the Transmission Operator and Balancing Authority. **Approved EOP-002-3.1, Requirement R6:** **R6**. If the Balancing Authority cannot comply with the Control Performance and Disturbance Control Standards, then it shall immediately implement remedies to do so. **Approved VAR-001-3, Requirement R1:** **R1.** Each Transmission Operator, individually and jointly with other Transmission Operators, shall ensure that formal policies and procedures are developed, maintained, and implemented for monitoring and controlling voltage levels and Mvar flows within their individual areas and with the areas of neighboring Transmission Operators. **Approved VAR-001-3, Requirement R8:** **R8.** Each Transmission Operator shall operate or direct the operation of capacitive and inductive reactive resources within its area – including reactive generation scheduling; transmission line and reactive resource switching; and, if necessary, load shedding – to maintain system and Interconnection voltages within established limits. **Approved VAR-001-3, Requirement R12:** **R12**. The Transmission Operator shall direct corrective action, including load reduction, necessary to prevent voltage collapse when reactive resources are insufficient.

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Approved IRO-009-1, Requirement R1: **R1.** For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs. **Approved IRO-009-1, Requirement R2:** **R2.** For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's Tv. **Approved EOP-003-2, Requirement R1:** **R1.** After taking all other remedial steps, a Transmission Operator or Balancing Authority operating with insufficient generation or transmission capacity shall shed customer load rather than risk an uncontrolled failure of components or cascading outages of the Interconnection.

Standard TOP-002-2a — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Balancing Authority and Transmission Operator shall maintain a set of current plans that are designed to evaluate options and set procedures for reliable operation through a reasonable future time period. In addition, each Balancing Authority and Transmission Operator shall be responsible for using available personnel and system equipment to implement these plans to ensure that interconnected system reliability will be maintained.	First sentence, retained for Balancing Authority and Transmission Operator and moved to proposed TOP-002-4, Requirements R2 and R4. Second sentence – Replaced by proposed TOP-001-3, Requirements R1 and R2 for Balancing Authority and Transmission Operator, which requires action to resolve issues. **Proposed TOP-002-4, Requirement R2:** **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. **Proposed TOP-002-4, Requirement R4:** **R4.** Each Balancing Authority shall have an Operating Plan(s) for the next-day … **Proposed TOP-001-3, Requirement R1:** **R1.** Each Transmission Operator shall act, or direct others to act by issuing Operating Instructions, to ensure the reliability of its Transmission Operator Area. **Proposed TOP-001-3, Requirement R2:** **R2.** Each Balancing Authority shall act, or direct others to act by issuing Operating Instructions, to ensure the reliability of its Balancing Authority Area.
R2. Each Balancing Authority and Transmission Operator shall ensure its operating personnel participate in the system planning and design study processes, so that these studies contain the operating personnel perspective and system operating personnel are aware of the planning purpose.	The SDT is proposing to retire this requirement. While it may be good utility practice to do this, it is of marginal benefit to reliability and is more of a 'how' to conduct business as opposed to a definitive 'what' to do.
R3. Each Load Serving Entity and Generator Operator shall coordinate (where confidentiality agreements allow) its current-day, next-day, and seasonal operations with its Host Balancing Authority and Transmission Service Provider. Each Balancing Authority and Transmission Service Provider shall coordinate its current-day, next-day, and seasonal operations with its Transmission Operator.	The Transmission Operator and balancing Authority will receive the necessary data in proposed TOP-003-3, Requirement R5. The Transmission Service Provider provisions are covered in approved MOD-001-1a, Requirement R1; approved MOD-030-2, Requirement R3; and approved MOD-001-1a, Requirement R2. The coordination of plans is in proposed IRO-017-1, Requirement R2. **Proposed TOP-003-3, Requirement R5:**

Standard TOP-002-2a — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications … **Approved MOD-001-1a, Requirement R1:** **R1.** Each Transmission Operator shall select one of the methodologies1 listed below for calculating Available Transfer Capability (ATC) or Available Flowgate Capability (AFC) for each ATC Path per time period identified in R2 for those Facilities within its Transmission operating area. **Approved MOD-030-2, Requirement R3:** **R3.** The Transmission Operator shall make available to the Transmission Service Provider a Transmission model to determine Available Flowgate Capability (AFC) that … **Approved MOD-001-1a, Requirement R2:** **R2**. Each Transmission Service Provider shall calculate ATC or AFC values as listed below using the methodology or methodologies selected by its Transmission Operator(s). **Proposed IRO-017-1, Requirement R2:** **R2.** Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator outage coordination process.
R4. Each Balancing Authority and Transmission Operator shall coordinate (where confidentiality agreements allow) its current-day, next-day, and seasonal planning and operations with neighboring Balancing Authorities and Transmission Operators and with its Reliability Coordinator, so that normal Interconnection operation will proceed in an orderly and consistent manner.	Coordination of plans is covered in proposed IRO-017-1, Requirement R2. **Proposed IRO-017-1, Requirement R2:** **R2.** Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator outage coordination process.
R5. Each Balancing Authority and Transmission Operator shall plan to meet scheduled system configuration, generation dispatch, interchange scheduling and demand patterns.	This requirement has been moved to proposed TOP-002-4, Requirements R2 and R4. **Proposed TOP-002-4, Requirement R2:**

Standard TOP-002-2a — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. **Proposed TOP-002-4, Requirement R4:** **R4.** Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: **4.1** Expected generation resource commitment and dispatch. **4.2** Interchange scheduling **4.3** Demand patterns **4.4** Capacity and energy reserve requirements, including deliverability capability
R6. Each Balancing Authority and Transmission Operator shall plan to meet unscheduled changes in system configuration and generation dispatch (at a minimum N-1 Contingency planning) in accordance with NERC, Regional Reliability Organization, subregional, and local reliability requirements.	The part of the requirement dealing with the Balancing Authority and Transmission Operator is replaced by proposed TOP-002-4, Requirements R2 and R4. The n-1 Contingency planning is 'built in' to the Operational Planning Analysis since SOLs are derived according to the approved FAC standards which include Contingency planning. In addition, the definition of Operational Planning Analysis has been revised to better show the intent of the Contingency aspects of the analysis. The SDT does not believe that there is a need to replace the last part of the sentence 'in accordance with…' with the advent of the ERO and enforceable reliability standards. **Proposed TOP-002-4, Requirement R2:** **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. **Proposed TOP-002-4, Requirement R4:** R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch. 4.2 Interchange scheduling

Standard TOP-002-2a — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed definition: Operational Planning Analysis** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
R7. Each Balancing Authority shall plan to meet capacity and energy reserve requirements, including the deliverability/capability for any single Contingency.	This requirement is replaced by proposed TOP-002-4, Requirement R4. **Proposed TOP-002-4, Requirement R4:** **R4.** Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: **4.1** Expected generation resource commitment and dispatch. **4.2** Interchange scheduling **4.3** Demand patterns **4.4** Capacity and energy reserve requirements, including deliverability capability
R8. Each Balancing Authority shall plan to meet voltage and/or reactive limits, including the deliverability/capability for any single contingency.	Voltage and reactive power balance are the responsibility of the Transmission Operator and are replaced by approved VAR-001-3, Requirement R1. Deliverability by the Balancing Authority is covered by proposed TOP-002-4, Requirement R4. **Approved VAR-001-3, Requirement R1:** **R1.** Each Transmission Operator, individually and jointly with other Transmission Operators, shall ensure that formal policies and procedures are developed, maintained, and

Standard TOP-002-2a — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	implemented for monitoring and controlling voltage levels and Mvar flows within their individual areas and with the areas of neighboring Transmission Operators. **Proposed TOP-002-4, Requirement R4:** R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: **4.1** Expected generation resource commitment and dispatch. **4.2** Interchange scheduling **4.3** Demand patterns **4.4** Capacity and energy reserve requirements, including deliverability capability
R9. Each Balancing Authority shall plan to meet Interchange Schedules and ramps.	This requirement is replaced by approved INT-003-3, Requirement R1, Part 1.1.1, and proposed TOP-002-4, Requirement R4. **Approved INT-003-3, Requirement R1:** **R1.** Each Receiving Balancing Authority shall confirm Interchange Schedules with the Sending Balancing Authority prior to implementation in the Balancing Authority's ACE equation. R1.1.1. Interchange Schedule start and end time. **Proposed TOP-002-4, Requirement R4:** **R4.** Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: **4.1** Expected generation resource commitment and dispatch. **4.2** Interchange scheduling **4.3** Demand patterns **4.4** Capacity and energy reserve requirements, including deliverability capability
R10. Each Balancing Authority and Transmission Operator shall plan to meet all System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs).	Balancing Authority - The Balancing Authority is only responsible to respond to Operating Instructions as per the definition of Balancing Authority in the NERC Glossary and, thus, consistent with the Commission-approved interpretation of Requirement R10, Balancing Authorities have been removed from the applicability of this requirement. SOLs and IROLs

Standard TOP-002-2a — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	are limits which the Balancing Authority may not have (and is not required to have) the ability to monitor or control. The Transmission Operator, who is required to monitor SOLs, instructs the Balancing Authority as to what to do in these situations. As stated in the NERC Functional Model V5, "the Balancing Authority's mission is to maintain the balance between loads and resources in real time within its Balancing Authority Area by keeping its actual interchange equal to its scheduled interchange and meeting its frequency bias obligation". The Balancing Authority does not possess the Bulk Power System information necessary to manage Transmission flows. Therefore, the Balancing Authority can only plan to meet SOLs and IROLs by responding to directions (as shown in proposed TOP-001-3, Requirement R3) from the Transmission Operator, including scheduling and operating resources within the limits prescribed by the Transmission Operator. The Balancing Authority must coordinate outage information and exchange data required to allow the Transmission Operator to deal with SOLs. Those items are in proposed IRO-017-1, Requirement R2 and proposed TOP-003-3, Requirement R5. That information is considered by the Transmission Operator when formulating its Operating Plans and since IROLs are a sub-set of SOLs, this is covered in proposed TOP-002-4, requirement R2. **Proposed TOP-001-3, Requirement R3:** **R3.** Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. **Proposed IRO-017-1, Requirement R2:** **R2.** Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator outage coordination process. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data

Standard TOP-002-2a — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications **Proposed TOP-002-4, Requirement R2:** **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.
R11. The Transmission Operator shall perform seasonal, next-day, and current-day Bulk Electric System studies to determine SOLs. Neighboring Transmission Operators shall utilize identical SOLs for common facilities. The Transmission Operator shall update these Bulk Electric System studies as necessary to reflect current system conditions; and shall make the results of Bulk Electric System studies available to the Transmission Operators, Balancing Authorities (subject confidentiality requirements), and to its Reliability Coordinator.	First sentence replaced by proposed TOP-002-4, Requirement R1, proposed TOP-001-3, Requirement R13. Specific requirements for seasonal studies are not necessary as proposed IRO-017-1 allows for the Reliability Coordinator to determine the timeframe of the studies that it needs. Second sentence – SOLs are set by the Transmission Operator in approved FAC-014-2, Requirement R2 according to the methodology distributed by the Reliability Coordinator in approved FAC-011-2, Requirement R4, Part 4.3. This should assure that SOLs are consistent for common facilities. Third sentence – Replaced by proposed TOP-001-3, Requirement R13 and proposed TOP-001-3, Requirement R8. **Proposed TOP-002-4, Requirement R1:** **R1**. Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed TOP-001-3, Requirement R13:** **R13**. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Approved FAC-014-2, Requirement R2:**

Standard TOP-002-2a — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R2. The Transmission Operator shall establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology. **Approved FAC-011-2, Requirement R4:** **R4.** The Reliability Coordinator shall issue its SOL Methodology and any changes to that methodology, prior to the effectiveness of the Methodology or of a change to the Methodology, to all of the following: 4.3 Each Transmission Operator that operates in the Reliability Coordinator Area. **Proposed TOP-001-3, Requirement R8:** **R8**. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known other impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency.
R12. The Transmission Service Provider shall include known SOLs or IROLs within its area and neighboring areas in the determination of transfer capabilities, in accordance with filed tariffs and/or regional Total Transfer Capability and Available Transfer Capability calculation processes.	Replaced by approved MOD-028-2, Requirement R6.1; approved MOD-029-1a, Requirement R3; and approved MOD-030-2, Requirement R2.4. Because IROLs by definition are a subset of SOLs, IROLs are included. **Approved MOD-028-2, Requirement R6.1:** **6.1** Determine the incremental Transfer Capability for each ATC Path by increasing generation and/or decreasing load within the source Balancing Authority area and decreasing generation and/or increasing load within the sink Balancing Authority area until either: • A System Operating Limit is reached on the Transmission Service Provider's system, or • A SOL is reached on any other adjacent system in the Transmission model that is not on the study path and the distribution factor is 5% or greater. **Approved MOD-029-1a, Requirement R3:** **R3.** Each Transmission Operator shall establish the TTC at the lesser of the value calculated in R2 or any System Operating Limit (SOL) for that ATC Path. **Approved MOD-030-2, Requirement R2.4:**

<table>
<tr><th colspan="2">Standard TOP-002-2a — Normal Operations Planning</th></tr>
<tr><th>Requirement in Approved Standard</th><th>Proposed Language in New Standard or Comment</th></tr>
<tr><td></td><td>2.4 Establish the TFC of each of the defined Flowgates as equal to:
- For thermal limits, the System Operating Limit (SOL) of the Flowgate.
- For voltage or stability limits, the flow that will respect the SOL of the Flowgate.</td></tr>
<tr><td>R13. At the request of the Balancing Authority or Transmission Operator, a Generator Operator shall perform generating real and reactive capability verification that shall include, among other variables, weather, ambient air and water conditions, and fuel quality and quantity, and provide the results to the Balancing Authority or Transmission Operator operating personnel as requested.</td><td>This requirement is replaced by proposed TOP-001-3, Requirement R2 where a Balancing Authority can issue Operating instructions to the Generator Operator which could include verification. The SDT believes that this requirement does not apply to the Transmission Operator since it is dealing exclusively with generation. The data coming back from the verification effort would be included in the Balancing Authority data specification as shown in proposed TOP-003-3, Requirements R2 and R5.

Proposed TOP-001-3, Requirement R2:

R2. Each Balancing Authority shall act, or direct others to act by issuing Operating Instructions, to ensure the reliability of its Balancing Authority Area.

Proposed TOP-003-3, Requirement R2:

R2. Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring.

Proposed TOP-003-3, Requirement R5:

R5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications.</td></tr>

</table>

Standard TOP-002-2a — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
14.2 Changes in real output capabilities(Effective August 1, 2007) **14.3** Automatic Voltage Regulator status and mode setting. (Retired August 1, 2007)	
R15. Generation Operators shall, at the request of the Balancing Authority or Transmission Operator, provide a forecast of expected real power output to assist in operations planning (e.g., a seven-day forecast of real output).	This requirement is replaced by proposed TOP-003-3, Requirement R5. **Proposed TOP-003-3, Requirement R5:** **R5**. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications.
R16. Subject to standards of conduct and confidentiality agreements, Transmission Operators shall, without any intentional time delay, notify their Reliability Coordinator and Balancing Authority of changes in capabilities and characteristics including but not limited to: **16.1** - Changes in transmission facility status. **16.2** - Changes in transmission facility rating	This requirement replaced by proposed IRO-010-2, Requirement R3. **Proposed IRO-010-2, Requirement R3:** **R3**. Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications
R17. Balancing Authorities and Transmission Operators shall, without any intentional time delay, communicate the information described in the requirements R1 to R16 above to their Reliability Coordinator.	This requirement replaced by proposed IRO-010-2, Requirement R3. **Proposed IRO-010-2, Requirement R3:** **R3.** Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications using:
R18. Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use uniform line identifiers when referring to transmission facilities of an interconnected network.	This requirement is proposed for retirement as it adds no reliability benefit. Entities have existing processes that handle this issue. There has never been a documented case of the lack of uniform line identifiers contributing to a system reliability issue. This is an administrative item as seen in the measure which simply requires a list of line identifiers. The true reliability issue is not the name of a line but what is happening to it, pointing out the

Standard TOP-002-2a — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	difficulty in assigning compliance responsibility for such a requirement, as well as the near impossibility of coming up with truly unique identifiers on a nation-wide basis. The bottom line is that this situation is handled by the operators as part of their normal responsibilities and no one is aware of a switching error caused by confusion over line identifiers.
R19. Each Balancing Authority and Transmission Operator shall maintain accurate computer models utilized for analyzing and planning system operations.	The SDT believes that modeling starts with the model created by the Planning Coordinator and model verification for the Planning Coordinator is addressed in proposed MOD-033-1, Requirements R1 and R2. Therefore, the SDT is proposing to retire this requirement. **Proposed MOD-033-1, Requirement R1:** **R1**. Each Planning Coordinator shall implement a documented data validation process that includes the following attributes: **1.1** Comparison of the performance of the Planning Coordinator's portion of the existing system in a planning power flow model to actual system behavior, represented by a state estimator case or other Real-time data sources, at least once every 24 calendar months through simulation; **1.2** Comparison of the performance of the Planning Coordinator's portion of the existing system in a planning dynamic model to actual system response, through simulation of a dynamic local event, at least once every 24 calendar months (use a dynamic local event that occurs within 24 calendar months of the last dynamic local event used in comparison, and complete each comparison within 24 calendar months of the dynamic local event). If no dynamic local event occurs within the 24 calendar months, use the next dynamic local event that occurs; **1.3** Guidelines the Planning Coordinator will use to determine unacceptable differences in performance under Part 1.1 or 1.2; and **1.4** Guidelines to resolve the unacceptable differences in performance identified under Part 1.3. **Proposed MOD-033-1, Requirement R2:** **R2.** Each Reliability Coordinator and Transmission Operator shall provide actual system behavior data (or a written response that it does not have the requested data) to any Planning Coordinator performing validation under Requirement R1 within 30 calendar

Standard TOP-002-2a — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	days of a written request, such as, but not limited to, state estimator case or other Real-time data (including disturbance data recordings) necessary for actual system response validation.

Standard TOP-003-1 — Planned Outage Coordination	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Generator Operators and Transmission Operators shall provide planned outage information. **1.1** Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements. **1.2** Each Transmission Operator shall provide outage information daily to its Reliability Coordinator, and to affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. The Reliability Coordinator shall establish the outage reporting requirements. **1.3** Such information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.	Parts 1.1, 1.2, and 1.3 are addressed as follows: **1.1** Generator Operators will provide planned outage information to Transmission Operators through proposed TOP-003-3, Requirement R5. Reporting requirements are set in proposed TOP-003-3, Requirement R1. **1.2** Transmission Operators will provide planned outage information to Reliability Coordinators through proposed IRO-010-2, Requirement R3. Reporting requirements are set in proposed IRO-010-2, Requirement R1. **1.3** Reporting requirements are set in proposed TOP-003-3, Requirement R1 and proposed IRO-010-2, Requirement R1. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications … **Proposed TOP-003-3, Requirement R1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification … **Proposed IRO-010-2, Requirement R3:** **R3.** Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications. **Proposed IRO-010-2, Requirement R1:** **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

Standard TOP-003-1 — Planned Outage Coordination	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R2. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators as required.	Generator Operators will provide planned outage information to Transmission Operators through proposed TOP-003-3, Requirement R5. Reporting requirements are set in proposed TOP-003-3, Requirement R1. Transmission Operators and Balancing Authorities coordinate outages through proposed IRO-017-1, Requirement R2. **Proposed TOP-003-3, Requirement R5:** **R5**. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications … **Proposed TOP-003-3, Requirement R1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification … **Proposed IRO-017-1, Requirement R2:** **R2.** Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator outage coordination process.
R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.	This requirement is replaced by proposed TOP-001-3, Requirement R9. **Proposed TOP-001-3, Requirement R9:** **R9**. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected NERC registered entities of outages of telemetering equipment, control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities.
R4. Each Reliability Coordinator shall resolve any scheduling of potential reliability conflicts.	This requirement is replaced by proposed IRO-008-2, Requirement R2. **Proposed IRO-008-2, Requirement R2:** **R2.** Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis

Standard TOP-003-1 — Planned Outage Coordination	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Transmission Operator shall operate within the Interconnection Reliability Operating Limits (IROLs) and System Operating Limits (SOLs).	This requirement has been replaced by proposed TOP-001-3, Requirements R12 and R14. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14**. Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
R2. Each Transmission Operator shall operate so that instability, uncontrolled separation, or cascading outages will not occur as a result of the most severe single contingency.	The SDT has revised the definitions of Operational Planning Analysis and Real-time Assessment to address all Contingencies, not just the single most severe Contingency and operations follow suit as shown in proposed TOP-001-3, Requirement R14 and proposed TOP-002-4, Requirement R2. **Proposed definition:** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed definition:**

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Operational Planning Analysis - An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Proposed TOP-002-4, Requirement R2:** **R2**. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.
R3. Each Transmission Operator shall operate to protect against instability, uncontrolled separation, or cascading outages resulting from multiple outages, as specified by its Reliability Coordinator.	This requirement is replaced by proposed TOP-001-3, Requirements R12 and R14. These requirements are not limited by single or multiple Contingencies. Approved FAC-011-2 and FAC-014-2 work collectively to establish how multiple Contingencies are considered in IROLs and SOLs. Approved FAC-014-2, Requirement R6 requires the Planning Coordinator to identify the subset of multiple Contingencies and to provide this list to the Reliability Coordinators. Approved FAC-011-2, Requirement R3.3 requires the Reliability Coordinator to include in its SOL methodology a process for determining which of the Stability limits associated with multiple Contingencies are used to establish SOLs. Approved FAC-014-2, Requirement R1 requires the Reliability Coordinator to determine which subset of SOLs qualify as IROLS. Approved FAC-014-2, Requirement R1 also requires the Reliability Coordinator to ensure SOLs, including IROLs, are established for its Reliability Coordinator Area while approved FAC-014-2, Requirement R2 also requires the Transmission Operator to establish SOLs for its area. Thus, IROLs and SOLs that consider multiple outages will be developed appropriately and the Transmission Operator will operate to them. **Proposed TOP-001-3, Requirement R12:**

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R12. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Approved FAC-011-2, Requirement R1:** **R1**. The Reliability Coordinator shall have a documented methodology for use in developing SOLs (SOL Methodology) within its Reliability Coordinator Area. This SOL Methodology shall: **R1.1**. Be applicable for developing SOLs used in the planning horizon **R1.2.** State that SOLs shall not exceed associated Facility Ratings. **R1.3.** Include a description of how to identify the subset of SOLs that qualify as IROLs. **Approved FAC-011-2, Requirement R3:** **R3.** The Reliability Coordinator's methodology for determining SOLs, shall include, as a minimum, a description of the following, along with any reliability margins applied for each: **R3.3**. A process for determining which of the stability limits associated with the list of multiple contingencies (provided by the Planning Authority in accordance with FAC-014 Requirement 6) are applicable for use in the operating horizon given the actual or expected system conditions. **R3.3.1**. This process shall address the need to modify these limits, to modify the list of limits, and to modify the list of associated multiple contingencies. **Approved FAC-014-2, Requirement R1:** **R1.**The Reliability Coordinator shall ensure that SOLs, including Interconnection Reliability Operating Limits (IROLs), for its Reliability Coordinator Area are established and that the SOLs (including Interconnection Reliability Operating Limits) are consistent with its SOL Methodology. **Approved FAC-014-2, Requirement R2:**

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R2. The Transmission Operator shall establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology. **Approved FAC-014-2, Requirement R6:** **R6.** The Planning Authority shall identify the subset of multiple contingencies (if any), from Reliability Standard TPL-003 which result in stability limits. **R6.1.** The Planning Authority shall provide this list of multiple contingencies and the associated stability limits to the Reliability Coordinators that monitor the facilities associated with these contingencies and limits. **R6.2.** If the Planning Authority does not identify any stability related multiple contingencies, the Planning Authority shall so notify the Reliability Coordinator.
R4. If a Transmission Operator enters an unknown operating state (i.e., any state for which valid operating limits have not been determined), it will be considered to be in an emergency and shall restore operations to respect proven reliable power system limits within 30 minutes.	The SDT believes that given the revised definitions for Operational Planning Analysis and Real-time Assessment, as well as the new requirement for TOPs to update their OPA results through the performance of a Real-time Assessment every 30 minutes, that entities will always be operating to valid operating limits. Therefore, this requirement is replaced by proposed TOP-001-3, Requirements R12, R13, and R14 along with the revised definitions of Operational Planning Analysis and Real-time Assessment. This allows the operator sufficient flexibility within a structured environment to take the necessary actions for the reliability of the Bulk Power System. **Proposed TOP-001-3, Requirement R12:** **R12**. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R13:** **R13**. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Proposed definition:**

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Operational Planning Analysis - An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition:** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)
R5. Each Transmission Operator shall make every effort to remain connected to the Interconnection. If the Transmission Operator determines that by remaining interconnected, it is in imminent danger of violating an IROL or SOL, the Transmission Operator may take such actions, as it deems necessary, to protect its area.	Normally, the Transmission Operator does not have the right to unilaterally separate – that can only be done through the authorization of the Reliability Coordinator, unless failure to act immediately would violate safety, equipment, or regulatory or statutory requirements, thus this requirement is proposed for retirement by the SDT. In the Functional Model v5, the Transmission Operator responsibilities and duties are clearly spelled out. Item 14 states that a Transmission Operator sheds load under the auspices of the Reliability Coordinator. Functional model v5: 14. Coordinates load shedding with, or as directed by, the Reliability Coordinator
R6. Transmission Operators, individually and jointly with other Transmission Operators, shall develop, maintain, and implement formal policies and procedures to provide for transmission reliability. These policies and procedures shall address the execution and coordination of activities that impact inter- and intra-Regional reliability, including:	The first sentence has been superseded by the NERC Reliability Standards taken as a whole and is proposed to be retired. The second sentence was replaced as follows: **R6.1** is duplicative of approved VAR-001-3, Requirement R1 for reactive power. Real power flows are covered in proposed TOP-001-3, Requirements R12 and R14. **R6.2** has been replaced by proposed TOP-001-3, Requirement R8.

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
6.1 Monitoring and controlling voltage levels and real and reactive power flows. **6.2** Switching transmission elements. **6.3** Planned outages of transmission elements. **6.4** Responding to IROL and SOL violations.	**R6.3** has been replaced by proposed IRO-017-1, Requirement R2. **R6.4** has been replaced by proposed TOP-001-3, Requirements R12 and R14. **Approved VAR-001-3, Requirement R1:** **R1.** Each Transmission Operator, individually and jointly with other Transmission Operators, shall ensure that formal policies and procedures are developed, maintained, and implemented for monitoring and controlling voltage levels and Mvar flows within their individual areas and with the areas of neighboring Transmission Operators. **Proposed TOP-001-3, Requirement R8:** **R8**. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known other impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Proposed IRO-017-1, Requirement R2:** **R2.** Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator outage coordination process.

Standard TOP-005-2a — Operational Reliability Information	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. As a condition of receiving data from the Interregional Security Network (ISN), each ISN data recipient shall sign the NERC Confidentiality Agreement for "Electric System Reliability Data."	Recognizing security concerns, the SDT has added security protocols to proposed IRO-010-2, Requirement R3, Part 3.3 and to proposed TOP-003-3, Requirement R5, Part 5.3 to address overall security concerns. **Proposed IRO-010-2, Requirement R3, Part 3.3:** **3.3** A mutually agreeable security protocol **Proposed TOP-003-3, Requirement R5, Part 5.3:** **5.3** A mutually agreeable security protocol.
R2. Upon request, each Balancing Authority and Transmission Operator shall provide to other Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability, the operating data that are necessary to allow these Balancing Authorities and Transmission Operators to perform operational reliability assessments and to coordinate reliable operations. Balancing Authorities and Transmission Operators shall provide the types of data as listed in Attachment 1-TOP-005-2a "Electric System Reliability Data**,"** unless otherwise agreed to by the Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability.	This requirement replaced by proposed TOP-003-3, Requirement R1, R2, and R5. **Proposed TOP-003-3, Requirement R1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed TOP-003-3, Requirement R2:** **R2**. Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications.
R3. Each Purchasing-Selling Entity shall provide information as requested by its Host Balancing Authorities and Transmission Operators to enable them to conduct operational reliability assessments and coordinate reliable operations.	Deleted as redundant to NAESB standards – All operating data that a Purchasing-Selling Entity has that a Transmission Operator or Balancing Authority needs is part of eTag and is acquired through that system.

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use. **1.1** - Each Generator Operator shall inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use. **1.2** - Each Transmission Operator shall inform the Reliability Coordinator and other affected Transmission Operators of all transmission resources available for use. **1.3 -** Each Balancing Authority shall inform its Reliability Coordinator of all generation resources available for use.	The main body of the requirement is replaced by proposed TOP-001-3, Requirements R10 and R11. **1.1** This Part is replaced by proposed TOP-003-3, Requirement R5. **1.2** This Part is replaced by proposed IRO-101-2, Requirement R3. **1.3** This Part is replaced by proposed IRO-010-2, Requirement R3. **Proposed TOP-001-3, Requirement R10:** **R10.** Each Transmission Operator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Transmission Operator, within its Transmission Operator Area and neighboring Transmission Operator Areas to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area. **Proposed TOP-001-3, Requirement R11:** **R11.** Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, to ensure that it is able to perform its reliability functions. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications. **Proposed IRO-010-2, Requirement R3:** **R3.** Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications.
R2. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources.	This requirement is replaced by proposed IRO-002-4, Requirement R3, proposed TOP-001-3, Requirement R10, and proposed TOP-001-3, R11. The requirements mandate that any Facility needed for an entity to perform its reliability-based functions must be monitored. This would include load-tap changers, rotating and static reactive resources, etc.

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed IRO-002-4, Requirement R3: **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed TOP-001-3, Requirement R10:** **R10.** Each Transmission Operator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Transmission Operator, within its Transmission Operator Area and neighboring Transmission Operator Areas to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area **Proposed TOP-001-3, Requirement R11:** **R11.** Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, to ensure that it is able to perform its reliability functions.
R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall provide its operating personnel with appropriate technical information concerning protective relays within the Reliability Coordinator Area, the Transmission Operator Area, and the Balancing Authority Area, respectively.	This requirement replaced by proposed IRO-010-2, Requirement R1, Part 1.2; proposed TOP-003-3, Requirement R1, Part 1.2; and proposed TOP-003-3, Requirement R2, Part 2.2. **Proposed IRO-010-2, Requirement R1, Part 1.2:** **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: **1.2** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **Proposed TOP-003-3, Requirement R1, Part 1.2:** **R 1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to:

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	1.2 Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **Proposed TOP-003-3, Requirement R2, Part 2.2:** **R2**. Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. The data specification shall include, but not be limited to: **2.2** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.
R4. Each Transmission Operator, and Balancing Authority shall have information, including weather forecasts and past load patterns, available to predict the system's near-term load pattern.	This requirement replaced by proposed TOP-003-3, Requirement R1 and R2 with regard to load patterns. Weather forecasts are a necessary element for load forecasts which are required for Operational Planning Analysis. Therefore, this requirement can be retired. **Proposed TOP-003-3, Requirement R1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed TOP-003-3, Requirement R2:** **R2.** Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. **Proposed definition:** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
R5. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use monitoring equipment to bring to the attention of operating personnel important deviations	This requirement replaced by proposed TOP-001-3, Requirements R10 and R11, and proposed IRO-002-4, Requirement R3.

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
in operating conditions and to indicate, if appropriate, the need for corrective action.	**Proposed TOP-001-3, Requirement R10:** **R10.** Each Transmission Operator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Transmission Operator, within its Transmission Operator Area and neighboring Transmission Operator Areas to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area **Proposed TOP-001-3, Requirement R11:** **R11.** Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, to ensure that it is able to perform its reliability functions. **Proposed IRO-002-4, Requirement R3:** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
R6. Each Balancing Authority and Transmission Operator shall use sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions under both normal and emergency situations.	Metering accuracy for Balancing Authorities is covered under approved BAL-005 -0.2b, Requirement R17 and thus this requirement can be retired from the TOP standards. The SDT believes that this requirement truly pertains to the Balancing Authority and that the Transmission Operator is the actual entity who will be taking care of many of the meters mentioned in approved BAL-005-0.2b. Therefore, the SDT is proposing to retire the Transmission Operator part of this requirement. **Approved BAL-005-0.2b, Requirement R17:** **R17.** Each Balancing Authority shall at least annually check and calibrate its time error and frequency devices against a common reference. The Balancing Authority shall adhere to the minimum values for measuring devices as listed below
R7. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor system frequency.	This requirement is replaced by proposed IRO-002-4, Requirement R3, and proposed TOP-001-3, Requirements R10 and R11. **Proposed IRO-002-4, Requirement R3**:

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R3. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed TOP-001-3, Requirement R10:** **R10.** Each Transmission Operator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Transmission Operator, within its Transmission Operator Area and neighboring Transmission Operator Areas to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area **Proposed TOP-001-3, Requirement R11:** **R11.** Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, to ensure that it is able to perform its reliability functions.

Standard TOP-007-0 - Reporting System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) Violations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. A Transmission Operator shall inform its Reliability Coordinator when an IROL or SOL has been exceeded and the actions being taken to return the system to within limits.	This requirement is replaced by proposed TOP-001-3, Requirement R15. The Reliability Coordinator has the primary responsibility for IROLs and will be in communication with Transmission Operators to mitigate the situation. This is shown in proposed IRO-008-2, Requirements R5 and R6. **Proposed TOP-001-3, Requirement R15:** **R15.** Each Transmission Operator shall inform its Reliability Coordinator of its actions to return the system to within limits when an SOL has been exceeded. **Proposed IRO-008-2, Requirement R5:** **R5.** Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area and other impacted Reliability Coordinators when the results of a Real-time Assessment indicate an actual or expected condition that

Standard TOP-007-0 - Reporting System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) Violations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Reliability Coordinator Wide Area. **Proposed IRO-008-2, Requirement R6:** **R6.** Each Reliability Coordinator shall issue Operating Instructions, as necessary, to ensure that actions are taken to deal with the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6.
R2. Following a Contingency or other event that results in an IROL violation, the Transmission Operator shall return its transmission system to within IROL as soon as possible, but not longer than 30 minutes.	This requirement is replaced by proposed TOP-001-3, Requirement R12. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v.
R3. A Transmission Operator shall take all appropriate actions up to and including shedding firm load, or directing the shedding of firm load, in order to comply with Requirement R2.	This requirement replaced by approved EOP-003-2, Requirement R1. **Approved EOP-003-2, Requirement R1:** **R1**. After taking all other remedial steps, a Transmission Operator or Balancing Authority operating with insufficient generation or transmission capacity shall shed customer load rather than risk an uncontrolled failure of components or cascading outages of the Interconnection.
R4. The Reliability Coordinator shall evaluate actions taken to address an IROL or SOL violation and, if the actions taken are not appropriate or sufficient, direct actions required to return the system to within limits.	This requirement replaced by proposed IRO-008-2, Requirement R6. **Proposed IRO-008-2, Requirement R6:** **R6**. Each Reliability Coordinator shall issue Operating Instructions, as necessary, to ensure that actions are taken to deal with the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6.

Standard TOP-008-1 - Response to Transmission Limit Violations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. The Transmission Operator experiencing or contributing to an IROL or SOL violation shall take immediate steps to relieve the condition, which may include shedding firm load.	This requirement replaced by approved EOP-003-1, Requirement R1 and proposed TOP-001-3, Requirements R12 and R14. **Approved EOP-003-2, Requirement R1:** **R1.** After taking all other remedial steps, a Transmission Operator or Balancing Authority operating with insufficient generation or transmission capacity shall shed customer load rather than risk an uncontrolled failure of components or cascading outages of the Interconnection. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
R2. Each Transmission Operator shall operate to prevent the likelihood that a disturbance, action, or inaction will result in an IROL or SOL violation in its area or another area of the Interconnection. In instances where there is a difference in derived operating limits, the Transmission Operator shall always operate the Bulk Electric System to the most limiting parameter.	First sentence – Replaced by proposed TOP-001-3, Requirements R12 and R14. Second sentence – Replaced by proposed TOP-001-3, Requirement R18. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Proposed TOP-001-3, Requirement R18:** **R18**. Each Transmission Operator and Balancing Authority shall always operate to the most limiting parameter in instances where there is a difference in SOLs.
R3. The Transmission Operator shall disconnect the affected facility if the overload on a transmission facility or abnormal voltage or reactive condition persists and equipment is endangered. In doing so, the Transmission Operator shall	First sentence - Placing this procedure in a requirement when it is only one of the possible options for alleviating the condition is bad practice and should not be mandated in standards. A standard should not be mandating disconnection. This is in conflict with other Reliability Standards where disconnection is dependent on System conditions and coordination with

Standard TOP-008-1 - Response to Transmission Limit Violations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
notify its Reliability Coordinator and all neighboring Transmission Operators impacted by the disconnection prior to switching, if time permits, otherwise, immediately thereafter.	other functional entities. Such actions, taken unilaterally, could make conditions worse. Therefore, the SDT is proposing to retire this requirement. Second sentence – In general, notification is replaced by proposed TOP-001-3, Requirement R8. **Proposed TOP-001-3, Requirement R8:** **R8**. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known other impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency.
R4. The Transmission Operator shall have sufficient information and analysis tools to determine the cause(s) of SOL violations. This analysis shall be conducted in all operating timeframes. The Transmission Operator shall use the results of these analyses to immediately mitigate the SOL violation.	The part of the requirement dealing with data is replaced by proposed TOP-003-3, Requirement R1. The part of the requirement dealing with analysis is replaced by proposed TOP-002-4, Requirement R1 and proposed TOP-001-3, Requirement R13. **Proposed TOP-003-3, Requirement R1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed TOP-002-4, Requirement R1:** **R1.** Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed TOP-001-3, Requirement R13:** **R13**. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

System Operating Limit Definition and Exceedance Clarification

The NERC-defined term System Operating Limit (SOL) is used extensively in the NERC Reliability Standards; however, there is much confusion with – and many widely varied interpretations and applications of – the SOL term. This whitepaper describes the Standard Drafting Team's (SDT) intent with regard to the SOL concept and brings clarity and consistency to the notion of establishing SOLs, exceeding SOLs, and implementing Operating Plans to mitigate SOL exceedances.

System Operating Limit Definition Clarification:
As stated in the NERC Glossary of Terms Used in Reliability Standards, a SOL is defined as the value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. SOLs are based upon certain operating criteria. These include, but are not limited to:

- Facility Ratings (Applicable pre- and post- Contingency equipment or Facility ratings)
- Transient Stability Ratings (Applicable pre- and/or post-Contingency Stability Limits)
- Voltage Stability Ratings (Applicable pre- and/or post- Contingency Voltage Stability)
- System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits)

The concept of SOL determination is not complete without looking at the approved NERC FAC standards FAC-008-3, FAC-011-2, and FAC-014-2:

1. The purpose of approved FAC-008-3, which is applicable to both Generation and Transmission Owners, is to ensure that Facility Ratings used in the reliable planning and operation of the BES are determined based on technically sound principles. A Facility Rating is essential for the determination of SOLs. The standard requires both Generation Owners and Transmission Owners to have a documented Facility Rating that respects the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility. The scope of the Ratings addressed shall include, as a minimum, both Normal and Emergency (short-term) Ratings (approved FAC-008-3, Requirement R3, part 3.4.2). A 24 hour continuous rating is an example of a Normal rating; however, rating practices vary from entity to entity and may include ratings that vary with ambient temperature. Typical Emergency (short-term) Ratings have a finite duration of less than 24 hours (e.g., 4 hours, 2 hours, 1 hour, 30 minutes, or 15 minutes).

2. The purpose of approved FAC-011-2, which is applicable to Reliability Coordinators, is to ensure that SOLs used in the reliable operation of the BES are determined based on an established methodology or methodologies. Approved FAC-011-2, Requirement R2 requires that the Reliability Coordinator's SOL Methodology include a requirement that SOLs provide a certain level of BES performance for the pre- and post-Contingency state. Specifically:

   Pre-Contingency: Acceptable system performance for the pre-Contingency state is characterized by the following:

   a. The BES shall demonstrate transient, dynamic, and voltage Stability.
   b. All Facilities shall be within their Normal Facility Ratings and thermal limits.
   c. All Facilities shall be within their pre-Contingency voltage limits.
   d. All Facilities shall be within their Stability limits.

   Post-Contingency: Acceptable system performance for the post-Contingency state for single Contingencies is characterized by the following (approved Reliability Standard FAC-011-2, Requirement R2, part 2.2):

   a. The BES shall demonstrate transient, dynamic, and voltage Stability.
   b. All Facilities shall be within their applicable Emergency (short-term) Facility Ratings and thermal limits.
   c. All Facilities shall be within their post-Contingency voltage limits.
   d. All Facilities shall be within their Stability limits.
   e. Cascading or uncontrolled separation shall not occur.

3. Approved FAC-014-2, Requirement R2 requires that Transmission Operators establish SOLs for their portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology.

Some have interpreted the language in approved FAC-011-2, Requirement R2 to imply that the objective is to perform prior studies to determine a specific MW flow value (SOL) that ensures operation within the criteria specified in approved FAC-011-2, Requirement R2 sub-requirements, the assumption being that if the system is operated within this pre-determined SOL value, then all of the pre- and post-Contingency requirements described in approved FAC-011-2, Requirement R2 will be met. The SDT believes this

approach may not capture the complete intent of the SOL concept within approved FAC-011-2, which is both:

1. Know the Facility Ratings, voltage limits, transient Stability limits, and voltage Stability limits, and
2. Ensure that they are all observed in both the pre- and post-Contingency state by performing a Real-time Assessment.

SOLs are based on Normal and Emergency (short-term) Facility Ratings, voltage limits, transient Stability limits, and voltage Stability limits – any of which can be the most restrictive limit at any point in time pre- or post-Contingency. For example, if an area of the BES is at no risk of encroaching upon Stability or voltage limitations in the pre- or post-Contingency state, and the most restrictive limitations in that area are pre- or post-Contingency exceedance of Facility Ratings, then the thermal Facility Ratings in that area are the limiting SOLs. Conversely, if an area has plenty of headroom on thermal Facility Ratings and has no risk of instability but is prone to low voltages pre- or post-Contingency, then the voltage limits in that area are the limiting SOLs.

It is important to distinguish operating practices and strategies from the SOL itself. As stated earlier, the SOL is based on the actual set of Facility Ratings, voltage limits, or Stability limits that are to be monitored for the pre- and post-Contingency state. How an entity remains within these SOLs can vary depending on the practices and mechanisms employed by that entity. For example, one Transmission Operator may utilize line outage distribution factors or other similar calculations as a mechanism to ensure SOLs are not exceeded, while another may utilize advanced network applications to achieve the same reliability objective.

In order to ensure an SOL is not exceeded, the following SOL performance must be maintained:

1. **Facility Ratings:**
   In the pre- and post-Contingency state, operate within Facility capability by utilizing Normal and Emergency (short-term) Ratings, as applicable, within their associated time parameters.
2. **Voltage Limits:**
   In the pre-Contingency state, operate within normal voltage limits. In the post-Contingency state, operate within applicable emergency voltage limits.
3. **Transient Stability Limits:**
   Transmission Operators establish SOLs to prevent unit/intra-area instability, inter-area instability, or tripping of Facilities due to out-of-step conditions. Transient Stability limits are typically defined as the

maximum power transfer or load level that ensures critical transient reliability criteria are met. Calculated flows must be maintained within appropriate pre- and/or post-Contingency limit.

4. **Voltage Stability Limits:**
   Transmission Operators typically stress Transmission Paths/Interfaces or load areas to the reasonably expected maximum transfer conditions or area load levels to determine whether steady state voltage Stability limits exist. Voltage Stability limits are typically defined as the maximum power transfer or load level for which a post-Contingency solution can be reached. Calculated flows must be maintained within appropriate pre- and/or post-Contingency limits.

System Operating Limit Exceedance Clarification:

The combination of requirements contained within the approved FAC and proposed TOP standards, as well as the use of defined terms contained within those standards such as Operational Planning Analysis, Real-time Assessment, and Operating Plans when executed properly result in maintaining reliable BES performance. Specifically,

1. Approved FAC standards require clear determination of Facility Ratings and describe acceptable system performance criteria for the pre- and post-Contingency state.
2. Proposed TOP-001-3, Requirement R13 requires that a Transmission Operator perform a Real-time Assessment at least once every 30 minutes.
3. Proposed TOP-002-4, Requirement R2 requires that each Transmission Operator have an Operating Plan to address potential SOL exceedances identified as a result of its Operational Planning Analysis.
4. Proposed TOP-001-3, Requirement R14 requires the Transmission Operator to initiate Operating Plan(s) to mitigate SOL exceedances.

<u>Facility Rating Exceedance</u>

Facility Rating exceedance is a function of the available limit set and the magnitude of pre- or post-Contingency flows in relation to those limits as observed in Real-time monitoring or Real-time Assessments. Figure 1 illustrates an SOL Performance Summary for Facility Ratings.

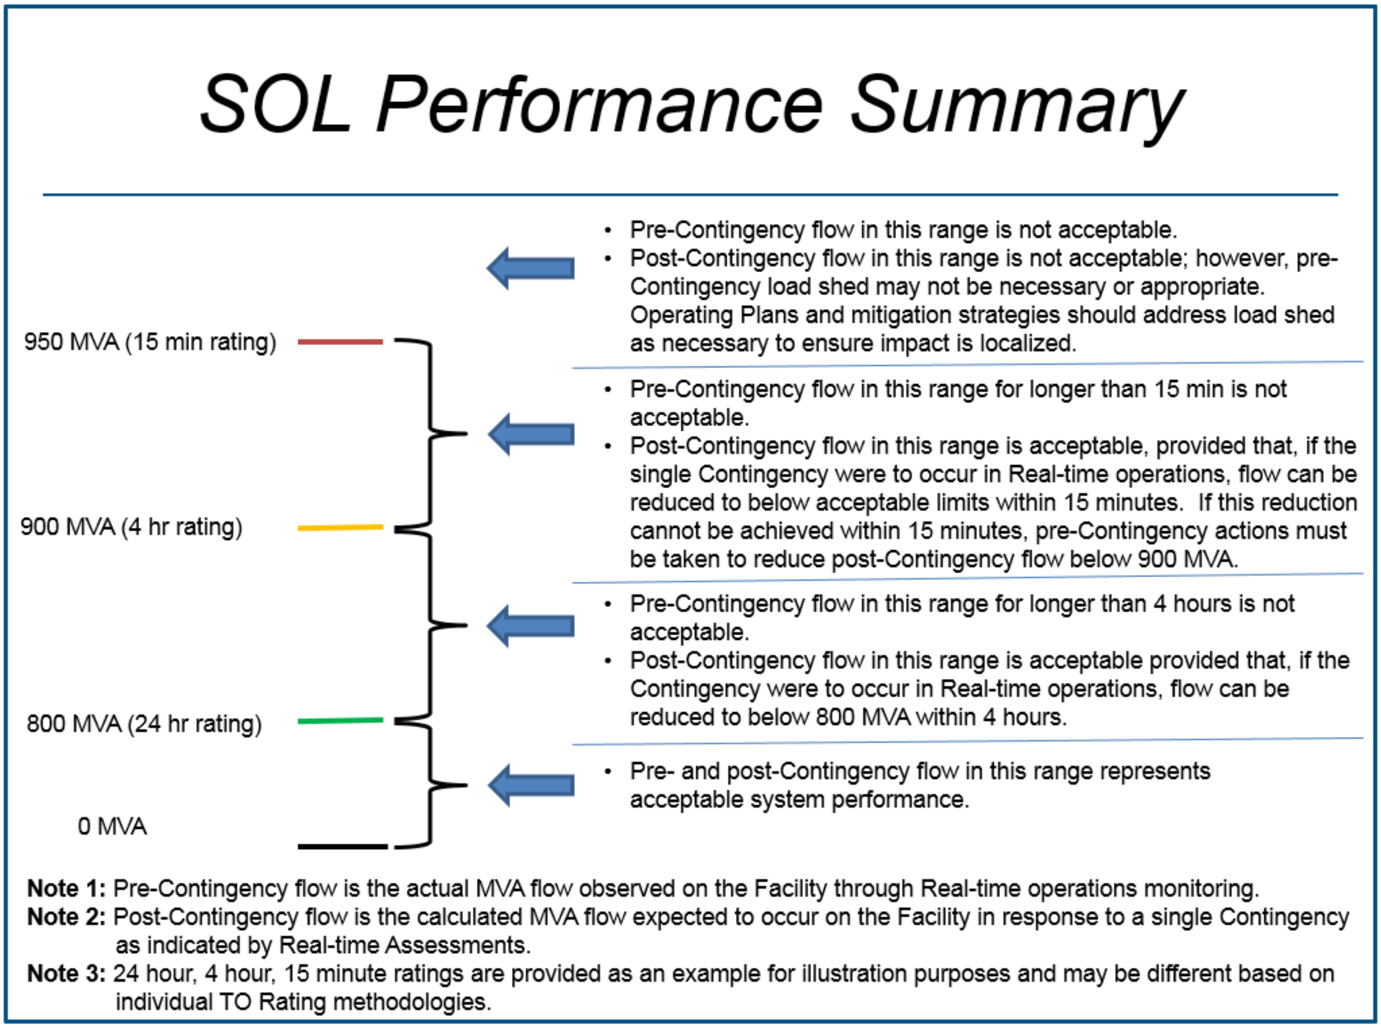

Figure 1. Facility Rating System Operating Limit Performance Summary

In cases where post-Contingency flow exceeds the highest available Facility Rating as shown in Figure 1, Transmission Operators are expected to take pre-Contingency action to relieve the condition (including redispatch, reconfiguration, and making adjustments to the uses of the transmission system); however, the operating condition may not warrant shedding load pre-Contingency to relieve the condition. Pre-Contingency Load shed is generally utilized as a last resort in conditions where the next Contingency could result in Cascading or widespread instability. An entity's Operating Plan is expected to define when it is appropriate to shed Load pre-Contingency versus post-Contingency while ensuring the BES remains N-1 secure.

Steady State Voltage Limit Exceedance

SOL performance for steady state voltage limits is determined through Real-time Assessments. Normal and emergency voltage limits are expected to respect any voltage limitations specified in the Transmission

Owner or the Generation Owner's Facility Ratings Methodology per approved FAC-008-3. Normal voltage limits are typically applicable for the pre-Contingency state while emergency voltage limits are applicable for the post-Contingency state. SOL exceedance with respect to these voltage limits occurs when either actual bus voltage is outside acceptable pre-Contingency (normal) bus voltage limits, or when Real-time Assessments indicate that bus voltages are expected to fall outside acceptable emergency limits in response to a Contingency event. Real-time Assessments should recognize the impact of auto-reactive devices and whether or not those devices are sufficient for maintaining voltages within acceptable limits pre- or post-Contingency.

Stability Limit Exceedance

Transient and voltage Stability limits can be determined through prior studies, or they can be determined in Real-time.

Transient Stability limits are often expressed as flow limits on a defined interface or cut plane that, if operated within, ensures that the system will remain transiently stable should the identified Contingency(s) occur. Transient instability could take several forms, including undamped oscillations, or angular instability resulting in portions of the system losing synchronism.

Though voltage Stability limits can be determined, expressed, and monitored in several ways, the general principle is universal – voltage Stability limits are intended to ensure that the system does not experience voltage collapse in the pre- or post-Contingency state.

SOL exceedance for Stability limits occurs when the system enters into an operating state where the next Contingency could result in transient or voltage instability. Figure 2 depicts a wide-area voltage Stability based SOL that qualifies as an IROL. In this example, SOL (IROL) exceedance occurs when power transfers over the monitored Facility(s) exceeds the P_{IROL} value. Note - A localized voltage collapse may not qualify as an IROL.

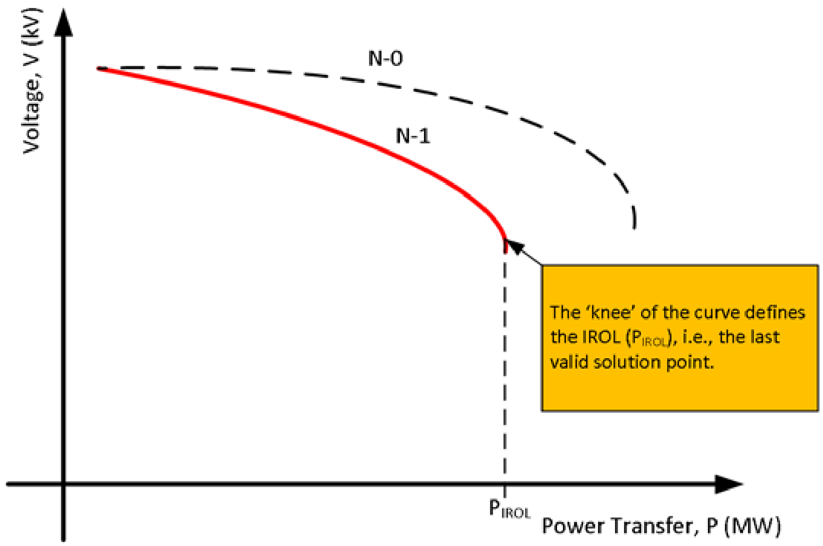

Figure 2. Voltage Stability System Operating Limit Performance Summary

SOL exceedance occurs when acceptable system performance as described in approved FAC-011-2 is not occurring in Real-time operations as determined by Real-time Assessments. In other words, unacceptable system performance as indicated by Real-time Assessments equates to SOL exceedance. An SOL is exceeded when any of the following occur or are observed as part of a Real-time Assessment:

- Actual flow on a Facility is above the Facility Rating for an unacceptable time duration
- Calculated Post-Contingency flow on a Facility is above the highest available Facility Rating
- Actual bus voltage is outside acceptable pre-Contingency (normal) bus voltage limits
- Post-Contingency bus voltage is outside acceptable post-Contingency (emergency) bus voltage limits
- Defined transient or voltage Stability limits are exceeded (techniques for determining and observing Stability limits can vary)

SOL Exceedance and Operating Plans:

When an SOL is being exceeded in Real-time operations, the Transmission Operator is required to implement mitigating strategies consistent with its Operating Plan(s). Operating Plans can include specific Operating Procedures or more general Operating Processes. Operating Plans include both pre- and post-Contingency mitigation plans/strategies. Pre-Contingency mitigation plans/strategies are actions that are implemented before the Contingency occurs to prevent the potential negative impacts on reliability of the

Contingency. Post-Contingency mitigation plans/strategies are actions that are implemented after the Contingency occurs to bring the system back within limits. Operating Plans contain details to include appropriate timelines to escalate the level of mitigating plans/strategies to ensure BES performance is maintained as per approved FAC-011-2, Requirement R2, preventing SOL exceedances from becoming an IROL. Operating Plan(s) must include the appropriate time element to return the system to within acceptable Normal and Emergency (short-term) Ratings and/or operating limits identified above. For example, in Figure 1, operating above the 950 MVA 15 minute limit would be an SOL exceedance for actual flows and may also be an exceedance for projected post-Contingency flows if a communicated post-Contingency load shed plan cannot be implemented in a timely fashion in order to prevent post-Contingency equipment damage and/or non-localized Cascading outages. However, operating between 900 MVA and 950 MVA is not an SOL exceedance unless the associated Operating Plan time parameter is exceeded as explained in Figure 1.

An example Operating Plan is shown in Table 1.

Thermal Limit Exceeded	Pre-Contingency Loading	Post-Contingency Loading
Normal (24 hr)	**Non-cost actions, off-cost actions, emergency procedures except load shed consistent with timelines identified in Operating Plan.**	**Trend – continue to monitor. Take non-cost actions to prevent Contingency from exceeding emergency limit consistent with timelines identified in Operating Plan.**
Emergency (4 hr)	**All of the above plus load shed to control violation below Emergency Rating consistent with timelines identified in Operating Plan.**	**Use all effective actions and emergency procedures except load shed consistent with timelines identified in Operating Plan.**
Emergency (15 min)	**All of the above plus load shed to control violation below Emergency Rating consistent with timelines identified in Operating Plan.**	**All of the above however, load shed only if necessary and appropriate to avoid post-Contingency Cascading consistent with timelines identified in Operating Plan.**

LOAD SHEDDING

Table 1. Operating Plan Example

APPLICABLE DEFINITIONS

Real-time Assessment – An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Operational Planning Analysis – An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Operating Plan – A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.

Operating Process – A document that identifies general steps for achieving a generic operating goal. An Operating Process includes steps with options that may be selected depending upon Real-time conditions. A guideline for controlling high voltage is an example of an Operating process.

Operating Procedure – A document that identifies specific steps or tasks that should be taken by one or more specific operating positions to achieve specific operating goal(s). The steps in an Operating Procedure should be followed in the order in which they are presented, and should be performed by the position(s) identified. A document that lists the specific steps for a System Operator to take in removing a specific transmission line from service is an example of an Operating Procedure.

Time Horizons

When establishing a time horizon for each requirement, the following criteria should be used:

- **Long-term Planning –** a planning horizon of one year or longer.

- **Operations Planning** – operating and resource plans from day-ahead up to and including seasonal.
- **Same-Day Operations** – routine actions required within the timeframe of a day, but not Real-time.
- **Real-time Operations** – actions required within one hour or less to preserve the reliability of the Bulk Electric System.

Facility Rating – The maximum or minimum voltage, current, frequency, or real or reactive power flow through a facility that does not violate the applicable equipment rating of any equipment comprising the facility.

Normal Rating – The rating as defined by the equipment owner that specifies the level of electrical loading, usually expressed in megawatts (MW) or other appropriate units that a system, facility, or element can support or withstand through the daily demand cycles without loss of equipment life.

Emergency Rating – The rating as defined by the equipment owner that specifics the level of electrical loading or output, usually expressed in megawatts (MW) or Mvar, or other appropriate units, that a system, facility, or element can support, procedure, or withstand for a finite period. The rating assumes acceptable loss of equipment life or other physical or safety limitations for the equipment involved.

System Operating Limit Definition and Exceedance Clarification

The NERC-defined term System Operating Limit (SOL) is used extensively in the NERC Reliability Standards; however, there is much confusion with – and many widely varied interpretations and applications of – the SOL term. This whitepaper describes the Standard Drafting Team's (SDT) intent with regard to the SOL concept and brings clarity and consistency to the notion of establishing SOLs, exceeding SOLs, and implementing Operating Plans to mitigate SOL exceedances.

System Operating Limit Definition Clarification:
As stated in the NERC Glossary of Terms Used in Reliability Standards, a SOL is defined as the value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. SOLs are based upon certain operating criteria. These include, but are not limited to:

- Facility Ratings (Applicable pre- and post- Contingency equipment or Facility ratings)
- Transient Stability Ratings (Applicable pre- and/or post-Contingency Stability Limits)
- Voltage Stability Ratings (Applicable pre- and/or post- Contingency Voltage Stability)
- System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits)

The concept of SOL determination is not complete without looking at the approved NERC FAC standards FAC-008-3, FAC-011-2, and FAC-014-2:

1. The purpose of approved FAC-008-3, which is applicable to both Generation and Transmission Owners, is to ensure that Facility Ratings used in the reliable planning and operation of the BES are determined based on technically sound principles. A Facility Rating is essential for the determination of SOLs. The standard requires both Generation Owners and Transmission Owners to have a documented Facility Rating that respects the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility. The scope of the Ratings addressed shall include, as a minimum, both Normal ~~(continuous)~~ and Emergency (short-term) Ratings (approved FAC-008-3, Requirement R3, part 3.4.2). ~~Typical Normal (continuous) Ratings are~~A 24 hour continuous rating is an example of a Normal rating; however, rating practices vary from entity to entity and may include ratings that vary with ambient temperature~~s~~. Typical Emergency (short-term) Ratings have a finite duration of less than 24 hours (e.g., 4 hours, 2 hours, 1 hour, 30 minutes, or 15 minutes).

2. The purpose of approved FAC-011-2, which is applicable to Reliability Coordinators, is to ensure that SOLs used in the reliable operation of the BES are determined based on an established methodology or methodologies. Approved FAC-011-2, Requirement R2 requires that the Reliability Coordinator's SOL Methodology include a requirement that SOLs provide a certain level of BES performance for the pre- and post-Contingency state. Specifically:

   Pre-Contingency: Acceptable system performance for the pre-Contingency state is characterized by the following:

   a. The BES shall demonstrate transient, dynamic, and voltage Stability.
   b. All Facilities shall be within their Normal ~~(continuous)~~ Facility Ratings and thermal limits.
   c. All Facilities shall be within their pre-Contingency voltage limits.
   d. All Facilities shall be within their Stability limits.

   Post-Contingency: Acceptable system performance for the post-Contingency state for single Contingencies is characterized by the following (approved Reliability Standard FAC-011-2, Requirement R2, part 2.2):

   a. The BES shall demonstrate transient, dynamic, and voltage Stability.
   b. All Facilities shall be within their applicable Emergency (short-term) Facility Ratings and thermal limits.
   c. All Facilities shall be within their post-Contingency voltage limits.
   d. All Facilities shall be within their Stability limits.
   e. Cascading or uncontrolled separation shall not occur.

3. Approved FAC-014-2, Requirement R2 requires that Transmission Operators establish SOLs for their portion of the Reliability Coordinator Area that are~~is~~ consistent with its Reliability Coordinator's SOL Methodology.

Some have interpreted the language in approved FAC-011-2, Requirement R2 to imply that the objective is to perform prior studies to determine a specific MW flow value (SOL) that ensures operation within the criteria specified in approved FAC-011-2, Requirement R2 sub-requirements, the assumption being that if the system is operated within this pre-determined SOL value, then all of the pre- and post-Contingency requirements described in approved FAC-011-2, Requirement R2 will be met. The SDT believes this

approach may~~does~~ not capture the complete intent of the SOL concept ~~believing the intent of~~within approved FAC-011-2, which is both:

1. Know the Facility Ratings, voltage limits, transient Stability limits, and voltage Stability limits, and
2. Ensure that they are all observed in both the pre- and post-Contingency state by performing a Real-time Assessment.

SOLs are based on ~~include Facility Ratings (~~Normal ~~(continuous)~~ and Emergency (short-term) Facility Ratings, voltage limits, transient Stability limits, and voltage Stability limits – any of which can be the most restrictive limit at any point in time pre- or post-Contingency. For example, if an area of the BES is at no risk of encroaching upon Stability or voltage limitations in the pre- or post-Contingency state, and the most restrictive limitations in that area are pre- or post-Contingency exceedance of Facility Ratings, then the thermal Facility Ratings in that area are the limiting SOLs. Conversely, if an area has plenty of headroom on thermal Facility Ratings and has no risk of instability but is prone to low voltages pre- or post-Contingency, then the voltage limits in that area are the limiting SOLs.

It is important to distinguish operating practices and strategies from the SOL itself. As stated earlier, the SOL is based on the actual set of Facility Ratings, voltage limits, or ~~s~~Stability limits that are to be monitored for the pre- and post-Contingency state. How an entity remains within these SOLs can vary depending on the practices and mechanisms employed~~ed~~ by that entity. For example, one ~~TOP~~Transmission Operator may utilize line outage distribution factors or other similar calculations as a mechanism to ensure SOLs are not exceeded, while another may utilize advanced network applications to achieve the same reliability objective.

In order to ensure an SOL is not exceeded, the following SOL performance must be maintained:

1. **Facility Ratings:**
   In the pre- and post-Contingency state, operate within Facility capability by utilizing Normal ~~(continuous)~~ and Emergency (short-term) Ratings, as applicable, within their associated time parameters.
2. **Voltage Limits:**
   In the pre-Contingency state, operate within normal voltage limits. In the post-Contingency state, operate within applicable emergency voltage limits.
3. **Transient Stability Limits:**

Transmission Operators ~~shall~~ establish SOLs to prevent unit/intra-area instability, inter-area instability, or tripping of Facilities due to out-of-step conditions. Transient Stability limits are typically defined as the maximum power transfer or load level that ensures critical transient reliability criteria are met~~for which a post-Contingency solution can be reached~~. Calculated flows must be maintained within appropriate pre- and/or post-Contingency limit.

4. **Voltage Stability Limits:**
   Transmission Operators typically~~shall~~ stress Transmission Paths/Interfaces or load areas to the reasonably expected maximum transfer conditions or area load levels to determine whether steady state voltage Stability limits exist. Voltage Stability limits are typically defined as the maximum power transfer or load level for which a post-Contingency solution can be reached. Calculated flows must be maintained within appropriate pre- and/or post-Contingency limits.

System Operating Limit Exceedance Clarification:

The combination of requirements contained within the approved FAC and proposed TOP standards, as well as the use of defined terms contained within those standards such as Operational Planning Analysis, Real-time Assessment, and Operating Plans when executed properly result in maintaining reliable BES performance. Specifically,

1. Approved FAC standards require clear determination of Facility Ratings and describe acceptable system performance criteria for the pre- and post-Contingency state.
2. Proposed TOP-001-3, Requirement R13 requires that a Transmission Operator perform a Real-time Assessment at least once every 30 minutes.
3. Proposed TOP-002-4, Requirement R2 requires that each Transmission Operator have an Operating Plan to address potential SOL exceedances identified as a result of its Operational Planning Analysis.
4. Proposed TOP-001-3, Requirement R14 requires the Transmission Operator to initiate Operating Plan(s) to mitigate SOL exceedances.

Facility Rating Exceedance

Facility Rating exceedance is a function of the available limit set and the magnitude of pre- or post-Contingency flows in relation to those limits as observed in Real-time monitoring or Real-time Assessments. Figure 1 illustrates an SOL Performance Summary for Facility Ratings.

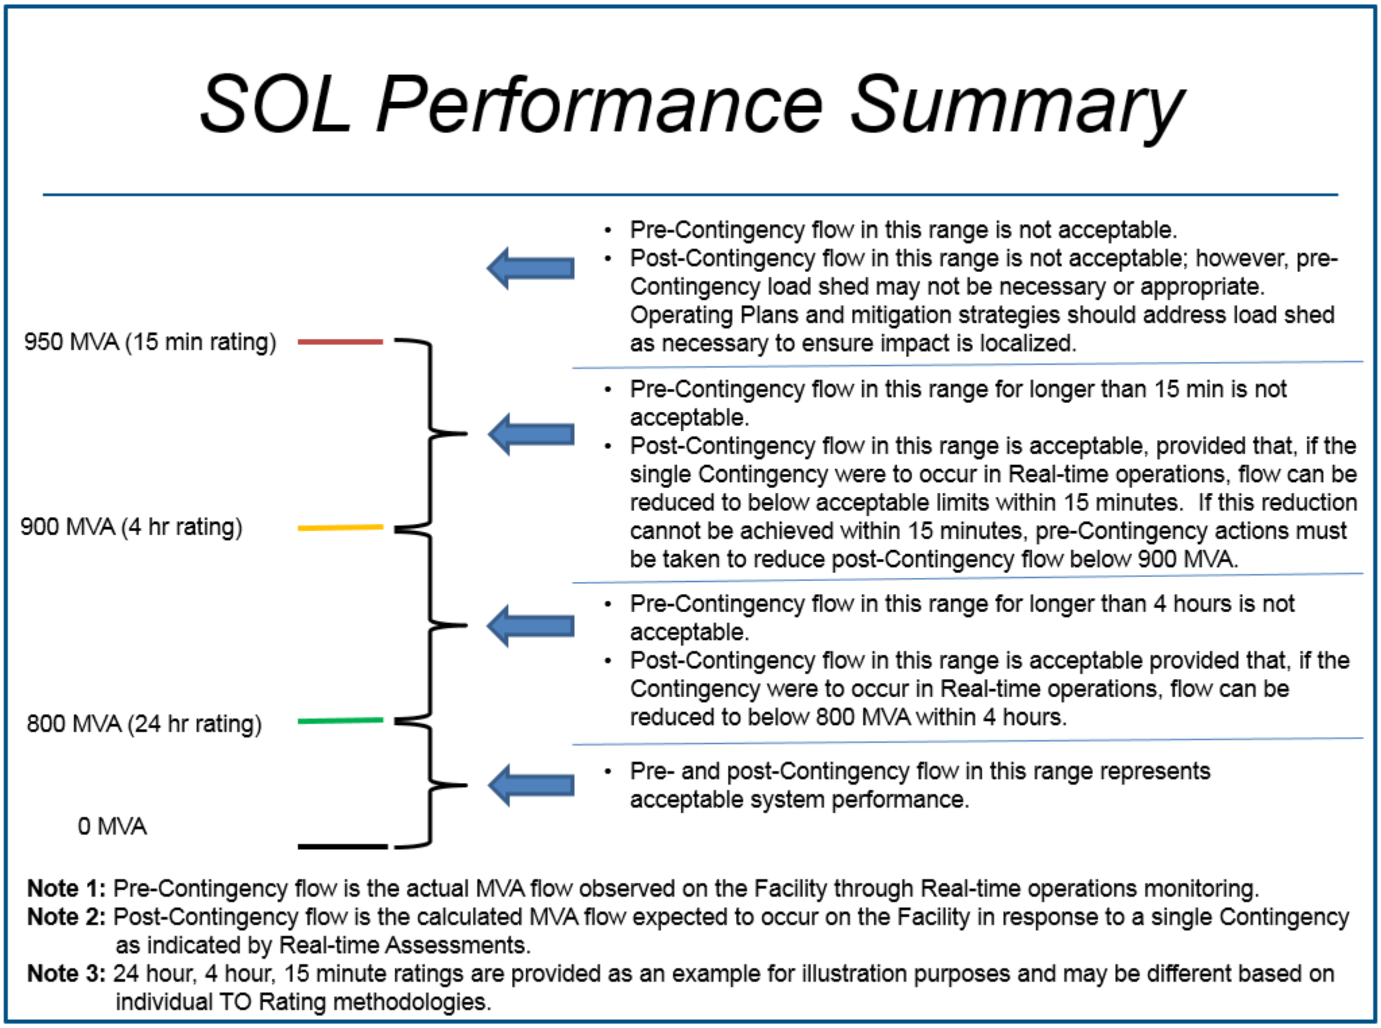

Figure 1. Facility Rating System Operating Limit Performance Summary

In cases where post-Contingency flow exceeds the highest available Facility Rating as shown in Figure 1, ~~TOPs~~Transmission Operators are expected to take pre-Contingency action to relieve the condition (including redispatch, reconfiguration, and making adjustments to the uses of the transmission system); however, the operating condition may not warrant shedding load pre-Contingency to relieve the condition. Pre-Contingency ~~l~~Load shed is generally utilized as a last resort in conditions where the next Contingency could result in Cascading or widespread instability. An entity's Operating Plan is expected to define when it is appropriate to shed ~~l~~Load pre-Contingency versus post-Contingency while ensuring the BES remains N-1 secure.

Steady State Voltage Limit Exceedance

SOL performance for steady state voltage limits is determined through Real-time Assessments. Normal and emergency voltage limits are expected to respect any voltage limitations specified in the Transmission

Owner or the Generation Owner's Facility Ratings Methodology per approved ~~NERC Standard~~ FAC-008-3~~Both normal and emergency voltage limits are established that respect the Transmission Owner or the Generation Owner's Facility Ratings Methodology per approved FAC-008-3~~. Normal voltage limits are typically applicable for the pre-Contingency state while emergency voltage limits are applicable for the post-Contingency state. SOL exceedance with respect to these voltage limits occurs when either actual bus voltage is outside acceptable pre-Contingency (normal) bus voltage limits, or when Real-time Assessments indicate that bus voltages are expected to fall outside acceptable emergency limits in response to a Contingency event. Real-time Assessments should recognize the impact of auto-reactive devices and whether or not those devices are sufficient for maintaining voltages within acceptable limits pre- or post-Contingency.

Stability Limit Exceedance

Transient and voltage Stability limits can be determined through prior studies, or they can be determined in Real-time.

Transient Stability limits are often expressed as flow limits on a defined interface or cut plane that, if operated within, ensures that the system will remain transiently stable should the identified Contingency(s) occur. Transient instability could take several forms, including undamped oscillations, or angular instability resulting in portions of the system losing synchronism.

Though voltage Stability limits can be determined, expressed, and monitored in several ways, the general principle is universal – voltage Stability limits are intended to ensure that the system does not experience voltage collapse in the pre- or post-Contingency state.

SOL exceedance for Stability limits occurs when the system enters into an operating state where the next Contingency could result in transient or voltage instability. Figure 2 depicts a wide-area voltage Stability based SOL that qualifies as an IROL. In this example, SOL (IROL) exceedance occurs when power transfers over the monitored Facility(s) exceeds the P_{IROL} value. Note - A localized voltage collapse may not qualify as an IROL.

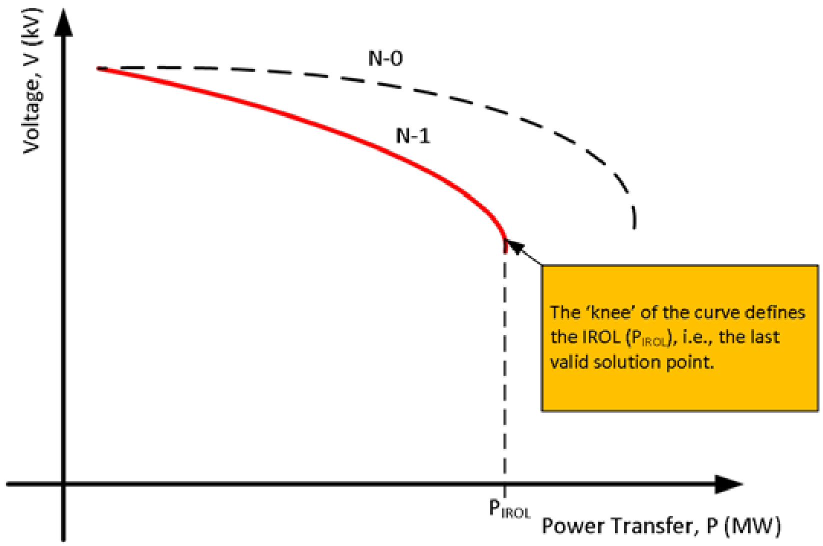

Figure 2. Voltage Stability System Operating Limit Performance Summary

SOL exceedance occurs when acceptable system performance as described in approved FAC-011-2 is not occurring in Real-time operations as determined by Real-time Assessments. In other words, unacceptable system performance as indicated by Real-time Assessments equates to SOL exceedance. An SOL is exceeded when any of the following occur or are observed as part of a Real-time Assessment:

- Actual flow on a Facility is above the Facility Rating for an unacceptable time duration
- Calculated Post-Contingency flow on a Facility is above the highest available Facility Rating
- Actual bus voltage is outside acceptable pre-Contingency (normal) bus voltage limits
- Post-Contingency bus voltage is outside acceptable post-Contingency (emergency) bus voltage limits
- Defined transient or voltage Stability limits are exceeded (techniques for determining and observing Stability limits can vary)

SOL Exceedance and Operating Plans:
When an SOL is being exceeded in Real-time operations, the Transmission Operator is required to implement mitigating strategies consistent with its Operating Plan(s). Operating Plans can include specific Operating Procedures or more general Operating Processes. Operating Plans include both pre- and post-Contingency mitigation plans/strategies. Pre-Contingency mitigation plans/strategies are actions that are implemented before the Contingency occurs to prevent the potential negative impacts on reliability of the

Contingency. Post-Contingency mitigation plans/strategies are actions that are implemented after the Contingency occurs to bring the system back within limits. Operating Plans contain details to include appropriate timelines to escalate the level of mitigating plans/strategies to ensure BES performance is maintained as per approved FAC-011-2, Requirement R2, preventing SOL exceedances from becoming an IROL. Operating Plan(s) must include the appropriate time element to return the system to within acceptable Normal ~~(continuous)~~ and Emergency (short-term) Ratings and/or operating limits identified above. For example, in Figure 1, operating above the 950 MVA 15 minute limit would be an SOL exceedance for actual flows and may also be an exceedance for projected post-Contingency flows if a communicated post-Contingency load shed plan cannot be implemented in a timely fashion in order to prevent post-Contingency equipment damage and/or non-localized Cascading outages. However, operating between 900 MVA and 950 MVA is not an SOL exceedance unless the associated Operating Plan time parameter is exceeded as explained in Figure 1.

An example Operating Plan is shown in Table 1.

Thermal Limit Exceeded	Pre-Contingency Loading	Post-Contingency Loading
Normal (24 hr)	Non-cost actions, off-cost actions, emergency procedures except load shed consistent with timelines identified in Operating Plan.	Trend – continue to monitor. Take non-cost actions to prevent Contingency from exceeding emergency limit consistent with timelines identified in Operating Plan.
Emergency (4 hr)	All of the above plus load shed to control violation below Emergency Rating consistent with timelines identified in Operating Plan.	Use all effective actions and emergency procedures except load shed consistent with timelines identified in Operating Plan.
~~Load Shed~~Emergency (15 min)	All of the above plus load shed to control violation below Emergency Rating consistent with timelines identified in Operating Plan.	All of the above however, load shed only if necessary and appropriate to avoid post-Contingency Cascading consistent with timelines identified in Operating Plan.

LOAD SHEDDING

Table 1. Operating Plan Example

APPLICABLE DEFINITIONS

Real-time Assessment – An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through ~~contracted~~ third-party services.)

Operational Planning Analysis – An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through ~~contracted~~ third-party services.)

Operating Plan – A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.

Operating Process – A document that identifies general steps for achieving a generic operating goal. An Operating Process includes steps with options that may be selected depending upon Real-time conditions. A guideline for controlling high voltage is an example of an Operating process.

Operating Procedure – A document that identifies specific steps or tasks that should be taken by one or more specific operating positions to achieve specific operating goal(s). The steps in an Operating Procedure should be followed in the order in which they are presented, and should be performed by the position(s) identified. A document that lists the specific steps for a S~~s~~ystem O~~o~~peratoring~~ing~~ to take in removing a specific transmission line from service is an example of an Operating Procedure.

Time Horizons

When establishing a time horizon for each requirement, the following criteria should be used:

- **Long-term Planning –** a planning horizon of one year or longer.
- **Operations Planning** – operating and resource plans from day-ahead up to and including seasonal.
- **Same-Day Operations** – routine actions required within the timeframe of a day, but not R~~r~~eal-time.
- **Real-time Operations** – actions required within one hour or less to preserve the reliability of the B~~b~~ulk E~~e~~lectric S~~s~~ystem.

Facility Rating – The maximum or minimum voltage, current, frequency, or real or reactive power flow through a facility that does not violate the applicable equipment rating of any equipment comprising the facility.

Normal Rating – The rating as defined by the equipment owner that specifies the level of electrical loading, usually expressed in megawatts (MW) or other appropriate units that a system, facility, or element can support or withstand through the daily demand cycles without loss of equipment life.

Emergency Rating – The rating as defined by the equipment owner that specifics the level of electrical loading or output, usually expressed in megawatts (MW) or Mvar, or other appropriate units, that a system, facility, or element can support, procedure, or withstand for a finite period. The rating assumes acceptable loss of equipment~~,~~ life or other physical or safety limitations for the equipment involved.

Plan and Operate within all System Operating Limits

Para 42: Without a requirement to analyze and operate within all SOLs in the proposed standards and by limiting non-IROL SOLs to only those identified by the transmission operator internal to its area, system reliability is reduced and negative consequences can occur outside of the transmission operator's internal area.

Para 43: … affects at least proposed Reliability Standard TOP-002-3, Requirements R1 and R2 as well as proposed Reliability Standard TOP-001-2, Requirements R8 through R11

SDT Consideration:

The Project 2014-03 SDT has changed the proposed requirements to include all SOLs. This resolves the first issue (analyze and operate within all SOLs) identified in paragraph 42. See proposed TOP-001-3, Requirements R14 and R15.

Proposed TOP-001-3, Requirement R14: Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.

Proposed TOP-001-3, Requirement R15: Each Transmission Operator shall inform its Reliability Coordinator of its actions to return the system to within limits when a SOL has been exceeded.

Approved FAC-011-2, Requirement R1 states that the Reliability Coordinator shall have a documented methodology for determining SOLs within its area. Approved FAC-011-2, Requirement R3, Part 3.1 states that the model used by the Reliability Coordinator must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study. Approved FAC-011-2, Requirement R4, Part 4.3 requires the Reliability Coordinator to issue its SOL methodology to Transmission Operators. Approved FAC-014-2, Requirement R2 requires each Transmission Operator to establish SOLs for its Transmission system that are consistent with the established Reliability Coordinator SOL methodology. In addition, proposed IRO-008-2, Requirements R1, R3, R6, R7, and R8 have been revised to include System Operating Limits. This resolves the second issue (only those identified… internal to its area) in paragraph 42.

Approved FAC-011-2, Requirement R1: The Reliability Coordinator shall have a documented methodology for use in developing SOLs (SOL Methodology) within its Reliability Coordinator Area.

Approved FAC-011-2, Requirement R3, Part 3.1: Study model (must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study.) Approved FAC-011-2, Requirement R4, Part 4.3: Each Transmission Operator that operates in the Reliability Coordinator Area.

Approved FAC-014-2, Requirement R2: The Transmission Operator shall establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology.

Proposed IRO-008-2, Requirement R1: Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area.

Proposed IRO-008-2, Requirement R2: Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1 considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.

Proposed IRO-008-2, Requirement R4: Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Reliability Coordinator Wide Area.

Proposed IRO-008-2, Requirement R5: Each Reliability Coordinator shall issue Operating Instructions, as necessary, to ensure that actions are taken to deal with the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6.

Proposed IRO-008-2, Requirement R6: Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been prevented or mitigated.

A remaining issue would be where SOLs overlap Transmission Operator Areas as pointed out in the Technical Conferences. If the SOL overlaps Transmission Operator Areas, then the Transmission Operator would coordinate with its Reliability Coordinator with its wide-area view to cover that SOL. This topic is already covered by the SOL methodology defined in approved FAC-011-2, Requirement R1, and the requirement to coordinate operations between Reliability Coordinators as shown in proposed IRO-014-3, Requirement R1. See also proposed IRO-002-4, Requirement R4.

Approved FAC-011-2, Requirement R1: The Reliability Coordinator shall have a documented methodology for use in developing SOLs (SOL Methodology) within its Reliability Coordinator Area.

Proposed IRO-014-3, Requirement R1: Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following:

Proposed IRO-002-4, Requirement R3: Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

Para 52: During deteriorating system conditions, an SOL can rapidly degrade into an IROL. … NERC has not explained adequately why the only "true reliability requirement is to operate within IROLs and that non-IROL SOLs are a local operating issue." Major cascading events including the Northeast Blackout of 2003 and the 2011 Southwest Outage were initiated by a non-IROL SOL exceedance, followed by a series of non-IROL SOL exceedances until the system cascaded.

<u>SDT consideration:</u>

The Project 2014-03 SDT has added all SOLs thus addressing this issue.

Para 53: We recognize that, if IROLs and non-IROL SOLs are determined accurately, the reliability consequences of an exceedance should usually be greater for the former than the latter. If NERC or commenters believe this probability warrants general exclusion of the latter from the TOP Reliability Standards (subject to an entity's specific inclusions), they should explain this view in more detail and present any information that may help us weigh its merit.

<u>SDT consideration:</u>

The Project 2014-03 SDT has added all SOLs thus addressing this issue.

Para 54: We believe that the transmission operator should have operational or mitigation plans for all Bulk-Power System IROLs and SOLs that can be implemented within 30 minutes or less to return the system to a secure state.

<u>SDT consideration:</u>

The original project teams (Projects 2006-06 and 2007-03) established the concept of operating within IROL T_v. T_v is always less than or equal to 30 minutes so the issue for IROLs is covered.

The Project 2014-03 SDT has agreed to the addition of all SOLs as explained above (see paragraph 43 response). Requirements for handling SOLs within a specified timeframe are covered under approved FAC-008-3, Requirement R6 where each Transmission Owner and Generator Owner shall have Facility Ratings for its solely and jointly owned Facilities that are consistent with the associated Facility Ratings methodology or documentation for determining its Facility Ratings. These Facility Ratings are part of the data required in the data specifications mandated in proposed TOP-003-3, Requirement R1. The Project 2014-03 SDT agrees the Transmission Operator shall have operational or mitigation plans for all SOLs that consider time-based rating methodology. See proposed TOP-001-3, Requirement R14. The SDT agrees that the Transmission Operator shall develop and coordinate these mitigation plans with its Reliability Coordinator – see proposed TOP-002-4, Requirement R6. Such plans shall also include steps that ensure BES performance consistent with approved FAC-011-2 Requirement R2, including provisions for pre-Contingency load shed to avoid voltage instability, uncontrolled Cascading, or separation.

> Approved FAC-008-3, Requirement R6: Each Transmission Owner and Generator Owner shall have Facility Ratings for its solely and jointly owned Facilities that are consistent with the associated Facility Ratings methodology or documentation for determining its Facility Ratings.
>
> Proposed TOP-003-3, Requirement R1: Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
>
> Proposed TOP-001-3, Requirement R14: Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
>
> Proposed TOP-002-4, Requirement R6: Each Transmission Operator shall provide its Operating Plan(s) for next-day operations identified in Requirement R2 to its Reliability Coordinator.
>
> Approved FAC-011-2, Requirement R2: The Reliability Coordinator's SOL Methodology shall include a requirement that SOLs provide BES performance

Para 55: Because proposed Reliability Standard TOP-001-2, Requirement R8 requires a transmission operator's notification of only those SOLs identified in a next-day Operational Planning Analysis, the Commission believes it is possible for additional SOLs to develop or occur in the same-day or real-time operational time horizon. This could impose an operational risk to the interconnected transmission network. For example, if real-time system load levels are unexpectedly higher than forecasted load conditions used in the Operational Planning Analysis, this condition could result in real-time SOLs not identified in the Operational Planning Analysis because facility ratings and stability limits are now exceeded under high load levels whereas under the forecasted load levels (lower load levels), facility ratings and stability limits were not expected to be exceeded. … we believe that the Requirement R8 operational responsibilities and actions should pertain to all IROLs and all SOLs for all operating time horizons.

SDT consideration:

The Project 2014-03 SDT views the time horizon item as an issue that involves analysis tools in a Real-time environment. The intent of the original SDTs was that any aspect of analysis tools would be covered in Project 2009-02. For various reasons, that project has been delayed. Therefore the Project 2014-03 SDT has adapted approved IRO-008-1, Requirement R2 to the SOL and Transmission Operator Area – see proposed TOP-001-3, Requirement R13. In addition, the SDT has added proposed TOP-001-3, Requirement R16 concerning operator control of monitoring and analysis capability outages.

> Proposed TOP-001-3, Requirement R13: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
>
> Proposed TOP-001-3, Requirement R16: Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunication, and Real-time Assessment capabilities.

As part of this process, the definition of Real-time Assessment has been revised to provide greater clarity as to the intent of the defined term.

> **Proposed: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

The Project 2014-03 SDT believes that approved EOP-008-1, Requirement R1, Part 1.6.2 assures that any solution to the analysis issue in the preceding paragraphs is adequately covered as to redundancy and back-up concerns.

> Approved EOP-008-1, Requirement R1, Part 1.6.2: Actions to manage the risk to the BES during the transition from primary to backup functionality as well as during outages of the primary or backup functionality.

In addition, due to concerns raised in the Technical Conferences, the Project 2014-03 SDT has provided guidance as to when an entity has exceeded a limit. This guidance is provided in a white paper that will be shown in the Associated Documents (Section F) of proposed TOP-001-3.

Para 56: Specifically, we propose to direct that NERC develop modifications to Reliability Standard TOP-002-3, Requirements R1 and R2 that address our concerns discussed above to ensure that transmission operators develop mitigation plans for all IROLs and SOLs expected to be exceeded. Similarly, for proposed Reliability Standard TOP-001-2, Requirement R8, we propose to direct that NERC develop modifications to require that transmission operator actions apply to all SOLs identified in all operational time horizons (operations planning, same-day operations and real-time operations). Further, for proposed Reliability Standard TOP-001-2, Requirements R9 through R11, we propose to direct that NERC develop modifications to require that transmission operator specified actions apply to all SOLs related responsibilities in the real-time operations time horizon.

SDT consideration:

See responses above to previous cited paragraphs on SOLs. .

System Models, Monitoring and Tools

Para 60: Monitoring and analysis capabilities are essential in establishing and maintaining situational awareness. While NERC indicates that these functions are assured through the certification process, we are not convinced that NERC's certification process is a suitable substitute for a mandatory Reliability Standard. … certification is a one-time process that may not adequately assure continual operational responsibility would occur if these requirements were in a Reliability Standard.

SDT consideration:

With respect to monitoring, the Project 2014-03 SDT has adapted approved IRO-003-2, Requirement R1 for the Transmission Operator and Balancing Authority Areas. See proposed TOP-001-3, Requirements R10 & R11.

> Proposed TOP-001-3, Requirement R10: Each Transmission Operator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Transmission Operator, within its Transmission Operator Area and neighboring Transmission Operator Areas to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area.
>
> Proposed TOP-001-3, Requirement R11: Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, to ensure that it is able to perform its reliability functions.

With respect to analysis, the Project 2014-03 SDT has adapted approved IRO-008-1, Requirement R2 for the Transmission Operator. See proposed TOP-001-3, Requirement R13.

Proposed TOP-001-3, Requirement R13: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

Para 61: The retirement of the current IRO and TOP requirements that address monitoring and analysis capabilities should not occur until the completion and implementation of Project 2009-02. Thus, in its NOPR comments NERC should propose a schedule that it will follow to ensure it completes and implements Project 2009-02 prior to any retirement of the standard such that there would be no gap.

SDT consideration:

See previous response.

Compliance with Reliability Directives

Para 64: The currently-effective TOP Reliability Standards use “reliability directive,” which, as an undefined term, does not appear to be limited to a specific set of circumstances. … In contrast, application of the proposed definition of “Reliability Directive” appears to require compliance with transmission operator directives only in emergencies, not normal or pre-emergency times. … We believe that directives from a reliability coordinator or transmission operator should be mandatory at all times, and not just during emergencies (unless contrary to safety, equipment, regulatory or statutory requirements).

SDT consideration:

The Project 2014-03 SDT is replacing the term ‘reliability directive’ with the defined term ‘Operating Instruction’ throughout the proposed standards. The proposal to use a new defined term ‘Reliability Directive’ is no longer being considered.

Para 65: NERC’s TOP and IRO petitions do not explain the proposed, defined term “Reliability Directive,” or why compliance with a transmission operator’s directives should be required only during emergencies (if this is the intent). Accordingly, we seek from NERC and other interested entities clarification and technical explanation regarding the scope and intent of the defined term, as well as the anticipated reliability benefits and/or drawbacks of the proposed term.

SDT consideration:

See previous response for paragraph 64.

Para 66: … NERC has not explained or justified its request for approval of the revised definition.

SDT consideration:

See previous response for paragraph 64.

Consideration of External Networks and sub-100 kV Facilities and Contingencies in Operational Planning Analysis

Para 67: In proposed Reliability Standard TOP-002-3, Requirement R1, NERC proposes to require transmission operators to prepare an Operational Planning Analysis, i.e., next day study, which represents "projected System conditions" to determine if their planned operations will exceed facility ratings and stability limits for normal and contingency conditions. NERC does not indicate whether this includes external networks or sub-100 kV facilities.

SDT consideration:

The Project 2014-03 SDT believes that standards must be viewed in aggregate to provide the complete picture of what is covered. The proposed TOP-003-3 requires applicable entities to develop a data specification that covers its needs for monitoring and analysis purposes. There is no restriction on what voltage level or area that data can be pulled from. Proposed TOP-003-3, Requirement R5 shows a Transmission Operator being required to supply requested data to another Transmission Operator which clearly shows that a Transmission Operator can request and receive data from outside of its immediate area. The original SDTs have been clear in response to questions on this matter that they did not intend to place any restrictions on the type and location of data involved as long as the request was reliability based. However, to clear up any possible misconceptions, the Project 2014-03 SDT has amended proposed TOP-003-3, Requirement R1, Part 1.1 to explicitly specify that sub-100 kV data and external data should be part of the data specification for Transmission Operators. Similar requirements exist in proposed IRO-010-2 for the Reliability Coordinator.

> Proposed TOP-003-3, Requirement R1, Part 1.1: A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data as deemed necessary by the Transmission Operator.
>
> Proposed IRO-010-2, Requirement R1, Part 1.1: A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data, as deemed necessary by the Reliability Coordinator.

Concerns were raised during the Technical Conferences that proposed TOP-003-2 did not require that an entity actually use the data acquired in its monitoring and analysis functions. The Project 2014-03 SDT discussed this concern and concluded that an explicit requirement to use the data was an unnecessary administrative concern.

Approved FAC-011-2, Requirement R1 states that the Reliability Coordinator shall have a documented methodology for determining SOLs within its area. Approved FAC-011-2, Requirement R3, Part 3.1 states that the model used by the Reliability Coordinator must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study. Approved FAC-011-2, Requirement R4, Part 4.3 then requires the Reliability Coordinator to issue its SOL methodology to Transmission Operators. These requirements will dictate what external data a Transmission Operator needs to acquire.

> Approved FAC-011-2, Requirement R1: The Reliability Coordinator shall have a documented methodology for use in developing SOLs (SOL Methodology) within its Reliability Coordinator Area.
>
> Approved FAC-011-2, Requirement R3, Part 3.1: Study model (must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study.)
>
> Approved FAC-011-2, Requirement R4, Part 4.3: Each Transmission Operator that operates in the Reliability Coordinator Area.

Para 68: In Order No. 693, the Commission directed a modification to planned outage coordination to require consideration of facilities below 100 kV that, in the opinion of the registered entity (such as a transmission operator) "will have a direct impact on the reliability of the Bulk-Power System…. The 2011 Southwest Outage Blackout Report includes similar recommendations that transmission operators should ensure their next-day studies include updated external networks and internal and external facilities (including those below 100 kV) that can impact Bulk-Power System reliability.

SDT consideration:

See previous response for data (paragraph 67).

In addition, the Project 2014-03 SDT has developed a new standard, IRO-017-1 Outage Coordination, to address all aspects of outage coordination between the Reliability Coordinator, Transmission Operator, Balancing Authority, Planning Coordinator, and Transmission Planner.

Para 69: The Commission seeks clarification and technical explanation from NERC whether the term "projected System conditions" in proposed Reliability Standard TOP-002-3 Requirement R1 includes updated external networks to reflect operating conditions external to their systems and sub-100 kV facilities (internal and external) in their operational planning analyses. If not, the Commission seeks comment on the associated reliability risks and, whether it is appropriate to include updated external networks to reflect operating conditions and external and sub-100 kV facilities (internal and external) in the operational planning analyses.

SDT consideration:

See previous responses under this heading.

Operating to Respect the Most Severe Single Contingency in Real-time Operations and Unknown Operating States

Para 70: NERC proposes to delete Reliability Standard TOP-004-2, Requirement R2, which provides that each transmission operator "shall operate so that instability, uncontrolled separation, or cascading outages will not occur as a result of the most severe single contingency." NERC's Petition does not provide an explanation for the deletion. However, the NERC "mapping document," which is included as an exhibit to the TOP Petition indicates that NERC intends that Requirement R2 be replaced by proposed Reliability Standards TOP-001-2, Requirements R7 and R9.

SDT consideration:

The Project 2014-03 SDT believes that the concept of stating an explicit requirement to operate to the most severe single Contingency is not necessary as the FAC standards require an entity to analyze and operate for all Contingencies and not just the most severe single Contingency. The definitions of Operational Planning Analysis and Real-time Assessment have been strengthened to clarify this point.

Proposed: Real-time Assessment - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Proposed: Operational Planning Analysis - An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Para 73: NERC has proposed to retire three key rules here, i.e., the requirements to be ready for the single largest contingency …

SDT consideration:

See previous response.

… to move quickly from an "unknown operating state" to within proven limits …

SDT consideration:

See previous responses for this heading.

… and to determine the cause of SOL violations in all time-frames, including real-time. We believe these three rules represent the bedrock core of real-time operating rules and practices, and it is therefore incumbent upon NERC to provide a more thorough and comprehensive explanation of how the proposed replacement standards compare in meeting the same objectives as the current standards.

SDT consideration:

The Project 2014-03 SDT agrees that a Transmission Operator needs to take appropriate action to mitigate the exceedance but does not agree to the inclusion of determining the 'cause' of the violation in Real-time. Real-time is not when to investigate or to do detailed analysis – but instead is the time to 'fix' the problem. Causes can be determined later and off-line. The Project 2014-03 SDT, as previously stated, has agreed to include the concept of Real-time Assessment for Transmission Operators. This assessment is believed to be sufficient in identifying 'cause' for operators in Real-time. See proposed TOP-001-3, Requirement R13 and the revised definition of Real-time Assessment.

Proposed TOP-001-3, Requirement R13: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

Proposed: Real-time Assessment - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Para 74: In particular, NERC should address whether its proposal would allow a different approach to real-time operational assessments and operation to the most severe single contingencies and, if so, NERC should explain and technically support the nature and associated reliability effects of any different approaches.

SDT consideration:

The Project 2014-03 SDT does not feel that it is advocating a different approach as shown in the previous responses above.

> How are the proposed requirements to not exceed IROLs or certain SOLs for more than the specified times are the functional or implicit equivalent of the current rules?
>
> > SDT consideration:
> >
> > The Project 2014-03 SDT has added all SOLs thus addressing this issue.
>
> For example, do the proposed rules allow reliance on post-contingency mitigation at times when the current rules would require pre-contingency mitigation?
>
> > SDT consideration:
> >
> > The Project 2014-03 SDT sees this item as having been addressed due to the commitments made above such as adding all SOLs to the standards and performing Real-time Assessments.
> >
> > In addition, approved FAC-011-2, Requirement R2 compels the Reliability Coordinator to develop an SOL methodology that considers voltage, thermal, and Stability limits (including voltage) while demonstrating that the BES remains stable (transient, dynamic, and voltage) during pre-contingent (Requirement R2, Part 2.1) and post-contingent (Requirement R2, Part 2.2) conditions. Approved FAC-014-2, Requirement R2 requires each Transmission Operator to establish SOLs for its Transmission system that are consistent with the established Reliability Coordinator SOL methodology. Approved FAC-014-2, Requirement R5, Part 2 compels the Transmission Operator to communicate its SOLs to its Reliability Coordinator and Transmission Service Provider and approved FAC-014-2, Requirement R5, Part 1 compels the Reliability Coordinator to communicate the SOLs to neighboring Reliability Coordinators and other Transmission Operators among a list of other entities.
> >
> > > Approved FAC-011-2, Requirement R2, and Parts 2.1 and 2.2: The Reliability Coordinator's SOL Methodology shall include a

requirement that SOLs provide BES performance consistent with the following:
2.1 In the pre-contingency state, the BES shall demonstrate transient, dynamic and voltage stability; all Facilities shall be within their Facility Ratings and within their thermal, voltage and stability limits. In the determination of SOLs, the BES condition used shall reflect current or expected system conditions and shall reflect changes to system topology such as Facility outages.
2.2 Following the single Contingencies identified in Requirement 2.2.1 through Requirement 2.2.3, the system shall demonstrate transient, dynamic and voltage stability; all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur.

Approved FAC-014-2, Requirement R2: The Transmission Operator shall establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology.

Approved FAC-014-2, Requirement R5, Part 1: The Reliability Coordinator shall provide its SOLs (including the subset of SOLs that are IROLs) to adjacent Reliability Coordinators and Reliability Coordinators who indicate a reliability-related need for those limits, and to the Transmission Operators, Transmission Planners, Transmission Service Providers and Planning Authorities within its Reliability Coordinator Area.

If so, is the difference significant for reliability purposes?

SDT consideration:

See previous response.

Do both the current and proposed rules prohibit an entity from operating for more than 30 minutes in a state where loss of a particular line would cause the loss of enough resources or load to risk cascading outages or instability?

SDT consideration:

Yes, industry operates to T_v for all IROLs which is 30 minutes or less. By definition, only IROLs can cause Cascading or instability.

Or, if the entity is not yet operating beyond the pre-determined ratings of the particular line, would the proposed rules allow doing so while the current rules do not?

SDT consideration:

The Project 2014-03 SDT does not see that any changes are being suggested that would change the way these situations are handled today.

Should all transmission operators be required to run a real-time contingency analysis (RTCA) frequently, since the lack of such analysis can impair situational awareness substantially?

SDT consideration:

The SDT proposes to use approved IRO-008-1, Requirement R2 as the model for development for such capabilities for Transmission Operators as described above. See proposed TOP-001-3, Requirement R13 and the revised definition of Real-time Assessment.

Proposed TOP-001-3, Requirement R13: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

Proposed: Real-time Assessment - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Or is the value of such information outweighed for smaller entities with such limited facilities and operations that they generally can maintain similar reliability based on operator experience and judgment without any extra staffing and procedures needed to ensure that the RTCA's informational inputs and modeling are valid and useful?

SDT consideration:

Proposed TOP-001-3, Requirement R13 states that a Transmission Operator must perform a Real-time Assessment every 30 minutes. This is 'what' must be accomplished but doesn't explain 'how' it can be done. That is left to the applicable entity. Smaller entities are free to devise equal and effective methods to accomplish this task. The ERO Rules of Procedure also allow them to contract out services for performing such assessments as long as they retain the responsibility for the final result. To clarify this concept, the Project 2014-03 SDT has added language to the definition of Real-time Assessment on the topic of contracted services.

> Proposed TOP-001-3, Requirement R13: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
>
> **Proposed: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Para 75: With regard to mitigation of unknown operating states, while NERC asserts that "unknown states" cannot exist, a transmission provider could have valid operating limits for all facilities but lack situational awareness when valid limits are exceeded. … the Commission seeks comment and technical explanation from NERC and other interested entities on the proposed retirement.

SDT consideration:

The Project 2014-03 SDT believes that standards must be viewed in aggregate to provide the complete picture of what is covered. Approved EOP-008-1, Requirement R1, Part 1.6.2 covers this situation.

Approved EOP-008-1, Requirement R1, Part 1.6.2: Actions to manage the risk to the BES during the transition from primary to backup functionality as well as during outages of the primary or backup functionality.

System Protection Coordination

Para 78: The Commission seeks comment and technical explanation from NERC and other interested entities on how current Reliability Standard PRC-001-1 Requirement R2's requirement for corrective action (i.e., return a system to a stable state) is addressed in its proposal. Further, the Commission proposes that NERC issue guidance on data needed for protection system coordination that addresses the applicable Order No. 693 directives and the proposed retirement of the Reliability Standard PRC-001-1 requirements.

SDT consideration:

Project 2014-03 SDT is no longer revising PRC-001-1. Project 2007-06 is responsible for PRC-001-1 revisions.

Notification of Emergencies

Para 80: NERC's proposed revisions warrant clarification. Read one way, proposed Requirement R3 is less comprehensive than the currently-effective requirements pertaining to notification of emergencies. Yet, it also contains provisions that, read another way, could require TOPs to notify others of all emergencies, not just day-ahead.

Para 81: Similarly, it is not clear whether proposed Reliability Standard TOP-001-2, Requirement R5 would address same-day and real-time operating emergencies not covered by TOP-001-2, Requirement R3. An Adverse Reliability Impact is an event that results in instability, or cascade conditions, while an Emergency includes conditions that could be a precursor to an Adverse Reliability Impact. Thus, the notification provisions of Requirement R5 do not cure the possible ambiguity in proposed Requirement R3.

Para 82: While NERC states that the obligation to notify for real-time emergency conditions was replaced by proposed Requirement R3, NERC does not indicate in its petition that the real-time or same-day obligation was purposely deleted or offer an explanation for the deletion. … We believe that, consistent with the currently-effective TOP Reliability Standards, the notification requirement of proposed Reliability Standard TOP-001-2 should apply to all emergencies, including real-time and same day emergencies. The Commission seeks comment from NERC and other interested entities regarding (1) the proper understanding of the scope of the notification provisions in the proposed requirements and (2) if the notification does not include all operational time horizons, technical justification for why transmission operators should not be required to notify reliability coordinators and other affected transmission operators of all emergencies in all operating time horizons.

SDT consideration:

The Project 2014-03 SDT has combined the previously proposed TOP-001-2, Requirements R3 & R5 into one requirement in proposed TOP-001-3, Requirement R5 that uses only actual and projected Emergency covering all time horizons.

> Proposed TOP-001-3, Requirement R8: Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known other impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency.

Para 83: … NERC uses two different definitions of Adverse Reliability Impact in the TOP and IRO Petitions. … In addition, if the definition NERC is proposing no longer includes the phrase "uncontrolled separation" NERC should explain the removal of the statutory phrase "uncontrolled separation."

SDT consideration:

See previous response.

Primary Decision-Making Authority for Mitigation of IROLs/SOLs

Para 84: NERC's proposal contains a potential overlap in authority between the transmission operator and reliability coordinator with regard to the provisions pertaining to mitigation of IROLs and SOLs as set forth in the proposed TOP and IRO Standards.

Para 87: NERC's proposal with respect to mitigating IROLs appears to give both the transmission operator and reliability coordinator authority to act. Therefore, we seek clarification and technical explanation whether the reliability coordinator or the transmission operator has primary responsibility for IROLs.

SDT consideration:

The Reliability Coordinator has the responsibility for IROLs and the Transmission Operator has the responsibility for SOLs. This split in responsibilities is an important concept for the preservation of reliability within the BES and needs to be clear in the various standards and requirements. However, as discussed above, the Reliability Coordinator shall provide oversight on SOLs and assistance in mitigating SOLs as necessary.

See previous response to paragraph 43 on SOL overlap issues.

Planned Outage Coordination

Paragraph 90: The Commission is concerned with NERC's proposal because Reliability Standards IRO-008-1, Requirement R3 and IRO-010-1a do not require coordination of outages. Outage coordination is a critical reliability function that should be performed by the reliability coordinator. Outage coordination is an integral part of the operational planning process with generation outages being scheduled from three to five years in advance and transmission maintenance and construction outages being scheduled one to three years in advance. Outages that have been planned well in advance still must go through a month-ahead, week-ahead, and sometimes even a day-ahead approval process depending on system topography and system conditions that may change as the scheduled maintenance outage approaches. For instance, forced outages often disrupt planned outage schedules. Therefore, the Commission believes it is essential that, as the functional entity with the wide-area view, the reliability coordinator coordinates this critical area of operational planning.

<u>SDT consideration</u>:

The SDT has developed a new standard, IRO-017-1 Outage Coordination, to address the overall topic of outage coordination. In addition, the SDT has revised proposed IRO-014-2, Requirement R1, Part 1.4 to show that outage information must be made available and analyzed. Also, the Planning Coordinator and Transmission Planner have been added to proposed IRO-010-2 as applicable entities to ensure the sharing of planning information with the Reliability Coordinator.

Proposed IRO-014-2, Requirement R1, Part 1.4: Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and Real-time Assessments.

Proposed IRO-017-1, Requirement R1: Each Reliability Coordinator shall develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area. The outage coordination process shall:
Identify applicable roles and reporting responsibilities.
1.1.1 Development and communication of outage schedules.
1.1.2 Assignment of coordination responsibilities for outage schedules between Transmission Operator(s) and Balancing Authority(s).
1.2 Specify outage submission timing requirements.
1.3 Define the process to evaluate the impact of Transmission and generator outages within its Wide Area.
1.4 Define the process to coordinate the resolution of identified outage conflicts with its Transmission Operators and Balancing Authorities, and other Reliability Coordinators.

Proposed IRO-017-1, Requirement R2: Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator outage coordination process.

Proposed IRO-017-1, Requirement R3: Each Planning Coordinator and Transmission Planner shall provide its Planning Assessment to impacted Reliability Coordinators.

Proposed IRO-017-1, Requirement R4: Each Planning Coordinator and Transmission Planner shall jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts with planned outages in its Planning Assessment for the Near-term Transmission Planning Horizon.

Secure Network

Paragraphs 92 & 93: Currently-effective Reliability Standard IRO-002-2, Requirement R2, requires that the data exchange between the reliability coordinator, transmission operator, and balancing authority be accomplished "via a secure network." According to NERC, the requirement to provide information via a "secure network" is now addressed in NERC Rules of Procedure, Section 1002 (Reliability Support Services). NERC also indicates that Requirement R2 is now addressed in proposed Reliability Standard IRO-014-2, Requirements R1, R2, and R3. Although NERC cites Section 1002 of the Rules of Procedure and proposed Reliability Standard IRO-014-2 as providing for the use of a secured data network, NERC does not explain how secured networks are covered in those sections. While Section 1002 of the NERC Rules and Reliability Standard IRO-014-2, Requirements R1, R2, and R3 address notification and exchange of information and data and coordination of actions, no language in these provisions appears to require the data exchange or notifications to be conducted in a secure mode.

SDT consideration:

The Project 2014-03 SDT understands the sensitivity around the concept of secure networks for transfer of data and has made appropriate changes to proposed TOP-003-3, Requirement R5, Part 5.3 and proposed IRO-010-2, Requirement R3, Part 3.3, to allow for the concept of security to be part of the mutually agreed upon data specification.

Proposed TOP-003-3, Requirement R5, Part 5.3: Mutually agreeable security protocol(s).

Proposed IRO-010-2, Requirement R3, Part 3.3: Mutually agreeable security protocol(s).

Reliability Coordinator Monitoring of SOLs

Paragraph 96: Although NERC's petition focuses on the appropriate entity to identify SOLs, it does not adequately explain the proposed retirement of the currently-effective Reliability Standard IRO-002-2 that establishes the obligation for reliability coordinators to monitor SOLs. With regard to NERC's explanation that Reliability Standard IRO-002-2 Requirement R4 is redundant with the requirements contained in IRO-010-1a and EOP-008-1, neither of these Reliability Standards requires the reliability coordinator to monitor SOLs.

SDT consideration:

The Project 2014-03 SDT believes that monitoring SOLs is intrinsic to the duties of a Reliability Coordinator as spelled out in Functional Model v5. However, to provide clarity, the Project 2014-03 SDT has provided explicit requirement language to address the need for monitoring SOLs at the Reliability Coordinator level. See proposed IRO-002-4, Requirement R4. As pointed out starting in paragraph 84 of the NOPR, only one entity can be responsible for SOLs and that is the Transmission Operator.

Approved FAC-011-2, Requirement R1 states that the Reliability Coordinator shall have a documented methodology for determining SOLs within its area. Approved FAC-011-2, Requirement R3, Part 3.1 states that the model used by the Reliability Coordinator must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study. These requirements will dictate what external data a Reliability Coordinator needs to acquire to effectively monitor SOLs.

Proposed IRO-010-2, Requirement R1, Parts 1.1 – 1.2 show additions to the data specification concept to clarify that external data, sub-100 kV data, and applicable relay data are included.

Proposed IRO-002-4, Requirement R3: Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

Approved FAC-011-2, Requirement R1: The Reliability Coordinator shall have a documented methodology for use in developing SOLs (SOL Methodology) within its Reliability Coordinator Area.

Approved FAC-011-2, Requirement R3, Part 3.1: Study model (must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study.)

Proposed IRO-010-2, Requirement R1, Part 1.1: A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data, as deemed necessary by the Reliability Coordinator.

Proposed IRO-010-2, Requirement R1, Part 1.2: Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.

Mapping of Revised TOP and IRO Reliability Standards to Address 2011 Southwest Outage Report Recommendations

The following table provides a mapping of the recommendations applicable to the Reliability Coordinator, Transmission Operator, and/or Balancing Authority contained in the 2011 Southwest Outage Report. Several of the recommendations are specific to the particular facts and circumstances of the 2011 Southwest Outage and are therefore not addressed here.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
1	All TOPs should conduct next-day studies and share the results with neighboring TOPs and the RC (before the next day) to ensure that all contingencies that could impact the BPS are studied.	Next-day studies are required by proposed TOP-002-4, Requirement R1. Sharing the results of those studies is required in proposed TOP-002-4, Requirement R3. Providing results to the Reliability Coordinator is required in proposed TOP-002-4, Requirement R6. **Proposed TOP-002-4, Requirement R1**: Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed TOP-002-4, Requirement R3:** Each Transmission Operator shall notify impacted NERC registered entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in those plan(s). **Proposed TOP-002-4, Requirement R6**: Each Transmission Operator shall provide its Operating Plan(s) for next-day operations identified in Requirement R2 to its Reliability Coordinator.
2	TOPs and BAs should ensure that their next-day studies are updated to reflect next-day operating conditions external to their systems, such as generation and	This is addressed in proposed TOP-002-4, through the revised definition of Operational Planning Analysis, and by the data specification standard

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
	transmission outages and scheduled interchanges, which can significantly impact the operation of their systems.	which dictates that external system data must be part of the data specification. **Proposed TOP-002-4, Requirement R1**: Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed TOP-003-3, Requirement R1, part 1.1:** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **1.1** A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data as deemed necessary by the Transmission Operator.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
	TOPs and BAs should take the necessary steps, such as executing nondisclosure agreements, to allow the free exchange of next-day operations data between operating entities.	This item is addressed through proposed TOP-003-3. **Proposed TOP-003-3, Requirement R1:** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **Proposed TOP-003-3, Requirement R2:** Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. The data specification shall include, but not be limited to: **Proposed TOP-003-3, Requirement R5**: Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications using:
	Also, RCs should review the procedures in the region for coordinating next-day studies, ensure adequate data exchange among BAs and TOPs, and facilitate the next-day studies of BAs and TOPs.	Proposed IRO-008-2, Requirement R2 requires the Reliability Coordinator to have a coordinated Operating Plan(s) which will have required the Reliability Coordinator to have reviewed the plans submitted by its Transmission Operators and Balancing Authorities. **Proposed IRO-008-2, Requirement R2:** Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1 considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
3	TOPs and RCs should ensure that their next-day studies include all internal and external facilities (including those below 100 kV) that can impact BPS reliability.	This is addressed in the data specification standards. **Proposed TOP-003-3, Requirement R1, part 1.1:** A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data as deemed necessary by the Transmission Operator. **Proposed IRO-010-2, Requirement R1, Part 1.1:** A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data, as deemed necessary by the Reliability Coordinator
4	WECC RC should improve its process for predicting interchanges in the day-ahead timeframe.	Interchange is now part of the list of things that a Reliability Coordinator must consider in the revised definition of Operational Planning Analysis. **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
5	WECC RE should ensure better integration and coordination of the various subregions' seasonal studies for the entire WECC system. To ensure a thorough seasonal planning process, at a minimum, WECC RE should require a full contingency analysis of	This recommendation is not applicable to the Reliability Coordinator, Transmission Operator, and/or Balancing Authority and is therefore not addressed here.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
	the entire WECC system, using one integrated seasonal study, and should identify and eliminate gaps between subregional studies. Individual TOPs should also conduct a full contingency analysis to identify contingencies outside their own systems that can impact the reliability of the BPS within their system and should share their seasonal studies with TOPs shown to affect or be affected by their contingencies.	The proposed TOP-003-3 states that Transmission Operators must gather external network data and proposed TOP-002-4 mandates sharing the results of studies. **Proposed TOP-003-3, Requirements R1, Part 1.1**: A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data as deemed necessary by the Transmission Operator. **Proposed TOP-002-4, Requirement R3**: Each Transmission Operator shall notify impacted entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in those plan(s). While there is no explicit requirement for seasonal studies, the Reliability Coordinator has the authority to request such a study if it believes it is needed for reliability.
6	TOPs should expand the focus of their seasonal planning to include external facilities and internal and external sub-100 kV facilities that impact BPS reliability.	The proposed TOP-003-3 explicitly states that Transmission Operators must obtain external network and sub-100 kV data. **Proposed TOP-003-3, Requirements R1, Part 1.1** A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data as deemed necessary by the Transmission Operator.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
		While there is no explicit requirement for seasonal studies, the Reliability Coordinator has the authority to request such a study if it believes it is needed for reliability.
7	TOPs should expand the cases on which they run their individual planning studies to include multiple base cases, as well as generation maintenance outages and dispatch scenarios during high load shoulder periods.	The revised definition of Operational Planning Analysis states that "projected system conditions" must be considered which would include generator outages and high load periods. **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
8	TOPs should include in the information they share during the seasonal planning process the overload relay trip settings on transformers and transmission lines that impact the BPS, and separately identify those that have overload trip settings below 150% of their normal rating, or below 115% of the highest emergency rating, whichever of these two values is greater.	The proposed TOP-003-3 states that Protection System data must be obtained. And the revised definition of Operational Planning Analysis states explicitly that Protection Systems must be included in studies. Sharing of results is addressed in proposed TOP-002-4. **Proposed TOP-003-3, Requirements R1, Part 1.2**: Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
		System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed TOP-002-4, Requirement R3**: Each Transmission Operator shall notify impacted entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in those plan(s). While there is no explicit requirement for seasonal studies, the Reliability Coordinator has the authority to request such a study if it believes it is needed for reliability.
9	WECC RE should take actions to mitigate these and any other identified gaps in the procedures for conducting near- and long-term planning studies. The September 8th event and other major events should be used to identify shortcomings when developing valid cases over the planning horizon and to identify flaws in the existing planning structure. WECC RE should then propose changes to improve the performance of planning studies on a subregional- and Interconnection-wide basis and ensure a coordinated review of TPs' and PCs' studies. TOPs, TPs, and PCs should develop study cases that cover critical system conditions over the planning horizon; consider the benefits and potential adverse effects of all protection systems, including RASs, Safety Nets (such as the SONGS separation scheme), and overload protection schemes; study the interaction of RASs and Safety Nets; and consider the impact of	This recommendation is not applicable to the Reliability Coordinator, Transmission Operator, and/or Balancing Authority and is therefore not addressed here. The proposed TOP-003-3 addresses these items. **Proposed TOP-003-3, Requirements R1, Parts1.1 and 1.2:** 1.1 A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data as deemed necessary by the Transmission Operator.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
	elements operated at less than 100 kV on BPS reliability.	1.2 Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. Planning Coordinators and Transmission Planners are outside the scope of this project.
10	WECC dynamic models should be benchmarked by TPs against actual data from the September 8th event to improve their conformity to actual system performance. In particular, improvements to model performance from validation would be helpful in analysis of under and/or over frequency events in the Western Interconnection and the stability of islanding scenarios in the SDG&E and CFE areas.	This recommendation is not applicable to the Reliability Coordinator, Transmission Operator, and/or Balancing Authority and is therefore not addressed here.
11	TOPs should engage in more real-time data sharing to increase their visibility and situational awareness of external contingencies that could impact the reliability of their systems. They should obtain sufficient data to monitor significant external facilities in real time, especially those that are known to have a direct bearing on the reliability of their system, and properly assess the impact of internal contingencies on the SOLs of other TOPs. In addition, TOPs should review their real-time monitoring tools, such as State Estimator and RTCA, to ensure that such tools represent critical facilities needed for the reliable operation of the BPS.	Proposed TOP-003-3, Requirement R1, part 1.1 states that Transmission Operators must include external network data in their respective data specifications. **Proposed TOP-003-3, Requirement R1, Part 1.1**: A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data as deemed necessary by the Transmission Operator. **Proposed TOP-001-3, Requirement R13:** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. The revised definition of Real-time Assessment includes potential post-contingency operating conditions.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
		Proposed Definition: Real-time Assessment - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed TOP-001-3, Requirement R13**: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
12	TOPs should take measures to ensure that their real-time tools are adequate, operational, and run frequently enough to provide their operators the situational awareness necessary to identify and plan for contingencies and reliably operate their systems.	The Project 2014-03 SDT has developed a requirement for the performance of a Real-time Assessment for Transmission Operators. **Proposed TOP-001-3, Requirement R13:** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
13	TOPs should review existing operating processes and procedures to ensure that post-contingency mitigation plans reflect the time necessary to take mitigating actions, including control actions, to return the system to a secure N-1 state as soon as possible but no longer than 30 minutes following a single contingency.	Proposed TOP-002-4, Requirement R2 states that Transmission Operators must have an Operating Plan to address SOL exceedances. Proposed TOP-001-3, Requirement R14 then states that the Transmission Operator must initiate its Operating Plan for mitigating and SOL exceedance. In addition, the SDT has developed a white paper on SOL Exceedance that clarifies the SDT position on SOL performance and SOL exceedance. **Proposed TOP-002-4, Requirement R2**: Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
	As part of this review, TOPs should consider the effect of relays that automatically isolate facilities without providing operators sufficient time to take mitigating measures.	**Proposed TOP-001-3, Requirement R14**: Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. The proposed TOP-003-3 explicitly requires the acquisition of Protection System data and the revised definitions of Operational Planning Analysis and Real-time Assessment call out Protection Systems as an item to be studied. **Proposed TOP-003-3, Requirement R1, Part 1.2:** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **Proposed: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
		(Real-time Assessment may be provided through internal systems or through third-party services.)
14	WECC RC should evaluate the effectiveness of its staffing level, training and tools. Based on the results of this evaluation, it should determine what actions are necessary to perform its functions appropriately as the RC and address any identified deficiencies.	This recommendation is specific to the WECC Reliability Coordinator and is therefore not addressed here.
15	TOPs should ensure procedures and training are in place to notify WECC RC and neighboring TOPs and BAs promptly after losing RTCA capabilities.	Proposed TOP-001-3, Requirement R9 states that Transmission Operators must notify impacted NERC registered entities of outages to monitoring and assessment capabilities. Training is outside the scope of this project. **Proposed TOP-001-3, Requirement R9**: Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected NERC registered entities of outages of telemetering equipment, control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities.
16	WECC should ensure consistencies in model parameters between its planning model and its RTCA model and should review all model parameters on a consistent basis to make sure discrepancies do not occur.	Model parameters are outside the scope of this project.
17	WECC, as the RE, should lead other entities, including TOPs and BAs, to ensure that all facilities that can adversely impact BPS reliability are either designated as part of the BES or otherwise incorporated into planning and operations studies and actively monitored and alarmed in RTCA systems.	Designation of BES facilities is outside the scope of this project. However, the revised standards do incorporate the need for sub-100 kV data and monitoring as deemed necessary by the reliability entities. **Proposed TOP-003-3, Requirement R1, Part 1.1**: A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
		Real-time Assessments including sub-100 kV data and external network data as deemed necessary by the Transmission Operator. **Proposed IRO-010-2, Requirement R1, Part 1.1**: A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data, as deemed necessary by the Reliability Coordinator. **Proposed TOP-001-3, Requirement R10**: Each Transmission Operator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Transmission Operator, within its Transmission Operator Area and neighboring Transmission Operator Areas to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area. **Proposed IRO-002-4, Requirement R4**: Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
19, 20, 22, 23, 25, 26	About coordination of SPS/RAS at the RC and TOP level.	Coordination of Special Protection Systems and Remedial Action Schemes is addressed in approved PRC-001-1.1a. Any changes to Protection System coordination issues is outside the scope of this project. Monitoring is addressed in proposed TOP-001-3, Requirement R10 and proposed IRO-002-4, Requirement R4. **Proposed TOP-001-3, Requirement R10**:

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
		Each Transmission Operator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Transmission Operator, within its Transmission Operator Area and neighboring Transmission Operator Areas to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area. **Proposed IRO-002-4, Requirement R4:** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
27	TOPs should have: (1) the tools necessary to determine phase angle differences following the loss of lines; and (2) mitigation and operating plans for reclosing lines with large phase angle differences.	(1) Phase angle calculation tools are outside the scope of this project. (2) Consideration of phase angle limitations has been added to the proposed definitions of Real-time Assessment (RTA) and Operational Planning Analysis (OPA). **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed Definition: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
	TOPs should also train operators to effectively respond to phase angle differences. These plans should be developed based on the seasonal and next-day contingency analyses that address the angular differences across opened system elements.	potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) While there is no explicit requirement for seasonal studies, the Reliability Coordinator has the authority to request such a study if it believes it is needed for reliability. Training is outside the scope of this project.

Project 2014-03 - Revision of TOP/IRO Reliability Standards

Resolution of Issues and Directives

The following table contains a list of all FERC directives, industry issues, and Independent Expert Review Panel (IERP) recommendations associated with the standards being revised in Project 2014-03, with proposed resolutions.

Standard	Source	Language	Resolution
IRO-001-3	FERC Order 693	892. Consider commenters' suggestions as part of the standards development process. APPA supports the approval of the Reliability Standard but expresses concern that the Version 1 standard does not include Measures that correspond to Requirements R2 and R9. APPA emphasizes the need for Measures corresponding to Requirement R9, which requires the reliability coordinator to act in the interests of reliability for the overall reliability coordinator area and the Interconnection before the interests of any other entity. APPA supports Requirement R8 with the extended applicability, provided that applicability is determined by reference to the NERC compliance registry. APPA agrees that the regional reliability organization should be eliminated as an applicable entity and suggests it be replaced with Regional Entities.	The SDT has added measures for all requirements. The Regional Reliability Organization has been removed from the standards.
IRO-001-3	FERC Order 693	893. Consider commenters' suggestions as part of the standards development process. FirstEnergy	The SDT has considered the commenter's suggestions and believes that safety refers to any

Standard	Source	Language	Resolution
		suggests that NERC clarify whether Requirement R8, which requires entities to comply with a reliability coordinator directive "unless such actions would violate safety, equipment or regulatory or statutory requirements," refers to personnel safety, equipment safety or both. In addition, it suggests the establishment of a chain of command so that, for example, if a generator receives conflicting instructions from a balancing authority and a transmission operator, it can determine which instruction governs.	type of safety including personal or equipment and that no additional wording is necessary. If a generator receives conflicting Operating Instructions, the generator should contact the Reliability Coordinator for clarification. The NERC Functional model refers to the Reliability Coordinator as overall authority.
IRO-001-3	FERC Order 693	895. California Cogeneration comments that the Reliability Standard fails to address the operational limitations of QFs because they have contractual obligations to provide thermal energy to their industrial hosts. It contends that a QF can be directed to change operations only in the case of a system emergency, pursuant to 18 CFR § 292.307.	The SDT has considered the comments and believes that a Reliability Coordinator can direct a Qualifying Facility (registered as a GO or GOP) to act through the issuance of Operating Instructions. Therefore, no additional requirements are necessary.
IRO-001-3	FERC Order 693	896. Eliminate the references to the regional reliability organization as an applicable entity. Paragraph 896. In the NOPR, the Commission proposed to approve the Reliability Standard as mandatory and enforceable. In addition, as a separate action under section 215(d)(5), the NOPR proposed to direct the ERO to develop modifications to Requirement R1 to substitute "Regional Entity" for "regional reliability organization" and reflect	The SDT has removed all references to the Regional Reliability Organization from the standards.

Standard	Source	Language	Resolution
		NERC's Rules of Procedure for registering, certifying and verifying entities, including reliability coordinators. Commenters do not raise any concerns regarding the proposed action. Accordingly, for the reasons stated in the NOPR, the Commission approves IRO-001-1 as mandatory and enforceable. In addition, for the reasons discussed in the NOPR, the Commission directs the ERO to develop modifications to the Reliability Standard through the Reliability Standards development process that reflect the process set forth in the NERC Rules of Procedures and eliminate the regional reliability organization as an applicable entity.	
IRO-001-3	FERC Order 693	897. Consider adding measures and levels of non-compliance. Further, the Commission directs the ERO to consider adding Measures and Levels of Non-Compliance in the Reliability Standard as requested by APPA.	The SDT has added measures and Violation Severity levels (VSLs) (which replaced levels of non-compliance) for each requirement.
IRO-001-3	FERC's December 20, 2007 and April 4, 2008 Orders	On March 4, 2008, NERC submitted a compliance filing in response to a December 20, 2007 Order, in which the Commission reversed a NERC decision to register three retail power marketers to comply with Reliability Standards applicable to load serving entities (LSEs) and directed NERC to submit a plan describing how it would address a possible "reliability gap" that NERC asserted would result if the LSEs were not registered. NERC's compliance	The SDT has established requirements that apply to the Load-Serving Entity. **Proposed TOP-001-3, Requirement R3**: **R3.** Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it

Standard	Source	Language	Resolution
		filing included the following proposal for a short-term plan and a long-term plan to address the potential gap: Short-term: Using a posting and open comment process, NERC will revise the registration criteria to define “Non-Asset Owning LSEs” as a subset of Load Serving Entities and will specify the reliability standards applicable to that subset. · Longer-term: NERC will determine the changes necessary to terms and requirements in reliability standards to address the issues surrounding accountability for loads served by retail marketers/suppliers and process them through execution of the three-year Reliability Standards Development Plan. In this revised Reliability Standards Development Plan, NERC is commencing the implementation of its stated long-term plan to address the issues surrounding accountability for loads served by retail marketers/suppliers. The NERC Reliability Standards Development Procedure will be used to identify the changes necessary to terms and requirements in reliability standards to address the issues surrounding accountability for loads served by retail marketers/suppliers. Specifically, the following description has been	would violate safety, equipment, regulatory, or statutory requirements.

Standard	Source	Language	Resolution
		incorporated into the scope for affected projects in this revised Reliability Standards Development Plan that includes a standard applicable to Load Serving Entities: Source: FERC's December 20, 2007 Order in Docket Nos. RC07-004-000, RC07-6-000, and RC07-7-000 Issue: In FERC's December 20, 2007 Order, the Commission reversed NERC's Compliance Registry decisions with respect to three load serving entities in the Reliability First (RFC) footprint. The distinguishing feature of these three LSEs is that none own physical assets. Both NERC and RFC assert that there will be a "reliability gap" if retail marketers are not registered as LSEs. To avoid a possible gap, a consistent, uniform approach to ensure that appropriate Reliability Standards and associated requirements are applied to retail marketers must be followed. Each drafting team responsible for reliability standards that are applicable to LSEs is to review and change as necessary, requirements in the reliability standards to address the issues surrounding accountability for loads served by retail marketers/suppliers. For additional information see: · FERC's December 20, 2007 Order (http://www.nerc.com/files/LSE_decision_order.pdf)	

Standard	Source	Language	Resolution

IRO-001-3	Fill in the Blank Team	Remove ", sub-region, or interregional coordinating group" from R1	Terms have been removed from the standard.
IRO-001-3	Version 0 Team	Inability to perform needs to be communicated	Clarity has been provided to address this issue throughout the various standards.
IRO-001	Version 0 Team	What is meant by 'interest of other entity'?	The SDT proposes to retire Requirement R9. All Reliability Coordinator Standard Requirements are developed so that the Reliability Coordinator shall act in the interest of reliability for the Reliability Coordinator Area and the Interconnection.
IRO-001-3	Fill in the Blank Team	Consider removing "Standards of conduct are necessary to ensure the Reliability Coordinator does not act in a manner that favors one market	The purpose statement has been revised accordingly.

Standard	Source	Language	Resolution
		participant over another." from the Purpose section of the standard.	Purpose: To establish the responsibility of Reliability Coordinators to act or direct other entities to act to prevent an Emergency.
IRO-001-3	NERC Audit Observation Team	All applicable registered functions shall comply with RC directives unless such actions would violate safety, equipment or regulatory or statutory requirements. Inform the RC immediately of the inability to perform such directives. For audit purposes, what is acceptable evidence?	Measure M2 contains the provisions for suitable evidence. **Proposed IRO-001-4, Measure M2**: **M2**. Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall have and provide evidence which may include, but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it complied with its Reliability Coordinator's Operating Instruction, unless the instruction could not be physically implemented, or such actions would have violated safety, equipment, regulatory or statutory requirements. In such cases, the Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, or Distribution Provider shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Reliability Coordinator’s Operating Instruction. If no event has occurred, the Transmission Operator, Balancing Authority, Generator Operator, Transmission Service

Standard	Source	Language	Resolution
			Provider, or Distribution Provider may provide an attestation that an event has not occurred.
IRO-001-3	VRFs Team	R6 - Since the RC must be NERC certified, it stands to reason that anyone performing RC tasks should be certified. However, since the RC still retains the accountability for actions, and requirement 4 handles the agreements, this requirement is a medium risk.	The SDT is proposing to retire this requirement. The Reliability Coordinator may delegate tasks but cannot delegate the responsibility for these tasks. Therefore, it is not necessary to mandate that delegated tasks must be carried out by certified personnel as it is the responsibility of the Reliability Coordinator to ensure that the task is carried out.
IRO-001-3	IERP	Requirement R1 content is incomplete. IERP recommended addressing 3 concepts as follows: RC has the authority to direct others to act. RC has the obligation to direct others to act to prevent identified events or mitigate the magnitude or duration of actual events that result in an Emergency or Adverse Reliability Impact.	The NERC Functional Model v5 spells out the authority of the Reliability Coordinator on page 30 under the description of the Reliability Coordinator functional entity. Proposed IRO-001-4, Requirement addresses the obligation of the Reliability Coordinator to direct others to act. **Proposed IRO-001-4, Requirement R1**: **R1**. Each Reliability Coordinator shall act, or direct others to act by issuing Operating Instructions, to ensure the reliability of its Reliability Coordinator Area. The term ‘Reliability Directive’ has been replaced with the defined term ‘Operating Instruction.’

Standard	Source	Language	Resolution
		When directing others to act in accordance with this requirement, a RC must identify its directive as a "Reliability Directive". Consider consolidating with other authority-related standards and COM-003 in a single Authority standard as follows: Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have the requirement and authority to take actions, including issuing a Reliability Directive, to prevent, mitigate and respond to an Emergency or Adverse Reliability Impact.	Proposed COM-002-4 determines the protocol for issuing Operating Instructions. The SDT believes that a separate authority standard is not necessary. Existing standards and requirements in conjunction with the Functional Model v5 are sufficient to address the authority issue raised here.
IRO-001-3	IERP	IERP viewed Requirement R2 language as unclear and unable to be practically implemented. Questioned whether equipment requirements were a valid reason for not complying with RC direction. IERP proposed covering this requirement under a single Authority standard as follows: Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with directions from a Reliability Coordinator, Transmission Operator or Balancing Authority under R1 unless it communicates to the RC, TOP or BA that it cannot because the direction cannot be physically implemented or unless such actions would violate	The SDT does not agree with the IERP statement/suggestion. The SDT feels this is more of a compliance issue and should not be addressed in Real-time.

Standard	Source	Language	Resolution
		safety, equipment, regulatory, or statutory requirements.	
IRO-001-3	IERP	IERP viewed content of Requirement R3 as incomplete by not requiring a reason for not complying with the RC's direction IERP recommended consolidating into a single Authority standard (see requirement above, which would replace both IRO-001 requirements R2 and R3)	The SDT does not agree with the IERP statement/suggestion. The SDT feels this is more of a compliance issue and should not be addressed in Real-time.
IRO-002-1	FERC Order 693	905 - Require a minimum set of tools that must be made available to the reliability coordinator. Further, consistent with the NOPR, the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe that this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions.	The SDT revised the definition of Real-time Assessment and Operations Planning Analysis to require Transmission Operators and Reliability Coordinators to ensure that those entities will have the capabilities they need to fulfill their reliability responsibilities. The SDT has crafted the definitions to provide functionality and methodology as opposed to a specific tool set but strongly believes that the definitions and accompanying requirements to run the studies and take actions based on those studies goes beyond the directive and provides for a robust and reliable interconnected transmission system. **Proposed: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment may reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System

Standard	Source	Language	Resolution
			status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed IRO-008-2, Requirement R1:** **R1**. Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area. **Proposed IRO-008-2, Requirement R4:**

Standard	Source	Language	Resolution
			R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
IRO-002	Version 0 Team	R5 – define synchronized information system	The term is not used in the revised standards.
IRO-002	Version 0 Team	R7 – define 'adequate' tools and 'wide-area'	The terms are not used in the revised standards
IRO-002-1	Version 0 Team	Words such as 'easily understood' and 'particular emphasis' need to be tightened	The terms are not used in the revised standards
IRO-002-3	IERP	IERP viewed Requirement R1 as incomplete. RC also needs to approve any other work being done on the tools, hardware/software/telecom systems within the RC that could affect the quality and the content of the data coming into the control center. Also consider consolidating with Project 2009-02 Requirement R1 was proposed for consolidation under a new Authority standard: Authority R2 Each RC, TOP and BA shall have the requirement and authority to approve, deny or cancel planned outages of	Proposed IRO-002-4, Requirement R2 addresses this issue. **Proposed IRO-002-4, Requirement R2**: **R2**. Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities. The Project 2014-03 SDT is addressing directives assigned to Project 2009-02 as well as issues identified in the NOPR on the TOP/IRO standards. The SDT believes that a separate authority standard is not necessary. Existing standards and requirements in conjunction with the Functional Model v5 are sufficient to address the authority issue raised here.

Standard	Source	Language	Resolution
		its EMS, telecom and other hardware, and associated analysis tools.	
IRO-002-3	IERP	IERP viewed Requirement R2 as incomplete. Procedures need to address not only tools outages, but also tools maintenance or other inhibitors to quality performance of analysis tools. Also consider consolidating with Project 2009-02	The SDT added 'maintenance' approval to proposed IRO-002-3, Requirement R3. This includes all work being done on monitoring and analysis capabilities and not just those that will cause an outage. **Proposed IRO-002-4, Requirement R2**: **R2.** Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities. The Project 2014-03 SDT is addressing directives assigned to Project 2009-02 as well as issues identified in the NOPR on the TOP/IRO standards.
IRO-003	Order 693	914. … we adopt in the Final Rule the proposal to direct that the ERO develop a modification to the Reliability Standard through the Reliability Standards development process to create criteria to define the term "critical facilities" in a reliability coordinator's area …	The term is not used in the revised standards. The proposed data specification concept allows for the Reliability Coordinator to ask for any reliability related data that it needs in order to fulfill its reliability tasks thus obviating the need for a specific criteria for determining critical facilities. And specific requirements for monitoring have been added for the Reliability Coordinator. **Proposed IRO-010-2, Requirement R1:** **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for

Standard	Source	Language	Resolution
			it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed IRO-002-4, Requirement R3:** **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
IRO-004-1	Order 693	934. In response to APPAs concern that NERC did not provide a Measure for each Requirement, we reiterate that it is in the EROs discretion whether each Requirement requires a corresponding Measure. The ERO should consider this issue through the Reliability Standards development process.	Measures have been added to all requirements.
IRO-004-1	Order 693	935. …direct the ERO to modify IRO-004-1 through the Reliability Standards development process to require the next-day analysis to identify control actions that can be implemented and effective within 30 minutes after a contingency	The SDT has addressed this issue in proposed IRO-008-2 and TOP-002-4 as well as through the revised definitions of Operational Planning Analysis and Real-time Assessment. SOLs must be controlled according to the Operating Plan which is set up on time-based facility ratings (see SOL Exceedance White Paper for further details). IROLs are controlled to the IROL T_v which by definition is always less than 30 minutes. **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to

Standard	Source	Language	Resolution
			assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed Definition: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment may reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed IRO-008-2, Requirement R1**: **R1**. Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and

Standard	Source	Language	Resolution
			Interconnection Operating Reliability Limits (IROLs) within its Wide Area. **Proposed IRO-008-2, Requirement R2**: **R2**. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. **Proposed TOP-002-4, Requirement R1**: **R1.** Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed TOP-002-4, Requirement R2**: **R2**. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.
IRO-005	FERC Order 693	520. Further, we clarify that we did not propose to require an entity to inform its reliability coordinator of every action it takes. Instead, the proposed directive	The SDT addresses the need for Reliability Coordinator assessment and approval on a

Standard	Source	Language	Resolution
		included a Requirement for the reliability coordinator to assess and approve only those actions that have impacts beyond the area views of transmission operators and balancing authorities. We remain convinced that it is the reliability coordinator's responsibility to ensure Reliable Operation of its reliability coordinator area. The reliability coordinator must also ensure that actions taken by operating entities under its authority will not have wide-area impacts that would adversely impact Reliable Operation of the Bulk-Power System. Therefore, we adopt the proposed directive as stated in the NOPR.	requirement by requirement basis. For example, see proposed IRO-008-2, Requirements R3 and R6. **Proposed IRO-008-2, Requirement R2**: **R2**. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. **Proposed IRO-008-2, Requirement R5**: **R5**. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Reliability Coordinator Wide Area.
IRO-005-1	FERC Order 693	946. "Conduct a survey on IROL practices and actual operating experiences by requiring reliability coordinators to report any violations of IROLS, their causes, the date and time, the durations and	Completed and filed in Oct 2008

Standard	Source	Language	Resolution
		magnitudes in which actual operations exceeds IROLs to NERC.	
IRO-005-1	FERC Order 693	950- Provide further clarification that reliability coordinators and transmission operators direct control actions, not LSEs as part of the standard development process. We do not share TAPS' concern regarding LSEs initiating load shedding as their own control action to respect IROLs or SOLs. The appropriate control actions to respect IROLs and SOLs are the responsibilities of a reliability coordinator and transmission operator. If load shedding is required, it is the responsibility of a reliability coordinator or a transmission operator to direct the appropriate entities including LSEs to carry it out. However, we urge the ERO to provide further clarification in this regard and include TAPS' concern in developing the modification of this Reliability Standard.	The SDT has proposed IRO-001-4, Requirement R1 to address the Commission's suggestion for clarification. **Proposed IRO-001-4, Requirement R1**: **R1**. Each Reliability Coordinator shall act, or direct others to act by issuing Operating Instructions, to ensure the reliability of its Reliability Coordinator Area.
IRO-005-1	FERC Order 693	951-"Measures and levels of non-compliance specific to IROL violations must be commensurate with the magnitude, duration, frequency, and causes of the violations and whether these occur during normal or contingency conditions. Accordingly, the Commission approves Reliability Standard IRO-005-1 as mandatory and enforceable. Further, because IRO-005-1 has no Measures or Levels of Non-Compliance, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission directs the ERO to develop a modification to IRO-005-1through the Reliability Standards development process that includes Measures and Levels of Non-Compliance. The Commission further	The SDT has added measures and VSLs (which replaced levels of non-compliance) for each requirement.

Standard	Source	Language	Resolution
		directs that the Measures and Levels of Non-Compliance specific to IROL violations must be commensurate with the magnitude, duration, frequency and causes of the violations and whether these occur during normal or contingency conditions.	
IRO-005-1	Fill in the Blank Team	R14 has regional reference	The term is not used in the revised standards.
IRO-005-1	Version 0 Team	R10, 11 & 12 – RA not empowered to do this	RA is no longer an applicable entity in the revised standards.
IRO-005-4	IERP	Requirement R1 is incomplete--needs to include Emergency. Requirement R1 reads: When the results of an Operational Planning Analysis or Real-time Assessment indicate an anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area, each Reliability Coordinator shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. Also - there are gaps between the old std IRO-005-3 R2 to IRO-005-4: missing is: There is a possible gap for RC in IRO-005-4 regarding RC handling emergencies as this has been dropped from IRO-005-3.1 Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required	The SDT replaced Adverse Reliability Impact with Emergency in all requirements. Emergency is a broader term. Proposed IRO-002-4, Requirement R3 addresses the issue of monitoring.

Standard	Source	Language	Resolution
		amount of operating reserves is provided and available as required to meet the Control Performance Standard and Disturbance Control Standard requirements. (Minus strikethrough) FROM IRO-005-3 R9: Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows.	**Proposed IRO-002-4, Requirement R3**: **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area The SDT believes all appropriate items, including Special Protection System evaluation and awareness is addressed through the revised definitions of Real-time Assessment and Operations Planning Analysis. The data specification has been revised to explicitly address Special Protection Systems. **Proposed: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment may reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations.

Standard	Source	Language	Resolution
			(Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed IRO-010-2, Requirement R1, Part 1.2:** **R1. Part 1.2** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.
		From IRO-005-3 R10: In instances where there is a difference in derived limits, the Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.	The SDT has addressed the issue of resolving differences in limits in proposed TOP-001-3, Requirement R18. **Proposed TOP-001-3, Requirement R18**: **R18.** Each Transmission Operator and Balancing Authority shall always operate to the most limiting

Standard	Source	Language	Resolution
		Recommend consolidating with IRO-008 R3.	parameter in instances where there is a difference in SOLs. The SDT has consolidated requirements and standards as it believes appropriate.
IRO-005-4	IERP	The proposed standard creates a gap in outage coordination by proposing to retire IRO-005-3 R6. This could be resolved through an Authority standard as proposed by the IERP From IRO-005-3 R6: The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.	The SDT has proposed a new standard, IRO-017-1 Outage Coordination, to address this issue.
IRO-005-4	IERP	Requirement R2 should also include Emergency Requirement R2 reads: Each Reliability Coordinator that identifies an anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when the problem has been mitigated.	The SDT replaced Adverse Reliability Impact with Emergency in all requirements for consistency. The definition of Adverse Reliability Impact is encompassed in Emergency.

Standard	Source	Language	Resolution
		Note: there is a possible gap for RC in IRO-005-4 regarding RC handling emergencies as this has been dropped from IRO-005-3.1 Recommend moving to IRO-008 and create an R4	
IRO-014-2	IERP	Gap in Requirement R1 - Need to identify RC's authority to direct another RC to take action - suggestion: create another Requirement, i.e., R6 (in proposed authority standard). Each RC shall comply with directions from another RC under R1 unless it communicates to the other RC that it cannot because compliance with the direction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements.	The SDT does not agree with this recommendation. A Reliability Coordinator does not direct another Reliability Coordinator. Proposed IRO-014-3 describes how to coordinate between Reliability Coordinators.
IRO-014-2	IERP	R2 is administrative and should be deleted	The SDT believes that this is not strictly an administrative requirement and serves a reliability purpose.
IRO-014-2	IERP	R3 implements plan from R1; it should be combined with R1	The SDT believes that combining the requirements would create a complex requirement with multiple objectives that would be difficult to measure for compliance.
IRO-014-2	IERP	Requirement R4 is administrative and should be deleted.	The SDT believes that this is not strictly an administrative requirement and serves a reliability purpose.

Standard	Source	Language	Resolution
IRO-014-2	IERP	R5 should require notification of “all IMPACTED RCs"; not "ALL"	The SDT has added ‘impacted’ to appropriate locations in the standards.
IRO-014-2	IERP	R6 should be consolidated with other standards that incorporate the concept of operating to the most conservative for reliability - IRO-009-1 R5 R6 reads: During each instance where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact each impacted Reliability Coordinator shall operate as though the problem exists.	Approved IRO-009-1 only addresses IROLs. Proposed IRO-014-3 addresses all limits.
IRO-014-2	IERP	Requirement R7 should be retired. The reliability objective is covered under R6, and also supported by IRO-009-1 R5	The SDT believes that the two requirements are sufficiently distinct to warrant separateness. Requirement R6 speaks to actual operations. Requirement R7 speaks to having an established plan. The SDT believes that reliability is best served by having a plan to follow.
IRO-014-2	IERP	Requirement R8 should be retired. The reliability objective is covered under R6.	The SDT does not agree with this recommendation. Requirement R8 is a separate requirement.
IRO-016	VRF's Team	R1.2.1 & R2 – ambiguous	Requirement R2 was approved for retirement by FERC effective January 2014. Requirement R1, part 1.2.1 was incorporated in the set of requirements in proposed IRO-014-3, and ambiguous language has been deleted.
TOP-001-1	FERC Order 693	1580 - Consider adding other measures and levels of non-compliance.	Measures and VSLs have been assigned to all requirements.

Standard	Source	Language	Resolution
TOP-001-1	FERC Order 693	1585 - Clarify the definition of "emergency" and define the criteria for entering into the various states. Also define the authority for declaring these states.	The SDT feels that the TOP-001 standard should be restricted to Transmission System operations and that definition of operating states more correctly belong in EOP-001 as pointed out in Order 693, paragraph 560. To make certain that the issue is handled there, the SDT has entered an official item in the NERC database of project issues in this regard. This will require the SDT working on revisions to EOP-001 to formally address this concern. EOP-001 is listed in the Reliability Standards Development Plan under Project 2009-03.
TOP-001-1	FERC Order 693	1588 - Consider Santa Clara's comments to provide that the transmission operator may notify the reliability coordinator or the balancing authority that it is removing facilities from service as part of the standards development process.	This concern is addressed in proposed TOP-001-3, Requirement R8. **Proposed TOP-001-3, Requirement R8**: **R8.** Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known other impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency.
TOP-001-1	Version 0 Team	What is 'clear decision making authority'?	The term is not used in the revised standards
TOP-001-1	Version 0 Team	Need to define single, central communications point during emergencies	This is an issue for COM standards.
TOP-001-1	Version 0 Team	Some emergencies will require follow up notification as opposed to immediate	Requirements have been revised to eliminate confusion.
TOP-001-1	Version 0 Team	Define emergency	The SDT feels that the TOP-001 standard should be restricted to Transmission System operations and that definition of operating states more correctly

Standard	Source	Language	Resolution
			belong in EOP-001 as pointed out in Order 693, paragraph 560. To make certain that the issue is handled there, the SDT has entered an official item in the NERC database of project issues in this regard. This will require the SDT working on revisions to EOP-001 to formally address this concern. EOP-001 is listed in the Reliability Standards Development Plan under Project 2009-03.
TOP-001-1	Version 0 Team	Need to expand included entities	Applicability has been reviewed by the SDT and changed as required.
TOP-001-2	IERP	Requirement R1 phrase "unless it violates requirements" is too permissive or there may be a better way to phrase it Consider consolidating TOP-001-2 Requirements R1 and R2 and all other standards requirements related Authority to into a single Authority standard as follows: Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with directions from a Reliability Coordinator, Transmission Operator or Balancing Authority under [Authority standard R1] unless it communicates to the RC, TOP or BA that it cannot because the direction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements.	The SDT believes that this is well understood language. The SDT believes that a separate authority standard is not necessary. Existing standards and requirements in conjunction with the Functional Model v5 are sufficient to address the authority issue raised here.
TOP-001-2	IERP	The language “emergency assistance” in Requirement R4 is unclear. When and how must assistance be rendered, and what type?	The SDT revised the language for clarity and included the Balancing Authority.

Standard	Source	Language	Resolution
		BA's should be included as functional entity. Consider moving R4 to EOP standards (this is an "emergency" operating requirement)	**Proposed TOP-001-3, Requirement R7:** **R7**. Each Transmission Operator shall assist other Transmission Operators, if requested and able, provided that the requesting entity has implemented its emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements.
TOP-001-2	IERP	Requirement R5 should also include notification of Emergencies (in addition to ARI), and should include Bas. R5 states: Each Transmission Operator shall inform its Reliability Coordinator and other Transmission Operators of its operations known or expected to result in an Adverse Reliability Impact on those respective Transmission Operator Areas unless conditions do not permit such communications. Examples of such operations are relay or equipment failures, and changes in generation, Transmission, or Load.	The SDT added impacted Balancing Authorities. The SDT replaced Adverse Reliability Impact with Emergency in all requirements for consistency. The definition of Adverse Reliability Impact is encompassed in Emergency. **Proposed TOP-001-3, Requirement R8:** **R8**. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known other impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency.
TOP-001-2	IERP	R6 needs to include real time outages of telecom as well as planned outages.	The SDT added telecommunications to the requirement. **Proposed TOP-001-2, Requirement R9:** **R9**. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and known impacted interconnected entities of outages of telemetering and telecommunication equipment,

Standard	Source	Language	Resolution
		Requirement should be covered under COM-001	control equipment, monitoring and assessment capabilities, and associated communication channels between it and the affected entities. COM standards are not in scope for this project.
TOP-001-2	IERP	Requirement R8 does not cover all information needed for reliability. It should cover 1) SOLs within a TOP's/RC's footprint, 2) SOLs that are within one TOP's/RC's footprint that could affect another entity and 3) an SOL that spans into 2 TOP's/RC's footprints The requirement should also obligate the TOP to also inform impacted TOPs (The entity that could be impacted must tell the TOP that could impact them that it needs the info)	The SDT has addressed issue 1 in proposed TOP-001-3, Requirement R15. SOLs that cross boundaries are taken care of at the Reliability Coordinator level. **Proposed TOP-001-3, Requirement R15:** **R15**. Each Transmission Operator shall inform its Reliability Coordinator of its actions to return the system to within limits when a SOL has been exceeded.
TOP-002-3	Order 693	1597. Consider ISO-NE recommendation that the reference to “transmission service provider” in TOP-002-2 R12 be replaced by TOP and/or TO. Requirement R12 states: The Transmission Service Provider shall include known SOLs and IROLs within its area and neighboring areas in the determination of transfer capabilities, in accordance with filed tariffs, and or regional Total Transfer Capability and Available Transfer Capability calculation processes.	This requirement is now addressed by approved MOD-028-2, Requirement R6.1; approved MOD-029-1a, Requirement R3; and approved MOD-030-2, Requirement R2.4. Because IROLs by definition are a subset of SOLs, IROLs are included. **Approved MOD-028-2, Requirement R6.1:** **R6.1** Determine the incremental Transfer Capability for each ATC Path by increasing generation and/or decreasing load within the source Balancing Authority area and decreasing generation and/or

Standard	Source	Language	Resolution
			increasing load within the sink Balancing Authority area until either: A System Operating Limit is reached on the Transmission Service Provider's system, or A SOL is reached on any other adjacent system in the Transmission model that is not on the study path and the distribution factor is 5% or greater. **Approved MOD-029-1a, Requirement R3**: **R3.** Each Transmission Operator shall establish the TTC at the lesser of the value calculated in R2 or any System Operating Limit (SOL) for that ATC Path. Approved MOD-030-2, Requirement R2.4: Establish the TFC of each of the defined Flowgates as equal to: For thermal limits, the System Operating Limit (SOL) of the Flowgate. For voltage or stability limits, the flow that will respect the SOL of the Flowgate.
TOP-002-3	Order 693	1598. Requires next-day analysis of minimum voltages at nuclear power plants auxiliary power buses.	The data specification standard require that a Reliability Coordinator and Transmission Operator acquire all of the data necessary for them to fulfill their reliability functions including sub-100 kV data as necessary. **Proposed IRO-010-2, Requirement R1 and Part 1.1:**

Standard	Source	Language	Resolution
			R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: 1.1 A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data, as deemed necessary by the Reliability Coordinator. **Proposed TOP-003-3, Requirement R1 and Part 1.1**: **R1**. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1 A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data as deemed necessary by the Transmission Operator.
TOP-002-3	Order 693	1600. Address critical energy infrastructure confidentiality as part of the routine standard development process	The data specification standards now contain provisions for addressing security of data. **Proposed IRO-010-2, Requirement R3, Part 3.3**:

Standard	Source	Language	Resolution
			R3. Part 3.3 A mutually agreeable security protocol. **Proposed TOP-003-3, Requirement R5, Part 5.3:** **R5. Part 5.3** A mutually agreeable security protocol.
TOP-002-3	Order 693	1601. …direct the ERO to modify Reliability Standard TOP-002-2 to require the next-day analysis for all IROLs to identify and communicate control actions to system operators that can be implemented within 30 minutes following a contingency to return the system to a reliable operating state and prevent cascading outages	SOLs are the responsibility of the Transmission Operator and IROLs are the responsibility of the Reliability Coordinator. This issue is addressed in proposed changes to the IRO standards. **Proposed IRO-008-2, Requirement R1**: **R1**. Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area. **Proposed IRO-008-2, Requirement R2**: **R2**. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. **Proposed IRO-008-2, Requirement R3**:

Standard	Source	Language	Resolution
			R3. Each Reliability Coordinator shall notify impacted entities identified in the Operating Plan(s) cited in Requirement R3 as to their role in those plan(s).
TOP-002-3	Order 693	1606. Commenters did not take issue with the proposed interpretation of the term deliverability as the ability to deliver the output from generation resources to firm load without any reliability criteria violations for plausible generation dispatches. The Commission adopts this proposed interpretation. In order to ensure the necessary clarity, the term as used in Requirement R7 of TOP-002-2 should be understood in this manner.	The SDT agrees and has addressed the issue in proposed TOP-002-3, Requirement R4, part 4.4: Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.4 Capacity and energy reserve requirements, including deliverability capability.
TOP-002-3	Order 693	1608. Require simulation contingencies to match what will actually happen in the field	The SDT has revised the definitions of Operational Planning Analysis and Real-time Assessment accordingly. The definitions require Contingencies to match field conditions as they require evaluations against projected system conditions for Operational Planning Analysis and system conditions for Real-time Assessment. **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational

Standard	Source	Language	Resolution
			Planning Analysis may be provided through internal systems or through third-party services.) **Proposed Definition: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment may reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)
TOP-002-3	IERP	Requirement R1. TOP-008-1 R4 needs to be incorporated into TOP-002-3 requirement R1. Also - the definition of "Operational Planning Analysis" provides too much latitude in time. Recommend removing the parenthesis in the definition; the entity will make the determination and document (documentation is evidence) the applicability of what it uses for their next day study	The SDT revised the definition of Operating Planning Analysis and Requirement R1. **Proposed: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Standard	Source	Language	Resolution
			Proposed TOP-002-3, Requirement R1: **R1.** Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs).
TOP-003-0	FERC Order 693	1620. …direct the ERO to develop a modification to TOP-003-0 that requires the communication of scheduled outages to all affected entities well in advance to ensure reliability and accuracy of ATC calculations.	The SDT has developed proposed IRO-017-1 Outage Coordination to address these type of issues. This new standard takes into account the recommendations from the Independent Expert Review Panel and SW Outage Report and brings all of the various outage coordination issues into one cohesive standard.
TOP-003-0	FERC Order 693	1621 - Incorporate an appropriate lead time for planned outages using suggestions from the various commenters. We direct the ERO to modify the Reliability Standard to incorporate an appropriate lead time for planned outages.	The SDT posed a question on this issue as a fact finding exercise in the second posting of Project 2007-03 in order to assist them in making a decision on how to respond to the FERC directive as requested in Order 693 – "The ERO should utilize the information filed by commenters in the Reliability Standards development process." The majority of respondents indicated that they do not feel that there is a reliability based need for such a North American requirement. Several respondents pointed out that such a requirement (if needed at all for reliability) would be better suited to a regional standard and several others stated that such requirements already exist in their particular regions. There are several regions that have existing rules for lead times but they are all different and are based on

Standard	Source	Language	Resolution
			the requirements of their regional markets. Any attempt to impose a North American standard runs the risk of interfering with those FERC approved markets. While NERC Reliability Standards are intended to promote reliability, they must at the same time accommodate competitive electricity markets. In response to concerns raised by the IERP and the SW Outage Report, the SDT has developed proposed IRO-017-1 Outage Coordination. This standard requires the development of a coordinated outage process between the Reliability Coordinator, Transmission Operator, Balancing Authority, Planning Coordinator, and Transmission Planner. If so desired, a Reliability Coordinator could include lead times in its process. In addition, proposed IRO-010-2 and TOP-003-2 dealing with data specifications could also cover this issue. The data specification must include any and all data required by the Reliability Coordinator, Transmission Operator and Balancing Authority. Planned outage data and timings could be included in such a data specification. Therefore, the SDT has not included a standard lead time in the revised requirements.
TOP-003-0	Order 693	1622. Consider TVAs suggestion for including breaker outages within the meaning of facilities that are subject to advance notice for planned outages.	The SDT has developed proposed IRO-017-1 Outage Coordination to address these types of issues.

Standard	Source	Language	Resolution
TOP-003-0	Order 693	1624. Direct the ERO to modify the Reliability Standard to require that any facility below the thresholds that, in the opinion of the transmission operator, balancing authority, or reliability coordinator will have a direct impact on the reliability of the Bulk-Power System be subject to Requirement R1 for planned outage coordination.	The data specification standard require that a Reliability Coordinator and Transmission Operator acquire all of the data necessary for them to fulfill their reliability functions including sub-100 kV data as necessary. **Proposed IRO-010-2, Requirement R1 and Part 1.1**: **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: 1.1 A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network data, as deemed necessary by the Reliability Coordinator. **Proposed TOP-003-3, Requirement R1 and Part 1.1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1 A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including sub-100 kV data and external network

Standard	Source	Language	Resolution
			data as deemed necessary by the Transmission Operator.
TOP-003-2	IERP	Requirements R1 and R2 do not address level of accuracy required; see if this is provided elsewhere (i.e. project 2009-02) Consolidate R1 and R2 at minimum; at max consolidate with RC (IRO-010-1a R1)	Level of accuracy is one of the issues identified in the Real-Time Tools Best Practices Task Force Report. NERC is currently instituting a review of all of the recommendations in various reports, including the Real-time Tools Best Practices Task Force report, to see what actions should be taken, if any are still required, to address recommendations in the reports. The SDT does not want to consolidate the two responsibilities. The industry has clearly indicated a desire for separate standards for the Reliability Coordinator and Transmission Operator where possible.
TOP-003-2	IERP	Consolidate R3 and R4 at minimum; at max consolidate with RC (IRO-010-1a R2)	The SDT does not want to consolidate the two requirements or the two standards. The SDT feels Requirements R3 and R4 are for different tasks. The industry has clearly indicated a desire for separate standards for the Reliability Coordinator and Transmission Operator where possible.
TOP-003-2	IERP	Requirement R5 should be consolidated with IRO-010-1a R3	The industry has clearly indicated a desire for separate standards for the Reliability Coordinator and Transmission Operator where possible.
TOP-004-1	FERC Order 693	1636 - Modify requirement R4 to state that the system should be restored to respect proven limits as soon as possible taking no more than 30 minutes.	The SDT believes that this issue has been addressed through the more stringent definitions proposed for Operational Planning Analysis, Real-time Assessment,

Standard	Source	Language	Resolution
			and the requirement for the Transmission Operator to perform an Operational Planning Analysis as well as a Real-time Assessment every 30 minutes and to create an Operating Plan for mitigation of SOL exceedances. The SDT has developed a white paper on the topic of SOL exceedance to explain the technical rationale behind this resolution. **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed Definition: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment may reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and

Standard	Source	Language	Resolution
			identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed TOP-002-4, Requirement R1**: **R1**. Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed TOP-002-4, Requirement R2**: **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. **Proposed TOP-001-3, Requirement R13**: **R13.** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Proposed TOP-001-3, Requirement R14**: **R14**. Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
TOP-004-1	Order 693	1637. …direct the ERO to conduct a survey on the operating practices and actual experiences surrounding drifting in and out of IROL violations.	Completed and filed in Oct 2008.

Standard	Source	Language	Resolution
TOP-004-1	FERC Order 693	1638 - Defines high risk conditions under which the system must be operated to respect multiple outages in requirement R3. We direct the ERO to develop a modification to the Reliability Standard that explicitly incorporates this interpretation with the details identified in the Reliability Standards development process (… the Commission proposed to interpret “multiple outages” in the context of Requirement R3 to include multiple element outages resulting from high risk conditions such as hurricanes, wild fires, ice storms or periods of high solar magnetic disturbances during which the probability of multiple outages approaches that of a single element outage. This is not an exhaustive list but is meant to contain illustrative examples, and the Reliability Standards development process should develop a procedure to identify applicable high risk conditions. Under … high-risk conditions, the Commission understands that systems are normally operated in a more secure manner so that the Bulk-Power System can withstand multiple outages. These multiple outages exceed the normal N-1 criterion because the probability of multiple outages during high risk conditions approaches that of a single outage during normal conditions.)	The SDT feels that approved EOP-001-2.1b dealing with emergency operations planning covers the intent of being prepared to react to the cited situations. The method chosen to respond to a given catastrophic challenge to a localized portion of the system cannot be predetermined by science; rather, it is an art. Reliability entities develop their response mechanisms based on experience in their local areas to achieve the maximum societal benefit during these periods. In addition, approved FAC-011-2 and FAC-014-2 deal with specific requirements for dealing with multiple contingencies.
TOP-004-1	Order 693	1639. Consider Santa Clara’s comment in the SDT process. Santa Clara states that Requirement R2 of the Reliability Standard should be revised to include	The data specification standards require that entities obtain all of the data that they need to perform their reliability functions. This would include frequency,

Standard	Source	Language	Resolution
		frequency monitoring in addition to the monitoring of voltage, real and reactive power flows	voltages, real and reactive power flows, and any other data that the entity needs. **Proposed IRO-010-2, Requirement R1**: **R1**. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed TOP-003-3, Requirement R1**: **R1**. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
TOP-004-1	Version 0 Team	Vagueness in application of IROL limits	The SDT has clarified the issue. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL $T_{v.}$
TOP-005	Order 693	1648. ...direct the ERO to develop a modification to TOP-005-1 through the Reliability Standards development process regarding the operational status of special protection systems and power system stabilizers in Attachment 1.	The SDT has added specific parts to the data specification standards as well as revising the definitions of Operational Planning Analysis and Real-time Assessment to address this issue. **Proposed: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The

Standard	Source	Language	Resolution
			evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment may reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed IRO-010-2, Requirement R1, Part 1.2**: 1.2 Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **Proposed TOP-003-3, Requirement R1, Part 1.2**:

Standard	Source	Language	Resolution
			1.2 Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.
TOP-005	Order 693	1650. Consider FirstEnergy's modifications to Attachment 1 and ISO-NEs recommended revision to requirement R4 in the standards development process. FirstEnergy states that TOP-005-1 should also apply to transmission providers because some of the information listed in Attachment 1 to the Reliability Standard is in their possession. Attachment 1 should be modified so that it allows each entity to know what data it is expected to provide. ISO-NE recommends that the reference to "purchasing-selling entity" should be replaced with LSE.	Attachment 1 has been deleted and replaced by the new data specification requirement in proposed TOP-003-3. Requirement R4 has been superseded by proposed TOP-003-3 which does include the indicated entities and has deleted PSE. **Proposed TOP-003-3, Requirement R5**: **R5.**Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications using:
TOP-005	Order 693	1651. … deletes references to confidentiality agreements, but addresses the issue separately to ensure that necessary protections are in place related to confidential information.	The SDT believes that confidentiality is a market issue and not a reliability issue and as such it does not belong in the Reliability Standards. However, security of information is a reliability concern and the SDT has addressed that issue through the addition of requirements for establishing security protocols in data exchanges. **Proposed TOP-003-3, Requirement R5, Part 5.3**: 5.3 A mutually agreeable security protocol. **Proposed IRO-010-2, Requirement R3, Part 3.3**: 3.3 A mutually agreeable security protocol.

Standard	Source	Language	Resolution
TOP-005	Order 693	1660. Add requirement related to the provision of minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the bulk power system	The SDT revised the definition of Real-time Assessment and Operations Planning Analysis to require Transmission Operators and Reliability Coordinators to ensure that those entities will have the capabilities they need to fulfill their reliability responsibilities. **Proposed: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment may reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be

Standard	Source	Language	Resolution
			provided through internal systems or through third-party services.)
TOP-006	Order 693	1665. Clarify the meaning of appropriate technical information concerning protective relays	That term is no longer used in the standards. To address concerns about the status of protection systems, the SDT has incorporated explicit references in the definitions of Operational Planning Analysis and Real-time Assessment and the data specification standards. **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed Definition: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment may reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection

Standard	Source	Language	Resolution
			System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed IRO-010-2, Requirement R1, Part 1.2**: 1.2 Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **Proposed TOP-003-3, Requirement R1, Part 1.2**: 1.2 Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.
TOP-006	Order 693	1664/1681. The ERO should consider APPA's comment regarding the missing Measures in the ERO's Reliability Standards development process.	All requirements now have measures.
TOP-006	Order 693	1673. Direct the ERO to consider NRC's comments in the Reliability Standards development process when addressing TOP-007-0 as part of its Work Plan. NRC states that some nuclear power plant voltage requirements would result in SOL, i.e., the nuclear power plant voltage limits would be an SOL as a result of the minimum and maximum voltages required at the nuclear power plant switchyard, which typically has a tighter operating band (a higher minimum and a lower maximum) than other nodes in the system. It therefore recommends adding a new requirement that states as	Analysis is required in proposed TOP-002-3, Requirement R1 and in proposed TOP-001-3, Requirement R13. A specified minimum voltage limit is by definition an SOL which must be studied in proposed TOP-002-3, Requirement R1 and proposed TOP-001-3, Requirement R13 as shown in the revised definition of Operational Planning Analysis and Real-time Assessment. Additionally, approved NUC-001-2.1, Requirements R3 & R4.1 require the transmission entity to incorporate NPIRs in their planning and operating analyses. Approved FAC-011-2 and approved FAC-014-2, Requirement R2 require

Standard	Source	Language	Resolution
		follows: "Following discovery of a potential contingency that could result in an SOL being exceeded at a nuclear power plant (e.g., at post-trip voltage), the transmission owner shall notify the nuclear power plant operator as soon as possible but not longer than 30 minutes if the contingency has not been corrected." NRC also suggests modifying the Measures and Compliance sections and Table 1 to account for the new requirement, and provides specific language to be included in those places.	the Transmission Operator to incorporate SOLs into their analyses. All data required for Operational Planning Analyses is stipulated in proposed TOP-003-3. Approved NUC-001-2, Requirements R3 & R8 cover the information flowing back to the nuclear plant operator. **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed Definition: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment may reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations.

Standard	Source	Language	Resolution
			(Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed TOP-002-3, Requirement R1**: **R1.** Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed TOP-001-3, Requirement R13**: **R13.** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Approved NUC-001-2.1, Requirement R3**: **R3**. Per the Agreements developed in accordance with this standard, the applicable Transmission Entities shall incorporate the NPIRs into their planning analyses of the electric system and shall communicate the results of these analyses to the Nuclear Plant Generator Operator. **Approved NUC-001-2.1, Requirement R4.1**: 4.1 Incorporate the NPIRs into their operating analyses of the electric system. **Approved NUC-001-2.1, Requirement R8:** **R8.** Per the Agreements developed in accordance with this standard, the applicable Transmission Entities shall inform the Nuclear Plant Generator Operator of actual or proposed changes to electric

Standard	Source	Language	Resolution
			system design, configuration, operations, limits, Protection Systems, or capabilities that may impact the ability of the electric system to meet the NPIRs.
VAR-001-1	Order 693 Transferred from Project 2013-04 Voltage and Reactive Control	1855. Since a reliability coordinator is the highest level of authority overseeing the reliability of the Bulk-Power System, the Commission believes that it is important to include the reliability coordinator as an applicable entity to assure that adequate voltage and reactive resources are being maintained. As MISO points out, other Reliability Standards address responsibilities of reliability coordinators, but we agree with EEI that it is important to include reliability coordinators in VAR-001-1 as well. Reliability coordinators have responsibilities in the IRO and TOP Reliability Standards, but not the specific responsibilities for voltage levels and reactive resources addressed by VAR-001-1, which have a great impact on system reliability. For example, voltage levels and reactive resources are important factors to ensure that IROLs are valid and operating voltages are within limits, and that reliability coordinators should have responsibilities in VAR-001-1 to monitor that sufficient reactive resources are available for reliable system operations. Accordingly, the ERO should modify VAR-001-1 to include reliability coordinators as applicable entities and include a new requirement(s) that identifies the reliability coordinator's monitoring responsibilities.	The SDT has clarified the issue of having the Reliability Coordinator provide oversight. The proposed requirement uses the term 'Facilities' which is defined as: "A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)." Therefore, the requirement covers voltage and reactive resources. **Proposed IRO-002-4, Requirement R3**: **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
INT-006-1	Order 693	866. The Commission directs the ERO to develop a modification to INT-006-1 through the Reliability	An equally efficient and effective method of addressing the directive was approved by the Board

Standard	Source	Language	Resolution
	Transferred from Project 2008-12 Coordinate Interchange Standards	Standards development process that makes it applicable to reliability coordinators and transmission operators. The Commission directs the ERO to develop a modification to INT-006-1 through the Reliability Standards development process that requires reliability coordinators and transmission operators to review energy interchange transactions from the wide-area and local area reliability viewpoints respectively and, where their review indicates a potential detrimental reliability impact, communicate to the sink balancing authorities necessary transaction modifications before implementation.	and filed with FERC by Project 2008-12 SDT by including the term 'Interchange' in the definition of Operational Planning Analysis. This change has been retained by Project 2014-03. Proposed IRO-008-2, Requirement R1 specifies that the Reliability Coordinator must perform an Operational Planning Analysis. By explicitly including "Interchange" in the definition of Operational Planning Analysis, the Reliability Coordinator must consider Interchange when performing the study. Then, in proposed IRO-008-2, Requirement R2, the Reliability Coordinator must develop a plan for addressing the problem. Similar requirements exist for the Transmission Operator in proposed TOP-002-3. **Proposed: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Standard	Source	Language	Resolution
			Proposed IRO-008-2, Requirement R1: **R1.** Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area. **Proposed IRO-008-2, Requirement R2**: **R2**. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. **Proposed IRO-008-2, Requirement R3:** **R3**. Each Reliability Coordinator shall notify impacted entities identified in the Operating Plan(s) cited in Requirement R3 as to their role in those plan(s). **Proposed TOP-002-4, Requirement R1:** **R1**. Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs).

Standard	Source	Language	Resolution
			Proposed TOP-002-4, Requirement R2: **R2**. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. **Proposed TOP-002-4, Requirement R3:** **R3**. Each Transmission Operator shall notify impacted entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in those plan(s).

NERC Operating Committee Response to NERC Standards Committee / RISC Triage of IERP Gaps

Updated August 2014

The NERC Operating Committee reviewed three perceived gaps, Outage Coordination, Governor Frequency Response, and Situational Awareness, as identified by the Independent Experts in their June 2013 report. As an important step in this review, the OC's Executive Committee met via WebEx with the Independent Experts to more thoroughly discuss and understand the thinking which led to these elements being cited as possible gaps. During the WebEx, the OCEC and the Independent Experts also reviewed all of the proposed requirements in the Independent Experts draft Authority matrix. The results of the OC's discussions, and the Project 2014-03 SDT's consideration within the revised TOP and IRO standards for two of the three perceived gaps (Outage Coordination and Situational Awareness) are presented below. The third gap identified by the Independent Experts, Governor Frequency Response, is outside the scope of Project 2014-03.

Outage Coordination

Draft requirements 3, 7, 8 and 9 of the Independent Experts draft Authority Standard focus on Outage Coordination. One concern recognized the fact that the Reliability Coordinators have a wide area view and broader situational awareness, allowing for early identification and resolution of conflicts. Therefore the RCs should have the most influence on outage coordination. Further concerns identify standards that are currently in flux, particularly those remanded standards in which requirements are being removed.

Operating Committee opinion

The Operating Committee concurs that Outage Coordination is an important grid reliability function. Outage coordination should originate from the TOPs and GOPs; with conflicts resolved by their respective RC. It makes sense for this process to begin with a set of previously approved scheduled long term outages with a sufficient time margin for results to be incorporated into seasonal operating studies. Further, the RC should retain the authority for final approval up to the time the asset is removed from service, as well as recall authority (if technically feasible and appropriate to recall) as needed to prevent or mitigate emergencies.

Longer term outage coordination is necessary for those assets that require long maintenance planning pursuant to the type of work required, such as turbine rebuilds, nuclear refueling, etc. This likely belongs in the scope of the Planning Coordinator (PC) for outages planned more than 12-months into the future. A Reliability Standard could be written that requires PCs to coordinate long term outages and which requires responsible entities (e.g., GOs, TOs) to request a time slot in which to perform whatever maintenance is required.

In either case, during the longer term planning horizon, or the Operations planning and real time operations time frame, each PC or RC should have an understanding of the impacts on neighboring PCs or RCs when those assets are planned to be out or are forced out, with notification/coordination requirements with these PCs or RCs.

SDT response:

To enhance reliability, the Project 2014-03 SDT has provided explicit requirement language to address the need for planned outage coordination at the Reliability Coordinator level. See proposed IRO-014-3, Requirement R1, part 1.4. The Project 2014-03 SDT has developed a new standard, IRO-017-1 Outage Coordination, to address overall outage coordination issues.

Proposed IRO-014-3, Requirement R1, part 1.4: Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and Real-time Assessments.

Situational Awareness (EMS RTCA models)

In this gap the Independent Experts recommend the development of a standard that defines the requirements for EMS RTCA models or performance expectations of the models (Project 2009-02 – Real Time Monitoring and Analyses Capabilities).

Operating Committee opinion

The Operating Committee has a concern that this gap could be interpreted as recommending a "HOW" standard where specific tools would be required even for the smallest TOPs, as opposed to a "WHAT" standard that would allow for other ways to accomplish the objective. In conversations with the Independent Experts it became clear that proper situational awareness was the primary concern. The OC concurs that real time contingency analysis process (real time updated topology and telemetry) should be performed on each BES facility. This functionality could be performed by use of an RTCA application at the TO or RC level, or coverage by alternate means would be appropriate.

SDT response:

The Project 2014-03 SDT has adapted approved IRO-008-1, Requirement R2 for the Transmission Operator. See proposed TOP-001-3, Requirement R13. In addition, the Project 2014-03 SDT has revised the definition of Real-time Assessment to allow for contracting needed services to accommodate concerns for smaller entities.

Proposed: Real-time Assessment - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase

angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Proposed TOP-001-3, Requirement R13: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

Remainder of the draft Authority Standard Requirements

Authority R1

Each RC, TOP and BA shall have the requirement and authority to take actions, including issuing a Reliability Directive, to prevent, mitigate and respond to an Emergency or Adverse Reliability Impact.

Operating Committee opinion

The current IRO-001-1.1 and TOP-001-1a are expected to be retired and replaced by IRO-001-3. In either case, these standards contain the authority to act, but the requirement to act appears to be implicit. The OC agrees that the RC, TOP and BA should explicitly be required to act.

SDT response:

The Project 2014-03 SDT agrees and has adjusted the wording in the standards to address this issue.

Proposed IRO-001-4, Requirement R1: Each Reliability Coordinator shall act, or direct others to act by issuing Operating Instructions, to ensure the reliability of its Reliability Coordinator Area.

Proposed TOP-001-3, Requirement R1: Each Transmission Operator shall act, or direct others to act by issuing Operating Instructions, to ensure the reliability of its Transmission Operator Area.

Proposed TOP-001-3, Requirement R2: Each Balancing Authority shall act, or direct others to act by issuing Operating Instructions, to ensure the reliability of its Balancing Authority Area.

Authority R2

Each RC, TOP and BA shall have the requirement and authority to approve, deny or cancel planned outages of its EMS, telecom and other hardware, and associated analysis tools.

Operating Committee opinion

The current IRO-002-2 provides for the RC to have control of its tools but does not include the TOP or BA. IRO-002-2 is expected to be retired and replaced by IRO-002-3, which clarifies that the system operators have the authority to approve outages of analysis tools (The OC suggests adding "under the direct control of their company"), but does not include TOPs or BAs. The OC concurs with the clarification in IRO-002-3, and the OC further agrees that TOPs and BAs should be included.

SDT response:

The Project 2014-03 has added proposed TOP-001-3, Requirements R16 and R17 to provide Transmission Operators and Balancing Authorities with capabilities similar to those of the Reliability Coordinator.

> Proposed TOP-001-3, Requirement R16: Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunication, and Real-time Assessment capabilities.
>
> Proposed TOP-001-3, Requirement R17: Each Balancing Authority shall provide its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunications, and analysis capabilities.

Authority R4

RC, TOP and BA shall provide its System Operators with the responsibility and authority to implement the actions under R1, R2 and R3.

Operating Committee opinion

During the OCEC/Independent Expert webex, the Independent Experts explained that the objective of this requirement is to mandate the posting of a letter in the control rooms granting authority to the system operators to carry out their required tasks. While the Operating Committee believes this is a good practice, it does not believe that it rises to the level of a Standards Requirement.

SDT response:

The Project 2014-03 SDT agrees with the position of the Operating Committee Executive Committee. A letter of authority located in the Control Room is an example of good utility practice. A change to the requirements is not warranted.

Authority R5

Each TOP, BA, GOP, and DP shall comply with directions from a RC, TOP or BA under R1 unless it communicates to the RC, TOP or BA that it cannot because the direction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements.

Operating Committee opinion

In relation to R1 above this understanding seems implicit. However, in the interest of clarity the OC would support this requirement.

SDT response:

The Project 2014-03 SDT agrees.

Proposed TOP-001-3, Requirement R3: Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements.

Proposed TOP-001-3, Requirement R5: Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Balancing Authority, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements.

Proposed IRO-001-4, Requirement R2: Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with its Reliability Coordinator's Operating Instructions unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements.

Authority R6

Each RC shall comply with directions from another RC under R1 unless it communicates to the other RC that it cannot because compliance with the direction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements.

Operating Committee opinion

IRO-014-5, IRO-015-1 and IRO-016-1 describe inter RC procedures, Plans, notifications and coordination. These standards are expected to be retired and replaced by IRO-014-2 incorporating the pertinent requirements from the retiring standards. However, none of these standards explicitly include a requirement for one RC to comply with a directive from another RC.

The OC recognizes that coordination between RCs is vitally important. It is also recognized that an RC is the entity with the best understanding and situational awareness of its unique footprint. Therefore it is not believed to be beneficial for operational reliability for one RC to direct the actions of another RC. Rather, it is more appropriate to have this type of coordination documented within the requisite Joint Operating Agreements in which the appropriate assistance would be documented and understood in advance of such actions.

SDT response:

The Project 2014-03 SDT believes that proposed IRO-014-2 Requirements R3 – R6 already require Reliability Coordinators to coordinate and implement action plans even if the RC cannot agree that a problem exists or what the exact action plan is

Proposed IRO-014-2, Requirement R3: Each Reliability Coordinator, upon identification of an expected or actual Emergency in its Reliability Coordinator Area, shall notify other impacted Reliability Coordinators.

Proposed IRO-014-2, Requirement R4: Each impacted Reliability Coordinator shall operate as though the Emergency exists during each instance where Reliability Coordinators disagree on the existence of an Emergency.

Proposed IRO-014-2, Requirement R5: Each Reliability Coordinator that identified an Emergency in its Reliability Coordinator Area shall develop an action plan to resolve the Emergency during those instances where impacted Reliability Coordinators disagree on the existence of an Emergency.

Proposed IRO-014-2, Requirement R6: Each impacted Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identified the Emergency during those instances where Reliability Coordinators disagree on the existence of an Emergency, unless such actions would violate safety, equipment, regulatory, or statutory requirements.

Standards Authorization Request Form

When completed, email this form to:
Laura.Hussey@nerc.net

For questions about this form or for assistance in completing the form, call Laura Hussey at 404-446-2579.

NERC welcomes suggestions for improving the reliability of the Bulk-Power System through improved Reliability Standards. Please use this form to submit your proposal for a new NERC Reliability Standard or a revision to an existing standard.

Request to propose a new or a revision to a Reliability Standard			
Proposed Standard:	TPL-001-5		
Date Submitted:	TBD		
SAR Requester Information			
Name:	TBD		
Organization:	TBD		
Telephone:	TBD	E-mail:	TBD
SAR Type (Check as many as applicable)			
☐ New Standard		☐ Withdrawal of existing Standard	
☒ Revision to existing Standard		☐ Urgent Action	

SAR Information
Industry Need (What is the industry problem this request is trying to solve?):
On October 17, 2013 the Commission issued its final ruling on TPL-001-4. In that ruling, FERC issued several directives that were to be addressed in the foreseeable future. In order to minimize the impact and burden on the industry caused by changes to address these directives, the resolution of other issues surrounding TPL-001-4 are proposed to be merged into one cohesive project. These issues include: addressing the directives of Order 786, resolution of the references to MOD standards due to revisions in that family of standards, addressing the comments and suggestions in the Independent Expert Review Report, possible integration of TPL-007-1 Transmission System Planned Performance for Geomagnetic Disturbance Events, revision of requirement R8 to specifically include the Reliability Coordinator, and other miscellaneous issues that may have been discovered during the first few years of implementation of TPL-001-4.

SAR Information
Purpose or Goal (How does this request propose to address the problem described above?):
The goal of this SAR is to consolidate into one cohesive project any changes needed to TPL-001-4 due to FERC directives, independent reports, and operating experience gained during the first few years of implementation of TPL-001-4.
Identify the Objectives of the proposed standard's requirements (What specific reliability deliverables are required to achieve the goal?):
Successful implementation of the revised standard will assure that all issues surrounding TPL-001-4 are addressed in one cohesive project thus minimizing the impact and burden of subsequent implementation on the industry.
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The proposed Standard Drafting Team (SDT) shall modify NERC Reliability Standard TPL-001-4 to explicitly address the directives of Order 786 including any adjustments indicated from the review of footnote 12 use, resolution of the references to MOD standards due to revisions in that family of standards, addressing the comments and suggestions in the Independent Expert Review Report, possible integration of TPL-007-1 Transmission System Planned Performance for Geomagnetic Disturbance Events, revision of requirement R8 to specifically include the Reliability Coordinator, and

SAR Information

other miscellaneous issues that may have been discovered during the first few years of implementation of TPL-001-4.

Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)

The SDT shall:

1. Consider adjustments to footnote 12 threshold values due to the report on usage filed by NERC
2. Address directives from FERC Order 786
   a. Paragraph 40: "…we direct NERC to modify Reliability Standard TPL-001-4 to address the concern that the six month threshold could exclude planned maintenance outages of significant facilities from future planning assessments."
   b. Paragraph 89: "… directs NERC to consider a similar spare equipment strategy for stability analysis upon the next review cycle of Reliability Standard TPL-001-4."
3. Consider any needed changes due to NERC's work on single points of failure in Protection Systems (paragraph 69 in FERC Order 786)
4. Consider the comments and suggestions in the Independent Expert Review Report
5. Consider the possible integration of TPL-007-1 Transmission System Planned Performance for Geomagnetic Disturbance Events for the creation of one cohesive planning performance standard
6. Modify the references to MOD standards due to revisions in that family of standards
7. Revise Requirement R8 to specifically include the Reliability Coordinator
8. Revise as necessary due to implementation experience
9. Modify the measures and Violation Severity Levels as necessary to address modified requirements

Reliability Functions	
The Standard will Apply to the Following Functions (Check each one that applies.)	
☐ Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.
☐ Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☐ Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐ Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☒ Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐ Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☒ Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐ Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒ Transmission Owner	Owns and maintains transmission facilities.
☐ Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐ Distribution Provider	Delivers electrical energy to the End-use customer.
☒ Generator Owner	Owns and maintains generation facilities.
☐ Generator Operator	Operates generation unit(s) to provide real and reactive power.

Reliability Functions		
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes

Reliability and Market Interface Principles	
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Violation Risk Factor and Violation Severity Level Assignments

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Violation Risk Factor and Violation Severity Level Assignments

This document provides the Standard Drafting Team's (SDT) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in Project 2014-03.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The SDT applied the following NERC criteria when proposing VRFs for the requirements in Project 2014-03.

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to

lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

---

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on rehearing and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").

[2] Id. at footnote 15.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

There are twenty requirements in proposed TOP-001-3. None of the twenty requirements were assigned a "Lower" VRF. Requirements R9 and R15 were assigned a "Medium" VRF while all of the other requirements were given a "High" VRF.

VRF for Proposed TOP-001-3, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements so only one VRF was assigned. Therefore, there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-001-1a that is assigned a High VRF. The requirements are viewed as similar since they both refer to taking action to ensure reliability. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to take action, or to direct others to take action, could directly affect the electrical state or the capability of the bulk power system and could lead to bulk power system instability, separation, or Cascading failures. Therefore, this requirement is assigned a High VRF.

- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R1 contains only one objective, therefore only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-001-1a that is assigned a High VRF. The requirements are viewed as similar since they both refer to taking action to ensure reliability: approved TOP-001-1a for a Transmission Operator and proposed TOP-001-3 for a Balancing Authority. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to take action, or to direct others to take action, could directly affect the electrical state or the capability of the bulk power system and could lead to bulk power system instability, separation, or Cascading failures. Therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R2 contains only one objective, therefore only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved TOP-001-1a that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to comply with issued Operating Instructions could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R3 contains only one objective, therefore only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R4:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.

- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved TOP-001-1a that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to comply with issued Operating Instructions could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R4 has only one objective, therefore only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R5:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, there is a similar requirement (Requirement R4) in approved TOP-001-1a that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to comply with issued Operating Instructions could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R5 contains only one objective. Therefore only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R6:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, there is a similar requirement (Requirement R4) in approved TOP-001-1a that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to comply with issued Operating Instructions could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R6 contains only one objective. Therefore only one VRF was assigned to the requirement.

VRF for Proposed TOP-001-3, Requirement R7:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (requirement R6) in approved TOP-001-1a which is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to provide requested assistance could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R7 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R8:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R7) in approved TOP-001-1a that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to inform other known impacted reliability entities of actions that may result in Emergencies could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R8 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R9:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved TOP-003-1 which is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Bulk power system instability, separation, or Cascading failures are not likely to occur due to a failure to adhere to this requirement. Thus, this requirement meets the criteria for a Medium VRF.

- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R9 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R10:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, there is a similar requirement (Requirement R4) in proposed IRO-002-4 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF. The requirements are considered similar as proposed IRO-002-4, Requirement R4 is for Reliability Coordinators while proposed TOP-001-3, Requirement R10 is for Transmission Operators.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Transmission Operator, could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 - Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R10 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R11:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, there is a similar requirement (Requirement R4) in approved IRO-002-4 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF. The requirements are considered similar as proposed IRO-002-4, Requirement R4 is for Reliability Coordinators while proposed TOP-001-3, Requirement R11 is for the Balancing Authority.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to monitor facilities could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R11 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R12:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.

- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-004-2 which has a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to operate within IROL T_v could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R12 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R13:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, there is a similar requirement (Requirement R2) in approved IRO-008-1 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF. The requirements are considered similar as approved IRO-008-1, Requirement R2 is for Reliability Coordinators while proposed TOP-001-3, Requirement R13 is for the Transmission Operator.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to ensure Real-time Assessments are performed at least every 30 minutes could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R13 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R14:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-004-2 which has a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to initiate the Operating Plan could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R14 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R15:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-007-0 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to inform the Reliability Coordinator of actions taken to return the system to within limits could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R15 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R16:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R8) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF. The requirements are considered similar as approved IRO-002-2, Requirement R8 is for Reliability Coordinators while proposed TOP-001-3, Requirement R16 is for the Transmission Operator.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to provide operators with authority to approve outages and maintenance of monitoring, telecommunication, and analysis capabilities could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R16 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R17:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R8) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF. The requirements are considered similar as approved IRO-002-2,

Requirement R8 is for Reliability Coordinators while proposed TOP-001-3, Requirement R17 is for the Balancing Authority.

- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to provide operators with authority to approve outages and maintenance of monitoring, telecommunications, and analysis capabilities could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R17 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R18:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R5) in approved IRO-009-1 that is assigned a High VRF. The requirements are considered similar since approved IRO-009-1 is about the Reliability Coordinator and proposed TOP-001-3, Requirement R18 is about the Transmission Operator. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to operate to the most limiting parameter when there is a difference in SOLs could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R18 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R19:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have data exchange capability could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R19, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R20:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have data exchange capability could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R20, contains only one objective; therefore, only one VRF was assigned.

There are seven requirements in proposed TOP-002-4. All of the requirements were assigned a Medium VRF.

VRF for Proposed TOP-002-4, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements, so only one VRF was assigned; therefore, there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-002-2.1b that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. This is an advanced planning requirement. So while not having an Operational Planning Analysis could hinder the Transmission Operator, in and of itself it does not directly affect the electrical state or the capability of the bulk power system and would not directly lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-002-4, Requirement R1, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-002-4, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.

- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-002-2.1b that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. This is an operational planning requirement. So in and of itself, it does not directly affect the electrical state or the capability of the bulk power system and would not directly lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-002-4, Requirement R2, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-002-4, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R4) in approved TOP-002-2.1b that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to notify other impacted reliability entities of their roles does not, in and of itself, lead to bulk power system instability, separation or Cascading failures. This is an advance planning requirement, not Real-time. The Transmission Operator still retains the operating requirements to preclude operating in exceedances of established limits. Thus, this requirement meets the criteria for a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-002-4, Requirement R3, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-002-4, Requirement R4:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-002-2.1b that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. This is an operational planning requirement. So in and of itself, it does not directly affect the electrical state or the capability of the bulk power system and would not directly lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.

- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-002-4, Requirement R4, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-002-4, Requirement R5:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R4) in approved TOP-002-2.1b that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to notify other impacted reliability entities of their roles does not, in and of itself, lead to bulk power system instability, separation or Cascading failures. This is an advance planning requirement, not Real-time. Thus, this requirement meets the criteria for a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-002-4, Requirement R5, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-002-4, Requirement R6:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement with no similar requirement to compare against. However, it is a coordination issue in the operational planning timeframe and so is being treated in a similar fashion to the other requirements in this standard. Hence, this requirement is assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to submit the Operating Plan for next-day operations cannot, in and of itself, lead to bulk power system instability, separation or Cascading failures. This is an advance planning requirement, not Real-time. Thus, this requirement meets the criteria for a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-002-4, Requirement R6, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-002-4, Requirement R7:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement with no similar requirement to compare against. However, it is a coordination issue in the operational planning timeframe and so is being treated in a similar fashion to the other requirements in this standard. Hence, this requirement is assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to submit the Operating Plan for next-day operations cannot, in and of itself, lead to bulk power system instability, separation or Cascading failures. This is an advance planning requirement, not Real-time. Thus, this requirement meets the criteria for a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-002-4, Requirement R7, contains only one objective; therefore, only one VRF was assigned.

There are five requirements in proposed TOP-003-3. Four of the five requirements were assigned a "Low" VRF: Requirements R1, R2, R3, and R4. Requirement R5 was assigned a "Medium" VRF.

VRF for Proposed TOP-003-3, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements, so only one VRF was assigned; therefore, there is no conflict.
- FERC's Guideline 3 — Consistency among reliability standards. There is a similar requirement (Requirement R1) in approved IRO-010-1a that is also assigned a Low VRF. The requirements are viewed as similar since they both refer to data specifications: approved IRO-010-1a for a Reliability Coordinator, and proposed TOP-003-3 for a Transmission Operator.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to compile a data specification does not relieve a Transmission Operator from its responsibility to reliably operate the bulk power system, so this requirement, in and of itself, is administrative in nature and does not directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Low VRF.

- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-003-3, Requirement R1, contains only one objective; therefore only one VRF was assigned.

VRF for Proposed TOP-003-3, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-010-1a that is assigned a Low VRF. The requirements are viewed as similar since they both refer to data specifications: approved IRO-010-1a for a Reliability Coordinator, and proposed TOP-003-3 for a Balancing Authority.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to distribute the data specification does not relieve a Balancing Authority from its responsibility to reliably operate the bulk power system, so this requirement, in and of itself, is administrative in nature and does not directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Low VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-003-3, Requirement R2, contains only one objective, therefore only one VRF was assigned.

VRF for Proposed TOP-003-3, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R2) in approved IRO-010-1a that is assigned a Low VRF. The requirements are viewed as similar since they both refer to the distribution of the data specification: approved IRO-010-1a for a Reliability Coordinator and proposed TOP-003-3, Requirement R3 for a Transmission Operator.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to distribute the data specification does not relieve a Transmission Operator from its responsibility to reliably operate the bulk power system, so this requirement, in and of itself, is administrative in nature and does not directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Lower VRF.

- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-003-3, Requirement R3, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-003-3, Requirement R4:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R2) in approved IRO-010-1a that is assigned a Low VRF. The requirements are viewed as similar since they both refer to the distribution of the data specification: approved IRO-010-1a for a Reliability Coordinator, and proposed TOP-003-3 for a Balancing Authority.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to distribute the data specification does not relieve a Balancing Authority from its responsibility to reliably operate the bulk power system, so this requirement, in and of itself, is administrative in nature and does not directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Low VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-003-3, Requirement R4, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-003-3, Requirement R5:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved IRO-010-1a that is assigned a Medium VRF. The requirements are viewed as similar since they both refer to the provision of data: approved IRO-010-1 for a Reliability Coordinator, and proposed TOP-003-3 for a Transmission Operator and Balancing Authority.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to provide the data requested does not, in and of itself, directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures. However, it greatly increases the likelihood of such problems and, therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-003-3, Requirement R5, has only one objective; therefore, only one VRF was assigned.

There are three requirements in proposed IRO-001-4. All of the requirements were assigned a "High" VRF.

VRF for Proposed IRO-001-4, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved IRO-001-1.1 that is assigned a High VRF. The requirements are viewed as similar since they both refer to taking actions to preserve reliability.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to act, or direct others to act, could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-001-4, Requirement R1, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-001-4, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R8) in approved IRO-001-1.1 that is assigned a High VRF. Therefore, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to comply with Operating Instructions could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-001-4, Requirement R2, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-001-4, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R8) in approved IRO-001-1.1 that is assigned a High VRF. Therefore this requirement is also assigned a High VRF.

- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to inform the Reliability Coordinator of the inability to follow an Operating Instruction could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-001-4, Requirement R3, contains only one objective; therefore, only one VRF was assigned.

There are four requirements in proposed IRO-002-4. All of the requirements were assigned a "High" VRF.

VRF for Proposed IRO-002-4, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have data exchange capabilities could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-002-4, Requirement R1, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-002-4, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R8) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to give operators the authority to approve planned outages and maintenance of telecommunication, monitoring and analysis capabilities could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-002-4, Requirement R2, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-002-4, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-003-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-002-4, Requirement R3, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-002-4, Requirement R4:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R4) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have adequate monitoring systems with emphasis on cited criteria could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-002-4, Requirement R4, contains only one objective; therefore, only one VRF was assigned.

There are six requirements in proposed IRO-008-2. Four of the six requirements were assigned a "Medium" VRF: Requirements R1, R2, R3, and R6. The other requirements were assigned a "High" VRF.

VRF for Proposed IRO-008-2, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-008-1 that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.

- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to perform an Operational Planning Analysis in the operational planning timeframe, in and of itself, does not directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-008-2, Requirement R1, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-008-2, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement and there are no comparable requirements to compare against. It is a coordination requirement in the operational planning timeframe so this requirement is assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to coordinate an Operating Plan in the operational planning timeframe, in and of itself, does not directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-008-2, Requirement R2, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-008-2, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved IRO-008-1 that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to notify entities of roles in Operating Plans in the operational planning timeframe, in and of itself, does not directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-008-2, Requirement R3, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-008-2, Requirement R4:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R2) in approved IRO-008-1 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to ensure that a Real-time Assessment is performed at least once every 30 minutes could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-008-2, Requirement R4, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-008-2, Requirement R5:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved IRO-008-1 that is assigned a Medium VRF. However, that requirement combines operations planning and Real-time. This requirement only applies to Real-time which in the belief of the SDT raises the VRF to High.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to notify impacted entities of roles in plans in the Real-time environment could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-008-2, Requirement R5, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-008-2, Requirement R6:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, it is similar to proposed TOP-001-3, Requirement R15 which is assigned a Medium VRF. The requirements are similar in that proposed IRO-008-2, Requirement R8 is for Reliability Coordinators while proposed TOP-001-3 is for Transmission Operators. Hence, this requirement is also assigned a Medium VRF.

- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to notify impacted entities of when exceedances have been mitigated will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-008-2, Requirement R6, contains only one objective; therefore, only one VRF was assigned.

There are three requirements in proposed IRO-010-2. Two of the requirements, Requirements R1 and R2, are assigned "Low" VRFs. Requirement R3 is assigned a "Medium" VRF.

VRF for Proposed IRO-010-2, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-010-1a that is assigned a Low VRF. Hence, this requirement is also assigned a Low VRF. This is also consistent with proposed TOP-003-3, Requirement R1.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to distribute the data specification does not, in and of itself, lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Low VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-010-2, Requirement R1, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-010-2, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R2) in approved IRO-010-1a that is assigned a Low VRF. Hence, this requirement is also assigned a Low VRF. This is also consistent with proposed TOP-003-3, Requirement R2.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to distribute the data specification does not, in and of itself, lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Low VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-010-3, Requirement R2, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-010-2, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved IRO-010-1a that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to supply the data requested does not, in and of itself, lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-010-2, Requirement R3, contains only one objective; therefore, only one VRF was assigned.

There are seven requirements in proposed IRO-014-3. Four of the requirements, Requirements R4, R5, R6, and R7, were assigned a "High" VRF. Requirements R1 and R3 were assigned a "Medium" VRF. Requirement R2 was assigned a "Low" VRF.

VRF for Proposed IRO-014-3, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-014-1 that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have and implement the plans and procedures, in and of itself, will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-014-3, Requirement R1, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-014-3, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement with no comparable requirement that is assigned a Low VRF. The requirement is for maintenance of plans, processes, and procedures. Hence, the designation of a Low VRF.

- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to maintain the plans, processes, and procedures is administrative in nature and does not directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Low VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-014-3, Requirement R2, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-014-3, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-016-1 that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to notify other Reliability Coordinators, in and of itself, will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-014-3, Requirement R3, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-014-3, Requirement R4:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1.2) in approved IRO-016-1 that is assigned a Medium VRF. Upon reviewing the requirement, the SDT believes that it needs to be elevated to a High VRF since it is dealing with actions taken to operate during a possible Emergency situation in Real-time.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to operate as if the Emergency exists while the situation needs to be resolved could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-014-3, Requirement R4, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-014-3, Requirement R5:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-016-1 that is assigned a Medium VRF. Upon reviewing the requirement, the SDT believes that it needs to be elevated to a High VRF since it is dealing with actions taken to operate during a possible Emergency situation in Real-time.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to operate as if the Emergency exists while the situation needs to be resolved could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-014-3, Requirement R5, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-014-3, Requirement R6:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1.1) in approved IRO-016-1 that is assigned a Medium VRF. Upon reviewing the requirement, the SDT believes that it needs to be elevated to a High VRF since it is dealing with actions taken to operate during a possible Emergency situation in Real-time.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to operate as if the Emergency exists while the situation needs to be resolved could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-014-3, Requirement R6, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-014-3, Requirement R7:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, it is similar to proposed TOP-001-3, Requirement R7 which has a High VRF assignment. The requirements are similar in that proposed TOP-001-3, Requirement R7 is for Transmission Operators and Balancing Authorities while proposed IRO-014-3, Requirement R9 is for Reliability Coordinators. Hence, this requirement is also assigned a High VRF.

- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to provide requested assistance could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-014-3, Requirement R7, contains only one objective; therefore, only one VRF was assigned.

There are four requirements in proposed IRO-017-1. All four of the requirements have been assigned a "Medium" VRF.

VRF for Proposed IRO-017-1, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R6) in proposed IRO-005-3.1a that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have a coordination process, in and of itself in the planning timeframe, will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-017-1, Requirement R1, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-017-1, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement with no comparable requirement that is assigned a Medium VRF. The requirement is for following the process described in proposed IRO-017-1, Requirement R1 which is assigned a Medium VRF. Hence, the designation of a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to follow the process, in and of itself in the planning timeframe, will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-017-1, Requirement R2, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-017-1, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R8) in approved TPL-001-4 that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to distribute the assessments, in and of itself in the planning timeframe, will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-017-1, Requirement R3, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-017-1, Requirement R4:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R6) in proposed IRO-005-3.1a that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to coordinate solutions, in and of itself in the planning timeframe, will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-017-1, Requirement R4, contains only one objective; therefore, only one VRF was assigned.

Justification for Assignment of Violation Severity Levels:
In developing the VSLs for the TOP/IRO standards, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance. The performance or product measured has significant value, as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance, or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement, or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance
Compare the VSLs to any prior levels of noncompliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of noncompliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties
A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement
VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of noncompliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation, per day basis is the "default" for penalty calculations.

VSLs for Proposed TOP-001-3, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines – Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSL for a similar requirement is for the approved TOP-001-1a, Requirement R1. While similar, that requirement is not exactly the same as it had two clearly different objects. One of the objects has more to do with actions than the other and that part of the VSL is binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSL for a similar requirement is for the approved TOP-001-1a, Requirement R1. While similar, that requirement is not exactly the same as it had two clearly different objects. One of the objects has more to do with actions than the other and that part of the VSL is Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines – Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSL for a similar requirement is for the approved TOP-001-1a, Requirement R3. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSLs use the same terminology as used in the associated requirement, and are, therefore, consistent with the requirement.	The VSLs are based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R4:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSL for a similar requirement is for the approved TOP-001-1a, Requirement R3. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R5:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSLs for a similar requirement are for the approved TOP-001-1a, Requirement R4. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSLs use the same terminology as used in the associated requirement, and are, therefore, consistent with the requirement.	The VSLs are based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R6:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R6.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSLs for a similar requirement are for the approved TOP-001-1a, Requirement R4. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSLs use the same terminology as used in the associated requirement, and are, therefore, consistent with the requirement.	The VSLs are based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R7:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R7.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved TOP-001-1a, Requirement R6. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for TOP-001-2 Requirement R8:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R8.	Meets NERC's VSL guidelines. There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The most comparable VSLs for a similar requirement are for the approved TOP-001-1a, Requirement R7. Those VSLs are binary Severe. However, when assigning the VSLs for this requirement, the SDT believed that it was possible to provide a gradual increasing scale for the VSLs and assigned the VSLs appropriately.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R9:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R9.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The most comparable VSLs for a similar requirement are those for proposed TOP-003-1, Requirement R3. Those VSLs are binary Severe. However, when assigning the VSL for the new requirement, the SDT believed that it was possible to provide a gradual increasing scale for the VSL and assigned the VSLs appropriately.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R10:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R10.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSLs for a similar requirement are for the proposed IRO-002-2, Requirement R4. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R11:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R11.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the proposed IRO-002-2, Requirement R4. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R12:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R12.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved TOP-004-2, Requirement R1. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R13:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R13.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The most comparable VSLs for a similar requirement are for the approved IRO-008-1, Requirement R2. Those VSLs are gradated based on missing the timing requirement. Therefore, the SDT assigned gradated VSLs to this requirement on the same basis.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R14:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R14.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved TOP-004-2, Requirement R1. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R15:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R15.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved TOP-007-0, Requirement R1. Those VSLs are gradated based on delivering an incomplete message. The SDT believed that the message needed to be complete to preserve reliability. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R16:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R16.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved IRO-002-2, Requirement R8. Those VSLs are gradated based on splitting up the different approval rights. The SDT did not believe that there was any value to reliability by splitting up the approval rights. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R17:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R17.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved IRO-002-2, Requirement R8. Those VSLs are gradated based on splitting up the different approval rights. The SDT did not believe that there was any value to reliability by splitting up the approval rights. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R18:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R18.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved IRO-009-1, Requirement R5. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R19:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R19.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved IRO-002-2, Requirement R1. Those VSLs are gradated based on a degree of incompleteness of the needed data exchange capabilities and the SDT has adopted that philosophy here as well.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R20:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R20.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved IRO-002-2, Requirement R1. Those VSLs are gradated based on a degree of incompleteness of the needed data exchange capabilities and the SDT has adopted that philosophy here as well.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-002-4, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	There is a similar requirement in approved TOP-002-2.1b, Requirement R1. Those VSLs are graded based on differing parts of the requirement. This requirement has only one objective – performing the analysis. That objective matches to the Severe VSL in approved TOP-002-2.1b and the SDT has proposed a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-002-4, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	There is a similar requirement in approved TOP-002-2.1b, Requirement R1. Those VSLs are graded based on differing parts of the requirement. This requirement has only one objective – performing the analysis. That objective matches to the Severe VSL in approved TOP-002-2.1b and the SDT has proposed a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-002-4, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	There is a similar requirement in approved TOP-002-2.1b, Requirement R4. Those VSLs are gradated and the SDT is proposing similar treatment here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-002-4, Requirement R4:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	There is a similar requirement in approved TOP-002-2.1b, Requirement R1. Those VSLs are gradated and the SDT is proposing similar treatment here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-002-4, Requirement R5:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	There is a similar requirement in approved TOP-002-2.1b, Requirement R4. Those VSLs are gradated and the SDT is proposing similar treatment here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-002-4, Requirement R6:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R6.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	This is a new requirement with no comparable requirements to compare against. There is only one action to take here, to submit the Operating Plan. There is no partial compliance so the SDT assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-002-4, Requirement R7:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R7.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	This is a new requirement with no comparable requirements to compare against. There is only one action to take here, to submit the Operating Plan. There is no partial compliance so the SDT assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-003-3, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-010-1a, Requirement R1. The proposed VSLs are similar in that they build on a graduated scale based on missing parts of the requirement. Thus, the VSL in the proposed standard does not lower the level of compliance currently required by setting VSLs that are less punitive than those already proposed.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-003-3, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-010-1a, Requirement R1. The proposed VSLs are similar in that they build on a graduated scale based on missing parts of the requirement. Thus, the VSL in the proposed standard does not lower the level of compliance currently required by setting VSLs that are less punitive than those already proposed.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-003-3, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-010-1a, Requirement R2. The proposed VSLs are similar in that they build on a graduated scale based on missing parts of the requirement. Thus, the VSL in the proposed standard does not lower the level of compliance currently required by setting VSLs that are less punitive than those already proposed.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-003-3, Requirement R4:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-010-1a, Requirement R2. The proposed VSLs are similar in that they build on a graduated scale based on missing parts of the requirement. Thus, the VSL in the proposed standard does not lower the level of compliance currently required by setting VSLs that are less punitive than those already proposed.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-003-3, Requirement R5:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-010-1a, Requirement R3. Those VSLs tried to gradate the provision of data. The SDT did not believe that such an exercise benefited reliability and that this was a binary situation where an entity supplies the data or it doesn't. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-001-4, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-001-1.1, Requirement R3. Those VSLs are binary Severe. Therefore, the SDT has assigned these VSLs to be binary Severe.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-001-4, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-001-1.1, Requirement R8. Those VSLs tried to gradate the situation by separating out following an Operating Instruction and informing of the inability to follow. Those actions are now separate requirements and this requirement is only about complying with the Operating Instruction which has a binary Severe VSL in approved IRO-001-1.1. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-001-4, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-001-1.1, Requirement R8. Those VSLs tried to gradate the situation by separating out following an Operating Instruction and informing of the inability to follow. Those actions are now separate requirements and this requirement is only about informing the Reliability Coordinator which has a single Moderate VSL in approved IRO-001-1.1. The SDT believes that such a failure should be classified as binary Severe under current guidelines.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-002-4, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-002-2, Requirement R1. Those VSLs are gradated and the SDT has followed that pattern here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-002-4, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-002-2, Requirement R8. Those VSLs tried to gradate the situation. The SDT did not believe that such an exercise benefited reliability and that this was a binary situation where an entity has supplied the authority or it hasn't. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-002-4, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-003-2, Requirement R1. Those VSLs tried to gradate the degree of monitoring. The SDT did not believe that such an exercise benefited reliability and that this was a binary situation where an entity is doing the monitoring or it isn't. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-002-4, Requirement R4:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-002-2, Requirement R4. Those VSLs tried to gradate the situation. The SDT did not believe that such an exercise benefited reliability and that this was a binary situation where an entity is providing adequate monitoring facilities with the particular emphasis or it doesn't. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-008-2, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-008-1, Requirement R1. Those VSLs tried to gradate the performance of the Operational Planning Analysis by the number of days in a month that it wasn't available. The SDT did not believe that such an exercise benefited reliability and that this was a binary situation where an entity performs the analysis or it doesn't. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-008-2, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	This is a new requirement with no comparable requirement to compare against. The SDT believes that this is a binary situation where an entity performs the coordination activity or it doesn't. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-008-2, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-008-1, Requirement R3. Those VSLs gradated the notification efforts. The SDT has followed a similar path and assigned incremental VSLs here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-008-2, Requirement R4:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-008-1, Requirement R2. Those VSLs gradated the performance of Real-time Assessments based on time increments. The SDT made a similar assignment here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-008-2, Requirement R5:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-008-1, Requirement R3. Those VSLs partially gradated the notification elements. The SDT has followed a similar path but assigned a complete set of incremental VSLs here consistent with current accepted practice.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-008-2, Requirement R6:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R6.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to proposed TOP-001-3, Requirement R15. Those VSLs are set up as a binary Severe situation but that requirement only involves notifying one entity, the Reliability Coordinator. There are potentially many more entities involved with this requirement so the SDT has set up a gradated set of VSLs.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-010-2, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-010-1a, Requirement R1. The proposed VSLs are similar in that they build on a graduated scale based on missing parts of the requirement. Thus, the VSL in the proposed standard does not lower the level of compliance currently required by setting VSLs that are less punitive than those already proposed.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-010-2, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-010-1a, Requirement R2. The proposed VSLs are similar in that they build on a graduated scale based on missing parts of the requirement. Thus, the VSL in the proposed standard does not lower the level of compliance currently required by setting VSLs that are less punitive than those already proposed.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-010-2, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-010-1a, Requirement R2. The proposed VSLs are similar in that they build on a graduated scale based on missing parts of the requirement. Thus, the VSL in the proposed standard does not lower the level of compliance currently required by setting VSLs that are less punitive than those already proposed.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-014-3, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-014-1, Requirement R1. Those VSLs present an incremental approach and the SDT has continued that approach.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-014-3, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	This is a new requirement with no comparable requirement to follow. There are a number of criteria cited for the requirement and this lends itself to an incremental approach for the VSLs.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-014-3, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-016-1, Requirement R1. Those VSLs are presented in an incremental approach. Therefore, the SDT has assigned incremental VSLs here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-014-3, Requirement R4:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-016-1, Requirement R1.2. Those VSLs are presented as binary Severe. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-014-3, Requirement R5:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-016-1, Requirement R1. Those VSLs tried to gradate things but the only differential is whether evidence was provided or not – actions themselves are covered in Severe. The SDT did not believe that such an exercise benefited reliability and that this was a binary situation where an entity develops a plan or it doesn't. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-014-3, Requirement R6:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R6.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-016-1, Requirement R1.1. Those VSLs tried to gradate the situation. The SDT did not believe that such an exercise benefited reliability and that this was a binary situation where an entity implements the plan or it doesn't. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-014-3, Requirement R7:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R7.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to proposed TOP-001-3, Requirement R7. Those VSLs are presented as binary Severe. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-017-1, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	This requirement is similar to proposed IRO-005-3.1a, Requirement R6 which has gradated VSLs and the SFT has adopted that approach here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-017-1, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	This is a new requirement with no similar requirement in the Reliability Standards. The responsible entity either follows the process or it doesn't. Attempting to increment the effort doesn't make sense. Therefore, this VSL is binary Severe.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-017-1, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	This requirement is similar to approved TPL-001-4, Requirement R8. In that case, the VSLs are incremental. However, the responsible entities there are dealing with many other entities. In this case, the responsible entity is dealing only with Reliability Coordinators which makes an incremental approach unnecessary due to the much smaller number of involved entities. Therefore, the VSL is binary Severe.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-017-1, Requirement R4:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	This requirement is similar in nature to proposed IRO-017-1, Requirement R1. The VSL has been assigned in a similar manner – binary Severe.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

Unofficial Comment Form

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Please **DO NOT** use this form for submitting comments. Please use the electronic form to submit comments on the Standard. The electronic comment form must be completed by 8 p.m. EST **Friday, September 19, 2014.**

If you have questions please contact Ed Dobrowolski at ed.dobrowolski@nerc.net or by telephone at 609-947-3673.

The project web page can be found at: http://www.nerc.com/pa/Stand/Pages/Project-2014-03-Revisions-to-TOP-and-IRO-Standards.aspx

Background Information - Project 2014-03 – Revisions to TOP/IRO Reliability Standards

On April 16, 2013, NERC submitted two petitions requesting Commission approval of TOP and IRO standards.

On November 21, 2013, FERC issued a NOPR proposing to remand three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) to replace the eight currently-effective TOP standards and four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) to replace six currently-effective IRO standards. In the NOPR, FERC stated that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards."

In response, NERC filed a motion requesting that FERC defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR and afford time to review the proposed TOP and IRO Standards through the NERC standards development process. That motion to defer action was granted on January 14, 2014.

The standard drafting team (SDT) formed to address those concerns made revisions to the TOP and IRO standards proposed to be remanded, along with several other IRO standards to provide consistency amongst the TOP and IRO standards, to address NOPR issues and recommendations made by the Independent Expert Review Panel, the IRO five-year review team, and the 2011 SW Outage Report. The initial draft standards were posted for an initial comment period and ballot through July 2, 2014.

This is the second posting of the standards. The SDT has made numerous changes in the second posting to the proposed standards and definitions in order to respond to industry comments raised in the first posting.

The SDT requests that commenters objectively evaluate the work of the SDT in responding to the issues raised in FERC's November 21, 2013 NOPR, along with the recommendations made by the Independent Expert Review Panel (IERP), the IRO FYRT, and the SW Outage Report. The drafting team has committed to address these issues and is not at liberty to question the issues in the FERC NOPR.

You do not have to answer all questions. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

Questions

1. Do you agree with the changes made to respond to industry comments to proposed IRO-001-4? If not, please provide technical rationale for your disagreement along with suggested language changes.

   Yes:

   No:

   Comments:

2. Do you agree with the changes made to respond to industry comments to proposed IRO-002-4? If not, please provide technical rationale for your disagreement along with suggested language changes.

   Yes:

   No:

   Comments:

3. Do you agree with the changes made to respond to industry comments to proposed IRO-008-2? If not, please provide technical rationale for your disagreement along with suggested language changes.

   Yes:

   No:

   Comments:

4. Do you agree with the changes made to respond to industry comments to proposed IRO-010-2? If not, please provide technical rationale for your disagreement along with suggested language changes.

   Yes:

   No:

Comments:

5. Do you agree with the changes made to respond to industry comments to proposed IRO-014-3? If not, please provide technical rationale for your disagreement along with suggested language changes.

   Yes:

   No:

   Comments:

6. The drafting team has proposed a new standard to address outage coordination concerns. Do you agree with the changes made to respond to industry comments to the new standard, IRO-017-1? If not, please provide technical rationale for your disagreement along with suggested language changes.

   Yes:

   No:

   Comments:

7. Do you agree with the changes made to respond to industry comments to proposed TOP-001-3? If not, please provide technical rationale for your disagreement along with suggested language changes.

   Yes:

   No:

   Comments:

8. Do you agree with the changes made to respond to industry comments to proposed TOP-002-4? If not, please provide technical rationale for your disagreement along with suggested language changes.

   Yes:

   No:

   Comments:

9. Do you agree with the changes made to respond to industry comments to proposed TOP-003-3? If not, please provide technical rationale for your disagreement along with suggested language changes.

   Yes:

   No:

Comments:

10. Do you have any comments on the changes made to respond to industry comments on the SOL Exceedance White Paper? If so, please provide technical rationale for your disagreement along with suggested language changes.

    Yes:

    No:

    Comments:

11. The SDT has made revisions to VRFs and VSLs as needed to conform to changes made to requirements and to respond to industry comments. Do you agree with the VRFs and VSLs for the nine posted standards? If you do not agree, please indicate specifically which standard(s) and requirement(s), and whether it is the VRF or VSLs you disagree with, and explain why.

    Yes:

    No:

    Comments:

12. Are there any other concerns with these standards that haven't been covered in previous questions and comments?

    Yes:

    No:

Standards Announcement Reminder

Project 2014-03 Revisions to TOP and IRO Standards

Additional Ballots Now Open through September 19, 2014

Now Available

Additional Ballots for three **TOP** and six **IRO Reliability Standards,** two definitions, and the implementation plan and non-binding polls of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) are open through **8 p.m. Eastern on Friday, September 19, 2014.**

Background information, including a revised white paper and additional supporting documents for this project can be found on the project page.

Instructions for Balloting

Members of the ballot pools associated with this project may log in and submit their vote for the standards, definitions, implementation plan and associated VRFs and VSLs by clicking here.

Note: If a member cast a vote in the initial ballot, that vote will not carry over to the additional ballot. It is the responsibility of the registered voter in the ballot pool to cast a vote again in the additional ballot. To ensure a quorum is reached, if you do not want to vote affirmative or negative, please cast an abstention.

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standards and post them for an additional ballot. If the comments do not show the need for significant revisions, the standards will proceed to a final ballot.

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, or at 404-446-2560.

Standards Announcement

Project 2014-03 Revisions to TOP and IRO Standards

Formal Comment Period Now Open through September 19, 2014

Now Available

A 45-day formal comment period for three **TOP** and six **IRO Reliability Standards,** two definitions, and the implementation plan is open through **8 p.m. Eastern on Friday, September 19, 2014.**

Background information, including a revised white paper and additional supporting documents for this project can be found on the project page.

Instructions for Commenting

Please use the electronic form to submit comments on the standards. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

Additional ballots for the standards and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **September 10-19, 2014.**

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller,
Standards Development Administrator, or at 404-446-2560.

Standards Announcement

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Additional Ballot and Non-Binding Poll Results

Now Available

Additional ballots for nine **TOP/IRO Reliability Standards**, two definitions, and the implementation plan; and nine non-binding polls of the associated Violation Risk Factors and Violation Severity Levels concluded at **8 p.m. Eastern on Friday, September 19, 2014**.

Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballots.

	Ballot Results	Non-Binding Poll Results
	Quorum /Approval	Quorum/Supportive Opinions
IRO-001-4	85.75% / 76.12%	85.34% / 74.01%
IRO-002-4	84.96% / 74.23%	85.04% / 69.69%
IRO-008-2	84.96% / 75.67%	85.34% / 69.39%
IRO-010-2	85.22% / 85.49%	85.63% / 83.78%
IRO-014-3	84.96% / 75.96%	85.63% / 78.61%
IRO-017-1	85.22% / 78.67%	86.22% / 74.19%
TOP-001-3	85.49% / 48.73%	86.51% / 53.45%
TOP-002-4	85.22% / 78.87%	86.51% / 73.30%
TOP-003-3	86.28% / 87.03%	86.51% / 79.30%
2 Definitions	83.11% / 93.34%	NA
Implementation Plan	83.91% / 90.13%	NA

Background information for this project can be found on the project page.

Next Steps

The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standards and post them for an additional ballot. If the comments do not show the need for significant revisions, the standards will proceed to a final ballot.

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller (via email), Standards Development Administrator, or at 404-446-2560.

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Non-Binding Poll Results	
Non-Binding Poll Name:	Project 2014-03 TOP-001-3
Poll Period:	9/10/2014 - 9/19/2014
Total # Opinions:	295
Total Ballot Pool:	341
Summary Results:	86.51% of those who registered to participate provided an opinion or an abstention; 53.45% of those who provided an opinion indicated support for the VRFs and VSLs.

Individual Ballot Pool Results

Segment	Organization	Member	Opinions	NERC Notes
1	Ameren Services	Eric Scott	Abstain	
1	American Electric Power	Paul B Johnson	Affirmative	
1	Arizona Public Service Co.	Brian Cole	Affirmative	
1	Associated Electric Cooperative, Inc.	John Bussman	Negative	SUPPORTS THIRD PARTY COMMENTS - (AECI)
1	Austin Energy	James Armke	Affirmative	
1	Avista Utilities	Heather Rosentrater

Non-Binding Poll Results

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Non-Binding Poll Results	
Non-Binding Poll Name:	Project 2014-03 TOP-002-4
Poll Period:	9/10/2014 - 9/19/2014
Total # Opinions:	295
Total Ballot Pool:	341
Summary Results:	86.51% of those who registered to participate provided an opinion or an abstention; 73.30% of those who provided an opinion indicated support for the VRFs and VSLs.

Individual Ballot Pool Results

Segment	Organization	Member	Opinions	NERC Notes
1	Ameren Services	Eric Scott	Abstain	
1	American Electric Power	Paul B Johnson	Abstain	
1	Arizona Public Service Co.	Brian Cole	Affirmative	
1	Associated Electric Cooperative, Inc.	John Bussman	Negative	SUPPORTS THIRD PARTY COMMENTS - (AECI)
1	Austin Energy	James Armke	Affirmative	
1	Avista Utilities	Heather Rosentrater		
1	Balancing Authority of Northern California	Kevin Smith	Affirmative	
1	BC Hydro and Power Authority	Patricia Robertson	Abstain	
1	Bonneville Power Administration	Donald S. Watkins	Affirmative	
1	Brazos Electric Power Cooperative, Inc.	Tony Kroskey	Affirmative	
1	Bryan Texas Utilities	John C Fontenot	Affirmative	
1	CenterPoint Energy Houston Electric, LLC	John Brockhan	Abstain	
1	Central Electric Power Cooperative	Michael B Bax		
1	Central Iowa Power Cooperative	Kevin J Lyons	Affirmative	
1	City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	Chang G Choi	Affirmative	
1	City of Tallahassee	Daniel S Langston	Affirmative	
1	Clark Public Utilities	Jack Stamper	Affirmative	

1	Colorado Springs Utilities	Shawna Speer	Affirmative	
1	Consolidated Edison Co. of New York	Christopher L de Graffenried	Affirmative	
1	CPS Energy	Glenn Pressler	Affirmative	
1	Dairyland Power Coop.	Robert W. Roddy	Affirmative	
1	Dominion Virginia Power	Larry Nash	Abstain	
1	Duke Energy Carolina	Doug E Hils	Negative	SUPPORTS THIRD PARTY COMMENTS - (Duke Energy)

Non-Binding Poll Results

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Non-Binding Poll Results	
Non-Binding Poll Name:	Project 2014-03 IRO-002-4
Poll Period:	9/10/2014 - 9/19/2014
Total # Opinions:	290
Total Ballot Pool:	341
Summary Results:	85.04% of those who registered to participate provided an opinion or an abstention; 69.69% of those who provided an opinion indicated support for the VRFs and VSLs.

Individual Ballot Pool Results

Non-Binding Poll Results

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Non-Binding Poll Results	
Non-Binding Poll Name:	Project 2014-03 IRO-008-2
Poll Period:	9/10/2014 - 9/19/2014
Total # Opinions:	291
Total Ballot Pool:	341
Summary Results:	85.34% of those who registered to participate provided an opinion or an abstention; 69.39% of those who provided an opinion indicated support for the VRFs and VSLs.

Individual Ballot Pool Results

Non-Binding Poll Results

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Non-Binding Poll Results	
Non-Binding Poll Name:	Project 2014-03 IRO-010-2
Poll Period:	9/10/2014 - 9/19/2014
Total # Opinions:	292
Total Ballot Pool:	341
Summary Results:	85.63% of those who registered to participate provided an opinion or an abstention; 83.78% of those who provided an opinion indicated support for the VRFs and VSLs.

Individual Ballot Pool Results

Segment	Organization	Member	Opinions	NERC Notes
1	Ameren Services	Eric Scott	Abstain	
1	American Electric Power	Paul B Johnson	Abstain	
1	Arizona Public Service Co.	Brian Cole		
1	Associated Electric Cooperative, Inc.	John Bussman	Affirmative	
1	Austin Energy	James Armke	Affirmative	
1	Avista Utilities	Heather Rosentrater		
1	Balancing Authority of Northern California	Kevin Smith	Affirmative	
1	BC Hydro and Power Authority	Patricia Robertson	Abstain	
1	Bonneville Power Administration	Donald S. Watkins	Affirmative	
1	Brazos Electric Power Cooperative, Inc.	Tony Kroskey	Negative	SUPPORTS THIRD PARTY COMMENTS - (ACES Power Marketing)
1	Bryan Texas Utilities	John C Fontenot	Affirmative	
1	CenterPoint Energy Houston Electric, LLC	John Brockhan	Abstain	
1	Central Electric Power Cooperative	Michael B Bax		
1	Central Iowa Power Cooperative	Kevin J Lyons	Negative	SUPPORTS THIRD PARTY COMMENTS - (ACES)
1	City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	Chang G Choi	Affirmative	
1	City of Tallahassee	Daniel S Langston	Affirmative	

1	Clark Public Utilities	Jack Stamper	Affirmative

No
The Purpose of IRO-004-4 is: “To establish the responsibility of Reliability Coordinators to act or direct others to act.” The Functional Model states that Reliability Coordinators interact with Transmission Service Providers, and Transmission Service Providers interact with Reliability Coordinators. Why is the TSP being removed from the Applicability and the Requirements? The contents of the Rationale boxes need to be reviewed and revised. For example, The Rationale under Applicability mentions Purchasing-Selling Entity and Load-Serving Entity being deleted from IRO-001-1.1. The Rationale for Requirements R2 and R3

mentions the retirement of IRO-004-2. The Rationale for IRO-001-4 should deal with IRO-001-4. The Drafting Team should consider the removal of the Rationale Box for R2 and R3. Suggest that the Drafting Team consider replacing the word “ensure” where used in the Requirements and Measures and VSL Table with the word “maintain”. Because Transmission Service Provider is being removed from the Applicability of the standard, Transmission Service Provider needs to be removed from the body of the standard. For example, the Quality Review did not catch its use in the Data Retention section.
No
The contents of the Rationale boxes must be reviewed with respect to their applicability to IRO-002-4. The Drafting Team should clarify and coordinate the requirements between voice and data equipment requirements and the associated COM-001 and IRO-002-4. The SDT should clarify the COM-001 is restricted to voice communications and the IRO-002-4 R1 is intended to address data. It is also not clear that IRO-002-4 R2 is limited to voice communication and/or data. A wording change for R2 to be considered: Each Reliability coordinator shall have the authority to approve planned outages and maintenance of its telecommunication and data exchange capabilities (as referenced in R1). Requirement R3 has had the word “telecommunication” added to it. Should also add the word telemetering to make the requirement read “…telecommunication and telemetering…”. Then use of telecommunication and telemetering should be made consistent throughout the document. In Requirement R4 delete the comma between “…Special Protection Systems, and sub-100kV…” to make it read “…Special Protection Systems and sub-100kV…”. This makes it clear that both Special Protection Systems and sub-100kV facilities shall be monitored.
No
“Ensure” or “ensured” should not be used in the standard. The contents of the Rationale boxes must be reviewed to ensure they are consistent with their associated Requirements. For example, the Rationale for Requirements R5 and R6 refers to the use of the word “impacted”. Impacted is not used in Requirement R5. The contents of the Rationale for R1, and R3 and R4 should be expanded to provide a short background statement for the Rationale. The wording of requirements should be made consistent. Why is Requirement R7 being deleted?
Yes
No
The Rationale for Requirement R1 explains what review changes were made, and do not address the contents of the Requirements. The Rationale for Requirement R1 should be removed. Measure M1 reflects Part 1.5 not being removed. Why is Part 1.5 being removed? A RC should have the detailed authority. What Requirements does the Rationale on page 7 refer to? The replacement of the word “other” with “adjacent” may leave a reliability gap. Because the words “may impact” already serve as the qualifier for the RC to select who to notify, then the RC is not obligated to notify all RCs hence the scope of notification is finite. We urge the SDT to consider reinserting the word “other” into R1. The Drafting Team

should review the use of the phrase “Wide Area” in IRO-008-2 (and other IRO standards) and the phrase “Reliability Coordinator Area” in IRO-014-3. If these phrases are synonymous, then use of one or the other should be decided upon. Regarding the Retention Period, there are no data retention periods for Requirements R3 and R4. Instead, there are retention period requirements for R8 and R9, which do not exist. We urge the SDT and NERC to conduct a thorough and independent quality review for all standards posted for commenting and balloting to avoid unnecessary delays in approving standards due to these errors. Suggest restoring the standard to its original wording.
No
“Operations Planning” in the Purpose is not defined in the NERC glossary and should not be capitalized. Regarding the Rationale and Time Horizon boxes on page 5: The words in the Rationale is appropriate for a guideline or announcement. It does not belong in a Rationale box. Neither “Time Horizon” nor “Operations Planning Time Horizon” is in the NERC Glossary and should not be capitalized. If those terms are to be considered for inclusion in the NERC Glossary, then they should be included on the Definitions of Terms Used in Standard. The R1 wording “…within its Reliability Coordinator Area” should be removed. Part 1.4 refers to “…other Reliability Coordinators”. The box “Note on part 1.5” does not belong in the standard. It is a comment response. “Near-Term Transmission Planning Horizon” is defined as “The transmission planning period that covers Year One through five.” The Rationale for Requirement R4 should be revised to just address the “why”, and justification for R4. During the last posting, we commented that the requirement for TOP and BA to coordinate outage plans is inappropriate since the BA does not develop outage plans or schedules; it only receives them from the Generator Owners and may suggest adjustments based on resource/demand/interchange assessments. The SDT’s response suggests that these details would be elaborated in the process document and hence no changes were made. While we agree that such details can be elaborated in the process document, sub-Part 1.1.2 should be expanded to include facility owners in order for the RC to develop a workable and appropriate outage coordination process involving the correct entities. We are unable to support sub-Part 1.1.2 as written, and suggest the Drafting Team to either revise it to remove the BA from it, or to expand it to include the facility owners and/or operators. Corresponding changes will need to be made to Requirement R2.
No
Regarding Requirements R1 and R2, “ensure” should not be used as mentioned in previous comments. This must be honored THROUGHOUT the standard. For this particular requirement, consider using the word “maintain” or “restore” instead. Throughout the standard, consider replacing “address” with “maintain”. The Time Horizon should not include Operations Planning, or Same-Day Operations. The phrase, ‘within its TOP/BA Area’ should not be removed. Entities do not have authority to direct others outside of their area. In addition R3 only requires those to comply that are in the TOP/BA Area. For consistency, we suggest retaining that above language. Regarding Requirement R3, Time Horizons should not include Operations Planning, or Same-Day Operations. Regarding ALL the standard’s requirements, where Operating Instruction is used, the Time Horizon category must be reviewed. In Requirement R7, the “e” in emergency must be capitalized.

“Comparable” should be added before “assistance”. In R7, the previous language should be retained to limit the assistance up to and including emergency procedures implemented by the requesting entity. As worded, this could expose the assisting entity to violations for not going beyond what has been implemented. This addition would distinguish it from the previous requirements. To address the Drafting Team response to the previous posting, when declaring an emergency, entities have a number of corrective actions to restore the system to normal. The previous language allows assisting entities to implement similar steps, which increase in severity, with the entity that is in the emergency. In Requirement R9, strike the words “interconnected NERC registered” to be consistent with TOP-002-4 Requirement R3. The language in Requirement R16 should be made consistent with the language in Requirement R9. There should be consistent language used in requirements R9, R16, and R17. During the last posting, a concern was expressed over the ambiguity in R9 as the words “between the affected entities” can be interpreted as any two entities (external to the one who is notifying others) that are affected by the outages of telemetering and telecommunication equipment, control equipment, monitoring and assessment capabilities, and associated communication channels. To clarify the intent of the requirement, suggest R9 be revised to: R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected NERC registered entities of outages of telemetering equipment, control equipment, monitoring and assessment capabilities, and associated communication channels between THEM AND the impacted entities. Regarding Requirement R10, a Transmission Operator cannot be held responsible for monitoring ANY facilities in neighboring Transmission Operator areas. A Transmission Operator can only rely on what information is provided by a neighboring Transmission Operator. The new requirement R19 addresses the data exchange capabilities needed. The Drafting Team should consider removing R10. If Requirement R10 is to remain, then if a sub-100 kV facility is needed to maintain reliability, it should be included in the BES by exception. This standard should require the TOP to monitor BES Elements in its area. Monitoring BES Elements beyond that is the responsibility of the RC. Monitoring of neighboring facilities presents an authority issue, which is clearly defined in the IERP Report, and Paragraphs 84 and 87 of the NOPR. R10 as written implies the TOP needs to monitor its neighboring TOP’s entire area when in reality a subset of facilities may be all that is required. One suggested rephrasing is: Each Transmission Operator shall monitor Facilities within its Transmission Operator Area and those Facilities it determines as necessary in its neighboring Transmission Operator Areas to maintain reliability within its Transmission Operator Area… Another suggestion is: Each Transmission Operator shall monitor Facilities within its Transmission Operator Area including sub-100kV facilities needed to maintain reliability and the status of Special Protection Systems within its Transmission Operator Area and neighboring Transmission Operator Areas to maintain reliability within its Transmission Operator Area. The Drafting Team should consider removing “ensure” or its replacement word from Requirement R11. Refer to standard PRC-001-1.1. Requirement R13 should be reworded to: Each Transmission Operator shall perform or have performed a Real-time Assessment at least once every 30 minutes. The “s” in system should be capitalized in Requirement R15. The word “own” should not be deleted

from Requirement R16. It provides clarity that this is only pertaining to the equipment the Transmission Operator owns and not other equipment. “Always” should be removed from Requirement R18. In Requirement R19 “(Balancing Authority Area)” is not needed and should be removed. In Requirement R20 remove “(Balancing Authority Area)” and “Transmission Operator Area”. What defines a neighboring Transmission Operator Area? There are many instances where the loss of a facility several Transmission Operator Areas away from a Transmission Operator Area impacts that Transmission Operator Area.
No
The proposed definition for Operational Planning Analysis shown in the Definitions of Terms Used in Standard should be a redline of what is in the NERC Glossary. The Rationale for Requirement R1 can be removed, and be placed in a guideline or support document. The Rationale for Requirement R3, and Rationale for Requirements R4 and R5 can be removed. It belongs in Consideration of Comments. The Rationale for Requirements R6 and R7 can be removed, and be placed in a guideline or support document.
No
The proposed definitions for Real-time Assessment and Operational Planning Analysis shown in the Definitions of Terms Used in Standard should be a red line of what is in the NERC Glossary. Additional information should be added to the Rationale for Requirement R5 for justification and background.
Yes
In the White Paper System Operating Limit Definition and Exceedance Clarification, delete the phrase “unit/intra-area instability,” from the Transient Stability Limits description. Individual unit instability is not being looked at; operations are to prevent system instability. During the last posting, the need to shed load under the pre-contingency loading condition when the 4-hour rating is exceeded was commented on. The Drafting Team’s response indicates that “it has revised the whitepaper to include “as necessary and appropriate”. However, this change is made to the post-contingency condition for exceeding the 15-minute Emergency Rating, but not to the pre-contingency loading condition when the 4-hour rating is exceeded as it still stipulates that “All of the above plus load shed to control violation below Emergency Rating consistent with timelines identified in Operating Plan.” We speculate that the insertion of “as necessary and appropriate” to the post-contingency condition when the 15-minute Emergency rating is exceeded was an error. However, if the SDT really meant to keep load shedding under the pre-contingency loading condition when the 4-hour rating is exceeded, then we will again express our disagreement with the approach. When the 4-hour rating is exceeded, the TOP still have up to 15 minutes to reduce loading to within the Normal rating. Further, as stated in the paragraph preceding Table 1, “However, operating between 900 MVA and 950 MVA (commenter insert: i.e. exceeding the 4-hour rating but not the 15-minute rating) is not an SOL exceedance unless the associated Operating Plan time parameter is exceeded as explained in Figure 1 (commenter insert: i.e. 15 minutes have elapsed and still unable to return loading to below 4-hour rating).” We urge the SDT to reassess whether or not the

“as necessary and appropriate” should be inserted to the pre-contingency loading condition for exceeding the 4-hour rating.
Yes
Yes
Because of the similarities in Purposes, Applicabilities, and Requirements of standards within the group that is posted, combining requirements with the intent on reducing the number of standards should be considered. During the last posting, we expressed a concern over the proposed retirement of TOP-004-2, Requirement R4, which stipulates that: R4. If a Transmission Operator enters an unknown operating state (i.e. any state for which valid operating limits have not been determined), it will be considered to be in an emergency and shall restore operations to respect proven reliable power system limits within 30 minutes. The SDT’s response to our comment indicates that: As presented in the white paper on the Treatment of SOLs, the proposed requirements are based on the concept of not depending on pre-determined existing SOLs/IROLs but rather to monitor the existing and potential operating conditions and evaluate them against the same ratings and limits that SOLs/IROLs would be based upon. Those ratings and limits rarely change due to changes in system conditions, whereas predetermined SOLs and IROLs may change due to the assumptions they were based on. No change made. While we agree that the ratings and limits upon which the SOLs/IROLs are based rarely change due to changes in system conditions, the changes in system condition themselves can render any SOLs/IROLs invalid. In other word, there does not exist any “proven reliable power system limits” as stated in R4 of TOP-002-4. While the concept of not depending on pre-determined existing SOLs/IROLs but rather to monitor the existing and potential operating conditions and evaluate them against the same ratings and limits that SOLs/IROLs would be based upon may seem appropriate, the concept itself (and being in a “white paper” status), or use of any information in the white paper, does not help or mandate re-calculation of valid SOLs and IROLs when entering an unknown state. If R4 in TOP-004-2 is retired, it leaves a potential reliability gap. The white paper does not mandate the proper and necessary action to “restore operations to respect proven reliable power system limits within 30 minutes” when entering into an unknown state. We again urge the SDT to consider not retiring Requirement R4 of TOP-002-4. A proper Quality Review of the postings would have eliminated the necessity of submitting many of the above comments.

1. IRO-001-4 R1, TOP-001-3 R1 & R3: The phrase "… to ensure the reliability of its RC/TOP/BA Area." is not measurable. The requirements should be stated so that the stated reliability is objectively measurable. For example, "… to ensure all Facilities within the RC/TOP/BA Area remain within SOLs and IROLs." Otherwise, the requirements are too vague as to when the RC/TOP/BA would be required to act, or whether the action taken was sufficient to ensure reliability. 2. TOP-002-4 R1: The definition of Operational Planning Analysis does not specify what "potential (post-Contingency) conditions" are to be evaluated, and is therefore not measurable. Either the requirement or the definition should be revised to clarify and add measurability as to which contingencies are required to be included in the analysis. 3. TOP-002-4 R4 (4.2): The phrase "…for the next-day that addresses: Interchange scheduling" is too vague and not measurable. The requirement should be stated so as to be objectively measurable. For example, "… for the next-day that addresses: Expected Interchange scheduling". 4. TOP-002-4 R4 (4.4): The phrase "… for the next-day that addresses: Capacity and energy reserve requirements …" is not measurable. Applicable reserve requirements should be clearly provided to provide measurability as to whether the Operating Plan addressed them. For example, "… for the next-day that addresses: Capacity and energy reserve requirements (at a minimum N-1 Contingency planning) …"

AECI agrees with SPP comments regarding R1-R3: R1 – We have concerns regarding the phrase 'to ensure the reliability'. The phrase is ambiguous and detracts from the purpose of the standard which is to ensure the Reliability Coordinator takes action or directs others to act. Additionally, we suggest tying the 'others' in Requirement R1 specifically to those entities identified in Requirements R2 and R3.We recommend the following rewrite: 'Each Reliability Coordinator shall act, or direct others as identified in Requirements R2 and R3 to act, by issuing Operating Instructions in accordance with its responsibilities as a Reliability Coordinator within its Reliability Coordinator Area. ' Rationale Box for Requirements R2 & R3 – The Rationale Box for Requirements R2 and R3 does not match the language in the requirements. There is no mention of the Transmission Service Provider in the requirements. It only appears in Measures M2 and M3. The IRO Five Year Review Team had recommended adding Transmission Service Provider to Requirements R2 and R3 to allow

the retirement of IRO-004-2. With the removal of the Transmission Service Provider in Requirements R2 and R3, can the retirement of IRO-004-2 move forward?
No
AECI agrees with SERC comments regarding R2: The OC Review Group suggests adding the word ‘its’ between ‘with’ and ‘Balancing Authorities’ to provide clarity. Suggested Wording: “R2: Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.”
No
AECI agrees with SERC comments regarding R8: In R8, the OC Review Group suggests removing the words ‘prevented or’ because prevention of SOL or IROL exceedance is difficult to prove and would typically not be communicated to BAs and TOPs. Suggested Wording: “R8: Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been mitigated.”
Yes
Yes
No
AECI agrees with SERC and SPP comments regarding R4: In R4, the OC Review Group suggests adding “on the BES” before “with planned outages” to clearly define the BES as the subject portion of the system. Suggested Wording: “R4: Each Planning Coordinator and Transmission Planner shall jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts on the BES with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon.”
No
AECI agrees with SERC and SPP comments regarding R1 and R2: The current language in TOP-001 R1 and R2 has further expanded the applicable use of operating instructions encompassing all individuals to the point where the compliance risk of the requirement is not appropriately weighted with the benefit to reliability. R3 and R4 state that only the registered entities identified must comply with OI; they do not state that registered entities identified are the only entities that can receive OI. Therefore, without the lack of specificity in R1 and R2 (or in R3 and R4) to whom OI can be issued to, the standard now requires three point communication to any party or entity for actions that will affect the BES, even though that entity (unless identified in R3 and R4) does not have to comply. Although the NERC functional model states to whom a BA and TOP can direct, this is not referenced or mentioned in the standard, and must be inferred by not only the entity maintaining

compliance, but also the individual performing an audit. It would seem very beneficial to specify this assumption within R1 and R2. Suggested Wording: R1 and R2: “Each Transmission Operator (Balancing Authority) shall act, or direct others (referenced in R3 and R4) to act by issuing Operating Instructions, to ensure the reliability of its Transmission Operator (Balancing Authority) Area.” AECI agrees with SPP comments regarding R10: R10 – We have concerns with the existing language in Requirement R10 which when applied in the real-world of today’s audit teams sometimes gets pushed beyond reason. For example, just how much of a neighboring TOP Area does a TOP have to model in order to determine impacts on SOLs within its TOP Area? What prevents an auditor from claiming that a TOP didn’t model enough of the neighboring TOP’s Area? Isn’t this really the function of the RC and aren’t we forcing the TOP to assume some of the RC functions with such a requirement? At the very least, we recommend the following language: Each Transmission Operator shall monitor the following to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area. 10.1 Facilities within its TOP Area 10.2 Status of Special Protection Systems identified as applicable by the Transmission Operator 10.3 Sub-100 kV facilities identified as applicable by the Transmission Operator, and 10.4 Facilities within neighboring Transmission Operator Areas identified as applicable by the Transmission Operator
No
AECI agrees with SERC comments regarding R1: In R1, the OC Review Group suggests adding the word “identified” before “SOLs” to clarify transmission operators are operating to the identified SOLs. Suggested Wording: “R1: Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its identified System Operating Limits (SOLs).”
Yes
No
No
TOP-001-3 R2 Severe VSL – Remove “within its Transmission Operator Area” to maintain consistency with current R2. TOP-001-3 R7 Severe VSL – Replace “if requested” with “when requested” and “when the requesting” with “and the requested” to avoid issues with predicting future performance, and correct possession of the requested entity. Suggested language: “The Transmission Operator did not provide assistance to other Transmission Operators, when requested and able and the requested entity had implemented its emergency procedures, and such actions could have been physically implemented and would not have violated safety, equipment, regulatory, or statutory requirements.”
No
Group

FRCC Operating Committee (Member Services)
John A. Libertz
The groups represented by the FRCC Operating Committee support IRO-001-4 revisions in principle, however we seek clarification on the potential interpretations of the term “Operating Instructions” and the potential administrative impact to normal and emergency BES operations needed to demonstrate compliance as stipulated in the Measures.
Yes
However, R5 requires “synchronized information systems”. The FRCC Operating Committee seeks clarification from the drafting team on what constitutes a “synchronized information system”. Consider replacing the word “synchronized” with “coordinated.”
Yes
Yes
Yes
Yes
Yes
The FRCC Operating Committee supports a majority of these proposed requirements. However, the OC does not support the language in new requirement R9 and finds that the mapping from current requirement (TOP-003-1 R3) is incomplete and needs to be addressed by the standard drafting team. The language in the existing TOP-003-1 R3 is more precise and should remain as is. If the SDT is attempting to address the comments from the SW Outage Report Recommendations “TOPs should ensure procedures and training are in place to notify WECC RC and neighboring TOPs and BAs promptly after losing RTCA capabilities,” they should create a separate requirement to reflect the notification for loss of Real-time Assessment capabilities. At a minimum, the requirement should state “telemetering and control equipment”, rather than “telemetering equipment, control equipment”. This will add clarification to the type of equipment being addressed in the requirement. In addition, the word “planned” from M9 was not removed as noted in SDT responses. We also recommend removing the words “interconnected NERC Registered”. The word “impacted” reflects who should be notified. The current mapping of existing TOP-003-1 R3 to TOP-001-3 R9 does not accurately reflect the original intent of TOP-003-1 R3. R19 and R20 have some inconsistencies with referencing TOPs and BAs.
Yes
Yes
Yes

We suggest adding the following clarification to page 2 of the white paper: • Remove the terms “Normal (continuous)” from the Pre-Contingency section, example “b”. We recommend it read the following: b. All Facilities shall be within their applicable Facility Ratings and thermal limits. • Remove the terms “Emergency (short term)” from the Post-Contingency section, example “b”. We recommend it read the following: b. All Facilities shall be within their applicable Facility Ratings and thermal limits. We also suggest that the paper be reviewed for consistency when using the terms “pre-contingency” and “post-contingency”. Interchanging the use and context causes confusion – i.e. Change the column headers in Table 1, “Pre-Contingency Loading” to “Pre-Contingency Mitigation” and change “Post-Contingency Loading” to “Post Contingency Mitigation”. Another example would be to use “Real-Time flow” instead of “Pre-Contingency Flow”. Also in Table 1, under the ‘Emergency (4hr)” row – “Post Contingency Loading” column change “all” to “available”.
Yes
The comments provided herein are consensus comments of the FRCC Operating Committee entity representatives. Our responses to the above questions in no way intends to convey how individual FRCC OC member entities will vote on the standards being proposed. Thank you for your efforts.

I plan to vote affirmative but wanted to provide a suggestion. R3 is a requirement for the PC and TP to provide its Planning Assessment to the RC. I agree that this should be done, however, it is out of place in IRO-017. It should instead be included in the TPL-001 standard. Even if R3 is retained I encourage a process to eventually move it from IRO-017 to TPL-001.

Measures are improved with not having to cite a reason specifically, but still too much evidence burden on the receiving entity. The BA should have recordings already and some of these evidence requirements are duplicative.
Yes
No
This standard seems unnecessary and I do not support it. The obligations are already covered in other standards.
No
Again, DPs should not have evidence requirements when the BA/TOP is recording the other end of the line. Suggest deleting "Such evidence could include, but is not limited to, dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format." from any DP measure.

Draft 2 has not satisfactorily addressed the circumstances of small transmission operators. Most small TOPS operate very simple and predicatble systems, with the capacity for only minimal impacts on the BES. Draft Requirement TOP-001-3, R13 which will require such TOPs to perform, review and document real-time assessments every 30 minutes, unneccessarily burdens such TOPs with additional process, expense and resource requirements that will contribute no added reliability above and beyond the real-time assessment processes which Reliability Coordinators already have in place

R9: The reference “impacted interconnected NERC registered entities” needs to be consistent with the R8 terminology. We request that it be changed to “known impacted interconnected entities”. R10: The reference”sub-100 kV facilities identified as necessary by the Transmission Operator” needs to be clarified. Specifically, the phrase “as necessary” is ambiguous and subject to interpretation. Our negative vote is driven solely by the ambiguous reference “sub-100 kV facilities identified as necessary by the Transmission Operator”.
Yes

Yes
Yes
There are inconsistencies between the information provided in Figure 1 (p.5) and Table 1 (p.8) which may cause confusion. Consider for example the range of 800 to 900 MVA. In Figure 1, the Pre-Contingency flow in this range is considered “not acceptable” if longer than 4 hours. The text “not acceptable” is too strong, so rather than this language, we suggest using “action may need to be taken”. The rows in Table 1 do not clearly correspond to the example in Figure 1. It would appear that Table 1 should have four rows rather than three. As a result, it is unclear exactly which of the four ranges in Figure 1 correlate to the three Operating Plans provided in Table. In Figure 1, does the 800mva (24 hr rating) refer to a Normal or Emergency facility rating, or perhaps both? Please provide clarification.

With regard to R13, we understand and support the need to do real-time assessments at least once every 30 minutes to avoid being in an unstudied state. However, if significant SCADA losses occur or an ICCP link is lost to a neighboring BA/TOP, the State Estimator solution can be affected to such a degree that a real-time assessment, with real-time data, may not be possible within 30 minutes. While this does not happen often, it does occur on occasion, but the requirement allows for NO exceptions to the 30 minute requirement. (As an example. the MOD-001 standard allows for a certain number of hours that ATC may not be recalculated without being in non-compliance).

Yes
Yes
No
CenterPoint Energy does not agree with the structure of R1.2. While Protection System owners generally monitor the status of their Protection Systems CenterPoint Energy is very concerned that the proposed language would require Protection System owners to continuously notify their respective RC of the status of each Protection System which would be a very onerous task with questionable reliability benefit. In addition, for the RC to monitor the status of all Protection Systems in their area would be an overwhelming burden with little reliability benefit. The Company recognizes the need to notify an RC of a Protection System failure that impacts System reliability as required in PRC-001 and therefore recommends Protection Systems and Special Protection Systems be split into separate sub bullets as such: 1.2. Provisions for notification of current Protection System failures that impact System reliability. 1.3. Provisions for notification of current SPS status or degradation that impact System reliability. These comments would also apply to TOP-003-3.
Yes
No
In regards to Requirements R3 and R4, CenterPoint Energy feels the SDT has misinterpreted Paragraph 90 of the NOPR. CenterPoint Energy interprets the language in Paragraph 90 as speaking to the the Reliability Coordinator's role in outage coordination in the operational planning horizon. Paragraph 90 mentions generation outages being scheduled 3-5 years in advance and transmission outages being scheduled 1-3 years in advance as part of the planning process. Paragraph 90 goes on to mention the need for the Reliability Coordinator, in operational planning, to re-evaluate these planned outages through "… a month-ahead, week-ahead, and sometimes even a day-ahead approval process." CenterPoint Energy does not interpret Paragraph 90 to involve the Reliability Coordinator in the 1-5 year Near Term Planning Horizon process, but to follow its outage coordination process developed in R1.3 and R1.4 to evaluate any previously planned outages within its Wide Area and coordinate resolutions of identified outage conflicts in the Operations Planning Horizon. CenterPoint Energy recommends deletion of Requirements R3 and R4.
No
CenterPoint Energy feels Requirement R1 is general and may provide double jeopardy with other requirements that dictate specifics on when and under what circumstances TOPs are

required to act and direct others to act. CenterPoint Energy suggests reverting back to authoritative language requiring TOPs giving its Operating Personnel the authority to act, or direct others to act: “Each Transmission Operator shall provide its Operating Personnel with the authority to act, or direct others to act…” Another suggestion is to delete the Requirement completely due to its broad generality which is already included in the Functional Model, while keeping R3 and R4 for accountability of any Operating Instructions from the Transmission Operator to be followed. CenterPoint Energy also feels the language in R1, “…to ensure the reliability of its Transmission Operator Area” puts an unavoidable burden on the TOP for when an unexpected event occurs. CenterPoint Energy suggests changing ‘ensure’ to ‘maintain’. These comments would also apply to IRO-001-4, R1. R10. CenterPoint Energy feels monitoring Facilities reaching into a neighboring Transmission Operator Area needs more direction. The term ‘as necessary’ is too vague for a TOP to determine how far into a neighboring Area or what specific equipment contained in another TOP Area it would need to monitor to determine SOL exceedances. CenterPoint Energy also feels it is the RC function to monitor and determine any reliability issues which may overlap or cascade between TOP Areas as they have the Wide Area view. CenterPoint Energy recommends removing ‘neighboring areas’ from R10.

No
The effective date for requirements R1 and R2 should be staggered (similar to the drafting team's approach to requirement R1 and R2 of IRO-010-2). It will be very difficult for a BA or TOP to comply with the RC's outage process if that process is finalized on or near the effective date for requirement R2. Requirement R2 is too broad and should be limited to "performing the applicable functions" of the RC's outage coordination process. In addition,

what will happen in the case that the RC specifies deadlines or processes that a BA or TOP cannot meet or requirements that are unrelated to outage coordination? To address this issue, in part, the RC should be required to collaborate with the BAs and TOPs in its area during the development of and revisions to the outage coordination process. This may not address all the issues that could arise, but would at least provide BAs and TOPs with time to address shortcomings in their processes prior to incurring a standard violation.
No
It is nearly impossible for entities to comply with requirements R1 and R2 of TOP-001-3 as currently drafted. This issue is highlighted (not corrected) by the draft RSAW's approach of evaluating compliance only during events. RSAWs are only guidance - reading footnote 1 of the current RSAW template makes it clear that the RSAW is a reference document only and entities cannot depend on the approach outlined there to resolve ambiguities associated with a requirement. The place to resolve ambiguities is in the standard's language, not in the RSAW. An entity must comply with any requirement at all times; it does not matter if the enforcement authority only checks compliance during certain periods. If an entity fails to comply with the requirement at any other time, that entity is obligated to self-report the violation. In this situation, then, each entity must "ensure" the reliability of its area 24/7/365 to be compliant with requirement R1 or R2. This means that any reliability event could reflect an entity's failure to comply with R1 or R2 because the entity failed to ensure the reliability of its area during that event. But can any entity really ensure the reliability of its area? This just doesn't seem possible because there are so many factors outside of an entity's control that can affect the reliability - for example, equipment failure or a fire along transmission lines. In addition, the burden of monitoring compliance based on the proposed language is immense. Requirements R1 and R2 of the currently effective TOP-001-1a require entities to take action to "alleviate operating emergencies". This is a high bar, but not so high that an entity cannot comply when factors beyond its control affect the reliability of its area. In addition, using this language in the proposed standard would be consistent with the RSAW's approach and ease the associated compliance monitoring obligation, while still requiring an entity to act to protect the reliability of its area.
The language of measure M2 is inconsistent with requirement R2 – it is missing the word "exceedance" after the phrase "System Operating Limits (SOLs)".
Yes
As discussed in the comments addressing IRO-017, requirements R1 and R2 of that proposed standard should be phased with requirement R1 becoming effective prior to R2.. Just as in IRO-010, the BAs and TOPs subject to requirement R2 are likely to need some time to implement the processes specified in RC's outage coordination process. In addition, connecting the implementation time to COM-001-2 if this group of standards is approved prior to or concurrent with COM-001-2 and COM-002-4 could result in a short implementation time. For example, say that FERC approval of both the COM standards and

the IRO/TOP standards becomes effective on June 30, 2015. According to the implementation plan, the standards will “become effective concurrently with COM-001-2 and the definition of Operating Instruction”. The effective date of COM-001-2 is “first day of the second calendar quarter beyond the date that this standard is approved by applicable regulatory authorities…”, which would be October 1, 2015 in this example. There is some ambiguity with this result since the term Operating Instruction is not used in COM-001-2, but in any case, using the effective date of COM-002-4, which is more consistent with the implementation period of the IRO/TOP standards, seems more appropriate.

Although proposed IRO-008-2 is not applicable to ATC, changes were made by the SDT to Requirement R1 and the proposed term “Reliability Coordinator Wide Area” that addressed ATC’s comments in response to the SDT’s 1st posting.
Yes
No
ATC requests the SDT to consider making the following modifications to the proposed Requirements R3 and R4: R3 – To be consistent with the “Long-term Planning” Time Horizon in Requirement R4 and due to Requirement R3’s association with the long-term horizon Planning Assessments, ATC suggests that the Time Horizon for Requirement R3 be changed to “Long-term Planning.” R4 – To be more consistent with paragraph 90 of the FERC NOPR and because the term “planned outages” has no specific NERC or industry-wide meaning, ATC suggests that the wording of “planned outages” in Requirement R4 be replaced with “scheduled generation, transmission maintenance and transmission construction outages.”
No
ATC requests the SDT to consider making the following changes to the proposed Requirement R10 based on the corresponding technical rationale. It is ATC’s understanding that the intention of the SDT is to not require each Transmission Operator to monitor all Facilities and all Special Protection Systems in the neighboring TOP areas. However, the

structure of the sentence in Requirement R10 does not provide this clarity. Rather, the sentence requires each TOP to monitor all Facilities, all Special Protection Systems and a subset of sub-100kV facilities for its TOP area and its neighboring TOP areas. If the TOP is to be given discretion on which neighboring Facilities and Special Protection Systems are to be monitored, then ATC suggests that Requirement R10 be modified as: “R10. Each Transmission Operator shall determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area by monitoring: R10.1 Within its Transmission Operator Area: R10.1.1 Facilities R10.1.2 Status of all Special Protection Systems R10.1.3 Sub-100 kV facilities identified as necessary by the Transmission Operator R10.2 Within neighboring Transmission Operator Areas and identified as necessary by the Transmission Operator: R10.2.1 Facilities R10.2.2 Status of Special Protection Systems R10.2.2 Sub-100kV facilities” Please Note: ATC also requested via the RSAW Feedback Form to modify the RSAW’s evidence listing for proposed Standard TOP-001-3 to address inconsistencies with the language of Requirement R10 or any modifications to this language based on ATC’s comments. For example, if the R10 language is left unchanged, the Facilities evidence should be “all Facilities within its TOP area and those Facilities in neighboring TOP areas determined necessary by the TOP.” This structure would also be applied to Special Protection Systems. For sub-100kV facilities, the evidence should be “those sub-100kV facilities determined necessary by the TOP” without a need to reference its TOP area or neighboring TOP areas since that is the plain reading of the requirement.

Yes

SCL appreciates the efforts of the Standard Drafting Team to increase clarity of the IRO and TOP Standards while generally reducing the compliance documentation burden.
SCL appreciates the efforts of the Standard Drafting Team to increase clarity of the TOP and IRO Standards while generally reducing the burden of compliance documentation. For IRO-101-2, SCL asks that the implementation times be extended from nine and twelve months to eighteen and twenty-four months, because it may take longer than one year to negotiate and impelment the necessary data exchange agreements among impacted entities. SCL's recommended implementation language is as follows: Section 5. Proposed Effective Date. Requirement R1 and R2 shall become effective on the first day of the first calendar quarter that is eighteen (18) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R1 and R2 shall become effective on the first day of the first calendar quarter that is eighteen (18) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction. Requirement R3 shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R3 shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
Yes
SCL appreciates the efforts of the Standard Drafting Team to increase clarity of the TOP and IRO Standards while generally reducing the burden of compliance documentation.
Yes
No
SCL appreciates the efforts of the Standard Drafting Team to increase the clarity of the TOP and IRO Standards while generaly reducing the burden of compliance documentation. However for TOP-001-3, SCL believes a changes are required before this Standard provides the clarity and effectiveness of the others. Specifically SCL asks for changes as follow: Requirement R9 covers too broad a scope to be useful. The phrase “…outage of telemetering equipment, control equipment, monitoring and assessment capabilities and associated communication channels…” is all encompassing. If each BA or TOP was calling the RC every time there was the slightest glich with telemetering or every time an ICCP link, microwave channel or EIDE data signal was cycled for maintenance or some type of momentary signal fade, the RC’s phone would be ringing continually. The intent of this requirement is to be sure all entities are aware of a loss of situation awareness. This risk associated with this is not of a momentary nature and a time qualifier should be used. Using the 30 minute time requirement that is used for R13 (as written, but also see below)

is sufficient to meet the intent. SCL suggests the following re-wording: R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected NERC registered entities of any scheduled and sustained outages of equipment or assessment capabilities that prevent Real-time Assessment for 30 minutes. Requirement R13, SCL suggests changing 30 minutes to 60 minutes. Usually generation, load and interchange are estimates and adjusted on hourly basis so performing assessment every 30 minutes is not necessary and could prove an onerous requirement for TOPs without providing any real reliability benefits. SCL suggests the following re-wording: R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 60 minutes. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]
Yes
Yes
SCL appreciates the efforts of the Standard Drafting Team in crafting IRO and TOP Standards that are clearer while generally reducing the burden of compliance documentation. For TOP-003-3, while somewhat burdensome, this Standard makes the process for requiring entities to request and provide real time reliability data standardized. SCL is concerned with the implementation period allowed for this Standard, because in our experience it has taken longer than 12 months to negotiate and implement the necessary data exchange agreements between entities. As such, SCL suggests extending the periods allowed to eighteen and twenty-four months, re-wording the effective date section as follows: Section 5. Effective Date. All requirements except Requirements R5 shall become effective on the first day of the first calendar quarter that is eighteen (18) months after the date that the standard is approved gy an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a stand to go into effect. Where approval by an applicable governmental authority is not required, the stand shall become effective on the first day of the first calendar quarter that is eighteen (18) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction. Requirement R5 shall become effective on the first day of the first calendar quarter that is twenty four (24) months after the date that the standard is approved gy an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a stand to go into effect. Where approval by an applicable governmental authority is not required, the stand shall become effective on the first day of the first calendar quarter that is twenty four (24) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction
No
SCL appreciates the efforts of the Standard Drafting Team to increase clarity of the IRO and TOP Standards.
Yes

SCL asks that the Implementation Plan be revised to conform with our recommendations that the implementation periods and effective dates for IRO-010-2 and TOP-003-3 be extended to eighteen and twenty-four months (to allow sufficient time to negotiate and implement data exchange agreements among entities), as indicated above.

Ingleside Cogeneration , LP
No
Ingleside Cogeneration LP (ICLP) believes that the project team has completely bypassed the language and intent of COM-002-4 by creating zero-tolerance requirements in IRO-001-4 R2 and R3. In R2/R3, every Operating Instruction, no matter how routine, must be perfectly executed and documented to the liking of an audit team. By comparison, COM-002-4 focuses only on training and ongoing reinforcement on the proper communications protocol to be used in the transaction of Operating Instructions. We understand that BES reliability depends far more heavily on IRO-001-4's requirements to execute an Operating Instruction – and not so much COM-002-4's oversight of the protocols to use. However, an Operating Instruction can be any communication to "change or preserve the state, status, output, or input" of a BES element/facility, which covers significant ground. If a single log entry is vague or missing, a severe penalty awaits even the most conscientious GOP. This means that the solution lies in the compliance approach to IRO-001-4, which should vary by the priority of the communication. For example, ICLP believes that every Operating Instruction issued during a declared Emergency, or one prefaced with "this is a mandatory Operating Instruction" should be properly documented by the recipient in a zero-tolerance manner. This would include time-stamps of conversations; an acknowledgement that three-part communications were used; and a coherent recount of the steps requested, taken, and their results. All other Operating Instructions would only be examined by an auditor if shown that slow or improper execution put the BES at risk. This is not a substantial hurdle to overcome – particularly since the issuer and recipient will both have telemetry and/or written records of an incidence of concern. The CEA could then dig deeper to determine if a pattern of poor performance by the GOP exists; which is really the behavior that we all want to eliminate over the longer term.
No
ICLP agrees there are times where the RC will need data regarding certain sub-100 kV facilities to ensure operational reliability. However, these facilities must be limited to those identified using the NERC exception process deployed concurrently with the new BES Definition. This process was developed precisely for this reason – and eliminates the possibility that the RC can declare any sub-100 kV facility to be under their authority without justification. This opens the door to rash actions on the part of RCs eager to close a perceived reliability gap based upon a single incident, which may or may not be reasonable. If the project team believes that the exception process is inadequate, a better solution may

be found in that venue (in NERC's Rules of Procedure). ICLP would suggest that a temporary exception could be quickly granted for a concerned RC – that a full evaluation by an independent panel would take place afterwards.
No
ICLP believes that the project team has completely bypassed the language and intent of COM-002-4 by creating zero-tolerance requirements in TOP-001-3 R3 through R6. In R3-R6, every Operating Instruction, no matter how routine, must be perfectly executed and documented to the liking of an audit team. By comparison, COM-002-4 focuses only on training and ongoing reinforcement on the proper communications protocol to be used in the transaction of Operating Instructions. We understand that BES reliability depends far more heavily on TOP-001-3's requirements to execute an Operating Instruction – and not so much COM-002-4's oversight of the protocols to use. However, an Operating Instruction can be any communication to "change or preserve the state, status, output, or input" of a BES element/facility, which covers significant ground. If a single log entry is vague or missing, a severe penalty awaits even the most conscientious GOP. This means that the solution lies in the compliance approach to TOP-001-3, which should vary by the priority of the communication. For example, ICLP believes that every Operating Instruction issued during a declared Emergency, or one prefaced with "this is a mandatory Operating Instruction" should be properly documented by the recipient in a zero-tolerance manner. This would include time-stamps of conversations; an acknowledgement that three-part communications were used; and a coherent recount of the steps requested, taken, and their results. NIPSCO feels R10 should align with the Operational Planning Analysis Requirement and include a reason such as "to determine SOL exceedances". NIPSCO feels R19 and R20 should be in TOP-003 or are already covered in COM-001. NIPSCO feels R16 and R17 are outage coordination and do not belong in TOP-001 which is Transmission Operations. These should be with the outage coordination standard.
No
TOP-002-4 R1 requires that you perform an analysis that identifies SOL exceedances, but SOLs are not explicitly included as a study input in the Operational Planning Analysis definition, only Facility Ratings, which are only a subset of FAC-014-2 R2 SOLs. There seems to be operating plans created by the TOP in R2 and operating plans created by the RC in IRO-008-2. How are comflicts resolved if the results differ? How does the R2 Operating Pland mesh with the operating plan specified in VAR-001-4 R1? Are they the same?
Yes
No
Yes
Yes
NIPSCO is voting against approving the definitions for the following reasons: 1. In the new definition of Operational Planning Analysis and Real-time Assessment, Facility Rating and

equipment limitations are listed. NIPSCO feels these should be removed and SOL and IROL be added. SOL and IROL include but is not limited to Facility Ratings and equipment limitations. See our comments on TOP-002 for more informaiton. 2. In the new definition of Operational Planning Analysis and Real-time Assessment, Phase Angle is listed as an included input. NIPSCO feels this needs more definition. Is this for every node?

R3 contains a requirement for the PC/TP to provide a copy of its assessment to the RC. This should be eliminated from this standard and merged into R8 of TPL that already requires the PC/TP to distribute the assessment with other entities. R4 – Planning Assessment performed as per TPL-001-4 is applicable to Long-term Planning time horizon (>12 months) and has no overlap with the Operations Planning time horizon (day-ahead to 12 months). Therefore, it is not clear how Planning Assessment would be an appropriate "tool" to address the outage coordination reliability objective in R4 in the Operations Planning time horizon.
No
In R7, how is the entity receiving the request able to know if the requesting entity has indeed implemented its emergency procedures? Suggest removing that qualifier, or change the requirement to state that "Each Transmission Operator shall assist Transmission Operators experiencing an Emergency, if requested, unless such actions cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements." R10 is not written clearly. Suggest restructuring. Each Transmission Operator shall monitor: o Facilities (including sub-100 kV facilities needed to maintain reliability) within its Transmission Operator Area and o Facilities (including sub-100 kV facilities needed to maintain reliability) in neighboring Transmission Operator Areas to maintain reliability within its Transmission Operator Area o Status of Special Protection Systems within its Transmission Operator Area R16 & R17 should state "...approve or defer/deny…" Is R18 only for derived limits or if there is a difference in any limit? Or is the intent of the requirement to be " … when limits are derived and there are differences when comparing solutions."?
No

R2 – is the descriptor “potential” needed? Do R6 & R7 need a qualifier “…by the time frame established by the RC”?

a. R6 and all of its VSL: The reference to “as identified in identified in Requirement R6” should be revised to “as identified in Requirement R5”. b. We wish to reiterate our previous comment on the inconsistent language used between the LOWER VSL for Requirement R6 (in which the word “Emergency” is used) and Requirement R6 (which does not use the word “Emergency”). R6 .Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been prevented or mitigated. LOWER VSL for R6. The Reliability Coordinator did not notify one other impacted Reliability Coordinator as indicated in its Operating Plan “when the Emergency identified in Requirement R6 was prevented or mitigated.” For consistency, please revise VSL to read “when the SOL or IROL exceedance identified in Requirement R5 has been prevented or mitigated”. c. The language between R4 and its VSL is inconsistent. R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. This requirement was changed from having the RC “perform” to “ensure that a Real-time Assessment is performed”. However, the VSL still assesses the condition that the RC did not “perform” as opposed to did not “ensure that the Real-time Assessment was performed”. Please revise as appropriate.
Yes
No
a. We generally agree with the changes made to IRO-014-3. However, the replacement of “other” with “adjacent” may leave a reliability gap. For example, the notification of Transmission Loading Relief may require “notification or coordination of actions” by, and

can have an impact on, RCs other than just the adjacent RCs. Since the words “may impact” already serve as the qualifier for the RC to select who to notify, then the RC is not obligated to notify all RCs hence the scope of notification is finite. We urge the SDT to consider reinserting the word “other” into R1, replacing “adjacent”. b. We do not have a preference, but we ask the SDT to review the use of the phrase “Wide Area” in IRO-008-2 (and other IRO standards) and the phrase “Reliability Coordinator Area” in IRO-014-3. If these phrases are expected or interpreted to be synonymous, we suggest using one or the other, but not both, throughout the IRO (and other) standards for consistency and to avoid confusion. c. Retention Period: We are unable to find the data retention period for Requirements R3 and R4. Instead, there are retention period requirements for R8 and R9, which do not exist. We urge the SDT and NERC to conduct a thorough and independent quality review for all standards posted for commenting and balloting to avoid unnecessary delays in approving standards due to these errors.
No
During the last posting, we commented that the requirement for TOP and BA to coordinate outage plans is inappropriate since the BA does not develop outage plans or schedules; it only receives them from the Generator Owners and may suggest adjustments based on resource/demand/interchange assessments. The SDT’s response suggests that these details would be elaborated in the process document and hence no changes were made. While we agree that such details can be elaborated in the process document, Part 1.1.2 should be expanded to include facility owners in order for the RC to develop a workable and appropriate outage coordination process involving the correct entities. We are concerned with Part 1.1.2 as written, and suggest the SDT to either revise it to remove the BA from it, or to expand it to include the facility owners and/or operators. Corresponding changes will need to be made to Requirement R2.
No
a. During the last posting, we expressed a concern over the ambiguity in R9 as the phrase “between the affected entities” can be interpreted as any two entities (external to the one who is notifying others) that are affected by the outages of telemetering and telecommunication equipment, control equipment, monitoring and assessment capabilities, and associated communication channels. To clarify the intent of the requirement, we suggest R9 be revised to: R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected NERC registered entities of outages of telemetering equipment, control equipment, monitoring and assessment capabilities, and associated communication channels between THEM AND the impacted entities b. We do not have any concerns or comments on R19 and R20, which are added to address data exchange requirement and to achieve consistency with the proposed IRO-002-4, Requirement R2. However, we suggest that the SDT add Requirement R20 to the NERC issue data base along with requirements R2, R5, R6, R11, and R17 which the SDT agrees with our previous comment that these requirements belong to the BAL standards and hence a future assessment of creating such a BAL standard will be conducted.

Yes
Yes
No
During the last posting, we commented on the need to shed load under the pre-contingency loading condition when the 4-hour rating is exceeded. The SDT’s response indicates that “it has revised the whitepaper to include “as necessary and appropriate”. However, this change is made to the post-contingency condition for exceeding the 15-minute Emergency Rating, but not to the pre-contingency loading condition when the 4-hour rating is exceeded as it still stipulates that “All of the above plus load shed to control violation below Emergency Rating consistent with timelines identified in Operating Plan.” We speculate that the insertion of “as necessary and appropriate” to the post-contingency condition when the 15-minute Emergency rating is exceeded was an error. However, if the SDT really meant to keep load shedding under the pre-contingency loading condition when the 4-hour rating is exceeded, then we will again express our disagreement with the approach. When the 4-hour rating is exceeded, the TOP still has up to 15 minutes to reduce loading to within the Normal rating. Further, as stated in the paragraph preceding Table 1, “However, operating between 900 MVA and 950 MVA (commenter insert: i.e. exceeding the 4-hour rating but not the 15-minute rating) is not an SOL exceedance unless the associated Operating Plan time parameter is exceeded as explained in Figure 1 (commenter insert: i.e. 15 minutes have elapsed and still unable to return loading to below 4-hour rating).” We urge the SDT to reassess whether or not the “as necessary and appropriate” should be inserted to the pre-contingency loading condition for exceeding the 4-hour rating.
Yes
Yes
During the last posting, we expressed a concern over the proposed retirement of TOP-004-2, Requirement R4, which stipulates that: R4. If a Transmission Operator enters an unknown operating state (i.e. any state for which valid operating limits have not been determined), it will be considered to be in an emergency and shall restore operations to respect proven reliable power system limits within 30 minutes. The SDT’s response to our comment indicates that: As presented in the white paper on the Treatment of SOLs, the proposed requirements are based on the concept of not depending on pre-determined existing SOLs/IROLs but rather to monitor the existing and potential operating conditions and evaluate them against the same ratings and limits that SOLs/IROLs would be based upon. Those ratings and limits rarely change due to changes in system conditions, whereas predetermined SOLs and IROLs may change due to the assumptions they were based on. No change made. While we agree that the ratings and limits upon which the SOLs/IROLs are based rarely change due to changes in system conditions, the changes in system condition themselves can render any SOLs/IROLs invalid. In other word, there does not exist any

"proven reliable power system limits" as stated in R4 of TOP-002-4. While the concept of not depending on pre-determined existing SOLs/IROLs but rather to monitor the existing and potential operating conditions and evaluate them against the same ratings and limits that SOLs/IROLs would be based upon may seem appropriate, the concept itself (and being in a "white paper" status), or use of any information in the white paper, does not help or mandate re-calculation of valid SOLs and IROLs when entering an unknown state. If R4 in TOP-004-2 is retired, it leaves a potential reliability gap. The white paper does not mandate the proper and necessary action to "restore operations to respect proven reliable power system limits within 30 minutes" when entering into an unknown state. We again urge the SDT to consider not retiring Requirement R4 of TOP-002-4. We are unclear whether or not the proposed retirement of TOP-004-2 will be balloted separately, which it should. Please advise.

To ensure the distribution of the Planning Assessment is tied to a reliability-related need, recommend modifying Requirement R3 as follows to reflect similar provisions already included in Requirement R4. R3. Each Planning Coordinator and Transmission Planner shall provide its Planning Assessment to impacted Reliability Coordinators when issues or conflicts are identified with planned outages in the Near-Term Transmission Planning Horizon.
No
As currently drafted, R6 would require the Transmission Operator to provide its Operating Plan to the Reliability Coordinator every day (next day studies) regardless of whether the Plan is modified or not. To prevent unnecessary duplication, recommend modifying R6 as follows to allow the Transmission Operators and Reliability Coordinators to develop an arrangement or schedule. R6. Each Transmission Operator shall provide its Operating Plan(s) for next-day operations identified in Requirement R2 to its Reliability Coordinator in accordance with the Reliability Coordinator's schedule.

Rationale for R2 and R3 should be modified for consistency with the removal of the TSP. R2 : Replace "compliance with the Operating Instructions" with "they" referring to the instructions. Compliance is not something that can be "physically implemented". Instructions can. Also for consistency with M2 M2 : Remove the Transmission Service Provider from the second portion of the measure (2 occurrences) Compliance section 1.2 : What is the rationale behind that modification? As proposed, the section doesn't give any useful information. That section should actually serve to list the actual processes that will be used for that particular standard. Or at least refer to the actual section of the ROP that lists the processes used (Appendix 4C, section 3.0). Compliance section 1.3 : Remove all occurrences of "Transmission Service Provider". (Would have been best achieved by a "search and replace"…)
No
Compliance section 1.2 : What is the rationale behind that modification? As proposed, the section doesn't give any useful information. That section should actually serve to list the actual processes that will be used for that particular standard. Or at least refer to the actual section of the ROP that lists the processes used (Appendix 4C, section 3.0).
No
R6 : Replace "Reliability Coordinator Wide Area" by "Wide Area" for consistency with modifications made to R1. Compliance section 1.2 : What is the rationale behind that modification? As proposed, the section doesn't give any useful information. That section should actually serve to list the actual processes that will be used for that particular standard. Or at least refer to the actual section of the ROP that lists the processes used (Appendix 4C, section 3.0). Table of Compliance Elements: VSLs for R4, R6 and R8 should be reworded. Due to their importance in determining penalties, VSL should be written clearly and without ambiguity. See examples given for TOP-001-3. Associated Documents : The content of the white paper shouldn't be included in the standard. A reference with an hyperlink would be enough.
No
R1 : Replace the last sentence with "The data specification shall include but is not be limited to:. Otherwise the "shall" applies to "not be limited to". That would mean that the data specification shall include other items that are not listed. Compliance section 1.2 : What is the rationale behind that modification? As proposed, the section doesn't give any useful information. That section should actually serve to list the actual processes that will be used for that particular standard. Or at least refer to the actual section of the ROP that lists the processes used (Appendix 4C, section 3.0). Compliance section 1.3 : Remove Planning Coordinator and Transmission Planner Table of Compliance Elements: VSLs for R2 should be reworded. Due to their importance in determining penalties, VSL should be written clearly and without ambiguity. See examples given for TOP-001-3.

No
Compliance section 1.2 : What is the rationale behind that modification? As proposed, the section doesn't give any useful information. Yes
No
In R4, modify the second "its Transmission Operator" by "that Transmission Operator" for consistency with the wording of R6. Also modify corresponding element in the Table of Compliance Elements. In R9 and M9, remove the expression "interconnected NERC registered" for consistency with IERP recommendation regarding TOP-002-4 R3 In R17, replace "analysis" by "Real-time Assessment" for consistency with R16. R18 is unclear. What does "where there is a difference in SOLs" mean? Difference in SOLs compared to which SOL? A "difference" implies a comparison between two SOLs. That portion of the requirement should be clarified. The rationale for R19 and R20, which are related to data exchange capabilities, states that they're added for consistency with IRO-002-4 R2 whereas R2 addresses RC's System Operator authority. In R19 and R20 why the use of "Transmission Operator Area (Balancing Authority Area)" for both requirements? R19 should say "Transmission Operator Area" and R20 should say "Balancing Authority Area" for consistency with associated Measures. Compliance section 1.2 : As proposed, the section doesn't give any useful information. That section should actually serve to list the actual processes that will be used for that particular standard. Or at least refer to the actual section of the ROP that lists the processes used (Appendix 4C, section 3.0). Table of Compliance Elements: VSLs for R8 and R9 should be reworded. Due to their importance in determining penalties, VSL should be written clearly and without ambiguity. Example: "Violation Severity Levels for requirement 8 are determined based on the number of other known impacted Transmission Operators or other known impacted Balancing Authorities that the Responsible Entity did not inform of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas or Balancing Authority Areas when conditions did permit such communications : High VSL : The lesser of 1) three other known impacted Transmission Operators or 2) 10% or more but less than or equal to 15% of the other known impacted Transmission Operators OR The lesser of 1) three other known impacted Balancing Authorities or 2) 10% or more but less than or equal to 15% of the other known impacted Balancing Authorities" The whole wording of the requirement could be omitted for more clarity : "Violation Severity Levels for requirement 8 are determined based on the number of other known impacted entities that the Responsible Entity did not inform in accordance with that requirement : High VSL : The lesser of 1) three other known impacted Transmission Operators or 2) 10% or more but less than or equal to 15% of the other known impacted Transmission Operators OR The

lesser of 1) three other known impacted Balancing Authorities or 2) 10% or more but less than or equal to 15% of the other known impacted Balancing Authorities" Associated Documents : The content of the white paper shouldn't be included in the standard. A reference with an hyperlink would be enough.
No
In R1, replace "shall have an Operational Planning Analysis" by "shall perform an Operational…" In R2, replace "as required in Requirement R1" by "performed in requirement R1" for consistency with M2. Do not capitalize "requirement" since it is not a defined term. R6 : Why not put that requirement in R2? Simply add "…and provide that plan to its Reliability Coordinator" to the end of R2 (same for R7). The standard would be more clear and concise. Compliance section 1.2 : As proposed, the section doesn't give any useful information. That section should actually serve to list the actual processes that will be used for that particular standard. Or at least refer to the actual section of the ROP that lists the processes used (Appendix 4C, section 3.0). Table of Compliance Elements : See comment made for TOP-001-3 Associated Documents : The content of the white paper shouldn't be included in the standard. A reference with an hyperlink would be enough.

R1 – We have concerns regarding the phrase ‘to ensure the reliability’. The phrase is ambiguous and detracts from the purpose of the standard which is to ensure the Reliability Coordinator takes action or directs others to act. Additionally, we suggest tying the ‘others’ in Requirement R1 specifically to those entities identified in Requirements R2 and R3.We recommend the following rewrite: ‘Each Reliability Coordinator shall act, or direct others as identified in Requirements R2 and R3 to act, by issuing Operating Instructions in accordance with its responsibilities as a Reliability Coordinator within its Reliability Coordinator Area. ‘ Rationale Box for Requirements R2 & R3 – The Rationale Box for Requirements R2 and R3 does not match the language in the requirements. There is no mention of the Transmission Service Provider in the requirements. It only appears in Measures M2 and M3. The IRO Five

Year Review Team had recommended adding Transmission Service Provider to Requirements R2 and R3 to allow the retirement of IRO-004-2. With the removal of the Transmission Service Provider in Requirements R2 and R3, can the retirement of IRO-004-2 move forward?
No
M1 – Capitalize Real-time in the last line of Measure M1.
No
1.3 Data Retention – Hyphenate 30- and 90-calendar days in 1.3 Data Retention for consistency with the other standards in this package.
Yes
Yes
No
R2/M2 – Make Reliability Coordinator in Requirement R2 and Measure M2 possessive. The requirement should read '…in its Reliability Coordinator's outage coordination process.'R4 – To focus the coordination effort of the Reliability Coordinator on BES issues we recommend modifying the wording of R4 to state '…for identified issues or conflicts on the BES with planned outages…'
No
R1 – We have concerns regarding the phrase 'to ensure the reliability'. The phrase is ambiguous and detracts from the purpose of the standard which is to ensure the Transmission Operator takes action or directs others to act. Additionally, we suggest tying the 'others' in Requirement R1 specifically to those entities identified in Requirements R3 and R4. We recommend the following rewrite: 'Each Transmission Operator shall act, or direct others as identified in Requirements R3 and R4 to act, by issuing Operating Instructions in accordance with its responsibilities as a Transmission Operator within its Transmission Operator Area. ' R2 – We have concerns regarding the phrase 'to ensure the reliability'. The phrase is ambiguous and detracts from the purpose of the standard which is to ensure the Balancing Authority takes action or directs others to act. Additionally, we suggest tying the 'others' in Requirement R2 specifically to those entities identified in Requirements R5 and R6. We recommend the following rewrite: 'Each Balancing Authority shall act, or direct others as identified in Requirements R5 and R6 to act, by issuing Operating Instructions in accordance with its responsibilities as a Balancing Authority within its Balancing Authority Area. ' R9 – We feel that the use of impacted interconnected entities is too broad for the notification requirement. Also, the current wording of the requirement would have the Balancing Authority and Transmission Operator providing notifications for all outages even those lasting only a couple of minutes or a few seconds. Additionally, the term 'NERC registered' in Requirement R9 and Measure M9 should be deleted. This term was deleted in IRO-008-2, Requirement R4 and TOP-002-4, Requirement R3. We recommend rewording the requirement to read: 'Each Balancing Authority and

Transmission Operator shall notify its Reliability Coordinator and known impacted entities of outages of telemetering and telecommunication equipment, control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities lasting 30 minutes or longer.' Should Requirement R9 be split into two separate requirements, one for the Transmission Operator and one for the Balancing Authority as was done with Requirements R1 and R2 and Requirements R19 and R20? R10 – We have concerns with the existing language in Requirement R10 which when applied in the real-world of today's audit teams sometimes gets pushed beyond reason. For example, just how much of a neighboring TOP Area does a TOP have to model in order to determine impacts on SOLs within its TOP Area? What prevents an auditor from claiming that a TOP didn't model enough of the neighboring TOP's Area? Isn't this really the function of the RC and aren't we forcing the TOP to assume some of the RC functions with such a requirement? At the very least, we recommend the following language: 'Each Transmission Operator shall monitor 10.1 Facilities within its TOP Area, 10.2 status of Special Protection Systems identified as necessary by the Transmission Operator, 10.3 sub-100 kV facilities identified as necessary by the Transmission Operator, and 10.4 Facilities within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator as necessary to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area.' Rationale Box for R14 – The newly inserted sentence in Rationale Box for R14 doesn't completely present the overall picture of the Operating Plan as contained in the Associated Documents at the back of the standard. We propose an additional sentence, as indicated below, be included in the Rationale Box. '…These Operating Plans are developed and documented in advance of Real-time and may be developed from Operational Planning Assessments (OPA) required per proposed TOP-002-4 or other assessments. The Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). The intent is not to have a…' R18 – Should Requirement R18 be split into two separate requirements, one for the Transmission Operator and one for the Balancing Authority as was done with Requirements R1 and R2 and Requirements R19 and R20? R19 – Delete the parenthetical Balancing Authority in Requirement R19. R20 – Delete Transmission Operator and the parentheses around Balancing Authority in Requirement R20.
No
R4 – We suggest that load forecast uncertainty and resource uncertainty be added to the list of Parts for Requirement R4. 1.3 Data Retention – Hyphenate 90-calendar days in 1.3 Data Retention for consistency with the other standards in this package.
Yes
Yes
First full paragraph on Page 3, we suggest the following rewrite for the last sentence in that paragraph. 'Conversely, if an area is not at risk of instability, no Facilities are approaching their thermal Facility Ratings but the area is prone to pre- or post-Contingency low voltage

conditions, then the voltage limits in that area are the limiting SOLs.' We also suggest deleting the 1st sentence in the following paragraph on Page 3. The paragraph flows better without it. We further suggest the following rewording in what would then be the 2nd sentence in the paragraph. 'How an entity remains within these SOLs can vary depending on the operating practices and planning strategies employed by that entity.' In 4. Voltage Stability Limits, replace the 2nd sentence with the following: 'Voltage Stability limits are typically defined as the maximum power transfer or load level that ensures voltage stability criteria are met.'
No
IRO-008-2 R4 – Change the Severe VSL for new Requirement R4 (old R5) to read '…more than three…' or '…four or more…' in lieu of '…three or more…'. The High VSL already uses three. IRO-014-3 R3 – The lead-in for the VSLs for Requirement R3 refers to Requirement R5. This reference should be to Requirement R3. R7 – Change the Severe VSL for Requirement R7 to read '…Coordinator had implemented…' and '…or would have violated safety…'. IRO-017-1 R2 – Make Reliability Coordinator possessive in the Severe VSL for Requirement R2. TOP-001-3 R8 – Delete 'other' in the VSLs for Requirement R8 referring to '…other known impacted Balancing Authorities…' and '…other Balancing Authorities…'. The use of 'other' only applies to references to Transmission Operator. Also in the VSLs for R8, change 'less' to 'greater' such that the Lower VSL would read: 'The Transmission Operator did not inform one other known impacted Transmission Operator or 5% or less of the affected known impacted other Transmission Operators, whichever is greater, of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas when conditions did permit such communications.' (This particular change applies to all VSLs in R8, R9, R19 and R20 as well as the VSLs for IRO-002-4, R1; IRO-008-2, R3, R5, R6; IRO-010-2, R2; TOP-002-4, R3, R5; TOP-003-3, R3, R4.) R9 – Delete the term 'NERC registered' in the VSLs for Requirement R9. (See comment in Question 7 above. R13 – Change the Severe VSL for Requirement R13 to read '…more than three…' or '…four or more…' in lieu of '…three or more…'. The High VSL already uses three. R19/R20 – Replace 'applicable' with 'identified' in the VSLs for Requirements R19 and R20. The use of 'identified' parallels the language in the requirements. TOP-002-4 R3 – Replace 'NERC' with 'entities' in the High and Severe VSLs for Requirement R3.
Yes
The definition of Special Protection System (SPS) is being revised to Remedial Action Scheme (RAS) yet this package of standards continues to use SPS. What process will be used to make the transition to RAS when the new definition is approved? Similarly, Load-Serving Entity will soon be eliminated as a registered function at NERC. How will this change be reflected in the standards?

Yes
The previous suggestion from the FRCC Operating committee was not taken regarding the “to approve” language in R3. As drafted this does not cover the full spectrum of authority needed by the RC. FMPA suggests replacing the words “to approve” with “over” to make it clear that the authority is all encompassing and that input on planned outages is required from the System Operators.
No
It seems the SDT did not understand FMPA’s previous comment regarding R1. FMPA’s comment was not concerning ratings or the determination of SOLs, it was concerning the contingencies to be studied in the Operational Planning Analysis (OPA). The phrase “N-1 Contingency planning” no longer exists with the revisions to these standards, and the number of contingencies to be studied is not described in the definition of Operational Planning Analysis. So, is the RC’s OPA supposed to consider N-2 events? N-3? Loss of an entire substation? It should be clear that the level of contingencies studied in the OPA is the same level of contingencies studied to determine SOLs and IROLs, thus our suggestion to refer to the performance requirements in FAC-011 or to add the phrase “in accordance with its SOL Methodology”. Otherwise, the OPA could show an exceedance of an SOL due to a contingency scenario that was not required to be considered in determining that SOL. As written, R1 is left open to interpretation, may not be measureable, and could set more stringent BES performance criteria than is already contained in the standards. The number of contingencies to be studied is also absent from the definition of Real-time Assessment.

Texas Reliability Entity
Yes
Yes
Requirement R4: Texas Reliability Entity, Inc. (Texas RE) requests that the SDT consider replacing the term “sub-100 kV” with “non-BES” to be more inclusive of those facilities where data or monitoring may be needed. For instance, the RC may choose to monitor private use networks or radial lines connected to large loads/generation connected at greater than 100 kV but are excluded from the BES, in addition to sub-100 kV facilities. This change would not be needed if it is the intent of the SDT that the reference to “sub-100 kV” facilities is for those facilities that have been intentionally included in the BES due to their criticality.
No
1) Requirement R1: The SDT changed “or” to “and” within the phrase “System Operating Limits (SOLs) or Interconnection Operating Reliability Limits (IROLS)” based on a comment. Neither the commenter nor the SDT provided justification for the change. Texas RE does not agree with the change because if either SOLs OR IROLs are exceeded then the assessment should be performed; not just if both are exceeded. Texas RE requests that the change be rejected and the original language be reinstated or explanation of why the change is correct. 2) Section 1.3. Data Retention: Texas RE does not agree with the change of data retention for R1, R2, R3, R5 and R6 from a rolling six months to a rolling 90 calendar days. The six-month requirement was aligned with the Data Retention and Sampling Team (DRAST) white paper, which indicates a six-month rolling period for high volume data, and 90-days for voice and audio recordings. The same comment applies for R4, which was changed from 90 days to a rolling 30 days.

Yes
Requirement R1.1: Texas RE requests that the SDT consider replacing the term “sub-100 kV” with “non-BES” to be more inclusive of those facilities where data or monitoring may be needed. For instance, the RC may choose to monitor private use networks or radial lines connected to large loads/generation connected at greater than 100 kV but are excluded from the BES, in addition to sub-100 kV facilities. This change would not be needed if it is the intent of the SDT that the reference to “sub-100 kV” facilities is for those facilities that have been intentionally included in the BES due to their criticality.
Yes
Requirements R1 and R2: Texas RE requests the SDT consider whether including Same-Day Operations in the Time Horizon is appropriate. The measures for R1 and R2 are focused on the maintenance of the Operating Procedures, Operating Processes and Operating Plans and not on any specific same-day actions that need to be taken. Texas RE suggests that Same-Day Operations be removed from the Time Horizon for R1 and R2. The Time Horizon of Operations Planning is correct. If the SDT disagrees with the suggested removal of the Same-Day Operations Time Horizon then we request an explanation of why it is appropriate to include it.
Yes
No
1) Requirement R8: Texas RE disagrees with the addition of the word “known” to impacted TOPs and BAs. Within the interconnected system, a TOP may not always know who is impacted. It would be prudent to also notify TOPs who may be impacted. We suggest the SDT keep the original language “impacted Transmission Operators.” Requirement R9 did not add “known” to the phrase “impacted interconnected NERC registered entities” which is inconsistent with R8. Texas RE recommends that R8 and R9 should be consistent when the SDT determines if “known” should be included or not. 2) Requirement R9, M9 and R9 VSL: Suggest the SDT remove “NERC registered” to be consistent with other standards in this project. 3) Requirements R9 and M9: The two paragraphs need to be consistent and cover both planned and unplanned outages. Texas RE recommends changing the two paragraphs so that “outages” is preceded by “planned and unplanned.” 4) Requirement R10: The use of the term “within its Transmission Operator Area” in R10 may lead to potential conflicts and reliability gaps, specifically for monitoring of SPS’s. For example, an SPS owned by a GO/GOP would not have to be monitored by a TOP since it is not within its Transmission Operator Area (i.e. the generator is not a “Transmission” asset per the definition), even though the operation or misoperation of the SPS may lead to SOL violations within the TOP area. Texas RE suggests clarifying language be added by the SDT to assure that a TOP monitors all facilities and Special Protection Systems within its area; not just those that fall under the definition of transmission asset. 5) Requirement R10: Texas RE requests that the SDT consider replacing the term “sub-100 kV” with “non-BES” to be more inclusive of those facilities where data or monitoring may be needed. For instance, the RC may choose to monitor private use networks or radial lines connected to large

loads/generation connected at greater than 100 kV but are excluded from the BES, in addition to sub-100 kV facilities. This change would not be needed if it is the intent of the SDT that the reference to "sub-100 kV" facilities is for those facilities that have been intentionally included in the BES due to their criticality. The SDT may also consider modifying the language to state "identified as necessary by the Transmission Operator or Reliability Coordinator." 6) Requirements R13, R14, R15: Texas RE requests the SDT consider whether there should be a similar requirement for a BA to perform a Real-time Assessment. The following questions are submitted to assist the SDT's assessment of our request. In real-time, how will a BA control frequency or know if it is experiencing or about to experience a capacity emergency unless it is performing such an assessment? For R14, how does the BA initiate its Operating Plan for an EEA unless it sees a capacity deficiency through a Real-time Assessment? For R15, how does the BA notify the RC of a capacity emergency unless it sees a capacity deficiency through a Real-time Assessment? 7) Requirement R19: The term "(Balancing Authority Area)" appears to be a typo and should be removed. 8) Requirement R20: The term "Transmission Operator Area (Balancing Authority Area)" appears to be a typo and should be replaced with "Balancing Authority Area."
No
1) Requirement R4: Texas RE reiterates our previous comments regarding adding a new requirement for the BA to have an Operational Planning Analysis (in line with R1 language for the TOP). The SDT responded to the initial comment that creation of an Operating Plan fulfills the reliability need. We continue to maintain that it appears there is a gap for the BA responsibilities. The BA must perform some type of Operational Planning Analysis in order to develop their Operating Plan for the next day. Texas RE requests the SDT further consider this suggestion. 2) Requirement R6: Texas RE requests the SDT consider whether the TOP should also be required to provide its Operating Plan(s) for next-day operations to the BA. The following questions are submitted to assist the SDT's assessment of our request. Without the TOP Operating Plan, how will a BA perform its assessment of delivery capability if it does not have predicted or planned transmission outages from the TOP(s)? 3) Requirement R7: Texas RE requests the SDT consider whether the BA should also be required to provide its Operating Plan(s) to TOPs. Without the BA Operating Plan, it is unclear how a TOP will perform its assessment to determine if there will be any SOL exceedances if it does not have the predicted generation dispatch and demand patterns from the BA.
No
1) Requirement R1.1: Texas RE requests that the SDT consider replacing the term "sub-100 kV" with "non-BES" to be more inclusive of those facilities where data or monitoring may be needed. For instance, the RC may choose to monitor private use networks or radial lines connected to large loads/generation connected at greater than 100 kV but are excluded from the BES, in addition to sub-100 kV facilities. This change would not be needed if it is the intent of the SDT that the reference to "sub-100 kV" facilities is for those facilities that have been intentionally included in the BES due to their criticality? 2) Requirement R2: Texas RE reiterates our previous comments about replacing "analysis functions" with

“Operational Planning Analysis.” This comment relates to the TOP-002-4, R4 comment for requiring a BA to have an Operational Planning Analysis. The SDT responded to the initial comment that creation of an Operating Plan fulfills the reliability need. We continue to maintain that it appears there is a gap for the BA responsibilities. The BA must perform some type of Operational Planning Analysis in order to develop their Operating Plan for the next day. Texas RE requests the SDT further consider this suggestion.
No
No
1) IRO-008-2, Requirement R4 VSLs - Suggest the SDT remove “NERC registered” to be consistent with the Requirement R4 language and other standards in this project. The words were removed once in the VSLs but they occur twice in the VSLs. 2) IRO-008-2, Requirement R6 VSL – Texas RE requests the SDT consider revising the R6 VSL to contain only a Severe VSL. Texas RE submits that any failure to notify of IROL or SOL exceedances could result in cascading outages. 3) TOP-001-3, Requirements R8 and R9 VSLs – Texas RE recommends removing each instance of the phrase “whichever is less” from the R8 and R9 VSLs or at least from the Severe VSLs. At worst, it appears to nullify intent stated by the SDT for R8 and R9 that a situation where a small entity did not inform just one affected entity should be a Severe violation. At best, it adds no clarity to assessing violation severity levels. Specifically, for R8, if a small TOP with 1 known impacted other TOP did not notify that impacted TOP then it’s 100% which should make it a Severe VSL. However, the phrase “whichever is less” appears to kick it back to a Lower VSL because it is only one failure to inform, not four or more, which is less. It’s important to note that TOP-002-4, Requirements R3 and R5 do not include the phrase “whichever is less” in the Severe VSL language which is presumably a recognition that it doesn’t apply in the Severe VSL. 4) TOP-002-4, Requirements R3 and R5 - Texas RE recommends removing each instance of the phrase “whichever is less” from the R3 and R5 VSLs. The phrase adds no clarity to assessing violation severity levels; in fact it is likely to add confusion to the determination of VSLs. 5) TOP-003-3, Requirements R3 and R4 - Texas RE recommends removing each instance of the phrase “whichever is less” from the R3 and R4 VSLs. The phrase adds no clarity to assessing violation severity levels; in fact it is likely to add confusion to the determination of VSLs. 6) IRO-010-2, Requirement R2 - Texas RE recommends removing each instance of the phrase “whichever is less” from the R2 VSLs. The phrase adds no clarity to assessing violation severity levels; in fact it is likely to add confusion to the determination of VSLs.
Yes
1) Texas RE appreciates the work that the SDT has done to address the comments received from industry during the previous ballot and comment period. Thank you for the time you have put into working towards making a set of steady state TOP and IRO standards. 2) Texas RE has one general comment regarding data retention for all the standards within this project. Texas RE recommends the SDT consider aligning the retention periods with the Data Retention and Sampling Team (DRAST) white paper which indicates a 4-year retention period for data with limited exemptions, such as a 6-month rolling period for high volume

data, and 90-days for voice and audio recordings. 3) Operational Planning Analysis definition: Texas RE requests the SDT provide explanation for why the phrase "may be performed either a day ahead or as much as 12 months ahead" was removed from the proposed definition. The phrase is included in the current Glossary defined term. Following up on our comment from the previous ballot and comment period, Texas RE still asserts that without that phrase the time frame for one day up to 12 months is not accounted for.

To ensure the distribution of the Planning Assessment is tied to a reliability-related need, recommend modifying Requirement R3 as follows to reflect similar provisions already included in Requirement R4. R3. Each Planning Coordinator and Transmission Planner shall provide its Planning Assessment to impacted Reliability Coordinators when issues or conflicts are identified with planned outages in the Near-Term Transmission Planning Horizon.
Yes
We believe that requirement R9 to notify impacted entities of planned outages of telemetering equipment, control equipment, and monitoring and assessment capabilities is too broad. Also, the current wording of the requirement would have the Balancing Authority and Transmission Operator providing notifications for all outages even those lasting only a couple of minutes or a few seconds. Therefore, we propose the following revision to R9: R9 Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and known impacted entities of “planned outages” of telemetering and telecommunication equipment, control equipment, monitoring and assessment capabilities lasting 30 minutes or longer. Requirements R16 and R17 require that TOP and BA give authority to their system operators to approve planned outages of telemetering and telecommunication equipment, control equipment, monitoring and assessment capabilities, and associated communication channels. Using the same rationale of R9, we propose to revise R16 and R17 as follow: R16 Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance last 30

minutes or longer of its monitoring, telecommunication, and Real-time Assessment capabilities. R17 Each Balancing Authority shall provide its System Operators with the authority to approve planned outages and maintenance last 30 minutes or longer of its monitoring, telecommunications, and analysis capabilities. Similarly, IRO-002-4 requirement R2 should also be revised as follow: R2 Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance last 30 minutes or longer of its telecommunication, monitoring and analysis capabilities.
Yes
As currently drafted, R6 would require the Transmission Operator to provide its Operating Plan to the Reliability Coordinator every day (next day studies) regardless of whether the Plan is modified or not. To prevent unnecessary duplication as well as allow for greater flexibility in the requirement, recommend modifying R6 as follows to allow the Transmission Operators and Reliability Coordinators to develop an arrangement or schedule. R6. Each Transmission Operator shall provide its Operating Plan(s) for next-day operations identified in Requirement R2 to its Reliability Coordinator in accordance with the Reliability Coordinator’s schedule.

The groups represented by the FRCC Operating Committee support IRO-001-4 revisions in principle, however we seek clarification on the potential interpretations of the term “Operating Instructions” and the potential administrative impact to normal and emergency BES operations needed to demonstrate compliance as stipulated in the Measures.
Yes
However, R5 requires “synchronized information systems”. The FRCC Operating Committee seeks clarification from the drafting team on what constitutes a “synchronized information system”. Consider replacing the word “synchronized” with “coordinated.”
Yes
Yes

Yes
Yes
Yes
The FRCC Operating Committee supports a majority of these proposed requirements. However, the OC does not support the language in new requirement R9 and finds that the mapping from current requirement (TOP-003-1 R3) is incomplete and needs to be addressed by the standard drafting team. The language in the existing TOP-003-1 R3 is more precise and should remain as is. If the SDT is attempting to address the comments from the SW Outage Report Recommendations “TOPs should ensure procedures and training are in place to notify WECC RC and neighboring TOPs and BAs promptly after losing RTCA capabilities,” they should create a separate requirement to reflect the notification for loss of Real-time Assessment capabilities. At a minimum, the requirement should state “telemetering and control equipment”, rather than “telemetering equipment, control equipment”. This will add clarification to the type of equipment being addressed in the requirement. In addition, the word “planned” from M9 was not removed as noted in SDT responses. We also recommend removing the words “interconnected NERC Registered”. The word “impacted” reflects who should be notified. The current mapping of existing TOP-003-1 R3 to TOP-001-3 R9 does not accurately reflect the original intent of TOP-003-1 R3. R19 and R20 have some inconsistencies with referencing TOPs and BAs.
Yes
Yes
Yes
We suggest adding the following clarification to page 2 of the white paper: -Remove the terms “Normal (continuous)” from the Pre-Contingency section, example “b”. We recommend it read the following: b. All Facilities shall be within their applicable Facility Ratings and thermal limits. -Remove the terms “Emergency (short term)” from the Post-Contingency section, example “b”. We recommend it read the following: b. All Facilities shall be within their applicable Facility Ratings and thermal limits. We also suggest that the paper be reviewed for consistency when using the terms “pre-contingency” and “post-contingency”. Interchanging the use and context causes confusion – i.e. Change the column headers in Table 1, “Pre-Contingency Loading” to “Pre-Contingency Mitigation” and change “Post-Contingency Loading” to “Post Contingency Mitigation”. Another example would be to use “Real-Time flow” instead of “Pre-Contingency Flow”. Also in Table 1, under the ‘Emergency (4hr)” row – “Post Contingency Loading” column change “all” to “available”.
Yes

The comments provided herein are consensus comments of the FRCC Operating Committee entity representatives. Our responses to the above questions in no way intends to convey how individual FRCC OC member entities will vote on the standards being proposed. Thank you for your efforts.

Salt River Project (SRP) has a general concern with the R1 requirement for the Reliability Coordinator to develop, implement and maintain an outage coordination process for generation and Transmission outages. Specifically, SRP is concerned if the RC will have the ability to approve or deny outages.
Yes
Yes
No
The Requirements go way beyond the established NERC process in creating and modifying current standards. The goal is stated to create reliability standards that “use a results based approach that focuses on performance, risk management and entity capabilities”. I suggest that the requirements in TOP-003-3 do not meet this threshold in that the burdensome requirements do not result in a significant enhancement in reliability nor do they consider entity capabilities. I suggest that the SDT work on creating a simple and efficient process to verify that necessary operating data is being freely exchanged as needed among entities. A suggestion might be to create a regional committee to address those conflicts that might occur between entities. If an entity is not able to obtain necessary operating data from an entity, they could provide a report to this committee and the committee could resolve the conflict. This would allow entities to obtain the data needed and avoid the significant burden associated with this Standard.

(1) We agree with the removal of the PSE and LSE from the applicability section of IRO-001-4. (2) Requirement R1 should be revised by removing the words “direct others to act” and stating that the RC shall issue Operating Instructions. The actions taken by an RC to direct others to act is inherent in the definition of Operating Instruction and is redundant with the language in the requirement. This additional clause is wordy and may not fully capture what the drafting team is trying to achieve. For example, by stating that the RC shall act or direct others to act by issuing an Operating Instruction, the RC is limited only to this option. We recommend alternative language for this requirement, “Each RC shall act or issue Operating Instructions in accordance with its responsibilities as a RC of its RC Area.” (3) Requirement R1’s language of requiring the RC to “ensure reliability” could be used as a zero defect standard if there is an event. “Each RC shall act or issue Operating Instructions in accordance with its responsibilities as a RC of its RC Area.” (4) The rationale for requirements R2 and R3 contradict with the revisions to the requirements. The rationale states that the TSP was added to allow retirement of IRO-004-2, but the draft removes the TSP from the requirements. Is the intent to keep IRO-004-2 intact? (5) Requirement R3 should be merged with R2. We suggest the following language for consideration, “Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Reliability Coordinator, or shall inform its Reliability Coordinator of its inability to perform because it cannot be physically implemented or such actions would violate safety, equipment, regulatory, or statutory requirements.” This revision captures the intent of both requirements, is consistent with TOP-001, and reduces the amount of requirements needed. It also reduces unnecessary compliance exposure since only one violation could occur rather than potentially two requirements being violated.
No
(1) We appreciate the drafting team’s consideration of previous comments and subsequent revisions. (2) We recommend changing the term “Special Protection System” to “Remedial Action Scheme” because the SDT Project 2010-05.2 has determined that RAS is more appropriate and SPS will be retired upon FERC approval. This standard would potentially have an outdated glossary term if it keeps SPS in the requirements. (3) Requirement R3 is problematic as written because it implies that sub-100 kV transmission equipment as being subject to a standard. Sub-100 kV transmission equipment are not subject to reliability standards unless they are deemed to be a part of the Bulk Electric System. A simple solution would be to remove the clause “including sub-100 kV facilities needed to make this determination.” If these sub-100 kV facilities are needed for reliability they would be part of the BES exception process and would be covered by the NERC defined term “Facilities.” The FERC NOPR that proposed to remand the TOP/IRO standards was issued on November 21, 2013, which was prior to the BES definition coming into effect on July 1, 2014. This is a significant justification to remove the sub-100 kV language. (4) We recommend verifying that the redlined and clean copies of the draft standard have consistent numbering of the requirements. When R1 was deleted in the redlined version, the other requirements did

not reflect this change. Considering there are over 30 documents to review with this posting, it can be confusing when the requirements do not match.
Yes
No
(1) The applicability section needs to be revised to remove the Load Serving Entity. The Risk Based Registration project will retire the LSE from Appendix 5B from the NERC Rules of Procedure. Having the LSE listed as an applicable entity leads to confusion and questions. For example, a reviewer of this standard could question how the RBRAG could arrive at the conclusion that LSE is not needed for reliability but this drafting team apparently determined it was needed for reliability by including it in the standard. At the very least, if the SDT is not intending to contradict the RBRAG's finding's a rationale box should state that LSE is only being included for historical purposes and will be removed pending the final approval of the RBRAG recommendations by the NERC Board of Trustees. (2) We disagree with Requirement R1, part 1.1 that includes sub-100 kV data. The BES definition is very clear to the applicability of standards. IRO-010-2 should apply to BES Facilities, which may include sub-100 kV Elements and Facilities based on a determination from Regional Entity. Asking for non-BES data is out of scope of the jurisdictional bounds of reliability standards.
Yes
Yes
(1) We appreciate the drafting team's consideration of previous comments and subsequent revisions.
No
(1) The applicability section needs to be revised to remove the Load Serving Entity. The Risk Based Registration project will retire the LSE from Appendix 5B from the NERC Rules of Procedure. Having the LSE listed as an applicable entity leads to confusion and questions. For example, a reviewer of this standard could question how the RBRAG could arrive at the conclusion that LSE is not needed for reliability but this drafting team apparently determined it was needed for reliability by including it in the standard. At the very least, if the SDT is not intending to contradict the RBRAG's finding's a rationale box should state that LSE is only being included for historical purposes and will be removed pending the final approval of the RBRAG recommendations by the NERC Board of Trustees. (2) Requirement R1 should be revised by removing the words "direct others to act" and stating that the TOP shall issue Operating Instructions to ensure reliability of its TOP Area. The actions taken by an RC to direct others to act is inherent in the definition of Operating Instruction and is redundant with the language in the requirement. This additional clause is wordy and may not fully capture what the drafting team is trying to achieve. By stating that the TOP shall act or direct others to act by issuing an Operating Instruction, the TOP is limited to only this option. We recommend alternative language for this requirement, "Each TOP shall act or issue Operating Instructions to ensure reliability of its TOP Area." (3) Requirement R1's language of requiring the RC to "ensure reliability" could be used as a zero defect standard

if there is an event. “Each RC shall act or issue Operating Instructions in accordance with its responsibilities as a RC of its RC Area.” Requirement R2 should be revised by removing the words “direct others to act” and stating that the BA shall issue Operating Instructions to ensure reliability of its BA Area. The actions taken by an RC to direct others to act is inherent in the definition of Operating Instruction and is redundant with the language in the requirement. This additional clause is wordy and may not fully capture what the drafting team is trying to achieve. By stating that the BA shall act or direct others to act by issuing an Operating Instruction, the BA is limited to only this option. We recommend alternative language for this requirement, “Each BA shall act or issue Operating Instructions to ensure reliability of its BA Area.” (4) Requirement R2’s language of requiring the RC to “ensure reliability” could be used as a zero defect standard if there is an event. “Each RC shall act or issue Operating Instructions in accordance with its responsibilities as a RC of its RC Area.” (5) Requirements R3, R4, R5 and R6 should be revised to remove the LSE function. (6) For Requirements R10 and R11, we recommend changing the term “Special Protection System” to “Remedial Action Scheme” because the SDT Project 2010-05.2 has determined that RAS is more appropriate and SPS will be retired upon FERC approval. This standard would potentially have an outdated glossary term if it keeps SPS in the requirement. (7) Requirement R10 is also problematic because it lists sub-100 kV transmission equipment as being subject to a standard. Sub-100 kV transmission equipment are not subject to reliability standards unless they are deemed to be a part of the Bulk Electric System. A simple solution would be to remove the clause “including sub-100 kV facilities needed to make this determination.” If these sub-100 kV facilities are needed for reliability they would be part of the BES inclusion process and would be covered by the NERC defined term “Facilities.” (8) We appreciate the clarification that Requirement R13 is not intended to require a Transmission Operator to have state estimation and real-time contingency analysis. We recommend revising the RSAW to ensure that auditors will review events to avoid this standard being zero defect. (9) We appreciate the clarification for Requirement R18 that derived limits are SOLs and have removed the GOP from this requirement. (10) Requirements R19 and R20 have a parenthetical (Balancing Authority Area) that should be removed to avoid confusion. If both TOP Area and BA Area are intended, please list both without parentheses.

Western has a concern on the use of the word ensure in R1. The concern is that whenever there is a reliability event it would be a violation of this requirement, since the RC didn’t provide instructions that ensured the reliability of its area. We would suggest changing the last portion of the requirement to ‘…… issuing Operating Instructions in accordance with its responsibilities as a Reliability Coordinator within its Reliability Coordinator Area.’

Proposed Standard IRO-017-1 R3 states: “Each Planning Coordinator and Transmission Planner shall provide its Planning Assessment to impacted Reliability Coordinators.” Oncor considers R3 to be a planning requirement that should not be included in IRO-017-1. This Requirement is redundant to approved Standard TPL-001-4 R8 and therefore is misaligned to the Paragraph 81 initiative Criteria B7 to eliminate redundant requirement. Oncor recommends the removal of IRO-017-1 R3.
No
Proposed Standard TOP-001-3 R9 States: “R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected NERC registered entities of outages of telemetering equipment, control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities.” In response to R9, Oncor recommend s that the requirement to make it mandatory for BA’s and TOP’s to notify only negatively impacted interconnected TOs, TOPs and GOPs. Oncor does not feel it necessary to notify registered entities that do not have reliability control functions to the BES. R10 as proposed requires each “Each Transmission Operator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Transmission Operator, within its Transmission Operator Area and neighboring Transmission Operator Areas to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area”. The ERCOT region is structured to support a deregulated market in which ERCOT monitors facilities for all TOPS and has a centralized view of the entire region to maintain reliability. TOPs operating within ERCOT currently do not have the technical capability to monitor facilities of neighboring TOPs. This requirement imposes a “one size fits all” regional structure which would place an unreasonable financial burden on all TOPs to both install and maintain additional hardware in each station or install and maintain multiple ICCPs between control centers. This requirement would place this financial burden on TOPs for nothing more than to replicate an RC function with no benefit to the BES. At no point in proposed Standard

TOP-001-3 does it require TOs to supply neighboring TOs with this data. Oncor requests R10 be reworded to provide flexibility for region structure. Proposed R12 changes the existing requirement of operating outside an IROL for no longer than 30 minutes to “a continuous duration exceeding its associated IROL Tv”. This requirement does not specify who determines the Tv of an IROL when multiple TOPs are involved in the circuit. Oncor believes that the 30 minute limit utilized in previous versions of this standard eliminates the possibility for disagreement. Oncors recommendation is to keep the existing 30 minute time limit.

The groups represented by the FRCC Operating Committee support IRO-001-4 revisions in principle, however we seek clarification on the potential interpretations of the term “Operating Instructions” and the potential administrative impact to normal and emergency BES operations needed to demonstrate compliance as stipulated in the Measures.
Yes
However, R5 requires “synchronized information systems”. The FRCC Operating Committee seeks clarification from the drafting team on what constitutes a “synchronized information system”. Consider replacing the word “synchronized” with “coordinated.”
Yes
Yes
Yes
Yes
Yes

The FRCC Operating Committee supports a majority of these proposed requirements. However, the OC does not support the language in new requirement R9 and finds that the mapping from current requirement (TOP-003-1 R3) is incomplete and needs to be addressed by the standard drafting team. The language in the existing TOP-003-1 R3 is more precise and should remain as is. If the SDT is attempting to address the comments from the SW Outage Report Recommendations “TOPs should ensure procedures and training are in place to notify WECC RC and neighboring TOPs and BAs promptly after losing RTCA capabilities,” they should create a separate requirement to reflect the notification for loss of Real-time Assessment capabilities. At a minimum, the requirement should state “telemetering and control equipment”, rather than “telemetering equipment, control equipment”. This will add clarification to the type of equipment being addressed in the requirement. In addition,the word “planned” from M9 was not removed as noted in SDT responses. We also recommend removing the words “interconnected NERC Registered”. The word “impacted” reflects who should be notified. The current mapping of existing TOP-003-1 R3 to TOP-001-3 R9 does not accurately reflect the original intent of TOP-003-1 R3. R19 and R20 have some inconsistencies with referencing TOPs and BAs.
Yes
Yes
Yes
We suggest adding the following clarification to page 2 of the white paper: Remove the terms “Normal (continuous)” from the Pre-Contingency section, example “b”. We recommend it read the following: b. All Facilities shall be within their applicable Facility Ratings and thermal limits. • Remove the terms “Emergency (short term)” from the Post-Contingency section, example “b”. We recommend it read the following: b. All Facilities shall be within their applicable Facility Ratings and thermal limits. We also suggest that the paper be reviewed for consistency when using the terms “pre-contingency” and “post-contingency”. Interchanging the use and context causes confusion – i.e. Change the column headers in Table 1, “Pre-Contingency Loading” to “Pre-Contingency Mitigation” and change “Post-Contingency Loading” to “Post Contingency Mitigation”. Another example would be to use “Real-Time flow” instead of “Pre-Contingency Flow”. Also in Table 1, under the ‘Emergency (4hr)” row – “Post Contingency Loading” column change “all” to “available”.
Yes
The comments provided herein are consensus comments of the FRCC Operating Committee entity representatives. Our responses to the above questions in no way intends to convey how individual FRCC OC member entities will vote on the standards being proposed. Thank you for your efforts.

Dominion does not agree with R3, of the “clean version,” as written. We are opposed to the inclusion of the phrase “including sub-100 kV facilities”. We would prefer to modify the requirement to read “Each Reliability Coordinator shall monitor BES Facilities, including sub-100 kV facilities and the status of Special Protection Systems within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas, to ensure that it is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.” It is our position that any relevant sub-100 kV facility should be included as a BES Facility through the BES Exception process. While Dominion acknowledges the SDT’s consideration of its comments relative to inclusion of the phrase ‘sub-100 kV facilities’ it still disagrees with the SDT’s decision to retain it in this requirement for the reasons previously stated. M1 as written, “…and real-time Assessments.”, the word “Real” needs to be capitalized.
No
In R8, Dominion suggests removing the words ‘prevented or’ because prevention of SOL or IROL exceedance is difficult to prove and would typically not be communicated to BAs and TOPs.
No
While Dominion acknowledges the SDT’s consideration of its comments relative to inclusion of the phrase ‘sub-100 kV facilities’ it still disagrees with the SDT’s decision to retain it in this requirement for the reasons previously stated.
No
In R1.1, Dominion suggests adding “as identified in R1” at the end of the sentence to identify the criteria and process being addressed. Suggested Wording: “R1.1: Criteria and processes for notifications as identified in R1.”
No
In R2, the Dominion suggests changing the word “function” to “roles and responsibilities” to match R1 Suggested Wording: “R2: Each Transmission Operator and Balancing Authority shall perform the functions roles and responsibilities specified in its Reliability Coordinator outage coordination process.”
No
While Dominion acknowledges the SDT’s consideration of its comments relative to inclusion of the phrase ‘sub-100 kV facilities’ it still disagrees with the SDT’s decision to retain it in this requirement for the reasons previously stated. R9 states: “R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and negatively impacted interconnected NERC registered entities of outages of telemetering and telecommunication equipment, control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities.” To be consistent with IRO-008-2

R4, where ‘NERC registered’ has been struck (also struck in TOP-002-4), Dominion suggests ‘NERC registered’ also be struck in R9 in TOP-001-3.
Yes
No
While Dominion acknowledges the SDT’s consideration of its comments relative to inclusion of the phrase ‘sub-100 kV facilities’ it still disagrees with the SDT’s decision to retain it in this requirement for the reasons previously stated.
No
Yes
Dominion encourages the SDT to continue to monitor the status of the proposed definition of Remedial Action Scheme “RAS” as the change in definition will impact this reliability standard as well as other related standards as identified in NERC’s white paper, Uses of “Special Protection System” and “Remedial Action Scheme” in Reliability Standards.

The new Requirement has the Reliability Coordinator issuing “Operating Instructions” rather than “Reliability Directives”. The scope of “Operating Instructions” broadens to non-emergency situations. BC Hydro does not support this increase in scope.
No

No Comment, please disregard the selected No.
No
No Comment, please disregard the selected No.
No
The new Requirement has the Reliability Coordinator able to ask for “sub-100 kV’ data if it deems necessary. This is an increase in scope from the data the RC currently asks for. As this data may be outside the BES definition, BC Hydro does not support this increase in scope.
The requirements as stated can be interpreted as the RC defines coordination processes and activities, and the TOP’s and BA’s follow. The responsibility for coordination should reside with the TOP’s and BA’s, in order to manage system and regional impacts of outages. Transmission Operators and Balancing Authorities that already have coordination processes for managing outages within their jurisdictions and with neighbors, would have added requirements, however such practices are already well developed, taking into account standards, mutually agreed requirements and special needs of participants, in addition to system wide needs for communication to support assessments. Under TOP-002-2.1b, R1 and R4, Transmission Operators and Balancing Authorities are already required to coordinate, current-day, next-day and seasonal planning and operations which implies the requirement for outage coordination. While TOP-003-1 R2 and R3 provides more specific and explicit requirements to coordinate outages of voltage regulating equipment and telemetering and control equipment, it does not address the coordination of generation and transmission equipment. While TOP-003 may not (in current form) be comprehensive in its inclusion of equipment types for coordination, TOP-003 however should be the place to identify requirements for coordination of transmission and generation outages. R1 states requirements to convey outage information, but is silent on coordination. However, a revision to TOP-003 standard could place the requirements for determining coordination activities in the TOP's and BA’s responsibilities. Nowhere in the IRO-017 is there a requirement for the RC to collaborate with the TOP and BA on defining processes to evaluate impact of outages, or the development of specifications for outage analysis. An RC driven coordination process does not account for differences and needs of TOP’s and BA’s, that have greater and/or mutual needs for practices not prescribed by RC needs. The requirements provide prescription that only addresses RC needs; involvement of governance (through the RRA involvement), collaboration, and emphasis on continuous improvement of processes would set a better standard, by requiring collaboration in the development of process requirements. The focus of IRO-017 should be on submission of outage information to support RC processes, including timelines for the submission of outages, practices for the communications of outages among the RC, TOP's and BA’s responsibility for assessment of system wide conflicts through study assessment, and development of conflict resolution processes to support operations
No

BC Hydro’s concern is that the Reliability Directive is replaced with Operating Instruction in the standard. The scope of “Operating Instructions” broadens to non-emergency situations. Requirement R3 and R4 have the BA’s complying with TOP’s Operating Instructions. BC Hydro’s concern is that there may be a conflict between the BA and the TOP. Requirement R3 provides exceptions for complying, but only for safety, equipment regulatory or statutory requirements. Nowhere does the Requirement address conflict in reliability requirements: for example, a TOP in our area issues an instruction to eliminate a voltage limit issue, and this action may cause another limits issue for another TOP. There appears to be no “out” clause based on reliability conflicts – such as deferring to an assessed lesser reliability impact. BC Hydro recommends revising these Requirements to allow for an “out” clause.

New York Independent System Operator (NYISO)
No
SDT should consider the use of the word ensure. We suggest revising the phase to, ‘maintain ensure the reliability…’. This term exists in other parts of this group of standards, please consider the comment for all.
No
The SDT should clarify and coordinate the requirements between voice and data equipment requirements and the associated COM-001 and IRO-002-4. The SDT should clarify the COM-001 is restricted to voice communications and the IRO-002-4 R1 is intended to address data. It is also not clear that IRO-002-4 R2 is limited to voice communication and/or data. The NYISO suggests that the voice and data requirements be including only in COM-002 and the ability to approve outages of either system be clarified in IRO-002-4 R2. A possible wording change for R2 could be, ‘ .. authority to approved planned outages and maintenance of its telecommunication and data exchange capabilities (as referenced in R1).
No
The NYISO believes that this requirement should be limited to IROL evaluations. We believe the 30 minutes may have been based on the requirements to be within IROL’s in 30 minutes. The 30 minute assessment for SOL’s may be over prescriptive as some SOL could be up to 4 hours.
Yes
No

See IRC/SRC Comments
No
See IRC/SRC Comments. The NYISO also would like to suggest the in R1, generation be replaced with generator to be consistent with R1.1.3
No
The NYISO has a concern with the term ensure. We suggest revising the phase to, 'maintain the reliability of it's…' R1/R2: The NYISO does not support the removal of the phrase, ' within it's TOP/BA Area'. Entities do not have authority to direct others outside of their area. In addition R3 only requires those to comply that are in the TOP/BA Area. For consistency, we suggest retaining that above language. R7: The NYISO continues to believe the previous language should be retained to limit the assistance up to and including emergency procedures implemented by the requesting entity. As worded, this could expose the assisting entity to violations for not going beyond what has been implemented. This addition would distinguish it from the previous requirements. To address the SDT response to the previous posting, when declaring an emergency, entities have a number of corrective actions to restore the system to normal. Our proposed language allows assisting entities to implement similar steps, which increase in severity, with the entity that is in the emergency. R13: The NYISO believes that this requirement should be limited to IROL evaluations. We believe the 30 minutes were based on the requirements to be within IROL's in 30 minutes. The 30 minute assessment for SOL's may be too limiting. R16: The NYISO suggests retaining the work 'own'. This would provide clarity that this in only about the equipment the TOP owns and not other equipment. R19/20: The SDT should clarify the purpose of the bracketed entities (Balancing Authority)? The NYISO believes that R19 should be focused on TOP and R20 should be focused on BA.
Yes
Yes
Yes
The current draft introduces the term 'limiting SOLs'. 'For example, if an area of the BES is at no risk of encroaching upon Stability or voltage limitations in the pre- or post-Contingency state, and the most restrictive limitations in that area are pre- or post-Contingency exceedance of Facility Ratings, then the thermal Facility Ratings in that area are the limiting SOLs. Conversely, if an area has plenty of headroom on thermal Facility Ratings and has no risk of instability but is prone to low voltages pre- or post-Contingency, then the voltage limits in that area are the limiting SOLs. We believe that a better wording would be the 'limiting criteria that results in the identified SOL'.

SPP Standards Review Group
Robert Rhodes
No
R1 – We have concerns regarding the phrase ‘to ensure the reliability’. The phrase is ambiguous and detracts from the purpose of the standard which is to ensure the Reliability Coordinator takes action or directs others to act. Additionally, we suggest tying the ‘others’ in Requirement R1 specifically to those entities identified in Requirements R2 and R3.We recommend the following rewrite: ‘Each Reliability Coordinator shall act, or direct others as identified in Requirements R2 and R3 to act, by issuing Operating Instructions in accordance with its responsibilities as a Reliability Coordinator within its Reliability Coordinator Area.' Rationale Box for Requirements R2 & R3 – The Rationale Box for Requirements R2 and R3 does not match the language in the requirements. There is no mention of the Transmission Service Provider in the requirements. It only appears in Measures M2 and M3. The IRO Five

Year Review Team had recommended adding Transmission Service Provider to Requirements R2 and R3 to allow the retirement of IRO-004-2. With the removal of the Transmission Service Provider in Requirements R2 and R3, can the retirement of IRO-004-2 move forward?
No
M1 – Capitalize Real-time in the last line of Measure M1.
No
1.3 Data Retention – Hyphenate 30- and 90-calendar days in 1.3 Data Retention for consistency with the other standards in this package.
Yes
Yes
No
R2/M2 – Make Reliability Coordinator in Requirement R2 and Measure M2 possessive. The requirement should read '…in its Reliability Coordinator's outage coordination process.' R4 – To focus the coordination effort of the Reliability Coordinator on BES issues we recommend modifying the wording of R4 to state '…for identified issues or conflicts on the BES with planned outages…'
No
R1 – We have concerns regarding the phrase 'to ensure the reliability'. The phrase is ambiguous and detracts from the purpose of the standard which is to ensure the Transmission Operator takes action or directs others to act. Additionally, we suggest tying the 'others' in Requirement R1 specifically to those entities identified in Requirements R3 and R4. We recommend the following rewrite: 'Each Transmission Operator shall act, or direct others as identified in Requirements R3 and R4 to act, by issuing Operating Instructions in accordance with its responsibilities as a Transmission Operator within its Transmission Operator Area.' R2 – We have concerns regarding the phrase 'to ensure the reliability'. The phrase is ambiguous and detracts from the purpose of the standard which is to ensure the Balancing Authority takes action or directs others to act. Additionally, we suggest tying the 'others' in Requirement R2 specifically to those entities identified in Requirements R5 and R6. We recommend the following rewrite: 'Each Balancing Authority shall act, or direct others as identified in Requirements R5 and R6 to act, by issuing Operating Instructions in accordance with its responsibilities as a Balancing Authority within its Balancing Authority Area.' R9 – We feel that the use of impacted interconnected entities is too broad for the notification requirement. Also, the current wording of the requirement would have the Balancing Authority and Transmission Operator providing notifications for all outages even those lasting only a couple of minutes or a few seconds. Additionally, the term 'NERC registered' in Requirement R9 and Measure M9 should be deleted. This term was deleted in IRO-008-2, Requirement R4 and TOP-002-4, Requirement R3. We recommend rewording the requirement to read: 'Each Balancing Authority and

Transmission Operator shall notify its Reliability Coordinator and known impacted entities of outages of telemetering and telecommunication equipment, control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities lasting 30 minutes or longer.' Should Requirement R9 be split into two separate requirements, one for the Transmission Operator and one for the Balancing Authority as was done with Requirements R1 and R2 and Requirements R19 and R20? R10 – We have concerns with the existing language in Requirement R10 which when applied in the real-world of today's audit teams sometimes gets pushed beyond reason. For example, just how much of a neighboring TOP Area does a TOP have to model in order to determine impacts on SOLs within its TOP Area? What prevents an auditor from claiming that a TOP didn't model enough of the neighboring TOP's Area? Isn't this really the function of the RC and aren't we forcing the TOP to assume some of the RC functions with such a requirement? At the very least, we recommend the following language: 'Each Transmission Operator shall monitor 10.1 Facilities within its TOP Area, 10.2 status of Special Protection Systems identified as necessary by the Transmission Operator, 10.3 sub-100 kV facilities identified as necessary by the Transmission Operator, and 10.4 Facilities within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator as necessary to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area.' Rationale Box for R14 – The newly inserted sentence in Rationale Box for R14 doesn't completely present the overall picture of the Operating Plan as contained in the Associated Documents at the back of the standard. We propose an additional sentence, as indicated below, be included in the Rationale Box. '…These Operating Plans are developed and documented in advance of Real-time and may be developed from Operational Planning Assessments (OPA) required per proposed TOP-002-4 or other assessments. The Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). The intent is not to have a…' R18 – Should Requirement R18 be split into two separate requirements, one for the Transmission Operator and one for the Balancing Authority as was done with Requirements R1 and R2 and Requirements R19 and R20? R19 – Delete the parenthetical Balancing Authority in Requirement R19. R20 – Delete Transmission Operator and the parentheses around Balancing Authority in Requirement R20.
No
R4 – We suggest that load forecast uncertainty and resource uncertainty be added to the list of Parts for Requirement R4. 1.3 Data Retention – Hyphenate 90-calendar days in 1.3 Data Retention for consistency with the other standards in this package.
Yes
Yes
Hyphenate 24-hour in the 8th line under 1. on Page 1. First full paragraph on Page 3, we suggest the following rewrite for the last sentence in that paragraph. 'Conversely, if an area is not at risk of instability, no Facilities are approaching their thermal Facility Ratings but the

area is prone to pre- or post-Contingency low voltage conditions, then the voltage limits in that area are the limiting SOLs.' We also suggest deleting the 1st sentence in the following paragraph on Page 3. The paragraph flows better without it. We further suggest the following rewording in what would then be the 2nd sentence in the paragraph. 'How an entity remains within these SOLs can vary depending on the operating practices and planning strategies employed by that entity.' In 4. Voltage Stability Limits, replace the 2nd sentence with the following: 'Voltage Stability limits are typically defined as the maximum power transfer or load level that ensures voltage stability criteria are met.'
No
IRO-008-2 R4 – Change the Severe VSL for new Requirement R4 (old R5) to read '…more than three…' or '…four or more…' in lieu of '…three or more…'. The High VSL already uses three. IRO-014-3 R3 – The lead-in for the VSLs for Requirement R3 refers to Requirement R5. This reference should be to Requirement R3. R7 – Change the Severe VSL for Requirement R7 to read '…Coordinator had implemented…' and '…or would have violated safety…'. IRO-017-1 R2 – Make Reliability Coordinator possessive in the Severe VSL for Requirement R2. TOP-001-3 R8 – Delete 'other' in the VSLs for Requirement R8 referring to '…other known impacted Balancing Authorities…' and '…other Balancing Authorities…'. The use of 'other' only applies to references to Transmission Operator. Also in the VSLs for R8, change 'less' to 'greater' such that the Lower VSL would read: 'The Transmission Operator did not inform one other known impacted Transmission Operator or 5% or less of the affected known impacted other Transmission Operators, whichever is greater, of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas when conditions did permit such communications.' (This particular change applies to all VSLs in R8, R9, R19 and R20 as well as the VSLs for IRO-002-4, R1; IRO-008-2, R3, R5, R6; IRO-010-2, R2; TOP-002-4, R3, R5; TOP-003-3, R3, R4.) R9 – Delete the term 'NERC registered' in the VSLs for Requirement R9. (See comment in Question 7 above. R13 – Change the Severe VSL for Requirement R13 to read '…more than three…' or '…four or more…' in lieu of '…three or more…'. The High VSL already uses three. R19/R20 – Replace 'applicable' with 'identified' in the VSLs for Requirements R19 and R20. The use of 'identified' parallels the language in the requirements. TOP-002-4 R3 – Replace 'NERC' with 'entities' in the High and Severe VSLs for Requirement R3.
Yes
The definition of Special Protection System (SPS) is being revised to Remedial Action Scheme (RAS) yet this package of standards continues to use SPS. Other active drafting teams, particularly the Relay Loadability: Stable Power Swings and the Protective System Maintenance and Testing – Phase 3 (Sudden Pressure Relays) teams, are using the new RAS definition in their work. What process will be used to make the transition to RAS when the new definition is approved? Similarly, Load-Serving Entity will soon be eliminated as a registered function at NERC. How will this change be reflected in the standards? We recommend that all changes we have proposed for the standards be reflected in the RSAWs as well.

Duke Energy
Michael Lowman
No
R1: Duke Energy suggests re-writing R1 as follows: “Each Reliability Coordinator shall issue Operating Instructions, as necessary, to ensure the reliability of its Reliability Coordinator Area.” As written, we believe that every communication involving an RC could be considered an Operating Instruction. For example, If a BA/TOP informs the RC of a loss of unit/tripping of equipment and the measures taken to mitigate the situation. Would an RC be required to give Operating Instructions back to the BA/TOP stemming from an informational conversation? We feel the revision adds clarity that the RC will issue Operating Instructions only when they believe it is warranted. R2: No comments M2: All instances of Transmission Service Provider should be removed from this measure. R3: No comments
No
R1: Duke Energy suggests the following revision: “Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.” We believe adding “its BA and TOP” narrows the scope of data sharing required by the RC. We believe the intent should be to ensure the RC has data sharing capabilities with the BAs and TOPs in its RC area and with other entities that the RC believes are needed for performing Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. R2: No comment R3: Duke Energy suggests the following rewording: “Each Reliability Coordinator shall monitor identified Facilities, status of Special Protection Systems, and sub-100 kV facilities necessary to identify any System Operating Limit exceedances, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas, and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area." We believe this rewording provides more clarity on the intent of this requirement. R4: Duke Energy suggest the following language: “Each Reliability Coordinator shall have Energy Management Systems and SCADA data that provides information utilized by the Reliability Coordinator’s System Operator over a redundant infrastructure.” We feel the language “as written” is too broad. We feel this revision helps remove the perceived vagueness when referring to “monitoring systems”. Also, in regards to “redundant infrastructure”, we ask the SDT the following question: If an entity has redundant capability of its EMS system and one leg of that system is rendered unavailable during a planned or unplanned outage, is the RC non-compliant? In this example, the RC will not be on a redundant system due to the outage. We have concerns that the language as written in the standard would render the RC non-compliant.
No
R1: No Comment R2: No Comment R3: No Comment R4: No Comment R5: Duke Energy still agrees with the intent of the SDT and the modifications made. However, we ask that the SDT review and describe the expectations for outages of an RC’s Energy Management

System during planned outages (data base modifications, model changes, etc.) and reconsider whether 30 minutes is an adequate amount of time to make those modifications. R6: We believe the incorrect requirement was referenced in R6. The phrase should be as follows : “when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R5 has been prevented or mitigated.” Please change the reference of “R6” with “R5” as seen in the example above. R8: Duke Energy suggests the following revision: “Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been mitigated.” We suggest removing “prevented” because the prevention of SOL/IROL exceedances will be difficult to prove and would not typically be communicated to BAs and TOPs. The communication activities should be restricted to communications of activities to mitigate a potential SOL/IROL exceedance and not the prevention.
No
Duke Energy does not disagree that the types of data exchanges described in this proposed IRO-010 are necessary. However, we believe that these data exchanges currently take place within the context of various existing ERO Requirements and/or various existing agreements between the Applicable Entities. Therefore we do not believe there is a need to codify these requirements in another ERO Standard. As written, this Standard simply creates additional administrative burden on the industry while providing no incremental reliability benefit. As written, Duke Energy believes this Standard would simply become a candidate for a future Paragraph 81 submittal.
No
R1.1 – Duke Energy suggests the following language: “Criteria and processes for notifications as identified in R1.” This provides the clarity on the specific notifications that are required with adjacent RC(s) as defined in R1. R2: No Comment R3: No Comment R4: No comment R5: Duke Energy suggests the following revision: “Each Reliability Coordinator that identifies an Emergency in its Reliability Coordinator Area shall develop an action plan to resolve the Emergency during those instances where impacted Reliability Coordinators disagree on the existence of an Emergency.” We believe “identifies” is the appropriate wording. R6: “Each impacted Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identifies the Emergency during those instances where Reliability Coordinators disagree on the existence of an Emergency, unless such actions would violate safety, equipment, regulatory, or statutory requirements.” We believe “identifies” is the appropriate wording.
No
While we are open to the suggestions made by the SDT, if the scope of RC is going to be expanded, we believe revisions to the Function Model need to occur first and then distributed to the industry for review and approval. The Functional Model is the foundation for the development of Reliability Standards used by Standard Drafting Teams. As indicated

above, these revisions to the Functional Model need to occur first before a substantial change in roles and responsibilities of Functional Entities take place within the standards. R1: No comments R2: Duke Energy suggests the following revision: “Each Transmission Operator and Balancing Authority shall perform the roles and reporting responsibilities specified in its Reliability Coordinator outage coordination process.” The use of “roles and reporting responsibilities” in the place of “functions” better aligns with the language used in R1.1 of the proposed standard. R3: No comments R4: Duke Energy suggests the following revision: “Each Planning Coordinator and Transmission Planner shall jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts on the BES with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon.” We believe “identified issues or conflicts on the BES” better aligns with the intent of this requirement and adds clarity that the RC, PC , and TP will jointly develop solutions for conflicts on the BES.
No
R1: Duke Energy suggests re-writing R1 as follows: “Each TOP shall act or issue Operating Instructions to entities, as necessary, within its TOP Area to ensure the reliability of its TOP Area.” We believe “within its TOP Area” is necessary within the context of the standard. Requirements R3 and R4 appear to imply that Operating Instructions from a TOP are within the bounds of the TOP area only. However, by removing this language, it is our view that the TOP could issue Operating Instructions to entities outside the TOP Area which is in direct conflict of the NERC Functional Model. R2: Duke Energy suggests re-writing R2 as follows: “Each BA shall act or issue Operating Instructions to entities , as necessary, within its BA Area, as necessary, to ensure the reliability of its BA Area.” We believe “within its BA Area” is necessary within the context of the standard. Requirements R5 and R6 appear to imply that Operating Instructions from a BA are within the bounds of the BA area only. However, by removing this language, it is our view that the BA could issue Operating Instructions to entities outside the TOP Area which is in direct conflict of the NERC Functional Model. R3-R6: No Comments R7: While Duke Energy believes that this is a great operational expectation or operating practice for a TOP, we believe that the requirement “as written” is unmeasurable. We believe it will be difficult for an auditor to measure how a TOP verified that another TOP implemented “its emergency procedures”. The term “emergency procedures” is too vague and subject to interpretation. For example, at what point in another TOP’s emergency procedures should a TOP provide assistance? Based on this language, we suggest removing R7 from this standard or adding this to a guidance document to promote operational excellence within the industry. R8: Duke Energy suggests re-writing R8 as follows: “Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities and other impacted Transmission Operators, of its actual or expected operations that result in, or could result in a known Emergency.” R9-R12: No Comments R13: Duke Energy still agrees with the intent of the SDT and the modifications made. However, we ask that the SDT review and describe the expectations for outages of an TOP’s Energy Management System during planned outages (data base modifications, model changes, etc.) and reconsider whether 30 minutes is an adequate amount of time to make those modifications. R14-R20: No Comments

No
R1: Duke Energy suggests re-writing R1 as follows: “Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any identified System Operating Limits (SOLs).” We believe the addition of “identified” adds additional clarity and conforms to the language in FAC-011. R2: Duke Energy requests clarification on whether a process for each SOL exceedance identified in the Operational Planning Analysis is necessary or is one document that address any and all exceedances of SOL(s) is acceptable? R3: Duke Energy believes “impacted” is not needed in the context of the requirement and suggests removal. R4: No Comment R5: Duke Energy believes “impacted” is not needed in the context of the requirement and suggests removal. R6/R7: Duke Energy suggests the following for R6: ”Each Transmission Operator shall provide the results of its Operating Planning Analysis for next-day operations identified in Requirement R2 to its Reliability Coordinator.” We also believe that R6 and R7 goes beyond the scope of Recommendation 1 of the SW Outage Report. The report indicates that TOPs should share the results with neighboring TOPs and RCs, and not necessarily the Operating Plan itself. In addition, the BA is not cited in Recommendation 1 of the SW Outage Report as having to do the same type of analysis.
No
Duke Energy asks the SDT to consider adding a mechanism to allow a recipient of a request to challenge the requestor if a reliability related need cannot be established. For example, should a BA wanting to know the ACE of every BA within the Eastern Interconnection be allowed to get this information if there is not a reliability related need to have the information?
Yes
Duke Energy agrees with the SOL Performance Summary described in Figure 1. We believe that Figure 1 adequately describes the intent on treatment of SOL(s), more so than the text of the White Paper itself. We suggest that the SDT revise the text in the White Paper to better align with the SOL Performance Summary in Figure 1.
No
Duke Energy does not necessarily disagree with the VRF(s) for IRO-017. However, we are seeking clarification for the increases in VRF from a “lower” in the first posting to a “medium” on this posting.

a. R6 and all of its VSL: The reference to “as identified in identified in Requirement R6” should be revised to “as identified in identified in Requirement R5”. b. We wish to reiterate our previous comment on the inconsistent language used between Requirement R6 (was R8 but misquoted in our previous comment as R6) and the LOWER VSL for R6 in which the word “Emergency” is used but the condition is not specified in R6. R6 stipulates that: Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been prevented or mitigated. However, the LOWER VSL for R6 indicates that: The Reliability Coordinator did not notify one other impacted Reliability Coordinator as indicated in its Operating Plan “when the Emergency identified in Requirement R6 was prevented or mitigated.” Please revise VSL to read “when the SOL or IROL exceedance identified in Requirement R5 has been prevented or mitigated” as opposed to “Emergency” for consistency. c. The language between R4 and its VSL is inconsistent. R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. This requirement was changed from having the RC to “perform” to “ensure that” a Real-time Assessment is performed. However, the VSL still assesses the condition that the RC did not “perform” as opposed to did not “ensure that” the Real-time Assessment was performed. Please revise as appropriate.
Yes
No
a. We generally agree with the changes made to IRO-014-3. However, the replacement of “other” with “adjacent” may leave a reliability gap. For example, the notification of Transmission Loading Relief invasion may require “notification or coordination of actions” by, and can have an impact on, RCs other than just the adjacent RCs. Since the words “may impact” already serve as the qualifier for the RC to select who to notify, then the RC is not obligated to notify all RCs hence the scope of notification is finite. We urge the SDT to consider reinserting the word “other” into R1. b. We do not have a preference, but ask the SDT to review the use of the phrase “Wide Area” in IRO-008-2 (and other IRO standards) and the phrase “Reliability Coordinator Area” in IRO-014-3. If these phrases are expected or interpreted to be synonymous, we suggest to use one or the other, but not both, throughout the IRO (and other) standards for consistency and to avoid confusion. c. Retention Period: We are unable to find the data retention period for Requirements R3 and R4. Instead, there are retention period requirements for R8 and R9, which do not exist. We urge the SDT and NERC to conduct a thorough and independent quality review for all standards posted for commenting and balloting to avoid unnecessary delays in approving standards due to these errors.
No

During the last posting, we commented that the requirement for TOP and BA to coordinate outage plans is inappropriate since the BA does not develop outage plans or schedules; it only receives them from the Generator Owners and may suggest adjustments based on resource/demand/interchange assessments. The SDT's response suggests that these details would be elaborated in the process document and hence no changes were made. While we agree that such details can be elaborated in the process document, Part 1.1.2 should be expanded to include facility owners in order for the RC to develop a workable and appropriate outage coordination process involving the correct entities. We are unable to support Part 1.1.2 as written, and suggest the SDT to either revise it to remove the BA from it, or to expand it to include the facility owners and/or operators. Corresponding changes will need to be made to Requirement R2.
No
We do not have any concerns or comments on R19 and R20, which are added to address data exchange requirement and to achieve consistency with the proposed IRO-002-4, Requirement R2. However, we suggest that the SDT add Requirement R20 to the NERC issue data base along with requirements R2, R5, R6, R11, and R17 which the SDT agrees with our previous comment that these requirements belong to the BAL standards and hence a future assessment of creating such a BAL standard will be conducted.
Yes
Yes
No
During the last posting, we commented on the need to shed load under the pre-contingency loading condition when the 4-hour rating is exceeded. The SDT's response indicates that "it has revised the whitepaper to include "as necessary and appropriate". However, this change is made to the post-contingency condition for exceeding the 15-minute Emergency Rating, but not to the pre-contingency loading condition when the 4-hour rating is exceeded as it still stipulates that "All of the above plus load shed to control violation below Emergency Rating consistent with timelines identified in Operating Plan." We speculate that the insertion of "as necessary and appropriate" to the post-contingency condition when the 15-minute Emergency rating is exceeded was an error. However, if the SDT really meant to keep load shedding under the pre-contingency loading condition when the 4-hour rating is exceeded, then we will again express our disagreement with the approach. When the 4-hour rating is exceeded, the TOP still have up to 15 minutes to reduce loading to within the Normal rating. Further, as stated in the paragraph preceding Table 1, "However, operating between 900 MVA and 950 MVA (commenter insert: i.e. exceeding the 4-hour rating but not the 15-minute rating) is not an SOL exceedance unless the associated Operating Plan time parameter is exceeded as explained in Figure 1 (commenter insert: i.e. 15 minutes have elapsed and still unable to return loading to below 4-hour rating)." We urge the SDT to reassess whether or not the "as necessary and

appropriate” should be inserted to the pre-contingency loading condition for exceeding the 4-hour rating.
Yes
Yes
During the last posting, we expressed a concern over the proposed retirement of TOP-004-2, Requirement R4, which stipulates that: R4. If a Transmission Operator enters an unknown operating state (i.e. any state for which valid operating limits have not been determined), it will be considered to be in an emergency and shall restore operations to respect proven reliable power system limits within 30 minutes. The SDT’s response to our comment indicates that: As presented in the white paper on the Treatment of SOLs, the proposed requirements are based on the concept of not depending on pre-determined existing SOLs/IROLs but rather to monitor the existing and potential operating conditions and evaluate them against the same ratings and limits that SOLs/IROLs would be based upon. Those ratings and limits rarely change due to changes in system conditions, whereas predetermined SOLs and IROLs may change due to the assumptions they were based on. No change made. While we agree that the ratings and limits upon which the SOLs/IROLs are based rarely change due to changes in system conditions, the changes in system condition themselves can render any SOLs/IROLs invalid, especially those that are voltage or stability limits. In other word, there does not exist any “proven reliable power system limits” as stated in R4 of TOP-002-4. We generally support the concept of not depending on pre-determined existing SOLs/IROLs but rather, to monitor the existing and potential operating conditions and evaluate them against the same ratings and limits that SOLs/IROLs would be based upon. However the concept itself (and being in a “white paper” status), or use of any information in the white paper, does not help or mandate re-calculation of valid SOLs and IROLs when entering an unknown state, and the ratings and limits that do not change have no bearing on those SOLs/IROLs that are voltage or stability limited and which are more dependent on system conditions, which have changed. While R13 in TOP-001- 3 requires a TOP to ensure that a Real-time Assessment is performed at least once every 30 minutes, it falls short of specifying the expected outcome (or objectives), such as new/revised SOLs/IROLs and assessing system performance against the new limits. The proposed definition of Real-time Assessment is also short of specifying the development or calculation of SOLs/IROLs. Hence, between R13 of TOP-003-1 and the definition of RTA, there is a gap that in an unknown state/condition, a TOP is not required to (and hence will not) develop SOLs/IROLs that are valid for the prevailing conditions. Hence, if R4 in TOP-004-2 is retired, it will leave a reliability gap. The white paper does not mandate the proper and necessary action to “restore operations to respect proven reliable power system limits within 30 minutes” when entering into an unknown state. We again urge the SDT to consider not retiring Requirement R4 of TOP-002-4. Finally, we are unclear whether or not the proposed retirement of TOP-004-2 will be balloted separately, which it should. Please advise.

We agree with Southwest Power Pool comments for this question. We were not allowed to associate with another entities comments at the beginning of this comment form so we are stating that in the questions. The following were the comments that we had in addition to SPP's comments. CSU references our previous comments again as we do not feel they were addressed correctly. 1. In R6 there should be a timeframe requirement that the RC needs to adhere to in notifying impacted entities. 2. In R8 there should be a timeframe requirement that the RC needs to adhere to in notifying impacted entities. The response by the SDT referenced other requirements that require notification in other standards stating that the time requirements are covered under those requirements. The requirements referenced by the SDT do require notification at the time of an actual SOL or IROL etc. IRO-001-4 is the pre-contingency analysis that needs to be communicated. We do not feel that the requirements referenced by the SDT cover the pre-contingency analysis required to be communicated by IRO-001-4.

We agree with Southwest Power Pool comments for this question. We were not allowed to associate with another entities comments at the beginning of this comment form so we are stating that in the questions. The following are our additional comments above and beyond what SPP's comments are. R13 - Would a tool such as a state estimator or RTCA be required to meet the Real-time Assessment definition or can it be done without “real-time” tools? Your response to our previous comments allude to the fact that all entities are currently using or contracting for such “real time” tools which is not universally true. Additional

implementation period is needed and thus requested due to the time needed for budgeting and implementation of “real time” tools.

ITC
Yes
ITC has concerns with the definitions of “Operational Planning Analysis” and “Real-time Assessment”, as they are used throughout the IRO and TOP standards. “Operational Planning Analysis” definitions states: The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations.” “Real-Time Assessment” definition states: The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. ITC is appreciative of the addition of the word “applicable” in the two definitions noted above, to provide more flexibility in selection the input. However, while the addition of the word “applicable” was an improvement, we are left with the issue of who determines “applicability” of the inputs. Lack of specificity in this regard will lead to confusion as to

whether the audit team or the entity will determine input. To clear this up, ITC suggests the addition of the following language to both definitions: “The evaluation [assessment] shall reflect inputs determined applicable by the entity such as …”. An example of how this would be beneficial would be regarding the input of “known Protection System and Special Protection System status or degradation”. This input can be utilized in the dynamic analysis conducted outside the next day or real time horizon. The revised wording would make it clear that the entity can exclude this input from it next day or real time studies.

Wayne Johnson
Yes
See VSL comments in response to question #11 below.
Yes
R4 begins with ‘Each Reliability Coordinator shall monitor Facilities...’ Southern suggest that the words, “Bulk Electric System” be added to R4 so that it reads ‘Each Reliability Coordinator shall monitor “Bulk Electric System Facilities”, consistent with the verbiage in IRO-003-2 Requirement 1. Measure 4 should also be changed accordingly. R4 - Southern suggest that utilization of the words, “as necessary” makes the requirement confusing and proposes the below verbiage to add clarity: ‘Each Reliability Coordinator shall monitor “Bulk Electric System Facilities”, the status of Special Protection Systems, and sub-100 kV facilities identified by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas, “as being necessary to determine” any System Operating Limit (SOL) exceedances within its Reliability Coordinator Area.’ Changes would apply to Measure 4 as well.
No
R4 – It is not clear why the SDT removed the qualifier “NERC registered”. Southern recommends adding “NERC registered” back to the requirement. The NERC registered entities have established a reliability relationship with the RC, TOP, and BA and should be notified per this requirement. In addition, Southern noted that the SDT responded with the following comment in consideration of comments received for R4. “Impacted goes beyond the concept of those entities that have an active role to play in the Operating Plan. It also includes those entities which may not have an active role to play in the plan but are still impacted by the given operating condition. For example, an entity may have Load impacted by a given situation and the only available option that entity may have is to shed that Load. But if the plan doesn’t call for that entity to shed the Load, then the entity doesn’t have an active role in the plan but is still impacted by the situation and therefore is deserving of notification.” It is very unclear on what expectation the SDT is suggesting in this comment. If the RC conducts a next day study and identifies potential issues, the RC will develop a plan to resolve the issue. This plan will be communicated to the NERC registered entity that is responsible for implementing the plan. The example provided by the SDT is unclear and

confusing in that it introduces an entity that was never part of the plan to resolve the issue. If this entity was never part of the plan, why would or should the RC notify such entity? R8 – Southern suggests modifying R8 as follows (include "actual") to require notification in the event of an actual SOL or IROL exceedance within the RC area, but not require notification in the case where there was a possible SOL/IROL exceedance, but system conditions changed that cause the potential issue to subside. Southern believes that requiring notification for the latter is a good utility practice, but does not maintain or enhance reliability as it is nothing more than a notification that "nothing is required any longer for what could have been" "Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the actual System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been prevented or mitigated. [Violation Risk Factor: Medium] [Time Horizon: Same-Day Operations, Real-time Operations] Southern also recommends moving the word "known" in the definition of Operational Planning Analysis to the beginning of the second sentence to reflect that the evaluation shall reflect applicable "known" inputs. The "known" should apply to each of the inputs and not just Protection Systems and SPS status and degradation. The Operational Planning Analysis should reflect what the TOP knows at the time the evaluation is conducted. TOPs continue to update the studies as updated or "known" information becomes available. See suggested revision below. Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable known inputs including, but not limited to, load forecasts; generation output levels; Interchange; Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
Yes
No
Southern agrees with the compliance assessment approach and note to the auditor in the RSAW and recommends that the SDT incorporate these concepts into the standard itself. The RSAW clearly recognizes that events / Emergencies have varying levels of significance. Southern continues to think the current definition of "Emergency" is too broad and is misused in standards development. This standard, and in particular requirements to notify neighboring RCs, should be focused more on issues that can truly impact them, not any situation that could be interpreted as an "Emergency" as it is currently defined. Southern recommends the SDT replace Emergency with Adverse Reliability Impact as it was before. If the SDT does not accept this recommendation, the SDT should consider modifying the requirements or even the definition of "Emergency" to incorporate the concept that an "Emergency" is an operating condition which has not been studied or for which no mitigation plan has previously been developed. For example, having a contingency occur

which was studied and for which a post-contingency mitigation plan has been developed, communicated, and can be implemented prior to an SOL exceedance, is not an emergency even though it may require immediate manual action by an operator. Similarly, an IROL which can be mitigated prior to Tv as required by IRO-009 should not be considered an Emergency regardless of what actions the IRO-009-1, R1's Operating Process/Procedure/Plan requires. An Emergency should be limited to multi-element contingencies due to things like weather, differential relay operations, relay failures, etc. or to other unstudied states where a potential or actual SOL exceedance needs to be managed as quickly as possible.
Yes
Southern believes that Requirement 4 should provide clear guidance that the Planning Coordinator and Transmission Planner are responsible for initiating the review of solutions with their Reliability Coordinator and additional language should be added to clarify that the joint discussions should only be focused on issues that may impact the Operations Planning Horizon. Southern proposes the following revision to the requirement: "Each Planning Coordinator and Transmission Planner shall coordinate with its respective Reliability Coordinator to jointly develop solutions for identified issues or conflicts with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon, which may ultimately impact the Operations Planning Horizon."
No
R1 and R2 - Southern understands other commenter's concerns about BAs, GOPs, DPs, and LSEs not falling into a Transmission Operator's TOP Area, but Southern disagrees with the approach taken by the SDT to address these concerns. Rather than removing "within its TOP Area" in R1 and "within its BA Area" in R2, the requirement should spell out the entities to link to R4 and R5. Suggested change as follows: R1 - Each Transmission Operator shall act, or direct its Balancing Authorities, Generator Operators, Distribution Providers, and Load Serving Entities to act by issuing Operating Instructions, to ensure the reliability of its Transmission Operator Area. [Violation Risk Factor: High][Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations] R2 - Each Balancing Authority shall act, or direct its Transmission Operators, Generator Operators, Distribution Providers, and Load Serving Entities to act by issuing Operating Instructions, to ensure reliability within its Balancing Authority Area. [Violation Risk Factor: High][Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations] R10 begins with 'Each Transmission Operator shall monitor Facilities...' Southern suggest that the words, "Bulk Electric System" be added to R10 so that it reads 'Each Transmission Operator shall monitor "Bulk Electric System Facilities", consistent with the verbiage in IRO-003-2 Requirement 1. Measure 10 should also be changed accordingly. R10 - Southern suggest that utilization of the words, "as necessary" makes the requirement confusing and proposes the below verbiage to add clarity: 'Each Transmission Operator shall monitor "Bulk Electric System Facilities", the status of Special Protection Systems, and sub-100 kV facilities identified by the Transmission Operator, within its Transmission Operator Area and neighboring Transmission Operator Areas, "as being necessary to determine" any System Operating Limit (SOL) exceedances within its Transmission Operator Area.' Measure 10 should also be

changed accordingly. R15 - Southern appreciates the SDT's consideration of Southern's comments but disagrees that the Requirement as currently drafted, does not reflect "past tense" with respect to actions taken. Southern suggest that the SDT reword the Requirement for clarification purposes: 'Each Transmission Operator shall inform its Reliability Coordinator of its actions taken to return the system to within limits when a SOL has been exceeded.'
No
R3 - It is not clear why the SDT removed the qualifier "NERC registered". Southern recommends adding "NERC registered" back to the requirement. The NERC registered entities have established a reliability relationship with the RC, TOP, and BA and should be notified per this requirement. R5 – See comment regarding removal of "NERC Registered" for R3. Also, in the SDT's consideration of our previous comments, the SDT states they do not believe R5 requires notification. Given R5 clearly states that the BA shall notify impacted entities, it is not clear what the SDT's expectation / interpretation of this requirement is. Southern suggests modifying the requirement to incorporate the concept that notification from the BA is only required to entities where the BA is requesting an action that is different than what the entity provided to the BA. For example, if a GOP provided their expected generation resource commitment and dispatch to the BA, the BA reviews the information and determines that this particular GOP needed to commit additional units to provide more regulation, frequency response, etc., then the BA should notify this GOP. If another GOP provided data and the BA did not have any suggested changes, then there should not be a notification requirement. Suggested changes are as follows: "Each Balancing Authority shall notify NERC registered entities identified in the Operating Plan(s) cited in Requirement R4 when the BA is requesting the entity to take an action that is different from the last submitted plan the entity originally provided to the BA."
Yes
Yes
As currently presented, the example Operating Plan in Table 1 on page 8 of the SOL Exceedance White Paper is confusing. It is actually a pretty good attempt to capture in table form the concepts described in the document text related to the time limit is exceeded versus pre-/post- contingency. However, it uses terms such as "non-cost" and "off-cost" which are not standard industry terms and which are not used elsewhere in the document. The SDT should consider removing these terms and using more standard terms, such as re-dispatch reconfiguration, etc. as appropriate. In addition, the "Legend" shown is confusing and does not help support the example.
No
Southern disagrees that any violation of IRO-001-4 requirements constitutes a Severe VSL. The RSAW suggests that auditors are to use the NERC EAP process (i.e. reviewing entity's Category 2 or higher events) in their compliance assessment. Southern agrees with this approach and suggest the SDT adopt this thought process in the VSLs. For example, a

Severe VSL would be a case where there was non-compliance for a Category 4 or 5 event, a High VSL would be for Category 3 events, and so on. This method should be used as not all events where Operating Instructions are issued, are equal.

(1) We agree with the removal of the PSE and LSE from the applicability section of IRO-001-4. (2) The current proposal for R2 as written could overly expose the DP to excess and double jeopardy compliance obligations for routine switching operations DPs perform on a daily basis which does not affect the reliability of the BES. Daily switching which require Operating Instructions could include scheduled outages for maintenance items and new construction. The functional model clearly states that RCs "…Issues corrective actions and emergency procedures directives (e.g., curtailments or load shedding) to Transmission Operators, Balancing Authorities, Generator Operators, Distribution Providers, and Interchange Coordinators". Based on this, one could assume the Operating Instruction issued by an RC to a DP would be limited to a load shedding scenario and not daily switching routines mentioned above. However, this arrangement becomes less clear when the issuer of the Operating Instruction has multiple registrations with NERC as the RC, BA, and TOP; and when the recipient of the operating instruction is registered with NERC as a DP, TO, and TSP. Under such exchange, a single Operating Instruction issued from such an entity is technically an Operating Instruction from the RC, BA, and TOP; the recipient of this

single Operating Instruction also applies to each of their registration type being a DP, TO, and TSP. To the auditor, this single Operating Instruction could be the same piece of evidence for multiple requirements across multiple Standards such as IRO-001 and TOP-001. GTC believes the RC to DP interaction (with the RCs wide area view) is limited to Emergency scenarios which warrant a separate requirement for clarification of such exchange. A separate requirement for the DP is also justified and helps the ambiguity surrounding Real Time vs Ahead of Time activities within scope of the RC. The RC could issue Operating Instructions to the TOP, BA, GOP and IA for both Real Time and Ahead of Time, but GTC believes the DP is limited to Real Time horizon associated with “load shed” only in order for the RC to ensure the reliability of its Reliability Coordinator Area. A standalone requirement would correct the ambiguity expressed above and would more accurately capture the scenario of when the RC would be issuing Operating Instructions to the DP rather than BA, TOP, GOP, etc. Again, GTC’s goal is for this requirement not to overlap on the daily switching routines performed by the DP which require Operating Instructions such as scheduled outages for maintenance items and new construction when the issuing entity has both registrations of RC and TOP. GTC proposes the following standalone requirement for the DP: “Each Distribution Provider shall comply with its Reliability Coordinator’s Operating Instructions associated with load shed unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements.” Alternately, GTC would accept “Each Distribution Provider shall comply with its Reliability Coordinator’s Operating Instructions during an Emergency unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements.”

(1) The applicability section needs to be revised to remove the Load Serving Entity. The Risk Based Registration project will retire the LSE from Appendix 5B from the NERC Rules of Procedure. Having the LSE listed as an applicable entity leads to confusion and questions. For example, a reviewer of this standard could question how the RBRAG could arrive at the conclusion that LSE is not needed for reliability but this drafting team apparently determined it was needed for reliability by including it in the standard. At the very least, if the SDT is not intending to contradict the RBRAG’s finding’s a rationale box should state that LSE is only being included for historical purposes and will be removed pending the final approval of the RBRAG recommendations by the NERC Board of Trustees. (2) We disagree with Requirement R1, part 1.1 that includes sub-100 kV data. The BES definition is very clear to the applicability of standards. IRO-010-2 should apply to BES Facilities, which may include sub-100 kV Elements and Facilities based on a determination from Regional Entity

through the BES exceptions process. Asking for non-BES data is out of scope of the jurisdictional bounds of reliability standards.
No
GTC supports GSOC's comments for IRO-014-3
No
(1) GTC disagrees that outages are planned for the near term planning horizon (years 1 – 5). Outages are planned and scheduled within the operational planning horizon (up to year 1). The Planning Assessment only covers the near term and the long term planning horizons; it does not cover the operational planning horizon. Furthermore, the RC model can only include the current system that has been built and deals with real time parameters. They cannot grant outages on proposed planning solutions. The Planning Assessment does not provide any useful information for scheduling outages in the operations horizon. An outage request for construction of new stations, lines, or facility upgrades is what is required so that the RC can run a real-time assessment and grant approval for outages. R1 and R2 adequately cover the process to grant outages as they are requested, and sufficiently cover the purpose of this standard. GTC believes R3 and R4 are not necessary for outage coordination in the operations horizon and should be eliminated from this Standard. Additionally, the purpose statement should remove reference to Near-Term Transmission Planning Horizon.
No
(1) The current proposal for R3 and R5 as written could overly expose the DP and LSE excess compliance obligations for routine switching operations performed on a daily basis which are not performed to “ensure the reliability” of the BES, such as scheduled outages for maintenance items and new construction, etc. The DP and LSE implement Operating Instructions on non-BES equipment on a routine basis, but the implementation of Operating Instructions on BES or non-BES equipment “to ensure the reliability of the BES” is not very routine. Based on the stated purpose of the standard, GTC believes this requirement for the DP/LSE should complement COM-002-4 R6 relating to Operating Instructions during an Emergency “affecting the reliability of the BES”. We believe that the use of the NERC term “Emergency” would properly capture the stated intent of this standard. GTC proposes the language “[during an Emergency]” be added after “....shall comply with each Operating Instruction issued by its Transmission Operator(s) [during an Emergency] “. Based on the stated purpose (which we believe is adequately captured by the use of the term “Emergency”), at a minimum, Operating Instructions issued to ensure the reliability of the BES should be the only Operating Instructions covered by this standard (as was done in R1 and R2). As is currently written Operating Instructions for scheduled outages associated with maintenance items and new construction will also be in scope which conflicts with the stated purpose of this standard. (2) Based on the functional model, the TOP is responsible for the Real-time operating reliability of its Area and has the authority to ensure that its TOP Area operates reliably. Thus, it is clear to us that part of the job of the TOP and/or BA to ensure that the Operating Instructions they issue are performed. Recipient entities such as the DP would rely on the TOP or BAs voice recordings

as evidence which is duplicative to what the TOP or BA is already collecting. We would suggest the following: R3: Each Transmission Operator is to verify each Operating Instruction it issues as a part of R1 is completed, unless informed that such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. R4: Each Balancing Authority is to verify each Operating Instruction it issues as a part of R2 is completed, unless informed that such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. An additional benefit to writing the requirements in this manner is a substantial reduction in redundant administrative record-keeping. TOPs and BAs will already be collecting such information as a part of R1 and R2, so requirements along the lines of those proposed above would provide the additional benefit of preventing duplication of records between multiple entities, keeping records of these Operating Instructions performed with the TOP and BA.

(1) The applicability section needs to be revised to remove the Load Serving Entity. The Risk Based Registration project will retire the LSE from Appendix 5B from the NERC Rules of Procedure. Having the LSE listed as an applicable entity leads to confusion and questions. For example, a reviewer of this standard could question how the RBRAG could arrive at the conclusion that LSE is not needed for reliability but this drafting team apparently determined it was needed for reliability by including it in the standard. At the very least, if the SDT is not intending to contradict the RBRAG's finding's a rationale box should state that LSE is only being included for historical purposes and will be removed pending the final approval of the RBRAG recommendations by the NERC Board of Trustees. (2) Requirement R1 is problematic because it lists sub-100 kV transmission equipment as being subject to a standard. Sub-100 kV transmission equipment are not subject to reliability standards unless they are deemed to be a part of the Bulk Electric System. A simple solution would be to remove the clause "including sub-100 kV facilities needed to make this determination." If these sub-100 kV facilities are needed for reliability they would be included in the BES per the BES exceptions process and would be covered by the NERC defined term "Facilities." (3) For Requirements R1 and R2, we recommend changing the term "Special Protection System" to "Remedial Action Scheme" because the SDT Project 2010-05.2 has determined that RAS is more appropriate and SPS will be retired upon FERC approval. This standard would potentially have an outdated glossary term if it keeps SPS in the requirement. (4) Requirement R5 should be revised to remove the LSE function.

R1 as written requires the RC to perform an OPA to assess whether planned operations will exceed SOLs and IROLs in its Wide Area. NERC defines Wide Area as “The entire Reliability Coordinator Area as well as the critical flow and status information from adjacent Reliability Coordinator Areas as determined by detailed system studies to allow the calculation of

Interconnected Reliability Operating Limits". According to this NERC definition, the Wide Area does not include actual Facilities outside the RC Area, but rather includes flow and status information from adjacent RC Areas for the purposes of IROL calculation (whether the IROL is in the RC Area, in the adjacent RC Area, or spanning across multiple RC Areas). It brings in information from outside the RC Area for IROL calculation – it does not bring in additional Facilities outside the RC Area for general monitoring. Therefore, requiring an OPA to assess SOL and IROL exceedances in a Wide Area actually doesn't make sense, given the fact that the Wide Area does not include actual Facilities outside the RC Area, but rather information from outside the RC Area. Given the NERC definition of Wide Area, the requirement can only make sense if it requires the OPA to assess whether planned operations in its Wide Area (i.e., flows and statuses outside its RC Area for the purposes of IROL calculation) is expected to exceed any of its SOLs and IROLs. Peak believes that the standard should be rephrased to state, "Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations within its Wide Area for the next-day will exceed any of its System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs)." With this language change, the flow and status information from the Wide Area are included in the RC's OPA to determine SOL and IROL exceedances appropriately (including IROLs within the RC Area as well as IROLs that span multiple RC Areas). This language change will also bring consistency with its companion requirement TOP-002-4 R1, which states, "Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs)." Peak believes this language change accurately reflects the NERC definition of Wide Area and ensures SOLs and IROLs are addressed appropriately to ensure reliability across the board. R5: It should be clarified what evidence will be needed to ensure that a Real Time Assessment is performed if the entity does not perform it themselves. If an entity relies on a third party to perform the Real-Time Assessment, there should be a requirement showing that this reliance was coordinated with the third party.
Yes
IRO-010-2 R1 states, "The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments." The concern with this language is the limiting nature of the scope of the data specification. The OPA is limited to data for next-day operations. R1 should not confine the RC's data specification to data for its OPA and RTA only, but rather should facilitate the RC to obtain the data it needs to perform its RC functions overall. With the current language, a TOP or BA may be able to claim that they have no compliance obligation to provide the RC with data it needs to perform its reliability functions. Peak recommends that R1 be rewritten to state: "The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its reliability functions." R2 should be updated similarly.
Yes
The new R4, R5, and R6 should also include "actual or expected Emergency" like R3.

Yes
No
There still needs to be clarity about conflicting Operating Instructions. For example, if TOP 1 gives and Operating Instruction to TOP 2 and then TOP 3 gives an Operating Instruction to TOP 2, which one trumps? The same would be true for BAs. This creates potential conflicts for TOPs, BAs, and RCs. "within its … Area" should not have been removed. R9: Why restrict to NERC registered entities when this term was removed from other requirements throughout the IRO/TOP revisions? R13: Should be clarified what evidence will be needed to ensure that a Real Time Assessment is performed if the entity does not perform it themselves. If an entity relies on a third party to perform the Real-Time Assessment, there should be a requirement showing that this reliance was coordinated with the third party.
Yes
Yes
Yes
The SOL Whitepaper directly addresses the confusion, debates, and misconceptions around the SOL concept that is so prevalent in the industry. Many thanks to the SDT for issuing the much needed SOL Whitepaper. Peak believes this paper will not only bring clarity and resolution to confusing and even contentious issues related to SOL establishment and exceedance, but will also result in improved reliability.
Yes
TOP-001-3 R13: The High VSL and Severe VSL overlap (High VSL TO RTA not conducted …3 times….Severe VSL TO RTA not conducted 3 or more times…) IRO-008-2 R4: The VSL removed the first occurrence of the term “NERC registered” entity but left the term in the second half of the VSL. Propose the following: Strike “Near-Term Transmission Planning Horizon” from Purpose; TPL-001-4 R1.1.1 already requires the model to represent known outages of generation or Transmission Facilities with a duration of at least six months. If outages with a duration of less than six months are required, then this should be a revision to the TPL standard. Strike “4.5. Transmission Planner” from Applicability: All requirements related to the Transmission Planner are either redundant to the TPL-001-4 standard or should be incorporated therein. Strike all of requirement R3: This requirement is redundant to the TPL-001 R8 requirement, since for ERCOT, the Planning Coordinator is the same as the Reliability Coordinator. If it cannot be stricken, then there should be a qualifier that states “this requirement only applies if the Planning Coordinator is NOT the same as the Reliability Coordinator”. Otherwise, the Transmission Planner in the ERCOT system is subject to double-jeopardy regarding this standard and the TPL-001 standard. Strike all of requirement R4: If it is required that the Planning Coordinator, Transmission Planner and Reliability Coordinator all have to work together to jointly develop solutions for planned outages less than 6 months in duration, then this should be reflected in the TPL-001 standard. In general, introducing standards that impose requirements on the Planning Assessment should all be incorporated in the TPL-001 standard as opposed to several disjointed standards, which creates confusion and possible redundant and double-jeopardy situations. Regarding R3 & R4, in general Paragraph 90 perspective is misinterprete & should be limited to next day (not up to 1-year).
No
R1, in general, change to only require TOP to have the authority to act, or direct others to act, R10, in general, regarding monitoring Facilityies reaching into a neighboring TOP area needs clarifying...best to delete neighboring areas wording.

No
The use of a documented specification for the data needed by the Reliability Coordinator is extremely vague and allows the inclusion of all other data needed by the current NERC standards which creates a double jeopardy issue or an instances where an entity may meet one NERC standard but violate IRO-010-2. For example, VAR-002-3 becomes effective on October 1, 2014 and does not require the notification of AVR status change if it has been restored within 30 minutes of such change. The Reliability Coordinator has already given notice that its manuals will reflect this change a few months after October 1, 2014. This means Generator Operators in this RC area will have to still give notification within 30 minutes in order not to violate IRO-010-2 even though VAR-002-3 says differently. The documented specification for data needs to exclude data that is covered by other NERC standards to prevent this from happening and to reduce the workload on entities.
No
IMPA does not agree with using Operating Instructions within this standard. By using Operating Instructions within this standard, NERC has created an extremely administrative type of standard for entities to follow. What happen to results-based standards? Just keeping the telephone logs in many instances will not be enough and it will require much more documented evidence to show that an entity followed the TOP’s Operating Instructions. If a Generator Operator is asked to change MW/VAR output or asked to maintain the same output numerous times in a day by its Transmission Operator, it will have to keep evidence to show that it carried out every single Operating Instruction throughout the entire day. Does this mean keeping track of the output of the Generator for the day and giving the entire log to the auditor to show the Generator Operator carried out each Operating Instruction?
No
The use of a documented specification for the data needed by the Transmission Operator is extremely vague and allows the inclusion of all other data needed by the current NERC standards which creates a double jeopardy issue or an instance where an entity may meet one NERC standard but violate IRO-010-2. For example, VAR-002-3 becomes effective on October 1, 2014 and does not require the notification of AVR status change if it has been restored within 30 minutes of such change. The Transmission Operator has already given notice that its manuals will reflect this change a few months after October 1, 2014. This means that Generator Operators in this TOP area will have to still give notification within 30 minutes in order not to violate IRO-010-2 even though VAR-002-3 says differently. The documented specification for data needs to exclude data that is covered by other NERC standards to prevent this from happening and to reduce the workload on entities.

No
The implications of removing the term NERC Registered from R4 are unclear because a Planning Coordinator may not be able to rely on information provided by unregistered entities. If the RC in IRO-008-2 M3 creates an Operating plan that includes non-registered Entities (TOP-002-4 R4 clearly shows that NERC thinks that non-registered entities WILL be included in some Operating Plans), the TOP responsibility of TOP-002-4 will only pertain to the NERC registered entities. This creates a serious potential reliability “gap” that must be addressed before this draft can be evaluated.
Yes
Yes
No
PacifiCorp cannot agree to the proposed new standard without having an understanding of the “Reliability Coordinator outage coordination process”. Additionally, PacifiCorp needs to understand how the Reliability Coordinator will resolve identified outage conflicts. PacifiCorp cannot support the proposed change of the Violation Risk Factor in R3 from Low to Medium.
No
PacifiCorp needs clarification concerning how R16 works in tandem with the Reliability Coordinator outage process noted in IRO-017-1. Additionally, PacifiCorp questions whether we have the ability to compel a non-NERC Registered Entity to provide data in order to maintain reliability in the Transmission Operator Area. Also, inclusion of the Near-term Planning Horizon (which is 1 – 5 years) into the future isn’t appropriate. This should be addressed in a revised TPL standard. Does this mean that Planning must coordinate all proposed 6 month (see TPL-001-4 R1 effective on 1/1/2015) or longer outages with the DMCC up to 5 years into the future every X days, months, or annually?
No
: PacifiCorp cannot support the standard as proposed with the removal of the term NERC Registered from R3 and R5 given that the obligation to notify non-NERC Registered entities

introduces an element of uncertainty into our notification obligations. Also, does next day require DMCC changes for Saturdays and Sundays? At least Operating Plan Analysis seems to allow for next-day analysis. Is the intention to mandate 24/7 rotating staff in control rooms?
Yes
No
No
PacifiCorp cannot support the proposed change of the Violation Risk Factor in IRO-017-1 R3 from Low to Medium with inadequate justification for the change.
No
TOP-001-3 exceeds the NOPR by requiring Protection Systems in addition to Special Protection Systems. The tools used to produce Real-time Assessments using Real-time data are not dynamic stability assessment tools, and do not inherently understand the status of all “Protection Systems”, degradations, or identified phase angles and equipment limitations. Note the definition references “Protection System and Special Protection System status,” while the NOPR references only Special Protection Schemes.
Individual
Rich Salgo
NV Energy
Yes
No
The changes made to R2 and R5 are responsive to our prior concerns. However, the language of R3 continues to be imprecise with regard to the requirement that an RC Operator approve each and every planned outage or maintenance of monitoring and analysis capabilities. Merely having the “authority to approve” doesn’t literally mean the same thing as “work shall not be performed without RC approval.” The latter appears to be what the SDT intends, but the language does not appear to support it.
Yes
No
We understand the SDT’s intent to include the RC in Near-Term planned outage solutions and reconciliations; however, we don’t believe that the RC has the tools nor the ability to adequately consider outages that may be proposed up to five years from the present day. Any attempts for the TP or PC to jointly develop solutions with the RC for outages in this time frame would be ineffective. We suggest the following language: Each Planning

Coordinator and Transmission Planner shall provide notice to its respective Reliability Coordinator regarding identified conflicts with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon.
No
The SDT has made a number of improvements to this particular standard in this latest posting. We are troubled by the following items: Definition of Real-Time Assessment contains two provisions that will make compliance with the Requirements unattainable. First, the applicable inputs to the assessment include among other things, “known Protection System status or degradation.” Real time tools are generally incapable of consideration of the performance of protection systems, and accordingly conducting these assessments prescribed in the Requirements will fall short of the expectation. Secondly, the real time assessment is to consider “identified phase angle and equipment limitations.” We are unclear as to whether this is intended to mean the identification of post-contingent standing phase angles (which current RTCA tools are ineffective at modelling and assessing) or alternatively, the identification of the angular limitations of power system equipment, such as sync check permission settings for circuit breakers. Such analyses are more readily conducted using on line power flow tools, and do not lend themselves to the real-time environment. We understand that the insertion of the modifier “applicable” may provide some relief in these considerations, but we fear that compliance enforcement will not allow discretion as to what inputs are applicable and which are not. We appreciate the significant improvement with regard to the language in Requirement R10. With regard to R13, we believe the SDT has improved the language by revisions such that the TOP shall “ensure that a Real-time Assessment is performed at least once every 30 minutes;” however, we continue to question the 30-minute requirement and believe that there will be tremendous difficulty in achieving this without defect. Rather, we would suggest the following: R13: “Each TOP shall ensure that a Real-time Assessment is performed with such periodicity so as to ensure continuous situational awareness of the TOP.” Measure M13 would need commensurate edits to conform with this R13 language.
No
We are troubled by the removal of the limiter “NERC registered” in reference to the entities that are to be notified under R3. This unnecessarily opens the requirement scope to an un-provable state. Suggest restoring the modifier “NERC registered” in front of “entities.”
Yes
Individual
Terry Harbour
MidAmerican Energy Company
Yes

No
MidAmerican remains concerned that the real-time assessment and operational planning assessment definitions as written will be wrongly interpreted to require things a real-time assessment tool cannot perform or an operational planning assessment cannot comply with. Real-time Assessment tools are not dynamic assessment tools and do not inherently understand phase angle impacts nor stability as suggested by the inclusion of Protection System status, degradation, and identified phase angle / equipment limitations. The SDT could check with real-time assessment vendors and verify that the revised definitions match the capabilities of real-time assessment tools and adjust the proposed definition. At a minimum, the SDT needs to clarify / modify words in the definition to ensure that real-time assessment tools can be compliant. Suggested clarifications include: Real-time assessment means a steady state analysis of thermal and voltage impacts. Power system transients, dynamics, nor actual phase angles are required. Protection Systems in the case of Real-time Assessment means the accurate system topology representation of normal protection system clearing (e.g. a three-terminal line as a single N-1 next worse contingency). Identified phase angles and equipment limits are identified in-terms of equipment ratings (amps, MVA, etc). Phase angle inputs (from PMU's etc) or phase angle calculations are not required. Further, personnel cannot be substituted for Real-time Assessments tools due to the 30 minute limitations imposed. Power system transient or dynamic analyses using real-time data can be time consuming to construct and run. At most, only a few power system dynamic analyses can be performed in the space of 30 minutes and may not keep pace with changing real-time conditions. The language of R3 continues to be imprecise with regard to the requirement that an RC Operator approve each and every planned outage or maintenance of monitoring and analysis capabilities. Merely having the "authority to approve" doesn't literally mean the same thing as "work shall not be performed without RC approval." The latter appears to be what the SDT intends, but the language does not appear to support it.
No
MidAmerican remains concerned that the real-time assessment and operational planning assessment definitions as written will be wrongly interpreted to require things a real-time assessment tool cannot perform or an operational planning assessment cannot comply with. Real-time Assessment tools are not dynamic assessment tools and do not inherently understand phase angle impacts nor stability as suggested by the inclusion of Protection System status, degradation, and identified phase angle / equipment limitations. The SDT could check with real-time assessment vendors and verify that the revised definitions match the capabilities of real-time assessment tools and adjust the proposed definition. At a minimum, the SDT needs to clarify / modify words in the definition to ensure that real-time assessment tools can be compliant. Suggested clarifications include: Real-time assessment means a steady state analysis of thermal and voltage impacts. Power system transients, dynamics, nor actual phase angles are required. Protection Systems in the case of Real-time Assessment means the accurate system topology representation of normal protection system clearing (e.g. a three-terminal line as a single N-1 next worse contingency). Identified phase angles and equipment limits are identified in-terms of

equipment ratings (amps, MVA, etc). Phase angle inputs (from PMU's etc) or phase angle calculations are not required. Further, personnel cannot be substituted for Real-time Assessments tools due to the 30 minute limitations imposed. Power system transient or dynamic analyses using real-time data can be time consuming to construct and run. At most, only a few power system dynamic analyses can be performed in the space of 30 minutes and may not keep pace with changing real-time conditions.

Yes
No
MidAmerican understands the SDT's intent to include the RC in Near-Term planned outage solutions and reconciliations; however, we don't believe that the RC has the tools nor the ability to adequately consider outages that may be proposed up to five years from the present day. Any attempts for the TP or PC to jointly develop solutions with the RC for outages in this time frame would be ineffective. MidAmerican suggests the following language: Each Planning Coordinator and Transmission Planner shall provide notice to its respective Reliability Coordinator regarding identified conflicts with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon.
No
MidAmerican remains concerned that the real-time assessment and operational planning assessment definitions as written will be wrongly interpreted to require things a real-time

assessment tool cannot perform or an operational planning assessment cannot comply with. Real-time Assessment tools are not dynamic assessment tools and do not inherently understand phase angle impacts nor stability as suggested by the inclusion of Protection System status, degradation, and identified phase angle / equipment limitations. The SDT could check with real-time assessment vendors and verify that the revised definitions match the capabilities of real-time assessment tools and adjust the proposed definition. Power system transient or dynamic analyses using real-time data can be time consuming to construct and run. At most, only a few power system dynamic analyses can be performed in the space of 30 minutes and may not keep pace with changing real-time conditions. With regard to R13, MidAmerican believes the SDT has improved the language by revisions such that the TOP shall "ensure that a Real-time Assessment is performed at least once every 30 minutes;" however, we continue to question the 30-minute requirement and believe that there will be tremendous difficulty in achieving this without defect. Rather, MidAmerican suggest the following: R13: "Each TOP shall ensure that a Real-time Assessment is performed with such periodicity so as to ensure continuous situational awareness of the TOP."
No
MidAmerican remains concerned that the real-time assessment and operational planning assessment definitions as written will be wrongly interpreted to require things a real-time assessment tool cannot perform or an operational planning assessment cannot comply with. Real-time Assessment tools are not dynamic assessment tools and do not inherently understand phase angle impacts nor stability as suggested by the inclusion of Protection System status, degradation, and identified phase angle / equipment limitations. The SDT could check with real-time assessment vendors and verify that the revised definitions match the capabilities of real-time assessment tools and adjust the proposed definition. Assessments tools due to the 30 minute limitations imposed. Power system transient or dynamic analyses using real-time data can be time consuming to construct and run. At most, only a few power system dynamic analyses can be performed in the space of 30 minutes and may not keep pace with changing real-time conditions. Removal of the limiter “NERC registered” in reference to the entities that are to be notified under R3 opens the requirement scope to an un-provable state and potential non-compliance. MidAmerican suggests the modifier “NERC registered” be restored in front of “entities.”

Regarding R4, Transmission Planning Assessments for the Near Term Planning Horizon do not consider outages that are less than one year in duration. If the transmission system is incapable of serving expected peak load during the Near Term Planning Horizon, current TPL standards and the future TPL-001-4 dictate Corrective Action Plans be undertaken and put in place. As currently written, R4 appears to be duplicative of TPL-001-4. BPA suggests R4 be rewritten to direct TOP and BA coordinate outages conflicts within the Operations Planning Horizon. BPA believes altering R4 in this fashion covers the reliability gap identified by the SW Outage Report, the IERP and FERC with respect to planning of outages. Additionally, this change will logically align R4 with R1.1.2, and R2, directing coordination between RC and TOP/BA.
No
BPA suggests referencing the System Operating Limit (SOL) Definition and Exceedance Clarification white paper in the language of the Requirements, as Regional Entities are not required to audit to appendices, unless indicated by the language of a Requirement. BPA believes the language in requirement R8 is still ambiguous and open-ended regarding, "… operations that result in, or could result in, an Emergency." It is unclear how entities are expected to determine events that could possibly happen. BPA suggests the drafting team include parameters for possible events, so applicable entities are not required to predict all possible future events. BPA also opposes language in the Standard conflates events that are actually happening with events that may happen at some point. BPA suggests the drafting team clearly separate these two concepts. Specifically, R8 requires entities to identify "… operations that result in, or could result in, an Emergency," without any qualification for likelihood. BPA does not feel it is appropriate to treat an actual Emergency the same way it treats a possible future Emergency that could, but likely will not happen.

1. The term Operating Instruction is defined as a command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.) Because the definition of Operating Instruction is focused on real-time activities necessary to preserve the real-time status and condition of the BES and indicates that such activities may only be issued by operating personnel responsible for the Real-time operation of the BES, ERCOT suggests that the use of the term Operating Instruction within the multiple time horizons referenced throughout IRO-001-4 (especially the operations planning and same-day operations time horizons) undermines the objectives of issuing Operating Instructions in Real-Time, are likely to cause confusion regarding the Operating Instruction an entity should implement, and would result in significant resource and operational concerns. First, because the term Operating Instruction as developed and utilized in COM-002-4 is intended to provide operating personnel responsible for the real-time status and condition of the BES with additional tools and authority to prevent miscommunications and ensure the reliability of the BES, its definition has been tailored to real-time scenarios and responsibilities. Indeed, the very definition is focused on responding to emerging conditions within the BES to ensure reliability, connoting urgency and ensuring that the issuer’s authority and direction is unchallenged and timely implemented. This sense of urgency and authority that provided additional strength to Reliability Coordinators in fulfilling obligations under COM-002-4 is weakened significantly when the term Operating Instruction is applied to activities expected to be performed days in advance of target operating day. Specifically, because the activities identified as mitigations to forecasted system conditions are based on forecasts and best available information in advance of the actual operating day, such conditions may never manifest themselves and the “command” issued may never need to be implemented. Accordingly, the use of the term Operating Instruction within Same-Day and Operations Planning Horizons is likely to cause confusion as the directed activities may never need to be taken, but would essentially be defined through the use of the term Operating Instructions, as “urgent” actions. Additionally, entities being issued advance “Operating Instructions” may become confused regarding what activities they should perform if Operating Instructions devised as a result of a Next-Day Study differed from the Operating Instructions received in Real-Time. Generally, actions in advance of the target operating day are coordinated amongst impacted entities with the objective of ensuring that operating parameters are respected should adverse conditions manifest during the target operating

day. These activities are generally plans that are developed prior to the target operating day in response to forecasted conditions. As discussed earlier, the term Operating Instruction was devised to provide Reliability Coordinators and other responsible entities with the tools and authority necessary to proactively ensure the reliability of the BES in real-time. Plans developed in response to forecasted conditions that may or may not manifest themselves are not and should not equated with actions that should be taken immediately to preserve reliability. Finally, ERCOT notes potential resource and operational concerns with requiring Reliability Coordinators to utilize their operating personnel responsible for Real-time activities to issue Operating Instructions that would result from Operational Planning Analyses conducted well in advance of real-time. In particular, because the definition of Operating Instruction requires that such an instruction be issued by operating personnel responsible for the real-time operation of the BES (which is generally interpreted synonymously with “system operator”), ERCOT respectfully submits its significant concerns regarding diverting its real-time personnel and resources to tasks generally performed by personnel focused on the day-ahead or operations planning time horizons. More specifically, Operational Planning Analyses are generally performed by personnel that are not considered operating personnel, but are, rather Operations Support Personnel or other technical personnel. The review, analysis, and final decisions regarding necessary actions, while coordinated with operating personnel, are generally completed and communicated by those same personnel. To issue Operating Instructions for analyses performed in the forward planning horizons would require diversion of operating personnel from their primary tasks in the real-time environment to tasks generally performed by personnel focused on operations planning. ERCOT respectfully submits that such would not only cause resource concerns by diverting real-time personnel from ensuring the reliability of the BES, but would also cause operational concerns as entities receiving such Operating Instructions from personnel that are essentially System Operators may cause confusion regarding when such Operating Instructions should be implemented. To resolve the foregoing concerns, ERCOT respectfully suggests that the Standards Drafting Team (SDT) insert the term “directive” or other verbiage where the use of Operating Instruction is intended to address multiple time horizons until the definition of operating instruction is modified or – should such modification not be possible –permanently (e.g., IRO-001-4, R1, R2, and R3) and coordinated with COM-002-4. As it stands today, applying the term to more than the Real Time horizon will likewise expand the scope of communications that must be addressed in COM-002-4 R1-R3. R1. Each Reliability Coordinator shall act, or direct others to act, by issuing directives or Operating Instructions, to ensure the reliability of its Reliability Coordinator Area. [Violation Risk Factor: High][Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations] 2. To ensure consistency amongst requirements within the IRO-001-4 standard, it is recommended that Requirement R3 be revised to more closely reflect its triggering or immediately preceding requirement, Requirement R2. The proposed Requirement R3 would read: R3. Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall inform its Reliability Coordinator upon recognition that the Operating Instruction issued by its Reliability Coordinator pursuant to Requirement 1 cannot be physically implemented or

would violate safety, equipment, regulatory, or statutory requirements. Additionally, it is recommended that the associated VSL also be modified accordingly.
No
1. ERCOT respectfully submits that Requirement R1 is duplicative to COM-001, R1 and recommends that it remain deleted. 2. ERCOT respectfully suggests that Requirement R2 requires clarification regarding the entities with which a Reliability Coordinator shall have data exchange capabilities and what shall constitute such data exchange capabilities as some information sharing does not lend itself to data links. The following revisions are proposed: R2. Each Reliability Coordinator shall exchange data with Balancing Authorities, Transmission Operators, and other entities as identified in the data specification developed and maintained in accordance with IRO-010 and necessary to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. [Violation Risk Factor: High] 3. ERCOT respectfully suggests that Requirement R3 may be confusing and redundant as written and proposes a streamlined, less ambiguous version for the SDT's consideration. The following revisions are proposed: R3. Each Reliability Coordinator shall monitor the Facilities, status of Special Protection Systems, and sub-100 kV facilities within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas that are necessary to identify System Operating Limit exceedances and Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]
No
1. ERCOT respectfully submits that Requirement R3 is ambiguous as written. More specifically, the use of terms such as "coordinated" and "considered" are undefined and unnecessarily complicate Reliability Coordinator's responsibilities and documentation. In R2-R3, the current definition of Operating Plan states "a document". While this context is appropriate for processes/procedures determined well in advance of real time (e.g. EOP 005, EOP 008). The timeframe described is really next day and while most "Operating Plans" are documented, all plans to operate reliably may not be documented or in "a document". The definition should be modified to address this new usage of the term to make it appropriate for all its uses, or a different term should be used. In its current form, it may lead to unnecessary administrative violations due to the lack of having "a document" rather than operations being coordinated and have a plan to operate reliably. The plan can be still coordinated but exist in various systems and conversations/emails/documents. This presents similar challenges for R4 as well as it further infers a single "document" and have several required elements. This can be overly prescriptive and burdensome. 2. ERCOT respectfully submits that Requirement R4 is ambiguous as written. More specifically, it is unclear as to whether the Reliability Coordinator is responsible for notification of those entities impacted in its Operating Plan or all Operating Plans referenced in Requirement R3. 3. ERCOT suggests that the SDT review the language of Requirement R5 and its VSL for consistency. In particular, Requirement R5 was modified to require that the Reliability Coordinator ensure that a Real-Time Assessment is performed every 30 minutes. However, the VSL still assesses the condition that the Reliability Coordinator did not "perform" as opposed to did not "ensure that" the Real-time Assessment was performed. These should

be reviewed and revised to ensure consistency between the requirement and its VSL. 4. ERCOT respectfully notes that Requirement R5 and the associated VSLs do not acknowledge the necessary tool outages that occur as part of planned system maintenance to ensure that Reliability Coordinator tools continue to run with high availability and accuracy. With the continuing obligations of Registered Entities to ensure the cybersecurity of their tools and the clear acknowledgment of the need for planned outages of Reliability Coordinator tools in IRO-002-4, R3, the current Requirement R5 and the associated VSLs create conflict and inconsistency amongst the overall set of Reliability Standards. If Registered Entities (and Reliability Coordinators in particular) are required to maintain their analysis tools, which maintenance may require outages of such tools, Requirement R5 should not provide that Reliability Coordinators will be penalized for the very activities they are required to conduct under its obligations set forth within the overall set of enforceable Reliability Standards. More clearly stated, it should not be a violation if an entity has a planned tool outage that causes a reasonable time deviation from the normal 30 minute timeframe. The following revisions are proposed are proposed to address this inconsistency: R5. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes except where performance is delayed as a result of a planned or unplanned tool outage and potential effects of the delay are mitigated where possible. [Violation Risk Factor: High] [Time Horizon: Same-day Operations, Real-time Operations] It is further recommended that the associated VSLs also be modified accordingly. 5. ERCOT has identified a potential typographical error in R6 and all of its VSLs. Specifically, the reference to “as identified in identified in Requirement R6” should likely be reviewed and revised to “as identified in Requirement R5”. 6. ERCOT respectfully reiterates its previous comment on the inconsistent language used between Requirements R5 and R6 and the LOWER VSL for Requirement R8. In particular, the word “Emergency” is used in the VSL for Requirement R8 but the condition is not specified elsewhere in the standard or the appropriate referenced requirements. Please revise the lower VSL for Requirement R8 to ensure consistency. The following language is proposed: “when the SOL or IROL exceedance identified in Requirement R5 has been prevented or mitigated”. 7. The reference in Requirements R6 and R8 to “as indicated in its Operating Plan” is unnecessary and only creates additional compliance burden. Operating conditions can change very quickly and can cause a “plan” to vary and the impacted entities to vary. The phrase “as indicated in its Operating Plan” should be deleted. 8. It is recommended that the additional text under Associated Documents be utilized to initiate a modification of the definition of “Operating Plan” and deleted from the standard. Registered Entities should be able to rely upon the official definitions and other associated Reliability Standards to discern their obligations. If the SDT has determined that Registered Entities cannot appropriately discern their responsibilities utilizing approved definitions and standards, such definitions should be evaluated for modification and enhancement.
No
Thought should be given to the overall approach to incorporating Protection System Status. While SPSs are currently in the standards, incorporating the broader definition of Protection Systems will likely incur additional hardware, modeling, display creation, etc.

ERCOT does not support its inclusion without a holistic review of its impact within the standards. At a minimum, the implementation timeframe should be extended to realize that additional time is necessary after the RC requests the data, for an entity to actually provide such data. ERCOT recommends a minimum of 24 months vs the 12 months for R3.
No
1. ERCOT notes that the consolidated set of IRO and TOP Reliability Standards utilize the terms “Wide Area” and “Reliability Coordinator Area”. If these phrases are expected or interpreted to be synonymous, ERCOT suggests use one or the other, but not both, throughout the IRO (and other) standards for consistency and to avoid confusion. 2. To ensure consistency, ERCOT recommends that, in Requirement R1.6, “provisions for” is removed and the sub-requirement begins with “Periodic”. 3. ERCOT respectfully recommends deletion of Requirement R3 as it is duplicative of IRO-008, Requirements R4 and R6. If the distinguishing factor and reason for inclusion is the acknowledgment of Emergency conditions, ERCOT recommends that such language is added to IRO-008. 4. ERCOT respectfully recommends deletion of Requirement R4 as it has been rendered moot by revisions to Requirement R6 and R7. Specifically, since Requirement R6 requires impacted Reliability Coordinators to implement any action plan developed by the Reliability Coordinator with the emergency and Requirement R7 requires assistance so long as the Reliability Coordinator with the emergency has implemented its emergency procedures, the dictation of operating state by other Reliability Coordinators is unnecessary. 5. ERCOT respectfully recommends deletion of Requirement R5 as it is duplicative of IRO-001-4, Requirement R1. Specifically, since Reliability Coordinators always have primary responsibility and ultimate authority to act when they observe conditions in their area that threaten reliability, disagreement with the Reliability Coordinator’s assessment of the conditions by another entity is of no consequence. However, if the objective is to ensure that Reliability Coordinators assist each other in Emergencies, Requirements R5 and R7 could be eliminated and Requirement R6 could be modified as follows: R6. Each impacted Reliability Coordinator shall implement any actions and/or provide any assistance requested by the Reliability Coordinator that identified an Emergency in its Reliability Coordinator Area unless such actions would violate safety, equipment, regulatory, or statutory requirements. 6. ERCOT respectfully notes that it is unable to discern the data retention period for Requirements R3 and R4. Instead, there are retention period requirements for R8 and R9, which do not exist. ERCOT urges the SDT and NERC to conduct a thorough and independent quality review for all standards posted for commenting and balloting to avoid unnecessary delays. 7. ERCOT respectfully recommends that, for consistency, the VSLs for Requirement R2 be modified to remove references to criteria and state that Reliability Coordinator failed to maintain Operating Plans, Processes, or Procedures pursuant to one part of Parts 2.1 – 2.3, two parts of Parts 2.1 – 2.3, and so on. 8. It is recommended that the additional text under Associated Documents be utilized to initiate a modification of the definition of “Operating Plan” and deleted from the standard. Registered Entities should be able to rely upon the official definitions and other associated Reliability Standards to discern their obligations. If the SDT has determined that Registered

Entities cannot appropriately discern their responsibilities utilizing approved definitions and standards, such definitions should be evaluated for modification and enhancement.
No
1. As an overarching comment, the proposed standard references both transmission and generation outages, but then appears to focus in on transmission outages. As a result, entities responsible for generation outages do not appear to be adequately addressed relative to potential obligations to comply with Reliability Coordinator processes that are developed. This oversight could have significant consequences and the standard should be reviewed to ensure that no gaps exist. At a minimum, those entities responsible for generator outages should be included under the Applicability Section as well as other applicable Requirements (e.g., Requirement R2). More specifically, during the last posting, ERCOT commented that the requirement for TOP and BA to coordinate outage plans is inappropriate since the BA does not develop outage plans or schedules; it only receives them from the Generator Owners and may suggest adjustments based on resource/demand/interchange assessments. The SDT's response suggests that these details would be elaborated in the process document and hence no changes were made. While ERCOT agrees that such details can be elaborated in the process document, Part 1.1.2 and other requirements should be expanded to include all appropriate entities to facilitate RC development of a workable and appropriate outage coordination process involving the correct entities. 2. ERCOT is unable to support Part 1.1.2 as written, and suggest the SDT to either revise it to remove the BA from it, or to expand it to include the facility owners and/or operators. Corresponding changes will need to be made to Requirement R2 as discussed above. ERCOT respectfully notes that Requirement R1 requires some revisions to ensure clarity and ensure that the obligations imposed are clear and unambiguous. Specifically, the requirement indicates that Reliability Coordinators shall develop, implement, and maintain and outage coordination process. However, it does not define what maintenance shall be performed. R1. Each Reliability Coordinator shall develop and implement an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area. The outage coordination process shall: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] ERCOT believes "develop" in R1 is unnecessary and only creates confusion when auditing and enforcing. To implement and maintain addresses the reliability concept. Replace R1.5 "document and" with "maintain", which is sufficient. Document is purely administrative. M1 infers a requirement by including "dated". By having current specifications for outage analysis during the operations planning horizon should be sufficient in itself for compliance. If a date is required, it should be in the requirement. Additionally, it is noted that use of the term "define" may not adequately connote the level of detail expected regarding the documentation of the outage evaluation and coordination process referenced in sub-requirements R1.3 and R1.4. Accordingly, the following revisions are suggested: 3. ERCOT respectfully notes that Requirement R2 requires some revisions to ensure clarity and ensure that the obligations imposed upon participants in each Reliability Coordinator's outage coordination process are clear and unambiguous. Accordingly, it is recommended that Requirement R2 be modified as follows: R2. Each Transmission Operator and Balancing Authority shall perform the roles,

responsibilities, and activities assigned to its function in its Reliability Coordinator outage coordination process. [Violation Risk Factor: LowMedium] [Time Horizon: Operations Planning] 4. ERCOT respectfully notes that TPL-001-4 already requires distribution of Planning Assessments to various entities. To ensure that all obligations related to Planning Assessments are clearly communicated and consolidated such that they are easily identified and fulfilled, it is recommended that Requirement R3 be deleted from IRO-017 and Requirement R8 within TPL-001-4 be reviewed for the necessary revisions.
No
Similar to comments provided for IRO-001 R1, ERCOT recommends maintaining existing TOP-001-1a R1 language as much as possible as follows: “Each Transmission Operator shall have clear decision-making authority to act and to direct actions to be taken by other entities to preserve the reliability of its Transmission Operator Area and shall exercise specific authority to prevent or mitigate operating emergencies without delay, but no longer than 30 minutes. [Violation Risk Factor: High][Time Horizon: Real-time Operations]”. This would preserve the original purpose of the requirement, address NOPR paragraph 64, be consistent with IRO-001 R1, and provide a timeliness requirement where appropriate for all requirements that require action by a TOP in real time without redundancy. R2 should be applied consistent to these changes as well. For R14, the current definition of Operating Plan states “a document”. Please refer to previous comments for IRO-008 related to this issue. Please refer to previously provided comments for IRO-001 related to the use of the defined term “Operating Instruction” outside of real time. We do not have any concerns or comments on R19 and R20, which are added to address data exchange requirement and to achieve consistency with the proposed IRO-002-4, Requirement R2. However, we suggest that the SDT add Requirement R20 to the NERC issue data base along with requirements R2, R5, R6, R11, and R17 which the SDT agrees with our previous comment that these requirements belong to the BAL standards and hence a future assessment of creating such a BAL standard will be conducted.
No
The current definition of Operating Plan states “a document”. Please refer to previous comments for IRO-008 related to this issue. For R3 and R5, please see previously provided comments for IRO-008 R4. For R4, the SDT should consider consistency of use of “Demand patterns” and “Load Forecast”.
No
Additional thought should be given to the overall approach to incorporating Protection System Status. While SPSs are currently in the standards, incorporating the broader definition of Protection Systems will likely incur additional hardware, modeling, display creation, etc. ERCOT does not support its inclusion without a holistic review of its impact within the standards. At a minimum, the implementation timeframe should be extended to realize that additional time is necessary after the RC requests the data, for an entity to actually provide such data. ERCOT recommends a minimum of 24 months vs the 12 months for R3.
Yes

During the last posting, we commented on the need to shed load under the pre-contingency loading condition when the 4-hour rating is exceeded. The SDT's response indicates that "it has revised the whitepaper to include "as necessary and appropriate". However, this change is made to the post-contingency condition for exceeding the 15-minute Emergency Rating, but not to the pre-contingency loading condition when the 4-hour rating is exceeded as it still stipulates that "All of the above plus load shed to control violation below Emergency Rating consistent with timelines identified in Operating Plan." If there is a basecase exceedance, the entity should take all actions up to and including shedding load within the timeframe to protect the equipment. If the entity is somewhere between the 4 hr. and 15 min. rating they have up to 15 min to get below the continuous (normal) rating for a basecase (pre contingency) exceedance.
Yes
Except as noted.
Yes
The proposed definitions of Real-Time Assessment and Operational Planning Analysis require use of applicable inputs. ERCOT respectfully submits that many of these inputs can only be utilized once communicated by other entities. Accordingly, the following revision is proposed: Real-time Assessment: An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable, known inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through contracted third-party services.) Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable, known inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through contracted third-party services.) During the last posting, we expressed a concern over the proposed retirement of TOP-004-2, Requirement R4, which stipulates that: R4. If a Transmission Operator enters an unknown operating state (i.e. any state for which valid operating limits have not been determined), it will be considered to be in an emergency and shall restore operations to respect proven reliable power system limits within 30 minutes. The SDT's response to our comment indicates that: As presented in the white paper on the Treatment of SOLs, the proposed requirements are based on the concept of not depending on pre-determined existing SOLs/IROLs but rather to monitor the existing and potential operating conditions and evaluate them against the same ratings and limits that SOLs/IROLs would be based upon. Those ratings and limits rarely change due to changes in system conditions, whereas predetermined SOLs and IROLs may change due to the assumptions they were based on. No change made. While we agree that the ratings and limits upon which the SOLs/IROLs are

based rarely change due to changes in system conditions, the changes in system condition themselves can render any SOLs/IROLs invalid, especially those that are voltage or stability limits. In other word, there does not exist any “proven reliable power system limits” as stated in R4 of TOP-002-4. We generally support the concept of not depending on pre-determined existing SOLs/IROLs but rather, to monitor the existing and potential operating conditions and evaluate them against the same ratings and limits that SOLs/IROLs would be based upon. However the concept itself (and being in a “white paper” status), or use of any information in the white paper, does not help or mandate re-calculation of valid SOLs and IROLs when entering an unknown state, and the ratings and limits that do not change have no bearing on those SOLs/IROLs that are voltage or stability limited and which are more dependent on system conditions, which have changed. While R13 in TOP-001- 3 requires a TOP to ensure that a Real-time Assessment is performed at least once every 30 minutes, it falls short of specifying the expected outcome (or objectives), such as new/revised SOLs/IROLs and assessing system performance against the new limits. The proposed definition of Real-time Assessment is also short of specifying the development or calculation of SOLs/IROLs. Hence, between R13 of TOP-003-1 and the definition of RTA, there is a gap that in an unknown state/condition, a TOP is not required to (and hence will not) develop SOLs/IROLs that are valid for the prevailing conditions. Hence, if R4 in TOP-004-2 is retired, it will leave a reliability gap. The white paper does not mandate the proper and necessary action to “restore operations to respect proven reliable power system limits within 30 minutes” when entering into an unknown state. We again urge the SDT to consider not retiring Requirement R4 of TOP-002-4. Finally, we are unclear whether or not the proposed retirement of TOP-004-2 will be balloted separately, which it should. TOP-006 R6 is not captured accurately. If the BAL-005 standard is intended to address metering outside of generation resources and the equipment that ties it to the BES, then the TO/TOP should be added to the BAL-005 R17 requirement. ERCOT suggests creating a requirement that addresses accuracy, range, and sampling rate holistically and apply it to Transmission Owners and Generation Owners as they typically purchase and maintain such devices. ERCOT does not agree that TOP-004 R6.2 is addressed sufficiently in TOP-001-3 R8. ERCOT believes that all switching that could impact another Transmission Operator should be coordinated, and not a subset which R8 limits it to. Failure to coordinate by the Transmission Operators that have local or direct control could result in inadvertent loss of load. ERCOT does not agree with the justification utilized for TOP-002 R19. Planning models may differ from Operations models due to software variances, new / retired facilities timelines, seasonal variations, etc. Therefore MOD-033-1 does not address R19.

Additional Comments

City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power

John Merrell

TOP-001-3 Requirement R9 states that the RC will be notified of all outages of telemetering equipment, control equipment, monitoring and assessment capabilities and associated communication channels without regard to being a planned or a unplanned outage. This will most likely result in overburdening of operating personnel and the RC being inundated with phone calls. A majority of calls will likely be notifications of unplanned outages that are short in duration and of no real impact to the interconnection. Tacoma recommends the word “planned” be added to R9 as it is in M9 such that all planned outages are communicated.

City of Austin dba Austin Energy
Thomas Standifur

1. Do you agree with the changes made to respond to industry comments to proposed IRO-001-4? If not, please provide technical rationale for your disagreement along with suggested language changes.

   Yes:
   No: X

   Comments: (1) City of Austin dba Austin Energy (AE) continues to disagree with the change to R1, which removes the “clear decision-making authority” language from the previous standard. AE believes the authority language provides clarity and substance in an easily recognizable format. AE believes the remaining requirements in the TOP/IRO families instruct the RC or TOP to “act, or direct others … to act” while providing more specificity regarding such actions. In this way, R1, as proposed, is redundant and difficult to demonstrate from a compliance perspective given its general nature. (2) AE understands the SDT’s intent in including the Operations Planning time horizon with respect to Operating Instructions is to cover the concept of “next day directives” previously in IRO-004. AE also understands there is no Next-Day Planning time horizon available. AE requests the SDT make its intent clear by adding additional language to the requirement, the rationale box or a Guidelines and Technical Basis section so it is not lost that the SDT expects Operating Instructions to be limited to next day, same day or real-time situations. This aligns with the concept of Operating Instructions coming out of Operations Planning Analyses, Real-Time Assessments and Real-Time operations. It would remove confusion that Operating Instructions could occur anytime within the Operations Planning time horizon.

4. Do you agree with the changes made to respond to industry comments to proposed IRO-010-2? If not, please provide technical rationale for your disagreement along with suggested language changes.

   Yes: X
   No:

6. The drafting team has proposed a new standard to address outage coordination concerns. Do you agree with the changes made to respond to industry comments to the new

standard, IRO-017-1? If not, please provide technical rationale for your disagreement along with suggested language changes.

Yes:
No: X

Comments: City of Austin dba Austin Energy (AE) AE believes R3 and R4 are redundant with requirements in TPL-001-4. TPL-001-4, R8 provides a mechanism for any entity with a reliability need to obtain a copy of the Planning Assessment. Through this requirement, the RC could certainly make a case for receiving copies from the PC and TPs. TPL-001-4, R4 Part 4.1 provides a mechanism for coordination, as necessary. AE notes the SDT's response in comments, "The SDT believes that Requirements R3 and R4 could be incorporated into a future version of TPL-001, but due to timing, is recommending that these requirements should be kept in proposed IRO-017-1 until such a change occurs. The SDT has added revisions to approved TPL-001-4 Requirement R8 to a draft SAR for other possible changes to approved TPL-001-4 which is posted on the project web site as a supporting document." AE suggests these changes should all be considered under the TPL-001-5 SAR and not in a separate IRO-017-1 standard.

7. Do you agree with the changes made to respond to industry comments to proposed TOP-001-3? If not, please provide technical rationale for your disagreement along with suggested language changes.

Yes:
No: X

Comments: City of Austin dba Austin Energy (AE) supports the streamlining effort and removal of redundant requirements. However, AE offers the following comments: (1) AE continues to disagree with the change to R1, which removes the "responsibility and clear decision-making authority" language from the previous standard. AE believes the authority language provides clarity and substance in an easily recognizable format. AE believes the remaining requirements in the TOP/IRO families instruct the TOP to "act, or direct others … to act" while providing more specificity regarding such actions. In this way, R1, as proposed, is redundant and difficult to demonstrate from a compliance perspective given its general nature. (2) AE understands the SDT's intent in including the Operations Planning time horizon with respect to Operating Instructions is to cover the concept of "next day directives" previously in IRO-004-2. However, IRO-004-2, as written is limited to RC directives. AE suggests the SDT remove the Operations Planning Horizon from R1. (3) R9 is too broad a scope to be useful. The phrase "…outage of telemetering equipment, control equipment, monitoring and assessment capabilities and associated communication channels…" is all encompassing. If each BA or TOP were to contact the RC every time there was the slightest glitch with telemetering or every time an ICCP link or microwave channel was cycled for maintenance or some type of momentary signal fade, the RC's phone would be ringing continually. The intent of this requirement is to be sure all entities are aware of a

loss of situation awareness. This risk associated with this is not of a momentary nature and a time qualifier should be used. Using the 30 minute time requirement that is used for R13 is sufficient to meet the intent. See suggested wording below:
Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected NERC registered entities of outages of equipment or assessment capabilities that prevent Real-time Assessment for 30 minutes. (4) R19 and R20 are redundant with existing COM standards. They will remain redundant when future COM standards come into effect. AE requests the SDT remove these added requirements from TOP-001-3.

8. Do you agree with the changes made to respond to industry comments to proposed TOP-002-4? If not, please provide technical rationale for your disagreement along with suggested language changes.

   Yes: X
   No:

9. Do you agree with the changes made to respond to industry comments to proposed TOP-003-3? If not, please provide technical rationale for your disagreement along with suggested language changes.

   Yes: X
   No:

11. The SDT has made revisions to VRFs and VSLs as needed to conform to changes made to requirements and to respond to industry comments. Do you agree with the VRFs and VSLs for the nine posted standards? If you do not agree, please indicate specifically which standard(s) and requirement(s), and whether it is the VRF or VSLs you disagree with, and explain why.

    Yes:
    No: X

    Comments: City of Austin dba Austin Energy (AE) provides the following comments regarding VSLs: (1) The VSL for TOP-003-3, R5 should parallel the VSL for IRO-010-2, R3. That is, the moderate level should be lower, the high should be moderate and the first half of severe should be high.

12. Are there any other concerns with these standards that haven't been covered in previous questions and comments?

    Yes:
    No: X

SCE&G
RoLynda Shumpert

1. Do you agree with the changes made to respond to industry comments to proposed IRO-001-4? If not, please provide technical rationale for your disagreement along with suggested language changes.

   Yes.

2. Do you agree with the changes made to respond to industry comments to proposed IRO-002-4? If not, please provide technical rationale for your disagreement along with suggested language changes.

   No.
   Comments: The OC Review Group suggests adding the word 'its' between 'with' and 'Balancing Authorities' to provide clarity.

   Suggested Wording: "R2: Each Reliability Coordinator shall have data exchange capabilities with **its** Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments."

3. Do you agree with the changes made to respond to industry comments to proposed IRO-008-2? If not, please provide technical rationale for your disagreement along with suggested language changes.

   No.
   Comments: In R5, the OC Review Group suggests expanding the time interval to 45 minutes instead of 30 minutes. When new EMS models are brought online, they may require greater than 30 minutes to perform an assessment. Either the time could be expanded or some sort of allowance provided for the times when the new models are being placed in service.

   In R8, the OC Review Group suggests removing the words 'prevented or' because prevention of SOL or IROL exceedance is difficult to prove and would typically not be communicated to BAs and TOPs.

   Suggested Wording: "R8: Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been ~~**prevented or**~~ mitigated."

4. Do you agree with the changes made to respond to industry comments to proposed IRO-010-2? If not, please provide technical rationale for your disagreement along with suggested language changes.

Yes.
Comments: Should LSE be removed from applicable entities since LSE may be removed from the NERC Functional Model?

5. Do you agree with the changes made to respond to industry comments to proposed IRO-014-3? If not, please provide technical rationale for your disagreement along with suggested language changes.

   No.
   Comments: In R1.1, the OC Review Group suggests adding "as identified in R1" at the end of the sentence to identify the criteria and process being addressed.

   Suggested Wording: "R1.1: Criteria and processes for notifications **as identified in R1**."

   The OC Review Group suggests adding "may" before "impact adjacent Reliability Coordinator Areas" in M1 to match R1.

   Suggested Wording: "M1: Each Reliability Coordinator shall have available the latest approved documented version of its Operating Procedures, Operating Processes, and Operating Plans that require notifications, or the coordination of actions among impacted Reliability Coordinators for conditions or activities that **may** impact adjacent Reliability Coordinator Areas. This documentation shall include dated, current in force documentation with the specified elements, and notes from periodic communications.

6. The drafting team has proposed a new standard to address outage coordination concerns. Do you agree with the changes made to respond to industry comments to the new standard, IRO-017-1? If not, please provide technical rationale for your disagreement along with suggested language changes.

   No.
   Comments: In R2, the OC Review Group suggests changing the word "function" to "roles and responsibilities" to match R1.

   Suggested Wording: "R2: Each Transmission Operator and Balancing Authority shall perform the ~~functions~~ **roles and responsibilities** specified in its Reliability Coordinator outage coordination process."

   In R4, the OC Review Group suggests adding "on the BES" before "with planned outages" to clearly define the BES as the subject portion of the system.

   Suggested Wording: "R4: Each Planning Coordinator and Transmission Planner shall jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts

on the BES with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon."

7. Do you agree with the changes made to respond to industry comments to proposed TOP-001-3? If not, please provide technical rationale for your disagreement along with suggested language changes.

   No.

   Comments: With regard to R13, we understand and support the need to do real-time assessments at least once every 30 minutes to avoid being in an unstudied state. However, if significant SCADA losses occur or an ICCP link is lost to a neighboring BA/TOP, the State Estimator solution can be affected to such a degree that a real-time assessment, <u>with real-time data</u>, may not be possible within 30 minutes. While this does not happen often, it does occur on occasion, but the requirement allows for NO exceptions to the 30 minute requirement. (As an example. the MOD-001 standard allows for a certain number of hours that ATC may not be recalculated without being in non-compliance).

8. Do you agree with the changes made to respond to industry comments to proposed TOP-002-4? If not, please provide technical rationale for your disagreement along with suggested language changes.

   No.

   Comments: In R1, the OC Review Group suggests adding the word "identified" before "SOLs" to clarify transmission operators are operating to the identified SOLs.

   Suggested Wording: "R1: Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its **identified** System Operating Limits (SOLs)."

9. Do you agree with the changes made to respond to industry comments to proposed TOP-003-3? If not, please provide technical rationale for your disagreement along with suggested language changes.

   Yes.

   Comments: Should LSE be removed from applicable entities since LSE may be removed from the NERC Functional Model?

10. Do you have any comments on the changes made to respond to industry comments on the SOL Exceedance White Paper? If so, please provide technical rationale for your disagreement along with suggested language changes.

    Yes.

11. The SDT has made revisions to VRFs and VSLs as needed to conform to changes made to requirements and to respond to industry comments. Do you agree with the VRFs and VSLs for the nine posted standards? If you do not agree, please indicate specifically which standard(s) and requirement(s), and whether it is the VRF or VSLs you disagree with, and explain why.

    No.
    Comments: See comments above for specific suggestions for changes to VSLs.

12. Are there any other concerns with these standards that haven't been covered in previous questions and comments?

    No.

Georgia System Operations Corporation

2. Do you agree with the changes made to respond to industry comments to proposed IRO-002-4? If not, please provide technical rationale for your disagreement along with suggested language changes.

   No.

   Comments: GSOC suggests adding the word 'its' between 'with' and 'Balancing Authorities' to provide clarity.

   Suggested Wording: "R2: Each Reliability Coordinator shall have data exchange capabilities with **its** Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments."

3. Do you agree with the changes made to respond to industry comments to proposed IRO-008-2? If not, please provide technical rationale for your disagreement along with suggested language changes.

   No.
   Comments: In R5, the GSOC suggests expanding the time interval to 45 minutes instead of 30 minutes. When new EMS models are brought online, they may require greater than 30 minutes to perform an assessment. Either the time could be expanded or some sort of allowance provided for the times when the new models are being placed in service.

   In R8, the GSOC suggests removing the words 'prevented or' because prevention of SOL or IROL exceedance is difficult to prove and would typically not be communicated to BAs and TOPs.

   Suggested Wording: "R8: Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit

(SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been ~~**prevented or**~~ mitigated."

4. Do you agree with the changes made to respond to industry comments to proposed IRO-010-2? If not, please provide technical rationale for your disagreement along with suggested language changes.

   Comments: Do you agree with the changes made to respond to industry comments to proposed IRO-014-3? If not, please provide technical rationale for your disagreement along with suggested language changes.

   No.
   Comments: In R1.1, the GSOC suggests adding "as identified in R1" at the end of the sentence to identify the criteria and process being addressed.

   Suggested Wording: "R1.1: Criteria and processes for notifications **as identified in R1**."

   The GSOC suggests adding "may" before "impact adjacent Reliability Coordinator Areas" in M1 to match R1.

   Suggested Wording: "M1: Each Reliability Coordinator shall have available the latest approved documented version of its Operating Procedures, Operating Processes, and Operating Plans that require notifications, or the coordination of actions among impacted Reliability Coordinators for conditions or activities that **may** impact adjacent Reliability Coordinator Areas. This documentation shall include dated, current in force documentation with the specified elements, and notes from periodic communications.

5. The drafting team has proposed a new standard to address outage coordination concerns. Do you agree with the changes made to respond to industry comments to the new standard, IRO-017-1? If not, please provide technical rationale for your disagreement along with suggested language changes.

   No.
   Comments: In R2, the GSOC suggests changing the word "function" to "roles and responsibilities" to match R1.

   Suggested Wording: "R2: Each Transmission Operator and Balancing Authority shall perform the ~~functions~~ **roles and responsibilities** specified in its Reliability Coordinator outage coordination process."

   In R4, the GSOC suggests adding "on the BES" before "with planned outages" to clearly define the BES as the subject portion of the system.

   Suggested Wording: "R4: Each Planning Coordinator and Transmission Planner shall jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts **on the BES** with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon."

6. Do you agree with the changes made to respond to industry comments to proposed TOP-001-3? If not, please provide technical rationale for your disagreement along with suggested language changes.

   No.
   Comments:

   The current language in TOP-001 R1 and R2 has further expanded the applicable use of operating instructions encompassing all individuals to the point where the compliance risk of the requirement is not appropriately weighted with the benefit to reliability.

   R3 and R4 state that only the registered entities identified **must comply** with OI; they do not state that registered entities identified are the only entities that **can receive** OI. Therefore, without the lack of specificity in R1 and R2 (or in R3 and R4) to whom OI can be issued to, the standard now requires three point communication to any party or entity for actions that will affect the BES, even though that entity (unless identified in R3 and R4) does not have to comply.

   Although the NERC functional model states to whom a BA and TOP can direct, this is not referenced or mentioned in the standard, and must be inferred by not only the entity maintaining compliance, but also the individual performing an audit. It would seem very beneficial to specify this assumption within R1 and R2.

   Suggested Wording: R1 and R2: "Each Transmission Operator (Balancing Authority) shall act, or direct others (referenced in R3 and R4) to act by issuing Operating Instructions, to ensure the reliability of its Transmission Operator (Balancing Authority) Area."

   In R10, replace "necessary" with "applicable" to maintain consistency with the definitions of Real-Time Assessment and Operational Planning Analysis.

   Suggested Wording: Each Transmission Operator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as ~~**necessary**~~ **applicable** by the Transmission Operator, within its Transmission Operator Area and neighboring Transmission Operator Areas to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area

   In R13, the GSOC suggests expanding the time interval to 45 minutes instead of 30 minutes. When new EMS models are brought online, they may require greater than 30 minutes to perform an assessment. Either the time could be expanded or some sort of allowance provided for the times when the new models are being placed in service.

   In the R13 VSL, the GSOC suggests the time graduations for each level of VSL be retained (30-35 minutes, 30-40 minutes, 40-45 minutes, >45 minutes).

In R18, the GSOC suggests removing the word "always" before "operate" and provide graduated VSL to allow for when limits were determined to be incorrect due to mistake in entry of data.

Suggested Wording: "R18: Each Transmission Operator and Balancing Authority shall **~~always~~** operate to the most limiting parameter in instances where there is a difference in SOLs."

Should LSE be removed from applicable entities since LSE may be removed from the NERC Functional Model?

7. Do you agree with the changes made to respond to industry comments to proposed TOP-002-4? If not, please provide technical rationale for your disagreement along with suggested language changes.

   No.
   Comments: In R1, the GSOC suggests adding the word "identified" before "SOLs" to clarify transmission operators are operating to the identified SOLs.

   Suggested Wording: "R1: Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its **identified** System Operating Limits (SOLs)."

12. Are there any other concerns with these standards that haven't been covered in previous questions and comments?

    No.

Consideration of Comments

Project 2014-03 Revisions to TOP/IRO Reliability Standards

The Project 2014-03 Drafting Team (SDT) thanks all commenters who submitted comments on the TOP/IRO Reliability Standards. These standards were posted for a 45-day public comment period from August 6, 2014 through September 19, 2014. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 59 sets of comments, including comments from approximately 166 different people from approximately 95 companies representing 8 of the 10 industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standards' project page.

Summary Consideration:

The SDT appreciates the careful review stakeholders provided of this large volume of standards and thanks stakeholders for their support in completing this project. The SDT has made a number of changes to each of the standards in response to stakeholder comments.

TOP-001-3 was the only standard requiring substantive changes, as well as a number of clarifying changes, in response to stakeholder comments. The SDT made the following changes to proposed TOP-001-3:

- Deleted *Operations Planning* time horizon from all requirements dealing with Operating Instructions
- Requirements R1 and R2 – changed 'ensure' to address'; clarified language on actions and issuance of Operating Instructions
- Requirement R7 – capitalized 'E' in Emergency
- Requirement R8 – deleted 'other'
- Requirement R9 – added 'sustained' to outages; deleted 'NERC registered'; merged 'telemetering and control'
- Requirement R10 – completely restructured for clarity on what needs to be monitored
- Requirement R11 – replaced 'ensure'
- Requirement R15 – grammatical changes
- Requirement R16 – Changed 'Real-time Assessment' to 'analysis'
- Requirement R18 – deleted 'Balancing Authority'; deleted 'always'
- Requirements R19 and R20 – corrected typographical errors

In response to stakeholder comments, the SDT has made only clarifying and non-substantive changes to the other eight standards, as follows:

- IRO-001-4
  - Deleted *Operations Planning* time horizon from all requirements dealing with Operating Instructions
  - Requirement R1 - changed 'ensure' to 'address;' clarified language on actions and issuance of Operating Instructions
  - Measure M2 – deleted 'Transmission Service Provider' to conform to Requirement R2
  - Data retention – deleted 'Transmission Service Provider' to conform to Applicability
- IRO-002-4
  - Requirement R1 – made grammatical change
  - Requirement R3 – replaced 'sub-100 kV' with 'non-BES' to clarify the drafting team's intent
- IRO-008-2
  - Requirement R3 – made grammatical changes
  - Requirement R5 – deleted 'Reliability Coordinator' from 'Wide Area'
  - Requirement R6 – corrected typographical error
- IRO-010-2
  - Requirement R1, Part 1.1 – replaced 'sub-100 kV' with 'non-BES' to clarify the drafting team's intent
- IRO-014-3
  - Measure M1 – added 'may' impact
  - Requirement R5 – corrected tense
  - Requirement R6 – corrected tense
  - Data retention – corrected requirement numbering
- IRO-017-1
  - Requirement R1, Part 1.3 – replaced 'generator' with 'generation'
  - Requirement R2 – made 'entity' plural
  - Requirement R3 – changed time horizon from 'Operations Planning' to 'Long-term Planning'
- TOP-002-4
  - Measure M2 – added 'exceedances' term
  - Requirements R3 and R5 – deleted 'impacted'
- TOP-003-3
  - Requirement R1, Part 1.1 - replaced 'sub-100 kV' with 'non-BES' to clarify the drafting team's intent
- SOL Exceedance White Paper
  - Made several clarifying changes
- Violation Severity Levels
  - IRO-008-2, Requirement R3 – deleted NERC registered;' changed 'less than' to 'greater than;' made grammatical change
  - IRO-008-2, Requirement R4 – deleted first part of Severe VSL

- o IRO-014-3, Requirement R2 – changed 'address' from 'meet;' changed from 'criteria' to 'parts'
- o IRO-014-3, Requirement R7 – corrected tense of verbs
- o IRO-017-1, Requirement R2 – changed entity to plural in Severe VSL
- o TOP-001-3, Requirements R1 and R2 – restructured language to match requirement
- o TOP-001-3, Requirement R7 – corrected grammatical errors
- o TOP-001-3, Requirement R8 – deleted 'whichever is less;' deleted 'other'
- o TOP-001-3, Requirement R9 – deleted 'whichever is less'
- o TOP-001-3, Requirement R10 – changed from binary approach to incremental approach
- o TOP-001-3, Requirement R13 – corrected numeric error in Severe VSL
- o TOP-002-4, Requirement R3 – corrected 'NERC entities' language
- o TOP-002-4, Requirement R5 – deleted 'impacted;' changed 'less than' to 'greater than'
- o TOP-003-3, Requirement R5 – added Lower VSL; deleted first part of severe VSL

The SDT is recommending that proposed TOP-001-3 be posted for an additional comment period and ballot, and that the other standards, definitions, and Implementation Plan be posted for final ballot.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Director of Standards, Valerie Agnew, at 404-446-2566 or at valerie.agnew@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

1. **Do you agree with the changes made to respond to industry comments to proposed IRO-001-4? If not, please provide technical rationale for your disagreement along with suggested language changes**.

Summary Consideration: The SDT deleted 'Operations Planning' from all time horizons concerning Operating Instructions as Operating Instructions are issued in Real-time environments.

R1. Each Reliability Coordinator shall act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions.

M2. Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it complied with its Reliability Coordinator's Operating Instructions, unless the instruction could not be physically implemented, or such actions would have violated safety, equipment, regulatory or statutory requirements. In such cases, the Transmission Operator, Balancing Authority, Generator Operator, or Distribution Provider shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Reliability Coordinator's Operating Instructions. If such a situation has not occurred, the Transmission Operator, Balancing Authority, Generator Operator, or Distribution Provider may provide an attestation.

1.3. Data Retention

The Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

Organization	Yes or No	Question 1 Comments
ACES Standards Collaborators	No	(1) We agree with the removal of the PSE and LSE from the applicability section of IRO-001-4. (2) Requirement R1 should be revised by removing the words "direct others to act" and stating that the RC shall issue Operating Instructions. The actions taken by an RC to direct others to act is inherent in the definition of Operating Instruction and is redundant with the language in the requirement. This additional clause is wordy and

Organization	Yes or No	Question 1 Comments
		may not fully capture what the drafting team is trying to achieve. For example, by stating that the RC shall act or direct others to act by issuing an Operating Instruction, the RC is limited only to this option. We recommend alternative language for this requirement, "Each RC shall act or issue Operating Instructions in accordance with its responsibilities as a RC of its RC Area." (3) Requirement R1's language of requiring the RC to "ensure reliability" could be used as a zero defect standard if there is an event. "Each RC shall act or issue Operating Instructions in accordance with its responsibilities as a RC of its RC Area." (4) The rationale for requirements R2 and R3 contradict with the revisions to the requirements. The rationale states that the TSP was added to allow retirement of IRO-004-2, but the draft removes the TSP from the requirements. Is the intent to keep IRO-004-2 intact? (5) Requirement R3 should be merged with R2. We suggest the following language for consideration, "Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Reliability Coordinator, or shall inform its Reliability Coordinator of its inability to perform because it cannot be physically implemented or such actions would violate safety, equipment, regulatory, or statutory requirements." This revision captures the intent of both requirements, is consistent with TOP-001, and reduces the amount of requirements needed. It also reduces unnecessary compliance exposure since only one violation could occur rather than potentially two requirements being violated.
Response: 1. Thank you for your support. 2. The SDT agrees and has revised the wording of the requirement. See summary for wording. 3. The SDT has revised the requirement to delete 'ensure' and replace it with 'address' as in the first posting. See summary for wording. 4. The SDT agrees and has corrected the language in the rationale box. 5. The SDT believes both requirements are needed independently and combining them using the proposed language creates essentially two requirements in one which should be avoided. No change made.		

Organization	Yes or No	Question 1 Comments
Georgia Transmission Corporation	No	(1) We agree with the removal of the PSE and LSE from the applicability section of IRO-001-4. (2) The current proposal for R2 as written could overly expose the DP to excess and double jeopardy compliance obligations for routine switching operations DPs perform on a daily basis which does not affect the reliability of the BES. Daily switching which require Operating Instructions could include scheduled outages for maintenance items and new construction. The functional model clearly states that RCs "...Issues corrective actions and emergency procedures directives (e.g., curtailments or load shedding) to Transmission Operators, Balancing Authorities, Generator Operators, Distribution Providers, and Interchange Coordinators". Based on this, one could assume the Operating Instruction issued by an RC to a DP would be limited to a load shedding scenario and not daily switching routines mentioned above. However, this arrangement becomes less clear when the issuer of the Operating Instruction has multiple registrations with NERC as the RC, BA, and TOP; and when the recipient of the operating instruction is registered with NERC as a DP, TO, and TSP. Under such exchange, a single Operating Instruction issued from such an entity is technically an Operating Instruction from the RC, BA, and TOP; the recipient of this single Operating Instruction also applies to each of their registration type being a DP, TO, and TSP. To the auditor, this single Operating Instruction could be the same piece of evidence for multiple requirements across multiple Standards such as IRO-001 and TOP-001. GTC believes the RC to DP interaction (with the RCs wide area view) is limited to Emergency scenarios which warrant a separate requirement for clarification of such exchange. A separate requirement for the DP is also justified and helps the ambiguity surrounding Real Time vs Ahead of Time activities within scope of the RC. The RC could issue Operating Instructions to the TOP, BA, GOP and IA for both Real Time and Ahead of Time, but GTC believes the DP is limited to Real Time horizon associated with "load shed" only in order for the RC to ensure the reliability of its Reliability Coordinator Area. A standalone requirement would correct the ambiguity expressed above and would more accurately capture the scenario of when the RC would be issuing Operating Instructions to the DP rather than BA, TOP, GOP, etc. Again, GTC's goal is for

Organization	Yes or No	Question 1 Comments
		this requirement not to overlap on the daily switching routines performed by the DP which require Operating Instructions such as scheduled outages for maintenance items and new construction when the issuing entity has both registrations of RC and TOP.GTC proposes the following standalone requirement for the DP: "Each Distribution Provider shall comply with its Reliability Coordinator's Operating Instructions associated with load shed unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements." Alternately, GTC would accept "Each Distribution Provider shall comply with its Reliability Coordinator's Operating Instructions during an Emergency unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements."
Response: 1. Thank you for your support. 2. The SDT agrees that Operating Instructions from the Reliability Coordinator to the Distribution Provider would most likely be limited to a Load shedding scenario; however the SDT does not believe a separate requirement for Reliability Coordinator to Distribution Provider communication is needed because the current wording in Requirements R2 and R3 covers this communication. No change made.		
Electric Reliability Council of Texas, Inc.	No	1. The term Operating Instruction is defined as a command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.) Because the definition of Operating Instruction is focused on real-time activities necessary to preserve the real-time status and condition of the BES and indicates that such activities may only be issued by operating personnel responsible for the Real-time operation of the BES, ERCOT suggests that the use of the term Operating Instruction within the multiple time horizons referenced throughout IRO-001-4 (especially the operations

Organization	Yes or No	Question 1 Comments
		planning and same-day operations time horizons) undermines the objectives of issuing Operating Instructions in Real-Time, are likely to cause confusion regarding the Operating Instruction an entity should implement, and would result in significant resource and operational concerns. First, because the term Operating Instruction as developed and utilized in COM-002-4 is intended to provide operating personnel responsible for the real-time status and condition of the BES with additional tools and authority to prevent miscommunications and ensure the reliability of the BES, its definition has been tailored to real-time scenarios and responsibilities. Indeed, the very definition is focused on responding to emerging conditions within the BES to ensure reliability, connoting urgency and ensuring that the issuer's authority and direction is unchallenged and timely implemented. This sense of urgency and authority that provided additional strength to Reliability Coordinators in fulfilling obligations under COM-002-4 is weakened significantly when the term Operating Instruction is applied to activities expected to be performed days in advance of target operating day. Specifically, because the activities identified as mitigations to forecasted system conditions are based on forecasts and best available information in advance of the actual operating day, such conditions may never manifest themselves and the "command" issued may never need to be implemented. Accordingly, the use of the term Operating Instruction within Same-Day and Operations Planning Horizons is likely to cause confusion as the directed activities may never need to be taken, but would essentially be defined through the use of the term Operating Instructions, as "urgent" actions. Additionally, entities being issued advance "Operating Instructions" may become confused regarding what activities they should perform if Operating Instructions devised as a result of a Next-Day Study differed from the Operating Instructions received in Real-Time. Generally, actions in advance of the target operating day are coordinated amongst impacted entities with the objective of ensuring that operating parameters are respected should adverse conditions manifest during the target operating day. These activities are generally plans that are developed prior to the target operating day in response to forecasted conditions. As discussed earlier, the term Operating Instruction was devised to provide Reliability Coordinators and other responsible entities with the tools and authority necessary to

Organization	Yes or No	Question 1 Comments
		proactively ensure the reliability of the BES in real-time. Plans developed in response to forecasted conditions that may or may not manifest themselves are not and should not equated with actions that should be taken immediately to preserve reliability. Finally, ERCOT notes potential resource and operational concerns with requiring Reliability Coordinators to utilize their operating personnel responsible for Real-time activities to issue Operating Instructions that would result from Operational Planning Analyses conducted well in advance of real-time. In particular, because the definition of Operating Instruction requires that such an instruction be issued by operating personnel responsible for the real-time operation of the BES (which is generally interpreted synonymously with “system operator”), ERCOT respectfully submits its significant concerns regarding diverting its real-time personnel and resources to tasks generally performed by personnel focused on the day-ahead or operations planning time horizons. More specifically, Operational Planning Analyses are generally performed by personnel that are not considered operating personnel, but are, rather Operations Support Personnel or other technical personnel. The review, analysis, and final decisions regarding necessary actions, while coordinated with operating personnel, are generally completed and communicated by those same personnel. To issue Operating Instructions for analyses performed in the forward planning horizons would require diversion of operating personnel from their primary tasks in the real-time environment to tasks generally performed by personnel focused on operations planning. ERCOT respectfully submits that such would not only cause resource concerns by diverting real-time personnel from ensuring the reliability of the BES, but would also cause operational concerns as entities receiving such Operating Instructions from personnel that are essentially System Operators may cause confusion regarding when such Operating Instructions should be implemented. To resolve the foregoing concerns, ERCOT respectfully suggests that the Standards Drafting Team (SDT) insert the term “directive” or other verbiage where the use of Operating Instruction is intended to address multiple time horizons until the definition of operating instruction is modified or - should such modification not be possible -permanently (e.g., IRO-001-4, R1, R2, and R3) and coordinated with COM-002-4. As it stands today, applying the term to more than the Real Time horizon will likewise expand the scope of

Organization	Yes or No	Question 1 Comments
		communications that must be addressed in COM-002-4 R1-R3.R1. Each Reliability Coordinator shall act, or direct others to act, by issuing directives or Operating Instructions, to ensure the reliability of its Reliability Coordinator Area. [Violation Risk Factor: High][Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations] 2. To ensure consistency amongst requirements within the IRO-001-4 standard, it is recommended that Requirement R3 be revised to more closely reflect its triggering or immediately preceding requirement, Requirement R2. The proposed Requirement R3 would read: R3. Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall inform its Reliability Coordinator upon recognition that the Operating Instruction issued by its Reliability Coordinator pursuant to Requirement 1 cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. Additionally, it is recommended that the associated VSL also be modified accordingly.
Response: 1. The SDT agrees with the comments regarding the Operations Planning Horizon and has deleted this horizon from all requirements dealing with Operating Instructions. 2. The SDT believes the current wording in Requirement R3, based on changes made from previous industry comments, clearly states the requirement to inform the Reliability Coordinator if an Operating Instruction cannot be performed. The SDT does not believe the suggested change adds clarity. No change made.		
Associated Electric Cooperative, Inc. - JRO00088 SPP Standards Review Group Kansas City Power & Light	No	AECI agrees with SPP comments regarding R1-R3: R1 - We have concerns regarding the phrase ‘to ensure the reliability’. The phrase is ambiguous and detracts from the purpose of the standard which is to ensure the Reliability Coordinator takes action or directs others to act. Additionally, we suggest tying the ‘others’ in Requirement R1 specifically to those entities identified in Requirements R2 and R3.We recommend the following rewrite: ’Each Reliability Coordinator shall act, or direct others as identified in Requirements R2 and R3 to act, by issuing Operating Instructions in accordance with its responsibilities as a Reliability Coordinator within its Reliability Coordinator Area.

Organization	Yes or No	Question 1 Comments
		'Rationale Box for Requirements R2 & R3 - The Rationale Box for Requirements R2 and R3 does not match the language in the requirements. There is no mention of the Transmission Service Provider in the requirements. It only appears in Measures M2 and M3. The IRO Five Year Review Team had recommended adding Transmission Service Provider to Requirements R2 and R3 to allow the retirement of IRO-004-2. With the removal of the Transmission Service Provider in Requirements R2 and R3, can the retirement of IRO-004-2 move forward?
Response: 1. The SDT has revised the requirement to delete 'ensure' and replace it with 'address' as in the first posting. See summary for wording. 2. The SDT agrees and has corrected the language in the rationale box.		
Ingleside Cogeneration , LP	No	Ingleside Cogeneration LP (ICLP) believes that the project team has completely bypassed the language and intent of COM-002-4 by creating zero-tolerance requirements in IRO-001-4 R2 and R3. In R2/R3, every Operating Instruction, no matter how routine, must be perfectly executed and documented to the liking of an audit team. By comparison, COM-002-4 focuses only on training and ongoing reinforcement on the proper communications protocol to be used in the transaction of Operating Instructions. We understand that BES reliability depends far more heavily on IRO-001-4's requirements to execute an Operating Instruction - and not so much COM-002-4's oversight of the protocols to use. However, an Operating Instruction can be any communication to "change or preserve the state, status, output, or input" of a BES element/facility, which covers significant ground. If a single log entry is vague or missing, a severe penalty awaits even the most conscientious GOP. This means that the solution lies in the compliance approach to IRO-001-4, which should vary by the priority of the communication. For example, ICLP believes that every Operating Instruction issued during a declared Emergency, or one prefaced with "this is a mandatory Operating Instruction" should be properly documented by the recipient in a zero-tolerance manner. This would include time-stamps of conversations; an acknowledgement that three-part communications were used; and a coherent recount

Organization	Yes or No	Question 1 Comments
		of the steps requested, taken, and their results. All other Operating Instructions would only be examined by an auditor if shown that slow or improper execution put the BES at risk. This is not a substantial hurdle to overcome - particularly since the issuer and recipient will both have telemetry and/or written records of an incidence of concern. The CEA could then dig deeper to determine if a pattern of poor performance by the GOP exists; which is really the behavior that we all want to eliminate over the longer term.
Response: The SDT believes that complying with Operating Instructions is extremely important for the reliability of the system and that emphasis in audits will be on whether the Operating Instruction was followed as opposed to a missing log entry. The SDT suggests that the commenter's points would be better submitted as comments on the RSAW for proposed IRO-001-4. No change made.		
Flathead Electric Cooperative, Inc.	No	Measures are improved with not having to cite a reason specifically, but still too much evidence burden on the receiving entity. The BA should have recordings already and some of these evidence requirements are duplicative.
Response: The measures provide examples of evidence that may be used to show an entity complied with an Operating Instruction from its Reliability Coordinator. The entity chooses what evidence to provide. No change made.		
Duke Energy	No	R1: Duke Energy suggests re-writing R1 as follows: "Each Reliability Coordinator shall issue Operating Instructions, as necessary, to ensure the reliability of its Reliability Coordinator Area." As written, we believe that every communication involving an RC could be considered an Operating Instruction. For example, If a BA/TOP informs the RC of a loss of unit/tripping of equipment and the measures taken to mitigate the situation. Would an RC be required to give Operating Instructions back to the BA/TOP stemming from an informational conversation? We feel the revision adds clarity that the RC will issue Operating Instructions only when they believe it is warranted. R2: No comments M2: All instances of Transmission Service Provider should be removed from this measure.

Organization	Yes or No	Question 1 Comments
		R3: No comments
Response: R1. The definition of Operating Instruction allows for the discussion of general information and alternatives. The SDT points the commenter to the draft RSAW for proposed IRO-001-4 as the SDT believes it provides clarity on situations that may require the issuance of an Operating Instruction and also may alleviate concerns over the potential administrative impact. The SDT has revised the wording of the requirement to provide clarity. See summary for wording. M2. Transmission Service Provider has been removed from M2. See summary for wording.		
Hydro-Quebec TransEnergie	No	Rationale for R2 and R3 should be modified for consistency with the removal of the TSP. R2 : Replace "compliance with the Operating Instructions" with "they" referring to the instructions. Compliance is not something that can be "physically implemented". Instructions can. Also for consistency with M2: Remove the Transmission Service Provider from the second portion of the measure (2 occurrences) Compliance section 1.2 : What is the rationale behind that modification? As proposed, the section doesn't give any useful information. That section should actually serve to list the actual processes that will be used for that particular standard. Or at least refer to the actual section of the ROP that lists the processes used (Appendix 4C, section 3.0). Compliance section 1.3 : Remove all occurrences of "Transmission Service Provider". (Would have been best achieved by a "search and replace"...)
Response: The SDT agrees and has corrected the language in the rationale box. The SDT believes the current wording of Requirement R2 is correct as written. No change made. Transmission Service Provider has been removed from Measure M2. See summary for wording.		

Organization	Yes or No	Question 1 Comments
The Compliance section is boilerplate language supplied by NERC. The SDT did not change this boilerplate language. The SDT will pass this comment on to NERC Legal. No change made. Transmission Service Provider has been removed from Compliance section 1.3.		
ReliabilityFirst	No	ReliabilityFirst offers the following comments for consideration.1. Requirement R3 - ReliabilityFirst continues to recommend there be a timeframe added to the requirement stating the allotted time the Entity has to inform its Reliability Coordinator of its inability to perform an Operating Instruction. Absent a timeframe, compliance to this requirement becomes subjective and difficult to enforce. ReliabilityFirst suggests the following language for consideration. “Each Transmission Operator, Balancing Authority, Generator Operator, Transmission Service provider, and Distribution Provider shall inform its Reliability Coordinator [within the time constraints allocated by the Reliability Coordinator in its notification protocol] of its inability to perform an Operating Instruction...”
Response: The SDT still believes it is understood that entities should begin initiating actions per an Operating Instruction immediately and if the entity realizes they cannot implement the instruction(s) for any of the reasons in Requirement R2, it should immediately notify the Reliability Coordinator. The SDT agrees that an Operating Instruction may include a timeframe given by the Reliability Coordinator, but defining a generic timeframe is not necessary, or appropriate, for a requirement. No change made.		
New York Independent System Operator (NYISO)	No	SDT should consider the use of the word ensure. We suggest revising the phase to, ‘maintain ensure the reliability...’. This term exists in other parts of this group of standards, please consider the comment for all.
Western Area Power Administration	No	Western has a concern on the use of the word ensure in R1. The concern is that whenever there is a reliability event it would be a violation of this requirement, since the RC didn’t provide instructions that ensured the reliability of its area. We would suggest changing the last portion of the requirement to ‘...... issuing Operating Instructions in accordance with its responsibilities as a Reliability Coordinator within its Reliability Coordinator Area.’

Organization	Yes or No	Question 1 Comments
Response: The SDT has revised the requirement to delete 'ensure' and replace it with 'address' as in the first posting. See summary for wording.		
CenterPoint Energy Houston Electric LLC	No	See comment for TOP-001-3, R1
Response: See response to TOP-001-3.		
BC Hydro	No	The new Requirement has the Reliability Coordinator issuing "Operating Instructions" rather than "Reliability Directives". The scope of "Operating Instructions" broadens to non-emergency situations. BC Hydro does not support this increase in scope.
Response: The SDT believes the use of Operating Instruction is responsive to concerns raised by FERC in the NOPR**.** The SDT's decision to utilize the term Operating Instruction was in part due to the concept that a directive is inclusive within its definition. The SDT believes the use of Operating Instruction(s) allows Reliability Coordinators and Transmission Operators to address or prevent situations that could lead to an Emergency. The Reliability Directive definition was never approved by FERC (see NOPR) and will eventually be withdrawn. The use of Operation Instruction is consistent with proposed COM-002-4. Proposed COM-002-4 (pending regulatory approval) was approved by the Board. No change made.		
Northeast Power Coordinating Council	No	The Purpose of IRO-004-4 is: "To establish the responsibility of Reliability Coordinators to act or direct others to act." The Functional Model states that Reliability Coordinators interact with Transmission Service Providers, and Transmission Service Providers interact with Reliability Coordinators. Why is the TSP being removed from the Applicability and the Requirements? The contents of the Rationale boxes need to be reviewed and revised. For example, The Rationale under Applicability mentions Purchasing-Selling Entity and Load-Serving Entity being deleted from IRO-001-1.1. The Rationale for Requirements R2 and R3 mentions the retirement of IRO-004-2. The Rationale for IRO-001-4 should deal with IRO-001-4. The Drafting Team should consider the removal of the Rationale Box for R2 and R3.

Organization	Yes or No	Question 1 Comments
		Suggest that the Drafting Team consider replacing the word “ensure” where used in the Requirements and Measures and VSL Table with the word “maintain”. Because Transmission Service Provider is being removed from the Applicability of the standard, Transmission Service Provider needs to be removed from the body of the standard. For example, the Quality Review did not catch its use in the Data Retention section.
Hydro One	Yes	Agree with same comments as NPCC-RSC
Response: Transmission Service Providers are not listed in the Functional Model for corrective actions issued by the Reliability Coordinator, therefore they would not receive an Operating Instruction from a Reliability Coordinator. These rationale boxes are meant to provide clarity for deletions/retirements made by the SDT. However, based on comments from others, the SDT has corrected the language in the rationale box for Requirements R2 and R3. The SDT has revised the requirement to delete ‘ensure’ and replace it with ‘address’ as in the first posting. See summary for wording. Transmission Service Provider has been removed from Measure M2 and the Compliance section. See summary for wording.		
Colorado Springs Utilities	No	We agree with Southwest Power Pool comments for this question. We were not allowed to associate with another entities comments at the beginning of this comment form so we are stating that in the questions. The following were the comments that we had in addition to SPP's comments. CSU references our previous comments again as we do not feel they were addressed correctly. 1. In R6 there should be a timeframe requirement that the RC needs to adhere to in notifying impacted entities. 2. In R8 there should be a timeframe requirement that the RC needs to adhere to in notifying impacted entities. The response by the SDT referenced other requirements that require notification in other standards stating that the time requirements are covered under those requirements. The requirements referenced by the SDT do require notification at the time of an actual SOL or IROL etc. IRO-001-4 is the pre-contingency analysis that needs to be communicated. We do not feel that the

Organization	Yes or No	Question 1 Comments
		requirements referenced by the SDT cover the pre-contingency analysis required to be communicated by IRO-001-4.
Response: The SDT believes the reference should be for proposed TOP-001-3 and points the commenter to question 7.		
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	Yes	See VSL comments in response to question #11 below.
Response: See response to q11.		
FRCC Operating Committee (Member Services) City of Tallahassee, TAL	Yes	The groups represented by the FRCC Operating Committee support IRO-001-4 revisions in principle, however we seek clarification on the potential interpretations of the term "Operating Instructions" and the potential administrative impact to normal and emergency BES operations needed to demonstrate compliance as stipulated in the Measures.
Response: The SDT points the commenter to the draft RSAW for proposed IRO-001-4 as the SDT believes it provides clarity on situations that may require the issuance of an Operating Instruction and also may alleviate concerns over the potential administrative impact.		
Tri-State Generation and Transmission Association, Inc.	Yes	There are still mentions of the "Transmission Service Provider" even though it has been removed as an applicable entity. It is mentioned twice in Measure M2 and once again under the compliance section "1.3 Data Retention." All references to the Transmission Service Provider should be removed.

Organization	Yes or No	Question 1 Comments
Response: Transmission Service Provider has been removed from Measure M2 and the Compliance section. See summary for wording.		
Seattle City Light	Yes	SCL appreciates the efforts of the Standard Drafting Team to increase clarity of the IRO and TOP Standards while generally reducing the compliance documentation burden.

Response: Thank you for your support.		

2. **Do you agree with the changes made to respond to industry comments to proposed IRO-002-4? If not, please provide technical rationale for your disagreement along with suggested language changes**.

Summary Consideration: The SDT has made the following non-substantive changes due to industry comments:

R1. Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

R3: Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

Organization	Yes or No	Question 2 Comments
ACES Standards Collaborators	No	(1) We appreciate the drafting team's consideration of previous comments and subsequent revisions. (2) We recommend changing the term "Special Protection System" to "Remedial Action Scheme" because the SDT Project 2010-05.2 has determined that RAS is more appropriate and SPS will be retired upon FERC approval. This standard would potentially have an outdated glossary term if it keeps SPS in the requirements. (3) Requirement R3 is problematic as written because it implies that sub-100 kV transmission equipment as being subject to a standard. Sub-100 kV transmission equipment are not subject to reliability standards unless they are deemed to be a part of the Bulk Electric System. A simple solution would be to remove the clause "including sub-100 kV facilities needed to make this determination." If these sub-100

Organization	Yes or No	Question 2 Comments
		kV facilities are needed for reliability they would be part of the BES exception process and would be covered by the NERC defined term “Facilities.” The FERC NOPR that proposed to remand the TOP/IRO standards was issued on November 21, 2013, which was prior to the BES definition coming into effect on July 1, 2014. This is a significant justification to remove the sub-100 kV language. (4) We recommend verifying that the redlined and clean copies of the draft standard have consistent numbering of the requirements. When R1 was deleted in the redlined version, the other requirements did not reflect this change. Considering there are over 30 documents to review with this posting, it can be confusing when the requirements do not match.
Response: (1). Thank you for your support. (2). Until Remedial Action Scheme has become the official approved definition, the SDT will use the existing language of Special Protection System. If Remedial Action Scheme is adopted as the new, official term and approved by FERC then a project will be undertaken to make the necessary corrections throughout these standards. No change made. (3) Due to this comment and those of others, the SDT has revised the wording of the requirement to replace ‘sub-100 kV’ with the term ‘non-BES facilities’ to clarify the drafting team’s intent. The SDT believes that the non-BES terminology must be maintained in order for the SDT to be responsive to the FERC NOPR, SW Outage Report recommendations, and the IERP recommendations. This non-substantive clarifying change has been made in several other standards for consistency purposes – TOP-001-3, TOP-003-3, and IRO-010-2. See summary for wording. (4) The SDT is making every effort to align the requirement numbering.		
Electric Reliability Council of Texas, Inc.	No	1. ERCOT respectfully submits that Requirement R1 is duplicative to COM-001, R1 and recommends that it remain deleted. 2. ERCOT respectfully suggests that Requirement R2 requires clarification regarding the entities with which a Reliability Coordinator shall have data exchange capabilities and what shall constitute such data exchange capabilities as some information sharing does not lend itself to data links. The following revisions are proposed: R2. Each Reliability Coordinator shall exchange data with Balancing Authorities,

Organization	Yes or No	Question 2 Comments
		Transmission Operators, and other entities as identified in the data specification developed and maintained in accordance with IRO-010 and necessary to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. [Violation Risk Factor: High] 3. ERCOT respectfully suggests that Requirement R3 may be confusing and redundant as written and proposes a streamlined, less ambiguous version for the SDT's consideration. The following revisions are proposed: R3. Each Reliability Coordinator shall monitor the Facilities, status of Special Protection Systems, and sub-100 kV facilities within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas that are necessary to identify System Operating Limit exceedances and Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]
Response: 1. Requirement R1 will remain deleted. 2. The SDT feels this requirement is clear as to entities the Reliability Coordinator deems it needs data exchange capabilities with and what purpose those data exchange capabilities would serve. No change made. 3. The SDT does not believe that the suggested change adds clarity. However, due to this comment and those of others, the SDT has revised the wording of the requirement to replace 'sub-100 kV' with the term 'non-BES facilities' to clarify the drafting team's intent. This non-substantive clarifying change has been made in several other standards for consistency purposes – TOP-003-3, IRO-002-4, and IRO-010-2. See summary for wording.		
Associated Electric Cooperative, Inc. - JRO00088	No	R2: The OC Review Group suggests adding the word 'its' between 'with' and 'Balancing Authorities' to provide clarity. Suggested Wording: "R2: Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments."
Response: The SDT agrees and has made this non-substantive change. See summary for wording.		

Organization	Yes or No	Question 2 Comments
Hydro-Quebec TransEnergie	No	Compliance section 1.2 : What is the rationale behind that modification? As proposed, the section doesn't give any useful information. That section should actually serve to list the actual processes that will be used for that particular standard. Or at least refer to the actual section of the ROP that lists the processes used (Appendix 4C, section 3.0).
Response: The Compliance section is boilerplate language supplied by NERC. The SDT did not change this boilerplate language. The SDT will pass this comment on to NERC Legal. No change made.		
Dominion Compliance Policy	No	Dominion does not agree with R3, of the "clean version," as written. We are opposed to the inclusion of the phrase "including sub-100 kV facilities". We would prefer to modify the requirement to read "Each Reliability Coordinator shall monitor BES Facilities, including sub-100 kV facilities and the status of Special Protection Systems within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas, to ensure that it is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area." It is our position that any relevant sub-100 kV facility should be included as a BES Facility through the BES Exception process. While Dominion acknowledges the SDT's consideration of its comments relative to inclusion of the phrase 'sub-100 kV facilities' it still disagrees with the SDT's decision to retain it in this requirement for the reasons previously stated. M1 as written, "...and real-time Assessments." the word "Real" needs to be capitalized.
Response: Due to this comment and those of others, the SDT has revised the wording of the requirement to replace 'sub-100 kV' with the term 'non-BES facilities' to clarify the drafting team's intent. The SDT believes that the non-BES terminology must be maintained in order for the SDT to be responsive to the FERC NOPR, SW Outage Report recommendations, and the IERP recommendations. This non-substantive clarifying change has been made in several other standards for consistency purposes – TOP-003-3, IRO-002-4, and IRO-010-2. See summary for wording.		

Organization	Yes or No	Question 2 Comments
The measure has been corrected.		
SPP Standards Review Group Colorado Springs Utilities	No	M1 - Capitalize Real-time in the last line of Measure M1.
Kansas City Power & Light	No	M1 - Capitalize Real-time in the last line of Measure M1.
Response: The measure has been corrected.		
MidAmerican Energy Company	No	MidAmerican remains concerned that the real-time assessment and operational planning assessment definitions as written will be wrongly interpreted to require things a real-time assessment tool cannot perform or an operational planning assessment cannot comply with. Real-time Assessment tools are not dynamic assessment tools and do not inherently understand phase angle impacts nor stability as suggested by the inclusion of Protection System status, degradation, and identified phase angle / equipment limitations. The SDT could check with real-time assessment vendors and verify that the revised definitions match the capabilities of real-time assessment tools and adjust the proposed definition. At a minimum, the SDT needs to clarify / modify words in the definition to ensure that real-time assessment tools can be compliant. Suggested clarifications include: Real-time assessment means a steady state analysis of thermal and voltage impacts. Power system transients, dynamics, nor actual phase angles are required. Protection Systems in the case of Real-time Assessment means the accurate system topology representation of normal protection system clearing (e.g. a three-terminal line as a single N-1 next worse contingency).Identified phase angles and equipment limits are identified in-terms of equipment ratings (amps, MVA, etc.). Phase angle inputs (from PMU's etc.) or phase angle calculations are not required. Further, personnel cannot be substituted for Real-time Assessments tools due to the 30 minute limitations imposed. Power system transient or dynamic analyses using real-time data can be time consuming to construct and run. At most, only a few power system dynamic analyses can be

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 2 Comments</th></tr>
<tr><td></td><td></td><td>performed in the space of 30 minutes and may not keep pace with changing real-time conditions.

The language of R3 continues to be imprecise with regard to the requirement that an RC Operator approve each and every planned outage or maintenance of monitoring and analysis capabilities. Merely having the “authority to approve” doesn’t literally mean the same thing as “work shall not be performed without RC approval.” The latter appears to be what the SDT intends, but the language does not appear to support it.</td></tr>
<tr><td colspan="3">Response: The SDT recognizes that not all entities are capable of performing Real-time transient Stability analysis within 30 minutes and would rely on Operating Plans. The inclusion of phase angle is based on the Southwest Outage recommendations. The SDT felt it was more prudent to include this item as part of the definition as opposed to a specific requirement within the standard. SDT has incorporated “applicable” based on industry feedback and believes that the proposed definition reflects an entity’s responsibility to model and assess the impacts of phase angles.   For example, modeling and assessment of phase angle reclosing limitations would be supported by Operating Plans. An entity can only provide data and information on what it has available and the addition of the term ‘applicable’ was intended to capture that intent and to protect an entity against unreasonable expectations. No change made.

It is the SDT’s intent that the System Operator has the authority to approve, deny, or cancel any outage affecting their ability to communicate, monitor, and analyze the system. No change made.</td></tr>
<tr><td>Duke Energy</td><td>No</td><td>R1: Duke Energy suggests the following revision: ”Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.” We believe adding “its BA and TOP” narrows the scope of data sharing required by the RC. We believe the intent should be to ensure the RC has data sharing capabilities with the BAs and TOPs in its RC area and with other entities that the RC believes are needed for performing Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

R2:   No comment</td></tr>
</table>

Organization	Yes or No	Question 2 Comments
		R3: Duke Energy suggests the following rewording: ”Each Reliability Coordinator shall monitor identified Facilities, status of Special Protection Systems, and sub-100 kV facilities necessary to identify any System Operating Limit exceedances, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas, and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Are a." We believe this rewording provides more clarity on the intent of this requirement. R4: Duke Energy suggest the following language: ”Each Reliability Coordinator shall have Energy Management Systems and SCADA data that provides information utilized by the Reliability Coordinator’s System Operator over a redundant infrastructure.” We feel the language “as written” is too broad. We feel this revision helps remove the perceived vagueness when referring to “monitoring systems”. Also, in regards to “redundant infrastructure”, we ask the SDT the following question: If an entity has redundant capability of its EMS system and one leg of that system is rendered unavailable during a planned or unplanned outage, is the RC non-compliant? In this example, the RC will not be on a redundant system due to the outage. We have concerns that the language as written in the standard would render the RC non-compliant.

Response: R1. The SDT agrees and has made this non-substantive change. See summary for wording.

R3. Due to this comment and those of others, the SDT has revised the wording of the requirement to replace ‘sub-100 kV’ with the term ‘non-BES facilities’ to clarify the drafting team’s intent. The SDT believes that the non-BES terminology must be maintained in order for the SDT to be responsive to the FERC NOPR, SW Outage Report recommendations, and the IERP recommendations. This non-substantive clarifying change has been made in several other standards for consistency purposes – TOP-003-3, IRO-002-4, and IRO-010-2. See summary for wording.

R4. It is not the SDT’s intent to require entities to have specific tools or systems or to dictate which software tools or systems an entity has to have to perform the function described in the requirement. No change made.

Organization	Yes or No	Question 2 Comments
The purpose of redundancy is to protect against a single point of failure. Specific questions on compliance need to be submitted to NERC Compliance.		
NV Energy	No	The changes made to R2 and R5 are responsive to our prior concerns. However, the language of R3 continues to be imprecise with regard to the requirement that an RC Operator approve each and every planned outage or maintenance of monitoring and analysis capabilities. Merely having the “authority to approve” doesn’t literally mean the same thing as “work shall not be performed without RC approval.” The latter appears to be what the SDT intends, but the language does not appear to support it.
Response: It is the SDT’s intent that the System Operator has the authority to approve, deny, or cancel any outage affecting their ability to communicate, monitor, and analyze the system. No change made.		
Northeast Power Coordinating Council Hydro One New York Independent System Operator (NYISO)	No	The contents of the Rationale boxes must be reviewed with respect to their applicability to IRO-002-4. The Drafting Team should clarify and coordinate the requirements between voice and data equipment requirements and the associated COM-001 and IRO-002-4. The SDT should clarify the COM-001 is restricted to voice communications and the IRO-002-4 R1 is intended to address data. It is also not clear that IRO-002-4 R2 is limited to voice communication and/or data. A wording change for R2 to be considered: Each Reliability coordinator shall have the authority to approve planned outages and maintenance of its telecommunication and data exchange capabilities (as referenced in R1). Requirement R3 has had the word “telecommunication” added to it. Should also add the word telemetering to make the requirement read “...telecommunication and telemetering...”. Then use of telecommunication and telemetering should be made consistent throughout the document. In Requirement R4 delete the comma between “...Special Protection Systems, and sub-100kV...” to make it read “...Special Protection Systems and sub-100kV...”. This

Organization	Yes or No	Question 2 Comments
		makes it clear that both Special Protection Systems and sub-100kV facilities shall be monitored.
Response: The SDT agrees and has corrected the language in the rationale box. The SDT does not believe that the suggested change adds clarity. No change made. The SDT believes that the commenter is referring to Requirement R2. The wording in Requirement R2 is consistent with the wording in proposed TOP-001-3 Requirement R16. No change made. The SDT does not believe that the suggested change adds clarity. No change made.		
FRCC Operating Committee (Member Services) City of Tallahassee	Yes	However, R5 requires "synchronized information systems". The FRCC Operating Committee seeks clarification from the drafting team on what constitutes a "synchronized information system". Consider replacing the word "synchronized" with "coordinated."
Response: The SDT believes that the commenter is referring to Requirement R4. The SDT believes that a 'synchronized' information system is adequately characterized by the dictionary definition of "cause to occur or operate at the same time or rate". The SDT sees no additional clarity being provided by the suggested change. No change made.		
MRO NERC Standards Review Forum	Yes	Please see question 7.
Response: Please see response to q7.		
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company	Yes	R4 begins with 'Each Reliability Coordinator shall monitor Facilities...' Southern suggest that the words, "Bulk Electric System" be added to R4 so that it reads 'Each Reliability Coordinator shall monitor "Bulk Electric System Facilities", consistent with the verbiage in IRO-003-2 Requirement 1. Measure 4 should also be changed accordingly. R4 - Southern suggest that utilization of the words, "as necessary" makes the requirement confusing and proposes the below verbiage to add clarity: 'Each

Organization	Yes or No	Question 2 Comments
Generation and Energy Marketing		Reliability Coordinator shall monitor "Bulk Electric System Facilities", the status of Special Protection Systems, and sub-100 kV facilities identified by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas, "as being necessary to determine" any System Operating Limit (SOL) exceedances within its Reliability Coordinator Area.' Changes would apply to Measure 4 as well.
Response: R4. The use of the defined term 'Facilities' means that it is BES and the suggested change would thus be redundant. No change made. The SDT feels the language as written communicates the correct intent. No change made.		
Texas Reliability Entity	Yes	Requirement R4: Texas Reliability Entity, Inc. (Texas RE) requests that the SDT consider replacing the term "sub-100 kV" with "non-BES" to be more inclusive of those facilities where data or monitoring may be needed. For instance, the RC may choose to monitor private use networks or radial lines connected to large loads/generation connected at greater than 100 kV but are excluded from the BES, in addition to sub-100 kV facilities. This change would not be needed if it is the intent of the SDT that the reference to "sub-100 kV" facilities is for those facilities that have been intentionally included in the BES due to their criticality.
Response: Due to this comment and those of others, the SDT has revised the wording of the requirement to replace 'sub-100 kV' with the term 'non-BES facilities' to clarify the drafting team's intent. The SDT believes that the non-BES terminology must be maintained in order for the SDT to be responsive to the FERC NOPR, SW Outage Report recommendations, and the IERP recommendations. This non-substantive clarifying change has been made in several other standards for consistency purposes – TOP-003-3, IRO-002-4, and IRO-010-2. See summary for wording.		
Florida Municipal Power Agency	Yes	The previous suggestion from the FRCC Operating committee was not taken regarding the "to approve" language in R3. As drafted this does not cover the full spectrum of authority needed by the RC. FMPA suggests replacing the words "to

Organization	Yes or No	Question 2 Comments
		approve" with "over" to make it clear that the authority is all encompassing and that input on planned outages is required from the System Operators.
Response: The SDT believes the Requirement language captures the SDT's intent of full authority to approve, deny, cancel, etc., planned outages. No change made.		
Seattle City Light	Yes	SCL appreciates the efforts of the Standard Drafting Team to increase clarity of the IRO and TOP Standards while generally reducing the compliance documentation burden.

3. **Do you agree with the changes made to respond to industry comments to proposed IRO-008-2? If not, please provide technical rationale for your disagreement along with suggested language changes.**

Summary Consideration: The SDT has made the following non-substantive changes to the requirements based on industry comments:

Rationale Box for Requirements R2 and R3: Requirements added ~~I~~in response to IERP and SW Outage Report recommendations concerning the coordination and review of plans.)

R3. Each Reliability Coordinator shall notify impacted entities identified in its ~~the~~ Operating Plan(s) cited in Requirement R2 as to their role in ~~those~~ such plan(s).

R5. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its ~~Reliability Coordinator~~ Wide Area.

R6. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R~~6~~5 has been prevented or mitigated.

Organization	Yes or No	Question 3 Comments
Texas Reliability Entity	No	1) Requirement R1: The SDT changed “or” to “and” within the phrase “System Operating Limits (SOLs) or Interconnection Operating Reliability Limits (IROLS)” based on a comment. Neither the commenter nor the SDT provided justification for the change. Texas RE does not agree with the change because if either SOLs OR IROLs are exceeded then the assessment should be performed; not just if both are exceeded. Texas RE requests that the change be rejected and the original language be reinstated or explanation of why the change is correct. 2) Section 1.3. Data Retention: Texas RE does not agree with the change of data retention for R1, R2, R3, R5 and R6 from a rolling six months to a rolling 90 calendar days. The six-month requirement was aligned with the Data Retention and Sampling Team (DRAST) white paper, which indicates a six-month rolling period for high volume

Organization	Yes or No	Question 3 Comments
		data, and 90-days for voice and audio recordings. The same comment applies for R4, which was changed from 90 days to a rolling 30 days.
Response: 1) The SDT believes that the proper term here is 'and'. Using 'or' leaves the requirement open to an interpretation where either SOLs or IROLs would need to be assessed. Both need to be assessed therefore justifying the use of 'and'. No change made. 2) The SDT believes that the requirements associated with an Operating Plan for next-day operations qualifies as a high volume task and could create a documentation burden on the part of the Reliability Coordinator. To reduce this compliance burden the data retention period was reduced. A similar argument applies to Requirement R4. No change made.		
Electric Reliability Council of Texas, Inc.	No	1. ERCOT respectfully submits that Requirement R3 is ambiguous as written. More specifically, the use of terms such as "coordinated" and "considered" are undefined and unnecessarily complicate Reliability Coordinator's responsibilities and documentation. In R2-R3, the current definition of Operating Plan states "a document". While this context is appropriate for processes/procedures determined well in advance of real time (e.g. EOP 005, EOP 008). The timeframe described is really next day and while most "Operating Plans" are documented, all plans to operate reliably may not be documented or in "a document". The definition should be modified to address this new usage of the term to make it appropriate for all its uses, or a different term should be used. In its current form, it may lead to unnecessary administrative violations due to the lack of having "a document" rather than operations being coordinated and have a plan to operate reliably. The plan can be still coordinated but exist in various systems and conversations/emails/documents. This presents similar challenges for R4 as well as it further infers a single "document" and have several required elements. This can be overly prescriptive and burdensome. 2. ERCOT respectfully submits that Requirement R4 is ambiguous as written. More specifically, it is unclear as to whether the Reliability Coordinator is responsible for notification of those entities impacted in its Operating Plan or all Operating Plans referenced in Requirement R3. 3. ERCOT suggests that the SDT review the language of Requirement R5 and its VSL for consistency. In particular, Requirement R5 was modified to require that the Reliability

Organization	Yes or No	Question 3 Comments
		Coordinator ensure that a Real-Time Assessment is performed every 30 minutes. However, the VSL still assesses the condition that the Reliability Coordinator did not "perform" as opposed to did not "ensure that" the Real-time Assessment was performed. These should be reviewed and revised to ensure consistency between the requirement and its VSL. 4. ERCOT respectfully notes that Requirement R5 and the associated VSLs do not acknowledge the necessary tool outages that occur as part of planned system maintenance to ensure that Reliability Coordinator tools continue to run with high availability and accuracy. With the continuing obligations of Registered Entities to ensure the cybersecurity of their tools and the clear acknowledgment of the need for planned outages of Reliability Coordinator tools in IRO-002-4, R3, the current Requirement R5 and the associated VSLs create conflict and inconsistency amongst the overall set of Reliability Standards. If Registered Entities (and Reliability Coordinators in particular) are required to maintain their analysis tools, which maintenance may require outages of such tools, Requirement R5 should not provide that Reliability Coordinators will be penalized for the very activities they are required to conduct under its obligations set forth within the overall set of enforceable Reliability Standards. More clearly stated, it should not be a violation if an entity has a planned tool outage that causes a reasonable time deviation from the normal 30 minute timeframe. The following revisions are proposed are proposed to address this inconsistency: R5. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes except where performance is delayed as a result of a planned or unplanned tool outage and potential effects of the delay are mitigated where possible. [Violation Risk Factor: High] [Time Horizon: Same-day Operations, Real-time Operations] It is further recommended that the associated VSLs also be modified accordingly. 5. ERCOT has identified a potential typographical error in R6 and all of its VSLs. Specifically, the reference to "as identified in identified in Requirement R6" should likely be reviewed and revised to "as identified in Requirement R5".

Organization	Yes or No	Question 3 Comments
		6. ERCOT respectfully reiterates its previous comment on the inconsistent language used between Requirements R5 and R6 and the LOWER VSL for Requirement R8. In particular, the word "Emergency" is used in the VSL for Requirement R8 but the condition is not specified elsewhere in the standard or the appropriate referenced requirements. Please revise the lower VSL for Requirement R8 to ensure consistency. The following language is proposed: "when the SOL or IROL exceedance identified in Requirement R5 has been prevented or mitigated". 7. The reference in Requirements R6 and R8 to "as indicated in its Operating Plan" is unnecessary and only creates additional compliance burden. Operating conditions can change very quickly and can cause a "plan" to vary and the impacted entities to vary. The phrase "as indicated in its Operating Plan" should be deleted. 8. It is recommended that the additional text under Associated Documents be utilized to initiate a modification of the definition of "Operating Plan" and deleted from the standard. Registered Entities should be able to rely upon the official definitions and other associated Reliability Standards to discern their obligations. If the SDT has determined that Registered Entities cannot appropriately discern their responsibilities utilizing approved definitions and standards, such definitions should be evaluated for modification and enhancement.

Response: 1. The SDT believes the commenter is referring to the new Requirement R2 (old Requirement R3). A Reliability Coordinator develops its Operating Plan by reviewing the results of its Operational Planning Analysis while taking into consideration the Operating Plans of the Transmission Operators and Balancing Authorities within its Reliability Coordinator Area. The outcome is a coordinated plan for next-day operations. No change made.

2. The SDT believes the commenter is referring to the new Requirement R3 (old Requirement R4). The SDT concurs with your concern and has modified Requirement R3 as found in the Summary Comments above.

3. VSL responses are handled in q11.

4. IRO-008-1, Requirement R2 currently requires the Reliability Coordinator to conduct a Real-time Assessment at least once every 30 minutes. Requirement R4 in proposed IRO-008-2 does not add or detract from that requirement. Approved EOP-008-1 specifically requires entities to have tools and applications to ensure that System Operators have situational awareness of the BES. It goes on

Organization	Yes or No	Question 3 Comments
to require that entities take necessary actions to manage the risk to the BES during periods when primary or backup functionality may not be available. This requirement isn't about maintaining RTCA or any other specific tool, it's about maintaining situational awareness at all times. No change made. 5. The SDT agrees and has corrected the typo. See summary for corrected requirement. VSL responses are handled in q11. 6. VSL responses are handled in q11. 7. The phrase was inserted to require the Reliability Coordinator to only notify those other Reliability Coordinators that are impacted by the Reliability Coordinator's Operating Plan. Otherwise, the Reliability Coordinator would have to notify all other Reliability Coordinators since they would all be impacted, some more than others. No change made. 8. The additional explanation under Associated Documents was provided to further enhance and clarify the definition. The SDT felt that this was a more effective and efficient way to provide this rather than incorporating it into the definition and creating a voluminous definition. No change made.		
SPP Standards Review Group Kansas City Power & Light Colorado Springs Utilities	No	1.3 Data Retention - Hyphenate 30- and 90-calendar days in 1.3 Data Retention for consistency with the other standards in this package.
Response: The SDT agrees and has made the indicated corrections.		
IRC Standards Review Committee Independent Electricity System Operator	No	a. R6 and all of its VSL: The reference to "as identified in identified in Requirement R6" should be revised to "as identified in identified in Requirement R5". b. We wish to reiterate our previous comment on the inconsistent language used between Requirement R6 (was R8 but misquoted in our previous comment as R6) and the LOWER VSL for R6 in which the word "Emergency" is used but the condition is not specified in R6.R6 stipulates that: Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been prevented or mitigated.

Organization	Yes or No	Question 3 Comments
		However, the LOWER VSL for R6 indicates that: The Reliability Coordinator did not notify one other impacted Reliability Coordinator as indicated in its Operating Plan “when the Emergency identified in Requirement R6 was prevented or mitigated.” Please revise VSL to read “when the SOL or IROL exceedance identified in Requirement R5 has been prevented or mitigated” as opposed to “Emergency” for consistency. c. The language between R4 and its VSL is inconsistent.R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. This requirement was changed from having the RC to “perform” to “ensure that” a Real-time Assessment is performed. However, the VSL still assesses the condition that the RC did not “perform” as opposed to did not “ensure that” the Real-time Assessment was performed. Please revise as appropriate.
Response: The SDT agrees and has corrected the typo. See summary for corrected requirement. VSL responses are handled in q11. b. and c. VSL responses are handled in Question 11.		
Northeast Power Coordinating Council Hydro One	No	“Ensure” or “ensured” should not be used in the standard. The contents of the Rationale boxes must be reviewed to ensure they are consistent with their associated Requirements. For example, the Rationale for Requirements R5 and R6 refers to the use of the word “impacted”. Impacted is not used in Requirement R5. The contents of the Rationale for R1, and R3 and R4 should be expanded to provide a short background statement for the Rationale. The wording of requirements should be made consistent. Why is Requirement R7 being deleted?
Response: The SDT has reviewed the use of ‘ensure’ throughout the standard and believes that the use of the term in this standard is correct. No change made.		

Organization	Yes or No	Question 3 Comments
Please refer to the clean version of the standard. The new Requirements R5 and R6 contain 'impacted'. Granted, the requirement numbers in the redline version did not align with the references in the Rationale Boxes which has now been corrected. . SOLs were included in Requirement R1 as a result of a concern expressed by FERC in paragraph 96 of the NOPR. Likewise, Requirements R2 and R3 were added to address concerns expressed in the SW Outage Report and by the Independent Expert Review Panel. Additional wording has been included in the Rationale Box for Requirements R2 and R3. The SDT decided to delete Requirement R7 because it is redundant with the more generic proposed IRO-001-4, Requirement R1.		
Associated Electric Cooperative, Inc. - JRO00088 South Carolina Electric and Gas	No	In R5, suggest expanding the time interval to 45 minutes instead of 30 minutes. When new EMS models are brought online, they may require greater than 30 minutes to perform an assessment. Either the time could be expanded or some sort of allowance provided for the times when the new models are being placed in service. In R8, the OC Review Group suggests removing the words 'prevented or' because prevention of SOL or IROL exceedance is difficult to prove and would typically not be communicated to BAs and TOPs. Suggested Wording: "R8: Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been mitigated."
Response: Requirement R5 (new Requirement R4) – Approved IRO-008-1, Requirement R2 currently requires the Reliability Coordinator to conduct a Real-time Assessment at least once every 30 minutes. Requirement R4 in proposed IRO-008-2 does not add or detract from that requirement. Approved EOP-008-1 specifically requires entities to have tools and applications to ensure that System Operators have situational awareness of the BES. It goes on to require that entities take necessary actions to manage the risk to the BES during periods when primary or backup functionality may not be available. This requirement isn't about maintaining RTCA or any other specific tool, it's about maintaining situational awareness at all times. No change made. Requirement R8 (new Requirement R6) – Requirement R5 requires the Reliability Coordinator to notify impacted entities whenever its analysis indicates an actual or expected exceedance of an SOL or IROL occurs. Notification of a potential exceedance will set in motion a process to either mitigate the SOL/IROL before it occurs or after it actually occurs. If that operating condition no longer exists, the		

Organization	Yes or No	Question 3 Comments
Reliability Coordinator must follow through with a 'stand down' notification such that those processes are returned to normal. No change made.		
Georgia Transmission Corporation	No	In R5, suggest expanding the time interval to 45 minutes instead of 30 minutes. When new EMS models are brought online, they may require greater than 30 minutes to perform an assessment. Either the time could be expanded or some sort of allowance provided for the times when the new models are being placed in service. In R8, suggest removing the words 'prevented or' because prevention of SOL or IROL exceedance is difficult to prove and would typically not be communicated to BAs and TOPs. Suggested Wording: "R8: Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been prevented or mitigated."
Response: Requirement R5 (new Requirement R4) – Approved IRO-008-1, Requirement R2 currently requires the Reliability Coordinator to conduct a Real-time Assessment at least once every 30 minutes. Requirement R4 in proposed IRO-008-2 does not add or detract from that requirement. Approved EOP-008-1 specifically requires entities to have tools and applications to ensure that System Operators have situational awareness of the BES. It goes on to require that entities take necessary actions to manage the risk to the BES during periods when primary or backup functionality may not be available. This requirement isn't about maintaining RTCA or any other specific tool, it's about maintaining situational awareness at all times. No change made. Requirement R8 (new Requirement R6) – Requirement R5 requires the Reliability Coordinator to notify impacted entities whenever its analysis indicates an actual or expected exceedance of an SOL or IROL occurs. Notification of a potential exceedance will set in motion a process to either mitigate the SOL/IROL before it occurs or after it actually occurs. If that operating condition no longer exists, the Reliability Coordinator must follow through with a 'stand down' notification such that those processes are returned to normal. No change made.		
Consumers Energy Company	No	I have a concern with the evidence for compliance with Requirement 4. The Standard as written does not clearly define parties who must be notified. The reference to the Operations Plan does not require the inclusion of any non-registered entity.

Organization	Yes or No	Question 3 Comments
Response: New Requirement R3 (old Requirement R4) indicates that the Reliability Coordinator must notify those entities that it determined were impacted in its Operating Plan which is based on its Operational Planning Analysis as conducted in Requirement R1. The SDT has made clarifying changes to Requirement R3 which should alleviate your concern. See the Summary Consideration.		
Dominion Compliance Policy	No	In R8, Dominion suggests removing the words 'prevented or' because prevention of SOL or IROL exceedance is difficult to prove and would typically not be communicated to BAs and TOPs.
Response: Requirement R8 (new Requirement R6) – Requirement R5 requires the Reliability Coordinator to notify impacted entities whenever its analysis indicates an actual or expected exceedance of an SOL or IROL occurs. Notification of a potential exceedance will set in motion a process to either mitigate the SOL/IROL before it occurs or after it actually occurs. If that operating condition no longer exists, the Reliability Coordinator must follow through with a 'stand down' notification such that those processes are returned to normal. No change made.		
Florida Municipal Power Agency	No	It seems the SDT did not understand FMPA's previous comment regarding R1. FMPA's comment was not concerning ratings or the determination of SOLs, it was concerning the contingencies to be studied in the Operational Planning Analysis (OPA). The phrase "N-1 Contingency planning" no longer exists with the revisions to these standards, and the number of contingencies to be studied is not described in the definition of Operational Planning Analysis. So, is the RC's OPA supposed to consider N-2 events? N-3? Loss of an entire substation? It should be clear that the level of contingencies studied in the OPA is the same level of contingencies studied to determine SOLs and IROLs, thus our suggestion to refer to the performance requirements in FAC-011 or to add the phrase "in accordance with its SOL Methodology". Otherwise, the OPA could show an exceedance of an SOL due to a contingency scenario that was not required to be considered in determining that SOL. As written, R1 is left open to interpretation, may not be measureable, and could set more stringent BES performance criteria than is already contained in the standards. The number of contingencies to be studied is also absent from the definition of Real-time Assessment.

Organization	Yes or No	Question 3 Comments
Response: The SDT does not want to be overly prescriptive. The Transmission Operator has the obligation to preserve the reliability of the interconnected Transmission system. The Contingencies to be handled in an Operational Planning Analysis are laid out in the Reliability Coordinator's SOL methodology and the SDT expects that an entity will adhere to that methodology when performing its Operational Planning Analysis. No change made.		
MidAmerican Energy Company	No	MidAmerican remains concerned that the real-time assessment and operational planning assessment definitions as written will be wrongly interpreted to require things a real-time assessment tool cannot perform or an operational planning assessment cannot comply with. Real-time Assessment tools are not dynamic assessment tools and do not inherently understand phase angle impacts nor stability as suggested by the inclusion of Protection System status, degradation, and identified phase angle / equipment limitations. The SDT could check with real-time assessment vendors and verify that the revised definitions match the capabilities of real-time assessment tools and adjust the proposed definition. At a minimum, the SDT needs to clarify / modify words in the definition to ensure that real-time assessment tools can be compliant. Suggested clarifications include: Real-time assessment means a steady state analysis of thermal and voltage impacts. Power system transients, dynamics, nor actual phase angles are required. Protection Systems in the case of Real-time Assessment means the accurate system topology representation of normal protection system clearing (e.g. a three-terminal line as a single N-1 next worse contingency).Identified phase angles and equipment limits are identified in-terms of equipment ratings (amps, MVA, etc.). Phase angle inputs (from PMU's etc.) or phase angle calculations are not required. Further, personnel cannot be substituted for Real-time Assessments tools due to the 30 minute limitations imposed. Power system transient or dynamic analyses using real-time data can be time consuming to construct and run. At most, only a few power system dynamic analyses can be performed in the space of 30 minutes and may not keep pace with changing real-time conditions.

Organization	Yes or No	Question 3 Comments
Response: The SDT recognizes that not all entities are capable of performing Real-time transient Stability analysis within 30 minutes and would rely on Operating Plans. The inclusion of phase angle is based on the Southwest Outage recommendations. The SDT felt it was more prudent to include this item as part of the definition as opposed to a specific requirement within the standard. SDT has incorporated "applicable" based on industry feedback and believes that the proposed definition reflects an entity's responsibility to model and assess the impacts of phase angles. For example, modeling and assessment of phase angle reclosing limitations would be supported by Operating Plans. An entity can only provide data and information on what it has available and the addition of the term 'applicable' was intended to capture that intent and to protect an entity against unreasonable expectations. No change made.		
Duke Energy	No	R1: No Comment R2: No Comment R3: No Comment R4: No Comment R5: Duke Energy still agrees with the intent of the SDT and the modifications made. However, we ask that the SDT review and describe the expectations for outages of an RC's Energy Management System during planned outages (data base modifications, model changes, etc.) and reconsider whether 30 minutes is an adequate amount of time to make those modifications. R6: We believe the incorrect requirement was referenced in R6. The phrase should be as follows :"when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R5 has been prevented or mitigated." Please change the reference of "R6" with "R5" as seen in the example above. R8: Duke Energy suggests the following revision: "Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been mitigated." We suggest removing "prevented" because the prevention of SOL/IROL

Organization	Yes or No	Question 3 Comments
		exceedances will be difficult to prove and would not typically be communicated to BAs and TOPs. The communication activities should be restricted to communications of activities to mitigate a potential SOL/IROL exceedance and not the prevention.
Response: Requirement R5 (new Requirement R4) – Approved IRO-008-1, Requirement R2 currently requires the Reliability Coordinator to conduct a Real-time Assessment at least once every 30 minutes. Requirement R4 in proposed IRO-008-2 does not add or detract from that requirement. Approved EOP-008-1 specifically requires entities to have tools and applications to ensure that System Operators have situational awareness of the BES. It goes on to require that entities take necessary actions to manage the risk to the BES during periods when primary or backup functionality may not be available. This requirement isn't about maintaining RTCA or any other specific tool, it's about maintaining situational awareness at all times. No change made. Requirement R6 (new Requirement R5) – The SDT agrees and has corrected the typo. See the Summary Consideration for the corrected requirement. VSL responses are handled in Question 11. Requirement R8 (new Requirement R6) – Requirement R5 requires the Reliability Coordinator to notify impacted entities whenever its analysis indicates an actual or expected exceedance of an SOL or IROL occurs. Notification of a potential exceedance will set in motion a process to either mitigate the SOL/IROL before it occurs or after it actually occurs. If that operating condition no longer exists, the Reliability Coordinator must follow through with a 'stand down' notification such that those processes are returned to normal. No change made.		
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	No	R4 - It is not clear why the SDT removed the qualifier "NERC registered". Southern recommends adding "NERC registered" back to the requirement. The NERC registered entities have established a reliability relationship with the RC, TOP, and BA and should be notified per this requirement. In addition, Southern noted that the SDT responded with the following comment in consideration of comments received for R4."Impacted goes beyond the concept of those entities that have an active role to play in the Operating Plan. It also includes those entities which may not have an active role to play in the plan but are still impacted by the given operating condition. For example, an entity may have Load impacted by a given situation and the only available option that entity may have is to shed that Load. But if the plan doesn't call for that entity to shed the Load, then the entity doesn't have an active role in the plan but is still impacted by the situation and therefore is deserving of notification." It is

Organization	Yes or No	Question 3 Comments
		very unclear on what expectation the SDT is suggesting in this comment. If the RC conducts a next day study and identifies potential issues, the RC will develop a plan to resolve the issue. This plan will be communicated to the NERC registered entity that is responsible for implementing the plan. The example provided by the SDT is unclear and confusing in that it introduces an entity that was never part of the plan to resolve the issue. If this entity was never part of the plan, why would or should the RC notify such entity? R8 - Southern suggests modifying R8 as follows (include “actual”) to require notification in the event of an actual SOL or IROL exceedance within the RC area, but not require notification in the case where there was a possible SOL/IROL exceedance, but system conditions changed that cause the potential issue to subside. Southern believes that requiring notification for the latter is a good utility practice, but does not maintain or enhance reliability as it is nothing more than a notification that “nothing is required any longer for what could have been ”Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the actual System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been prevented or mitigated. [Violation Risk Factor: Medium] [Time Horizon: Same-Day Operations, Real-time Operations] Southern also recommends moving the word “known” in the definition of Operational Planning Analysis to the beginning of the second sentence to reflect that the evaluation shall reflect applicable “known” inputs. The “known” should apply to each of the inputs and not just Protection Systems and SPS status and degradation. The Operational Planning Analysis should reflect what the TOP knows at the time the evaluation is conducted. TOPs continue to update the studies as updated or “known” information becomes available. See suggested revision below. Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable known inputs including, but not limited to, load

Organization	Yes or No	Question 3 Comments
		forecasts; generation output levels; Interchange; Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
Response: Requirement R4 (new Requirement R3) – There are entities that fulfill the functional roles as described in the Functional Model which are not necessarily registered at NERC. This is especially true for some entities in the Canadian provinces. If the term 'NERC registered entities' is used those unregistered entities would not be included in the requirements. Removing that specific language includes those unregistered entities. In the referenced example, the impacted Load may only suffer the consequences of the operational condition and still not play an active role in the mitigation of that condition. If for example, the Load is suffering from low voltage and its Distribution Provider has done everything it can do to alleviate the situation short of shedding Load, the plan could call on other entities identified in the plan to take action to assist in relieving the under-voltage situation such that Load would not have to be shed. Since its Load is on the line, the Distribution Provider should be notified of the potential for the condition and then notified when that threat is mitigated. No change made. Requirement R8 (new Requirement R6) – Requirement R5 requires the Reliability Coordinator to notify impacted entities whenever its analysis indicates a real or expected exceedance of an SOL or IROL occurs. Notification of a potential exceedance will set in motion a process to either mitigate the SOL/IROL before it occurs or after it actually occurs. If that operating condition no longer exists, the Reliability Coordinator must follow through with a 'stand down' notification such that those processes are returned to normal. No change made. Operational Planning Analysis – The SDT believes that the definition is worded correctly as stated since it now includes the word 'applicable'. No change made.		
Hydro-Quebec TransEnergie	No	R6: Replace "Reliability Coordinator Wide Area" by "Wide Area" for consistency with modifications made to R1. Compliance section 1.2: What is the rationale behind that modification? As proposed, the section doesn't give any useful information. That section should actually serve to list the actual processes that will be used for that particular standard. Or at least refer

Organization	Yes or No	Question 3 Comments
		to the actual section of the ROP that lists the processes used (Appendix 4C, section 3.0). Table of Compliance Elements: VSLs for R4, R6 and R8 should be reworded. Due to their importance in determining penalties, VSL should be written clearly and without ambiguity. See examples given for TOP-001-3. Associated Documents: The content of the white paper shouldn't be included in the standard. A reference with a hyperlink would be enough.
Response: Requirement R6 (new Requirement R5) –The SDT agrees and has made the suggested change. See the Summary Consideration. The Compliance section is boilerplate language supplied by NERC. The SDT did not change this boilerplate language. The SDT will pass this comment on to NERC Legal. No change made. VSL responses are handled in Question 11. Associated Documents – It is the normal practice to include this type of clarifying information, including the content of the Rationale Boxes, in this section of the standard. It provides a quick reference, in the standard itself, for further clarification of the requirements. No change made.		
PacifiCorp	No	The implications of removing the term NERC Registered from R4 are unclear because a Planning Coordinator may not be able to rely on information provided by unregistered entities. If the RC in IRO-008-2 M3 creates an Operating plan that includes non-registered Entities (TOP-002-4 R4 clearly shows that NERC thinks that non-registered entities WILL be included in some Operating Plans), the TOP responsibility of TOP-002-4 will only pertain to the NERC registered entities. This creates a serious potential reliability "gap" that must be addressed before this draft can be evaluated.
Response: There are entities that fulfill the functional roles as described in the Functional Model which are not necessarily registered at NERC. This is especially true for some entities in the Canadian provinces. If the term 'NERC registered entities' is used those		

Organization	Yes or No	Question 3 Comments
unregistered entities would not be included in the requirements. Removing that specific language includes those unregistered entities. No change made.		
New York Independent System Operator (NYISO)	No	The NYISO believes that this requirement should be limited to IROL evaluations. We believe the 30 minutes may have been based on the requirements to be within IROL's in 30 minutes. The 30 minute assessment for SOL's may be over prescriptive as some SOL could be up to 4 hours.
Response: The SDT does not agree that this requirement should be limited to IROL evaluations. The FERC NOPR made it clear that Transmission Operators should be performing SOL evaluations as well. The SDT wants to reinforce that a Real-time Assessment does not imply that all identified SOL exceedances need to be resolved within 30 minutes. SOL exceedances need to be mitigated consistent with the Transmission Operator's Operating Plan as highlighted in the SOL Exceedance White Paper. IROL exceedances would need to be mitigated consistent with the IROL T_v. No change made.		
Peak Reliability	Yes	R1 as written requires the RC to perform an OPA to assess whether planned operations will exceed SOLs and IROLs in its Wide Area. NERC defines Wide Area as "The entire Reliability Coordinator Area as well as the critical flow and status information from adjacent Reliability Coordinator Areas as determined by detailed system studies to allow the calculation of Interconnected Reliability Operating Limits". According to this NERC definition, the Wide Area does not include actual Facilities outside the RC Area, but rather includes flow and status information from adjacent RC Areas for the purposes of IROL calculation (whether the IROL is in the RC Area, in the adjacent RC Area, or spanning across multiple RC Areas). It brings in information from outside the RC Area for IROL calculation - it does not bring in additional Facilities outside the RC Area for general monitoring. Therefore, requiring an OPA to assess SOL and IROL exceedances in a Wide Area actually doesn't make sense, given the fact that the Wide Area does not include actual Facilities outside the RC Area, but rather information from outside the RC Area. Given the NERC definition of Wide Area, the requirement can only make sense if it requires the OPA to assess whether planned operations in its Wide Area (i.e., flows and statuses outside its RC Area for the purposes of IROL calculation) is expected to exceed any of its SOLs and IROLs. Peak

Organization	Yes or No	Question 3 Comments
		believes that the standard should be rephrased to state, "Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations within its Wide Area for the next-day will exceed any of its System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs)." With this language change, the flow and status information from the Wide Area are included in the RC's OPA to determine SOL and IROL exceedances appropriately (including IROLs within the RC Area as well as IROLs that span multiple RC Areas).This language change will also bring consistency with its companion requirement TOP-002-4 R1, which states, "Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs)." Peak believes this language change accurately reflects the NERC definition of Wide Area and ensures SOLs and IROLs are addressed appropriately to ensure reliability across the board. R5: It should be clarified what evidence will be needed to ensure that a Real Time Assessment is performed if the entity does not perform it themselves. If an entity relies on a third party to perform the Real-Time Assessment, there should be a requirement showing that this reliance was coordinated with the third party.

Response: Requirement R1 – The wording change being proposed limits the Reliability Coordinator's assessment to the SOLs and IROLs only within its Reliability Coordinator Area. This then limits the overall benefit of the Wide Area. If conditions within Reliability Coordinator A's Reliability Coordinator Area create the potential for SOL or IROL exceedances outside its Reliability Coordinator Area, but still within its Wide Area, but those conditions are not within the Wide Area view of neighboring Reliability Coordinator B's Wide Area view, then without notification by Reliability Coordinator A, Reliability Coordinator B would not be aware of the situation. Additionally, the SDT believes that the definition of Wide Area does include knowledge of Facilities within that Wide Area. If not, why would status information be included? A Reliability Coordinator must have those Facilities included in its models in order to factor in the status of those Facilities. Given the gap presented by the proposed language and the belief that Facilities are already properly accounted for; the SDT prefers the original language. No change made.

Requirement R5 (new Requirement R4) – The same evidence would be required regardless of which party actually conducts the assessment. Even though a Reliability Coordinator may delegate that task to a third party, the Reliability Coordinator is still

Organization	Yes or No	Question 3 Comments
accountable from a compliance standpoint. In the situation where a third-party actually performs the assessment, the only additional evidence that may be required is the delegation agreement between the Reliability Coordinator and the third party. No change made.		
Seattle City Light	Yes	SCL appreciates the efforts of the Standard Drafting Team to increase clarity of the IRO and TOP Standards while generally reducing the compliance documentation burden.
American Transmission Company, LLC	Yes	Although proposed IRO-008-2 is not applicable to ATC, changes were made by the SDT to Requirement R1 and the proposed term “Reliability Coordinator Wide Area” that addressed ATC’s comments in response to the SDT’s 1st posting.

4. **Do you agree with the changes made to respond to industry comments to proposed IRO-010-2? If not, please provide technical rationale for your disagreement along with suggested language changes.**

Summary Consideration: The SDT has made the following non-substantive changes due to industry comments:

R1, Part 1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including ~~sub-100 kV~~non-BES data and external network data, as deemed necessary by the Reliability Coordinator.

Organization	Yes or No	Question 4 Comments
Dominion Compliance Policy	No	While Dominion acknowledges the SDT's consideration of its comments relative to inclusion of the phrase 'sub-100 kV facilities' it still disagrees with the SDT's decision to retain it in this requirement for the reasons previously stated.
Ingleside Cogeneration , LP	No	ICLP agrees there are times where the RC will need data regarding certain sub-100 kV facilities to ensure operational reliability. However, these facilities must be limited to those identified using the NERC exception process deployed concurrently with the new BES Definition. This process was developed precisely for this reason - and eliminates the possibility that the RC can declare any sub-100 kV facility to be under their authority without justification. This opens the door to rash actions on the part of RCs eager to close a perceived reliability gap based upon a single incident, which may or may not be reasonable. If the project team believes that the exception process is inadequate, a better solution may be found in that venue (in NERC's Rules of Procedure). ICLP would suggest that a temporary exception could be quickly granted for a concerned RC - that a full evaluation by an independent panel would take place afterwards.
BC Hydro	No	The new Requirement has the Reliability Coordinator able to ask for "sub-100 kV' data if it deems necessary. This is an increase in scope from the data the RC currently asks

Organization	Yes or No	Question 4 Comments
		for. As this data may be outside the BES definition, BC Hydro does not support this increase in scope.
Response: Requirement R1, Part 1.1 was added to directly address Recommendations # 3 and 6 of the SW Outage Report and the FERC NOPR. The SDT has clarified its intent in revised wording. See summary for wording.		
ACES Standards Collaborators Georgia Transmission Corporation	No	(1) The applicability section needs to be revised to remove the Load Serving Entity. The Risk Based Registration project will retire the LSE from Appendix 5B from the NERC Rules of Procedure. Having the LSE listed as an applicable entity leads to confusion and questions. For example, a reviewer of this standard could question how the RBRAG could arrive at the conclusion that LSE is not needed for reliability but this drafting team apparently determined it was needed for reliability by including it in the standard. At the very least, if the SDT is not intending to contradict the RBRAG's finding's a rationale box should state that LSE is only being included for historical purposes and will be removed pending the final approval of the RBRAG recommendations by the NERC Board of Trustees. (2) We disagree with Requirement R1, part 1.1 that includes sub-100 kV data. The BES definition is very clear to the applicability of standards. IRO-010-2 should apply to BES Facilities, which may include sub-100 kV Elements and Facilities based on a determination from Regional Entity. Asking for non-BES data is out of scope of the jurisdictional bounds of reliability standards.
Response: As previously stated, the Load-Serving Entity will be removed from all pertinent standards and requirements when the registration project is completed and approved. This activity will be a separate endeavor and will encompass all pertinent standards. The SDT does not believe that leaving the Load-Serving Entity in the applicability of these standards will cause any confusion. No change made. Requirement R1, Part 1.1 was added to directly address Recommendations # 3 and 6 of the SW Outage Report and the FERC NOPR. The SDT has clarified its intent in revised wording. See summary for wording.		
CenterPoint Energy Houston Electric LLC	No	CenterPoint Energy does not agree with the structure of R1.2. While Protection System owners generally monitor the status of their Protection Systems CenterPoint Energy is very concerned that the proposed language would require Protection

Organization	Yes or No	Question 4 Comments
CPS Energy		System owners to continuously notify their respective RC of the status of each Protection System which would be a very onerous task with questionable reliability benefit. In addition, for the RC to monitor the status of all Protection Systems in their area would be an overwhelming burden with little reliability benefit. The Company recognizes the need to notify an RC of a Protection System failure that impacts System reliability as required in PRC-001 and therefore recommends Protection Systems and Special Protection Systems be split into separate sub bullets as such: 1.2. Provisions for notification of current Protection System failures that impact System reliability. 1.3. Provisions for notification of current SPS status or degradation that impact System reliability. These comments would also apply to TOP-003-3.
Response: The SDT does not intend for the Reliability Coordinator to monitor Protection Systems rather the intent is for the equipment owner to notify the Reliability Coordinator when a Protection System failure could impact how the Reliability Coordinator assesses reliability, i.e., changes Contingencies that need to be studied. The suggested change is semantic in nature. Both portions of the compound subject are modified by the descriptive prepositional phrase: "…Protection System and Special Protection System status or degradation that impacts System reliability." No change made.		
Duke Energy	No	Duke Energy does not disagree that the types of data exchanges described in this proposed IRO-010 are necessary. However, we believe that these data exchanges currently take place within the context of various existing ERO Requirements and/or various existing agreements between the Applicable Entities. Therefore we do not believe there is a need to codify these requirements in another ERO Standard. As written, this Standard simply creates additional administrative burden on the industry while providing no incremental reliability benefit. As written, Duke Energy believes this Standard would simply become a candidate for a future Paragraph 81 submittal.
Response: This proposed standard is directly responsive to the SW Outage Report Recommendation #3. No change made.		
Hydro-Quebec TransEnergie	No	R1: Replace the last sentence with "The data specification shall include but is not be limited to: Otherwise the "shall" applies to "not be limited to". That would mean that the data specification shall include other items that are not listed.

Organization	Yes or No	Question 4 Comments
		Compliance section 1.2 : What is the rationale behind that modification? As proposed, the section doesn't give any useful information. That section should actually serve to list the actual processes that will be used for that particular standard. Or at least refer to the actual section of the ROP that lists the processes used (Appendix 4C, section 3.0). Compliance section 1.3 : Remove Planning Coordinator and Transmission Planner Table of Compliance Elements: VSLs for R2 should be reworded. Due to their importance in determining penalties, VSL should be written clearly and without ambiguity. See examples given for TOP-001-3.
Response: The suggested wording change is semantic in nature and the SDT does not believe it adds clarity. No change made. The Compliance section is boilerplate language supplied by NERC. The SDT did not change this boilerplate language. The SDT will pass this comment on to NERC Legal. No change made. Compliance Section 1.3 – The SDT agrees, and removed Planning Coordinator and Transmission Planner. Interchange Authority was removed in the previous posting. VSL responses are handled in q11.		
ReliabilityFirst	No	ReliabilityFirst offers the following comments for consideration.1. Requirement R1, Part 1.1 - ReliabilityFirst requests the SDT define the term “as deemed necessary” in Requirement R1, Part 1.1. ReliabilityFirst finds that the first bullet of “Section 4 - Measurability” of the NERC document titled Acceptance Criteria of a Reliability Standard states “Words and phrases such as “sufficient”, “adequate”, “be ready”, “be prepared”, “consider”, etc. should not be used.” ReliabilityFirst believes the phrase “as deemed necessary” is such a phrase, which leaves the requirement open to interpretation making it difficult to enforce and therefore, should not be used in the Standard.

Organization	Yes or No	Question 4 Comments
Response: In Requirement R1, Part 1.1, "as deemed necessary" refers to the certain data elements that the Reliability Coordinator decides is needed. This would not be a measurement component of this requirement, since Requirement R1, Part 1.1 requires the publication of a list, which can be objectively measured during an audit. No change made.		
Indiana Municipal Power Agency	No	The use of a documented specification for the data needed by the Reliability Coordinator is extremely vague and allows the inclusion of all other data needed by the current NERC standards which creates a double jeopardy issue or an instances where an entity may meet one NERC standard but violate IRO-010-2. For example, VAR-002-3 becomes effective on October 1, 2014 and does not require the notification of AVR status change if it has been restored within 30 minutes of such change. The Reliability Coordinator has already given notice that its manuals will reflect this change a few months after October 1, 2014. This means Generator Operators in this RC area will have to still give notification within 30 minutes in order not to violate IRO-010-2 even though VAR-002-3 says differently. The documented specification for data needs to exclude data that is covered by other NERC standards to prevent this from happening and to reduce the workload on entities.
Response: The ability of the Reliability Coordinator to request and receive the data necessary to preserve reliability is a foundation of coordinated system operations. The suggested change would result in an unmeasurable and non-auditable standard. No change made.		
Electric Reliability Council of Texas, Inc.	No	Thought should be given to the overall approach to incorporating Protection System Status. While SPSs are currently in the standards, incorporating the broader definition of Protection Systems will likely incur additional hardware, modeling, display creation, etc. ERCOT does not support its inclusion without a holistic review of its impact within the standards. At a minimum, the implementation timeframe should be extended to realize that additional time is necessary after the RC requests the data, for an entity to actually provide such data. ERCOT recommends a minimum of 24 months vs the 12 months for R3.

Organization	Yes or No	Question 4 Comments
Response: This data concerning Protection System status is currently collected routinely and data transfer mechanisms are in place. Twelve months is a reasonable time frame to implement Requirement R3. The SDT does not intend for the Reliability Coordinator to monitor Protection Systems rather the intent is for the equipment owner to notify the Reliability Coordinator when a Protection System failure could impact how the Reliability Coordinator assesses reliability, i.e., changes Contingencies that need to be studied. No change made.		
Seattle City Light		SCL appreciates the efforts of the Standard Drafting Team to increase clarity of the TOP and IRO Standards while generally reducing the burden of compliance documentation. For IRO-101-2, SCL asks that the implementation times be extended from nine and twelve months to eighteen and twenty-four months, because it may take longer than one year to negotiate and implement the necessary data exchange agreements among impacted entities. SCL's recommended implementation language is as follows: Section 5. Proposed Effective Date. Requirement R1 and R2 shall become effective on the first day of the first calendar quarter that is eighteen (18) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R1 and R2 shall become effective on the first day of the first calendar quarter that is eighteen (18) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction. Requirement R3 shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R3 shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Organization	Yes or No	Question 4 Comments
Response: Data exchange agreements need not take significant time to negotiate. Data specified by the Reliability Coordinator must be supplied in order to preserve reliability. No change made.		
Peak Reliability	Yes	IRO-010-2 R1 states, "The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments." The concern with this language is the limiting nature of the scope of the data specification. The OPA is limited to data for next-day operations. R1 should not confine the RC's data specification to data for its OPA and RTA only, but rather should facilitate the RC to obtain the data it needs to perform its RC functions overall. With the current language, a TOP or BA may be able to claim that they have no compliance obligation to provide the RC with data it needs to perform its reliability functions. Peak recommends that R1 be rewritten to state: "The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its reliability functions." R2 should be updated similarly.
Response: The SDT believes that the current wording allows for a Reliability Coordinator to obtain the data it needs. No change made.		
Texas Reliability Entity	Yes	Requirement R1.1: Texas RE requests that the SDT consider replacing the term "sub-100 kV" with "non-BES" to be more inclusive of those facilities where data or monitoring may be needed. For instance, the RC may choose to monitor private use networks or radial lines connected to large loads/generation connected at greater than 100 kV but are excluded from the BES, in addition to sub-100 kV facilities. This change would not be needed if it is the intent of the SDT that the reference to "sub-100 kV" facilities is for those facilities that have been intentionally included in the BES due to their criticality.
Response: The SDT has clarified its intent in revised wording. See summary for wording.

5. **Do you agree with the changes made to respond to industry comments to proposed IRO-014-3? If not, please provide technical rationale for your disagreement along with suggested language changes.**

Summary Consideration: The SDT has made the following non-substantive changes to the standard based on industry comments:

- **M1.** Each Reliability Coordinator shall have available the latest approved documented version of its Operating Procedures, Operating Processes, and Operating Plans that require notifications, or the coordination of actions among impacted Reliability Coordinators for conditions or activities that may impact adjacent Reliability Coordinator Areas. This documentation shall include dated, current in force documentation with the specified elements, and notes from periodic communications.
- **R5.** Each Reliability Coordinator that ~~identified~~Identifies an Emergency in its Reliability Coordinator Area shall develop an action plan to resolve the Emergency during those instances where impacted Reliability Coordinators disagree on the existence of an Emergency.
- **R6.** Each impacted Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that ~~identified~~identifies the Emergency during those instances where Reliability Coordinators disagree on the existence of an Emergency, unless such actions would violate safety, equipment, regulatory, or statutory requirements.
- **Data retention:** Each Reliability Coordinator shall retain evidence for 90-calendar days for operator logs and voice recordings and for the period since the last compliance audit for other evidence for Requirements R3, R4, and R7 ~~and R9~~ and Measures M3, M4, and M7 ~~and M9~~.
- **Data retention:** Each Reliability Coordinator shall retain 3-calendar years plus current calendar year of evidence for Requirement~~s~~ R6 ~~and R8~~ and Measure~~s~~ M6 ~~and M8~~.

Organization	Yes or No	Question 5 Comments
Electric Reliability Council of Texas, Inc.	No	1. ERCOT notes that the consolidated set of IRO and TOP Reliability Standards utilize the terms “Wide Area” and “Reliability Coordinator Area”. If these phrases are expected or interpreted to be synonymous, ERCOT suggests use one or the other, but not both, throughout the IRO (and other) standards for consistency and to avoid confusion.

Organization	Yes or No	Question 5 Comments
		2. To ensure consistency, ERCOT recommends that, in Requirement R1.6, “provisions for” is removed and the sub-requirement begins with “Periodic”. 3. ERCOT respectfully recommends deletion of Requirement R3 as it is duplicative of IRO-008, Requirements R4 and R6. If the distinguishing factor and reason for inclusion is the acknowledgment of Emergency conditions, ERCOT recommends that such language is added to IRO-008. 4. ERCOT respectfully recommends deletion of Requirement R4 as it has been rendered moot by revisions to Requirement R6 and R7. Specifically, since Requirement R6 requires impacted Reliability Coordinators to implement any action plan developed by the Reliability Coordinator with the emergency and Requirement R7 requires assistance so long as the Reliability Coordinator with the emergency has implemented its emergency procedures, the dictation of operating state by other Reliability Coordinators is unnecessary. 5. ERCOT respectfully recommends deletion of Requirement R5 as it is duplicative of IRO-001-4, Requirement R1. Specifically, since Reliability Coordinators always have primary responsibility and ultimate authority to act when they observe conditions in their area that threaten reliability, disagreement with the Reliability Coordinator’s assessment of the conditions by another entity is of no consequence. However, if the objective is to ensure that Reliability Coordinators assist each other in Emergencies, Requirements R5 and R7 could be eliminated and Requirement R6 could be modified as follows: R6. Each impacted Reliability Coordinator shall implement any actions and/or provide any assistance requested by the Reliability Coordinator that identified an Emergency in its Reliability Coordinator Area unless such actions would violate safety, equipment, regulatory, or statutory requirements. 6. ERCOT respectfully notes that it is unable to discern the data retention period for Requirements R3 and R4. Instead, there are retention period requirements for R8 and R9, which do not exist. ERCOT urges the SDT and NERC to conduct a thorough and

Organization	Yes or No	Question 5 Comments
		independent quality review for all standards posted for commenting and balloting to avoid unnecessary delays. 7. ERCOT respectfully recommends that, for consistency, the VSLs for Requirement R2 be modified to remove references to criteria and state that Reliability Coordinator failed to maintain Operating Plans, Processes, or Procedures pursuant to one part of Parts 2.1 - 2.3, two parts of Parts 2.1 - 2.3, and so on. 8. It is recommended that the additional text under Associated Documents be utilized to initiate a modification of the definition of "Operating Plan" and deleted from the standard. Registered Entities should be able to rely upon the official definitions and other associated Reliability Standards to discern their obligations. If the SDT has determined that Registered Entities cannot appropriately discern their responsibilities utilizing approved definitions and standards, such definitions should be evaluated for modification and enhancement.
Response: 1. The definition of ***Wide Area*****:** The entire Reliability Coordinator Area as well as the critical flow and status information from adjacent Reliability Coordinator Areas as determined by detailed system studies to allow the calculation of Interconnected Reliability Operating Limits. The definition of ***Reliability Coordinator Area*****:** The collection of generation, transmission, and loads within the boundaries of the Reliability Coordinator. Its boundary coincides with one or more Balancing Authority Areas. The SDT maintains these terms are not synonymous. No change made. 2. The SDT believes **"**provisions" is correct for the idea being expressed. No change made. 3. Requirement R3 speaks to notification of Emergencies. Proposed IRO-008-2 Requirement R4 addresses periodicity of Real-time Assessments and Requirement R6 outlines requirements to act for notification of mitigation of SOL and IROL exceedances identified in the Operating Plan. These are not duplicative. No change made. 4. The SDT does not feel that the suggested change adds to reliability or corrects a defect in the standard and declines to make the suggested change at this time. 5. Proposed IRO-001-4 requirement R1 outlines the method by which Reliability Coordinators will act or direct others to act, i.e., issuing Operating Instructions. Proposed IRO-014-3 Requirement R5 requires development of an action plan. Said action plan may not include any Operating Instructions at all. No change made.		

Organization	Yes or No	Question 5 Comments
6. Data retention for Requirements R3 and R4 has been addressed. See summary for wording. 7. VSL responses are handled in q11. 8. The SDT does not feel that a revised definition of Operating Plan is required. The text included under Associated Document is simply an indication of the SDT's intent as to how it anticipated that Operating Plan would be used with respect to this standard. No change made.		
Independent Electricity System Operator IRC Standards Review Committee New York Independent System Operator (NYISO)	No	a. We generally agree with the changes made to IRO-014-3. However, the replacement of "other" with "adjacent" may leave a reliability gap. For example, the notification of Transmission Loading Relief may require "notification or coordination of actions" by, and can have an impact on, RCs other than just the adjacent RCs. Since the words "may impact" already serve as the qualifier for the RC to select who to notify, then the RC is not obligated to notify all RCs hence the scope of notification is finite. We urge the SDT to consider reinserting the word "other" into R1, replacing "adjacent". b. We do not have a preference, but we ask the SDT to review the use of the phrase "Wide Area" in IRO-008-2 (and other IRO standards) and the phrase "Reliability Coordinator Area" in IRO-014-3. If these phrases are expected or interpreted to be synonymous, we suggest using one or the other, but not both, throughout the IRO (and other) standards for consistency and to avoid confusion. c. Retention Period: We are unable to find the data retention period for Requirements R3 and R4. Instead, there are retention period requirements for R8 and R9, which do not exist. We urge the SDT and NERC to conduct a thorough and independent quality review for all standards posted for commenting and balloting to avoid unnecessary delays in approving standards due to these errors.
Response: a. "Other" was replaced by "adjacent" due to overwhelming response by the industry during the first posting. The SDT believes that notifications concerning Transmission Loading Relief are handled through a separate and distinct mechanism. No change made.		

Organization	Yes or No	Question 5 Comments
b**.** The definition of ***Wide Area*****:** The entire Reliability Coordinator Area as well as the critical flow and status information from adjacent Reliability Coordinator Areas as determined by detailed system studies to allow the calculation of Interconnected Reliability Operating Limits. The definition of ***Reliability Coordinator Area*****:** The collection of generation, transmission, and loads within the boundaries of the Reliability Coordinator. Its boundary coincides with one or more Balancing Authority Areas. The SDT maintains these terms are not synonymous. No change made. c. Data retention for Requirements R3 and R4 has been addressed. See summary for wording.		
Hydro-Quebec TransEnergie	No	Compliance section 1.2 : What is the rationale behind that modification? As proposed, the section doesn't give any useful information. That section should actually serve to list the actual processes that will be used for that particular standard. Or at least refer to the actual section of the ROP that lists the processes used (Appendix 4C, section 3.0). Associated Documents: The content of the white paper shouldn't be included in the standard. A reference with a hyperlink would be enough.
Response: The Compliance section is boilerplate language supplied by NERC. The SDT did not change this boilerplate language. The SDT will pass this comment on to NERC Legal. No change made. The SDT does not understand the comment as no white paper is included in this standard. No change made.		
Georgia Transmission Corporation South Carolina Electric and Gas	No	In R1.1, suggest adding “as identified in R1” at the end of the sentence to identify the criteria and process being addressed. Suggested Wording: “R1.1: Criteria and processes for notifications as identified in R1.” Suggests adding “may” before “impact adjacent Reliability Coordinator Areas” in M1 to match R1. Suggested Wording: “M1: Each Reliability Coordinator shall have available the latest approved documented version of its Operating Procedures, Operating Processes, and Operating Plans that require notifications, or the coordination of actions among impacted Reliability Coordinators for conditions or activities that may impact adjacent Reliability Coordinator Areas. This documentation

R2: No Comment

R3: No Comment

R4: No comment

R5: Duke Energy suggests the following revision: “Each Reliability Coordinator that identifies an Emergency in its Reliability Coordinator Area shall develop an action plan to resolve the Emergency during those instances where impacted Reliability Coordinators disagree on the existence of an Emergency.” We believe “identifies” is the appropriate wording.

R6: “Each impacted Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identifies the Emergency during those instances where Reliability Coordinators disagree on the existence of an Emergency,</td></tr>
</table>

Organization	Yes or No	Question 5 Comments
		unless such actions would violate safety, equipment, regulatory, or statutory requirements." We believe "identifies" is the appropriate wording.
Response: As Requirement R1, Part 1.1 is a sub-part of the general requirement, the SDT believes that the suggested change is not necessary. No change made. The SDT agrees and has made the suggested change. See summary for wording. The SDT agrees and has made the suggested change. See summary for wording.		
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	No	Southern agrees with the compliance assessment approach and note to the auditor in the RSAW and recommends that the SDT incorporate these concepts into the standard itself. The RSAW clearly recognizes that events / Emergencies have varying levels of significance. Southern continues to think the current definition of "Emergency" is too broad and is misused in standards development. This standard, and in particular requirements to notify neighboring RCs, should be focused more on issues that can truly impact them, not any situation that could be interpreted as an "Emergency" as it is currently defined. Southern recommends the SDT replace Emergency with Adverse Reliability Impact as it was before. If the SDT does not accept this recommendation, the SDT should consider modifying the requirements or even the definition of "Emergency" to incorporate the concept that an "Emergency" is an operating condition which has not been studied or for which no mitigation plan has previously been developed. For example, having a contingency occur which was studied and for which a post-contingency mitigation plan has been developed, communicated, and can be implemented prior to an SOL exceedance, is not an emergency even though it may require immediate manual action by an operator. Similarly, an IROL which can be mitigated prior to Tv as required by IRO-009 should not be considered an Emergency regardless of what actions the IRO-009-1, R1's Operating Process/Procedure/Plan requires. An Emergency should be limited to multi-element contingencies due to things like weather, differential relay operations, relay failures, etc. or to other unstudied states where a potential or actual SOL exceedance needs to be managed as quickly as possible.

Organization	Yes or No	Question 5 Comments
Response: Emergency is used as it is more inclusive which may lead to more communication. The possession of a mitigation plan does not mean an Emergency doesn't exist. In fact, the mitigation plan is in direct response to an identified Emergency. No change made.		
Northeast Power Coordinating Council Hydro One	No	The Rationale for Requirement R1 explains what review changes were made, and do not address the contents of the Requirements. The Rationale for Requirement R1 should be removed. Measure M1 reflects Part 1.5 not being removed. Why is Part 1.5 being removed? A RC should have the detailed authority. What Requirements does the Rationale on page 7 refer to? The replacement of the word "other" with "adjacent" may leave a reliability gap. Because the words "may impact" already serve as the qualifier for the RC to select who to notify, then the RC is not obligated to notify all RCs hence the scope of notification is finite. We urge the SDT to consider reinserting the word "other" into R1. The Drafting Team should review the use of the phrase "Wide Area" in IRO-008-2 (and other IRO standards) and the phrase "Reliability Coordinator Area" in IRO-014-3. If these phrases are synonymous, then use of one or the other should be decided upon. Regarding the Retention Period, there are no data retention periods for Requirements R3 and R4. Instead, there are retention period requirements for R8 and R9, which do not exist. We urge the SDT and NERC to conduct a thorough and independent quality review for all standards posted for commenting and balloting to avoid unnecessary delays in approving standards due to these errors. Suggest restoring the standard to its original wording.
Response: 1. The SDT agrees and has deleted the rationale box.		

Organization	Yes or No	Question 5 Comments
2. Requirement R1, Part 1.1.5 was deleted as the Reliability Coordinator's authority to act is implied. Measure M1 accurately reflects the requirement language. No change made. 3. Rationale on page 7 refers to Requirement R7 and why the language was added. 4. **"**Other" was replaced by "adjacent" due to overwhelming response by the industry during the first posting. The SDT believes that the wording is correct. No change made. 5. Definition of ***Wide Area*****:** The entire Reliability Coordinator Area as well as the critical flow and status information from adjacent Reliability Coordinator Areas as determined by detailed system studies to allow the calculation of Interconnected Reliability Operating Limits. Definition of ***Reliability Coordinator Area*****:** The collection of generation, transmission, and loads within the boundaries of the Reliability Coordinator. Its boundary coincides with one or more Balancing Authority Areas. The SDT maintains these terms are not synonymous. No change made. 6. Data retention for Requirements R3 and R4 has been addressed. See summary for wording.		
Texas Reliability Entity	Yes	Requirements R1 and R2: Texas RE requests the SDT consider whether including Same-Day Operations in the Time Horizon is appropriate. The measures for R1 and R2 are focused on the maintenance of the Operating Procedures, Operating Processes and Operating Plans and not on any specific same-day actions that need to be taken. Texas RE suggests that Same-Day Operations be removed from the Time Horizon for R1 and R2. The Time Horizon of Operations Planning is correct. If the SDT disagrees with the suggested removal of the Same-Day Operations Time Horizon then we request an explanation of why it is appropriate to include it.
Response: The measures simply reflect the language in the requirements and do not apply to any specific time horizon. The SDT believes that Same-day Operations is a valid time horizon for implementing Operating Procedures, Operating Processes, or Operating Plans. No change made.		
Peak Reliability	Yes	The new R4, R5, and R6 should also include "actual or expected Emergency" like R3.

Organization	Yes or No	Question 5 Comments
Response: Since Requirements R4, R5, and R6 follow Requirement R3 in logical and sequential order, the 'actual or expected' language is automatically included by default in the requirements following Requirement R3 and addition of that language would be superfluous. No change made.		
Seattle City Light	Yes	SCL appreciates the efforts of the Standard Drafting Team to increase clarity of the TOP and IRO Standards while generally reducing the burden of compliance documentation.

6. **The drafting team has proposed a new standard to address outage coordination concerns. Do you agree with the changes made to respond to industry comments to the new standard, IRO-017-1? If not, please provide technical rationale for your disagreement along with suggested language changes.**

Summary Consideration: The SDT has made the following non-substantive changes based on industry comments:

R1 Part 1.3. Define the process to evaluate the impact of Transmission and ~~generator~~generation outages within its Wide Area.

R2. Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator's outage coordination process.

R3. Each Planning Coordinator and Transmission Planner shall provide its Planning Assessment to impacted Reliability Coordinators. *[Violation Risk Factor: Medium] [Time Horizon: ~~Operations Planning~~Long-term Planning]*

Organization	Yes or No	Question 6 Comments
City of Austin dba Austin Energy (AE)	No	AE believes R3 and R4 are redundant with requirements in TPL-001-4. TPL-001-4, R8 provides a mechanism for any entity with a reliability need to obtain a copy of the Planning Assessment. Through this requirement, the RC could certainly make a case for receiving copies from the PC and TPs. TPL-001-4, R4 Part 4.1 provides a mechanism for coordination, as necessary. AE notes the SDT's response in comments, "The SDT believes that Requirements R3 and R4 could be incorporated into a future version of TPL-001, but due to timing, is recommending that these requirements should be kept in proposed IRO-017-1 until such a change occurs. The SDT has added revisions to approved TPL-001-4 Requirement R8 to a draft SAR for other possible changes to approved TPL-001-4 which is posted on the project web site as a supporting document." AE suggests these changes should all be considered under the TPL-001-5 SAR and not in a separate IRO-017-1 standard.
Response: The SDT disagrees, and notes that approved TPL-001-4 does not require sharing of Planning Assessments with the impacted Reliability Coordinator. The SDT continues to believe that including this requirement in proposed IRO-017-1 is necessary until a future revision of TPL-001-4. No change made.		

Organization	Yes or No	Question 6 Comments
Georgia Transmission Corporation	No	(1) GTC disagrees that outages are planned for the near term planning horizon (years 1 - 5). Outages are planned and scheduled within the operational planning horizon (up to year 1). The Planning Assessment only covers the near term and the long term planning horizons; it does not cover the operational planning horizon. Furthermore, the RC model can only include the current system that has been built and deals with real time parameters. They cannot grant outages on proposed planning solutions. The Planning Assessment does not provide any useful information for scheduling outages in the operations horizon. An outage request for construction of new stations, lines, or facility upgrades is what is required so that the RC can run a real-time assessment and grant approval for outages. R1 and R2 adequately cover the process to grant outages as they are requested, and sufficiently cover the purpose of this standard. GTC believes R3 and R4 are not necessary for outage coordination in the operations horizon and should be eliminated from this Standard. Additionally, the purpose statement should remove reference to Near-Term Transmission Planning Horizon.
Bonneville Power Administration	No	Regarding R4, Transmission Planning Assessments for the Near Term Planning Horizon do not consider outages that are less than one year in duration. If the transmission system is incapable of serving expected peak load during the Near Term Planning Horizon, current TPL standards and the future TPL-001-4 dictate Corrective Action Plans be undertaken and put in place. As currently written, R4 appears to be duplicative of TPL-001-4. BPA suggests R4 be rewritten to direct TOP and BA coordinate outages conflicts within the Operations Planning Horizon. BPA believes altering R4 in this fashion covers the reliability gap identified by the SW Outage Report, the IERP and FERC with respect to planning of outages. Additionally, this change will logically align R4 with R1.1.2, and R2, directing coordination between RC and TOP/BA.
Response: The SDT disagrees, and notes that some outages are planned over a year in advance. The SDT is intentional about including the Near-Term Transmission Planning Horizon for this reason. The SDT does recommend that proposed IRO-017-1		

Organization	Yes or No	Question 6 Comments
Requirements R3 and R4 be discussed as part of any future revisions of approved TPL-001-4 but does not have the scope to make such changes at this time. The SDT was tasked to address the FERC concern on how the industry is coordinating outages, in part related to pending generation retirements resulting from environmental legislation. One option the SDT considered was to expand the Operation Planning Horizon beyond the seasonal timeframe, which the SDT interprets as covering through Year 1. The SDT instead decided to leverage the existing TPL-001-4 Near-Term Planning Assessment, which occurs during the Near-term Transmission Planning Horizon (year 1 – 5) as opposed to creating an overlap between time horizons and mandating a separate analysis. No change made.		
Electric Reliability Council of Texas, Inc.	No	1. As an overarching comment, the proposed standard references both transmission and generation outages, but then appears to focus in on transmission outages. As a result, entities responsible for generation outages do not appear to be adequately addressed relative to potential obligations to comply with Reliability Coordinator processes that are developed. This oversight could have significant consequences and the standard should be reviewed to ensure that no gaps exist. At a minimum, those entities responsible for generator outages should be included under the Applicability Section as well as other applicable Requirements (e.g., Requirement R2). More specifically, during the last posting, ERCOT commented that the requirement for TOP and BA to coordinate outage plans is inappropriate since the BA does not develop outage plans or schedules; it only receives them from the Generator Owners and may suggest adjustments based on resource/demand/interchange assessments. The SDT's response suggests that these details would be elaborated in the process document and hence no changes were made. While ERCOT agrees that such details can be elaborated in the process document, Part 1.1.2 and other requirements should be expanded to include all appropriate entities to facilitate RC development of a workable and appropriate outage coordination process involving the correct entities. 2. ERCOT is unable to support Part 1.1.2 as written, and suggest the SDT to either revise it to remove the BA from it, or to expand it to include the facility owners

Organization	Yes or No	Question 6 Comments
		and/or operators. Corresponding changes will need to be made to Requirement R2 as discussed above. ERCOT respectfully notes that Requirement R1 requires some revisions to ensure clarity and ensure that the obligations imposed are clear and unambiguous. Specifically, the requirement indicates that Reliability Coordinators shall develop, implement, and maintain and outage coordination process. However, it does not define what maintenance shall be performed. R1. Each Reliability Coordinator shall develop and implement an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area. The outage coordination process shall: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] ERCOT believes “develop” in R1 is unnecessary and only creates confusion when auditing and enforcing. To implement and maintain addresses the reliability concept. Replace R1.5 “document and” with “maintain”, which is sufficient. Document is purely administrative. M1 infers a requirement by including “dated”. By having current specifications for outage analysis during the operations planning horizon should be sufficient in itself for compliance. If a date is required, it should be in the requirement. Additionally, it is noted that use of the term “define” may not adequately connote the level of detail expected regarding the documentation of the outage evaluation and coordination process referenced in sub-requirements R1.3 and R1.4. Accordingly, the following revisions are suggested: 3. ERCOT respectfully notes that Requirement R2 requires some revisions to ensure clarity and ensure that the obligations imposed upon participants in each Reliability Coordinator’s outage coordination process are clear and unambiguous. Accordingly, it is recommended that Requirement R2 be modified as follows: R2. Each Transmission Operator and Balancing Authority shall perform the roles, responsibilities, and activities assigned to its function in its Reliability Coordinator

Organization	Yes or No	Question 6 Comments
		outage coordination process. [Violation Risk Factor: Low Medium] [Time Horizon: Operations Planning] 4. ERCOT respectfully notes that TPL-001-4 already requires distribution of Planning Assessments to various entities. To ensure that all obligations related to Planning Assessments are clearly communicated and consolidated such that they are easily identified and fulfilled, it is recommended that Requirement R3 be deleted from IRO-017 and Requirement R8 within TPL-001-4 be reviewed for the necessary revisions.
Response: The SDT disagrees that Transmission outages are emphasized more than generation outages, and notes that the intention of this standard is to cover both. 1 & 2 - Since the requirement is for the outage coordination process document, the SDT does not consider it necessary to include an exhaustive list of entities, especially in the applicable entities section. Some of the comments appear to be based on the first draft posting of this standard which was subsequently changed. No change made. 3 – The SDT disagrees that a change to this language is necessary. No change made. 4 – The SDT does recommend that proposed IRO-017-1 Requirements R3 and R4 be discussed as part of any future revisions of approved TPL-001-4 but does not have the scope to make such changes at this time. The SDT was tasked to address the FERC concern on how the industry is coordinating outages, in part related to pending generation retirements resulting from environmental legislation. One option the SDT considered was to expand the Operation Planning Horizon beyond the seasonal timeframe, which the SDT interprets as covering through Year 1. The SDT instead decided to leverage the existing TPL-001-4 Near-Term Planning Assessment, which occurs during the Near-term Transmission Planning Horizon (year 1 – 5) as opposed to creating an overlap between time horizons and mandating a separate analysis. No change made.		
Northeast Power Coordinating Council Hydro One	No	"Operations Planning" in the Purpose is not defined in the NERC glossary and should not be capitalized. Regarding the Rationale and Time Horizon boxes on page 5: The words in the Rationale is appropriate for a guideline or announcement. It does not belong in a Rationale box.

Organization	Yes or No	Question 6 Comments
		Neither "Time Horizon" nor "Operations Planning Time Horizon" is in the NERC Glossary and should not be capitalized. If those terms are to be considered for inclusion in the NERC Glossary, then they should be included on the Definitions of Terms Used in Standard. The R1 wording "...within its Reliability Coordinator Area" should be removed. Part 1.4 refers to "...other Reliability Coordinators". The box "Note on part 1.5" does not belong in the standard. It is a comment response. "Near-Term Transmission Planning Horizon" is defined as "The transmission planning period that covers Year One through five." The Rationale for Requirement R4 should be revised to just address the "why", and justification for R4. During the last posting, we commented that the requirement for TOP and BA to coordinate outage plans is inappropriate since the BA does not develop outage plans or schedules; it only receives them from the Generator Owners and may suggest adjustments based on resource/demand/interchange assessments. The SDT's response suggests that these details would be elaborated in the process document and hence no changes were made. While we agree that such details can be elaborated in the process document, sub-Part 1.1.2 should be expanded to include facility owners in order for the RC to develop a workable and appropriate outage coordination process involving the correct entities. We are unable to support sub-Part 1.1.2 as written, and suggest the Drafting Team to either revise it to remove the BA from it, or to expand it to include the facility owners and/or operators. Corresponding changes will need to be made to Requirement R2.
Response: The SDT notes that the rationale boxes will be removed after approval and are purely for explanatory purpose during the standard drafting process. No change made.		

Organization	Yes or No	Question 6 Comments
While Time Horizon and Operations Planning Time Horizon are not defined terms in the NERC Glossary, the terms are used in standards in the Time Horizon section that follows every requirement. The rationale box where these terms appear will be removed after final balloting. No change made. R1 – The SDT disagrees and believes that the current language clarifies that the Reliability Coordinator's authority is limited to its Reliability Coordinator Area. However, coordination with neighboring Reliability Coordinators is important, as noted in Requirement R1 Part1.4. No change made. R1.1.2 and R2 – The SDT continues to believe that additional details can be provided in the outage coordination process document. No change made.		
Associated Electric Cooperative, Inc. - JRO00088	No	In R4, the OC Review Group suggests adding "on the BES" before "with planned outages" to clearly define the BES as the subject portion of the system. Suggested Wording: "R4: Each Planning Coordinator and Transmission Planner shall jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts on the BES with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon."
Response: The SDT believes that this change is unnecessary as standards are written for the BES unless stated otherwise. No change made.		
American Transmission Company, LLC	No	ATC requests the SDT to consider making the following modifications to the proposed Requirements R3 and R4: R3 - To be consistent with the "Long-term Planning" Time Horizon in Requirement R4 and due to Requirement R3's association with the long-term horizon Planning Assessments, ATC suggests that the Time Horizon for Requirement R3 be changed to "Long-term Planning." R4 - To be more consistent with paragraph 90 of the FERC NOPR and because the term "planned outages" has no specific NERC or industry-wide meaning, ATC suggests that the wording of "planned outages" in Requirement R4 be replaced with

Organization	Yes or No	Question 6 Comments
		"scheduled generation, transmission maintenance and transmission construction outages."
Response: R3 – The SDT agrees and has corrected the time horizon. R4 – The SDT believes that the term "planned outages" is sufficiently explanatory. No change made.		
IRC Standards Review Committee Independent Electricity System Operator	No	During the last posting, we commented that the requirement for TOP and BA to coordinate outage plans is inappropriate since the BA does not develop outage plans or schedules; it only receives them from the Generator Owners and may suggest adjustments based on resource/demand/interchange assessments. The SDT's response suggests that these details would be elaborated in the process document and hence no changes were made. While we agree that such details can be elaborated in the process document, Part 1.1.2 should be expanded to include facility owners in order for the RC to develop a workable and appropriate outage coordination process involving the correct entities. We are unable to support Part 1.1.2 as written, and suggest the SDT to either revise it to remove the BA from it, or to expand it to include the facility owners and/or operators. Corresponding changes will need to be made to Requirement R2.
Response: The SDT continues to believe that additional details can be provided in the outage coordination process document. No change made.		
Clark Public Utilities	No	I plan to vote affirmative but wanted to provide a suggestion. R3 is a requirement for the PC and TP to provide its Planning Assessment to the RC. I agree that this should be done, however, it is out of place in IRO-017. It should instead be included in the TPL-001 standard. Even if R3 is retained I encourage a process to eventually move it from IRO-017 to TPL-001.
Response: The SDT does recommend that proposed IRO-017-1 Requirements R3 and R4 be discussed as part of any future revisions of approved TPL-001-4 but does not have the scope to make such changes at this time. No change made.		

Organization	Yes or No	Question 6 Comments
Xcel Energy	No	R3 contains a requirement for the PC/TP to provide a copy of its assessment to the RC. This should be eliminated from this standard and merged into R8 of TPL that already requires the PC/TP to distribute the assessment with other entities. R4 - Planning Assessment performed as per TPL-001-4 is applicable to Long-term Planning time horizon (>12 months) and has no overlap with the Operations Planning time horizon (day-ahead to 12 months). Therefore, it is not clear how Planning Assessment would be an appropriate "tool" to address the outage coordination reliability objective in R4 in the Operations Planning time horizon.
Response: The SDT does recommend that proposed IRO-017-1 Requirements R3 and R4 be discussed as part of any future revisions of approved TPL-001-4 but does not have the scope to make such changes at this time. The SDT was tasked to address the FERC concern on how the industry is coordinating outages, in part related to pending generation retirements resulting from environmental legislation. One option the SDT considered was to expand the Operation Planning Horizon beyond the seasonal timeframe, which the SDT interprets as covering through Year 1. The SDT instead decided to leverage the existing TPL-001-4 Near-Term Planning Assessment, which occurs during the Near-term Transmission Planning Horizon (year 1 – 5) as opposed to creating an overlap between time horizons and mandating a separate analysis. No change made.		
Dominion Compliance Policy	No	In R2, the Dominion suggests changing the word "function" to "roles and responsibilities" to match R1 Suggested Wording: "R2: Each Transmission Operator and Balancing Authority shall perform the functions roles and responsibilities specified in its Reliability Coordinator outage coordination process."
Response: The SDT does not believe that the suggested change adds clarity. No change made.		
CenterPoint Energy Houston Electric LLC	No	In regards to Requirements R3 and R4, CenterPoint Energy feels the SDT has misinterpreted Paragraph 90 of the NOPR. CenterPoint Energy interprets the language in Paragraph 90 as speaking to the Reliability Coordinator's role in outage coordination in the operational planning horizon. Paragraph 90 mentions generation outages being scheduled 3-5 years in advance and transmission outages being scheduled 1-3 years in advance as part of the planning process. Paragraph 90

Organization	Yes or No	Question 6 Comments
		goes on to mention the need for the Reliability Coordinator, in operational planning, to re-evaluate these planned outages through "... a month-ahead, week-ahead, and sometimes even a day-ahead approval process." CenterPoint Energy does not interpret Paragraph 90 to involve the Reliability Coordinator in the 1-5 year Near Term Planning Horizon process, but to follow its outage coordination process developed in R1.3 and R1.4 to evaluate any previously planned outages within its Wide Area and coordinate resolutions of identified outage conflicts in the Operations Planning Horizon. CenterPoint Energy recommends deletion of Requirements R3 and R4.
MidAmerican Energy Company	No	MidAmerican understands the SDT's intent to include the RC in Near-Term planned outage solutions and reconciliations; however, we don't believe that the RC has the tools nor the ability to adequately consider outages that may be proposed up to five years from the present day. Any attempts for the TP or PC to jointly develop solutions with the RC for outages in this time frame would be ineffective. MidAmerican suggests the following language: Each Planning Coordinator and Transmission Planner shall provide notice to its respective Reliability Coordinator regarding identified conflicts with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon.
Response: The SDT disagrees, and believes that the Reliability Coordinator may have valuable input into the resolution of potential conflicts. The SDT has revised the rationale for Requirements R3 and R4 to point to the IERP recommendations as well as the FERC NOPR. No change made. However, the SDT does recommend that proposed IRO-017-1 Requirements R3 and R4 be discussed as part of any future revisions of approved TPL-001-4 but does not have the scope to make such changes at this time. The SDT was tasked to address the FERC concern on how the industry is coordinating outages, in part related to pending generation retirements resulting from environmental legislation. One option the SDT considered was to expand the Operation Planning Horizon beyond the seasonal timeframe, which the SDT interprets as covering through Year 1. The SDT instead decided to leverage the existing TPL-001-4 Near-Term Planning Assessment, which occurs during the Near-term Transmission Planning Horizon (year 1 – 5) as opposed to creating an overlap between time horizons and mandating a separate analysis. No change made.		

Organization	Yes or No	Question 6 Comments
PacifiCorp	No	PacifiCorp cannot agree to the proposed new standard without having an understanding of the “Reliability Coordinator outage coordination process”. Additionally, PacifiCorp needs to understand how the Reliability Coordinator will resolve identified outage conflicts. PacifiCorp cannot support the proposed change of the Violation Risk Factor in R3 from Low to Medium.
Response: The SDT believes that processes may differ in different areas, and therefore defers some specifics to the RC’s outage coordination process document. No change made. VRF responses are handled in Q11.		
CPS Energy	No	Propose the following: Strike “Near-Term Transmission Planning Horizon” from Purpose; TPL-001-4 R1.1.1 already requires the model to represent known outages of generation or Transmission Facilities with a duration of at least six months. If outages with a duration of less than six months are required, then this should be a revision to the TPL standard. Strike “4.5. Transmission Planner” from Applicability: All requirements related to the Transmission Planner are either redundant to the TPL-001-4 standard or should be incorporated therein. Strike all of requirement R3: This requirement is redundant to the TPL-001 R8 requirement, since for ERCOT, the Planning Coordinator is the same as the Reliability Coordinator. If it cannot be stricken, then there should be a qualifier that states “this requirement only applies if the Planning Coordinator is NOT the same as the Reliability Coordinator”. Otherwise, the Transmission Planner in the ERCOT system is subject to double-jeopardy regarding this standard and the TPL-001 standard. Strike all of requirement R4: If it is required that the Planning Coordinator, Transmission Planner and Reliability Coordinator all have to work together to jointly develop solutions for planned outages less than 6 months in duration, then this should be reflected in the TPL-001 standard. In general, introducing standards that impose requirements on the Planning Assessment should all be incorporated in the

Organization	Yes or No	Question 6 Comments
		TPL-001 standard as opposed to several disjointed standards, which creates confusion and possible redundant and double-jeopardy situations. Regarding R3 & R4, in general Paragraph 90 perspective is misinterpreted & should be limited to next day (not up to 1-year).
Oncor Electric Delivery LLC	No	Proposed Standard IRO-017-1 R3 states: "Each Planning Coordinator and Transmission Planner shall provide its Planning Assessment to impacted Reliability Coordinators." Oncor considers R3 to be a planning requirement that should not be included in IRO-017-1. This Requirement is redundant to approved Standard TPL-001-4 R8 and therefore is misaligned to the Paragraph 81 initiative Criteria B7 to eliminate redundant requirement. Oncor recommends the removal of IRO-017-1 R3.
Response: The SDT does not intend to imply changes to the approved TPL-001-4 outage inclusion criteria. Proposed IRO-017-1 Requirement R4 requires that any identified conflicts be resolved in coordination with the Reliability Coordinator. No change made. The SDT notes that approved TPL-001-4 does not specifically require communication of the Planning Assessment to the Reliability Coordinator, and therefore proposed IRO-017-1 Requirement R3 is not redundant. However, the SDT does recommend that proposed IRO-017-1 Requirements R3 and R4 be discussed as part of any future revisions of approved TPL-001-4 but does not have the scope to make such changes at this time. No change made.		
SPP Standards Review Group Kansas City Power & Light Colorado Springs Utilities	No	R2/M2 - Make Reliability Coordinator in Requirement R2 and Measure M2 possessive. The requirement should read '...in its Reliability Coordinator's outage coordination process.' R4 - To focus the coordination effort of the Reliability Coordinator on BES issues we recommend modifying the wording of R4 to state '...for identified issues or conflicts on the BES with planned outages...'
Response: R2/M2 – The SDT agrees with this comment and has update the language as suggested.		

Organization	Yes or No	Question 6 Comments
R4 – The SDT does not believe this change is necessary as all standards are written for the BES unless stated otherwise. No change made.		
Salt River Project	No	Salt River Project (SRP) has a general concern with the R1 requirement for the Reliability Coordinator to develop, implement and maintain an outage coordination process for generation and Transmission outages. Specifically, SRP is concerned if the RC will have the ability to approve or deny outages.
Response: The Reliability Coordinator already has approval authority and responsibility to cancel planned outages in order to address reliability. Proposed IRO-017-1 Requirement R1 requires the Reliability Coordinator to have an outage coordination process that defines roles and responsibilities for outage coordination within its Reliability Coordinator area. No change made.		
South Carolina Electric and Gas	No	In R2, the OC Review Group suggests changing the word “function” to “roles and responsibilities” to match R1. Suggested Wording: “R2: Each Transmission Operator and Balancing Authority shall perform the functions roles and responsibilities specified in its Reliability Coordinator outage coordination process.” In R4, the OC Review Group suggests adding “on the BES” before “with planned outages” to clearly define the BES as the subject portion of the system. Suggested Wording: “R4: Each Planning Coordinator and Transmission Planner shall jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts on the BES with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon.”
Response: The SDT does not believe that the suggested change adds clarity. No change made. R4 – The SDT does not believe this change is necessary. No change made.		
New York Independent System Operator (NYISO)	No	See IRC/SRC Comments. The NYISO also would like to suggest the in R1, generation be replaced with generator to be consistent with R1.1.3

Organization	Yes or No	Question 6 Comments
Response: See IRC/SRC response. The SDT agrees that the language should be consistent and has changed Requirement R1 Part 1.1.3 to 'generation'. See summary for wording.		
Puget Sound Energy	No	The effective date for requirements R1 and R2 should be staggered (similar to the drafting team's approach to requirement R1 and R2 of IRO-010-2). It will be very difficult for a BA or TOP to comply with the RC's outage process if that process is finalized on or near the effective date for requirement R2. Requirement R2 is too broad and should be limited to "performing the applicable functions" of the RC's outage coordination process. In addition, what will happen in the case that the RC specifies deadlines or processes that a BA or TOP cannot meet or requirements that are unrelated to outage coordination? To address this issue, in part, the RC should be required to collaborate with the BAs and TOPs in its area during the development of and revisions to the outage coordination process. This may not address all the issues that could arise, but would at least provide BAs and TOPs with time to address shortcomings in their processes prior to incurring a standard violation.
Response: The SDT disagrees that a staggered approach is needed. These items are not going to be created in a vacuum and the SDT believes that the entities involved will be coordinating as the process is developed. No change made. R2 – The SDT does not believe that the suggested change adds clarity. No change made.		
Flathead Electric Cooperative, Inc.	No	This standard seems unnecessary and I do not support it. The obligations are already covered in other standards.
Response: The SDT disagrees and believes that this standard addresses currently existing gaps. The SDT does recommend that proposed IRO-017-1 Requirements R3 and R4 be discussed as part of any future revisions of approved TPL-001-4 but does not have the scope to make such changes at this time. No change made.		

Organization	Yes or No	Question 6 Comments
Lincoln Electric System	No	To ensure the distribution of the Planning Assessment is tied to a reliability-related need, recommend modifying Requirement R3 as follows to reflect similar provisions already included in Requirement R4.R3. Each Planning Coordinator and Transmission Planner shall provide its Planning Assessment to impacted Reliability Coordinators when issues or conflicts are identified with planned outages in the Near-Term Transmission Planning Horizon.
NV Energy	No	We understand the SDT's intent to include the RC in Near-Term planned outage solutions and reconciliations; however, we don't believe that the RC has the tools nor the ability to adequately consider outages that may be proposed up to five years from the present day. Any attempts for the TP or PC to jointly develop solutions with the RC for outages in this time frame would be ineffective. We suggest the following language: Each Planning Coordinator and Transmission Planner shall provide notice to its respective Reliability Coordinator regarding identified conflicts with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon.
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	Yes	Southern believes that Requirement 4 should provide clear guidance that the Planning Coordinator and Transmission Planner are responsible for initiating the review of solutions with their Reliability Coordinator and additional language should be added to clarify that the joint discussions should only be focused on issues that may impact the Operations Planning Horizon. Southern proposes the following revision to the requirement: "Each Planning Coordinator and Transmission Planner shall coordinate with its respective Reliability Coordinator to jointly develop solutions for identified issues or conflicts with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon, which may ultimately impact the Operations Planning Horizon."

Organization	Yes or No	Question 6 Comments
MRO NERC Standards Review Forum	Yes	To ensure the distribution of the Planning Assessment is tied to a reliability-related need, recommend modifying Requirement R3 as follows to reflect similar provisions already included in Requirement R4.R3. Each Planning Coordinator and Transmission Planner shall provide its Planning Assessment to impacted Reliability Coordinators when issues or conflicts are identified with planned outages in the Near-Term Transmission Planning Horizon.
Response: The SDT does not believe there is harm in requiring that the Planning Assessment be shared with impacted Reliability Coordinators, even if no outage conflicts are identified. No change made.		
Duke Energy	No	While we are open to the suggestions made by the SDT, if the scope of RC is going to be expanded, we believe revisions to the Function Model need to occur first and then distributed to the industry for review and approval. The Functional Model is the foundation for the development of Reliability Standards used by Standard Drafting Teams. As indicated above, these revisions to the Functional Model need to occur first before a substantial change in roles and responsibilities of Functional Entities take place within the standards. R1: No comments R2: Duke Energy suggests the following revision: "Each Transmission Operator and Balancing Authority shall perform the roles and reporting responsibilities specified in its Reliability Coordinator outage coordination process." The use of "roles and reporting responsibilities" in the place of "functions" better aligns with the language used in R1.1 of the proposed standard. R3: No comments R4: Duke Energy suggests the following revision: "Each Planning Coordinator and Transmission Planner shall jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts on the BES with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon." We believe "identified issues or conflicts on the BES" better aligns with the intent of this

Organization	Yes or No	Question 6 Comments
		requirement and adds clarity that the RC, PC, and TP will jointly develop solutions for conflicts on the BES.
Response: The SDT does not believe that the functional model needs to be revised prior to approving these changes. R2 – The SDT does not believe that the suggested change adds clarity. No change made. R4 – The SDT does not believe this change is necessary. No change made.		
BC Hydro		The requirements as stated can be interpreted as the RC defines coordination processes and activities, and the TOP's and BA's follow. The responsibility for coordination should reside with the TOP's and BA's, in order to manage system and regional impacts of outages. Transmission Operators and Balancing Authorities that already have coordination processes for managing outages within their jurisdictions and with neighbors, would have added requirements, however such practices are already well developed, taking into account standards, mutually agreed requirements and special needs of participants, in addition to system wide needs for communication to support assessments. Under TOP-002-2.1b, R1 and R4, Transmission Operators and Balancing Authorities are already required to coordinate, current-day, next-day and seasonal planning and operations which implies the requirement for outage coordination. While TOP-003-1 R2 and R3 provides more specific and explicit requirements to coordinate outages of voltage regulating equipment and telemetering and control equipment, it does not address the coordination of generation and transmission equipment. While TOP-003 may not (in current form) be comprehensive in its inclusion of equipment types for coordination, TOP-003 however should be the place to identify requirements for coordination of transmission and generation outages. R1 states requirements to convey outage information, but is silent on coordination. However, a revision to TOP-003 standard could place the requirements for determining coordination activities in the TOP's and BA's responsibilities. Nowhere in the IRO-017 is there a requirement for the RC to collaborate with the TOP and BA on defining processes to evaluate impact of outages, or the development of specifications for outage

Organization	Yes or No	Question 6 Comments
		analysis. An RC driven coordination process does not account for differences and needs of TOP's and BA's, that have greater and/or mutual needs for practices not prescribed by RC needs. The requirements provide prescription that only addresses RC needs; involvement of governance (through the RRA involvement), collaboration, and emphasis on continuous improvement of processes would set a better standard, by requiring collaboration in the development of process requirements. The focus of IRO-017 should be on submission of outage information to support RC processes, including timelines for the submission of outages, practices for the communications of outages among the RC, TOP's and BA's responsibility for assessment of system wide conflicts through study assessment, and development of conflict resolution processes to support operations
Response: These requirements were developed in response to IERP recommendations. The SDT believes that processes may differ in different areas, and therefore defers specifics to the Reliability Coordinator's outage coordination process document. The Transmission Operators and Balancing Authorities should participate in the development of the Reliability Coordinator outage coordination process. The SDT sees no conflicts with a Transmission Operator/Balancing Authority process as long as it is coordinated with the Reliability Coordinator process. No change made.

Response: Thank you for your support.

7. **Do you agree with the changes made to respond to industry comments to proposed TOP-001-3? If not, please provide technical rationale for your disagreement along with suggested language changes.**

Summary Consideration: The SDT deleted 'Operations Planning' from all time horizons concerning Operating Instructions as Operating Instructions are issued in Real-time environments.

The SDT has made the following changes due to industry comments:

R1. Each Transmission Operator shall act~~, or direct others to act by issuing Operating Instructions,~~ to ~~ensure~~address the reliability of its Transmission Operator Area via direct actions or by issuing Operating Instructions.

R2. Each Balancing Authority shall act~~, or direct others to act by issuing Operating Instructions,~~ to ~~ensure~~address the reliability of its Balancing Authority Area via direct actions or by issuing Operating Instructions.

R7. Each Transmission Operator shall assist other Transmission Operators, if requested and able, provided that the requesting entity has implemented its ~~e~~Emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements.

R8. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known ~~other~~ impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency.

R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected ~~NERC registered~~ entities of sustained outages of telemetering ~~equipment,~~and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities.

M9. Each Balancing Authority and Transmission Operator shall make available upon request, evidence that it notified its Reliability Coordinator and impacted interconnected ~~NERC registered~~ entities of ~~planned~~ sustained outages of telemetering ~~equipment,~~and control equipment, monitoring and assessment capabilities, and associated communication channels . Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Balancing Authority or Transmission Operator may provide an attestation.

R10. Each Transmission Operator shall monitor the following as necessary for determining SOL exceedances in its Transmission Operator Area:

10.1 Within its Transmission Operator Area:

10.1.1 Facilities,

10.1.2 ~~t~~The status of Special Protection Systems, and

10.1.3 ~~sub-100 kV facilities~~Non-BES facilities identified as necessary by the Transmission Operator ~~, within its Transmission Operator Area~~

and

10.2 Within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator:

10.2.1 Facilities,

10.2.2 Status of Special Protection Systems, and

10.2.3 Non-BES facilities.

R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, ~~to ensure~~in order for ~~that~~ it ~~is~~to be able to perform its reliability functions.

R15. Each Transmission Operator shall inform its Reliability Coordinator of ~~its~~ actions taken to return the system to within limits when a SOL has been exceeded.

R16. Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunication, and ~~Real-time Assessment~~analysis capabilities.

R18. Each Transmission Operator ~~and Balancing Authority~~ shall ~~always~~ operate to the most limiting parameter in instances where there is a difference in SOLs.

R19. Each Transmission Operator shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Transmission Operator Area~~(Balancing Authority Area)~~.

R20. Each Balancing Authority shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its ~~Transmission Operator Area (~~Balancing Authority Area~~)~~.

The SDT has made the following non-substantive changes to other standards for consistency:

TOP-003-3 Requirement R1 Part 1.1: A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including ~~sub-100 kV~~non-BES data and external network data as deemed necessary by the Transmission Operator.

IRO-001-4 Requirement R1: Each Reliability Coordinator shall act~~, or direct others to act, by issuing Operating Instructions,~~ to ~~ensure~~address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions.

IRO-002-4 Requirement R3: Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and ~~sub-100 kV~~non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

IRO-010-2 Requirement R1 Part 1.1: A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including ~~sub-100 kV~~non-BES data and external network data, as deemed necessary by the Reliability Coordinator.

Organization	Yes or No	Question 7 Comments
City of Austin	No	City of Austin dba Austin Energy (AE) supports the streamlining effort and removal of redundant requirements. However, AE offers the following comments: (1) AE continues to disagree with the change to R1, which removes the "responsibility and clear decision-making authority" language from the previous standard. AE believes the authority language provides clarity and substance in an easily recognizable format. AE believes the remaining requirements in the TOP/IRO families instruct the TOP to "act, or direct others … to act" while providing more specificity regarding such actions. In this way, R1, as proposed, is redundant and difficult to demonstrate from a compliance perspective given its general nature. (2) AE understands the SDT's intent in including the Operations Planning time horizon with respect to Operating Instructions is to cover the concept of "next day directives" previously in IRO-004-2. However, IRO-004-2, as written is limited to RC directives. AE suggests the SDT remove the Operations Planning Horizon from R1. (3) R9 is too broad a scope to be useful. The phrase "…outage of telemetering equipment, control equipment, monitoring and assessment capabilities and associated communication channels…" is all encompassing. If each BA or TOP were to contact the RC every time there was the slightest glitch with telemetering or every time an ICCP link or microwave channel was cycled for maintenance or some type of momentary signal fade, the RC's phone would be ringing continually. The intent of

Organization	Yes or No	Question 7 Comments
		this requirement is to be sure all entities are aware of a loss of situation awareness. This risk associated with this is not of a momentary nature and a time qualifier should be used. Using the 30 minute time requirement that is used for R13 is sufficient to meet the intent. See suggested wording below: Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected NERC registered entities of outages of equipment or assessment capabilities that prevent Real-time Assessment for 30 minutes. (4) R19 and R20 are redundant with existing COM standards. They will remain redundant when future COM standards come into effect. AE requests the SDT remove these added requirements from TOP-001-3.
Response: (1) The SDT disagrees that such a requirement is still needed in today's environment. However, the SDT has revised the wording of Requirements R1 and R2 to provide clarity. See summary for wording. (2) The SDT has removed Operations Planning from the time horizon of all requirements dealing with Operating Instructions as those instructions are Real-time oriented. (3) The SDT believes that the use of the term 'impacted' obviates any concern for momentary outages or glitches as such problems would be unlikely to impact other entities. No change made. (4) The SDT does not agree that Requirements R19 and R20 are redundant with anything in the proposed COM standards. No change made.		
South Carolina Electric and Gas	No	With regard to R13, we understand and support the need to do real-time assessments at least once every 30 minutes to avoid being in an unstudied state. However, if significant SCADA losses occur or an ICCP link is lost to a neighboring BA/TOP, the State Estimator solution can be affected to such a degree that a real-time assessment, with real-time data, may not be possible within 30 minutes. While this does not happen often, it does occur on occasion, but the requirement allows for NO exceptions to the 30 minute requirement. (As an example. the MOD-001 standard

Organization	Yes or No	Question 7 Comments
		allows for a certain number of hours that ATC may not be recalculated without being in non-compliance).
Response: The requirement allows for an entity to arrange for another entity to perform the assessment which aligns with requirements in approved EOP-008-1. Approved EOP-008-1 specifically requires entities to have tools and applications to ensure that System Operators have situational awareness of the BES. It goes on to require that entities take necessary actions to manage the risk to the BES during periods when primary or backup functionality may not be available. This requirement isn't about maintaining RTCA or any other specific tool, it's about maintaining situational awareness at all times. For the specific example cited in the comment, the SDT believes that entities have several different methods for resolving the situation. One (and the preferred method) is to notify whomever is cited as providing capabilities pursuant to approved EOP-008-1 and let that entity take over the analysis. Another possible route to take would be to have the operator do an assessment of the system. This could involve the operator studying the Real-time data, the alarm subsystem, system topology, etc., to see if anything has changed since the last assessment. The operator could also call out to other Transmission Operators and the Reliability Coordinator to see if they have noticed anything through scans or analysis that should be taken into account. Once the operator has done this, he/she could provide an assessment of the situation using their professional judgment and chart a course of action as necessary or simply 'certify' that everything is status quo from the last Real-time Assessment. The operator should then communicate the findings as appropriate while recording this information, as well as an indication as to how the assessment was made, in the Operator Log. While the SDT believes this approach is less than optimal, and can't be sustained for a long period, as long as the system hasn't significantly changed, it should be acceptable for a period to cover a short-term 'glitch'. No change made.		
Dominion Compliance Policy	No	While Dominion acknowledges the SDT's consideration of its comments relative to inclusion of the phrase 'sub-100 kV facilities' it still disagrees with the SDT's decision to retain it in this requirement for the reasons previously stated. R9 states:"R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and negatively impacted interconnected NERC registered entities of outages of telemetering and telecommunication equipment, control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities." To be consistent with IRO-008-2 R4, where

Organization	Yes or No	Question 7 Comments
		'NERC registered' has been struck (also struck in TOP-002-4), Dominion suggests 'NERC registered' also be struck in R9 in TOP-001-3.
Response: The SDT has replaced the wording of the requirement to replace 'sub-100 kV' with the term 'non-BES facilities' to clarify the drafting team's intent. The SDT believes that the non-BES terminology must be maintained in order for the SDT to be responsive to the FERC NOPR, SW Outage Report recommendations, and the IERP recommendations. This non-substantive clarifying change has been made in several other standards for consistency purposes – TOP-003-3, IRO-002-4, and IRO-010-2. The SDT has also re-structured the requirement for greater clarity. See summary for wording. The SDT has eliminated 'NERC registered' from the requirement for consistency. See summary for wording.		
ACES Standards Collaborators	No	(1) The applicability section needs to be revised to remove the Load Serving Entity. The Risk Based Registration project will retire the LSE from Appendix 5B from the NERC Rules of Procedure. Having the LSE listed as an applicable entity leads to confusion and questions. For example, a reviewer of this standard could question how the RBRAG could arrive at the conclusion that LSE is not needed for reliability but this drafting team apparently determined it was needed for reliability by including it in the standard. At the very least, if the SDT is not intending to contradict the RBRAG's finding's a rationale box should state that LSE is only being included for historical purposes and will be removed pending the final approval of the RBRAG recommendations by the NERC Board of Trustees. (2) Requirement R1 should be revised by removing the words "direct others to act" and stating that the TOP shall issue Operating Instructions to ensure reliability of its TOP Area. The actions taken by an RC to direct others to act is inherent in the definition of Operating Instruction and is redundant with the language in the requirement. This additional clause is wordy and may not fully capture what the drafting team is trying to achieve. By stating that the TOP shall act or direct others to act by issuing an Operating Instruction, the TOP is limited to only this option. We recommend alternative language for this requirement, "Each TOP shall act or issue Operating Instructions to ensure reliability of its TOP Area."

Organization	Yes or No	Question 7 Comments
		(3) Requirement R1's language of requiring the RC to "ensure reliability" could be used as a zero defect standard if there is an event. "Each RC shall act or issue Operating Instructions in accordance with its responsibilities as a RC of its RC Area." Requirement R2 should be revised by removing the words "direct others to act" and stating that the BA shall issue Operating Instructions to ensure reliability of its BA Area. The actions taken by an RC to direct others to act is inherent in the definition of Operating Instruction and is redundant with the language in the requirement. This additional clause is wordy and may not fully capture what the drafting team is trying to achieve. By stating that the BA shall act or direct others to act by issuing an Operating Instruction, the BA is limited to only this option. We recommend alternative language for this requirement, "Each BA shall act or issue Operating Instructions to ensure reliability of its BA Area." (4) Requirement R2's language of requiring the RC to "ensure reliability" could be used as a zero defect standard if there is an event. "Each RC shall act or issue Operating Instructions in accordance with its responsibilities as a RC of its RC Area." (5) Requirements R3, R4, R5 and R6 should be revised to remove the LSE function. (6) For Requirements R10 and R11, we recommend changing the term "Special Protection System" to "Remedial Action Scheme" because the SDT Project 2010-05.2 has determined that RAS is more appropriate and SPS will be retired upon FERC approval. This standard would potentially have an outdated glossary term if it keeps SPS in the requirement. (7) Requirement R10 is also problematic because it lists sub-100 kV transmission equipment as being subject to a standard. Sub-100 kV transmission equipment are not subject to reliability standards unless they are deemed to be a part of the Bulk Electric System. A simple solution would be to remove the clause "including sub-100 kV facilities needed to make this determination." If these sub-100 kV facilities are needed for reliability they would be part of the BES inclusion process and would be covered by the NERC defined term "Facilities."

Organization	Yes or No	Question 7 Comments
		(8) We appreciate the clarification that Requirement R13 is not intended to require a Transmission Operator to have state estimation and real-time contingency analysis. We recommend revising the RSAW to ensure that auditors will review events to avoid this standard being zero defect. (9) We appreciate the clarification for Requirement R18 that derived limits are SOLs and have removed the GOP from this requirement. (10) Requirements R19 and R20 have a parenthetical (Balancing Authority Area) that should be removed to avoid confusion. If both TOP Area and BA Area are intended, please list both without parentheses.

Response: 1. As previously stated, the Load-Serving Entity will be removed from all pertinent standards and requirements when the registration project is completed and approved. This activity will be a separate endeavor and will encompass all pertinent standards. The SDT does not believe that leaving the Load-Serving Entity in the applicability of these standards will cause any confusion. No change made.

2. The SDT agrees and has revised the wording of the requirement. A corresponding change was made to Requirement R2 for consistency. See summary for wording.

3 & 4. The SDT has revised the requirement to delete 'ensure' and replace it with 'address' as in the first posting. See summary for wording.

5. See response to item 1.

6. As previously stated, if the change in term is approved, there will be a project to go through all of the applicable standards to make the needed correction. No change made.

7. Due to this comment and those of others, the SDT has revised the wording of the requirement to replace 'sub-100 kV' with the term 'non-BES facilities' to clarify the drafting team's intent. The SDT believes that the non-BES terminology must be maintained in order for the SDT to be responsive to the FERC NOPR, SW Outage Report recommendations, and the IERP recommendations. This non-substantive clarifying change has been made in several other standards for consistency purposes – TOP-003-3, IRO-002-4, and IRO-010-2. The SDT has also re-structured the requirement for greater clarity. See summary for wording.

8. The SDT recognizes your comment and will forward the comment to the responsible party.

Organization	Yes or No	Question 7 Comments
9. Thank you for your support. 10. The SDT has corrected the typo in requirements R19 and R20. See summary for wording.		
Georgia Transmission Corporation	No	(1) The current proposal for R3 and R5 as written could overly expose the DP and LSE excess compliance obligations for routine switching operations performed on a daily basis which are not performed to “ensure the reliability” of the BES, such as scheduled outages for maintenance items and new construction, etc. The DP and LSE implement Operating Instructions on non-BES equipment on a routine basis, but the implementation of Operating Instructions on BES or non-BES equipment “to ensure the reliability of the BES” is not very routine. Based on the stated purpose of the standard, GTC believes this requirement for the DP/LSE should complement COM-002-4 R6 relating to Operating Instructions during an Emergency “affecting the reliability of the BES”. We believe that the use of the NERC term “Emergency” would properly capture the stated intent of this standard. GTC proposes the language “[during an Emergency]” be added after “....shall comply with each Operating Instruction issued by its Transmission Operator(s) [during an Emergency] “. Based on the stated purpose (which we believe is adequately captured by the use of the term “Emergency”), at a minimum, Operating Instructions issued to ensure the reliability of the BES should be the only Operating Instructions covered by this standard (as was done in R1 and R2). As is currently written Operating Instructions for scheduled outages associated with maintenance items and new construction will also be in scope which conflicts with the stated purpose of this standard. (2) Based on the functional model, the TOP is responsible for the Real-time operating reliability of its Area and has the authority to ensure that its TOP Area operates reliably. Thus, it is clear to us that part of the job of the TOP and/or BA to ensure that the Operating Instructions they issue are performed. Recipient entities such as the DP would rely on the TOP or BAs voice recordings as evidence which is duplicative to what the TOP or BA is already collecting. We would suggest the following:R3: Each Transmission Operator is to verify each Operating Instruction it issues as a part of R1 is completed, unless informed that such action cannot be physically implemented or

Organization	Yes or No	Question 7 Comments
		it would violate safety, equipment, regulatory, or statutory requirements. R4: Each Balancing Authority is to verify each Operating Instruction it issues as a part of R2 is completed, unless informed that such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. An additional benefit to writing the requirements in this manner is a substantial reduction in redundant administrative record-keeping. TOPs and BAs will already be collecting such information as a part of R1 and R2, so requirements along the lines of those proposed above would provide the additional benefit of preventing duplication of records between multiple entities, keeping records of these Operating Instructions performed with the TOP and BA.
Response: (1) The purpose of the standard is to prevent instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Interconnection by ensuring prompt action to prevent or mitigate such occurrences. It is not practical for Transmission Operators to direct switching on the distribution system to prevent such occurrences. However, Transmission Operators would direct Distribution Providers and Load-Serving Entities to perform functions identified in the Functional Model, such as Load shed or voltage reduction to prevent or mitigate such occurrences. The SDT does not believe that the present wording of the requirement places any entity in undue jeopardy or strays from the stated purpose of the standard. The SDT does not believe that constraining the requirement to only be applicable during Emergencies is a viable alternative. Non-Emergency situations can lead to Emergencies and the purpose of issuing an Operating Instruction during those non-Emergency situations is to avoid potential Emergencies down the road. No change made. (2) The SDT does not agree that the responsibility for monitoring these activities should be the sole responsibility of the Transmission Operator or Balancing Authority. Consistent with responsibilities defined in the Functional Model, Distribution Providers and Load-Serving Entities would also need to maintain evidence of such mitigation action as Load shed or voltage reduction. No change made.		
Texas Reliability Entity	No	1) Requirement R8: Texas RE disagrees with the addition of the word “known” to impacted TOPs and BAs. Within the interconnected system, a TOP may not always know who is impacted. It would be prudent to also notify TOPs who may be impacted. We suggest the SDT keep the original language “impacted Transmission Operators.” Requirement R9 did not add “known” to the phrase “impacted interconnected NERC registered entities” which is inconsistent with R8. Texas RE

Organization	Yes or No	Question 7 Comments
		recommends that R8 and R9 should be consistent when the SDT determines if "known" should be included or not. 2) Requirement R9, M9 and R9 VSL: Suggest the SDT remove "NERC registered" to be consistent with other standards in this project. 3) Requirements R9 and M9: The two paragraphs need to be consistent and cover both planned and unplanned outages. Texas RE recommends changing the two paragraphs so that "outages" is preceded by "planned and unplanned." 4) Requirement R10: The use of the term "within its Transmission Operator Area" in R10 may lead to potential conflicts and reliability gaps, specifically for monitoring of SPS's. For example, an SPS owned by a GO/GOP would not have to be monitored by a TOP since it is not within its Transmission Operator Area (i.e. the generator is not a "Transmission" asset per the definition), even though the operation or misoperation of the SPS may lead to SOL violations within the TOP area. Texas RE suggests clarifying language be added by the SDT to assure that a TOP monitors all facilities and Special Protection Systems within its area; not just those that fall under the definition of transmission asset. 5) Requirement R10: Texas RE requests that the SDT consider replacing the term "sub-100 kV" with "non-BES" to be more inclusive of those facilities where data or monitoring may be needed. For instance, the RC may choose to monitor private use networks or radial lines connected to large loads/generation connected at greater than 100 kV but are excluded from the BES, in addition to sub-100 kV facilities. This change would not be needed if it is the intent of the SDT that the reference to "sub-100 kV" facilities is for those facilities that have been intentionally included in the BES due to their criticality. The SDT may also consider modifying the language to state "identified as necessary by the Transmission Operator or Reliability Coordinator." 6) Requirements R13, R14, R15: Texas RE requests the SDT consider whether there should be a similar requirement for a BA to perform a Real-time Assessment. The following questions are submitted to assist the SDT's assessment of our request. In

Organization	Yes or No	Question 7 Comments
		real-time, how will a BA control frequency or know if it is experiencing or about to experience a capacity emergency unless it is performing such an assessment? For R14, how does the BA initiate its Operating Plan for an EEA unless it sees a capacity deficiency through a Real-time Assessment? For R15, how does the BA notify the RC of a capacity emergency unless it sees a capacity deficiency through a Real-time Assessment? 7) Requirement R19: The term "(Balancing Authority Area)" appears to be a typo and should be removed. 8) Requirement R20: The term "Transmission Operator Area (Balancing Authority Area)" appears to be a typo and should be replaced with "Balancing Authority Area."

Response: 1) The SDT added the term 'known' based on industry feedback for the exact reasons Texas Reliability Entity is requesting the term to be removed. The addition of the term 'known' reinforces that the Transmission Operator only needs to notify Transmission Operators/Balancing Authorities that are recognized as being impacted through the analysis functions it is performing. However, the SDT has removed 'other' for consistency and clarity.

2) VSL comments are handled in q11.

3) The SDT agrees and has revised the wording to eliminate 'planned' from the Measure which means that both planned and unplanned outages are included. See summary for wording.

4) The SDT believes that the Special Protection System cited would be considered a transmission asset regardless of ownership and would be monitored by the Transmission Operator as part of this requirement. However, the SDT has modified Requirement R10 based on industry feedback for clarity. See summary for wording.

5) Due to this comment and those of others, the SDT has revised the wording of the requirement to replace 'sub-100 kV' with the term 'non-BES facilities' to clarify the drafting team's intent. The SDT believes that the non-BES terminology must be maintained in order for the SDT to be responsive to the FERC NOPR, SW Outage Report recommendations, and the IERP recommendations. This non-substantive clarifying change has been made in several other standards for consistency purposes – TOP-003-3, IRO-002-4, and IRO-010-2. The SDT has also re-structured the requirement for greater clarity. See summary for wording.

6) The SDT does not believe that the Balancing Authority can perform a Real-time Assessment given the proposed definition. Nor does the SDT believe that the Balancing Authority needs to perform a special assessment in order to fulfill its responsibilities. There

Organization	Yes or No	Question 7 Comments
are mechanisms already in place in the BAL standards that allow the Balancing Authority to monitor and react to the proposed situations. In addition, the Reliability Coordinator and Transmission Operator would be monitoring the system and coordinating with the Balancing Authority as needed. No change made. 7) & 8) The SDT has corrected the typo in requirements R19 and R20. See summary for wording.		
Independent Electricity System Operator	No	a. During the last posting, we expressed a concern over the ambiguity in R9 as the phrase "between the affected entities" can be interpreted as any two entities (external to the one who is notifying others) that are affected by the outages of telemetering and telecommunication equipment, control equipment, monitoring and assessment capabilities, and associated communication channels. To clarify the intent of the requirement, we suggest R9 be revised to: R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected NERC registered entities of outages of telemetering equipment, control equipment, monitoring and assessment capabilities, and associated communication channels between THEM AND the impacted entities b. We do not have any concerns or comments on R19 and R20, which are added to address data exchange requirement and to achieve consistency with the proposed IRO-002-4, Requirement R2. However, we suggest that the SDT add Requirement R20 to the NERC issue data base along with requirements R2, R5, R6, R11, and R17 which the SDT agrees with our previous comment that these requirements belong to the BAL standards and hence a future assessment of creating such a BAL standard will be conducted.
Response: a. The SDT does not agree with the commenter's interpretation of the requirement wording and believes that it is clearly stated that the communication is only between the affected entities. No change made. b. The SDT has already made NERC management aware of the need for a future project to separate the Transmission Operator and Balancing Authority requirements into separate standards.		

Organization	Yes or No	Question 7 Comments
Associated Electric Cooperative, Inc. - JRO00088	No	R1 and R2: The current language in TOP-001 R1 and R2 has further expanded the applicable use of operating instructions encompassing all individuals to the point where the compliance risk of the requirement is not appropriately weighted with the benefit to reliability. R3 and R4 state that only the registered entities identified must comply with OI; they do not state that registered entities identified are the only entities that can receive OI. Therefore, without the lack of specificity in R1 and R2 (or in R3 and R4) to whom OI can be issued to, the standard now requires three point communication to any party or entity for actions that will affect the BES, even though that entity (unless identified in R3 and R4) does not have to comply. Although the NERC functional model states to whom a BA and TOP can direct, this is not referenced or mentioned in the standard, and must be inferred by not only the entity maintaining compliance, but also the individual performing an audit. It would seem very beneficial to specify this assumption within R1 and R2. Suggested Wording: R1 and R2: "Each Transmission Operator (Balancing Authority) shall act, or direct others (referenced in R3 and R4) to act by issuing Operating Instructions, to ensure the reliability of its Transmission Operator (Balancing Authority) Area." AECI agrees with SPP comments regarding R10:R10 - We have concerns with the existing language in Requirement R10 which when applied in the real-world of today's audit teams sometimes gets pushed beyond reason. For example, just how much of a neighboring TOP Area does a TOP have to model in order to determine impacts on SOLs within its TOP Area? What prevents an auditor from claiming that a TOP didn't model enough of the neighboring TOP's Area? Isn't this really the function of the RC and aren't we forcing the TOP to assume some of the RC functions with such a requirement? At the very least, we recommend the following language: Each Transmission Operator shall monitor the following to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area.10.1 Facilities within its TOP Area 10.2 Status of Special Protection Systems identified as applicable by the Transmission Operator 10.3 Sub-100 kV facilities identified as

Organization	Yes or No	Question 7 Comments
		applicable by the Transmission Operator, and 10.4 Facilities within neighboring Transmission Operator Areas identified as applicable by the Transmission Operator
Response: The SDT agrees and has made the suggested changes. See summary for wording. The SDT has modified the language of Requirement R10 for clarity. See summary for wording.		
Flathead Electric Cooperative, Inc.	No	Again, DPs should not have evidence requirements when the BA/TOP is recording the other end of the line. Suggest deleting "Such evidence could include, but is not limited to, dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format." from any DP measure.
Response: The SDT does not agree that the responsibility for monitoring these activities should be the sole responsibility of the Transmission Operator or Balancing Authority. Consistent with responsibilities defined in the Functional Mode, DP and LSE would also need to maintain evidence of such mitigation action as load shed or voltage reduction. No change made.		
American Transmission Company, LLC	No	ATC requests the SDT to consider making the following changes to the proposed Requirement R10 based on the corresponding technical rationale. It is ATC's understanding that the intention of the SDT is to not require each Transmission Operator to monitor all Facilities and all Special Protection Systems in the neighboring TOP areas. However, the structure of the sentence in Requirement R10 does not provide this clarity. Rather, the sentence requires each TOP to monitor all Facilities, all Special Protection Systems and a subset of sub-100kV facilities for its TOP area and its neighboring TOP areas. If the TOP is to be given discretion on which neighboring Facilities and Special Protection Systems are to be monitored, then ATC suggests that Requirement R10 be modified as:"R10. Each Transmission Operator shall determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area by monitoring: R10.1 Within its Transmission Operator Area: R10.1.1 Facilities R10.1.2 Status of all Special Protection Systems R10.1.3 Sub-100 kV facilities identified as necessary by the Transmission Operator R10.2 Within neighboring Transmission Operator Areas and

Organization	Yes or No	Question 7 Comments
		identified as necessary by the Transmission Operator: R10.2.1 Facilities R10.2.2 Status of Special Protection Systems R10.2.2 Sub-100kV facilities” Please Note: ATC also requested via the RSAW Feedback Form to modify the RSAW’s evidence listing for proposed Standard TOP-001-3 to address inconsistencies with the language of Requirement R10 or any modifications to this language based on ATC’s comments. For example, if the R10 language is left unchanged, the Facilities evidence should be “all Facilities within its TOP area and those Facilities in neighboring TOP areas determined necessary by the TOP.” This structure would also be applied to Special Protection Systems. For sub-100kV facilities, the evidence should be “those sub-100kV facilities determined necessary by the TOP” without a need to reference its TOP area or neighboring TOP areas since that is the plain reading of the requirement.
Response: The SDT has re-structured the requirement for greater clarity. See summary for wording.		
BC Hydro	No	BC Hydro’s concern is that the Reliability Directive is replaced with Operating Instruction in the standard. The scope of “Operating Instructions” broadens to non-emergency situations. Requirement R3 and R4 have the BA’s complying with TOP’s Operating Instructions. BC Hydro’s concern is that there may be a conflict between the BA and the TOP. Requirement R3 provides exceptions for complying, but only for safety, equipment regulatory or statutory requirements. Nowhere does the Requirement address conflict in reliability requirements: for example, a TOP in our area issues an instruction to eliminate a voltage limit issue, and this action may cause another limits issue for another TOP. There appears to be no “out” clause based on reliability conflicts - such as deferring to an assessed lesser reliability impact. BC Hydro recommends revising these Requirements to allow for an “out” clause.
Response: If an entity wishes to set up an additional higher level of communications, as is apparently intended through the use of Reliability Directive, that entity is free to do so as long as it properly documents the process and continues to follow the COM-002-4		

Organization	Yes or No	Question 7 Comments
established protocols. As far as the definition of Reliability Directive is concerned, the SDT believes that the FERC NOPR clearly stated that the approach proposed in previous projects was not acceptable. Furthermore, the SDT's decision to utilize the term Operating Instruction was in part due to the concept that a directive is inclusive within its definition. The SDT believes the use of Operating Instruction(s) allows Reliability Coordinators and Transmission Operators to address or prevent situations that could lead to an Emergency. The Reliability Directive definition was never approved by FERC (see NOPR) and will eventually be withdrawn. The use of Operation Instruction is consistent with proposed COM-002-4. No change made. The SDT believes that entities already have established processes for conflict resolution and that the Reliability Coordinator can always be called upon to adjudicate if needed. No change made.		
Bonneville Power Administration	No	BPA suggests referencing the System Operating Limit (SOL) Definition and Exceedance Clarification white paper in the language of the Requirements, as Regional Entities are not required to audit to appendices, unless indicated by the language of a Requirement. BPA believes the language in requirement R8 is still ambiguous and open-ended regarding, "... operations that result in, or could result in, an Emergency." It is unclear how entities are expected to determine events that could possibly happen. BPA suggests the drafting team include parameters for possible events, so applicable entities are not required to predict all possible future events. BPA also opposes language in the Standard conflates events that are actually happening with events that may happen at some point. BPA suggests the drafting team clearly separate these two concepts. Specifically, R8 requires entities to identify "... operations that result in, or could result in, an Emergency," without any qualification for likelihood. BPA does not feel it is appropriate to treat an actual Emergency the same way it treats a possible future Emergency that could, but likely will not happen.
Response: The SOL Exceedance White Paper is background material that pieces together existing requirements across FAC, TOP, and IRO standards and is not a necessary ingredient as part of the TOP standard. The SDT believes that the requirements are sufficiently robust to stand-alone and that the White Paper is just corroborating material. No change made.		

Organization	Yes or No	Question 7 Comments
The SDT believes that the standards need to be taken as a whole and that Requirement R8 refers to Real-time Assessments as well as Operational Planning Analysis results both of which can point to potential problems. Examples of emergent conditions that could result in an Emergency are notification of “stuck breaker”, pending equipment failure or de-rates, or notification of relay degradation. No change made. The SDT believes that likelihood of occurrence is not an issue here. Transmission Operators should make the notifications so that others are informed of the possibility and can take appropriate actions as dictated by internal policies. The SOL White Paper further defines acceptable BES performance and mitigating strategies to control pre-contingency and post-contingency SOL exceedances. No change made.		
CenterPoint Energy Houston Electric LLC	No	CenterPoint Energy feels Requirement R1 is general and may provide double jeopardy with other requirements that dictate specifics on when and under what circumstances TOPs are required to act and direct others to act. CenterPoint Energy suggests reverting back to authoritative language requiring TOPs giving its Operating Personnel the authority to act, or direct others to act: “Each Transmission Operator shall provide its Operating Personnel with the authority to act, or direct others to act...” Another suggestion is to delete the Requirement completely due to its broad generality which is already included in the Functional Model, while keeping R3 and R4 for accountability of any Operating Instructions from the Transmission Operator to be followed. CenterPoint Energy also feels the language in R1, “...to ensure the reliability of its Transmission Operator Area” puts an unavoidable burden on the TOP for when an unexpected event occurs. CenterPoint Energy suggests changing ‘ensure’ to ‘maintain’. These comments would also apply to IRO-001-4, R1. R10. CenterPoint Energy feels monitoring Facilities reaching into a neighboring Transmission Operator Area needs more direction. The term ‘as necessary’ is too vague for a TOP to determine how far into a neighboring Area or what specific equipment contained in another TOP Area it would need to monitor to determine SOL exceedances.

Organization	Yes or No	Question 7 Comments
		CenterPoint Energy also feels it is the RC function to monitor and determine any reliability issues which may overlap or cascade between TOP Areas as they have the Wide Area view. CenterPoint Energy recommends removing 'neighboring areas' from R10.
Response: The SDT does not believe there are other requirements in the standards that would produce a double jeopardy situation with Requirement R1. The SDT also believes that Requirements R1 and R3 (as well as Requirements R2 and R4) are a logical and consistent presentation of the use and need for Operating Instructions. The SDT did modify Requirements R1 and R2 based on industry feedback. See summary for wording. The SDT has revised the requirement to delete 'ensure' and replace it with 'address' as in the first posting. Corresponding changes were made to proposed IRO-001-4. See summary for wording. The SDT believes that the Transmission Operator is in the best position to judge what is necessary and that credit needs to be given to the Transmission Operator's professional judgment in this area. No change made. Monitoring of neighboring facilities does not mean that the Transmission Operator is now taking control of overlap issues from the Reliability Coordinator. The SDT believes that the Transmission Operator's models require information from neighboring systems in order for Operational Planning Analysis and Real-time Assessments to solve accurately. Specifically, a Transmission Operator needs to monitor the status and flows of neighboring Facilities that if outaged could adversely impact its Transmission Operator Area. The SDT has re-structured the requirement for greater clarity. See summary for wording.		
HHWP	No	Draft 2 has not satisfactorily addressed the circumstances of small transmission operators. Most small TOPS operate very simple and predictable systems, with the capacity for only minimal impacts on the BES. Draft Requirement TOP-001-3, R13 which will require such TOPs to perform, review and document real-time assessments every 30 minutes, unnecessarily burdens such TOPs with additional process, expense and resource requirements that will contribute no added reliability above and beyond the real-time assessment processes which Reliability Coordinators already have in place

Organization	Yes or No	Question 7 Comments
Response: The requirement allows for an entity to arrange for another entity to perform the assessment which would alleviate any resource burdens on smaller entities. The SDT believes that the Real-time Assessment for small Transmission Operators with simple and predictable systems would be minimal under normal operating conditions. No change made.		
Ingleside Cogeneration , LP	No	ICLP believes that the project team has completely bypassed the language and intent of COM-002-4 by creating zero-tolerance requirements in TOP-001-3 R3 through R6. In R3-R6, every Operating Instruction, no matter how routine, must be perfectly executed and documented to the liking of an audit team. By comparison, COM-002-4 focuses only on training and ongoing reinforcement on the proper communications protocol to be used in the transaction of Operating Instructions. We understand that BES reliability depends far more heavily on TOP-001-3's requirements to execute an Operating Instruction - and not so much COM-002-4's oversight of the protocols to use. However, an Operating Instruction can be any communication to "change or preserve the state, status, output, or input" of a BES element/facility, which covers significant ground. If a single log entry is vague or missing, a severe penalty awaits even the most conscientious GOP. This means that the solution lies in the compliance approach to TOP-001-3, which should vary by the priority of the communication. For example, ICLP believes that every Operating Instruction issued during a declared Emergency, or one prefaced with "this is a mandatory Operating Instruction" should be properly documented by the recipient in a zero-tolerance manner. This would include time-stamps of conversations; an acknowledgement that three-part communications were used; and a coherent recount of the steps requested, taken, and their results. All other Operating Instructions would only be examined by an auditor if shown that slow or improper execution put the BES at risk. This is not a substantial hurdle to overcome - particularly since the issuer and recipient will both have telemetry and/or written records of an incidence of concern. The CEA could then dig deeper to determine if a pattern of poor performance by the GOP exists; which is really the behavior that we all want to eliminate over the longer term.

Organization	Yes or No	Question 7 Comments
Indiana Municipal Power Agency	No	IMPA does not agree with using Operating Instructions within this standard. By using Operating Instructions within this standard, NERC has created an extremely administrative type of standard for entities to follow. What happen to results-based standards? Just keeping the telephone logs in many instances will not be enough and it will require much more documented evidence to show that an entity followed the TOP's Operating Instructions. If a Generator Operator is asked to change MW/VAR output or asked to maintain the same output numerous times in a day by its Transmission Operator, it will have to keep evidence to show that it carried out every single Operating Instruction throughout the entire day. Does this mean keeping track of the output of the Generator for the day and giving the entire log to the auditor to show the Generator Operator carried out each Operating Instruction?
Response: The SDT believes that complying with Operating Instructions is extremely important for the reliability of the system and that emphasis in audits will be on whether the Operating Instruction was followed as opposed to a missing log entry. The SDT suggests that the commenter's points would be better submitted in the RSAW process for proposed TOP-001-3. The current RSAWs instruct the auditor to focus on EOP-004 reportable events. No change made.		
Hydro-Quebec TransEnergie	No	In R4, modify the second "its Transmission Operator" by "that Transmission Operator" for consistency with the wording of R6. Also modify corresponding element in the Table of Compliance Elements. In R9 and M9, remove the expression "interconnected NERC registered" for consistency with IERP recommendation regarding TOP-002-4 R3 In R17, replace "analysis" by "Real-time Assessment" for consistency with R16. R18 is unclear. What does "where there is a difference in SOLs" mean? Difference in SOLs compared to which SOL? A "difference" implies a comparison between two SOLs. That portion of the requirement should be clarified. The rationale for R19 and R20, which are related to data exchange capabilities, states that they're added for consistency with IRO-002-4 R2 whereas R2 addresses RC's System Operator authority.

Organization	Yes or No	Question 7 Comments
		In R19 and R20 why the use of "Transmission Operator Area (Balancing Authority Area)" for both requirements? R19 should say "Transmission Operator Area" and R20 should say "Balancing Authority Area" for consistency with associated Measures. Compliance section 1.2: As proposed, the section doesn't give any useful information. That section should actually serve to list the actual processes that will be used for that particular standard. Or at least refer to the actual section of the ROP that lists the processes used (Appendix 4C, section 3.0). Table of Compliance Elements: VSLs for R8 and R9 should be reworded. Due to their importance in determining penalties, VSL should be written clearly and without ambiguity. Example: "Violation Severity Levels for requirement 8 are determined based on the number of other known impacted Transmission Operators or other known impacted Balancing Authorities that the Responsible Entity did not inform of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas or Balancing Authority Areas when conditions did permit such communications :High VSL : The lesser of 1) three other known impacted Transmission Operators or 2) 10% or more but less than or equal to 15% of the other known impacted Transmission Operators OR The lesser of 1) three other known impacted Balancing Authorities or 2) 10% or more but less than or equal to 15% of the other known impacted Balancing Authorities" The whole wording of the requirement could be omitted for more clarity :"Violation Severity Levels for requirement 8 are determined based on the number of other known impacted entities that the Responsible Entity did not inform in accordance with that requirement :High VSL : The lesser of 1) three other known impacted Transmission Operators or 2) 10% or more but less than or equal to 15% of the other known impacted Transmission Operators OR The lesser of 1) three other known impacted Balancing Authorities or 2) 10% or more but less than or equal to 15% of the other known impacted Balancing Authorities" Associated Documents: The content of the white paper shouldn't be included in the standard. A reference with a hyperlink would be enough.

Organization	Yes or No	Question 7 Comments
Response: The SDT does not believe that the suggested change adds any clarity. No change made. The SDT agrees and has made the suggested change. See summary for wording. The Balancing Authority does not perform Real-time Assessments per the proposed definition but does perform other analyses that are defined in the BAL standards. Therefore, the SDT believes that the current wording is correct. No change made. The requirement applies to the instance where differing Transmission Operators, for some unknown reason, are working off of different SOLs for the same equipment. The SDT believes that the wording is clear and has been understood by the industry. However, the SDT has deleted the Balancing Authority from the requirement. See summary for wording. The rationale box contained a typo which has been fixed. The correct reference is proposed IRO-001-4 Requirement R1. The SDT has corrected the typo in requirements R19 and R20. See summary for wording. The Compliance section is boilerplate language supplied by NERC. The SDT did not change this boilerplate language. The SDT will pass this comment on to NERC Legal. No change made. VSL comments are handled in Q11. How the SOL Exceedance White Paper will be included is to be determined by NERC staff. It may be a hyperlink or it may be the inclusion of the entire paper.		
Xcel Energy	No	In R7, how is the entity receiving the request able to know if the requesting entity has indeed implemented its emergency procedures? Suggest removing that qualifier, or change the requirement to state that “Each Transmission Operator shall assist Transmission Operators experiencing an Emergency, if requested, unless such actions cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements.” R10 is not written clearly. Suggest restructuring. Each Transmission Operator shall monitor: o Facilities (including sub-100 kV facilities needed to maintain reliability) within its Transmission Operator Area and o Facilities (including sub-100 kV facilities needed to maintain reliability) in neighboring Transmission Operator Areas to

Organization	Yes or No	Question 7 Comments
		maintain reliability within its Transmission Operator Area o Status of Special Protection Systems within its Transmission Operator Area R16 & R17 should state "...approve or defer/deny..." Is R18 only for derived limits or if there is a difference in any limit? Or is the intent of the requirement to be " ... when limits are derived and there are differences when comparing solutions."?
Response: The SDT believes that the requested Transmission Operator will ascertain whether the requesting entity has implemented its procedures. No change made. Due to this comment and those of others, the SDT has revised the wording of the requirement to replace 'sub-100 kV' with the term 'non-BES facilities' to clarify the drafting team's intent. The SDT believes that the non-BES terminology must be maintained in order for the SDT to be responsive to the FERC NOPR, SW Outage Report recommendations, and the IERP recommendations. This non-substantive clarifying change has been made in several other standards for consistency purposes – TOP-003-3, IRO-002-4, and IRO-010-2. See summary for wording. The SDT believes that absence of approval by the operator is equivalent to deny and that the additional wording is not necessary. No change made. The language on derived limits was removed in the second posting. The Transmission Operator shall operate to the most limiting SOL at any point in time.		
Consumers Energy Company	No	In Requirement 1 and 2 the term reliability provides a vague stipulation. "... by issuing Operating Instructions to ensure the reliability of its Transmission Operating Area." I don't know if language can be suggested at this point, but I would prefer to see "stability" rather than "reliability".
Response: The SDT believes that 'reliability' is the appropriate term. No change made.		
Puget Sound Energy	No	It is nearly impossible for entities to comply with requirements R1 and R2 of TOP-001-3 as currently drafted. This issue is highlighted (not corrected) by the draft RSAW's approach of evaluating compliance only during events. RSAWs are only guidance -

Organization	Yes or No	Question 7 Comments
		reading footnote 1 of the current RSAW template makes it clear that the RSAW is a reference document only and entities cannot depend on the approach outlined there to resolve ambiguities associated with a requirement. The place to resolve ambiguities is in the standard's language, not in the RSAW. An entity must comply with any requirement at all times; it does not matter if the enforcement authority only checks compliance during certain periods. If an entity fails to comply with the requirement at any other time, that entity is obligated to self-report the violation. In this situation, then, each entity must "ensure" the reliability of its area 24/7/365 to be compliant with requirement R1 or R2. This means that any reliability event could reflect an entity's failure to comply with R1 or R2 because the entity failed to ensure the reliability of its area during that event. But can any entity really ensure the reliability of its area? This just doesn't seem possible because there are so many factors outside of an entity's control that can affect the reliability - for example, equipment failure or a fire along transmission lines. In addition, the burden of monitoring compliance based on the proposed language is immense. Requirements R1 and R2 of the currently effective TOP-001-1a require entities to take action to "alleviate operating emergencies". This is a high bar, but not so high that an entity cannot comply when factors beyond its control affect the reliability of its area. In addition, using this language in the proposed standard would be consistent with the RSAW's approach and ease the associated compliance monitoring obligation, while still requiring an entity to act to protect the reliability of its area.
Response: The SDT has revised the requirement to delete 'ensure' and replace it with 'address' as in the first posting. See summary for wording.		
MidAmerican Energy Company	No	MidAmerican remains concerned that the real-time assessment and operational planning assessment definitions as written will be wrongly interpreted to require things a real-time assessment tool cannot perform or an operational planning assessment cannot comply with. Real-time Assessment tools are not dynamic assessment tools and do not inherently understand phase angle impacts nor stability as suggested by the inclusion of Protection System status, degradation, and identified

Organization	Yes or No	Question 7 Comments
		phase angle / equipment limitations. The SDT could check with real-time assessment vendors and verify that the revised definitions match the capabilities of real-time assessment tools and adjust the proposed definition. At a minimum, the SDT needs to clarify / modify words in the definition to ensure that real-time assessment tools can be compliant. Suggested clarifications include: Real-time assessment means a steady state analysis of thermal and voltage impacts. Power system transients, dynamics, nor actual phase angles are required. Protection Systems in the case of Real-time Assessment means the accurate system topology representation of normal protection system clearing (e.g. a three-terminal line as a single N-1 next worse contingency).Identified phase angles and equipment limits are identified in-terms of equipment ratings (amps, MVA, etc). Phase angle inputs (from PMU's etc) or phase angle calculations are not required. Further, personnel cannot be substituted for Real-time Assessments tools due to the 30 minute limitations imposed. Power system transient or dynamic analyses using real-time data can be time consuming to construct and run. At most, only a few power system dynamic analyses can be performed in the space of 30 minutes and may not keep pace with changing real-time conditions. With regard to R13, MidAmerican believes the SDT has improved the language by revisions such that the TOP shall "ensure that a Real-time Assessment is performed at least once every 30 minutes;" however, we continue to question the 30-minute requirement and believe that there will be tremendous difficulty in achieving this without defect. Rather, MidAmerican suggest the following: R13: "Each TOP shall ensure that a Real-time Assessment is performed with such periodicity so as to ensure continuous situational awareness of the TOP."
Response: The SDT recognizes that not all entities are capable of performing Real-time transient Stability analysis within 30 minutes and would rely on Operating Plans. The inclusion of phase angle is based on the Southwest Outage recommendations. The SDT felt it was more prudent to include this item as part of the definition as opposed to a specific requirement within the standard. SDT has incorporated "applicable" based on industry feedback and believes that the proposed definition reflects an entity's responsibility to model and assess the impacts of phase angles. For example, modeling and assessment of phase angle reclosing limitations would be		

Organization	Yes or No	Question 7 Comments
supported by Operating Plans. An entity can only provide data and information on what it has available and the addition of the term 'applicable' was intended to capture that intent and to protect an entity against unreasonable expectations. No change made. The requirement allows for an entity to arrange for another entity to perform the assessment which aligns with requirements in approved EOP-008-1. Approved EOP-008-1 specifically requires entities to have tools and applications to ensure that System Operators have situational awareness of the BES. It goes on to require that entities take necessary actions to manage the risk to the BES during periods when primary or backup functionality may not be available. This requirement isn't about maintaining RTCA or any other specific tool, it's about maintaining situational awareness at all times. No change made.		
Northern Indiana Public Service Company (NIPSCO)	No	NIPSCO feels R10 should align with the Operational Planning Analysis Requirement and include a reason such as "to determine SOL exceedances". NIPSCO feels R19 and R20 should be in TOP-003 or are already covered in COM-001. NIPSCO feels R16 and R17 are outage coordination and do not belong in TOP-001 which is Transmission Operations. These should be with the outage coordination standard.
Response: Requirement R10 includes the term 'to determine any SOL exceedances". No change made. The SDT does not agree. Proposed COM-001-2 is for interpersonal communications which covers voice communications. The purpose of proposed TOP-003-3 focuses on defining data requirements. The SDT added Requirements R19 and R20 to cover real-time data exchange. No change made. The SDT does not agree. Requirements R16 and R17 are about the Real-time data exchange and analysis capabilities that an operator has at his/her disposal and not about Transmission and generation outages as described in proposed IRO-017-1. No change made.		
PacifiCorp	No	PacifiCorp needs clarification concerning how R16 works in tandem with the Reliability Coordinator outage process noted in IRO-017-1. Additionally, PacifiCorp questions whether we have the ability to compel a non-NERC Registered Entity to provide data in order to maintain reliability in the Transmission Operator Area.

Organization	Yes or No	Question 7 Comments
		Also, inclusion of the Near-term Planning Horizon (which is 1 - 5 years) into the future isn't appropriate. This should be addressed in a revised TPL standard. Does this mean that Planning must coordinate all proposed 6 month (see TPL-001-4 R1 effective on 1/1/2015) or longer outages with the DMCC up to 5 years into the future every X days, months, or annually?
Response: Requirement R16 is about the Real-time data exchange and analysis capabilities that an operator has at his/her disposal and not about Transmission and generation outages as described in proposed IRO-017-1. Standards only apply to NERC registered entities, specifically those entities identified in the applicability section of each standard. PacifiCorp would need to rely on Interconnection or Operating Agreements for authority outside of the NERC Standards. The SDT can only write standards that apply to NERC Registered Entities. The SDT assumes this comment is about proposed IRO-017-1 and not about proposed TOP-001-3 which does not pertain to planning. The inclusion of the Near-Term Transmission Planning Horizon in proposed IRO-017-1 is a direct response to the FERC NOPR and IERP report. As is pointed out in the rationale box for proposed IRO-017-1 Requirement R4, and shown in the second posting inclusion of a draft SAR for future revisions to approved TPL-001-4, the long-term goal is to move appropriate requirements from proposed IRO-017-1 to a future revision of approved TPL-001-4. However, the scope of this project did not allow for changes to TPL standards. Requirement R4 of proposed IRO-017-1 does not state that a planner must coordinate outages – it states that planners must resolve potential conflicts that appear in its assessments and include the Reliability Coordinator in such a process.		
Oncor Electric Delivery LLC	No	Proposed Standard TOP-001-3 R9 States:"R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected NERC registered entities of outages of telemetering equipment, control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities." In response to R9, Oncor recommend s that the requirement to make it mandatory for BA's and TOP's to notify only negatively impacted interconnected TOs, TOPs and GOPs. Oncor does not feel it necessary to notify registered entities that do not have reliability control functions to the BES.

Organization	Yes or No	Question 7 Comments
		R10 as proposed requires each "Each Transmission Operator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Transmission Operator, within its Transmission Operator Area and neighboring Transmission Operator Areas to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area". The ERCOT region is structured to support a deregulated market in which ERCOT monitors facilities for all TOPS and has a centralized view of the entire region to maintain reliability. TOPs operating within ERCOT currently do not have the technical capability to monitor facilities of neighboring TOPs. This requirement imposes a "one size fits all" regional structure which would place an unreasonable financial burden on all TOPs to both install and maintain additional hardware in each station or install and maintain multiple ICCPs between control centers. This requirement would place this financial burden on TOPs for nothing more than to replicate an RC function with no benefit to the BES. At no point in proposed Standard TOP-001-3 does it require TOs to supply neighboring TOs with this data. Oncor requests R10 be reworded to provide flexibility for region structure. Proposed R12 changes the existing requirement of operating outside an IROL for no longer than 30 minutes to "a continuous duration exceeding its associated IROL Tv". This requirement does not specify who determines the Tv of an IROL when multiple TOPs are involved in the circuit. Oncor believes that the 30 minute limit utilized in previous versions of this standard eliminates the possibility for disagreement. Oncor's recommendation is to keep the existing 30 minute time limit.

Response: Due to comments received from a number of entities in the first posting, the term 'negatively' was removed as it was open to interpretation and superfluous. The SDT continues to agree with this approach. No change made.

Requirement R10 does not stipulate that an entity install equipment for the purposes of monitoring neighboring Transmission Operator SOLs. Monitoring can be accomplished in a number of ways including utilizing existing data links with its Reliability Coordinator or neighboring Transmission Operators to receive the status of neighboring facilities and associated flows that could impact Facilities within the Transmission Operator Area. The SDT believes that Transmission Operators need such data in order to have its models solve and for its analysis methods to be valid and also believes that the majority of Transmission Operators are

Organization	Yes or No	Question 7 Comments
already doing this to some extent. Therefore, it does not see this requirement as placing any undue burden or cost on Transmission Operators. The SDT has re-structured the requirement for greater clarity based on industry comments. See summary for wording. Based on approved FAC-011-2 Requirement R3, Part 3.7, the Reliability Coordinator has the responsibility to develop an SOL Methodology which includes defining IROL and associated T_v. The Reliability Coordinator is always the arbiter of disputes of this nature. No change made.		
SPP Standards Review Group Kansas City Power & Light	No	R1 - We have concerns regarding the phrase 'to ensure the reliability'. The phrase is ambiguous and detracts from the purpose of the standard which is to ensure the Transmission Operator takes action or directs others to act. Additionally, we suggest tying the 'others' in Requirement R1 specifically to those entities identified in Requirements R3 and R4. We recommend the following rewrite: 'Each Transmission Operator shall act, or direct others as identified in Requirements R3 and R4 to act, by issuing Operating Instructions in accordance with its responsibilities as a Transmission Operator within its Transmission Operator Area.' R2 - We have concerns regarding the phrase 'to ensure the reliability'. The phrase is ambiguous and detracts from the purpose of the standard which is to ensure the Balancing Authority takes action or directs others to act. Additionally, we suggest tying the 'others' in Requirement R2 specifically to those entities identified in Requirements R5 and R6. We recommend the following rewrite: 'Each Balancing Authority shall act, or direct others as identified in Requirements R5 and R6 to act, by issuing Operating Instructions in accordance with its responsibilities as a Balancing Authority within its Balancing Authority Area.' R9 - We feel that the use of impacted interconnected entities is too broad for the notification requirement. Also, the current wording of the requirement would have the Balancing Authority and Transmission Operator providing notifications for all outages even those lasting only a couple of minutes or a few seconds. Additionally, the term 'NERC registered' in Requirement R9 and Measure M9 should be deleted. This term was deleted in IRO-008-2, Requirement R4 and TOP-002-4,

Organization	Yes or No	Question 7 Comments
		Requirement R3. We recommend rewording the requirement to read: 'Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and known impacted entities of outages of telemetering and telecommunication equipment, control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities lasting 30 minutes or longer.' Should Requirement R9 be split into two separate requirements, one for the Transmission Operator and one for the Balancing Authority as was done with Requirements R1 and R2 and Requirements R19 and R20? R10 - We have concerns with the existing language in Requirement R10 which when applied in the real-world of today's audit teams sometimes gets pushed beyond reason. For example, just how much of a neighboring TOP Area does a TOP have to model in order to determine impacts on SOLs within its TOP Area? What prevents an auditor from claiming that a TOP didn't model enough of the neighboring TOP's Area? Isn't this really the function of the RC and aren't we forcing the TOP to assume some of the RC functions with such a requirement? At the very least, we recommend the following language: 'Each Transmission Operator shall monitor 10.1 Facilities within its TOP Area,10.2 status of Special Protection Systems identified as necessary by the Transmission Operator,10.3 sub-100 kV facilities identified as necessary by the Transmission Operator, and10.4 Facilities within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator as necessary to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area.' Rationale Box for R14 - The newly inserted sentence in Rationale Box for R14 doesn't completely present the overall picture of the Operating Plan as contained in the Associated Documents at the back of the standard. We propose an additional sentence, as indicated below, be included in the Rationale Box.'...These Operating Plans are developed and documented in advance of Real-time and may be developed from Operational Planning Assessments (OPA) required per proposed TOP-002-4 or

Organization	Yes or No	Question 7 Comments
		other assessments. The Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). The intent is not to have a...' R18 - Should Requirement R18 be split into two separate requirements, one for the Transmission Operator and one for the Balancing Authority as was done with Requirements R1 and R2 and Requirements R19 and R20? R19 - Delete the parenthetical Balancing Authority in Requirement R19. R20 - Delete Transmission Operator and the parentheses around Balancing Authority in Requirement R20.
Response: The SDT has revised the requirements to delete 'ensure' and replace it with 'address' as in the first posting. See summary for wording. The SDT agrees and has revised Requirements R1 and R2 accordingly. See summary for wording. The SDT has revised the requirement to delete 'ensure' and replace it with 'address' as in the first posting. See summary for wording. The SDT believes that the suggested wording is unnecessary redundancy and that it is clear from reading the standard as a whole what entities are applicable. No change made. The SDT believes the current language accurately reflects the reliability need and absent a suggested replacement sees no reason to change the proposed language. The SDT also believes that the use of the term 'impacted' should alleviate concerns over momentary outages as such outages are unlikely to impact others. No change made. The SDT believes that the professional judgment of the Transmission Operator should be the overriding factor in determining how much of a neighboring system that it needs to monitor with the principal reasoning being to monitor status and flows of key external facilities that impact Transmission Operator Facilities and that any attempt to legislate how far to go is unworkable in a standard. The SDT also believes that some degree of monitoring of neighboring systems is required for models and analysis to work correctly and that Transmission Operators are already doing this type of work. Monitoring does not imply that the Transmission Operator is usurping the wide area responsibilities of the Reliability Coordinator – it only implies that a Transmission Operator must have some		

Organization	Yes or No	Question 7 Comments
degree of visibility outside its own footprint in order to fulfill its reliability responsibilities. The SDT has re-structured the requirement for greater clarity. See summary for wording. The SDT agrees and has added the suggested sentence to the rationale box. The SDT does not believe that the suggested change adds clarity. No change made. The SDT has corrected the typo in requirements R19 and R20. See summary for wording.		
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	No	R1 and R2 - Southern understands other commenter's concerns about BAs, GOPs, DPs, and LSEs not falling into a Transmission Operator's TOP Area, but Southern disagrees with the approach taken by the SDT to address these concerns. Rather than removing "within its TOP Area" in R1 and "within its BA Area" in R2, the requirement should spell out the entities to link to R4 and R5. Suggested change as follows: R1 - Each Transmission Operator shall act, or direct its Balancing Authorities, Generator Operators, Distribution Providers, and Load Serving Entities to act by issuing Operating Instructions, to ensure the reliability of its Transmission Operator Area. [Violation Risk Factor: High][Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations] R2 - Each Balancing Authority shall act, or direct its Transmission Operators, Generator Operators, Distribution Providers, and Load Serving Entities to act by issuing Operating Instructions, to ensure reliability within its Balancing Authority Area. [Violation Risk Factor: High][Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations] R10 begins with 'Each Transmission Operator shall monitor Facilities...' Southern suggest that the words, "Bulk Electric System" be added to R10 so that it reads 'Each Transmission Operator shall monitor "Bulk Electric System Facilities", consistent with the verbiage in IRO-003-2 Requirement 1. Measure 10 should also be changed accordingly. R10 - Southern suggest that utilization of the words, "as necessary" makes the requirement confusing and proposes the below verbiage to add clarity: 'Each Transmission Operator shall monitor "Bulk Electric System Facilities", the status of Special Protection Systems, and sub-100 kV facilities identified by the Transmission

Organization	Yes or No	Question 7 Comments
		Operator, within its Transmission Operator Area and neighboring Transmission Operator Areas, “as being necessary to determine” any System Operating Limit (SOL) exceedances within its Transmission Operator Area.’ Measure 10 should also be changed accordingly. R15 - Southern appreciates the SDT’s consideration of Southern’s comments but disagrees that the Requirement as currently drafted, does not reflect “past tense” with respect to actions taken. Southern suggest that the SDT reword the Requirement for clarification purposes: ’Each Transmission Operator shall inform its Reliability Coordinator of its actions taken to return the system to within limits when a SOL has been exceeded.’
Response: The SDT agrees and has revised the requirements accordingly. See summary for wording. The use of the capitalized term ‘Facilities’ means that the requirement phrase is for the BES. Therefore, the SDT believes that the suggested change would be redundant and possibly create confusion. The SDT has re-structured the requirement for greater clarity. See summary for wording. The SDT received multiple comments concerning Requirement R10 and has re-structured the requirement based on all comments received. See summary for wording. The SDT has made the suggested change for consistency in wording. See summary for wording.		
CPS Energy	No	R1, in general, change to only require TOP to have the authority to act, or direct others to act, R10, in general, regarding monitoring Facilities reaching into a neighboring TOP area needs clarifying...best to delete neighboring areas wording.
Response: The SDT received a number of comments on the wording of Requirement R1 and has revised the language accordingly which should serve to alleviate your concerns. See summary for wording. The SDT has re-structured the requirement for greater clarity based on numerous industry comments. See summary for wording.		

Organization	Yes or No	Question 7 Comments
Duke Energy	No	R1: Duke Energy suggests re-writing R1 as follows: ”Each TOP shall act or issue Operating Instructions to entities, as necessary, within its TOP Area to ensure the reliability of its TOP Area.” We believe “within its TOP Area” is necessary within the context of the standard. Requirements R3 and R4 appear to imply that Operating Instructions from a TOP are within the bounds of the TOP area only. However, by removing this language, it is our view that the TOP could issue Operating Instructions to entities outside the TOP Area which is in direct conflict of the NERC Functional Model. R2: Duke Energy suggests re-writing R2 as follows: ”Each BA shall act or issue Operating Instructions to entities , as necessary, within its BA Area, as necessary, to ensure the reliability of its BA Area.” We believe “within its BA Area” is necessary within the context of the standard. Requirements R5 and R6 appear to imply that Operating Instructions from a BA are within the bounds of the BA area only. However, by removing this language, it is our view that the BA could issue Operating Instructions to entities outside the TOP Area which is in direct conflict of the NERC Functional Model. R3-R6: No Comments R7: While Duke Energy believes that this is a great operational expectation or operating practice for a TOP, we believe that the requirement “as written” is unmeasurable. We believe it will be difficult for an auditor to measure how a TOP verified that another TOP implemented “its emergency procedures”. The term “emergency procedures” is too vague and subject to interpretation. For example, at what point in another TOP’s emergency procedures should a TOP provide assistance? Based on this language, we suggest removing R7 from this standard or adding this to a guidance document to promote operational excellence within the industry. R8: Duke Energy suggests re-writing R8 as follows: ”Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities and other

Organization	Yes or No	Question 7 Comments
		impacted Transmission Operators, of its actual or expected operations that result in, or could result in a known Emergency." R9-R12: No Comments R13: Duke Energy still agrees with the intent of the SDT and the modifications made. However, we ask that the SDT review and describe the expectations for outages of an TOP's Energy Management System during planned outages (data base modifications, model changes, etc.) and reconsider whether 30 minutes is an adequate amount of time to make those modifications. R14-R20: No Comments
Response: The SDT has revised the wording of Requirements R1 and R2 to address your concerns and those of others. See summary for wording. The SDT believes that the requested Transmission Operator will ascertain whether the requesting entity has implemented its procedures as part of normal operations dialogue. No change made. The SDT does not believe that the suggested change adds clarity. No change made. The requirement allows for an entity to arrange for another entity to perform the assessment which aligns with requirements in approved EOP-008-1. Approved EOP-008-1 specifically requires entities to have tools and applications to ensure that System Operators have situational awareness of the BES. It goes on to require that entities take necessary actions to manage the risk to the BES during periods when primary or backup functionality may not be available. This requirement isn't about maintaining RTCA or any other specific tool, it's about maintaining situational awareness at all times. No change made.		
American Electric Power	No	R9: The reference "impacted interconnected NERC registered entities" needs to be consistent with the R8 terminology. We request that it be changed to "known impacted interconnected entities". R10: The reference"sub-100 kV facilities identified as necessary by the Transmission Operator" needs to be clarified. Specifically, the phrase "as necessary" is ambiguous and subject to interpretation. Our negative vote is driven solely by the ambiguous

Organization	Yes or No	Question 7 Comments
		reference “sub-100 kV facilities identified as necessary by the Transmission Operator”.
Response: The term ‘NERC registered’ has been deleted. See summary for wording. Due to this comment and those of others, the SDT has revised the wording of the requirement to replace ‘sub-100 kV’ with the term ‘non-BES facilities’ to clarify the drafting team’s intent. The SDT believes that the non-BES terminology must be maintained in order for the SDT to be responsive to the FERC NOPR, SW Outage Report recommendations, and the IERP recommendations. This non-substantive clarifying change has been made in several other standards for consistency purposes – TOP-003-3, IRO-002-4, and IRO-010-2. The SDT has also re-structured the requirement for greater clarity. However, the SDT believes that the Transmission Operator is the only one who can determine which non-BES facilities it needs to monitor and any attempt to mandate a specific coverage would be unworkable. See summary for wording.		
Northeast Power Coordinating Council Hydro One	No	Regarding Requirements R1 and R2, “ensure” should not be used as mentioned in previous comments. This must be honored THROUGHOUT the standard. For this particular requirement, consider using the word “maintain” or “restore” instead. Throughout the standard, consider replacing “address” with “maintain”. The Time Horizon should not include Operations Planning, or Same-Day Operations. The phrase, ‘within its TOP/BA Area’ should not be removed. Entities do not have authority to direct others outside of their area. In addition R3 only requires those to comply that are in the TOP/BA Area. For consistency, we suggest retaining that above language. Regarding Requirement R3, Time Horizons should not include Operations Planning, or Same-Day Operations. Regarding ALL the standard’s requirements, where Operating Instruction is used, the Time Horizon category must be reviewed. In Requirement R7, the “e” in emergency must be capitalized. “Comparable” should be added before “assistance”. In R7, the previous language should be retained to limit the assistance up to and including emergency procedures implemented by the requesting entity. As worded, this could expose the assisting entity to violations for not going beyond what has been implemented. This addition would distinguish it

Organization	Yes or No	Question 7 Comments
		from the previous requirements. To address the Drafting Team response to the previous posting, when declaring an emergency, entities have a number of corrective actions to restore the system to normal. The previous language allows assisting entities to implement similar steps, which increase in severity, with the entity that is in the emergency. In Requirement R9, strike the words “interconnected NERC registered” to be consistent with TOP-002-4 Requirement R3. The language in Requirement R16 should be made consistent with the language in Requirement R9. There should be consistent language used in requirements R9, R16, and R17. During the last posting, a concern was expressed over the ambiguity in R9 as the words “between the affected entities” can be interpreted as any two entities (external to the one who is notifying others) that are affected by the outages of telemetering and telecommunication equipment, control equipment, monitoring and assessment capabilities, and associated communication channels. To clarify the intent of the requirement, suggest R9 be revised to: R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected NERC registered entities of outages of telemetering equipment, control equipment, monitoring and assessment capabilities, and associated communication channels between THEM AND the impacted entities. Regarding Requirement R10, a Transmission Operator cannot be held responsible for monitoring ANY facilities in neighboring Transmission Operator areas. A Transmission Operator can only rely on what information is provided by a neighboring Transmission Operator. The new requirement R19 addresses the data exchange capabilities needed. The Drafting Team should consider removing R10. If Requirement R10 is to remain, then if a sub-100 kV facility is needed to maintain reliability, it should be included in the BES by exception. This standard should require the TOP to monitor BES Elements in its area. Monitoring BES Elements beyond that is the responsibility of the RC. Monitoring of neighboring facilities presents an

Organization	Yes or No	Question 7 Comments
		authority issue, which is clearly defined in the IERP Report, and Paragraphs 84 and 87 of the NOPR. R10 as written implies the TOP needs to monitor its neighboring TOP's entire area when in reality a subset of facilities may be all that is required. One suggested rephrasing is: Each Transmission Operator shall monitor Facilities within its Transmission Operator Area and those Facilities it determines as necessary in its neighboring Transmission Operator Areas to maintain reliability within its Transmission Operator Area... Another suggestion is: Each Transmission Operator shall monitor Facilities within its Transmission Operator Area including sub-100kV facilities needed to maintain reliability and the status of Special Protection Systems within its Transmission Operator Area and neighboring Transmission Operator Areas to maintain reliability within its Transmission Operator Area. The Drafting Team should consider removing "ensure" or its replacement word from Requirement R11. Refer to standard PRC-001-1.1. Requirement R13 should be reworded to: Each Transmission Operator shall perform or have performed a Real-time Assessment at least once every 30 minutes. The "s" in system should be capitalized in Requirement R15. The word "own" should not be deleted from Requirement R16. It provides clarity that this is only pertaining to the equipment the Transmission Operator owns and not other equipment. "Always" should be removed from Requirement R18. In Requirement R19 "(Balancing Authority Area)" is not needed and should be removed. In Requirement R20 remove "(Balancing Authority Area)" and "Transmission Operator Area". What defines a neighboring Transmission Operator Area? There are many instances where the loss of a facility several Transmission Operator Areas away from a Transmission Operator Area impacts that Transmission Operator Area.

Organization	Yes or No	Question 7 Comments

Response: The SDT has revised the requirement to delete 'ensure' and replace it with 'address' as in the first posting. See summary for wording. The SDT has deleted Operations Planning from the Time Horizon for all requirements in this standard as Operating Instructions are issued in a Real-time environment. However, the SDT believes that Same-Day Operations are sufficiently Real-time oriented and has retained that term.

The SDT believes that the wording of Requirement R3 as currently stated is correct. However, due to your comment and those of others, the SDT has restored the language concerning 'within a Transmission Operator/Balancing Authority Area". See summary for wording.

The SDT agrees and has capitalized the 'e' in Emergency. See summary for wording. However, the SDT does not agree with the return of 'comparable'. The SDT believes that this term is unmeasurable and open to interpretation.

The SDT has revised Requirement R9. See summary for wording.

The SDT does not believe that there needs to be a one-to-one correspondence between the language in Requirements R9, R16, and R17 as they are addressing different topics. No change made.

The SDT does not believe that the suggested change adds clarity to Requirement R9. No change made.

The SDT has revised the wording of Requirement R10 concerning sub-100 kV facilities to clarify the drafting team's intent. The SDT believes that the non-BES terminology must be maintained in order for the SDT to be responsive to the FERC NOPR, SW Outage Report recommendations, and the IERP recommendations. The SDT has also re-structured the requirement for greater clarity. See summary for wording. However, the SDT disagrees that the current wording requires a Transmission Operator to monitor all of its neighbor's facilities.

The SDT has removed 'ensure' from the requirement. See summary for wording.

The SDT does not believe that the suggested change adds clarity to Requirement R13. No change made.

As 'System' includes distribution as per the definition in the NERC Glossary, the SDT disagrees that 's' should be capitalized. No change made.

The SDT continues to believe that 'own' is superfluous and is not needed in the requirement language. No change made.

The SDT agrees that 'always' is superfluous and provides no value or clarity. See summary for wording.

The SDT has corrected the typo in Requirements R19 and R20.

Organization	Yes or No	Question 7 Comments
The SDT believes that a Transmission Operator is in the best position to determine how far out it needs to go, i.e., what its neighbors are. The SDT agrees that events several areas away can impact an entity and for that reason has used 'neighbors' instead of 'adjacent'. The professional judgment of the Transmission Operator should determine what a neighbor is.		
ReliabilityFirst	No	ReliabilityFirst offers the following comments for consideration. 1. Requirement R4 - ReliabilityFirst continues to recommend there be a timeframe added to the requirement stating the allotted time the Entity has to inform its Transmission Operator of its inability to perform an Operating Instruction. Absent a timeframe, compliance to this requirement becomes subjective and difficult to enforce. ReliabilityFirst suggests the following language for consideration. (i) "Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Transmission Operator [within the time constraints allocated by the Transmission Operator in its notification protocol] of its inability to perform an Operating Instruction issued by its Transmission Operator..." 2. Requirement R6 - ReliabilityFirst continues to recommend there be a timeframe added to the requirement stating the allotted time the Entity has to inform its Balancing Authority of its inability to perform an Operating Instruction. Absent a timeframe, compliance to this requirement becomes subjective and difficult to enforce. ReliabilityFirst suggests the following language for consideration. (i) "Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Balancing Authority [within the time constraints allocated by the Balancing Authority in its notification protocol] of its inability to perform an Operating Instruction issued by that Balancing Authority."
Response: The SDT believes it is understood that entities should begin initiating actions per an Operating Instruction immediately and if the entity realizes it cannot implement the instruction(s) for any of the reasons in Requirement R2, it should immediately notify the Reliability Coordinator. The SDT agrees that an Operating Instruction may include a timeframe given by the Reliability Coordinator, but defining a generic timeframe is not necessary, or appropriate, for a requirement. No change made.		

Organization	Yes or No	Question 7 Comments
Seattle City Light	No	SCL appreciates the efforts of the Standard Drafting Team to increase the clarity of the TOP and IRO Standards while generally reducing the burden of compliance documentation. However for TOP-001-3, SCL believes a changes are required before this Standard provides the clarity and effectiveness of the others. Specifically SCL asks for changes as follow: Requirement R9 covers too broad a scope to be useful. The phrase "...outage of telemetering equipment, control equipment, monitoring and assessment capabilities and associated communication channels..." is all encompassing. If each BA or TOP was calling the RC every time there was the slightest glitch with telemetering or every time an ICCP link, microwave channel or EIDE data signal was cycled for maintenance or some type of momentary signal fade, the RC's phone would be ringing continually. The intent of this requirement is to be sure all entities are aware of a loss of situation awareness. This risk associated with this is not of a momentary nature and a time qualifier should be used. Using the 30 minute time requirement that is used for R13 (as written, but also see below) is sufficient to meet the intent. SCL suggests the following re-wording:R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected NERC registered entities of any scheduled and sustained outages of equipment or assessment capabilities that prevent Real-time Assessment for 30 minutes. Requirement R13, SCL suggests changing 30 minutes to 60 minutes. Usually generation, load and interchange are estimates and adjusted on hourly basis so performing assessment every 30 minutes is not necessary and could prove an onerous requirement for TOPs without providing any real reliability benefits. SCL suggests the following re-wording:R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 60 minutes. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]
Response: The SDT believes that the use of the term 'impacted' obviates any concern for momentary outages or glitches as such problems would be unlikely to impact other entities. No change made.		

Organization	Yes or No	Question 7 Comments
The SDT does not agree. The requirement allows for an entity to arrange for another entity to perform the assessment which aligns with requirements in approved EOP-008-1. Approved EOP-008-1 specifically requires entities to have tools and applications to ensure that System Operators have situational awareness of the BES. It goes on to require that entities take necessary actions to manage the risk to the BES during periods when primary or backup functionality may not be available. This requirement isn't about maintaining RTCA or any other specific tool, it's about maintaining situational awareness at all times. No change made.		
Electric Reliability Council of Texas, Inc.	No	Similar to comments provided for IRO-001 R1, ERCOT recommends maintaining existing TOP-001-1a R1 language as much as possible as follows: "Each Transmission Operator shall have clear decision-making authority to act and to direct actions to be taken by other entities to preserve the reliability of its Transmission Operator Area and shall exercise specific authority to prevent or mitigate operating emergencies without delay, but no longer than 30 minutes. [Violation Risk Factor: High][Time Horizon: Real-time Operations]". This would preserve the original purpose of the requirement, address NOPR paragraph 64, be consistent with IRO-001 R1, and provide a timeliness requirement where appropriate for all requirements that require action by a TOP in real time without redundancy. R2 should be applied consistent to these changes as well. For R14, the current definition of Operating Plan states "a document". Please refer to previous comments for IRO-008 related to this issue. Please refer to previously provided comments for IRO-001 related to the use of the defined term "Operating Instruction" outside of real time. We do not have any concerns or comments on R19 and R20, which are added to address data exchange requirement and to achieve consistency with the proposed IRO-002-4, Requirement R2. However, we suggest that the SDT add Requirement R20 to the NERC issue data base along with requirements R2, R5, R6, R11, and R17 which the SDT agrees with our previous comment that these requirements belong to the BAL standards and hence a future assessment of creating such a BAL standard will be conducted.

Organization	Yes or No	Question 7 Comments
Response: The SDT disagrees that such a requirement is still needed in today's environment and the proposed revision is consistent with recommendations in the IERP report. Furthermore, the SDT believes that the suggested wording does not add clarity to the situation and may actually create confusion as there are too many objectives being covered in one sentence. However, the SDT has revised the wording of Requirements R1 and R2 to address industry comments. See summary for wording. The SDT does not understand the comment as written and is unable to find a comment from ERCOT for proposed IRO-008-2 for this topic. The SDT agrees and has deleted Operations Planning from Time Horizons for all requirements dealing with Operating Instructions. The SDT has already informed NERC management of the need for a future project to separate the Balancing Authority from the TOP standards.		
New York Independent System Operator (NYISO)	No	The NYISO has a concern with the term ensure. We suggest revising the phase to, 'maintain the reliability of it's...' R1/R2: The NYISO does not support the removal of the phrase, ' within it's TOP/BA Area'. Entities do not have authority to direct others outside of their area. In addition R3 only requires those to comply that are in the TOP/BA Area. For consistency, we suggest retaining that above language. R7: The NYISO continues to believe the previous language should be retained to limit the assistance up to and including emergency procedures implemented by the requesting entity. As worded, this could expose the assisting entity to violations for not going beyond what has been implemented. This addition would distinguish it from the previous requirements. To address the SDT response to the previous posting, when declaring an emergency, entities have a number of corrective actions to restore the system to normal. Our proposed language allows assisting entities to implement similar steps, which increase in severity, with the entity that is in the emergency.

Organization	Yes or No	Question 7 Comments
		R13: The NYISO believes that this requirement should be limited to IROL evaluations. We believe the 30 minutes were based on the requirements to be within IROL's in 30 minutes. The 30 minute assessment for SOL's may be too limiting. R16: The NYISO suggests retaining the work 'own'. This would provide clarity that this in only about the equipment the TOP owns and not other equipment. R19/20: The SDT should clarify the purpose of the bracketed entities (Balancing Authority)? The NYISO believes that R19 should be focused on TOP and R20 should be focused on BA.
Response: The SDT has revised the requirement to delete 'ensure' and replace it with 'address' as in the first posting. Due to your comment and those of others, the SDT has restored the language concerning 'within a Transmission Operator/Balancing Authority Area". See summary for wording. The SDT does not believe that the suggested change adds clarity to Requirement R3. No change made. The SDT has capitalized the 'e' in Emergency to provide additional clarity. See summary for wording. The SDT does not agree and believes that the requested Transmission Operator will discuss what procedures the requesting Transmission Operator has put in place as part of normal operating dialogue in these situations. No change made. The SDT does not agree that this requirement should be limited to IROL evaluations. The FERC NOPR made it clear that Transmission Operators should be performing SOL evaluations as well. The SDT wants to reinforce that a Real-time Assessment does not imply that all identified SOL exceedances need to be resolved within 30 minutes. SOL exceedances need to be mitigated consistent with the Transmission Operator's Operating Plan as highlighted in the SOL Exceedance White Paper. IROL exceedances would need to be mitigated consistent with the IROL T_v. No change made. The SDT disagrees and considers the adjective as unnecessary in this context. No change made. The SDT has corrected the typo in requirements R19 and R20. See summary for wording.		
NV Energy	No	The SDT has made a number of improvements to this particular standard in this latest posting. We are troubled by the following items: Definition of Real-Time Assessment contains two provisions that will make compliance with the Requirements

Organization	Yes or No	Question 7 Comments
		unattainable. First, the applicable inputs to the assessment include among other things, “known Protection System status or degradation.” Real time tools are generally incapable of consideration of the performance of protection systems, and accordingly conducting these assessments prescribed in the Requirements will fall short of the expectation. Secondly, the real time assessment is to consider “identified phase angle and equipment limitations.” We are unclear as to whether this is intended to mean the identification of post-contingent standing phase angles (which current RTCA tools are ineffective at modelling and assessing) or alternatively, the identification of the angular limitations of power system equipment, such as sync check permission settings for circuit breakers. Such analyses are more readily conducted using on line power flow tools, and do not lend themselves to the real-time environment. We understand that the insertion of the modifier “applicable” may provide some relief in these considerations, but we fear that compliance enforcement will not allow discretion as to what inputs are applicable and which are not. We appreciate the significant improvement with regard to the language in Requirement R10.With regard to R13, we believe the SDT has improved the language by revisions such that the TOP shall “ensure that a Real-time Assessment is performed at least once every 30 minutes;” however, we continue to question the 30-minute requirement and believe that there will be tremendous difficulty in achieving this without defect. Rather, we would suggest the following: R13: “Each TOP shall ensure that a Real-time Assessment is performed with such periodicity so as to ensure continuous situational awareness of the TOP.” Measure M13 would need commensurate edits to conform with this R13 language.

Response: The inclusion of phase angle and Special Projection Scheme status is based on FERC NOPR and Southwest Outage recommendations. The SDT felt it was more prudent to include these items as part of the Real-time Assessment definition as opposed to a specific requirement within the standard. SDT has incorporated “applicable” based on industry feedback and believes that the proposed definition reflects an entity’s responsibility to model and assess the impacts of Protection Systems and/or phase angles. Modeling and assessment of Special Protection Schemes and/or phase angles would be supported by Operating Plans. For

Organization	Yes or No	Question 7 Comments
example, an Operating Plan could instruct those performing a Real-time Assessment to enable/disable specific Contingencies that reflect Special Protection Scheme status (in-service or out-of-service).No change made. An entity can only provide data and information on what it has available and the addition of the term 'applicable' was intended to capture that intent and to protect an entity against unreasonable expectations. No change made. The SDT does not agree. The requirement allows for an entity to arrange for another entity to perform the assessment which aligns with requirements in approved EOP-008-1. Approved EOP-008-1 specifically requires entities to have tools and applications to ensure that System Operators have situational awareness of the BES. It goes on to require that entities take necessary actions to manage the risk to the BES during periods when primary or backup functionality may not be available. This requirement isn't about maintaining RTCA or any other specific tool, it's about maintaining situational awareness at all times. No change made.		
Tennessee Valley Authority	No	There should be more than one level of VSL. As currently written there seems to be no allowance for instances where entities may be operating at two different ratings (i.e. temperature-dependent ratings, directional ratings, etc.) or a period of time before the entities coordinate which rating should be used in real-time.
Response: VSL comments are addressed in q11.		
Peak Reliability	No	There still needs to be clarity about conflicting Operating Instructions. For example, if TOP 1 gives and Operating Instruction to TOP 2 and then TOP 3 gives an Operating Instruction to TOP 2, which one trumps? The same would be true for BAs. This creates potential conflicts for TOPs, BAs, and RCs. "within its ... Area" should not have been removed. R9: Why restrict to NERC registered entities when this term was removed from other requirements throughout the IRO/TOP revisions? R13: Should be clarified what evidence will be needed to ensure that a Real Time Assessment is performed if the entity does not perform it themselves. If an entity relies on a third party to perform the Real-Time Assessment, there should be a requirement showing that this reliance was coordinated with the third party.

Organization	Yes or No	Question 7 Comments
Response: The SDT does not believe that a Transmission Operator can deliver an Operating Instruction to another Transmission Operator. Such instructions would have to be provided by a Reliability Coordinator. However, due to your comment and those of others, the SDT has restored the language concerning 'within a Transmission Operator/Balancing Authority Area". See summary for wording. Requirement R9 has been corrected. See summary for wording. The SDT does not believe that a requirement is necessary for this issue and that it can, and will, be handled through the measure for this requirement. No change made.		
Colorado Springs Utilities	No	We agree with Southwest Power Pool comments for this question. We were not allowed to associate with another entities comments at the beginning of this comment form so we are stating that in the questions. The following are our additional comments above and beyond what SPP's comments are. R13 - Would a tool such as a state estimator or RTCA be required to meet the Real-time Assessment definition or can it be done without "real-time" tools? Your response to our previous comments allude to the fact that all entities are currently using or contracting for such "real time" tools which is not universally true. Additional implementation period is needed and thus requested due to the time needed for budgeting and implementation of "real time" tools.
Response: The requirement does not specify how an entity will accomplish the task. RTCA would be one method but there are others. And, the requirement leaves open the possibility of aligning with a third-party to accomplish the task. Therefore, the SDT does not believe that additional implementation time is required. No change made.		
IRC Standards Review Committee	No	We do not have any concerns or comments on R19 and R20, which are added to address data exchange requirement and to achieve consistency with the proposed IRO-002-4, Requirement R2. However, we suggest that the SDT add Requirement R20 to the NERC issue data base along with requirements R2, R5, R6, R11, and R17 which the SDT agrees with our previous comment that these requirements belong to the

Organization	Yes or No	Question 7 Comments
		BAL standards and hence a future assessment of creating such a BAL standard will be conducted.
Response: The SDT has already informed NERC management of the need for a future project to separate the Balancing Authority from the TOP standards.		
Western Area Power Administration	No	Western has a concern on the use of the word ensure in R1 and R2. The concern is that whenever there is a reliability event it would be a violation of this requirement, since the TOP, in R1, or BA, in R2, didn't provide instructions that ensured the reliability of its area. We would suggest changing the last portion of R1 to '.... issuing Operating Instructions in accordance with its responsibilities as a Transmission Operator within its Transmission Operator Area.' and the last portion of R2 to '....issuing Operating Instructions in accordance with its responsibilities as a Balancing Authority within its Balancing Authority Area.'
Response: The SDT has revised the requirement to delete 'ensure' and replace it with 'address' as in the first posting. Due to your comment and those of others, the SDT has restored the language concerning 'within a Transmission Operator/Balancing Authority Area". See summary for wording.		
Florida Municipal Power Agency	Yes	In R16 and R17, FMPA suggests replacing the words "to approve" with "over" to make it clear that the authority is all encompassing and that input on planned outages is required from the System Operators. In R16, FMPA suggests replacing "Real-time Assessment" with "analysis" to be consistent with the similar requirements for the RC and BA.FMPA notes that the number of contingencies to be studied is absent from the definition of Real-time Assessment, see comments on TOP-002-4.
Response: The SDT does not believe that the suggested change adds clarity. No change made. The SDT agrees and has used 'analysis' for consistency. See summary for wording. See response to TOP-002-4 for other considerations.		

Organization	Yes or No	Question 7 Comments
FRCC Operating Committee (Member Services) City of Tallahassee, TAL	Yes	The FRCC Operating Committee supports a majority of these proposed requirements. However, the OC does not support the language in new requirement R9 and finds that the mapping from current requirement (TOP-003-1 R3) is incomplete and needs to be addressed by the standard drafting team. The language in the existing TOP-003-1 R3 is more precise and should remain as is. If the SDT is attempting to address the comments from the SW Outage Report Recommendations "TOPs should ensure procedures and training are in place to notify WECC RC and neighboring TOPs and BAs promptly after losing RTCA capabilities," they should create a separate requirement to reflect the notification for loss of Real-time Assessment capabilities. At a minimum, the requirement should state "telemetering and control equipment", rather than "telemetering equipment, control equipment". This will add clarification to the type of equipment being addressed in the requirement. In addition, the word "planned" from M9 was not removed as noted in SDT responses. We also recommend removing the words "interconnected NERC Registered". The word "impacted" reflects who should be notified. The current mapping of existing TOP-003-1 R3 to TOP-001-3 R9 does not accurately reflect the original intent of TOP-003-1 R3. R19 and R20 have some inconsistencies with referencing TOPs and BAs.

Response: The SDT believes that the current language accurately reflects the intent of the requirement and is an accurate representation of existing requirements. However, the SDT agrees with the suggested change regarding telemetering and control equipment. See summary for wording.

'Planned' and 'NERC registered' have been removed from the measure. See summary for wording.

The SDT has corrected the typo in requirements R19 and R20. See summary for wording.

Organization	Yes or No	Question 7 Comments
Ameren	Yes	We are concerned that an entity may have a reportable NERC violation if Contingency Analysis is down for more than 30 minutes.
Response: The SDT does not agree. The requirement allows for an entity to arrange for another entity to perform the assessment which aligns with requirements in approved EOP-008-1. Approved EOP-008-1 specifically requires entities to have tools and applications to ensure that System Operators have situational awareness of the BES. It goes on to require that entities take necessary actions to manage the risk to the BES during periods when primary or backup functionality may not be available. This requirement isn't about maintaining RTCA or any other specific tool, it's about maintaining situational awareness at all times. No change made.		
MRO NERC Standards Review Forum	Yes	We believe that requirement R9 to notify impacted entities of planned outages of telemetering equipment, control equipment, and monitoring and assessment capabilities is too broad. Also, the current wording of the requirement would have the Balancing Authority and Transmission Operator providing notifications for all outages even those lasting only a couple of minutes or a few seconds. Therefore, we propose the following revision to R9: R9 Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and known impacted entities of "planned outages" of telemetering and telecommunication equipment, control equipment, monitoring and assessment capabilities lasting 30 minutes or longer. Requirements R16 and R17 require that TOP and BA give authority to their system operators to approve planned outages of telemetering and telecommunication equipment, control equipment, monitoring and assessment capabilities, and associated communication channels. Using the same rationale of R9, we propose to revise R16 and R17 as follow: R16 Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance last 30 minutes or longer of its monitoring, telecommunication, and Real-time Assessment capabilities. R17 Each Balancing Authority shall provide its System Operators with the authority to approve planned outages and maintenance last 30 minutes or longer of its monitoring, telecommunications, and analysis capabilities. Similarly, IRO-002-4 requirement R2 should also be revised as follow: R2 Each Reliability Coordinator shall provide its System Operators with the authority to

Organization	Yes or No	Question 7 Comments
		approve planned outages and maintenance last 30 minutes or longer of its telecommunication, monitoring and analysis capabilities.
Response: The SDT believes that the use of the term 'impacted' obviates any concern for momentary outages or glitches as such problems would be unlikely to impact other entities. No change made. The SDT does not believe that the suggested change adds clarity. No change made.		
Arizona Public Service Company	Yes	
Clark Public Utilities	Yes	
Manitoba Hydro	Yes	
Pepco Holdings Inc.	Yes	
Idaho Power Company	Yes	
Salt River Project	Yes	
Tri-State Generation and Transmission Association, Inc.	Yes	
Northeast Utilities	Yes	
PJM Interconnection	Yes	
Response: Thank you for your response.		

8. **Do you agree with the changes made to respond to industry comments to proposed TOP-002-4? If not, please provide technical rationale for your disagreement along with suggested language changes.**

Summary Consideration: The SDT has made the following non-substantive changes due to industry comments:

M2. Each Transmission Operator shall have evidence that it has an Operating Plan to address potential System Operating Limits (SOLs) exceedances identified as a result of the Operational Planning Analysis performed in Requirement R1. Such evidence could include but it is not limited to plans for precluding operating in excess of each SOL that was identified as a result of the Operational Planning Analysis.

R3. Each Transmission Operator shall notify ~~impacted~~ entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in those plan(s).

R5. Each Balancing Authority shall notify ~~impacted~~ entities identified in the Operating Plan(s) cited in Requirement R4 as to their role in those plan(s).

Organization	Yes or No	Question 8 Comments
PacifiCorp	No	: PacifiCorp cannot support the standard as proposed with the removal of the term NERC Registered from R3 and R5 given that the obligation to notify non-NERC Registered entities introduces an element of uncertainty into our notification obligations. Also, does next day require DMCC changes for Saturdays and Sundays? At least Operating Plan Analysis seems to allow for next-day analysis. Is the intention to mandate 24/7 rotating staff in control rooms?
Response: There are entities that fulfill the functional roles as described in the Functional Model which are not necessarily registered at NERC. This is especially true for some entities in the Canadian provinces. If the term 'NERC registered entities' is used those unregistered entities would not be included in the requirements. Removing that specific language includes those unregistered entities. No change made. The SDT can't tell any entity how to do its job. It can only write requirements. In this case, the SDT believes that it is important for reliability to have a valid next-day analysis available. How an entity accomplishes this is up to them.		
Texas Reliability Entity	No	1) Requirement R4: Texas RE reiterates our previous comments regarding adding a new requirement for the BA to have an Operational Planning Analysis (in line with R1

Organization	Yes or No	Question 8 Comments
		language for the TOP). The SDT responded to the initial comment that creation of an Operating Plan fulfills the reliability need. We continue to maintain that it appears there is a gap for the BA responsibilities. The BA must perform some type of Operational Planning Analysis in order to develop their Operating Plan for the next day. Texas RE requests the SDT further consider this suggestion. 2) Requirement R6: Texas RE requests the SDT consider whether the TOP should also be required to provide its Operating Plan(s) for next-day operations to the BA. The following questions are submitted to assist the SDT's assessment of our request. Without the TOP Operating Plan, how will a BA perform its assessment of delivery capability if it does not have predicted or planned transmission outages from the TOP(s)? 3) Requirement R7: Texas RE requests the SDT consider whether the BA should also be required to provide its Operating Plan(s) to TOPs. Without the BA Operating Plan, it is unclear how a TOP will perform its assessment to determine if there will be any SOL exceedances if it does not have the predicted generation dispatch and demand patterns from the BA.
Response: 1) The SDT does not believe that the Balancing Authority can perform an Operational Planning Analysis given the proposed definition. Nor does the SDT believe that the Balancing Authority needs to perform a special analysis in order to fulfill its responsibilities. There are mechanisms already in place in the BAL standards that allow the Balancing Authority to monitor and react to the proposed situations. In addition, the Reliability Coordinator and Transmission Operator would be monitoring the system and coordinating with the Balancing Authority as needed. No change made. 2) Since the Transmission Operator's Operating Plan may contain confidential Transmission information that a Balancing Authority can't see, the SDT believes that submittal of the plan to the Reliability Coordinator is the correct mechanism. If there are situations that arise where there are potential conflicts between the plans of the Transmission Operator and Balancing Authority, the SDT believes that the role of the Reliability Coordinator, both in this standard and in proposed IRO-017-1, will take care of those situations. In addition, the SDT points to proposed TOP-003-3 in which Transmission Operators and balancing Authorities can exchange information through the data specification concept. No change made. 3) See response to item 2. No change made.		
Associated Electric Cooperative, Inc. - JRO00088	No	In R1, the OC Review Group suggests adding the word "identified" before "SOLs" to clarify transmission operators are operating to the identified SOLs. Suggested

Organization	Yes or No	Question 8 Comments
South Carolina Electric and Gas		Wording: “R1: Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its identified System Operating Limits (SOLs).”
Georgia Transmission Corporation	No	In R1, the GSOC suggests adding the word “identified” before “SOLs” to clarify transmission operators are operating to the identified SOLs. Suggested Wording: “R1: Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its identified System Operating Limits (SOLs).”
Response: The SDT believes the suggestion does not add clarity. No change made.		
Bonneville Power Administration	No	BPA suggests referencing the System Operating Limit (SOL) Definition and Exceedance Clarification white paper in the language of the Requirements, as Regional Entities are not required to audit to appendices, unless indicated by the language of a Requirement.
Response: The SOL Exceedance White Paper is background material that pieces together existing requirements across FAC, TOP, and IRO standards and is not a necessary ingredient as part of the TOP standard. The SDT believes that the requirements are sufficiently robust to stand-alone and that the White Paper is just corroborating material. No change made.		
Hydro-Quebec TransEnergie	No	In R1, replace "shall have an Operational Planning Analysis" by "shall perform an Operational..." In R2, replace "as required in Requirement R1" by "performed in requirement R1" for consistency with M2.Do not capitalize "requirement" since it is not a defined term. R6: Why not put that requirement in R2? Simply add "...and provide that plan to its Reliability Coordinator" to the end of R2 (same for R7). The standard would be more clear and concise.

Organization	Yes or No	Question 8 Comments
		Compliance section 1.2: As proposed, the section doesn't give any useful information. That section should actually serve to list the actual processes that will be used for that particular standard. Or at least refer to the actual section of the ROP that lists the processes used (Appendix 4C, section 3.0). Table of Compliance Elements : See comment made for TOP-001-3 Associated Documents: The content of the white paper shouldn't be included in the standard. A reference with a hyperlink would be enough.
Response: R1 – The SDT disagrees. The present wording allows for an entity to use an existing Operational Planning Analysis if it is still pertinent. The SDT believes this flexibility relieves the entity of a possible undue burden. The suggested language would not allow for such flexibility. No change made. R2 – The SDT believes the present wording is correct given the explanation in item 1 above. It is standard procedure in Reliability Standards to capitalize the word 'Requirement' when it is used within a requirement. No change made. R6 – The SDT believes that the suggested consolidation would create a single requirement that contains two actions (a compound requirement) which SDT Guidelines state should be avoided. No change made. The Compliance section is boilerplate language supplied by NERC. The SDT did not change this boilerplate language. The SDT will pass this comment on to NERC Legal. No change made. See response to TOP-001-3. The SOL Exceedance White Paper is background material that pieces together existing requirements across FAC, TOP, and IRO standards and is not a necessary ingredient as part of the TOP standard. The SDT believes that the requirements are sufficiently robust to stand-alone and that the White Paper is just corroborating material. No change made.		
Florida Municipal Power Agency	No	It seems the SDT did not understand FMPA's previous comment regarding R1. FMPA's comment was not concerning ratings or the determination of SOLs, it was concerning the contingencies to be studied in the Operational Planning Analysis (OPA). The phrase "N-1 Contingency planning" no longer exists with the revisions to these standards, and the number of contingencies to be studied is not described in the definition of Operational Planning Analysis. So, is the TOP's OPA supposed to consider

Organization	Yes or No	Question 8 Comments
		N-2 events? N-3? Loss of an entire substation? It should be clear that the level of contingencies studied in the OPA is the same level of contingencies studied to determine SOLs, thus our suggestion to refer to the performance requirements in FAC-011 or to add the phrase “in accordance with its RC’s SOL Methodology”. Otherwise, the OPA could show an exceedance of an SOL due to a contingency scenario that was not required to be considered in determining that SOL. As written, R1 is left open to interpretation, may not be measureable, and could set more stringent BES performance criteria than is already contained in the standards.
Response: The SDT does not want to be overly prescriptive. The Transmission Operator has the obligation to preserve the reliability of the interconnected Transmission system. The Contingencies to be handled in an Operational Planning Analysis are laid out in the Reliability Coordinator’s SOL methodology and the SDT expects that an entity will adhere to that methodology when performing its Operational Planning Analysis. No change made.		
MidAmerican Energy Company	No	MidAmerican remains concerned that the real-time assessment and operational planning assessment definitions as written will be wrongly interpreted to require things a real-time assessment tool cannot perform or an operational planning assessment cannot comply with. Real-time Assessment tools are not dynamic assessment tools and do not inherently understand phase angle impacts nor stability as suggested by the inclusion of Protection System status, degradation, and identified phase angle / equipment limitations. The SDT could check with real-time assessment vendors and verify that the revised definitions match the capabilities of real-time assessment tools and adjust the proposed definition. At a minimum, the SDT needs to clarify / modify words in the definition to ensure that real-time assessment tools can be compliant. Suggested clarifications include: Real-time assessment means a steady state analysis of thermal and voltage impacts. Power system transients, dynamics, nor actual phase angles are required. Protection Systems in the case of Real-time Assessment means the accurate system topology representation of normal protection system clearing (e.g. a three-terminal line as a single N-1 next worse contingency).Identified phase angles and equipment limits are identified in-terms of equipment ratings (amps, MVA, etc.). Phase angle inputs (from PMU’s etc.) or phase

Organization	Yes or No	Question 8 Comments
		angle calculations are not required. Further, personnel cannot be substituted for Real-time Assessments tools due to the 30 minute limitations imposed. Power system transient or dynamic analyses using real-time data can be time consuming to construct and run. At most, only a few power system dynamic analyses can be performed in the space of 30 minutes and may not keep pace with changing real-time conditions. Removal of the limiter “NERC registered” in reference to the entities that are to be notified under R3 opens the requirement scope to an un-provable state and potential non-compliance. MidAmerican suggests the modifier “NERC registered” be restored in front of “entities.”
Response: The SDT recognizes that not all entities are capable of performing Real-time transient Stability analysis within 30 minutes and would rely on Operating Plans. The inclusion of phase angle is based on the Southwest Outage recommendations. The SDT felt it was more prudent to include this item as part of the definition as opposed to a specific requirement within the standard. SDT has incorporated “applicable” based on industry feedback and believes that the proposed definition reflects an entity’s responsibility to model and assess the impacts of phase angles. For example, modeling and assessment of phase angle reclosing limitations would be supported by Operating Plans. An entity can only provide data and information on what it has available and the addition of the term ‘applicable’ was intended to capture that intent and to protect an entity against unreasonable expectations. No change made. There are entities that fulfill the functional roles as described in the Functional Model which are not necessarily registered at NERC. This is especially true for some entities in the Canadian provinces. If the term ‘NERC registered entities’ is used those unregistered entities would not be included in the requirements. Removing that specific language includes those unregistered entities. No change made.		
Duke Energy	No	R1: Duke Energy suggests re-writing R1 as follows: ”Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any identified System Operating Limits (SOLs).”We believe the addition of “identified” adds additional clarity and conforms to the language in FAC-011.

Organization	Yes or No	Question 8 Comments
		R2: Duke Energy requests clarification on whether a process for each SOL exceedance identified in the Operational Planning Analysis is necessary or is one document that address any and all exceedances of SOL(s) is acceptable? R3: Duke Energy believes "impacted" is not needed in the context of the requirement and suggests removal. R4: No Comment R5: Duke Energy believes "impacted" is not needed in the context of the requirement and suggests removal. R6/R7:Duke Energy suggests the following for R6:"Each Transmission Operator shall provide the results of its Operating Planning Analysis for next-day operations identified in Requirement R2 to its Reliability Coordinator." We also believe that R6 and R7 goes beyond the scope of Recommendation 1 of the SW Outage Report. The report indicates that TOPs should share the results with neighboring TOPs and RCs, and not necessarily the Operating Plan itself. In addition, the BA is not cited in Recommendation 1 of the SW Outage Report as having to do the same type of analysis.
Response: R1 - The SDT believes the suggestion does not add clarity. No change made. R2 – The SDT outlined its beliefs on this matter in the associated explanation of Operating Plan which appears in Section F of the proposed standard. R5 – The SDT agrees and has made the suggested change. See summary for wording. R6/R7 – The SDT believes that simply providing the results could be potentially misleading and that it would be better for reliability to provide the entire plan. While the SDT agrees that the SW Outage report did not specifically spell out the Balancing Authority, that inclusion of the Balancing Authority is consistent with the over-all approach of the project standards and makes sense for reliability. No change made.		
Xcel Energy	No	R2 - is the descriptor "potential" needed?

Organization	Yes or No	Question 8 Comments
		Do R6 & R7 need a qualifier "...by the time frame established by the RC"?

Response: The SDT believes that since the requirement is dealing with next-day operations that haven't happened, that the use of 'potential' is correct and needed. No change made.

The SDT believes that the Transmission Operator/Balancing Authority will coordinate with the Reliability Coordinator as to when the plans need to be submitted and that placing such language in a requirement is unnecessary and could be detrimental. No change made.

Organization	Yes or No	Question 8 Comments
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	No	R3 - It is not clear why the SDT removed the qualifier "NERC registered". Southern recommends adding "NERC registered" back to the requirement. The NERC registered entities have established a reliability relationship with the RC, TOP, and BA and should be notified per this requirement. R5 - See comment regarding removal of "NERC Registered" for R3. Also, in the SDT's consideration of our previous comments, the SDT states they do not believe R5 requires notification. Given R5 clearly states that the BA shall notify impacted entities, it is not clear what the SDT's expectation / interpretation of this requirement is. Southern suggests modifying the requirement to incorporate the concept that notification from the BA is only required to entities where the BA is requesting an action that is different than what the entity provided to the BA. For example, if a GOP provided their expected generation resource commitment and dispatch to the BA, the BA reviews the information and determines that this particular GOP needed to commit additional units to provide more regulation, frequency response, etc., then the BA should notify this GOP. If another GOP provided data and the BA did not have any suggested changes, then there should not be a notification requirement. Suggested changes are as follows: "Each Balancing Authority shall notify NERC registered entities identified in the Operating Plan(s) cited in Requirement R4 when the BA is requesting the entity to take an action that is different from the last submitted plan the entity originally provided to the BA."

Organization	Yes or No	Question 8 Comments
Response: There are entities that fulfill the functional roles as described in the Functional Model which are not necessarily registered at NERC. This is especially true for some entities in the Canadian provinces. If the term 'NERC registered entities' is used those unregistered entities would not be included in the requirements. Removing that specific language includes those unregistered entities. No change made. The SDT disagrees and believes that specific notifications should be delivered for each day's Operating Plan. No change made.		
SPP Standards Review Group Kansas City Power & Light Colorado Springs Utilities	No	R4 - We suggest that load forecast uncertainty and resource uncertainty be added to the list of Parts for Requirement R4.1.3 Data Retention - Hyphenate 90-calendar days in 1.3 Data Retention for consistency with the other standards in this package.
Response: The SDT believes that uncertainty can be handled within the existing requirement language in Requirement R4, Parts 4.1 and 4.3. No change made. The SDT agrees and has corrected the typos.		
Electric Reliability Council of Texas, Inc.	No	The current definition of Operating Plan states "a document". Please refer to previous comments for IRO-008 related to this issue. For R3 and R5, please see previously provided comments for IRO-008 R4.For R4, the SDT should consider consistency of use of "Demand patterns" and "Load Forecast".
Response: See response to IRO-008-2 comment. Without a specific reference for consistency, the SDT believes that the current language is correct. No change made.		
Northeast Power Coordinating Council Hydro One	No	The proposed definition for Operational Planning Analysis shown in the Definitions of Terms Used in Standard should be a redline of what is in the NERC Glossary. The Rationale for Requirement R1 can be removed, and be placed in a guideline or support document.

Organization	Yes or No	Question 8 Comments
		The Rationale for Requirement R3, and Rationale for Requirements R4 and R5 can be removed. It belongs in Consideration of Comments. The Rationale for Requirements R6 and R7 can be removed, and be placed in a guideline or support document.
Response: Due to the extensive changes made to the two definitions, the SDT believes that it would have caused considerable confusion if a redlined version had been supplied. No change made.		
Northern Indiana Public Service Company (NIPSCO)	No	TOP-002-4 R1 requires that you perform an analysis that identifies SOL exceedances, but SOLs are not explicitly included as a study input in the Operational Planning Analysis definition, only Facility Ratings, which are only a subset of FAC-014-2 R2 SOLs. There seems to be operating plans created by the TOP in R2 and operating plans created by the RC in IRO-008-2. How are conflicts resolved if the results differ? How does the R2 Operating Plan mesh with the operating plan specified in VAR-001-4 R1? Are they the same?
Response: The SDT believes that if an entity observes its applicable Facility Ratings in pre- and post-Contingency situations that it will avoid SOL exceedances since SOLs are based on Facility Ratings. The SDT believes that there are existing protocols for resolving conflicts and that the exchange of Operating Plans required by these proposed standards facilitate the identification of any potential conflicts and start the conflict resolution process. No change made. The SDT believes that the plan cited in VAR-001-4 Requirement R1 would be one part of the Operating Plan cited in this proposed standard.		
NV Energy	No	We are troubled by the removal of the limiter “NERC registered” in reference to the entities that are to be notified under R3. This unnecessarily opens the requirement scope to an un-provable state. Suggest restoring the modifier “NERC registered” in front of “entities.”

Organization	Yes or No	Question 8 Comments
Response: There are entities that fulfill the functional roles as described in the Functional Model which are not necessarily registered at NERC. This is especially true for some entities in the Canadian provinces. If the term 'NERC registered entities' is used those unregistered entities would not be included in the requirements. Removing that specific language includes those unregistered entities. No change made.		
Puget Sound Energy		The language of measure M2 is inconsistent with requirement R2 - it is missing the word "exceedance" after the phrase "System Operating Limits (SOLs)".
Response: The SDT agrees and has made the suggested change to ensure consistency. See summary for wording.		
MRO NERC Standards Review Forum Lincoln Electric	Yes	As currently drafted, R6 would require the Transmission Operator to provide its Operating Plan to the Reliability Coordinator every day (next day studies) regardless of whether the Plan is modified or not. To prevent unnecessary duplication as well as allow for greater flexibility in the requirement, recommend modifying R6 as follows to allow the Transmission Operators and Reliability Coordinators to develop an arrangement or schedule.R6. Each Transmission Operator shall provide its Operating Plan(s) for next-day operations identified in Requirement R2 to its Reliability Coordinator in accordance with the Reliability Coordinator's schedule.
Response: The SDT disagrees with the commenter's statement. The present wording allows for an entity to use an existing Operational Planning Analysis if it is still pertinent. The SDT believes this flexibility relieves the entity of a possible undue burden. The suggested language would not allow for such flexibility. No change made.		
Ameren	Yes	Our Daily Analysis supplements the MISO Operational Planning Analysis and although we could rely on MISO, we have chosen to go beyond what is required.

Response: Thank you for your support.		

9. **Do you agree with the changes made to respond to industry comments to proposed TOP-003-3? If not, please provide technical rationale for your disagreement along with suggested language changes.**

Summary Consideration: The SDT has made the following non-substantive changes due to industry comments:

R1, Part 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including ~~sub-100 kV~~non-BES data and external network data as deemed necessary by the Transmission Operator.

Organization	Yes or No	Question 9 Comments
ACES Standards Collaborators Georgia Transmission Corporation	No	(1) The applicability section needs to be revised to remove the Load Serving Entity. The Risk Based Registration project will retire the LSE from Appendix 5B from the NERC Rules of Procedure. Having the LSE listed as an applicable entity leads to confusion and questions. For example, a reviewer of this standard could question how the RBRAG could arrive at the conclusion that LSE is not needed for reliability but this drafting team apparently determined it was needed for reliability by including it in the standard. At the very least, if the SDT is not intending to contradict the RBRAG's finding's a rationale box should state that LSE is only being included for historical purposes and will be removed pending the final approval of the RBRAG recommendations by the NERC Board of Trustees. (2) Requirement R1 is problematic because it lists sub-100 kV transmission equipment as being subject to a standard. Sub-100 kV transmission equipment are not subject to reliability standards unless they are deemed to be a part of the Bulk Electric System. A simple solution would be to remove the clause "including sub-100 kV facilities needed to make this determination." If these sub-100 kV facilities are needed for reliability they would be part of the BES inclusion process and would be covered by the NERC defined term "Facilities."

Organization	Yes or No	Question 9 Comments
		(3) For Requirements R1 and R2, we recommend changing the term "Special Protection System" to "Remedial Action Scheme" because the SDT Project 2010-05.2 has determined that RAS is more appropriate and SPS will be retired upon FERC approval. This standard would potentially have an outdated glossary term if it keeps SPS in the requirement. (4) Requirement R5 should be revised to remove the LSE function.
Response: (1) As previously stated, the Load-Serving Entity will be removed from all pertinent standards and requirements when the registration project is completed and approved. This activity will be a separate endeavor and will encompass all pertinent standards. The SDT does not believe that leaving the Load-Serving Entity in the applicability of these standards will cause any confusion. No change made. (2) The SDT has clarified its intent in revised wording. See summary for wording. (3) The term Special Protection System remains within the NERC Glossary as an approved term. If at some point in the future, this term is replaced, a change to this standard can and should be proposed to conform it to the new term. No change made (4) As previously stated, the Load-Serving Entity will be removed from all pertinent standards and requirements when the registration project is completed and approved. This activity will be a separate endeavor and will encompass all pertinent standards. The SDT does not believe that leaving the Load-Serving Entity in the applicability of these standards will cause any confusion. No change made.		
Texas Reliability Entity	No	1) Requirement R1.1: Texas RE requests that the SDT consider replacing the term "sub-100 kV" with "non-BES" to be more inclusive of those facilities where data or monitoring may be needed. For instance, the RC may choose to monitor private use networks or radial lines connected to large loads/generation connected at greater than 100 kV but are excluded from the BES, in addition to sub-100 kV facilities. This change would not be needed if it is the intent of the SDT that the reference to "sub-100 kV" facilities is for those facilities that have been intentionally included in the BES due to their criticality? 2) Requirement R2: Texas RE reiterates our previous comments about replacing "analysis functions" with "Operational Planning Analysis." This comment relates to the TOP-002-4, R4 comment for requiring a BA to have an Operational Planning

Organization	Yes or No	Question 9 Comments
		Analysis. The SDT responded to the initial comment that creation of an Operating Plan fulfills the reliability need. We continue to maintain that it appears there is a gap for the BA responsibilities. The BA must perform some type of Operational Planning Analysis in order to develop their Operating Plan for the next day. Texas RE requests the SDT further consider this suggestion.
Response: The SDT has clarified its intent in revised wording. See summary for wording. The SDT considers that "analysis functions" is an adequate description of the Balancing Authority's study process, and considers that the proposed definition of Operational Planning Analysis would require the Balancing Authority to possess information related to Transmission limitations unrelated to the act of balancing Load and resources. There is not reliability gap. No change made.		
Electric Reliability Council of Texas, Inc.	No	Additional thought should be given to the overall approach to incorporating Protection System Status. While SPSs are currently in the standards, incorporating the broader definition of Protection Systems will likely incur additional hardware, modeling, display creation, etc. ERCOT does not support its inclusion without a holistic review of its impact within the standards. At a minimum, the implementation timeframe should be extended to realize that additional time is necessary after the RC requests the data, for an entity to actually provide such data. ERCOT recommends a minimum of 24 months vs the 12 months for R3.
Response: This data concerning Protection System status is currently collected routinely and data transfer mechanisms are in place. Twelve months is a reasonable time frame to implement Requirement R3. The SDT assumes that the commenter meant to say Transmission Operator and not Reliability Coordinator. The SDT does not intend for the Transmission Operator to monitor Protection Systems rather the intent is for the equipment owner to notify the Transmission Operator when a Protection System failure could impact how the Reliability Coordinator assesses reliability, i.e., changes Contingencies that need to be studied. No change made.		
Hydro-Quebec TransEnergie	No	Compliance section 1.2 : As proposed, the section doesn't give any useful information. That section should actually serve to list the actual processes that will be used for that

Organization	Yes or No	Question 9 Comments
		particular standard. Or at least refer to the actual section of the ROP that lists the processes used (Appendix 4C, section 3.0).
Response: The Compliance section is boilerplate language supplied by NERC. The SDT did not change this boilerplate language. The SDT will pass this comment on to NERC Legal. No change made.		
Duke Energy	No	Duke Energy asks the SDT to consider adding a mechanism to allow a recipient of a request to challenge the requestor if a reliability related need cannot be established. For example, should a BA wanting to know the ACE of every BA within the Eastern Interconnection be allowed to get this information if there is not a reliability related need to have the information?
Response: The SDT is unconvinced that a requestor will consistently request data that it does not need to assure continued reliability. The SDT understands your concern but this does not rise to the level of a standard requirement. No change made.		
Ingleside Cogeneration , LP	No	ICLP agrees there are times where the TOP will need data regarding certain sub-100 kV facilities to ensure operational reliability. However, these facilities must be limited to those identified using the NERC exception process deployed concurrently with the new BES Definition. This process was developed precisely for this reason - and eliminates the possibility that the TOP can declare any sub-100 kV facility to be under their authority without justification. This opens the door to rash actions on the part of TOPs eager to close a perceived reliability gap based upon a single incident, which may or may not be reasonable. If the project team believes that the exception process is inadequate, a better solution may be found in that venue (in NERC's Rules of Procedure). ICLP would suggest that a temporary exception could be quickly granted for a concerned TOP - that a full evaluation by an independent panel would take place afterwards.
Response: Requirement R1, part 1.1 was added to directly address Recommendations # 3 and 6 of the SW Outage Report and the FERC NOPR. The SDT has clarified its intent in revised wording. See summary for wording.		

Organization	Yes or No	Question 9 Comments
ReliabilityFirst	No	ReliabilityFirst offers the following comments for consideration.1. Requirement R1, Part 1.1 - ReliabilityFirst requests the SDT define the term “as deemed necessary” in Requirement R1, Part 1.1. ReliabilityFirst finds that the first bullet of “Section 4 - Measurability” of the NERC document titled Acceptance Criteria of a Reliability Standard states “Words and phrases such as “sufficient”, “adequate”, “be ready”, “be prepared”, “consider”, etc. should not be used.” ReliabilityFirst believes the phrase “as deemed necessary” is such a phrase, which leaves the requirement open to interpretation making it difficult to enforce and therefore, should not be used in the Standard.
Response: In Requirement R1 Part 1.1, “as deemed necessary” refers to the certain data elements that the Transmission Operator decides is needed. This would not be a measurement component of this requirement, since Requirement R1 Part 1.1 requires the publication of a list, which can be objectively measured during an audit. No change made.		
CPS Energy	No	see comments for IRO-010-2
CenterPoint Energy Houston Electric LLC	No	See comments for IRO-010-2.
Response: See response to IRO-010-2.		
Northeast Power Coordinating Council Hydro One	No	The proposed definitions for Real-time Assessment and Operational Planning Analysis shown in the Definitions of Terms Used in Standard should be a red line of what is in the NERC Glossary. Additional information should be added to the Rationale for Requirement R5 for justification and background.
Response: Since the changes to the two definitions were so extensive, the SDT believed it would be confusing to provide a redline version of the definitions. No change made. The SDT believes that the rationale provided is sufficient when taken in conjunction with the NOPR comment. No change made.		

Organization	Yes or No	Question 9 Comments
Salt River Project	No	The Requirements go way beyond the established NERC process in creating and modifying current standards. The goal is stated to create reliability standards that “use a results based approach that focuses on performance, risk management and entity capabilities”. I suggest that the requirements in TOP-003-3 do not meet this threshold in that the burdensome requirements do not result in a significant enhancement in reliability nor do they consider entity capabilities. I suggest that the SDT work on creating a simple and efficient process to verify that necessary operating data is being freely exchanged as needed among entities. A suggestion might be to create a regional committee to address those conflicts that might occur between entities. If an entity is not able to obtain necessary operating data from an entity, they could provide a report to this committee and the committee could resolve the conflict. This would allow entities to obtain the data needed and avoid the significant burden associated with this Standard.
Response: The need for data to support reliability is unquestioned in a system where multiple Balancing Authorities, Transmission Operators and Reliability Coordinators are coordinating together to preserve reliability. The proposed change would produce delays in securing the data necessary to support preserving reliability. No change made.		
Indiana Municipal Power Agency	No	The use of a documented specification for the data needed by the Transmission Operator is extremely vague and allows the inclusion of all other data needed by the current NERC standards which creates a double jeopardy issue or an instance where an entity may meet one NERC standard but violate IRO-010-2. For example, VAR-002-3 becomes effective on October 1, 2014 and does not require the notification of AVR status change if it has been restored within 30 minutes of such change. The Transmission Operator has already given notice that its manuals will reflect this change a few months after October 1, 2014. This means that Generator Operators in this TOP area will have to still give notification within 30 minutes in order not to violate IRO-010-2 even though VAR-002-3 says differently. The documented specification for data needs to exclude data that is covered by other NERC standards to prevent this from happening and to reduce the workload on entities.

Organization	Yes or No	Question 9 Comments
Response: The ability of the Reliability Coordinator to request and receive the data necessary to preserve reliability is a foundation of coordinated system operations. The suggested change would result in an unmeasurable and non-auditable standard. No change made.		
Dominion Compliance Policy	No	While Dominion acknowledges the SDT's consideration of its comments relative to inclusion of the phrase 'sub-100 kV facilities' it still disagrees with the SDT's decision to retain it in this requirement for the reasons previously stated.
Response: Requirement R1, Part 1.1 was added to directly address Recommendations # 3 and 6 of the SW Outage Report and the FERC NOPR. The SDT has clarified its intent in revised wording. See summary for wording.		
Seattle City Light	Yes	SCL appreciates the efforts of the Standard Drafting Team in crafting IRO and TOP Standards that are clearer while generally reducing the burden of compliance documentation. For TOP-003-3, while somewhat burdensome, this Standard makes the process for requiring entities to request and provide real time reliability data standardized. SCL is concerned with the implementation period allowed for this Standard, because in our experience it has taken longer than 12 months to negotiate and implement the necessary data exchange agreements between entities. As such, SCL suggests extending the periods allowed to eighteen and twenty-four months, re-wording the effective date section as follows: Section 5. Effective Date. All requirements except Requirements R5 shall become effective on the first day of the first calendar quarter that is eighteen (18) months after the date that the standard is approved gy an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a stand to go into effect. Where approval by an applicable governmental authority is not required, the stand shall become effective on the first day of the first calendar quarter that is eighteen (18) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction. Requirement R5 shall become effective on the first day of the first calendar quarter that is twenty four (24) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval

Organization	Yes or No	Question 9 Comments
		by an applicable governmental authority is required for a stand to go into effect. Where approval by an applicable governmental authority is not required, the stand shall become effective on the first day of the first calendar quarter that is twenty four (24) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction
Response: Data exchange agreements need not take significant time to negotiate. Data specified by the Reliability Coordinator must be supplied in order to preserve reliability. No change made.		
Ameren	Yes	We are concerned about the change from "Planned Outage Coordination" to "Operational Reliability Data" which as we understand deals with the specification and exchange of data for use in studies for which we find the languages confusing and needing clarification.
Response: Planned Outage Coordination is now in proposed IRO-017-1.

10. **Do you have any comments on the changes made to respond to industry comments on the SOL Exceedance White Paper? If so, please provide technical rationale for your disagreement along with suggested language changes.**

Summary Consideration: The SDT reviewed the submitted comments and incorporated most of the suggestions. The SDT believes the suggested changes provided clarity resulting in a better product. Changes can be seen in the redlined version of the SOL Exceedance White Paper.

Organization	Yes or No	Question 10 Comments
IRC Standards Review Committee Independent Electricity System Operator	No	During the last posting, we commented on the need to shed load under the pre-contingency loading condition when the 4-hour rating is exceeded. The SDT's response indicates that "it has revised the whitepaper to include "as necessary and appropriate". However, this change is made to the post-contingency condition for exceeding the 15-minute Emergency Rating, but not to the pre-contingency loading condition when the 4-hour rating is exceeded as it still stipulates that "All of the above plus load shed to control violation below Emergency Rating consistent with timelines identified in Operating Plan." We speculate that the insertion of "as necessary and appropriate" to the post-contingency condition when the 15-minute Emergency rating is exceeded was an error. However, if the SDT really meant to keep load shedding under the pre-contingency loading condition when the 4-hour rating is exceeded, then we will again express our disagreement with the approach. When the 4-hour rating is exceeded, the TOP still have up to 15 minutes to reduce loading to within the Normal rating. Further, as stated in the paragraph preceding Table 1, "However, operating between 900 MVA and 950 MVA (commenter insert: i.e. exceeding the 4-hour rating but not the 15-minute rating) is not an SOL exceedance unless the associated Operating Plan time parameter is exceeded as explained in Figure 1 (commenter insert: i.e. 15 minutes have elapsed and still unable to return loading to below 4-hour rating)." We urge the SDT to reassess whether or not the "as necessary and appropriate" should be inserted to the pre-contingency loading condition for exceeding the 4-hour rating.

Organization	Yes or No	Question 10 Comments
Response: The SDT agrees and has modified the White Paper as suggested.		
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	Yes	As currently presented, the example Operating Plan in Table 1 on page 8 of the SOL Exceedance White Paper is confusing. It is actually a pretty good attempt to capture in table form the concepts described in the document text related to the time limit is exceeded versus pre-/post- contingency. However, it uses terms such as “non-cost” and “off-cost” which are not standard industry terms and which are not used elsewhere in the document. The SDT should consider removing these terms and using more standard terms, such as re-dispatch reconfiguration, etc. as appropriate. In addition, the “Legend” shown is confusing and does not help support the example.
Response: The SDT agrees and has modified the White Paper as suggested.		
Electric Reliability Council of Texas, Inc.	Yes	During the last posting, we commented on the need to shed load under the pre-contingency loading condition when the 4-hour rating is exceeded. The SDT’s response indicates that “it has revised the whitepaper to include “as necessary and appropriate”. However, this change is made to the post-contingency condition for exceeding the 15-minute Emergency Rating, but not to the pre-contingency loading condition when the 4-hour rating is exceeded as it still stipulates that “All of the above plus load shed to control violation below Emergency Rating consistent with timelines identified in Operating Plan.” If there is a basecase exceedance, the entity should take all actions up to and including shedding load within the timeframe to protect the equipment. If the entity is somewhere between the 4 hr. and 15 min. rating they have up to 15 min to get below the continuous (normal) rating for a basecase (pre contingency) exceedance.
Response: The SDT agrees and has modified the White Paper as suggested.		
SPP Standards Review Group Kansas City Power & Light Colorado Springs Utilities	Yes	Hyphenate 24-hour in the 8th line under 1. on Page 1. First full paragraph on Page 3, we suggest the following rewrite for the last sentence in that paragraph. ’Conversely, if an area is not at risk of instability, no Facilities are

Organization	Yes or No	Question 10 Comments
		approaching their thermal Facility Ratings but the area is prone to pre- or post-Contingency low voltage conditions, then the voltage limits in that area are the limiting SOLs.' We also suggest deleting the 1st sentence in the following paragraph on Page 3. The paragraph flows better without it. We further suggest the following rewording in what would then be the 2nd sentence in the paragraph. 'How an entity remains within these SOLs can vary depending on the operating practices and planning strategies employed by that entity.' In 4. Voltage Stability Limits, replace the 2nd sentence with the following: 'Voltage Stability limits are typically defined as the maximum power transfer or load level that ensures voltage stability criteria are met.'

Response: The SDT has modified the White Paper to incorporate many of the proposed changes.

24-hour in the 8th line under '1.' on Page 1 has been hyphenated.

As suggested, the last sentence in the first full paragraph on page three has been modified to state, "Conversely, if an area is not at risk of instability and no Facilities are approaching their thermal Facility Ratings, but the area is prone to pre- or post-Contingency low voltage conditions, then the voltage limits in that area are the most limiting SOLs."

The first sentence in the following paragraph states, "It is important to distinguish operating practices and strategies from the SOL itself." The SDT believes this is an important statement that is critical to conveying the intent of the White Paper. No change made.

The recommendation regarding the second sentence in the in this paragraph proposes to remove the word "mechanisms" and replace it with "planning strategies". The SDT agrees that the addition of "planning strategies" adds clarity to the sentence and will accept the recommended change. However, the SDT believes that "mechanisms" are an important part of how an entity remains within the SOLs as explained in the following sentence in the White Paper. The SDT changed the sentence to state, "How an entity remains within these SOLs can vary depending on the planning strategies, operating practices, and mechanisms employed by that entity."

As suggested, the second sentence in the voltage stability section has been modified to state, "Voltage Stability limits are typically defined as the maximum power transfer or load level that ensures voltage stability criteria are met."

Organization	Yes or No	Question 10 Comments
Northeast Power Coordinating Council Hydro One	Yes	In the White Paper System Operating Limit Definition and Exceedance Clarification, delete the phrase “unit/intra-area instability,” from the Transient Stability Limits description. Individual unit instability is not being looked at; operations are to prevent system instability. During the last posting, the need to shed load under the pre-contingency loading condition when the 4-hour rating is exceeded was commented on. The Drafting Team’s response indicates that “it has revised the whitepaper to include “as necessary and appropriate”. However, this change is made to the post-contingency condition for exceeding the 15-minute Emergency Rating, but not to the pre-contingency loading condition when the 4-hour rating is exceeded as it still stipulates that “All of the above plus load shed to control violation below Emergency Rating consistent with timelines identified in Operating Plan.” We speculate that the insertion of “as necessary and appropriate” to the post-contingency condition when the 15-minute Emergency rating is exceeded was an error. However, if the SDT really meant to keep load shedding under the pre-contingency loading condition when the 4-hour rating is exceeded, then we will again express our disagreement with the approach. When the 4-hour rating is exceeded, the TOP still have up to 15 minutes to reduce loading to within the Normal rating. Further, as stated in the paragraph preceding Table 1, “However, operating between 900 MVA and 950 MVA (commenter insert: i.e. exceeding the 4-hour rating but not the 15-minute rating) is not an SOL exceedance unless the associated Operating Plan time parameter is exceeded as explained in Figure 1 (commenter insert: i.e. 15 minutes have elapsed and still unable to return loading to below 4-hour rating).”We urge the SDT to reassess whether or not the “as necessary and appropriate” should be inserted to the pre-contingency loading condition for exceeding the 4-hour rating.
Response: The SDT agrees and has modified the White Paper as suggested.		
New York Independent System Operator (NYISO)	Yes	The current draft introduces the term ‘limiting SOLs’. ’For example, if an area of the BES is at no risk of encroaching upon Stability or voltage limitations in the pre- or post-Contingency state, and the most restrictive limitations in that area are pre- or

Organization	Yes or No	Question 10 Comments
		post-Contingency exceedance of Facility Ratings, then the thermal Facility Ratings in that area are the limiting SOLs. Conversely, if an area has plenty of headroom on thermal Facility Ratings and has no risk of instability but is prone to low voltages pre- or post-Contingency, then the voltage limits in that area are the limiting SOLs. We believe that a better wording would be the 'limiting criteria that results in the identified SOL'.
Response: The SDT does not believe that the phrase 'limiting SOL' introduces a new term, but in order to provide additional clarity, the phrase 'limiting SOL' has been replaced with 'most limiting SOL'. The SDT chose not to adopt the proposed wording, 'limiting criteria that results in the identified SOL'. In the referenced 'for example' sentence, the Facility Ratings are the actual SOLs that are not to be exceeded pre- or post-Contingency consistent with the example provided in Figure 1. In this example scenario, the SDT views the Facility Ratings as being the 'most limiting SOLs' rather than the most 'limiting criteria'. This concept is supported by paragraph 1 on page 7 which states, "An SOL is exceeded when any of the following occur or are observed as part of a Real-time Assessment: • Actual flow on a Facility is above the Facility Rating for an unacceptable time duration • Calculated Post-Contingency flow on a Facility is above the highest available Facility Rating" No change made.		
American Electric Power	Yes	There are inconsistencies between the information provided in Figure 1 (p.5) and Table 1 (p.8) which may cause confusion. Consider for example the range of 800 to 900 MVA. In Figure 1, the Pre-Contingency flow in this range is considered "not acceptable" if longer than 4 hours. The text "not acceptable" is too strong, so rather than this language, we suggest using "action may need to be taken". The rows in Table 1 do not clearly correspond to the example in Figure 1. It would appear that Table 1 should have four rows rather than three. As a result, it is unclear exactly which of the four ranges in Figure 1 correlate to the three Operating Plans provided in Table. In Figure 1, does the 800mva (24 hr rating) refer to a Normal or Emergency facility rating, or perhaps both? Please provide clarification.

Organization	Yes or No	Question 10 Comments
Response: The phrase 'not acceptable' is simply used to distinguish two possible categorizations of system performance – acceptable versus not acceptable (or unacceptable). Given these two categorizations, in the Figure 1 example, exceeding the 4-hour emergency rating for longer than 15 minutes constitutes unacceptable system performance. The SDT chose to keep the existing language. No change made. There are four operating ranges in Figure 1 and three rows in Table 1. The bottom range in Figure 1 does not have a corresponding row in Table 1 since no Facility Rating is being exceeded in that operating range. Table 1 Row 1 corresponds to the operating range in Figure 1 between 800-900 MVA (between the green and the yellow Facility Ratings). Table 1 Row 2 corresponds to the operating range in Figure 1 between 900-950 MVA (between the yellow and the red Facility Ratings). Table 1 Row 3 corresponds to the operating range in Figure 1 above 950 MVA (above the red Facility Rating). Regarding the nature of the 800 MVA rating, item 1 on page 1 states, "A 24- hour continuous rating is an example of a Normal rating; however, rating practices vary from entity to entity and may include ratings that vary with ambient temperature." No change made to Figure 1.		
FRCC Operating Committee (Member Services) City of Tallahassee, TAL Florida Municipal Power Agency	Yes	We suggest adding the following clarification to page 2 of the white paper: o Remove the terms "Normal (continuous)" from the Pre-Contingency section, example "b". We recommend it read the following: b. All Facilities shall be within their applicable Facility Ratings and thermal limits. o Remove the terms "Emergency (short term)" from the Post-Contingency section, example "b". We recommend it read the following: b. All Facilities shall be within their applicable Facility Ratings and thermal limits. We also suggest that the paper be reviewed for consistency when using the terms "pre-contingency" and "post-contingency". Interchanging the use and context causes confusion - i.e. Change the column headers in Table 1, "Pre-Contingency Loading" to "Pre-Contingency Mitigation" and change "Post-Contingency Loading" to "Post Contingency Mitigation". Another example would be to use "Real-Time flow" instead of "Pre-Contingency Flow".

Organization	Yes or No	Question 10 Comments
		Also in Table 1, under the 'Emergency (4hr)" row - "Post Contingency Loading" column change "all" to "available".
Response: The SDT agrees with the suggestion to revise the language on page 2 in item 'b' under the pre-Contingency section and item 'b' under the post-Contingency section to state "All Facilities shall be within their applicable Facility Ratings and thermal limits". This change is justified by the subsequent clarifications in the White Paper along with the Figure 1 example which illustrates an SOL performance summary for Facility Ratings. Note 1 in Figure 1 clarifies that pre-Contingency flow is the actual MVA flow observed on the Facility through Real-time operations monitoring. The SDT reviewed the paper and verified the accuracy of the use of "pre-Contingency" and "post-Contingency". The SDT chose to maintain Table 1 column headings as "Pre-Contingency Loading" and "Post-Contingency Loading" since the purpose of the mitigation strategies contained within the table are to control loadings. However, the SDT agrees with changing "all" to "available" in Table 1, "Post-Contingency Loading" column, "Emergency (4 hr.)" row.		
Duke Energy	Yes	Duke Energy agrees with the SOL Performance Summary described in Figure 1. We believe that Figure 1 adequately describes the intent on treatment of SOL(s), more so than the text of the White Paper itself. We suggest that the SDT revise the text in the White Paper to better align with the SOL Performance Summary in Figure 1.
Response: The SDT believes the White Paper is most effective through the combination of text, tables, and figures. The SDT is willing to process specific feedback regarding White Paper text.		
Peak Reliability	Yes	The SOL Whitepaper directly addresses the confusion, debates, and misconceptions around the SOL concept that is so prevalent in the industry. Many thanks to the SDT for issuing the much needed SOL Whitepaper. Peak believes this paper will not only bring clarity and resolution to confusing and even contentious issues related to SOL establishment and exceedance, but will also result in improved reliability.
Seattle City Light	No	SCL appreciates the efforts of the Standard Drafting Team to increase clarity of the IRO and TOP Standards.

11. **The SDT has made revisions to VRFs and VSLs as needed to conform to changes made to requirements and to respond to industry comments. Do you agree with the VRFs and VSLs for the nine posted standards? If you do not agree, please indicate specifically which standard(s) and requirement(s), and whether it is the VRF or VSLs you disagree with, and explain why.**

Summary Consideration: The SDT corrected several typos and made a grammatical change to all VSLs dealing with notification. As was pointed out in a comment, the 'syntax' of the proposed VSLs was incorrect. Instead of saying 'lesser than' it should have said 'greater than' to allow for the proper consideration of the violation. Due to the simple replacement of one word or because it was just a simple typographical correction and the volume of changes, the actual changes are only shown in the redlined standards.

The SDT has made the following changes to VSLs in response to industry comments:

IRO-008-2:

R3	The Reliability Coordinator did not notify one impacted entity or 5% or less of the impacted ~~NERC registered~~ entities whichever is ~~less~~greater identified in ~~the~~its Operating Plan(s) as to their role in ~~those~~that plan(s).	The Reliability Coordinator did not notify two impacted entities or more than 5% and less than or equal to 10% of the impacted ~~NERC registered~~ entities whichever is ~~less~~greater, identified in ~~the~~its Operating Plan(s) as to their role in ~~those~~that plan(s).	The Reliability Coordinator did not notify three impacted entities or more than 10% and less than or equal to 15% of the impacted ~~NERC registered~~ entities whichever is ~~less~~greater, identified in ~~the~~its Operating Plan(s) as to their role in ~~those~~that plan(s).	The Reliability Coordinator did not notify four or more impacted entities or more than 15% of the impacted ~~NERC registered~~ entities identified in ~~the~~its Operating Plan(s) as to their role in ~~those~~that plan(s).

IRO-008-2: Requirement R4 Severe VSL - ~~The Reliability Coordinator did not perform Real-time Assessments. OR~~ For any sample 24-hour period within the 30-day retention period, the Reliability Coordinator's Real-time Assessment was not conducted for three or more 30-minute periods within that 24-hour period.

IRO-014-3:

R2	N/A	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 but failed to ~~meet~~address one of the ~~criteria~~parts specified in Requirement R2.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 but failed to ~~meet~~address two of the ~~criteria~~parts specified in Requirement R2.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 but failed to ~~meet~~address all three of the ~~criteria~~parts specified in Requirement R2.

IRO-014-3: Requirement R7 Severe VSL - The Reliability Coordinator did not provide assistance to Reliability Coordinators, if requested and able, provided that the requesting Reliability Coordinator ~~has~~had implemented its emergency procedures, unless such actions could not physically be implemented or would have violated safety, equipment, regulatory, or statutory requirements.

IRO-017-1: Requirement R2 Severe VSL - The Transmission Operator or Balancing Authority did not perform the functions specified in its Reliability Coordinator's outage coordination process.

TOP-001-3: Requirement R1 Severe VSL - The Transmission Operator failed to act~~, or direct others within its Transmission Operator Area to act,~~ to ~~ensure~~address the reliability of its Transmission Operator Area via direct actions or by issuing Operating Instructions.

TOP-001-3: Requirement R2 Severe VSL - The Balancing Authority failed to act ~~or direct others within its Balancing Authority Area to act,~~ to ~~ensure~~address the reliability of its Balancing Authority Area via direct actions or by issuing Operating Instructions.

TOP-001-3: Requirement R7 Severe VSL - The Transmission Operator did not provide assistance to other Transmission Operators, ~~if~~when requested and able, ~~when~~and the requesting entity had implemented its ~~e~~Emergency procedures, and such actions could have been physically implemented and would not have violated safety, equipment, regulatory, or statutory requirements.

TOP-001-3: Requirement R8 Severe VSL - The Transmission Operator did not inform its Reliability Coordinator of its actual or expected operations that resulted in, or could have resulted in, an Emergency on those respective Transmission Operator Areas when conditions did permit such communications. OR The Transmission Operator did not inform four or more other known impacted Transmission Operators or more than 15% of the known impacted other Transmission Operators~~, whichever is less,~~ of its actual or expected operations that resulted in, or could have resulted in, an Emergency on those respective Transmission Operator Areas when conditions did permit such communications. OR The Transmission Operator did not inform four or more ~~other~~ known impacted Balancing Authorities or more 15% of the known impacted ~~other~~ Balancing Authorities~~, whichever is less,~~ of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Balancing Authority Areas when conditions did permit such communications.

TOP-001-3: Requirement R9 Severe VSL - The responsible entity did not notify its Reliability Coordinator of a planned outage of telemetering equipment, monitoring and assessment capabilities, control equipment, and associated communication channels. OR, The responsible entity did not notify four or more impacted interconnected NERC registered entities or more than 15% of the negatively impacted NERC registered entities~~, whichever is less,~~ of a planned outage of telemetering equipment, control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities.

TOP-001-3

R10		N/A	~~N/A~~ The Transmission Operator did not monitor one of the items listed in Requirement R10, Part 10.1. OR, The Transmission Operator did not monitor one of the items listed in Requirement R10, Part 10.2.	~~N/A~~ The Transmission Operator did not monitor two of the items listed in Requirement R10, Part 10.1. OR, The Transmission Operator did not monitor two of the items listed in Requirement R10, Part 10.2.	The Transmission Operator did not monitor Facilities, the status of Special Protection Systems, and ~~sub-100 kV~~non-BES facilities. ~~identified as necessary by the Transmission Operator, within its Transmission Operator Area and neighboring Transmission Operator Areas to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area~~

TOP-001-3: Requirement R13 Severe VSL - The Transmission Operator did not perform Real-time Assessments. OR, ~~-~~For any sample 24-hour period within the 30-day retention period, the Transmission Operator's Real-time Assessment was not conducted for ~~three~~four or more 30-minute periods within that 24-hour period.

TOP-002-4

R3	The Transmission Operator did not notify one impacted entity or 5% or less of the impacted entities, whichever is less identified in the Operating Plan(s) as to their role in the plan(s).	The Transmission Operator did not notify two impacted entities or more than 5% and less than or equal to 10% of the impacted entities, whichever is less, identified in the Operating Plan(s) as to their role in the plan(s).	The Transmission Operator did not notify three impacted ~~NERC~~entities or more than 10% and less than or equal to 15% of the impacted entities, whichever is less, identified in the Operating Plan(s) as to their role in the plan(s).	The Transmission Operator did not notify four or more impacted ~~NERC~~entities or more than 15% of the impacted NERC identified in the Operating Plan(s) as to their role in the plan(s).
R5	The Balancing Authority did not notify one impacted entity or 5% or less of the ~~impacted~~ entities, whichever is ~~less~~greater, identified in the Operating Plan(s) as to their role in the plan(s).	The Balancing Authority did not notify two ~~impacted~~ entities or more than 5% and less than or equal to 10% of the impacted entities, whichever is ~~less~~greater, identified in the Operating Plan(s) as to their role in the plan(s).	The Balancing Authority did not notify three impacted entities or more than 10% and less than or equal to 15% of the ~~impacted~~ entities, whichever is ~~less~~greater, identified in the Operating Plan(s) as to their role in the plan(s).	The Balancing Authority did not notify four or more ~~impacted~~ entities or more than 15% of the impacted entities identified in the Operating Plan(s) as to their role in the plan(s).

TOP-003-3:

R5	~~N/A~~ The responsible entity receiving a data specification in	The responsible entity receiving a data specification in	The responsible entity receiving a data specification in	~~The responsible entity receiving a data specification in~~

	Requirement R3 or R4 satisfied the obligations in the data specification but did not meet one of the criteria shown in Requirement R5 (Parts 5.1 – 5.3).	Requirement R3 or R4 satisfied the obligations in the data specification but did not meet ~~one~~two of the criteria shown in Requirement R5 (Parts 5.1 – 5.3).	Requirement R3 or R4 satisfied the obligations in the data specification but did not meet ~~two~~three of the criteria shown in Requirement R5 (Parts 5.1 – 5.3).	~~Requirement R3 or R4 satisfied the obligations in the data specification but did not meet all three of the criteria shown in Requirement R5 (Parts 5.1 – 5.3).~~ ~~OR,~~ The responsible entity receiving a data specification in Requirement R3 or R4 did not satisfy the obligations of the documented specifications for data.

Organization	Yes or No	Question 11 Comments
City of Austin	No	The VSL for TOP-003-3, R5 should parallel the VSL for IRO-010-2, R3. That is, the moderate level should be lower, the high should be moderate and the first half of severe should be high.
Response: The SDT agrees as the VSLs for proposed TOP-003-3 and proposed IRO-010-2 should agree and the VSLs for proposed IRO-010-2 are based on VSLs for approved IRO-010-1. See summary for wording.		

Organization	Yes or No	Question 11 Comments
Texas Reliability Entity	No	1) IRO-008-2, Requirement R4 VSLs - Suggest the SDT remove “NERC registered” to be consistent with the Requirement R4 language and other standards in this project. The words were removed once in the VSLs but they occur twice in the VSLs. 2) IRO-008-2, Requirement R6 VSL - Texas RE requests the SDT consider revising the R6 VSL to contain only a Severe VSL. Texas RE submits that any failure to notify of IROL or SOL exceedances could result in cascading outages. 3) TOP-001-3, Requirements R8 and R9 VSLs - Texas RE recommends removing each instance of the phrase “whichever is less” from the R8 and R9 VSLs or at least from the Severe VSLs. At worst, it appears to nullify intent stated by the SDT for R8 and R9 that a situation where a small entity did not inform just one affected entity should be a Severe violation. At best, it adds no clarity to assessing violation severity levels. Specifically, for R8, if a small TOP with 1 known impacted other TOP did not notify that impacted TOP then it’s 100% which should make it a Severe VSL. However, the phrase “whichever is less” appears to kick it back to a Lower VSL because it is only one failure to inform, not four or more, which is less. It’s important to note that TOP-002-4, Requirements R3 and R5 do not include the phrase “whichever is less” in the Severe VSL language which is presumably a recognition that it doesn’t apply in the Severe VSL. 4) TOP-002-4, Requirements R3 and R5 - Texas RE recommends removing each instance of the phrase “whichever is less” from the R3 and R5 VSLs. The phrase adds no clarity to assessing violation severity levels; in fact it is likely to add confusion to the determination of VSLs. 5) TOP-003-3, Requirements R3 and R4 - Texas RE recommends removing each instance of the phrase “whichever is less” from the R3 and R4 VSLs. The phrase adds no clarity to assessing violation severity levels; in fact it is likely to add confusion to the determination of VSLs.

Organization	Yes or No	Question 11 Comments
		6) IRO-010-2, Requirement R2 - Texas RE recommends removing each instance of the phrase “whichever is less” from the R2 VSLs. The phrase adds no clarity to assessing violation severity levels; in fact it is likely to add confusion to the determination of VSLs. TOP-001-3: Requirement R9, M9 and R9 VSL: Suggest the SDT remove “NERC registered” to be consistent with other standards in this project.
Response: 1) The SDT believes that the comment refers to Requirement R3 VSLs. The SDT agrees and has deleted the phrase ‘NERC registered’ from all VSLs for Requirement R3. 2) The SDT disagrees and believes that an incremental approach is the correct one for reliability. No change made. 3) The SDT agrees and has deleted the phrase ’whichever is less’ from the Severe VSL only for both Requirement R8 and R9. 4) The SDT disagrees but has made grammatical corrections to the VSLs which it believes may have led to confusion. 5) The SDT disagrees and believes that the wording is correct. No change made. 6) The SDT disagrees and believes that the wording is correct. No change made.		
Duke Energy	No	Duke Energy does not necessarily disagree with the VRF(s) for IRO-017. However, we are seeking clarification for the increases in VRF from a “lower” in the first posting to a “medium” on this posting.
PacifiCorp	No	PacifiCorp cannot support the proposed change of the Violation Risk Factor in IRO-017-1 R3 from Low to Medium with inadequate justification for the change.
Response: As was pointed out in the VRF/VSL Justification document for the second posting, the Medium VRFs are because of the need to correspond to similar requirement VRFs for consistency as per the VRF Guidelines. Similar requirements had Medium VRFs so proposed IRO-017-1 was assigned Medium VRFs.		

Organization	Yes or No	Question 11 Comments
SPP Standards Review Group Kansas City Power & Light Colorado Springs Utilities	No	IRO-008-2R4 - Change the Severe VSL for new Requirement R4 (old R5) to read '...more than three...' or '...four or more...' in lieu of '...three or more...'. The High VSL already uses three. IRO-014-3R3 - The lead-in for the VSLs for Requirement R3 refers to Requirement R5. This reference should be to Requirement R3. R7 - Change the Severe VSL for Requirement R7 to read '...Coordinator had implemented...' and '...or would have violated safety...'. IRO-017-1R2 - Make Reliability Coordinator possessive in the Severe VSL for Requirement R2. TOP-001-3R8 - Delete 'other' in the VSLs for Requirement R8 referring to '...other known impacted Balancing Authorities...' and '...other Balancing Authorities...'. The use of 'other' only applies to references to Transmission Operator. Also in the VSLs for R8, change 'less' to 'greater' such that the Lower VSL would read: 'The Transmission Operator did not inform one other known impacted Transmission Operator or 5% or less of the affected known impacted other Transmission Operators, whichever is greater, of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas when conditions did permit such communications.' (This particular change applies to all VSLs in R8, R9, R19 and R20 as well as the VSLs for IRO-002-4, R1; IRO-008-2, R3, R5, R6; IRO-010-2, R2; TOP-002-4, R3, R5; TOP-003-3, R3, R4.) R9 - Delete the term 'NERC registered' in the VSLs for Requirement R9. (See comment in Question 7 above. R13 - Change the Severe VSL for Requirement R13 to read '...more than three...' or '...four or more...' in lieu of '...three or more...'. The High VSL already uses three.

Organization	Yes or No	Question 11 Comments
		R19/R20 - Replace 'applicable' with 'identified' in the VSLs for Requirements R19 and R20. The use of 'identified' parallels the language in the requirements. TOP-002-4R3 - Replace 'NERC' with 'entities' in the High and Severe VSLs for Requirement R3.
Response: Proposed IRO-008-2 Requirement R4 VSL does not use the 'three or more' language cited. No change made. IRO-014-3 Requirement R3: The SDT agrees and has corrected the typo. IRO-014-3 Requirement R7: The SDT agrees and has made the suggested change. See summary for wording. IRO-017-1 Requirement R2: The SDT agrees and has made the suggested change. See summary for wording. TOP-001-3 Requirement R8: The SDT agrees and has deleted 'other' as suggested. See summary for wording of Severe VSL. TOP-001-3 Requirement R8: The SDT agrees with the change of 'lesser' to 'greater' in this standard and all others cited. Due to the simple replacement of one word and the volume of changes, the actual changes are only shown in the redlined standards. TOP-001-3 Requirement R9: The SDT agrees and has deleted the term 'NERC registered'. Due to the simple deletion of the phrase, the actual changes are only shown in the redlined standards. TOP-001-3 Requirement R13: The SDT agrees and has made the suggested change. See summary for wording. TOP-001-3 Requirement R19 and R20: The SDT agrees and has made the suggested change. Due to the simple replacement of one word, the actual changes are only shown in the redlined standards. TOP-002-4 Requirement R3: The SDT agrees and has made the suggested change. See summary for wording.		
Tennessee Valley Authority	No	TOP-001-3. There should be more than one level of VSL. As currently written there seems to be no allowance for instances where entities may be operating at two different ratings (i.e. temperature-dependent ratings, directional ratings, etc.) or a period of time before the entities coordinate which rating should be used in real-time.

Organization	Yes or No	Question 11 Comments
Response: The VSL for this requirement is based on a similar requirement and VSL for approved IRO-009-1 Requirement R5. That VSL is binary Severe. The SDT is supposed to structure VSLs whenever possible from existing approved VSLs. Therefore, the SDT assigned a binary Severe VSL to this requirement. No change made.		
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	No	Southern disagrees that any violation of IRO-001-4 requirements constitutes a Severe VSL. The RSAW suggests that auditors are to use the NERC EAP process (i.e. reviewing entity's Category 2 or higher events) in their compliance assessment. Southern agrees with this approach and suggest the SDT adopt this thought process in the VSLs. For example, a Severe VSL would be a case where there was non-compliance for a Category 4 or 5 event, a High VSL would be for Category 3 events, and so on. This method should be used as not all events where Operating Instructions are issued, are equal.
Response: The VSLs for these requirements are based on similar requirements and VSLs for approved IRO-001-1.1. Those VSLs are binary Severe. The SDT is supposed to structure VSLs whenever possible from existing approved VSLs. Therefore, the SDT assigned a binary Severe VSL to these requirements. No change made.		
Associated Electric Cooperative, Inc. - JRO00088	No	TOP-001-3 R2 Severe VSL - Remove "within its Transmission Operator Area" to maintain consistency with current R2. TOP-001-3 R7 Severe VSL - Replace "if requested" with "when requested" and "when the requesting" with "and the requested" to avoid issues with predicting future performance, and correct possession of the requested entity. Suggested language: "The Transmission Operator did not provide assistance to other Transmission Operators, when requested and able and the requested entity had implemented its emergency procedures, and such actions could have been physically implemented and would not have violated safety, equipment, regulatory, or statutory requirements."

Organization	Yes or No	Question 11 Comments
Response: The SDT assumes that the commenter is referring to Requirement R1. The SDT has made changes to the requirement language which is reflected in the VSL language. See summary for wording. The SDT agrees and has made the suggested changes. See summary for wording.		
Hydro Quebec	No	TOP-001-3: Table of Compliance Elements: VSLs for R8 and R9 should be reworded. Due to their importance in determining penalties, VSL should be written clearly and without ambiguity. Example: "Violation Severity Levels for requirement 8 are determined based on the number of other known impacted Transmission Operators or other known impacted Balancing Authorities that the Responsible Entity did not inform of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas or Balancing Authority Areas when conditions did permit such communications :High VSL : The lesser of 1) three other known impacted Transmission Operators or 2) 10% or more but less than or equal to 15% of the other known impacted Transmission Operators OR The lesser of 1) three other known impacted Balancing Authorities or 2) 10% or more but less than or equal to 15% of the other known impacted Balancing Authorities" The whole wording of the requirement could be omitted for more clarity :"Violation Severity Levels for requirement 8 are determined based on the number of other known impacted entities that the Responsible Entity did not inform in accordance with that requirement :High VSL : The lesser of 1) three other known impacted Transmission Operators or 2) 10% or more but less than or equal to 15% of the other known impacted Transmission Operators OR The lesser of 1) three other known impacted Balancing Authorities or 2) 10% or more but less than or equal to 15% of the other known impacted Balancing Authorities" IRO-008: Table of Compliance Elements: VSLs for R4, R6 and R8 should be reworded. Due to their importance in determining penalties, VSL should be written clearly and without ambiguity. See examples given for TOP-001-3.

Organization	Yes or No	Question 11 Comments
		IRO-010: Table of Compliance Elements: VSLs for R2 should be reworded. Due to their importance in determining penalties, VSL should be written clearly and without ambiguity. See examples given for TOP-001-3.
Response: The language cited by the commenter as an 'introduction' to the Requirement R8 and R9 VSLs has been used previously in other standards and is an acceptable method. The SDT has made changes to the language of the VSLs based on other comments but believes that the remaining language is clear as written. The re-worded Severe VSLs are shown in the summary. There is no Requirement R8 for proposed IRO-008-2. The SDT has made changes to the language of the VSLs in proposed IRO-008-2 based on other comments but believes that the remaining language is clear as written. See the redlined standard for the complete list of changes. The language cited by the commenter as an 'introduction' to the Requirement R2 VSLs has been used previously in other standards and is an acceptable method. The SDT has made changes to the language of the VSLs based on other comments but believes that the remaining language is clear as written. See the redlined standard for a complete list of changes.		
ERCOT	No	IRO-008: ERCOT suggests that the SDT review the language of Requirement R5 and its VSL for consistency. In particular, Requirement R5 was modified to require that the Reliability Coordinator ensure that a Real-Time Assessment is performed every 30 minutes. However, the VSL still assesses the condition that the Reliability Coordinator did not "perform" as opposed to did not "ensure that" the Real-time Assessment was performed. These should be reviewed and revised to ensure consistency between the requirement and its VSL. IRO-008: ERCOT has identified a potential typographical error in R6 and all of its VSLs. Specifically, the reference to "as identified in identified in Requirement R6" should likely be reviewed and revised to "as identified in Requirement R5". IRO-008: ERCOT respectfully reiterates its previous comment on the inconsistent language used between Requirements R5 and R6 and the LOWER VSL for Requirement R8. In particular, the word "Emergency" is used in the VSL for Requirement R8 but the condition is not specified elsewhere in the standard or the appropriate referenced requirements. Please revise the lower VSL for

Organization	Yes or No	Question 11 Comments
		Requirement R8 to ensure consistency. The following language is proposed: "when the SOL or IROL exceedance identified in Requirement R5 has been prevented or mitigated". IRO-014: ERCOT respectfully recommends that, for consistency, the VSLs for Requirement R2 be modified to remove references to criteria and state that Reliability Coordinator failed to maintain Operating Plans, Processes, or Procedures pursuant to one part of Parts 2.1 - 2.3, two parts of Parts 2.1 - 2.3, and so on.
Response: The SDT assumes the commenter is referring to Requirement R4 and agrees and has made changes to the Severe VSL. See summary for wording. The SDT agrees and has corrected the typographical error. The SDT assumes the commenter was referring to Requirement R6 Lower VSL as there is no Requirement R8. The SDT agrees and has corrected the typographical error. The SDT agrees and has made the suggested changes. See summary for wording.		
IRC Standards Review Committee Independent Electricity System Operator	No	IRO-008: R6 and all of its VSL: The reference to "as identified in identified in Requirement R6" should be revised to "as identified in identified in Requirement R5". IRO-008: We wish to reiterate our previous comment on the inconsistent language used between Requirement R6 (was R8 but misquoted in our previous comment as R6) and the LOWER VSL for R6 in which the word "Emergency" is used but the condition is not specified in R6.R6 stipulates that: Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R6 has been prevented or mitigated. However, the LOWER VSL for R6 indicates that: The Reliability Coordinator did not notify one other impacted Reliability Coordinator as indicated in its Operating Plan "when the Emergency

Organization	Yes or No	Question 11 Comments
		identified in Requirement R6 was prevented or mitigated." Please revise VSL to read "when the SOL or IROL exceedance identified in Requirement R5 has been prevented or mitigated" as opposed to "Emergency" for consistency. IRO-008: The language between R4 and its VSL is inconsistent.R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. This requirement was changed from having the RC to "perform" to "ensure that" a Real-time Assessment is performed. However, the VSL still assesses the condition that the RC did not "perform" as opposed to did not "ensure that" the Real-time Assessment was performed. Please revise as appropriate.
Response: The SDT agrees and has corrected the typographical error. The SDT agrees and has corrected the typographical error. The SDT agrees and has changed the VSL language. See summary for wording.		
Peak Reliability	Yes	TOP-001-3 R13: The High VSL and Severe VSL overlap (High VSL TO RTA not conducted ...3 times....Severe VSL TO RTA not conducted 3 or more times...) IRO-008-2 R4: The VSL removed the first occurrence of the term "NERC registered" entity but left the term in the second half of the VSL. IRO-008-2 R5: The High VSL and Severe VSL overlap (High VSL TO RTA not conducted ...3 times....Severe VSL TO RTA not conducted 3 or more times...)
Response: The SDT agrees and has revised the Severe VSL. See summary for wording. The SDT assumes that the commenter is referring to Requirement R3 and agrees and has made the suggested change. See summary for wording. The SDT assumes the commenter is referring to Requirement R4 and agrees and has made the suggested change. See summary for wording.

12. **Are there any other concerns with these standards that haven't been covered in previous questions and comments?**

Summary Consideration: The SDT has not made any additional changes to the standards based on comments to this question.

Organization	Yes or No	Question 12 Comments
Dominion Compliance Policy	Yes	Dominion encourages the SDT to continue to monitor the status of the proposed definition of Remedial Action Scheme "RAS" as the change in definition will impact this reliability standard as well as other related standards as identified in NERC's white paper, Uses of "Special Protection System" and "Remedial Action Scheme" in Reliability Standards.
Response: Until Remedial Action Scheme has become the official approved definition, the SDT will use the existing language of Special Protection System. If Remedial Action Scheme is adopted as the new, official term then a project will be undertaken to make the necessary corrections throughout all standards. No change made.		
Texas Reliability Entity	Yes	1) Texas RE appreciates the work that the SDT has done to address the comments received from industry during the previous ballot and comment period. Thank you for the time you have put into working towards making a set of steady state TOP and IRO standards. 2) Texas RE has one general comment regarding data retention for all the standards within this project. Texas RE recommends the SDT consider aligning the retention periods with the Data Retention and Sampling Team (DRAST) white paper which indicates a 4-year retention period for data with limited exemptions, such as a 6-month rolling period for high volume data, and 90-days for voice and audio recordings. 3) Operational Planning Analysis definition: Texas RE requests the SDT provide explanation for why the phrase "may be performed either a day ahead or as much as 12 months ahead" was removed from the proposed definition. The phrase is included in the current Glossary defined term. Following up on our comment from the

Organization	Yes or No	Question 12 Comments
		previous ballot and comment period, Texas RE still asserts that without that phrase the time frame for one day up to 12 months is not accounted for.
Response: Thank you for your support. The SDT has reviewed the data retention periods and believes that they are correct as stated. No change made. The SDT believed the parenthetical was not required as part of the definition. The Operations Planning Time Horizon includes conditions seen in studies, from day-ahead up to and including seasonal (which the SDT has stated that it believes essentially equates to one year), that may impact the Real-time reliability of the Reliability Coordinator Area. No change made.		
FRCC Compliance	Yes	1. IRO-001-4 R1, TOP-001-3 R1 & R3: The phrase "... to ensure the reliability of its RC/TOP/BA Area." is not measurable. The requirements should be stated so that the stated reliability is objectively measurable. For example, "... to ensure all Facilities within the RC/TOP/BA Area remain within SOLs and IROLs." Otherwise, the requirements are too vague as to when the RC/TOP/BA would be required to act, or whether the action taken was sufficient to ensure reliability. 2. TOP-002-4 R1: The definition of Operational Planning Analysis does not specify what "potential (post-Contingency) conditions" are to be evaluated, and is therefore not measurable. Either the requirement or the definition should be revised to clarify and add measurability as to which contingencies are required to be included in the analysis. 3. TOP-002-4 R4 (4.2): The phrase "...for the next-day that addresses: Interchange scheduling" is too vague and not measurable. The requirement should be stated so as to be objectively measurable. For example, "... for the next-day that addresses: Expected Interchange scheduling". 4. TOP-002-4 R4 (4.4): The phrase "... for the next-day that addresses: Capacity and energy reserve requirements ..." is not measurable. Applicable reserve requirements should be clearly provided to provide measurability as to whether the Operating Plan

Organization	Yes or No	Question 12 Comments
		addressed them. For example, "... for the next-day that addresses: Capacity and energy reserve requirements (at a minimum N-1 Contingency planning) ..."
Response: 1. The SDT has revised the requirement to delete 'ensure' and replace it with 'address' as in the first posting. 2. The purpose of proposed TOP-002-4 Requirement R1 is to perform an Operational Planning Analysis to identify SOL exceedances. The SOL Exceedance White Paper provide additional clarity by pointing to other requirements within FAC, TOP and IRO standards, including examples. No change made. 3. The SDT believes "expected" is implied since the Operational Planning Analysis is targeting "next-day" system conditions. No change made. 4. The SDT chose to use the generic term "Capacity and Energy Reserve Requirements" as part of the Interconnection-wide standard and believes that it is measurable. Minimum Reserve Requirements are addressed as part of the BAL standard. Balancing Authorities may have differing reserve requirements based on system conditions that need to be communicated to their Transmission Operator and Reliability Coordinator. No change required.		
Puget Sound Energy	Yes	As discussed in the comments addressing IRO-017, requirements R1 and R2 of that proposed standard should be phased with requirement R1 becoming effective prior to R2. Just as in IRO-010, the BAs and TOPs subject to requirement R2 are likely to need some time to implement the processes specified in RC's outage coordination process. In addition, connecting the implementation time to COM-001-2 if this group of standards is approved prior to or concurrent with COM-001-2 and COM-002-4 could result in a short implementation time. For example, say that FERC approval of both the COM standards and the IRO/TOP standards becomes effective on June 30, 2015. According to the implementation plan, the standards will "become effective concurrently with COM-001-2 and the definition of Operating Instruction". The effective date of COM-001-2 is "first day of the second calendar quarter beyond the date that this standard is approved by applicable regulatory authorities..." which would be October 1, 2015 in this example. There is some ambiguity with this result since the term Operating Instruction is not used in COM-001-2, but in any case, using the effective date of COM-002-4, which is more consistent with the implementation period of the IRO/TOP standards, seems more appropriate.

Organization	Yes or No	Question 12 Comments
Response: The SDT disagrees that a staggered approach is needed. These items are not going to be created in a vacuum and the SDT believes that the entities involved will be coordinating as the process is developed. No change made.		
Northeast Power Coordinating Council	Yes	Because of the similarities in Purposes, Applicability's, and Requirements of standards within the group that is posted, combining requirements with the intent on reducing the number of standards should be considered. During the last posting, we expressed a concern over the proposed retirement of TOP-004-2, Requirement R4, which stipulates that: R4. If a Transmission Operator enters an unknown operating state (i.e. any state for which valid operating limits have not been determined), it will be considered to be in an emergency and shall restore operations to respect proven reliable power system limits within 30 minutes. The SDT's response to our comment indicates that: As presented in the white paper on the Treatment of SOLs, the proposed requirements are based on the concept of not depending on pre-determined existing SOLs/IROLs but rather to monitor the existing and potential operating conditions and evaluate them against the same ratings and limits that SOLs/IROLs would be based upon. Those ratings and limits rarely change due to changes in system conditions, whereas predetermined SOLs and IROLs may change due to the assumptions they were based on. No change made. While we agree that the ratings and limits upon which the SOLs/IROLs are based rarely change due to changes in system conditions, the changes in system condition themselves can render any SOLs/IROLs invalid. In other word, there does not exist any "proven reliable power system limits" as stated in R4 of TOP-002-4. While the concept of not depending on pre-determined existing SOLs/IROLs but rather to monitor the existing and potential operating conditions and evaluate them against the same ratings and limits that SOLs/IROLs would be based upon may seem appropriate, the concept itself (and being in a "white paper" status), or use of any information in the white paper, does not help or mandate re-calculation of valid SOLs and IROLs when entering an unknown state. If R4 in TOP-004-2 is retired, it leaves a potential reliability gap. The white paper does not mandate the proper and necessary action to "restore operations to respect proven reliable power system limits within

		30 minutes" when entering into an unknown state. We again urge the SDT to consider not retiring Requirement R4 of TOP-002-4. A proper Quality Review of the postings would have eliminated the necessity of submitting many of the above comments.
Response: The SDT has made every effort to consolidate topics to reduce the number of requirements and standards in this project. The SDT has discussed the concern over the retirement of approved TOP-004-2 Requirement R4 and believes the existing requirements within the standard to perform a Real-time Assessment include reevaluation of SOL/IROL limits to either reestablish new limits or implement Operating Plans to stay within updated limits. The SDT does not believe that the proposed requirements and standards allow an entity to be in an unknown state consistent with established IROL T_v. The premise of the SDT's philosophy is that an Operational Planning Analysis must be available for next day and that this analysis must be periodically updated by performing a Real-time Assessment as per proposed TOP-001-4 Requirement R13. Both of these functions require an established set of Facility Ratings be in use so that analysis can discern when these limits are being exceeded. It is the SDT's belief that once these limits have been established that it does not matter what event occurs to cause an exceedance. The event takes place and is analyzed against the set of limits currently in place. It is these limits that an entity must restore the system to following the event as per proposed TOP-001-4 Requirement R14. Therefore, the SDT believes that approved TOP-004-2 Requirement R4 can be retired without creating a reliability gap. The SDT recognizes that not all entities are capable of performing Real-time transient Stability analysis within 30 minutes and would rely on Operating Plans. No change made. The SDT submitted the documents to Quality Review as required and received numerous comments and suggestions for changes/corrections that were accepted by the SDT.		
IRC Standards Review Committee Independent Electricity System Operator	Yes	During the last posting, we expressed a concern over the proposed retirement of TOP-004-2, Requirement R4, which stipulates that: R4. If a Transmission Operator enters an unknown operating state (i.e. any state for which valid operating limits have not been determined), it will be considered to be in an emergency and shall restore operations to respect proven reliable power system limits within 30 minutes. he SDT's response to our comment indicates that: As presented in the white paper on the Treatment of SOLs, the proposed requirements are based on the concept of not depending on pre-determined existing SOLs/IROLs but rather to monitor the existing

		and potential operating conditions and evaluate them against the same ratings and limits that SOLs/IROLs would be based upon. Those ratings and limits rarely change due to changes in system conditions, whereas predetermined SOLs and IROLs may change due to the assumptions they were based on. No change made. While we agree that the ratings and limits upon which the SOLs/IROLs are based rarely change due to changes in system conditions, the changes in system condition themselves can render any SOLs/IROLs invalid, especially those that are voltage or stability limits. In other word, there does not exist any "proven reliable power system limits" as stated in R4 of TOP-002-4. We generally support the concept of not depending on pre-determined existing SOLs/IROLs but rather, to monitor the existing and potential operating conditions and evaluate them against the same ratings and limits that SOLs/IROLs would be based upon. However the concept itself (and being in a "white paper" status), or use of any information in the white paper, does not help or mandate re-calculation of valid SOLs and IROLs when entering an unknown state, and the ratings and limits that do not change have no bearing on those SOLs/IROLs that are voltage or stability limited and which are more dependent on system conditions, which have changed. While R13 in TOP-001- 3 requires a TOP to ensure that a Real-time Assessment is performed at least once every 30 minutes, it falls short of specifying the expected outcome (or objectives), such as new/revised SOLs/IROLs and assessing system performance against the new limits. The proposed definition of Real-time Assessment is also short of specifying the development or calculation of SOLs/IROLs. Hence, between R13 of TOP-003-1 and the definition of RTA, there is a gap that in an unknown state/condition, a TOP is not required to (and hence will not) develop SOLs/IROLs that are valid for the prevailing conditions. Hence, if R4 in TOP-004-2 is retired, it will leave a reliability gap. The white paper does not mandate the proper and necessary action to "restore operations to respect proven reliable power system limits within 30 minutes" when entering into an unknown state. We again urge the SDT to consider not retiring Requirement R4 of TOP-002-4. Finally, we are unclear whether or not the proposed retirement of TOP-004-2 will be balloted separately, which it should. Please advise.

Organization	Yes or No	Question 12 Comments
Response: 1. The SDT has discussed the concern over the retirement of approved TOP-004-2 Requirement R4 and believes the existing requirements within the standard to perform a Real-time Assessment include reevaluation of SOL/IROL limits to either reestablish new limits or implement Operating Plans to stay within updated limits. The SDT does not believe that the proposed requirements and standards allow an entity to be in an unknown state consistent with established IROL T_v. The premise of the SDT's philosophy is that an Operational Planning Analysis must be available for next day and that this analysis must be periodically updated by performing a Real-time Assessment as per proposed TOP-001-4 Requirement R13. Both of these functions require an established set of Facility Ratings be in use so that analysis can discern when these limits are being exceeded. It is the SDT's belief that once these limits have been established that it does not matter what event occurs to cause an exceedance. The event takes place and is analyzed against the set of limits currently in place. It is these limits that an entity must restore the system to following the event as per proposed TOP-001-4 Requirement R14. Therefore, the SDT believes that approved TOP-004-2 Requirement R4 can be retired without creating a reliability gap. The SDT recognizes that not all entities are capable of performing Real-time transient Stability analysis within 30 minutes and would rely on Operating Plans. No change made. 2. The SDT does not plan on balloting for the retirement of approved TOP-004-2 since the intent of the requirement was successfully mapped as part of the Mapping Document. Acceptance of the proposed standards which includes the Mapping Document is considered sufficient to retire the standards cited in the Implementation Plan. No change made.		
Northern Indiana Public Service Company (NIPSCO)	Yes	NIPSCO is voting against approving the definitions for the following reasons: 1. In the new definition of Operational Planning Analysis and Real-time Assessment, Facility Rating and equipment limitations are listed. NIPSCO feels these should be removed and SOL and IROL be added. SOL and IROL include but is not limited to Facility Ratings and equipment limitations. See our comments on TOP-002 for more information. 2. In the new definition of Operational Planning Analysis and Real-time Assessment, Phase Angle is listed as an included input. NIPSCO feels this needs more definition. Is this for every node?
Response: 1. The SDT recognizes the concern but believes the proposed TOP-001-3 Requirement R13, TOP-001-3 Requirement R14, TOP-002-4 Requirement R1 and TOP-002-4 Requirement R2 further define the purpose of the Real-time Assessment and Operational Planning Analysis is to address potential SOL exceedances. No change made.		

Organization	Yes or No	Question 12 Comments
2. The inclusion of phase angle is based on the Southwest Outage recommendations. The SDT felt it was more prudent to include this item as part of the definition as opposed to a specific requirement within the standard. SDT has incorporated "applicable" based on industry feedback and believes that the proposed definition reflects an entity's responsibility to model and assess the impacts of phase angles. For example, modeling and assessment of phase angle reclosing limitations would be supported by Operating Plans. An entity can only provide data and information on what it has available and the addition of the term 'applicable' was intended to capture that intent and to protect an entity against unreasonable expectations. No change made.		
Seattle City Light	Yes	SCL asks that the Implementation Plan be revised to conform with our recommendations that the implementation periods and effective dates for IRO-010-2 and TOP-003-3 be extended to eighteen and twenty-four months (to allow sufficient time to negotiate and implement data exchange agreements among entities), as indicated above.
Response: The SDT does not believe that additional implementation time is required. Data exchange agreements need not take significant time to negotiate. Data specified by the Reliability Coordinator must be supplied in order to preserve reliability. No change made.
