SPP Standards Review Group Kansas City Power & Light Colorado Springs Utilities	Yes	The definition of Special Protection System (SPS) is being revised to Remedial Action Scheme (RAS) yet this package of standards continues to use SPS. Other active drafting teams, particularly the Relay Loadability: Stable Power Swings and the Protective System Maintenance and Testing - Phase 3 (Sudden Pressure Relays) teams, are using the new RAS definition in their work. What process will be used to make the transition to RAS when the new definition is approved? Similarly, Load-Serving Entity will soon be eliminated as a registered function at NERC. How will this change be reflected in the standards? We recommend that all changes we have proposed for the standards be reflected in the RSAWs as well.

Organization	Yes or No	Question 12 Comments
Response: Until Remedial Action Scheme has become the official approved definition, the SDT will use the existing language of Special Protection System. If Remedial Action Scheme is adopted as the new, official term then a project will be undertaken to make the necessary corrections throughout all standards. No change made. Changes to requirement language due to industry comments will be reflected in RSAWs.		
Electric Reliability Council of Texas, Inc.	Yes	1. The proposed definitions of Real-Time Assessment and Operational Planning Analysis require use of applicable inputs. ERCOT respectfully submits that many of these inputs can only be utilized once communicated by other entities. Accordingly, the following revision is proposed: Real-time Assessment: An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable, known inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through contracted third-party services.) Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable, known inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through contracted third-party services.) 2. During the last posting, we expressed a concern over the proposed retirement of TOP-004-2, Requirement R4, which stipulates that:R4. If a Transmission Operator enters an unknown operating state (i.e. any state for which valid operating limits have not been determined), it will be considered to be in an emergency and shall restore operations to respect proven reliable power system limits within 30

Organization	Yes or No	Question 12 Comments
		minutes. The SDT’s response to our comment indicates that: As presented in the white paper on the Treatment of SOLs, the proposed requirements are based on the concept of not depending on pre-determined existing SOLs/IROLs but rather to monitor the existing and potential operating conditions and evaluate them against the same ratings and limits that SOLs/IROLs would be based upon. Those ratings and limits rarely change due to changes in system conditions, whereas predetermined SOLs and IROLs may change due to the assumptions they were based on. No change made. While we agree that the ratings and limits upon which the SOLs/IROLs are based rarely change due to changes in system conditions, the changes in system condition themselves can render any SOLs/IROLs invalid, especially those that are voltage or stability limits. In other word, there does not exist any “proven reliable power system limits” as stated in R4 of TOP-002-4. We generally support the concept of not depending on pre-determined existing SOLs/IROLs but rather, to monitor the existing and potential operating conditions and evaluate them against the same ratings and limits that SOLs/IROLs would be based upon. However the concept itself (and being in a “white paper” status), or use of any information in the white paper, does not help or mandate re-calculation of valid SOLs and IROLs when entering an unknown state, and the ratings and limits that do not change have no bearing on those SOLs/IROLs that are voltage or stability limited and which are more dependent on system conditions, which have changed. While R13 in TOP-001- 3 requires a TOP to ensure that a Real-time Assessment is performed at least once every 30 minutes, it falls short of specifying the expected outcome (or objectives), such as new/revised SOLs/IROLs and assessing system performance against the new limits. The proposed definition of Real-time Assessment is also short of specifying the development or calculation of SOLs/IROLs. Hence, between R13 of TOP-003-1 and the definition of RTA, there is a gap that in an unknown state/condition, a TOP is not required to (and hence will not) develop SOLs/IROLs that are valid for the prevailing conditions. Hence, if R4 in TOP-004-2 is retired, it will leave a reliability gap. The white paper does not mandate the proper and necessary

Organization	Yes or No	Question 12 Comments
		action to "restore operations to respect proven reliable power system limits within 30 minutes" when entering into an unknown state. We again urge the SDT to consider not retiring Requirement R4 of TOP-002-4. Finally, we are unclear whether or not the proposed retirement of TOP-004-2 will be balloted separately, which it should. 3. TOP-006 R6 is not captured accurately. If the BAL-005 standard is intended to address metering outside of generation resources and the equipment that ties it to the BES, then the TO/TOP should be added to the BAL-005 R17 requirement. ERCOT suggests creating a requirement that addresses accuracy, range, and sampling rate holistically and apply it to Transmission Owners and Generation Owners as they typically purchase and maintain such devices. ERCOT does not agree that TOP-004 R6.2 is addressed sufficiently in TOP-001-3 R8. ERCOT believes that all switching that could impact another Transmission Operator should be coordinated, and not a subset which R8 limits it to. Failure to coordinate by the Transmission Operators that have local or direct control could result in inadvertent loss of load. ERCOT does not agree with the justification utilized for TOP-002 R19. Planning models may differ from Operations models due to software variances, new / retired facilities timelines, seasonal variations, etc. Therefore MOD-033-1 does not address R19.

Response: 1. The SDT recognizes that only known inputs can be included as part of an RTA or OPA once the required information is communicated by other entities. No change made.

2. The SDT has discussed the concern over the retirement of approved TOP-004-2 Requirement R4 and believes the existing requirements within the standard to perform a Real-time Assessment include reevaluation of SOL/IROL limits to either reestablish new limits or implement Operating Plans to stay within updated limits. The SDT does not believe that the proposed requirements and standards allow an entity to be in an unknown state consistent with established IROL T_V. The premise of the SDT's philosophy is that an Operational Planning Analysis must be available for next day and that this analysis must be periodically updated by performing a Real-time Assessment as per proposed TOP-001-4 Requirement R13. Both of these

Organization	Yes or No	Question 12 Comments
functions require an established set of Facility Ratings be in use so that analysis can discern when these limits are being exceeded. It is the SDT's belief that once these limits have been established that it does not matter what event occurs to cause an exceedance. The event takes place and is analyzed against the set of limits currently in place. It is these limits that an entity must restore the system to following the event as per proposed TOP-001-4 Requirement R14. Therefore, the SDT believes that approved TOP-004-2 Requirement R4 can be retired without creating a reliability gap. The SDT recognizes that not all entities are capable of performing Real-time transient Stability analysis within 30 minutes and would rely on Operating Plans. No change made. 3. The requirement is replaced by proposed TOP-003-3, Requirements R1 and R2 which state that data specifications can include, but are not limited to the 4 criteria listed. This allows for an entity to create specifications that would include items such as range of metering, accuracy, etc. The mapping document has been updated accordingly. 4. The SDT disagrees and believes that the proposed replacement addresses the situation. No change made. 5. Accuracy is a relative term that would be difficult to objectively measure and assess compliance with. Proposed TOP-003-3, Requirement R1 stipulates that entities must supply the data needed for reliability. The expectation is that the Transmission Operator would specify the data it requires to perform its functions which would include all of the data it needs to create the model for its analyses and studies. The requirement language allows the entity to specify accuracy of the data provided as part of its data specification. This will, in turn, lead to the creation of an accurate model based on accurate data received. In addition, proposed TOP-003-3, Requirement R5, Part 5.2 allows for the resolution of any data causing conflicts that could affect the models. The SDT updated the mapping document.		
PacifiCorp	No	TOP-001-3 exceeds the NOPR by requiring Protection Systems in addition to Special Protection Systems. The tools used to produce Real-time Assessments using Real-time data are not dynamic stability assessment tools, and do not inherently understand the status of all "Protection Systems", degradations, or identified phase angles and equipment limitations. Note the definition references "Protection System and Special Protection System status," while the NOPR references only Special Protection Schemes.
Response: The SDT was required to consider additional inputs beyond the FERC NOPR as part of the Standards Development process. The SDT recognizes that not all Real-time Assessment tools include dynamic Stability assessments. Typically facilities with degraded protection systems are switched out-of-service. If the facilities are not switched out-of-service, Contingencies within the		

Organization	Yes or No	Question 12 Comments
Real-time Assessment should be modified to reflect remote clearing. If there are transient Stability concerns, Operating Plans would address expected operator actions. No change made.		
FRCC Operating Committee (Member Services) City of Tallahassee	Yes	The comments provided herein are consensus comments of the FRCC Operating Committee entity representatives. Our responses to the above questions in no way intends to convey how individual FRCC OC member entities will vote on the standards being proposed. Thank you for your efforts.
Florida Municipal Power Agency	No	FMPA appreciates the good work of the SDT in streamlining and improving the clarity of these standards.
PJM Interconnection	No	PJM is submitting affirmative ballots for all the standards. The revisions made to IRO-002-4 and IRO-008-2 addressed PJM's concerns with the previous drafts of these standards.

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted for comment February 21, 2014 – March 24, 2014

First posting May 19, 2014 - July 2, 2014

Second posting August 6, 2014 – September 19, 2014

Description of Current Draft

This is the third posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date
Final ballot	October 2014
BOT	November 2014

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
1	November 19, 2006	Changes "Distribution Provider" to "Transmission Service provider"	Errata
1.1	October 29, 2008	Removed "proposed" from effective date BOT adopted errata changes: updated version number to "1.1"	Errata
1.1	May 13, 2009	FERC Approval	Revised
2	July 25, 2011	Revisions under Project 2006-06 to remove Requirement R7 to avoid duplication with IRO-014-2	Revised
3	July 6, 2012	Revisions to complete scope of revisions under Project 2006-06	Revised
3	August 4, 2011	Adopted by Board of Trustees	Revised
4	TBD	Revisions as per Project 2014-03	

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

There are no new or revised definitions proposed in this standard revision.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title**: Reliability Coordination – Responsibilities
2. **Number**: IRO-001-4
3. **Purpose**: To establish the responsibility of Reliability Coordinators to act or direct other entities to act.
4. **Applicability**

> **Rationale:** Purchasing-Selling Entity and Load-Serving Entity have been deleted from the approved IRO-001-1.1 as they are not listed as entities that the Reliability Coordinator directs in Functional Model v5.

4.1. Reliability Coordinator

4.2. Transmission Operator

4.3. Balancing Authority

4.4. Generator Operator

4.5. Distribution Provider

5. **Effective Date:**

See Implementation Plan.

6. **Background:**

See the Project 2014-03 project page.

B. Requirements and Measures

> **Rationale**: The change from Reliability Directive to Operating Instruction throughout the standard is in response to NOPR paragraph 64 (…"*We believe that directives from a reliability coordinator or transmission operator should be mandatory at all times, and not just during emergencies (unless contrary to safety, equipment, regulatory or statutory requirements). For example, mandatory compliance with directives in non-emergency situations is important when a decision is made to alter or maintain the state of an element on the interconnected transmission network…*") This change is also consistent with the proposed COM-002-4.

R1. Each Reliability Coordinator shall act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions. *[Violation Risk Factor: High][Time Horizon: Same-Day Operations, Real-time Operations]*

M1. Each Reliability Coordinator shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions.

Rationale for Requirements R2 and R3: The Transmission Service Provider has been removed from Requirements R2 and R3 as the Transmission Service Provider is not listed in the Functional Model as a recipient of corrective actions issued by the Reliability Coordinator. This allows for the retirement of IRO-004-2.

R2. Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with its Reliability Coordinator's Operating Instructions unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]*

M2. Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it complied with its Reliability Coordinator's Operating Instructions, unless the instruction could not be physically implemented, or such actions would have violated safety, equipment, regulatory or statutory requirements. In such cases, the Transmission Operator, Balancing Authority, Generator Operator, or Distribution Provider shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Reliability Coordinator's Operating Instructions. If such a situation has not occurred, the Transmission Operator, Balancing Authority, Generator Operator, or Distribution Provider may provide an attestation.

R3. Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall inform its Reliability Coordinator of its inability to perform the Operating Instruction issued by its Reliability Coordinator in Requirement R1. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]*

M3. Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it informed its Reliability Coordinator of its inability to perform an Operating Instruction issued by its Reliability Coordinator in Requirement R1.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes:

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator for Requirement R1, Measure M1 shall retain voice recordings for the most recent 90-calendar days and documentation for the most recent 12-calendar months.
- The Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider for Requirements R2 and R3, Measures M2 and M3 shall retain voice recordings for the most recent 90-calendar days and documentation for the most recent 12-calendar months.

If a Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator failed to act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions.
R2	Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The responsible entity did not comply with the Reliability Coordinator's Operating Instructions, and compliance with the Operating Instructions could have been physically implemented and such actions would not have violated safety, equipment, regulatory, or statutory requirements.
R3	Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The responsible entity failed to inform its Reliability Coordinator upon recognition of its inability to perform an Operating Instruction issued by its Reliability Coordinator in Requirement R1 .

D. Regional Variances

4	TBD	Revisions as per Project 2014-03	

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

There are no new or revised definitions proposed in this standard revision.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title**: Reliability Coordination – Responsibilities
2. **Number**: IRO-001-4
3. **Purpose**: To establish the responsibility of Reliability Coordinators to act or direct other entities to act.
4. **Applicability**

> **Rationale:** Purchasing-Selling Entity and Load-Serving Entity have been deleted from the approved IRO-001-1.1 as they are not listed as entities that the Reliability Coordinator directs in Functional Model v5.

4.1. Reliability Coordinator

4.2. Transmission Operator

4.3. Balancing Authority

4.4. Generator Operator

4.5. Distribution Provider

5. **Effective Date:**

~~The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

See Implementation Plan.

6. **Background:**

See the Project 2014-03 project page.

B. Requirements and Measures

Rationale: The change from Reliability Directive to Operating Instruction throughout the standard is in response to NOPR paragraph 64 (…"*We believe that directives from a reliability coordinator or transmission operator should be mandatory at all times, and not just during emergencies (unless contrary to safety, equipment, regulatory or statutory requirements). For example, mandatory compliance with directives in non-emergency situations is important when a decision is made to alter or maintain the state of an element on the interconnected transmission network…*") This change is also consistent with the proposed COM-002-4.

R1. Each Reliability Coordinator shall act~~, or direct others to act, by issuing Operating Instructions,~~ to ~~ensure~~address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions. *[Violation Risk Factor: High][Time Horizon: ~~Operations Planning,~~ Same-Day Operations, Real-time Operations]*

M1. Each Reliability Coordinator shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted~~, or directed others to act, by issuing Operating Instructions~~ to ~~ensure~~address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions.

Rationale for Requirements R2 and R3: The ~~addition of~~ Transmission Service Provider ~~to~~has been removed from Requirements R2 and R3 as the Transmission Service Provider is not listed in the Functional Model as a recipient of corrective actions issued by the Reliability Coordinator. This allows for the retirement of IRO-004-2.

R2. Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with its Reliability Coordinator's Operating Instructions unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: ~~Operations Planning,~~ Same-Day Operations, Real-time Operations]*

M2. Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it complied with its Reliability Coordinator's Operating Instructions, unless the instruction could not be physically implemented, or such actions would have violated safety, equipment, regulatory or statutory requirements. In such cases, the Transmission Operator, Balancing Authority, Generator Operator, ~~Transmission Service Provider,~~ or Distribution Provider shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Reliability Coordinator's Operating Instructions. If such a situation has not occurred, the Transmission Operator, Balancing Authority, Generator Operator, ~~Transmission Service Provider,~~ or Distribution Provider may provide an attestation.

R3. Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall inform its Reliability Coordinator of its inability to perform the Operating Instruction issued by its Reliability Coordinator in Requirement R1. *[Violation Risk Factor: High] [Time Horizon: ~~Operations Planning,~~ Same-Day Operations, Real-time Operations]*

M3. Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it informed its Reliability Coordinator of its inability to perform an Operating Instruction issued by its Reliability Coordinator in Requirement R1.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes:

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, ~~Transmission Service Provider,~~ and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator for Requirement R1, Measure M1 shall retain voice recordings for the most recent 90-calendar days and documentation for the most recent 12-calendar months.
- The Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider for Requirements R2 and R3, Measures M2 and M3 shall retain voice recordings for the most recent 90-calendar days and documentation for the most recent 12-calendar months.

If a Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	~~Operations Planning,~~ Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator failed to act~~, or direct others to act, by issuing Operating Instructions,~~ to ~~ensure~~address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions.
R2	~~Operations Planning,~~ Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The responsible entity did not comply with the Reliability Coordinator's Operating Instructions, and compliance with the Operating Instructions could have been physically implemented and such actions would not have violated safety, equipment, regulatory, or statutory requirements.
R3	~~Operations Planning,~~ Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The responsible entity failed to inform its Reliability Coordinator upon recognition of its inability to perform an Operating Instruction issued by its Reliability Coordinator in Requirement R1 .

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

None.

2	February 24, 2014	Updated VSLs based on June 24, 2013 approval.	VSLs revised
3	July 25, 2011	Revised under Project 2006-06	Revised
3	August 4, 2011	Approved by Board of Trustees	
4	TBD	Revisions under Project 2014-03	Revised

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Real-time Assessment: An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Reliability Coordination – Monitoring and Analysis**
2. **Number:** IRO-002-4
3. **Purpose:** Provide System Operators with the capabilities necessary to monitor and analyze data needed to perform their reliability functions.
4. **Applicability**

   4.1. Reliability Coordinator
5. **Effective Date:**

   See Implementation Plan.
6. **Background:**

   See the Project 2014-03 project page.

B. Requirements and Measures

Rationale: The data exchange elements of Requirements R1 and R2 from approved IRO-002-2 have been added back into proposed IRO-002-4 in order to ensure that there is no reliability gap. The SDT found no proposed requirements in the current project that covered the issue. Voice communication is covered in proposed COM-001-2 but data communications needs to remain in IRO-002-4 as it is not covered in proposed COM-001-2. Staffing of communications and facilities in corresponding requirements from IRO-002-2 is addressed in approved PER-004-2, Requirement R1 and has been deleted from this draft.

R1. Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M1. Each Reliability Coordinator shall have and provide upon request, evidence that could include but is not limited to a document that lists its data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

R2. Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M2. Each Reliability Coordinator shall have and provide upon request evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities.

Rationale: Requirement R2 from IRO-002-3 has been deleted because approved EOP-008-1, Requirement R1, part 1.6.2 addresses redundancy and back-up concerns for outages of analysis tools. New Requirement R4 has been added to address NOPR paragraphs 96 and 97: *"…As we explain above, the reliability coordinator's obligation to monitor SOLs is important to reliability because a SOL can evolve into an IROL during deteriorating system conditions, and for potential system conditions such as this, the reliability coordinator's monitoring of SOLs provides a necessary backup function to the transmission operator…."*

R3. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

M3. Each Reliability Coordinator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitored Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

Rationale for Requirement R4: Requirement R4 added back from approved IRO-002-2 as the SDT found no proposed requirements that covered the issues.

R4. Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M4. The Reliability Coordinator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitoring systems consistent with the requirement.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes:

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Reliability Coordinator shall retain its current, in force document and any documents in force for the current year and previous calendar year for Requirements R1, R2, and R3 and Measures M1, M2, and M3.

The Reliability Coordinator shall keep data or evidence for Requirement R4 and Measure M4 for the current calendar year and one previous calendar year.

If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning, Same-Day Operations, Real-time Operations	High	The Reliability Coordinator did not have data exchange capabilities with one applicable entity, or 5% or less of the applicable entities, whichever is greater.	The Reliability Coordinator did not have data exchange capabilities with two applicable entities, or more than 5% or less than or equal to 10% of the applicable entities, whichever is greater.	The Reliability Coordinator did not have data exchange capabilities with three applicable entities, or more than 10% or less than or equal to 15% of the applicable entities, whichever is greater.	The Reliability Coordinator did not have data exchange capabilities with four or more applicable entities or greater than 15% of the applicable entities, whichever is greater.
R2	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator failed to provide its System Operator with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities.
R3	Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator did not monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						Operating Limit exceedances within its Reliability Coordinator Area.
R4	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator did not have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted February 21, 2014 – March 24, 2014

First posting May 19, 2014 – July 2, 2014

Second posting August 6, 2014 – September 19, 2014

Description of Current Draft

This is the ~~second~~third posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date
Final ballot	October 2014
BOT	November 2014

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
2		Deleted R2, M3 and associated compliance elements Replaced Levels of Non-compliance with the Feb 28, BOT approved Violation Severity Levels (VSLs) Corrected typographical errors in BOT approved version of VSLs	Revised
2	October 17, 2008	Adopted by NERC Board of Trustees	Revised
2	March 17, 2011	Order issued by FERC approving IRO-002-2 (approval effective 5/23/11)	FERC approval
2	February 24, 2014	Updated VSLs based on June 24, 2013 approval.	VSLs revised
3	July 25, 2011	Revised under Project 2006-06	Revised
3	August 4, 2011	Approved by Board of Trustees	
4	TBD	Revisions under Project 2014-03	Revised

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Real-time Assessment: An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Reliability Coordination – Monitoring and Analysis**
2. **Number:** IRO-002-4
3. **Purpose:** Provide System Operators with the capabilities necessary to monitor and analyze data needed to perform their reliability functions.
4. **Applicability**

   4.1. Reliability Coordinator

5. **Effective Date:**

   ~~The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

   See Implementation Plan.

6. **Background:**

   See the Project 2014-03 project page.

B. Requirements and Measures

Rationale: The data exchange elements of Requirements R1 and R2 from approved IRO-002-2 have been added back into proposed IRO-002-4 in order to ensure that there is no reliability gap. The SDT found no proposed requirements in the current project that covered the issue~~s~~. ~~The currently-effective requirement in IRO-002-2 has been separated into two parts (Requirements R1 and R2 below) to distinguish voice and data requirements.~~ Voice communication is covered in proposed COM-001-2 but data communications needs to remain in IRO-002-4 as it is not covered in proposed COM-001-2. Staffing of communications and facilities in corresponding requirements from IRO-002-2 is addressed in approved PER-004-2, Requirement R1 and has been deleted from this draft.

R1. Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M1. Each Reliability Coordinator shall have and provide upon request, evidence that could include but is not limited to a document that lists its data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its operational Planning Analyses, Real-time monitoring, and ~~r~~Real-time Assessments.

R2. Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M2. Each Reliability Coordinator shall have and provide upon request evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities.

Rationale: Requirement R2 from IRO-002-3 has been deleted because approved EOP-008-1, Requirement R1, part 1.6.2 addresses redundancy and back-up concerns for outages of analysis tools. New Requirement R4 has been added to address NOPR paragraphs 96 and 97: *"…As we explain above, the reliability coordinator's obligation to monitor SOLs is important to reliability because a SOL can evolve into an IROL during deteriorating system conditions, and for potential system conditions such as this, the reliability coordinator's monitoring of SOLs provides a necessary backup function to the transmission operator…."*

R3. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and ~~sub-100 kV~~non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

M3. Each Reliability Coordinator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitored Facilities, the status of Special Protection Systems, and ~~sub-100 kV~~non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability

Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

Rationale for Requirement R4: Requirement R4 added back from approved IRO-002-2 as the SDT found no proposed requirements that covered the issues.

R4. Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M4. The Reliability Coordinator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitoring systems consistent with the requirement.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes:

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Reliability Coordinator shall retain its current, in force document and any documents in force for the current year and previous calendar year for Requirements R1, R2, and R3 and Measures M1, M2, and M3.

The Reliability Coordinator shall keep data or evidence for Requirement R4 and Measure M4 for the current calendar year and one previous calendar year.

If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning, Same-Day Operations, Real-time Operations	High	The Reliability Coordinator did not have data exchange capabilities with one applicable entity, or 5% or less of the applicable entities, whichever is ~~less~~greater.	The Reliability Coordinator did not have data exchange capabilities with two applicable entities, or more than 5% or less than or equal to 10% of the applicable entities, whichever is ~~less~~greater.	The Reliability Coordinator did not have data exchange capabilities with three applicable entities, or more than 10% or less than or equal to 15% of the applicable entities, whichever is ~~less~~greater.	The Reliability Coordinator did not have data exchange capabilities with four or more applicable entities or greater than 15% of the applicable entities, whichever is ~~less~~greater.
R2	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator failed to provide its System Operator with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities.
R3	Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator did not monitor Facilities, the status of Special Protection Systems, and ~~sub-100 kV~~non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
R4	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator did not have monitoring systems that provide information utilized by the Reliability Coordinator’s operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure.

D. Regional Variances

F. Associated Documents

None.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted February 21, 2014 – March 24, 2014

First posting May 19, 2014 – July 2, 2014

Second posting August 6, 2014 – September 19, 2014

Description of Current Draft

This is the third posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date
Final ballot	October 2014
BOT	November 2014

Version History

Version	Date	Action	Change Tracking
1	October 17, 2008	Adopted by Board of Trustees	New
1a	August 5, 2009	Added Appendix 1: Interpretation of R1.2 and R3 as approved by Board of Trustees	Addition
1a	March 17, 2011	Order issued by FERC approving IRO-010-1a (approval effective 5/23/11)	
1a	November 19, 2013	Updated VRFs based on June 24, 2013 approval.	
2	April 2014	Revisions pursuant to Project 2014-03	

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Real-time Assessment: An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

A. Introduction

1. **Title:** Reliability Coordinator Data Specification and Collection
2. **Number:** IRO-010-2
3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact reliability, by ensuring the Reliability Coordinator has the data it needs to monitor and assess the operation of its Reliability Coordinator Area.

Rationale for Applicability changes: Changes were made to applicability based on IRO FYRT recommendation to address the need for UVLS and UFLS information in the data specification.

The Interchange Authority was removed because activities in the Coordinate Interchange standards are performed by software systems and not a responsible entity. The software, not a functional entity, performs the task of accepting and disseminating interchange data between entities. The Balancing Authority is the responsible functional entity for these tasks.

The Planning Coordinator and Transmission Planner were removed from Draft 2 as those entities would not be involved in a data specification concept as outlined in this standard.

4. **Applicability**
   - **4.1.** Reliability Coordinator.
   - **4.2.** Balancing Authority.
   - **4.3.** Generator Owner.
   - **4.4.** Generator Operator.
   - **4.5.** Load-Serving Entity.
   - **4.6.** Transmission Operator.
   - **4.7.** Transmission Owner.
   - **4.8.** Distribution Provider.

5. **Proposed Effective Date:**

   See Implementation Plan.

6. **Background**

   See Project 2014-03 project page.

B. Requirements

Rationale:

Proposed Requirement R1, Part 1.1 is in response to issues raised in NOPR paragraph 67 on the need for obtaining non-BES and external network data necessary for the Reliability Coordinator to fulfill its responsibilities.

Proposed Requirement R1, Part 1.2 is in response to NOPR paragraph 78 on relay data.

Proposed Requirement R3, Part 3.3 is in response to NOPR paragraph 92 where concerns were raised about data exchange through secured networks.

Corresponding changes have been made to proposed TOP-003-3.

R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator.

1.2. Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.

1.3. A periodicity for providing data.

1.4. The deadline by which the respondent is to provide the indicated data.

M1. The Reliability Coordinator shall make available its dated, current, in force documented specification for data.

R2. The Reliability Coordinator shall distribute its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

M2. The Reliability Coordinator shall make available evidence that it has distributed its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. This evidence could include but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

R3. Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications using: *(Violation Risk Factor: Medium) (Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations)*

3.1 A mutually agreeable format

3.2 A mutually agreeable process for resolving data conflicts

3.3 A mutually agreeable security protocol

M3. The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall make available evidence that it satisfied the obligations of the documented specification using the specified criteria. Such evidence could include but is not limited to electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2 Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Reliability Coordinator shall retain its dated, current, in force documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R1, Measure M1 as well as any documents in force since the last compliance audit.

The Reliability Coordinator shall keep evidence for three calendar years that it has distributed its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R2, Measure M2.

Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R3 and Measurement M3.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R#	Time Horizon	VRF	Violation Severity Levels			
			Lower	Moderate	High	Severe
R1	Operations Planning	Low	The Reliability Coordinator did not include one of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include two of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include three of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include any of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Reliability Coordinator did not have a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted February 21, 2014 – March 24, 2014

First posting May 19, 2014 – July 2, 2014

Second posting August 6, 2014 – September 19, 2014

Description of Current Draft

This is the ~~second~~third posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date
Final ballot	October 2014
BOT	November 2014

Version History

Version	Date	Action	Change Tracking
1	October 17, 2008	Adopted by Board of Trustees	New
1a	August 5, 2009	Added Appendix 1: Interpretation of R1.2 and R3 as approved by Board of Trustees	Addition
1a	March 17, 2011	Order issued by FERC approving IRO-010-1a (approval effective 5/23/11)	
1a	November 19, 2013	Updated VRFs based on June 24, 2013 approval.	
2	April 2014	Revisions pursuant to Project 2014-03	

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Real-time Assessment: An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

A. Introduction

1. **Title:** Reliability Coordinator Data Specification and Collection
2. **Number:** IRO-010-2
3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact reliability, by ensuring the Reliability Coordinator has the data it needs to monitor and assess the operation of its Reliability Coordinator Area.

> **Rationale for Applicability changes:** Changes were made to applicability based on IRO FYRT recommendation to address the need for UVLS and UFLS information in the data specification.
>
> The Interchange Authority was removed because activities in the Coordinate Interchange standards are performed by software systems and not a responsible entity. The software, not a functional entity, performs the task of accepting and disseminating interchange data between entities. The Balancing Authority is the responsible functional entity for these tasks.
>
> The Planning Coordinator and Transmission Planner were removed from Draft 2 as those entities would not be involved in a data specification concept as outlined in this standard.

4. **Applicability**
   - **4.1.** Reliability Coordinator.
   - **4.2.** Balancing Authority.
   - **4.3.** Generator Owner.
   - **4.4.** Generator Operator.
   - **4.5.** Load-Serving Entity.
   - **4.6.** Transmission Operator.
   - **4.7.** Transmission Owner.
   - **4.8.** Distribution Provider.

5. **Proposed Effective Date:**

   ~~Requirement R1 and R2 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R1 and R2 shall become effective on the first day of the first calendar~~

~~quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

~~Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

See Implementation Plan.

6. Background

See Project 2014-03 project page.

B. Requirements

Rationale:

Proposed Requirement R1, Part 1.1 is in response to issues raised in NOPR paragraph 67 on the need for obtaining ~~sub-100 kV~~non-BES and external network data necessary for the Reliability Coordinator to fulfill its responsibilities.

Proposed Requirement R1, Part 1.2 is in response to NOPR paragraph 78 on relay data.

Proposed Requirement R3, Part 3.3 is in response to NOPR paragraph 92 where concerns were raised about data exchange through secured networks.

Corresponding changes have been made to proposed TOP-003-3.

R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including ~~sub-100 kV~~non-BES data and external network data, as deemed necessary by the Reliability Coordinator.

1.2. Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.

1.3. A periodicity for providing data.

1.4. The deadline by which the respondent is to provide the indicated data.

M1. The Reliability Coordinator shall make available its dated, current, in force documented specification for data.

R2. The Reliability Coordinator shall distribute its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

M2. The Reliability Coordinator shall make available evidence that it has distributed its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. This evidence could include but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

R3. Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications using: *(Violation Risk Factor: Medium) (Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations)*

3.1 A mutually agreeable format

3.2 A mutually agreeable process for resolving data conflicts

3.3 A mutually agreeable security protocol

M3. The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall make available evidence that it satisfied the obligations of the documented specification using the specified criteria. Such evidence could include but is not limited to electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2 Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The Reliability Coordinator, Balancing Authority, ~~Planning Coordinator, Transmission Planner,~~ Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Reliability Coordinator shall retain its dated, current, in force documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R1, Measure M1 as well as any documents in force since the last compliance audit.

The Reliability Coordinator shall keep evidence for three calendar years that it has distributed its data specification to entities that have data required by the Reliability Coordinator’s Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R2, Measure M2.

Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R3 and Measurement M3.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R#	Time Horizon	VRF	Violation Severity Levels			
			Lower	Moderate	High	Severe
R1	Operations Planning	Low	The Reliability Coordinator did not include one of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include two of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include three of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include any of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Reliability Coordinator did not have a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time

R#	Time Horizon	VRF	Violation Severity Levels			
			Lower	Moderate	High	Severe
						monitoring, and Real-time Assessments.
For the Requirement R2 VSLs only, the intent of the SDT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.						
R2	Operations Planning	Low	The Reliability Coordinator did not distribute its data specification as developed in Requirement R1 to one entity, or 5% or less of the entities, whichever is ~~less~~greater, that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time	The Reliability Coordinator did not distribute its data specification as developed in Requirement R1 to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is ~~less~~greater, that have data required by the Reliability Coordinator's	The Reliability Coordinator did not distribute its data specification as developed in Requirement R1 to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is ~~less~~greater, that have data required by the Reliability	The Reliability Coordinator did not distribute its data specification as developed in Requirement R1 to four or more entities, or more than 15% of the entities, whichever is ~~less~~greater, that have data required by the Reliability Coordinator's Operational

Definitions

Project 2014-03 Revisions to TOP/IRO Reliability Standards

As part of the work in Project 2014-03 Revisions to TOP/IRO Reliability Standards, the SDT is proposing changes to two existing definitions: Operational Planning Analysis and Real-time Assessment.

The currently-effective definition of Operational Planning Analysis is: *"An analysis of the expected system conditions for the next day's operation. (That analysis may be performed either a day ahead or as much as 12 months ahead.) Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.)."*

The proposed version of the definition of Operational Planning Analysis is: *"An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)"*

The currently-effective definition of Real-time Assessment is: *"An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data."*

The proposed version of the definition of Real-time Assessment is: *"An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)"*

The definitions were revised in response to issues raised in NOPR paragraphs 55, 73, and 74 on analysis and monitoring of SOLs in all time horizons, NOPR paragraph 70 (updating study results in Real-time), and NOPR paragraph 78 (Protection System coordination). The phase angle item was added in response to SW Outage Report recommendation 27.

The two definitions are also employed in the following proposed project standards: TOP-001-3, TOP-002-4, TOP-003-3, IRO-002-4, IRO-008-2, and IRO-010-2. These definitions are not used in any other standards, either currently-effective or in development in any other project.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Requested Approvals

- TOP-001-3 Transmission Operations
- TOP-002-4 Operations Planning
- TOP-003-3 Operational Reliability Data
- IRO-001-4 Reliability Coordination - Responsibilities and Authorities
- IRO-002-4 Reliability Coordination — Analysis Tools
- IRO-008-2 Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-010-2 Reliability Coordinator Data Specification and Collection
- IRO-014-3 Coordination Among Reliability Coordinators
- IRO-017-1 Outage Coordination

Requested Retirements (two groups of standards)

1. **Existing Approved Standards**
    - TOP-001-1a Reliability Responsibilities and Authorities
    - TOP-002—2.1b Normal Operations Planning
    - TOP-003-1 Planned Outage Coordination
    - TOP-004-2 Transmission Operations
    - TOP-005-2a Operational Reliability Information
    - TOP-006-2 Monitoring System Conditions
    - TOP-007-0 Reporting System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) Violations
    - TOP-008-1 Response to Transmission Limit Violations
    - IRO-001-1.1 Reliability Coordination — Responsibilities and Authorities
    - IRO-002-2 Reliability Coordination — Facilities
    - IRO-003-2 Reliability Coordination – Wide Area View
    - IRO-004-2 Reliability Coordination – Operations Planning
    - IRO-005-3.1a Reliability Coordination — Current Day Operations
    - IRO-008-1 Reliability Coordinator Operational Analyses and Real-time Assessments
    - IRO-010-1a Reliability Coordinator Data Specification and Collection
    - IRO-014-1 Coordination Among Reliability Coordinators
    - IRO-015-1 Notifications and Information Exchange Between Reliability Coordinators
    - IRO-016-1 Coordination of Real-time Activities Between Reliability Coordinators
    - PER-001-0.2 Operating Personnel Responsibility and Authority

2. **Filed with FERC but not approved** – these standards were filed with FERC but never approved and will be retired as part of this project. Upon Board approval of replacement standards, NERC will request the Board to rescind its approval of these standards and petition FERC to withdraw its petition for approval of these standards:
   - TOP-001-2 Transmission Operations
   - TOP-002-3 Operations Planning
   - TOP-003-2 Operational Reliability Data
   - IRO-001-3 Reliability Coordination - Responsibilities and Authorities
   - IRO-002-3 Reliability Coordination — Analysis Tools
   - IRO-005-4 Reliability Coordination — Current Day Operations
   - IRO-014-2 Coordination Among Reliability Coordinators
   - PRC-001-2 System Protection Coordination

Prerequisite Approvals[1]

Definition of Operating Instruction (filed with proposed COM-002-4).
COM-001-2 – Communications (filed with proposed COM-002-4)

Revisions to Defined Terms in the NERC Glossary

The Standards Drafting Team proposes retiring the following Board-approved definitions:	
Reliability Directive	Original definition – approved by the Board but never adopted by FERC; will be withdrawn as part of this project, consistent with the approach for the standards that were filed with FERC and not approved. Definition: *A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impacts.*
The Standards Drafting Team proposes revising the following Board-approved definitions:	
Operational Planning Analysis	**Original definition**: *An analysis of the expected system conditions for the next day's operation. (That analysis may be performed either a day ahead or as much as 12 months ahead.) Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).* **Revised definition**: *An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels;*

[1] In the event approval of COM-001-2 and the definition of Operating Instruction do not occur prior to the approval of the standards and definitions revised or developed in Project 2014-03, the currently enforceable standards and definitions would remain effective until those approvals have occurred, and the new or revised standards in Project 2014-03 shall become effective concurrent with the effective date of COM-001-2 and the definition of Operating Instruction.

	Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
Real-time Assessment	**Original definition**: *An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.* **Revised definition**: *An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)*

The definitions were revised in response to issues raised in NOPR paragraphs 55, 73, and 74 on analysis and monitoring of SOLs in all time horizons, NOPR paragraph 70 (updating study results in Real-time), and NOPR paragraph 78 (Protection System coordination). The phase angle item was added in response to SW Outage Report recommendation 27.

Background

On April 16, 2013, NERC submitted two petitions requesting Commission approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) (collectively, the "TOP Standards") to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) (collectively, the "IRO Standards") to replace six currently-effective IRO standards.

On November 21, 2013, the Commission issued a NOPR in response to these petitions. The NOPR proposed to remand the proposed TOP and IRO Standards. In the NOPR, the Commission raises a concern that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." For example, the Commission cites the fact that the proposed TOP standards do not require Transmission Operators to plan and operate within all System Operating Limits ("SOLs"), which is a requirement in the currently effective standards.

On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR. This deferral would provide an opportunity for the industry, NERC, and FERC to work toward a common understanding and afford time to review the proposed TOP and IRO standards through the NERC standards development process to address the concerns set forth in the NOPR. That motion to defer action was granted by the Commission on January 14, 2014.

On February 12, 2014, the Standards Committee appointed a Standard Drafting Team to take on the task of revising the aforementioned standards in response to the NOPR issues and the recommendations made by the Independent Expert Review Panel, the IRO FYRT, and the SW Outage Report and this implementation plan is developed from the changes made to the standards revised by that project.

General Considerations

The twelve month implementation period for all of the standards except TOP-003-3 and IRO-010-2 is intended to allow time for entities to update processes and train operators on the revised requirements. All of the Requirements in proposed TOP-003-3 and IRO-010-2 except TOP-003-3, Requirements R5 and IRO-010-2, Requirement R3 become effective three months earlier, in order to provide recipients of data requests from their Reliability Coordinators, Transmission Operators, and/or Balancing Authorities time to respond to the request for data.

Applicable Entities

- Reliability Coordinator
- Balancing Authority
- Transmission Owner
- Transmission Operator
- Distribution Provider
- Generator Owner
- Generator Operator
- Load-Serving Entity
- Planning Coordinator
- Transmission Planner

Effective Date for Standards

1. **If the Prerequisite Approvals occur on or before Approval of the standards in Project 2014-03:**

- **For all standards except proposed TOP-003-3 and proposed IRO-010-2:**
  The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

- **For proposed TOP-003-3:**
  All requirements except Requirement R5 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

  Requirement R5 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

  The reason for the difference in effective dates for proposed TOP-003-3 is to allow applicable entities to have time to properly respond to the data specification requests.

- **For proposed IRO-010-2:**
  Requirement R1 and R2 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R1 and R2 shall become

effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

The reason for the difference in effective dates for proposed IRO-010-2 is to allow applicable entities to have time to properly respond to the data specification requests.

2. If the approval of the standards in Project 2014-03 occurs concurrent with or before the Prerequisite Approvals:

- **For all standards except proposed TOP-003-3 and proposed IRO-010-2:**
  The standard shall become effective concurrently with COM-001-2 and the definition of Operating Instruction.

- **For proposed TOP-003-3:**
  All requirements except Requirement R5 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the definition of Operating Instruction is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date COM-001-2 is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

  Requirement R5 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the definition of Operating Instruction is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the definition of Operating Instruction is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

The reason for the difference in effective dates for proposed TOP-003-3 is to allow applicable entities to have time to properly respond to the data specification requests.

- **For proposed IRO-010-2:**
  Requirement R1 and R2 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the definition of Operating Instruction is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R1 and R2 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
  Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the definition of Operating Instruction is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

- **Standards for Retirement:**
  Midnight of the day before the first day of the first calendar quarter that is twelve (12) months after the date that the standards in Project 2014-03 are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standards shall be retired at midnight of the day before the first day of the first calendar quarter that is twelve (12) months after the date the standards in Project 2014-03 are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

- **Definition of Reliability Directive:**
  Midnight of the day before the first day of the first calendar quarter that is twelve (12) months after the date that the standards in Project 2014-03 are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the definition shall be retired at midnight of the day before the first day of the first calendar quarter that is twelve (12) months after the date the standards in Project 2014-03 are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for Definitions

The definitions of Operational Planning Analysis and Real-time Assessment shall become effective on the first day of the first calendar quarter that is ten (10) months after the date that the definitions are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a definitions to go into effect. Where approval by an applicable governmental authority is not required, the definitions shall become effective on the first day of the first calendar quarter that is ten (10) months after the date the definitions are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

The definitions are used in proposed IRO-010-2, Requirements R1 and R2 and in proposed TOP-003-3, Requirements R1 and R3 so it is necessary that the definitions become effective concurrent with those requirements.

The two definitions are also employed in the following proposed project standards: TOP-001-3, TOP-002-4, and IRO-008-2. These definitions are not used in any other standards, either approved or in development in any other project.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2014-03 Revisions to TOP and IRO Standards

Final Ballots Now Open through October 20, 2014

Now Available

Final ballots and non-binding polls of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for **TOP-002-4, TOP-003-3, IRO-008-2, IRO-014-3, and IRO-017-1** are open through **8 p.m. Eastern on Monday, October 20, 2014**.

Additionally, final ballots for **IRO-001-4, IRO-002-4, IRO-010-2, two Definitions, and Implementation Plan** are open through **8 p.m. Eastern on Monday, October 20, 2014**.

Instructions for Balloting
In the final ballot, votes are counted by exception. Only members of the ballot pool may cast a ballot; all ballot pool members may change their previously cast votes. A ballot pool member who failed to cast a vote during the last ballot window may cast a vote in the final ballot window. If a ballot pool member cast a vote in the previous ballot and does not participate in the final ballot, that member's vote will be carried over in the final ballot.

Members of the ballot pools associated with this project may log in and submit their vote for the standards, definitions, implementation plan and associated VRFs and VSLs as described above by clicking here**.**

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Mark Olson.

Standards Announcement

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Final Ballot and Non-Binding Poll Results

Now Available

Final ballots for **TOP-002-4, TOP-003-3, IRO-008-2, IRO-014-3, and IRO-017-1** concluded at **8 p.m. Eastern, Monday, October 20, 2014**. The non-binding polls of the associated Violation Risk Factors and Violation Severity Levels concluded at **8 p.m. Eastern, Wednesday, October 22, 2014**

Additionally, final ballots for **IRO-001-4, IRO-002-4, IRO-010-2, two Definitions, and Implementation Plan** concluded at **8 p.m. Eastern, Monday, October 20, 2014.**

The standards achieved a quorum and sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballots.

	Ballot Results	Non-Binding Poll Results
	Quorum /Approval	Quorum/Supportive Opinions
IRO-001-4	90.77% / 82.64%	N/A
IRO-002-4	89.97% / 85.96%	N/A
IRO-008-2	89.71% / 83.73%	78.59% / 85.88%
IRO-010-2	89.97% / 86.22%	N/A
IRO-014-3	89.71% / 89.88%	78.59% / 91.33%
IRO-017-1	89.97% / 82.58%	78.89% / 92.18%
TOP-002-4	89.71% / 84.76%	78.89% / 86.77%
TOP-003-3	90.50% / 86.55%	78.30% / 82.29%
2 Definitions	88.39% / 94.07%	NA
Implementation Plan	88.39% / 91.84%	NA

Background information for this project can be found on the project page.

Next Steps

The standards and associated documents will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

Ballot Name:	Project 2014-03 TOP/IRO Implementation Plan
Ballot Period:	10/10/2014 - 10/20/2014
Ballot Type:	Final
Total # Votes:	335
Total Ballot Pool:	379
Quorum:	**88.39 % The Quorum has been reached**
Weighted Segment Vote:	91.84 %
Ballot Results:	**A quorum was reached and there were sufficient affirmative votes for approval.**

Individual Ballot Pool Results

Segment	Organization	Member	Ballot	NERC Notes
1	Ameren Services	Eric Scott	Abstain	
1	American Electric Power	Paul B Johnson	Abstain	
1	American Transmission Company, LLC	Andrew Z Pusztai	Affirmative	
1	Arizona Public Service Co.	Brian Cole	Affirmative	
1	Associated Electric Cooperative, Inc.	John Bussman	Affirmative	
1	Austin Energy	James Armke	Affirmative	
1	Avista Utilities	Heather Rosentrater		
1	Balancing Authority of Northern California	Kevin Smith	Affirmative	
1	Baltimore Gas & Electric Company	Christopher J Scanlon	Affirmative	
1	BC Hydro and Power Authority	Patricia Robertson	Abstain	
1	Black Hills Corp	Wes Wingen	Affirmative	
1	Bonneville Power Administration	Donald S. Watkins	Negative	COMMENT RECEIVED
1	Brazos Electric Power Cooperative, Inc.	Tony Kroskey	Abstain	
1	Bryan Texas Utilities	John C Fontenot	Affirmative	
1	CenterPoint Energy Houston Electric, LLC	John Brockhan	Affirmative	
1	Central Electric Power Cooperative	Michael B Bax		
1	Central Iowa Power Cooperative	Kevin J Lyons	Negative	SUPPORTS THIRD PARTY COMMENTS
1	Central Maine Power Company	Joseph Turano Jr.	Affirmative	
1	City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	Chang G Choi	Affirmative	
1	City of Tallahassee	Daniel S Langston	Affirmative	
1	Clark Public Utilities	Jack Stamper	Affirmative	
1	Cleco Power LLC	Danny McDaniel		
1	Colorado Springs Utilities	Shawna Speer	Affirmative	
1	Consolidated Edison Co. of New York	Christopher L de Graffenried	Affirmative	
1	CPS Energy	Glenn Pressler	Affirmative	
1	Dairyland Power Coop.	Robert W. Roddy	Affirmative	
1	Dominion Virginia Power	Larry Nash	Negative	SUPPORTS THIRD PARTY COMMENTS
1	Duke Energy Carolina	Doug E Hils	Negative	SUPPORTS THIRD PARTY COMMENTS
1	Encari	Steven E Hamburg		
1	Entergy Transmission	Oliver A Burke	Affirmative	
1	FirstEnergy Corp.	William J Smith	Affirmative	
1	Florida Keys Electric Cooperative Assoc.	Dennis Minton	Affirmative	
1	Florida Power & Light Co.	Mike O'Neil	Affirmative	
1	Gainesville Regional Utilities	Richard Bachmeier	Abstain	
1	Georgia Transmission Corporation	Jason Snodgrass	Negative	COMMENT RECEIVED
1	Great River Energy	Gordon Pietsch	Affirmative	
1	Hoosier Energy Rural Electric Cooperative, Inc.	Bob Solomon	Negative	SUPPORTS THIRD PARTY COMMENTS
1	Hydro One Networks, Inc.	Muhammed Ali	Affirmative	
1	Hydro-Quebec TransEnergie	Martin Boisvert	Affirmative	
1	Idaho Power Company	Molly Devine	Affirmative	
1	International Transmission Company Holdings Corp	Michael Moltane	Affirmative	
1	JDRJC Associates	Jim D Cyrulewski	Abstain	
1	JEA	Ted E Hobson	Affirmative	
1	KAMO Electric Cooperative	Walter Kenyon	Affirmative	

1	Kansas City Power & Light Co.	Daniel Gibson	Negative	
1	Lakeland Electric	Larry E Watt	Affirmative	
1	Lee County Electric Cooperative	John Chin		
1	Lincoln Electric System	Doug Bantam	Abstain	
1	Long Island Power Authority	Robert Ganley	Affirmative	
1	Los Angeles Department of Water & Power	faranak sarbaz	Affirmative	
1	Lower Colorado River Authority	Martyn Turner	Affirmative	
1	M & A Electric Power Cooperative	William Price	Affirmative	
1	Manitoba Hydro	Jo-Anne M Ross	Affirmative	
1	MEAG Power	Danny Dees	Affirmative	
1	MidAmerican Energy Co.	Terry Harbour	Affirmative	
1	Minnkota Power Coop. Inc.	Daniel L Inman	Abstain	
1	Muscatine Power & Water	Andrew J Kurriger		
1	N.W. Electric Power Cooperative, Inc.	Mark Ramsey	Affirmative	
1	National Grid USA	Michael Jones	Affirmative	
1	NB Power Corporation	Alan MacNaughton	Affirmative	
1	Nebraska Public Power District	Jamison Cawley	Abstain	
1	New York Power Authority	Bruce Metruck	Affirmative	
1	Northeast Missouri Electric Power Cooperative	Kevin White	Affirmative	
1	Northeast Utilities	William Temple	Affirmative	
1	Northern Indiana Public Service Co.	Julaine Dyke	Affirmative	
1	NorthWestern Energy	John Canavan		
1	Ohio Valley Electric Corp.	Scott R Cunningham	Abstain	
1	Oklahoma Gas and Electric Co.	Terri Pyle	Affirmative	
1	Omaha Public Power District	Doug Peterchuck	Affirmative	
1	Oncor Electric Delivery	Jen Fiegel	Affirmative	
1	Otter Tail Power Company	Daryl Hanson	Abstain	
1	Pacific Gas and Electric Company	Bangalore Vijayraghavan	Affirmative	
1	Peak Reliability	Jared Shakespeare	Affirmative	
1	Platte River Power Authority	John C. Collins	Affirmative	
1	Portland General Electric Co.	John T Walker	Affirmative	
1	Potomac Electric Power Co.	David Thorne	Affirmative	
1	PPL Electric Utilities Corp.	Brenda L Truhe	Affirmative	
1	Public Service Electric and Gas Co.	Kenneth D. Brown	Affirmative	
1	Public Utility District No. 1 of Okanogan County	Dale Dunckel		
1	Puget Sound Energy, Inc.	Denise M Lietz	Negative	COMMENT RECEIVED
1	Rochester Gas and Electric Corp.	John C. Allen	Affirmative	
1	Sacramento Municipal Utility District	Tim Kelley	Affirmative	
1	Salt River Project	Robert Kondziolka	Affirmative	
1	SaskPower	Wayne Guttormson	Abstain	
1	Seattle City Light	Pawel Krupa	Affirmative	
1	Seminole Electric Cooperative, Inc.	Glenn Spurlock	Affirmative	
1	Sho-Me Power Electric Cooperative	Denise Stevens		
1	Snohomish County PUD No. 1	Long T Duong	Affirmative	
1	South Carolina Electric & Gas Co.	Tom Hanzlik	Affirmative	
1	South Carolina Public Service Authority	Shawn T Abrams	Abstain	
1	Southern California Edison Company	Steven Mavis	Affirmative	
1	Southern Company Services, Inc.	Robert A. Schaffeld	Negative	
1	Southern Illinois Power Coop.	William Hutchison		
1	Southwest Transmission Cooperative, Inc.	John Shaver	Negative	
1	Sunflower Electric Power Corporation	Noman Lee Williams	Affirmative	
1	Tampa Electric Co.	Beth Young		
1	Tennessee Valley Authority	Howell D Scott	Affirmative	
1	Trans Bay Cable LLC	Steven Powell	Affirmative	
1	Tri-State Generation & Transmission Association, Inc.	Tracy Sliman	Affirmative	
1	U.S. Bureau of Reclamation	Richard T Jackson		
1	United Illuminating Co.	Jonathan Appelbaum	Affirmative	
1	Westar Energy	Allen Klassen	Affirmative	
1	Western Area Power Administration	Lloyd A Linke	Affirmative	
1	Wolverine Power Supply Coop., Inc.	Michelle Clements	Abstain	
1	Xcel Energy, Inc.	Gregory L Pieper	Abstain	
2	BC Hydro	Venkataramakrishnan Vinnakota	Abstain	
2	California ISO	Rich Vine	Affirmative	
2	Electric Reliability Council of Texas, Inc.	Cheryl Moseley	Negative	

2	Independent Electricity System Operator	Leonard Kula		
2	ISO New England, Inc.	Matthew F Goldberg	Affirmative	
2	MISO	Marie Knox		
2	New York Independent System Operator	Gregory Campoli	Affirmative	
2	PJM Interconnection, L.L.C.	stephanie monzon	Affirmative	
2	Southwest Power Pool, Inc.	Charles H. Yeung	Affirmative	
3	AEP	Michael E Deloach	Abstain	
3	Alabama Power Company	Robert S Moore	Negative	
3	Ameren Corp.	David J Jendras	Abstain	
3	APS	Sarah Kist	Affirmative	
3	Associated Electric Cooperative, Inc.	Todd Bennett	Affirmative	
3	Atlantic City Electric Company	NICOLE BUCKMAN	Affirmative	
3	Avista Corp.	Scott J Kinney		
3	BC Hydro and Power Authority	Pat G. Harrington	Abstain	
3	Central Electric Power Cooperative	Adam M Weber	Affirmative	
3	Central Lincoln PUD	Steve Alexanderson	Affirmative	
3	City of Anaheim Public Utilities Department	Dennis M Schmidt	Abstain	
3	City of Austin dba Austin Energy	Andrew Gallo	Affirmative	
3	City of Clewiston	Lynne Mila	Affirmative	
3	City of Farmington	Linda R Jacobson	Abstain	
3	City of Garland	Ronnie C Hoeinghaus	Abstain	
3	City of Green Cove Springs	Mark Schultz	Affirmative	
3	City of Redding	Bill Hughes	Affirmative	
3	City of Tallahassee	Bill R Fowler	Affirmative	
3	Cleco Corporation	Michelle A Corley		
3	Colorado Springs Utilities	Jean Mueller	Affirmative	
3	ComEd	John Bee	Affirmative	
3	Consolidated Edison Co. of New York	Peter T Yost	Affirmative	
3	Consumers Energy Company	Gerald G Farringer	Affirmative	
3	Cowlitz County PUD	Russell A Noble	Affirmative	
3	CPS Energy	Jose Escamilla	Affirmative	
3	Delmarva Power & Light Co.	Michael R. Mayer	Affirmative	
3	Dominion Resources, Inc.	Connie B Lowe	Negative	SUPPORTS THIRD PARTY COMMENTS
3	DTE Electric	Kent Kujala	Affirmative

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted for comment February 21, 2014 to March 24, 2014

First posting May 19, 2014 to July 2, 2014

Second posting August 6, 2014 to September 19, 2014

Proposed Action Plan and Description of Current Draft

This is the third posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date
Final ballot	October 2014
BOT	November 2014

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
2	June 14, 2007	Fixed typo in R11., (subject to …)	Errata
2a	February 10, 2009	Added Appendix 1 – Interpretation of R11 approved by BOT on February 10, 2009	Interpretation
2a	December 2, 2009	Interpretation of R11 approved by FERC on December 2, 2009	Same Interpretation
2b	November 4, 2010	Added Appendix 2 – Interpretation of R10 adopted by the Board of Trustees	
2b	October 20, 2011	FERC Order issued approving the Interpretation of R10 (FERC's Order became effective on October 20, 2011)	
2.1b	March 8, 2012	Errata adopted by Standards Committee; (Removed unnecessary language from the Effective Date section. Deleted retired sub-requirements from Requirement R14)	Errata
2.1b	April 11, 2012	Additional errata adopted by Standards Committee; (Deleted language from retired sub-requirement from Measure M7)	Errata
2.1b	September 13, 2012	FERC approved	Errata
3	May 6, 2012	Revisions under Project 2007-03	Revised

3	May 9, 2012	Adopted by Board of Trustees	Revised
4	April 2014	Revisions under Project 2014-03	Revised

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Operations Planning**
2. **Number: TOP-002-4**
3. **Purpose:** To ensure that Transmission Operators and Balancing Authorities have plans for operating within specified limits.
4. **Applicability:**

   4.1. Transmission Operator

   4.2. Balancing Authority
5. **Effective Date:**

   See Implementation Plan.
6. **Background:**

   See Project 2014-03 project page.

B. Requirements and Measures

Rationale for Requirement R1: Terms deleted in Requirement R1 as they are now contained in the revised definition of Operational Planning Analysis.

R1. Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M1. Each Transmission Operator shall have evidence of a completed Operational Planning Analysis. Such evidence could include but is not limited to dated power flow study results.

Rationale for Requirement R2: The change to Requirement R2 is in response to NOPR paragraph 42 and in concert with proposed changes made to proposed TOP-001-4.

R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M2. Each Transmission Operator shall have evidence that it has an Operating Plan to address potential System Operating Limits (SOLs) exceedances identified as a result of the Operational Planning Analysis performed in Requirement R1. Such evidence could include but it is not limited to plans for precluding operating in excess of each SOL that was identified as a result of the Operational Planning Analysis.

Rationale for Requirement R3: Changes in response to IERP recommendation.

R3. Each Transmission Operator shall notify entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in those plan(s). *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Each Transmission Operator shall have evidence that it notified entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in the plan(s). Such evidence could include but is not limited to dated operator logs, or e-mail records.

Rationale for Requirements R4 and R5: These Requirements were added to address IERP recommendations.

R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

4.1 Expected generation resource commitment and dispatch

4.2 Interchange scheduling

4.3 Demand patterns

4.4 Capacity and energy reserve requirements, including deliverability capability

M4. Each Balancing Authority shall have evidence that it has developed a plan to operate within the criteria identified. Such evidence could include but is not limited to dated operator logs or e-mail records.

R5. Each Balancing Authority shall notify entities identified in the Operating Plan(s) cited in Requirement R4 as to their role in those plan(s). *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M5. Each Balancing Authority shall have evidence that it notified entities identified in the plan(s) cited in Requirement R4 as to their role in the plan(s). Such evidence could include but is not limited to dated operator logs or e-mail records.

Rationale for Requirements R6 and R7: Added in response to SW Outage Report recommendation 1.

R6. Each Transmission Operator shall provide its Operating Plan(s) for next-day operations identified in Requirement R2 to its Reliability Coordinator. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M6. Each Transmission Operator shall have evidence that it provided its Operating Plan(s) for next-day operations identified in Requirement R2 to its Reliability Coordinator. Such evidence could include but is not limited to dated operator logs or e-mail records.

R7. Each Balancing Authority shall provide its Operating Plan(s) for next-day operations identified in Requirement R4 to its Reliability Coordinator. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M7. Each Balancing Authority shall have evidence that it provided its Operating Plan(s) for next-day operations identified in Requirement R4 to its Reliability Coordinator. Such evidence could include but is not limited to dated operator logs or e-mail records.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Transmission Operator and Balancing Authority shall keep data or evidence to show compliance for each applicable Requirement for a rolling 90-calendar days period for analyses, the most recent 90-calendar days for voice recordings, and 12 months for operating logs and e-mail records unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Operator or Balancing Authority is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning	Medium	N/A	N/A	N/A	The Transmission Operator did not have an Operational Planning Analysis allowing it to assess whether its planned operations for the next day within its Transmission Operator Area exceeded any of its System Operating Limits (SOLs).
R2	Operations Planning	Medium	N/A	N/A	N/A	The Transmission Operator did not have an Operating Plan to address potential System Operating Limit (SOL) exceedances identified as a result of the Operational Planning Analysis performed in Requirement R1.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
For the Requirement R3 and R5 VSLs only, the intent of the SDT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.						
R3	Operations Planning	Medium	The Transmission Operator did not notify one impacted entity or 5% or less of the entities, whichever is greater identified in the Operating Plan(s) as to their role in the plan(s).	The Transmission Operator did not notify two entities or more than 5% and less than or equal to 10% of the impacted entities, whichever is greater, identified in the Operating Plan(s) as to their role in the plan(s).	The Transmission Operator did not notify three impacted entities or more than 10% and less than or equal to 15% of the entities, whichever is greater, identified in the Operating Plan(s) as to their role in the plan(s).	The Transmission Operator did not notify four or more entities or more than 15% of the impacted NERC identified in the Operating Plan(s) as to their role in the plan(s).
R4	Operations Planning	Medium	The Balancing Authority has an Operating Plan but it does not address one of the criteria in Requirement R4.	The Balancing Authority has an Operating Plan but it does not address two of the criteria in Requirement R4.	The Balancing Authority has an Operating Plan but it does not address three of the criteria in Requirement R4.	The Balancing Authority did not have an Operating Plan.
R5	Operations Planning	Medium	The Balancing Authority did not notify one impacted entity or 5% or less	The Balancing Authority did not notify two entities or more than 5% and	The Balancing Authority did not notify three impacted entities or	The Balancing Authority did not notify four or more entities or more than

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			of the entities, whichever is greater, identified in the Operating Plan(s) as to their role in the plan(s).	less than or equal to 10% of the impacted entities, whichever is greater, identified in the Operating Plan(s) as to their role in the plan(s).	more than 10% and less than or equal to 15% of the entities, whichever is greater, identified in the Operating Plan(s) as to their role in the plan(s).	15% of the impacted entities identified in the Operating Plan(s) as to their role in the plan(s).
R6	Operations Planning	Medium	N/A	N/A	N/A	The Transmission Operator did not provide its Operating Plan(s) for next-day operations as identified in Requirement R2 to its Reliability Coordinator.
R7	Operations Planning	Medium	N/A	N/A	N/A	The Balancing Authority did not provide its Operating Plan(s) for next-day operations as identified in Requirement R4 to its Reliability Coordinator.

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific SOL or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator's disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific SOL or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible SOL or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those SOLs or IROLs, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day SOL or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of "the Operating Plan document" for compliance purposes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

3	May 9, 2012	Adopted by Board of Trustees	Revised
4	April 2014	Revisions under Project 2014-03	Revised

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Operations Planning**
2. **Number: TOP-002-4**
3. **Purpose:** To ensure that Transmission Operators and Balancing Authorities have plans for operating within specified limits.
4. **Applicability:**

   4.1. Transmission Operator

   4.2. Balancing Authority

5. **Effective Date:**

   ~~The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

   See Implementation Plan.

6. **Background:**

   See Project 2014-03 project page.

B. Requirements and Measures

R1. Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

Rationale for Requirement R1: Terms deleted in Requirement R1 as they are now contained in the revised definition of Operational Planning Analysis.

M1. Each Transmission Operator shall have evidence of a completed Operational Planning Analysis. Such evidence could include but is not limited to dated power flow study results.

Rationale for Requirement R2: The change to Requirement R2 is in response to NOPR paragraph 42 and in concert with proposed changes made to proposed TOP-001-4.

R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M2. Each Transmission Operator shall have evidence that it has an Operating Plan to address potential System Operating Limits (SOLs) exceedances identified as a result of the Operational Planning Analysis performed in Requirement R1. Such evidence could include but it is not limited to plans for precluding operating in excess of each SOL that was identified as a result of the Operational Planning Analysis.

Rationale for Requirement R3: Changes in response to IERP recommendation.

R3. Each Transmission Operator shall notify ~~impacted~~ entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in those plan(s). *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Each Transmission Operator shall have evidence that it notified ~~impacted~~ entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in the plan(s). Such evidence could include but is not limited to dated operator logs, or e-mail records.

Rationale for Requirements R4 and R5: These Requirements were added to address IERP recommendations.

R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

4.1 Expected generation resource commitment and dispatch

4.2 Interchange scheduling

4.3 Demand patterns

4.4 Capacity and energy reserve requirements, including deliverability capability

M4. Each Balancing Authority shall have evidence that it has developed a plan to operate within the criteria identified. Such evidence could include but is not limited to dated operator logs or e-mail records.

R5. Each Balancing Authority shall notify ~~impacted~~ entities identified in the Operating Plan(s) cited in Requirement R4 as to their role in those plan(s). *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M5. Each Balancing Authority shall have evidence that it notified ~~impacted~~ entities identified in the plan(s) cited in Requirement R4 as to their role in the plan(s). Such evidence could include but is not limited to dated operator logs or e-mail records.

Rationale for Requirements R6 and R7: Added in response to SW Outage Report recommendation 1.

R6. Each Transmission Operator shall provide its Operating Plan(s) for next-day operations identified in Requirement R2 to its Reliability Coordinator. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M6. Each Transmission Operator shall have evidence that it provided its Operating Plan(s) for next-day operations identified in Requirement R2 to its Reliability Coordinator. Such evidence could include but is not limited to dated operator logs or e-mail records.

R7. Each Balancing Authority shall provide its Operating Plan(s) for next-day operations identified in Requirement R4 to its Reliability Coordinator. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M7. Each Balancing Authority shall have evidence that it provided its Operating Plan(s) for next-day operations identified in Requirement R4 to its Reliability Coordinator. Such evidence could include but is not limited to dated operator logs or e-mail records.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Transmission Operator and Balancing Authority shall keep data or evidence to show compliance for each applicable Requirement for a rolling 90--calendar days period for analyses, the most recent 90--calendar days for voice recordings, and 12 months for operating logs and e-mail records unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Operator or Balancing Authority is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning	Medium	N/A	N/A	N/A	The Transmission Operator did not have an Operational Planning Analysis allowing it to assess whether its planned operations for the next day within its Transmission Operator Area exceeded any of its System Operating Limits (SOLs).
R2	Operations Planning	Medium	N/A	N/A	N/A	The Transmission Operator did not have an Operating Plan to address potential System Operating Limit (SOL) exceedances identified as a result of the Operational Planning Analysis performed in Requirement R1.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Real-time Assessment: An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Operational Reliability Data**
2. **Number: TOP-003-3**
3. **Purpose:** To ensure that the Transmission Operator and Balancing Authority have data needed to fulfill their operational and planning responsibilities.
4. **Applicability:**
   - **4.1.** Transmission Operator
   - **4.2.** Balancing Authority
   - **4.3.** Generator Owner
   - **4.4.** Generator Operator
   - **4.5.** Load-Serving Entity
   - **4.6.** Transmission Owner
   - **4.7.** Distribution Provider
5. **Effective Date:**

   See Implementation Plan.
6. **Background:**

   See Project 2014-03 project page.

B. Requirements and Measures

Rationale for Requirement R1: Changes to proposed Requirement R1, Part 1.1 are in response to issues raised in NOPR paragraph 67 on the need for obtaining non-BES and external network data necessary for the Transmission Operator to fulfill its responsibilities.

Proposed Requirement R1, Part 1.2 is in response to NOPR paragraph 78 on relay data. The language has been moved from approved PRC-001-1.

Corresponding changes have been made to Requirement R2 for the Balancing Authority and to proposed IRO-010-2, Requirement R1 for the Reliability Coordinator.

R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: *[Violation Risk Factor: Low] [Time Horizon: Operations Planning]*

1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator.

1.2. Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.

1.3. A periodicity for providing data.

1.4. The deadline by which the respondent is to provide the indicated data.

M1. Each Transmission Operator shall make available its dated, current, in force documented specification for data.

R2. Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. The data specification shall include, but not be limited to: *[Violation Risk Factor: Low] [Time Horizon: Operations Planning]*

2.1. A list of data and information needed by the Balancing Authority to support its analysis functions and Real-time monitoring.

2.2. Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.

2.3. A periodicity for providing data.

2.4. The deadline by which the respondent is to provide the indicated data.

M2. Each Balancing Authority shall make available its dated, current, in force documented specification for data.

R3. Each Transmission Operator shall distribute its data specification to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessment. *[Violation Risk Factor: Low] [Time Horizon: Operations Planning]*

M3. Each Transmission Operator shall make available evidence that it has distributed its data specification to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. Such evidence could include but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

R4. Each Balancing Authority shall distribute its data specification to entities that have data required by the Balancing Authority's analysis functions and Real-time monitoring. *[Violation Risk Factor: Low] [Time Horizon: Operations Planning]*

M4. Each Balancing Authority shall make available evidence that it has distributed its data specification to entities that have data required by the Balancing Authority's analysis functions and Real-time monitoring. Such evidence could include but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, or e-mail records.

Rationale for Requirement R5: Proposed Requirement R5, Part 5.3 is in **r**esponse to NOPR paragraph 92 where concerns were raised about data exchange through secured networks.

R5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications using: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

5.1. A mutually agreeable format

5.2. A mutually agreeable process for resolving data conflicts

5.3. A mutually agreeable security protocol

M5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall make available evidence that it has satisfied the obligations of the documented specifications. Such evidence could include, but is not limited to, electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Process

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each responsible entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

Each Transmission Operator shall retain its dated, current, in force, documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R1 and Measurement M1 as well as any documents in force since the last compliance audit.

Each Balancing Authority shall retain its dated, current, in force, documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring in accordance with Requirement R2 and Measurement M2 as well as any documents in force since the last compliance audit.

Each Transmission Operator shall retain evidence for three calendar years that it has distributed its data specification to entities that have data required by the Transmission Operator’s Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R3 and Measurement M3.

Each Balancing Authority shall retain evidence for three calendar years that it has distributed its data specification to entities that have data required by the Balancing Authority’s analysis functions and Real-time monitoring in accordance with Requirement R4 and Measurement M4.

Each Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R5 and Measurement M5.

If a responsible entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning	Low	The Transmission Operator did not include one of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include two of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include three of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include four of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Transmission Operator did not have a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R2	Operations Planning	Low	The Balancing Authority did not include one of the parts (Part 2.1 through Part 2.4) of the documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring.	The Balancing Authority did not include two of the parts (Part 2.1 through Part 2.4) of the documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring.	The Balancing Authority did not include three of the parts (Part 2.1 through Part 2.4) of the documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring.	The Balancing Authority did not include four of the parts (Part 2.1 through Part 2.4) of the documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. OR, The Balancing Authority did not have a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring.
For the Requirement R3 and R4 VSLs only, the intent of the SDT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.						
R3	Operations Planning	Low	The Transmission Operator did not distribute its data	The Transmission Operator did not distribute its data	The Transmission Operator did not distribute its data	The Transmission Operator did not distribute its data

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			specification to one entity, or 5% or less of the entities, whichever is greater, that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	specification to two entities, or more than 5% and less than or equal to10% of the reliability entities, whichever is greater, that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	specification to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	specification to four or more entities, or more than 15% of the entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R4	Operations Planning	Low	The Balancing Authority did not distribute its data specification to one entity, or 5% or less of the entities, whichever is greater, that have data required by the Balancing Authority's analysis functions and Real-time monitoring.	The Balancing Authority did not distribute its data specification to two entities, or more than 5% and less than or equal to 10% of the entities, whichever is greater, that have data required by the Balancing Authority's analysis functions and Real-time monitoring.	The Balancing Authority did not distribute its data specification to three entities, or more than 10% and less than or equal to 15% of the entities, whichever is greater, that have data required by the Balancing Authority's analysis functions and Real-time monitoring.	The Balancing Authority did not distribute its data specification to four or more entities, or more than 15% of the entities that have data required by the Balancing Authority's analysis functions and Real-time monitoring.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	Operations Planning, Same-Day Operations, Real-time Operations	Medium	The responsible entity receiving a data specification in Requirement R3 or R4 satisfied the obligations in the data specification but did not meet one of the criteria shown in Requirement R5 (Parts 5.1 – 5.3).	The responsible entity receiving a data specification in Requirement R3 or R4 satisfied the obligations in the data specification but did not meet two of the criteria shown in Requirement R5 (Parts 5.1 – 5.3).	The responsible entity receiving a data specification in Requirement R3 or R4 satisfied the obligations in the data specification but did not meet three of the criteria shown in Requirement R5 (Parts 5.1 – 5.3).	The responsible entity receiving a data specification in Requirement R3 or R4 did not satisfy the obligations of the documented specifications for data.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted for comment February 21, 2014 to March 24, 2014

First posting May 19, 2014 to July 2, 2014

Second posting August 6, 2014 to September 19, 2014

Proposed Action Plan and Description of Current Draft

This is the ~~second~~third posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 15, 2015.

Anticipated Actions	Anticipated Date
Final ballot	October 2014
BOT	November 2014

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata
1		Modified R1.2 Modified M1 Replaced Levels of Non-compliance with the Feb 28, BOT approved Violation Severity Levels (VSLs)	Revised
1	October 17, 2008	Adopted by NERC Board of Trustees	
1	March 17, 2011	Order issued by FERC approving TOP-003-1 (approval effective 5/23/11)	
2	May 6, 2012	Revised under Project 2007-03	Revised
2	May 9, 2012	Adopted by Board of Trustees	Revised
3	April 2014	Changes pursuant to Project 2014-03	Revised

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Real-time Assessment: An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Operational Reliability Data**
2. **Number: TOP-003-3**
3. **Purpose:** To ensure that the Transmission Operator and Balancing Authority have data needed to fulfill their operational and planning responsibilities.
4. **Applicability:**
   - **4.1.** Transmission Operator
   - **4.2.** Balancing Authority
   - **4.3.** Generator Owner
   - **4.4.** Generator Operator
   - **4.5.** Load-Serving Entity
   - **4.6.** Transmission Owner
   - **4.7.** Distribution Provider
5. **Effective Date:**

   ~~All requirements except Requirement R5 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

   ~~Requirement R5 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

   See Implementation Plan.
6. **Background:**

   See Project 2014-03 project page.

B. Requirements and Measures

Rationale for Requirement R1: Changes to proposed Requirement R1, Part 1.1 are in response to issues raised in NOPR paragraph 67 on the need for obtaining ~~sub-100 kV~~non-BES and external network data necessary for the Transmission Operator to fulfill its responsibilities.

Proposed Requirement R1, Part 1.2 is in response to NOPR paragraph 78 on relay data. The language has been moved from approved PRC-001-1.

Corresponding changes have been made to Requirement R2 for the Balancing Authority and to proposed IRO-010-2, Requirement R1 for the Reliability Coordinator.

R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: *[Violation Risk Factor: Low] [Time Horizon: Operations Planning]*

1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including ~~sub-100 kV~~non-BES data and external network data as deemed necessary by the Transmission Operator.

1.2. Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.

1.3. A periodicity for providing data.

1.4. The deadline by which the respondent is to provide the indicated data.

M1. Each Transmission Operator shall make available its dated, current, in force documented specification for data.

R2. Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. The data specification shall include, but not be limited to: *[Violation Risk Factor: Low] [Time Horizon: Operations Planning]*

2.1. A list of data and information needed by the Balancing Authority to support its analysis functions and Real-time monitoring.

2.2. Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.

2.3. A periodicity for providing data.

2.4. The deadline by which the respondent is to provide the indicated data.

M2. Each Balancing Authority shall make available its dated, current, in force documented specification for data.

R3. Each Transmission Operator shall distribute its data specification to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessment. *[Violation Risk Factor: Low] [Time Horizon: Operations Planning]*

M3. Each Transmission Operator shall make available evidence that it has distributed its data specification to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. Such evidence could include but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

R4. Each Balancing Authority shall distribute its data specification to entities that have data required by the Balancing Authority's analysis functions and Real-time monitoring. *[Violation Risk Factor: Low] [Time Horizon: Operations Planning]*

M4. Each Balancing Authority shall make available evidence that it has distributed its data specification to entities that have data required by the Balancing Authority's analysis functions and Real-time monitoring. Such evidence could include but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, or e-mail records.

Rationale for Requirement R5: Proposed Requirement R5, Part 5.3 is in **r**esponse to NOPR paragraph 92 where concerns were raised about data exchange through secured networks.

R5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications using: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

5.1. A mutually agreeable format

5.2. A mutually agreeable process for resolving data conflicts

5.3. A mutually agreeable security protocol

M5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall make available evidence that it has satisfied the obligations of the documented specifications. Such evidence could include, but is not limited to, electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Process

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each responsible entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

Each Transmission Operator shall retain its dated, current, in force, documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R1 and Measurement M1 as well as any documents in force since the last compliance audit.

Each Balancing Authority shall retain its dated, current, in force, documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring in accordance with Requirement R2 and Measurement M2 as well as any documents in force since the last compliance audit.

Each Transmission Operator shall retain evidence for three calendar years that it has distributed its data specification to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R3 and Measurement M3.

Each Balancing Authority shall retain evidence for three calendar years that it has distributed its data specification to entities that have data required by the Balancing Authority's analysis functions and Real-time monitoring in accordance with Requirement R4 and Measurement M4.

Each Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R5 and Measurement M5.

If a responsible entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R1	Operations Planning	Low	The Transmission Operator did not include one of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include two of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include three of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include four of the parts (Part 1.1 through Part 1.4) of the documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Transmission Operator did not have a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R2	Operations Planning	Low	The Balancing Authority did not include one of the parts (Part 2.1 through Part 2.4) of the documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring.	The Balancing Authority did not include two of the parts (Part 2.1 through Part 2.4) of the documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring.	The Balancing Authority did not include three of the parts (Part 2.1 through Part 2.4) of the documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring.	The Balancing Authority did not include four of the parts (Part 2.1 through Part 2.4) of the documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. OR, The Balancing Authority did not have a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring.
For the Requirement R3 and R4 VSLs only, the intent of the SDT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. First posting from May 19, 2014 to July 2, 2014

Second posting August 6, 2014 to September 19, 2014

Proposed Action Plan and Description of Current Draft

This is the third posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date
Final ballot	October 2014
BOT	November 2014

Version History

Version	Date	Action	Change Tracking
1	October 17, 2008	Adopted by NERC Board of Trustees	
1	March 17, 2011	Order issued by FERC approving IRO-008-1 (approval effective 5/23/11)	
1	February 28, 2014	Updated VSLs and VRF's based on June 24, 2013 approval.	
2	TBD	Revisions under Project 2014-03	Revised

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Real-time Assessment: An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

A. Introduction

1. **Title**: Reliability Coordinator Operational Analyses and Real-time Assessments
2. **Number:** IRO-008-2
3. **Purpose:** Perform analyses and assessments to prevent instability, uncontrolled separation, or Cascading.
4. **Applicability**

   4.1. Reliability Coordinator.
5. **Proposed Effective Date:**

   See Implementation Plan.
6. **Background**

   See Project 2014-03 project page.

B. Requirements and Measures

> **Rationale for Requirement R1**: Revised in response to NOPR paragraph 96 on the obligation of Reliability Coordinators to monitor SOLs. Measure M1 revised for consistency with TOP-003-3, Measure M1.

R1. Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area. [*Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M1. Each Reliability Coordinator shall have evidence of a completed Operational Planning Analysis. Such evidence could include but is not limited to dated power flow study results.

> **Rationale for Requirements R2 and R3**: Requirements added in response to IERP and SW Outage Report recommendations concerning the coordination and review of plans.

R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and

Balancing Authorities. [*Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M2. Each Reliability Coordinator shall have evidence that it has a coordinated Operating Plan for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of the Operational Planning Analysis performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. Such evidence could include but is not limited to plans for precluding operating in excess of each SOL and IROL that were identified as a result of the Operational Planning Analysis.

R3. Each Reliability Coordinator shall notify impacted entities identified in its Operating Plan(s) cited in Requirement R2 as to their role in such plan(s). *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Each Reliability Coordinator shall have evidence that it notified impacted entities identified in its Operating Plan(s) cited in Requirement R2 as to their role in such plan(s). Such evidence could include but is not limited to dated operator logs, or e-mail records.

R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. *[Violation Risk Factor: High] [Time Horizon: Same-day Operations, Real-time Operations]*

M4. Each Reliability Coordinator shall have, and make available upon request, evidence to show it ensured that a Real-time Assessment is performed at least once every 30 minutes. This evidence could include but is not limited to dated computer logs showing times the assessment was conducted, dated checklists, or other evidence.

Rationale for Requirements R5 and R6: In Requirements R5 and R6 the use of the term 'impacted' and the tie to the Operating Plan where notification protocols will be set out should minimize the volume of notifications.

R5. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]*

M5. Each Reliability Coordinator shall make available upon request, evidence that it informed impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, of its actual or expected operations that result in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Reliability Coordinator may provide an attestation.

R6. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R5 has been prevented or mitigated. *[Violation Risk Factor: Medium] [Time Horizon: Same-Day Operations, Real-time Operations]*

M6. Each Reliability Coordinator shall make available upon request, evidence that it informed impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R5 has been prevented or mitigated. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Reliability Coordinator may provide an attestation.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Reliability Coordinator shall keep data or evidence to show compliance for Requirements R1 through R3, R5, and R6 and Measures M1 through M3, M5, and M6 for a rolling 90-calendar days period for analyses, the most recent 90-calendar days for voice recordings, and 12 months for operating logs and e-mail records unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

Each Reliability Coordinator shall each keep data or evidence for Requirement R4 and Measure M4 for a rolling 30-calendar day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None

Table of Compliance Elements

R#	Time Horizons	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning	Medium	N/A	N/A	N/A	The Reliability Coordinator did not perform an Operational Planning Analysis allowing it to assess whether its planned operations for the next-day within its Wide Area will exceed any of its System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs).
R2	Operations Planning	Medium	N/A	N/A	N/A	The Reliability Coordinator did not have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.

F. Associated Documents

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific SOL or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures, including electronic data exchange, which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator's disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific SOL or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible SOL or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those SOLs or IROLs, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day SOL or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of "the Operating Plan document" for compliance purposes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted for comment February 21, 2014 to March 24, 2014

First posting from May 19, 2014 to July 2, 2014

Second posting August 6, 2014 to September 19, 2014

Proposed Action Plan and Description of Current Draft

This is the ~~second~~third posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date

Version	Date	Action	Change Tracking
1	October 17, 2008	Adopted by NERC Board of Trustees	
1	March 17, 2011	Order issued by FERC approving IRO-008-1 (approval effective 5/23/11)	
1	February 28, 2014	Updated VSLs and VRF's based on June 24, 2013 approval.	
2	TBD	Revisions under Project 2014-03	Revised

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Real-time Assessment: An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Operational Planning Analysis: An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

A. Introduction

1. **Title**: Reliability Coordinator Operational Analyses and Real-time Assessments
2. **Number:** IRO-008-2
3. **Purpose:** Perform analyses and assessments to prevent instability, uncontrolled separation, or Cascading.
4. **Applicability**

   4.1. Reliability Coordinator.
5. **Proposed Effective Date:**

   ~~The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

   See Implementation Plan.
6. **Background**

   See Project 2014-03 project page.

B. Requirements and Measures

Rationale for Requirement R1: Revised in response to NOPR paragraph 96 on the obligation of Reliability Coordinators to monitor SOLs. Measure M1 revised for consistency with TOP-003-3, Measure M1.

R1. Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area. [*Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M1. Each Reliability Coordinator shall have evidence of a completed Operational Planning Analysis. Such evidence could include but is not limited to dated power flow study results.

Rationale for Requirements R2 and R3: Requirements added ~~I~~in response to IERP and SW Outage Report recommendations concerning the coordination and review of plans.

R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. [*Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M2. Each Reliability Coordinator shall have evidence that it has a coordinated Operating Plan for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of the Operational Planning Analysis performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. Such evidence could include but is not limited to plans for precluding operating in excess of each SOL and IROL that were identified as a result of the Operational Planning Analysis.

R3. Each Reliability Coordinator shall notify impacted entities identified in its ~~the~~ Operating Plan(s) cited in Requirement R2 as to their role in ~~those~~ such plan(s). *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Each Reliability Coordinator shall have evidence that it notified impacted entities identified in its ~~the~~ Operating Plan(s) cited in Requirement R2 as to their role in ~~the~~ such plan(s). Such evidence could include but is not limited to dated operator logs, or e-mail records.

R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. *[Violation Risk Factor: High] [Time Horizon: Same-day Operations, Real-time Operations]*

M4. Each Reliability Coordinator shall have, and make available upon request, evidence to show it ensured that a Real-time Assessment is performed at least once every 30 minutes. This evidence could include but is not limited to dated computer logs showing times the assessment was conducted, dated checklists, or other evidence.

Rationale for Requirements R5 and R6: In Requirements R5 and R6 the use of the term 'impacted' and the tie to the Operating Plan where notification protocols will be set out should minimize the volume of notifications.

R5. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its ~~Reliability Coordinator~~ Wide Area. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]*

M5. Each Reliability Coordinator shall make available upon request, evidence that it informed impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, of its actual or expected operations that result in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Reliability Coordinator may provide an attestation.

R6. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R~~6~~5 has been prevented or mitigated. *[Violation Risk Factor: Medium] [Time Horizon: Same-Day Operations, Real-time Operations]*

M6. Each Reliability Coordinator shall make available upon request, evidence that it informed impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R~~6~~5 has been prevented or mitigated. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Reliability Coordinator may provide an attestation.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Reliability Coordinator shall keep data or evidence to show compliance for Requirements R1 through R3, R5, and R6 and Measures M1 through M3, M5, and M6 for a rolling 90--calendar days period for analyses, the most recent 90-calendar days for voice recordings, and 12 months for operating logs and e-mail records unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

Each Reliability Coordinator shall each keep data or evidence for Requirement R4 and Measure M4 for a rolling 30--calendar day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None

Table of Compliance Elements

R#	Time Horizons	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning	Medium	N/A	N/A	N/A	The Reliability Coordinator did not perform an Operational Planning Analysis allowing it to assess whether its planned operations for the next-day within its Wide Area will exceed any of its System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs).
R2	Operations Planning	Medium	N/A	N/A	N/A	The Reliability Coordinator did not have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.

R#	Time Horizons	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
For the Requirement R3 and R5 VSLs, the intent of the SDT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size. If a Reliability Coordinator has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation						
R3	Operations Planning	Medium	The Reliability Coordinator did not notify one impacted entity or 5% or less of the impacted ~~NERC registered~~ entities whichever is ~~less~~greater identified in ~~the~~its Operating Plan(s) as to their role in ~~those~~that plan(s).	The Reliability Coordinator did not notify two impacted entities or more than 5% and less than or equal to 10% of the impacted ~~NERC registered~~ entities whichever is ~~less~~greater, identified in ~~the~~its Operating Plan(s) as to their role in ~~those~~that plan(s). F. Associated Documents

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific SOL or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures, including electronic data exchange, which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator's disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific SOL or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible SOL or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those SOLs or IROLs, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day SOL or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of "the Operating Plan document" for compliance purposes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted February 21, 2014 – March 24, 2014

First posting May 19, 2014 – July 2, 2014

Second posting August 6, 2014 – September 19, 2014

Description of Current Draft

This is the third posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

There are no new or revised definitions proposed in this standard revision.

A. Introduction

1. **Title:** Coordination Among Reliability Coordinators
2. **Number:** IRO-014-3
3. **Purpose:** To ensure that each Reliability Coordinator's operations are coordinated such that they will not adversely impact other Reliability Coordinator Areas and to preserve the reliability benefits of interconnected operations.
4. **Applicability:**
   4.1. Reliability Coordinator
5. **Effective Date**
   See Implementation Plan.
6. **Background:**
   See Project 2014-03 project page.

B. Requirements and Measures

R1. Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations]*

1.1. Criteria and processes for notifications.

1.2. Energy and capacity shortages.

1.3. Control of voltage, including the coordination of reactive resources.

1.4. Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and Real-time Assessments.

1.5. Provisions for periodic communications to support reliable operations.

M1. Each Reliability Coordinator shall have available the latest approved documented version of its Operating Procedures, Operating Processes, and Operating Plans that require notifications, or the coordination of actions among impacted Reliability Coordinators for conditions or activities that may impact adjacent Reliability Coordinator Areas. This documentation shall include dated, current in force documentation with the specified elements, and notes from periodic communications.

R2. Each Reliability Coordinator shall maintain its Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 as follows: *[Violation Risk Factor: Low] [Time Horizon: Operations Planning, Same-Day Operations]*

2.1. Review and update annually with no more than 15 months between reviews.

2.2. Obtain written agreement from all of the Reliability Coordinators required to take the indicated action(s) for each update.

2.3. Distribute to all Reliability Coordinators that are required to take the indicated action(s) within 30 days of an update.

M2. Each Reliability Coordinator shall have dated evidence that its Operating Procedures, Operating Processes, and Operating Plans that require one or more other Reliability Coordinators to take action were maintained as specified. This evidence may include but is not limited to dated documentation with confirmation of receipt, dated notice of acceptance or agreement to take specified actions, or dated electronic communications with confirmation of receipt and acceptance or agreement to take specified actions.

Rationale: Terminology changed from Adverse Reliability Impact to Emergency for consistency amongst standards. Emergency is a more inclusive term.

R3. Each Reliability Coordinator, upon identification of an expected or actual Emergency in its Reliability Coordinator Area, shall notify other impacted Reliability Coordinators. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same Day Operations, Real-time Operations]*

M3. Each Reliability Coordinator shall have and provide evidence which may include but is not limited to operator logs, voice recordings, or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it, upon identification of an expected or actual Emergency in its Reliability Coordinator Area, notified other impacted Reliability Coordinators.

R4. Each impacted Reliability Coordinator shall operate as though the Emergency exists during each instance where Reliability Coordinators disagree on the existence of an Emergency. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M4. Each Reliability Coordinator shall have and provide evidence which may include but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it operated as though an Emergency existed during each instance where Reliability Coordinators disagreed on the existence of an Emergency.

R5. Each Reliability Coordinator that Identifies an Emergency in its Reliability Coordinator Area shall develop an action plan to resolve the Emergency during those instances where impacted Reliability Coordinators disagree on the existence of an Emergency. *[Violation Risk Factor: High][Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M5. Each Reliability Coordinator that identifies an Emergency in its Reliability Coordinator Area shall have evidence that it developed an action plan during those instances where impacted Reliability Coordinators disagreed on the existence of an Emergency. This evidence may include but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation.

R6. Each impacted Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identifies the Emergency during those instances where Reliability Coordinators disagree on the existence of an Emergency, unless such actions would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High][Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M6. Each impacted Reliability Coordinator shall have and provide evidence which may include but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it implemented the action plan developed by the Reliability Coordinator who identifies the Emergency when Reliability Coordinators disagree on the existence of an Emergency unless such actions would have violated safety, equipment, regulatory, or statutory requirements.

Rationale for Requirement R7: Language added for consistency with proposed TOP-001-3, Requirement R7.

R7. Each Reliability Coordinator shall assist Reliability Coordinators, if requested and able, provided that the requesting Reliability Coordinator has implemented its emergency procedures, unless such actions cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M7. Each Reliability Coordinator shall make available upon request, evidence that requested assistance was provided, if able, to requesting Reliability Coordinators unless such actions could not be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. If such a situation has not occurred, the Reliability Coordinator may provide an attestation.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes:

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Each Reliability Coordinator shall retain its current, in force document and any documents in force since the last compliance audit for Requirements R1 and R2 and Measures M1 and M2.
- Each Reliability Coordinator shall retain its most recent 12 months of evidence for Requirement R5 and Measure M5.
- Each Reliability Coordinator shall retain 3-calendar years plus current calendar year of evidence for Requirement R6 and Measure M6.
- Each Reliability Coordinator shall retain evidence for 90-calendar days for operator logs and voice recordings and for the period since the last compliance audit for other evidence for Requirements R3, R4, and R7 and Measures M3, M4, and M7.

If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant, or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4 Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning, Same-Day Operations	Medium	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification or coordination of actions with impacted adjacent Reliability Coordinators to support Interconnection reliability but failed to address one of the topical areas identified in Parts 1.1 through 1.5.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, or coordination of actions with impacted adjacent Reliability Coordinators to support Interconnection reliability but failed to address two of the topical areas identified in Parts 1.1 through 1.5.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, or coordination of actions with impacted adjacent Reliability Coordinators to support Interconnection reliability but failed to address three of the topical areas identified in Parts 1.1 through 1.5.	The Reliability Coordinator failed to have Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, or coordination of actions with impacted adjacent Reliability Coordinators to support Interconnection reliability. OR, The Reliability Coordinator failed to implement its Operating Procedures, Operating processes, or Operating Plans when activities required notification, or coordination of actions with impacted adjacent Reliability Coordinators to support

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						Interconnection reliability.
R2	Operations Planning, Same-Day Operations	Lower	N/A	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 but failed to address one of the parts specified in Requirement R2.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 but failed to address two of the parts specified in Requirement R2.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 but failed to address all three of the parts specified in Requirement R2.
For the Requirement R3 VSLs only, the intent of the SDT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size. If a Reliability Coordinator has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.						
R3	Operations Planning, Same-Day Operations, Real-time Operations	Medium	The Reliability Coordinator did not notify one other impacted Reliability Coordinator upon identification of an expected or actual Emergency in its Reliability Coordinator Area.	The Reliability Coordinator did not notify two other impacted Reliability Coordinators upon identification of an expected or actual Emergency in its Reliability Coordinator Area.	The Reliability Coordinator did not notify three other impacted Reliability Coordinators upon identification of an expected or actual Emergency in its Reliability Coordinator Area.	The Reliability Coordinator did not notify four or more other impacted Reliability Coordinators upon identification of an expected or actual Emergency in its Reliability Coordinator Area.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator failed to operate as though the Emergency existed during an instance where Reliability Coordinators disagreed on the existence of an Emergency.
R5	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator that identifies the Emergency in its Reliability Coordinator Area failed to develop an action plan to resolve the Emergency during an instance where impacted Reliability Coordinators disagreed on the existence of Emergency.
R6	Real-time Operations, Same-Day Operations	High	N/A	N/A	N/A	The impacted Reliability Coordinator failed to implement the action plan developed by the Reliability Coordinator that identifies the

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						Emergency during an instance where Reliability Coordinators disagreed on the existence of the Emergency.
R7	Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator did not provide assistance to Reliability Coordinators, if requested and able, provided that the requesting Reliability Coordinator had implemented its emergency procedures, unless such actions could not physically be implemented or would have violated safety, equipment, regulatory, or statutory requirements.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

There are no new or revised definitions proposed in this standard revision.

A. Introduction

1. **Title:** Coordination Among Reliability Coordinators

2. **Number:** IRO-014-3

3. **Purpose:** To ensure that each Reliability Coordinator's operations are coordinated such that they will not adversely impact other Reliability Coordinator Areas and to preserve the reliability benefits of interconnected operations.

4. **Applicability:**

   4.1. Reliability Coordinator

5. **Effective Date**

   ~~The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

   See Implementation Plan.

6. **Background:**

   ~~On April 16, 2013, NERC submitted two petitions requesting Commission approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) to replace six currently-effective IRO standards.~~

   ~~On November 21, 2013, the Commission issued a NOPR proposing to remand these TOP and IRO Standards, stating that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." For example, the Commission cites the fact that the proposed TOP Standards do not require Transmission Operators to plan and operate within all System Operating Limits ("SOLs"), which is a requirement in the currently-effective standards.~~

   ~~On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR and afford time to review the proposed TOP and IRO Standards through the NERC~~

~~standards development process to ensure that a technically justified set of solutions is in place for reliability. That motion to defer action was granted on January 14, 2014.~~

~~On February 12, 2014, the Standards Committee appointed a Standard Drafting Team to take on the task of revising the aforementioned standards in response to the NOPR issues and the recommendations made by the Independent Expert Review Panel, the IRO FYRT, and the SW Outage Report.~~

See Project 2014-03 project page.

~~**Rationale for Requirement R1**: Grammatical changes for consistency with defined terms to Requirement R1.~~

~~Deletions are due to duplication with proposed IRO-008-2, Requirements R4 and R6 and proposed IRO-010-3.~~

~~Other changes are grammatical for clarity.~~

B. Requirements and Measures

R1. Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations]*

1.1. Criteria and processes for notifications.

1.2. Energy and capacity shortages.

1.3. Control of voltage, including the coordination of reactive resources.

1.4. Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and Real-time Assessments.

1.5. Provisions for periodic communications to support reliable operations.

M1. Each Reliability Coordinator shall have available the latest approved documented version of its Operating Procedures, Operating Processes, and Operating Plans that require notifications, or the coordination of actions among impacted Reliability Coordinators for conditions or activities that may impact adjacent Reliability Coordinator Areas. This documentation shall include dated, current in force documentation with the specified elements, and notes from periodic communications.

R2. Each Reliability Coordinator shall maintain its Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 as follows: *[Violation Risk Factor: Low] [Time Horizon: Operations Planning, Same-Day Operations]*

2.1. Review and update annually with no more than 15 months between reviews.

2.2. Obtain written agreement from all of the Reliability Coordinators required to take the indicated action(s) for each update.

2.3. Distribute to all Reliability Coordinators that are required to take the indicated action(s) within 30 days of an update.

M2. Each Reliability Coordinator shall have dated evidence that ~~the~~its Operating Procedures, Operating Processes, and Operating Plans that require one or more other Reliability Coordinators to take action were maintained as specified. This evidence may include but is not limited to dated documentation with confirmation of receipt, dated notice of acceptance or agreement to take specified actions, or dated electronic communications with confirmation of receipt and acceptance or agreement to take specified actions.

Rationale: Terminology changed from Adverse Reliability Impact to Emergency for consistency amongst standards. Emergency is a more inclusive term.

R3. Each Reliability Coordinator, upon identification of an expected or actual Emergency in its Reliability Coordinator Area, shall notify other impacted Reliability Coordinators. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same Day Operations, Real-time Operations]*

M3. Each Reliability Coordinator shall have and provide evidence which may include but is not limited to operator logs, voice recordings, or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it, upon identification of an expected or actual Emergency in its Reliability Coordinator Area, notified other impacted Reliability Coordinators.

R4. Each impacted Reliability Coordinator shall operate as though the Emergency exists during each instance where Reliability Coordinators disagree on the existence of an Emergency. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M4. Each Reliability Coordinator shall have and provide evidence which may include but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it operated as though an Emergency existed during each instance where Reliability Coordinators disagreed on the existence of an Emergency.

R5. Each Reliability Coordinator that ~~i~~Identifie~~d~~s an Emergency in its Reliability Coordinator Area shall develop an action plan to resolve the Emergency during those instances where impacted Reliability Coordinators disagree on the existence of an Emergency. *[Violation Risk Factor: High][Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M5. Each Reliability Coordinator that identifie~~d~~s an Emergency in its Reliability Coordinator Area shall have evidence that it developed an action plan during those instances where impacted Reliability Coordinators disagreed on the existence of an Emergency. This evidence may include but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation.

R6. Each impacted Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identifie~~d~~s the Emergency during those instances where Reliability Coordinators disagree on the existence of an Emergency, unless such actions would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High][Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M6. Each impacted Reliability Coordinator shall have and provide evidence which may include but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it implemented the action plan developed by the Reliability Coordinator who ~~has identified~~identifies the Emergency when Reliability Coordinators disagree on the existence of an Emergency unless such actions would have violated safety, equipment, regulatory, or statutory requirements.

Rationale for Requirement R7: Language added for consistency with proposed TOP-001-3, Requirement R7.

R7. Each Reliability Coordinator shall assist Reliability Coordinators, if requested and able, provided that the requesting Reliability Coordinator has implemented its emergency procedures, unless such actions cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M7. Each Reliability Coordinator shall make available upon request, evidence that requested assistance was provided, if able, to requesting Reliability Coordinators unless such actions could not be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. If such a situation has not occurred, the Reliability Coordinator may provide an attestation.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes:

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Each Reliability Coordinator shall retain its current, in force document and any documents in force since the last compliance audit for Requirements R1 and R2 and Measures M1 and M2.
- Each Reliability Coordinator shall retain its most recent 12 months of evidence for Requirement R5 and Measure M5.
- Each Reliability Coordinator shall retain 3-calendar years plus current calendar year of evidence for Requirement~~s~~ R6 and ~~R8 and Measures~~Measure M6~~ and M8~~.
- Each Reliability Coordinator shall retain evidence for 90-calendar days for operator logs and voice recordings and for the period since the last compliance audit for other evidence for Requirements ~~R7~~R3, R4, and ~~R9~~R7 and Measures ~~M7~~M3, M4, and ~~M9~~M7.

If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant, or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4 Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning, Same-Day Operations	Medium	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification or coordination of actions with impacted adjacent Reliability Coordinators to support Interconnection reliability but failed to address one of the topical areas identified in Parts 1.1 through 1.5.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, or coordination of actions with impacted adjacent Reliability Coordinators to support Interconnection reliability but failed to address two of the topical areas identified in Parts 1.1 through 1.5.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, or coordination of actions with impacted adjacent Reliability Coordinators to support Interconnection reliability but failed to address three of the topical areas identified in Parts 1.1 through 1.5.	The Reliability Coordinator failed to have Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, or coordination of actions with impacted adjacent Reliability Coordinators to support Interconnection reliability. OR, The Reliability Coordinator failed to implement its Operating Procedures, Operating processes, or Operating Plans when activities required notification, or coordination of actions with impacted adjacent Reliability Coordinators to support

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						Interconnection reliability.
R2	Operations Planning, Same-Day Operations	Lower	N/A	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 but failed to ~~meet~~address one of the ~~criteria~~parts specified in Requirement R2.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 but failed to ~~meet~~address two of the ~~criteria~~parts specified in Requirement R2.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 but failed to ~~meet~~address all three of the ~~criteria~~parts specified in Requirement R2.
For the Requirement ~~R5~~R3 VSLs only, the intent of the SDT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size. If a Reliability Coordinator has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.						
R3	Operations Planning, Same-Day Operations, Real-time Operations	Medium	The Reliability Coordinator did not notify one other impacted Reliability Coordinator upon identification of an expected or actual Emergency in its Reliability Coordinator Area.	The Reliability Coordinator did not notify two other impacted Reliability Coordinators upon identification of an expected or actual Emergency in its Reliability Coordinator Area.	The Reliability Coordinator did not notify three other impacted Reliability Coordinators upon identification of an expected or actual Emergency in its Reliability Coordinator Area.	The Reliability Coordinator did not notify four or more other impacted Reliability Coordinators upon identification of an expected or actual Emergency in its Reliability Coordinator Area.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator failed to operate as though the Emergency existed during an instance where Reliability Coordinators disagreed on the existence of an Emergency.
R5	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator that identifie~~d~~s the Emergency in its Reliability Coordinator Area failed to develop an action plan to resolve the Emergency during an instance where impacted Reliability Coordinators disagreed on the existence of Emergency.
R6	Real-time Operations, Same-Day Operations	High	N/A	N/A	N/A	The impacted Reliability Coordinator failed to implement the action plan developed by the Reliability Coordinator that identifie~~d~~s the

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						Emergency during an instance where Reliability Coordinators disagreed on the existence of the Emergency.
R7	Real-time Operations	High	N/A	N/A	N/A	The Reliability Coordinator did not provide assistance to Reliability Coordinators, if requested and able, provided that the requesting Reliability Coordinator ha~~s~~d implemented its emergency procedures, unless such actions could not physically be implemented or would ~~violate~~have violated safety, equipment, regulatory, or statutory requirements.

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific SOL or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures, including electronic data exchange, which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator's disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific SOL or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible SOL or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those SOLs or IROLs, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day SOL or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of "the Operating Plan document" for compliance purposes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted for comment February 21, 2014 to March 24, 2014

First posting May 19, 2014 to July 2, 2014

Second posting August 6 2014 to September 19, 2014

Proposed Action Plan and Description of Current Draft

This is the third posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 15, 2015.

Anticipated Actions	Anticipated Date
Final ballot	October 2014
BOT	November 2014

Version History

Version	Date	Action	Change Tracking
1	April 2014	New standard developed by Project 2014-03	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

There are no new or revised definitions proposed in this standard revision.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Outage Coordination**
2. **Number: IRO-017-1**
3. **Purpose:** To ensure that outages are properly coordinated in the Operations Planning time horizon and Near-Term Transmission Planning Horizon.
4. **Applicability:**
   - **4.1.** Reliability Coordinator
   - **4.2.** Transmission Operator
   - **4.3.** Balancing Authority
   - **4.4.** Planning Coordinator
   - **4.5.** Transmission Planner
5. **Effective Date:**

   See Implementation Plan.
6. **Background:**

   See Project 2014-03 project page.

B. Requirements and Measures

Rationale: This standard is in response to issues raised in NOPR paragraph 90 and recommendations made by the Independent Expert Review Panel and SW Outage Report on the need for an outage coordination standard. It allows for one cohesive standard to address all outage coordination concerns as opposed to having multiple requirements spread throughout the various standards.

Time Horizon: The official definition of the Operations Planning Time Horizon is: "operating and resource plans from day-ahead up to and including seasonal." The SDT equates 'seasonal' as being up to one year out and that these requirements covers the period from day-ahead to one year out.

R1. Each Reliability Coordinator shall develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area. The outage coordination process shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. Identify applicable roles and reporting responsibilities including:

1.1.1. Development and communication of outage schedules.

1.1.2. Assignment of coordination responsibilities for outage schedules between Transmission Operator(s) and Balancing Authority(s).

1.2. Specify outage submission timing requirements.

1.3. Define the process to evaluate the impact of Transmission and generation outages within its Wide Area.

1.4. Define the process to coordinate the resolution of identified outage conflicts with its Transmission Operators and Balancing Authorities, and other Reliability Coordinators.

M1. Each Reliability Coordinator shall make available its dated, current, in force outage coordination process for generation and Transmission outages within its Reliability Coordinator Area.

R2. Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator's outage coordination process. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M2. Each Transmission Operator and Balancing Authority shall provide evidence upon request that it performed the functions specified in its Reliability Coordinator's outage coordination process. Such evidence could include but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

Rationale for Requirement R3: Planning Assessment is a defined term and a document that Planning Coordinators and Transmission Planners already have to produce for approved TPL-001-4. It is not a compilation of load flow studies but a textual summary of what was found in those studies including rationales and assumptions.

R3. Each Planning Coordinator and Transmission Planner shall provide its Planning Assessment to impacted Reliability Coordinators. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M3. Each Planning Coordinator and Transmission Planner shall provide evidence upon request showing that it provided its Planning Assessment to impacted Reliability Coordinators. Such evidence could include but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

Rationale for Requirement R4: The SDT has re-written Requirement R4 to show that the process starts with the Planning Assessments created by the Planning Coordinator and Transmission Planner and then those Planning Assessments are reviewed and reconciled as needed with the Reliability Coordinator. This is in response to comments in paragraph 90 of the FERC NOPR about directly involving the Reliability Coordinator in the planning process for periods beyond the present one year outreach as well as recommendations in the IERP. The re-write should not be construed as relieving the Reliability Coordinator of responsibilities in this area but simply as a reflection of how the process actually starts.

In the future, the SDT believes that such coordination should take place in the TPL standards and to support that position, the SDT has created an item in a draft SAR for TPL-001-4 that would revise Requirement R8 to make the Reliability Coordinator an explicit party in the review process described there.

In addition, the SDT will submit a request to the Functional Model Working Team to adjust the roles and responsibilities of the Reliability Coordinator to this new paradigm.

R4. Each Planning Coordinator and Transmission Planner shall jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator, and Transmission Planner shall provide evidence upon request showing that it jointly developed solutions with its respective Reliability Coordinator(s) for identified issues or conflicts with planned outages in its Planning Assessment for the Near-term Transmission Planning Horizon. Such evidence could include but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Process

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each responsible entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

Each Reliability Coordinator shall retain its dated, current, in force, outage coordination process in accordance with Requirement R1 and Measurement M1 as well as any documents in force since the last compliance audit.

Each Transmission Operator and Balancing Authority shall retain evidence for three calendar years that it followed its Reliability Coordinator outage coordination process in accordance with Requirement R2 and Measurement M2.

Each Planning Coordinator and Transmission Planner shall retain evidence for three calendar years that it has its Planning Assessment to impacted Reliability Coordinators in accordance with Requirement R3 and Measurement M3.

Each Reliability Coordinator, Planning Coordinator, and Transmission Planner shall retain evidence for three calendar years that it has coordinated solutions within the Reliability Coordinator Area for identified issues or conflicts with planned outages in the Planning Assessment in accordance with Requirement R4 and Measurement M4.

If a responsible entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning	Medium	The Reliability Coordinator did develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area but it was missing one of the parts specified in Requirement R1 (Parts 1.1 – 1.4).	The Reliability Coordinator did develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area but it was missing two of the parts specified in Requirement R1 (Parts 1.1 – 1.4).	The Reliability Coordinator did develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area but it was missing three of the parts specified in Requirement R1 (Parts 1.1 – 1.4).	The Reliability Coordinator did develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area but it was missing all four of the parts specified in Requirement R1 (Parts 1.1 – 1.4). OR, The Reliability Coordinator did not develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area.
R2	Operations Planning	Medium	N/A	N/A	N/A	The Transmission Operator or Balancing Authority did not perform the functions specified in its Reliability Coordinator's outage coordination process.
R3	Operations Planning	Medium	N/A	N/A	N/A	The Planning Coordinator or Transmission Planner did not provide its Planning Assessment to impacted Reliability Coordinators.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	Operations Planning	Medium	N/A	N/A	N/A	The Planning Coordinator or Transmission Planner did not jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts with planned outages in its Planning Assessment for the Near-term Transmission Planning Horizon.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

There are no new or revised definitions proposed in this standard revision.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Outage Coordination**
2. **Number: IRO-017-1**
3. **Purpose:** To ensure that outages are properly coordinated in the Operations Planning time horizon and Near-Term Transmission Planning Horizon.
4. **Applicability:**
   - **4.1.** Reliability Coordinator
   - **4.2.** Transmission Operator
   - **4.3.** Balancing Authority
   - **4.4.** Planning Coordinator
   - **4.5.** Transmission Planner
5. **Effective Date:**

   ~~The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

   See Implementation Plan.
6. **Background:**

   See Project 2014-03 project page.

B. Requirements and Measures

Rationale: This standard is in response to issues raised in NOPR paragraph 90 and recommendations made by the Independent Expert Review Panel and SW Outage Report on the need for an outage coordination standard. It allows for one cohesive standard to address all outage coordination concerns as opposed to having multiple requirements spread throughout the various standards.

Time Horizon: The official definition of the Operations Planning Time Horizon is: "operating and resource plans from day-ahead up to and including seasonal." The SDT equates 'seasonal' as being up to one year out and that these requirements covers the period from day-ahead to one year out.

R1. Each Reliability Coordinator shall develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area. The outage coordination process shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1. Identify applicable roles and reporting responsibilities including:

1.1.1. Development and communication of outage schedules.

1.1.2. Assignment of coordination responsibilities for outage schedules between Transmission Operator(s) and Balancing Authority(s).

1.2. Specify outage submission timing requirements.

1.3. Define the process to evaluate the impact of Transmission and ~~generator~~generation outages within its Wide Area.

1.4. Define the process to coordinate the resolution of identified outage conflicts with its Transmission Operators and Balancing Authorities, and other Reliability Coordinators.

M1. Each Reliability Coordinator shall make available its dated, current, in force outage coordination process for generation and Transmission outages within its Reliability Coordinator Area.

R2. Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator's outage coordination process. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M2. Each Transmission Operator and Balancing Authority shall provide evidence upon request that it performed the functions specified in its Reliability Coordinator's outage coordination process. Such evidence could include but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

Rationale for Requirement R3: Planning Assessment is a defined term and a document that Planning Coordinators and Transmission Planners already have to produce for approved TPL-001-4. It is not a compilation of load flow studies but a textual summary of what was found in those studies including rationales and assumptions.

R3. Each Planning Coordinator and Transmission Planner shall provide its Planning Assessment to impacted Reliability Coordinators. *[Violation Risk Factor: Medium] [Time Horizon: ~~Operations Planning~~Long-term Planning]*

M3. Each Planning Coordinator and Transmission Planner shall provide evidence upon request showing that it provided its Planning Assessment to impacted Reliability Coordinators. Such evidence could include but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

Rationale for Requirement R4: The SDT has re-written Requirement R4 to show that the process starts with the Planning Assessments created by the Planning Coordinator and Transmission Planner and then those Planning Assessments are reviewed and reconciled as needed with the Reliability Coordinator. This is in response to comments in paragraph 90 of the FERC NOPR about directly involving the Reliability Coordinator in the planning process for periods beyond the present one year outreach as well as recommendations in the IERP. The re-write should not be construed as relieving the Reliability Coordinator of responsibilities in this area but simply as a reflection of how the process actually starts.

In the future, the SDT believes that such coordination should take place in the TPL standards and to support that position, the SDT has created an item in a draft SAR for TPL-001-4 that would revise Requirement R8 to make the Reliability Coordinator an explicit party in the review process described there.

In addition, the SDT will submit a request to the Functional Model Working Team to adjust the roles and responsibilities of the Reliability Coordinator to this new paradigm.

R4. Each Planning Coordinator and Transmission Planner shall jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator, and Transmission Planner shall provide evidence upon request showing that it jointly developed solutions with its respective Reliability Coordinator(s) for identified issues or conflicts with planned outages in its Planning Assessment for the Near-term Transmission Planning Horizon. Such evidence could include but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or e-mail records.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Process

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each responsible entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

Each Reliability Coordinator shall retain its dated, current, in force, outage coordination process in accordance with Requirement R1 and Measurement M1 as well as any documents in force since the last compliance audit.

Each Transmission Operator and Balancing Authority shall retain evidence for three calendar years that it followed its Reliability Coordinator outage coordination process in accordance with Requirement R2 and Measurement M2.

Each Planning Coordinator and Transmission Planner shall retain evidence for three calendar years that it has its Planning Assessment to impacted Reliability Coordinators in accordance with Requirement R3 and Measurement M3.

Each Reliability Coordinator, Planning Coordinator, and Transmission Planner shall retain evidence for three calendar years that it has coordinated solutions within the Reliability Coordinator Area for identified issues or conflicts with planned outages in the Planning Assessment in accordance with Requirement R4 and Measurement M4.

If a responsible entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning	Medium	The Reliability Coordinator did develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area but it was missing one of the parts specified in Requirement R1 (Parts 1.1 – 1.4).	The Reliability Coordinator did develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area but it was missing two of the parts specified in Requirement R1 (Parts 1.1 – 1.4).	The Reliability Coordinator did develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area but it was missing three of the parts specified in Requirement R1 (Parts 1.1 – 1.4).	The Reliability Coordinator did develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area but it was missing all four of the parts specified in Requirement R1 (Parts 1.1 – 1.4). OR, The Reliability Coordinator did not develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area.
R2	Operations Planning	Medium	N/A	N/A	N/A	The Transmission Operator or Balancing Authority did not perform the functions specified in its Reliability Coordinator's outage coordination process.
R3	Operations Planning	Medium	N/A	N/A	N/A	The Planning Coordinator or Transmission Planner did not provide its Planning Assessment to impacted Reliability Coordinators.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	Operations Planning	Medium	N/A	N/A	N/A	The Planning Coordinator or Transmission Planner did not jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts with planned outages in its Planning Assessment for the Near-term Transmission Planning Horizon.

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

Time Horizon: The official definition of the Operations Planning Time Horizon is: "operating and resource plans from day-ahead up to and including seasonal." The SDT equates 'seasonal' as being up to one year out and that these requirements covers the period from day-ahead to one year out.

Violation Risk Factor and Violation Severity Level Assignments

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Violation Risk Factor and Violation Severity Level Assignments

This document provides the Standard Drafting Team's (SDT) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in Project 2014-03.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The SDT applied the following NERC criteria when proposing VRFs for the requirements in Project 2014-03.

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to

lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

[2] Id. at footnote 15.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

There are twenty requirements in proposed TOP-001-3. None of the twenty requirements were assigned a "Lower" VRF. Requirements R9 and R15 were assigned a "Medium" VRF while all of the other requirements were given a "High" VRF.

VRF for Proposed TOP-001-3, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements so only one VRF was assigned. Therefore, there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-001-1a that is assigned a High VRF. The requirements are viewed as similar since they both refer to taking action to ensure reliability. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to take action, or to direct others to take action, could directly affect the electrical state or the capability of the bulk power system and could lead to bulk power system instability, separation, or Cascading failures. Therefore, this requirement is assigned a High VRF.

- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R1 contains only one objective, therefore only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-001-1a that is assigned a High VRF. The requirements are viewed as similar since they both refer to taking action to ensure reliability: approved TOP-001-1a for a Transmission Operator and proposed TOP-001-3 for a Balancing Authority. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to take action, or to direct others to take action, could directly affect the electrical state or the capability of the bulk power system and could lead to bulk power system instability, separation, or Cascading failures. Therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R2 contains only one objective, therefore only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved TOP-001-1a that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to comply with issued Operating Instructions could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R3 contains only one objective, therefore only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R4:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.

- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved TOP-001-1a that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to comply with issued Operating Instructions could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R4 has only one objective, therefore only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R5:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, there is a similar requirement (Requirement R4) in approved TOP-001-1a that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to comply with issued Operating Instructions could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R5 contains only one objective. Therefore only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R6:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, there is a similar requirement (Requirement R4) in approved TOP-001-1a that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to comply with issued Operating Instructions could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R6 contains only one objective. Therefore only one VRF was assigned to the requirement.

VRF for Proposed TOP-001-3, Requirement R7:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (requirement R6) in approved TOP-001-1a which is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to provide requested assistance could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R7 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R8:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R7) in approved TOP-001-1a that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to inform other known impacted reliability entities of actions that may result in Emergencies could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R8 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R9:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved TOP-003-1 which is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Bulk power system instability, separation, or Cascading failures are not likely to occur due to a failure to adhere to this requirement. Thus, this requirement meets the criteria for a Medium VRF.

- FERC’s Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R9 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R10:

- FERC’s Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC’s Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, there is a similar requirement (Requirement R4) in proposed IRO-002-4 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF. The requirements are considered similar as proposed IRO-002-4, Requirement R4 is for Reliability Coordinators while proposed TOP-001-3, Requirement R10 is for Transmission Operators.
- FERC’s Guideline 4 — Consistency with NERC’s Definition of a VRF. Failure to monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Transmission Operator, could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC’s Guideline 5 - Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R10 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R11:

- FERC’s Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC’s Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, there is a similar requirement (Requirement R4) in approved IRO-002-4 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF. The requirements are considered similar as proposed IRO-002-4, Requirement R4 is for Reliability Coordinators while proposed TOP-001-3, Requirement R11 is for the Balancing Authority.
- FERC’s Guideline 4 — Consistency with NERC’s Definition of a VRF. Failure to monitor facilities could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC’s Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R11 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R12:

- FERC’s Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.

- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-004-2 which has a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to operate within IROL T_v could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R12 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R13:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, there is a similar requirement (Requirement R2) in approved IRO-008-1 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF. The requirements are considered similar as approved IRO-008-1, Requirement R2 is for Reliability Coordinators while proposed TOP-001-3, Requirement R13 is for the Transmission Operator.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to ensure Real-time Assessments are performed at least every 30 minutes could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R13 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R14:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-004-2 which has a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to initiate the Operating Plan could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R14 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R15:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-007-0 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to inform the Reliability Coordinator of actions taken to return the system to within limits could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R15 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R16:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R8) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF. The requirements are considered similar as approved IRO-002-2, Requirement R8 is for Reliability Coordinators while proposed TOP-001-3, Requirement R16 is for the Transmission Operator.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to provide operators with authority to approve outages and maintenance of monitoring, telecommunication, and analysis capabilities could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R16 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R17:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R8) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF. The requirements are considered similar as approved IRO-002-2,

Requirement R8 is for Reliability Coordinators while proposed TOP-001-3, Requirement R17 is for the Balancing Authority.

- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to provide operators with authority to approve outages and maintenance of monitoring, telecommunications, and analysis capabilities could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R17 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R18:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R5) in approved IRO-009-1 that is assigned a High VRF. The requirements are considered similar since approved IRO-009-1 is about the Reliability Coordinator and proposed TOP-001-3, Requirement R18 is about the Transmission Operator. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to operate to the most limiting parameter when there is a difference in SOLs could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R18 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R19:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have data exchange capability could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R19, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R20:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have data exchange capability could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R20, contains only one objective; therefore, only one VRF was assigned.

There are seven requirements in proposed TOP-002-4. All of the requirements were assigned a Medium VRF.

VRF for Proposed TOP-002-4, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements, so only one VRF was assigned; therefore, there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-002-2.1b that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. This is an advanced planning requirement. So while not having an Operational Planning Analysis could hinder the Transmission Operator, in and of itself it does not directly affect the electrical state or the capability of the bulk power system and would not directly lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-002-4, Requirement R1, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-002-4, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.

* FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-002-2.1b that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
* FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. This is an operational planning requirement. So in and of itself, it does not directly affect the electrical state or the capability of the bulk power system and would not directly lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
* FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-002-4, Requirement R2, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-002-4, Requirement R3:

* FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
* FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R4) in approved TOP-002-2.1b that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
* FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to notify other impacted reliability entities of their roles does not, in and of itself, lead to bulk power system instability, separation or Cascading failures. This is an advance planning requirement, not Real-time. The Transmission Operator still retains the operating requirements to preclude operating in exceedances of established limits. Thus, this requirement meets the criteria for a Medium VRF.
* FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-002-4, Requirement R3, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-002-4, Requirement R4:

* FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
* FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-002-2.1b that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
* FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. This is an operational planning requirement. So in and of itself, it does not directly affect the electrical state or the capability of the bulk power system and would not directly lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.

- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-002-4, Requirement R4, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-002-4, Requirement R5:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R4) in approved TOP-002-2.1b that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to notify other impacted reliability entities of their roles does not, in and of itself, lead to bulk power system instability, separation or Cascading failures. This is an advance planning requirement, not Real-time. Thus, this requirement meets the criteria for a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-002-4, Requirement R5, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-002-4, Requirement R6:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement with no similar requirement to compare against. However, it is a coordination issue in the operational planning timeframe and so is being treated in a similar fashion to the other requirements in this standard. Hence, this requirement is assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to submit the Operating Plan for next-day operations cannot, in and of itself, lead to bulk power system instability, separation or Cascading failures. This is an advance planning requirement, not Real-time. Thus, this requirement meets the criteria for a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-002-4, Requirement R6, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-002-4, Requirement R7:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement with no similar requirement to compare against. However, it is a coordination issue in the operational planning timeframe and so is being treated in a similar fashion to the other requirements in this standard. Hence, this requirement is assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to submit the Operating Plan for next-day operations cannot, in and of itself, lead to bulk power system instability, separation or Cascading failures. This is an advance planning requirement, not Real-time. Thus, this requirement meets the criteria for a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-002-4, Requirement R7, contains only one objective; therefore, only one VRF was assigned.

There are five requirements in proposed TOP-003-3. Four of the five requirements were assigned a "Low" VRF: Requirements R1, R2, R3, and R4. Requirement R5 was assigned a "Medium" VRF.

VRF for Proposed TOP-003-3, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements, so only one VRF was assigned; therefore, there is no conflict.
- FERC's Guideline 3 — Consistency among reliability standards. There is a similar requirement (Requirement R1) in approved IRO-010-1a that is also assigned a Low VRF. The requirements are viewed as similar since they both refer to data specifications: approved IRO-010-1a for a Reliability Coordinator, and proposed TOP-003-3 for a Transmission Operator.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to compile a data specification does not relieve a Transmission Operator from its responsibility to reliably operate the bulk power system, so this requirement, in and of itself, is administrative in nature and does not directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Low VRF.

- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-003-3, Requirement R1, contains only one objective; therefore only one VRF was assigned.

VRF for Proposed TOP-003-3, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-010-1a that is assigned a Low VRF. The requirements are viewed as similar since they both refer to data specifications: approved IRO-010-1a for a Reliability Coordinator, and proposed TOP-003-3 for a Balancing Authority.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to distribute the data specification does not relieve a Balancing Authority from its responsibility to reliably operate the bulk power system, so this requirement, in and of itself, is administrative in nature and does not directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Low VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-003-3, Requirement R2, contains only one objective, therefore only one VRF was assigned.

VRF for Proposed TOP-003-3, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R2) in approved IRO-010-1a that is assigned a Low VRF. The requirements are viewed as similar since they both refer to the distribution of the data specification: approved IRO-010-1a for a Reliability Coordinator and proposed TOP-003-3, Requirement R3 for a Transmission Operator.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to distribute the data specification does not relieve a Transmission Operator from its responsibility to reliably operate the bulk power system, so this requirement, in and of itself, is administrative in nature and does not directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Lower VRF.

- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-003-3, Requirement R3, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-003-3, Requirement R4:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R2) in approved IRO-010-1a that is assigned a Low VRF. The requirements are viewed as similar since they both refer to the distribution of the data specification: approved IRO-010-1a for a Reliability Coordinator, and proposed TOP-003-3 for a Balancing Authority.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to distribute the data specification does not relieve a Balancing Authority from its responsibility to reliably operate the bulk power system, so this requirement, in and of itself, is administrative in nature and does not directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Low VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-003-3, Requirement R4, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-003-3, Requirement R5:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved IRO-010-1a that is assigned a Medium VRF. The requirements are viewed as similar since they both refer to the provision of data: approved IRO-010-1 for a Reliability Coordinator, and proposed TOP-003-3 for a Transmission Operator and Balancing Authority.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to provide the data requested does not, in and of itself, directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures. However, it greatly increases the likelihood of such problems and, therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-003-3, Requirement R5, has only one objective; therefore, only one VRF was assigned.

There are three requirements in proposed IRO-001-4. All of the requirements were assigned a “High” VRF.

VRF for Proposed IRO-001-4, Requirement R1:

- FERC’s Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC’s Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved IRO-001-1.1 that is assigned a High VRF. The requirements are viewed as similar since they both refer to taking actions to preserve reliability.
- FERC’s Guideline 4 — Consistency with NERC’s Definition of a VRF. Failure to act, or direct others to act, could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC’s Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-001-4, Requirement R1, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-001-4, Requirement R2:

- FERC’s Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC’s Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R8) in approved IRO-001-1.1 that is assigned a High VRF. Therefore, this requirement is also assigned a High VRF.
- FERC’s Guideline 4 — Consistency with NERC’s Definition of a VRF. Failure to comply with Operating Instructions could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC’s Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-001-4, Requirement R2, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-001-4, Requirement R3:

- FERC’s Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC’s Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R8) in approved IRO-001-1.1 that is assigned a High VRF. Therefore this requirement is also assigned a High VRF.

- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to inform the Reliability Coordinator of the inability to follow an Operating Instruction could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-001-4, Requirement R3, contains only one objective; therefore, only one VRF was assigned.

There are four requirements in proposed IRO-002-4. All of the requirements were assigned a "High" VRF.

VRF for Proposed IRO-002-4, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have data exchange capabilities could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-002-4, Requirement R1, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-002-4, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R8) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to give operators the authority to approve planned outages and maintenance of telecommunication, monitoring and analysis capabilities could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-002-4, Requirement R2, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-002-4, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-003-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-002-4, Requirement R3, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-002-4, Requirement R4:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R4) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have adequate monitoring systems with emphasis on cited criteria could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-002-4, Requirement R4, contains only one objective; therefore, only one VRF was assigned.

There are six requirements in proposed IRO-008-2. Four of the six requirements were assigned a "Medium" VRF: Requirements R1, R2, R3, and R6. The other requirements were assigned a "High" VRF.

VRF for Proposed IRO-008-2, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-008-1 that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.

- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to perform an Operational Planning Analysis in the operational planning timeframe, in and of itself, does not directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-008-2, Requirement R1, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-008-2, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement and there are no comparable requirements to compare against. It is a coordination requirement in the operational planning timeframe so this requirement is assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to coordinate an Operating Plan in the operational planning timeframe, in and of itself, does not directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-008-2, Requirement R2, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-008-2, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved IRO-008-1 that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to notify entities of roles in Operating Plans in the operational planning timeframe, in and of itself, does not directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-008-2, Requirement R3, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-008-2, Requirement R4:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R2) in approved IRO-008-1 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to ensure that a Real-time Assessment is performed at least once every 30 minutes could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-008-2, Requirement R4, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-008-2, Requirement R5:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved IRO-008-1 that is assigned a Medium VRF. However, that requirement combines operations planning and Real-time. This requirement only applies to Real-time which in the belief of the SDT raises the VRF to High.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to notify impacted entities of roles in plans in the Real-time environment could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-008-2, Requirement R5, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-008-2, Requirement R6:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, it is similar to proposed TOP-001-3, Requirement R15 which is assigned a Medium VRF. The requirements are similar in that proposed IRO-008-2, Requirement R8 is for Reliability Coordinators while proposed TOP-001-3 is for Transmission Operators. Hence, this requirement is also assigned a Medium VRF.

- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to notify impacted entities of when exceedances have been mitigated will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-008-2, Requirement R6, contains only one objective; therefore, only one VRF was assigned.

There are three requirements in proposed IRO-010-2. Two of the requirements, Requirements R1 and R2, are assigned "Low" VRFs. Requirement R3 is assigned a "Medium" VRF.

VRF for Proposed IRO-010-2, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-010-1a that is assigned a Low VRF. Hence, this requirement is also assigned a Low VRF. This is also consistent with proposed TOP-003-3, Requirement R1.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to distribute the data specification does not, in and of itself, lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Low VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-010-2, Requirement R1, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-010-2, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R2) in approved IRO-010-1a that is assigned a Low VRF. Hence, this requirement is also assigned a Low VRF. This is also consistent with proposed TOP-003-3, Requirement R2.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to distribute the data specification does not, in and of itself, lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Low VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-010-3, Requirement R2, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-010-2, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved IRO-010-1a that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to supply the data requested does not, in and of itself, lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-010-2, Requirement R3, contains only one objective; therefore, only one VRF was assigned.

There are seven requirements in proposed IRO-014-3. Four of the requirements, Requirements R4, R5, R6, and R7, were assigned a "High" VRF. Requirements R1 and R3 were assigned a "Medium" VRF. Requirement R2 was assigned a "Low" VRF.

VRF for Proposed IRO-014-3, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-014-1 that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have and implement the plans and procedures, in and of itself, will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-014-3, Requirement R1, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-014-3, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement with no comparable requirement that is assigned a Low VRF. The requirement is for maintenance of plans, processes, and procedures. Hence, the designation of a Low VRF.

- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to maintain the plans, processes, and procedures is administrative in nature and does not directly affect the electrical state or the capability of the bulk power system, and will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Low VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-014-3, Requirement R2, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-014-3, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-016-1 that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to notify other Reliability Coordinators, in and of itself, will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-014-3, Requirement R3, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-014-3, Requirement R4:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1.2) in approved IRO-016-1 that is assigned a Medium VRF. Upon reviewing the requirement, the SDT believes that it needs to be elevated to a High VRF since it is dealing with actions taken to operate during a possible Emergency situation in Real-time.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to operate as if the Emergency exists while the situation needs to be resolved could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-014-3, Requirement R4, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-014-3, Requirement R5:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-016-1 that is assigned a Medium VRF. Upon reviewing the requirement, the SDT believes that it needs to be elevated to a High VRF since it is dealing with actions taken to operate during a possible Emergency situation in Real-time.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to operate as if the Emergency exists while the situation needs to be resolved could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-014-3, Requirement R5, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-014-3, Requirement R6:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1.1) in approved IRO-016-1 that is assigned a Medium VRF. Upon reviewing the requirement, the SDT believes that it needs to be elevated to a High VRF since it is dealing with actions taken to operate during a possible Emergency situation in Real-time.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to operate as if the Emergency exists while the situation needs to be resolved could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-014-3, Requirement R6, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-014-3, Requirement R7:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, it is similar to proposed TOP-001-3, Requirement R7 which has a High VRF assignment. The requirements are similar in that proposed TOP-001-3, Requirement R7 is for Transmission Operators and Balancing Authorities while proposed IRO-014-3, Requirement R9 is for Reliability Coordinators. Hence, this requirement is also assigned a High VRF.

- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to provide requested assistance could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-014-3, Requirement R7, contains only one objective; therefore, only one VRF was assigned.

There are four requirements in proposed IRO-017-1. All four of the requirements have been assigned a "Medium" VRF.

VRF for Proposed IRO-017-1, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R6) in proposed IRO-005-3.1a that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have a coordination process, in and of itself in the planning timeframe, will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-017-1, Requirement R1, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-017-1, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement with no comparable requirement that is assigned a Medium VRF. The requirement is for following the process described in proposed IRO-017-1, Requirement R1 which is assigned a Medium VRF. Hence, the designation of a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to follow the process, in and of itself in the planning timeframe, will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-017-1, Requirement R2, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-017-1, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R8) in approved TPL-001-4 that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to distribute the assessments, in and of itself in the planning timeframe, will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-017-1, Requirement R3, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed IRO-017-1, Requirement R4:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned, so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R6) in proposed IRO-005-3.1a that is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to coordinate solutions, in and of itself in the planning timeframe, will not lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a Medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed IRO-017-1, Requirement R4, contains only one objective; therefore, only one VRF was assigned.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the TOP/IRO standards, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance. The performance or product measured has significant value, as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance, or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement, or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of noncompliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of noncompliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of noncompliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation, per day basis is the “default” for penalty calculations.

VSLs for Proposed TOP-001-3, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines – Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSL for a similar requirement is for the approved TOP-001-1a, Requirement R1. While similar, that requirement is not exactly the same as it had two clearly different objects. One of the objects has more to do with actions than the other and that part of the VSL is binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSL for a similar requirement is for the approved TOP-001-1a, Requirement R1. While similar, that requirement is not exactly the same as it had two clearly different objects. One of the objects has more to do with actions than the other and that part of the VSL is Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines – Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSL for a similar requirement is for the approved TOP-001-1a, Requirement R3. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSLs use the same terminology as used in the associated requirement, and are, therefore, consistent with the requirement.	The VSLs are based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R4:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSL for a similar requirement is for the approved TOP-001-1a, Requirement R3. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R5:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSLs for a similar requirement are for the approved TOP-001-1a, Requirement R4. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSLs use the same terminology as used in the associated requirement, and are, therefore, consistent with the requirement.	The VSLs are based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R6:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R6.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSLs for a similar requirement are for the approved TOP-001-1a, Requirement R4. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSLs use the same terminology as used in the associated requirement, and are, therefore, consistent with the requirement.	The VSLs are based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R7:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R7.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved TOP-001-1a, Requirement R6. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for TOP-001-2 Requirement R8:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R8.	Meets NERC's VSL guidelines. There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The most comparable VSLs for a similar requirement are for the approved TOP-001-1a, Requirement R7. Those VSLs are binary Severe. However, when assigning the VSLs for this requirement, the SDT believed that it was possible to provide a gradual increasing scale for the VSLs and assigned the VSLs appropriately.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R9:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R9.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The most comparable VSLs for a similar requirement are those for proposed TOP-003-1, Requirement R3. Those VSLs are binary Severe. However, when assigning the VSL for the new requirement, the SDT believed that it was possible to provide a gradual increasing scale for the VSL and assigned the VSLs appropriately.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R10:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R10.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSLs for a similar requirement are for the proposed IRO-002-2, Requirement R4. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R11:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R11.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the proposed IRO-002-2, Requirement R4. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R12:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R12.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved TOP-004-2, Requirement R1. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R13:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R13.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The most comparable VSLs for a similar requirement are for the approved IRO-008-1, Requirement R2. Those VSLs are gradated based on missing the timing requirement. Therefore, the SDT assigned gradated VSLs to this requirement on the same basis.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R14:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R14.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved TOP-004-2, Requirement R1. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R15:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R15.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved TOP-007-0, Requirement R1. Those VSLs are gradated based on delivering an incomplete message. The SDT believed that the message needed to be complete to preserve reliability. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R16:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R16.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved IRO-002-2, Requirement R8. Those VSLs are gradated based on splitting up the different approval rights. The SDT did not believe that there was any value to reliability by splitting up the approval rights. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R17:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R17.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved IRO-002-2, Requirement R8. Those VSLs are gradated based on splitting up the different approval rights. The SDT did not believe that there was any value to reliability by splitting up the approval rights. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R18:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R18.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved IRO-009-1, Requirement R5. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R19:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R19.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved IRO-002-2, Requirement R1. Those VSLs are gradated based on a degree of incompleteness of the needed data exchange capabilities and the SDT has adopted that philosophy here as well.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R20:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R20.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved IRO-002-2, Requirement R1. Those VSLs are gradated based on a degree of incompleteness of the needed data exchange capabilities and the SDT has adopted that philosophy here as well.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-002-4, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	There is a similar requirement in approved TOP-002-2.1b, Requirement R1. Those VSLs are graded based on differing parts of the requirement. This requirement has only one objective – performing the analysis. That objective matches to the Severe VSL in approved TOP-002-2.1b and the SDT has proposed a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-002-4, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	There is a similar requirement in approved TOP-002-2.1b, Requirement R1. Those VSLs are graded based on differing parts of the requirement. This requirement has only one objective – performing the analysis. That objective matches to the Severe VSL in approved TOP-002-2.1b and the SDT has proposed a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-002-4, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	There is a similar requirement in approved TOP-002-2.1b, Requirement R4. Those VSLs are gradated and the SDT is proposing similar treatment here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-002-4, Requirement R4:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	There is a similar requirement in approved TOP-002-2.1b, Requirement R1. Those VSLs are gradated and the SDT is proposing similar treatment here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-002-4, Requirement R5:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	There is a similar requirement in approved TOP-002-2.1b, Requirement R4. Those VSLs are gradated and the SDT is proposing similar treatment here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-002-4, Requirement R6:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R6.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	This is a new requirement with no comparable requirements to compare against. There is only one action to take here, to submit the Operating Plan. There is no partial compliance so the SDT assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-002-4, Requirement R7:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R7.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	This is a new requirement with no comparable requirements to compare against. There is only one action to take here, to submit the Operating Plan. There is no partial compliance so the SDT assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-003-3, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-010-1a, Requirement R1. The proposed VSLs are similar in that they build on a graduated scale based on missing parts of the requirement. Thus, the VSL in the proposed standard does not lower the level of compliance currently required by setting VSLs that are less punitive than those already proposed.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-003-3, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-010-1a, Requirement R1. The proposed VSLs are similar in that they build on a graduated scale based on missing parts of the requirement. Thus, the VSL in the proposed standard does not lower the level of compliance currently required by setting VSLs that are less punitive than those already proposed.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-003-3, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-010-1a, Requirement R2. The proposed VSLs are similar in that they build on a graduated scale based on missing parts of the requirement. Thus, the VSL in the proposed standard does not lower the level of compliance currently required by setting VSLs that are less punitive than those already proposed.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-003-3, Requirement R4:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-010-1a, Requirement R2. The proposed VSLs are similar in that they build on a graduated scale based on missing parts of the requirement. Thus, the VSL in the proposed standard does not lower the level of compliance currently required by setting VSLs that are less punitive than those already proposed.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-003-3, Requirement R5:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-010-1a, Requirement R3. Those VSLs tried to gradate the provision of data. The SDT did not believe that such an exercise benefited reliability and that this was a binary situation where an entity supplies the data or it doesn't. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-001-4, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-001-1.1, Requirement R3. Those VSLs are binary Severe. Therefore, the SDT has assigned these VSLs to be binary Severe.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-001-4, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-001-1.1, Requirement R8. Those VSLs tried to gradate the situation by separating out following an Operating Instruction and informing of the inability to follow. Those actions are now separate requirements and this requirement is only about complying with the Operating Instruction which has a binary Severe VSL in approved IRO-001-1.1. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-001-4, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-001-1.1, Requirement R8. Those VSLs tried to gradate the situation by separating out following an Operating Instruction and informing of the inability to follow. Those actions are now separate requirements and this requirement is only about informing the Reliability Coordinator which has a single Moderate VSL in approved IRO-001-1.1. The SDT believes that such a failure should be classified as binary Severe under current guidelines.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-002-4, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-002-2, Requirement R1. Those VSLs are gradated and the SDT has followed that pattern here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-002-4, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-002-2, Requirement R8. Those VSLs tried to gradate the situation. The SDT did not believe that such an exercise benefited reliability and that this was a binary situation where an entity has supplied the authority or it hasn't. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-002-4, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-003-2, Requirement R1. Those VSLs tried to gradate the degree of monitoring. The SDT did not believe that such an exercise benefited reliability and that this was a binary situation where an entity is doing the monitoring or it isn't. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-002-4, Requirement R4:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-002-2, Requirement R4. Those VSLs tried to gradate the situation. The SDT did not believe that such an exercise benefited reliability and that this was a binary situation where an entity is providing adequate monitoring facilities with the particular emphasis or it doesn't. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-008-2, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-008-1, Requirement R1. Those VSLs tried to gradate the performance of the Operational Planning Analysis by the number of days in a month that it wasn't available. The SDT did not believe that such an exercise benefited reliability and that this was a binary situation where an entity performs the analysis or it doesn't. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-008-2, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	This is a new requirement with no comparable requirement to compare against. The SDT believes that this is a binary situation where an entity performs the coordination activity or it doesn't. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-008-2, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-008-1, Requirement R3. Those VSLs gradated the notification efforts. The SDT has followed a similar path and assigned incremental VSLs here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-008-2, Requirement R4:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-008-1, Requirement R2. Those VSLs gradated the performance of Real-time Assessments based on time increments. The SDT made a similar assignment here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-008-2, Requirement R5:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-008-1, Requirement R3. Those VSLs partially gradated the notification elements. The SDT has followed a similar path but assigned a complete set of incremental VSLs here consistent with current accepted practice.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-008-2, Requirement R6:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R6.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to proposed TOP-001-3, Requirement R15. Those VSLs are set up as a binary Severe situation but that requirement only involves notifying one entity, the Reliability Coordinator. There are potentially many more entities involved with this requirement so the SDT has set up a gradated set of VSLs.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-010-2, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-010-1a, Requirement R1. The proposed VSLs are similar in that they build on a graduated scale based on missing parts of the requirement. Thus, the VSL in the proposed standard does not lower the level of compliance currently required by setting VSLs that are less punitive than those already proposed.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-010-2, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-010-1a, Requirement R2. The proposed VSLs are similar in that they build on a graduated scale based on missing parts of the requirement. Thus, the VSL in the proposed standard does not lower the level of compliance currently required by setting VSLs that are less punitive than those already proposed.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-010-2, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-010-1a, Requirement R2. The proposed VSLs are similar in that they build on a graduated scale based on missing parts of the requirement. Thus, the VSL in the proposed standard does not lower the level of compliance currently required by setting VSLs that are less punitive than those already proposed.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-014-3, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is similar to approved IRO-014-1, Requirement R1. Those VSLs present an incremental approach and the SDT has continued that approach.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-014-3, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	This is a new requirement with no comparable requirement to follow. There are a number of criteria cited for the requirement and this lends itself to an incremental approach for the VSLs.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-014-3, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-016-1, Requirement R1. Those VSLs are presented in an incremental approach. Therefore, the SDT has assigned incremental VSLs here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-014-3, Requirement R4:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-016-1, Requirement R1.2. Those VSLs are presented as binary Severe. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-014-3, Requirement R5:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-016-1, Requirement R1. Those VSLs tried to gradate things but the only differential is whether evidence was provided or not – actions themselves are covered in Severe. The SDT did not believe that such an exercise benefited reliability and that this was a binary situation where an entity develops a plan or it doesn't. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-014-3, Requirement R6:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R6.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved IRO-016-1, Requirement R1.1. Those VSLs tried to gradate the situation. The SDT did not believe that such an exercise benefited reliability and that this was a binary situation where an entity implements the plan or it doesn't. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-014-3, Requirement R7:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R7.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to proposed TOP-001-3, Requirement R7. Those VSLs are presented as binary Severe. Therefore, the SDT has assigned a binary Severe VSL here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-017-1, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	This requirement is similar to proposed IRO-005-3.1a, Requirement R6 which has gradated VSLs and the SFT has adopted that approach here.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-017-1, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	This is a new requirement with no similar requirement in the Reliability Standards. The responsible entity either follows the process or it doesn't. Attempting to increment the effort doesn't make sense. Therefore, this VSL is binary Severe.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-017-1, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	This requirement is similar to approved TPL-001-4, Requirement R8. In that case, the VSLs are incremental. However, the responsible entities there are dealing with many other entities. In this case, the responsible entity is dealing only with Reliability Coordinators which makes an incremental approach unnecessary due to the much smaller number of involved entities. Therefore, the VSL is binary Severe.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed IRO-017-1, Requirement R4:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	This requirement is similar in nature to proposed IRO-017-1, Requirement R1. The VSL has been assigned in a similar manner – binary Severe.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

Standards Announcement

Project 2014-03 Revisions to TOP and IRO Standards

Final Ballots Now Open through October 20, 2014

Now Available

Final ballots and non-binding polls of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for **TOP-002-4, TOP-003-3, IRO-008-2, IRO-014-3, and IRO-017-1** are open through **8 p.m. Eastern on Monday, October 20, 2014**.

Additionally, final ballots for **IRO-001-4, IRO-002-4, IRO-010-2, two Definitions, and Implementation Plan** are open through **8 p.m. Eastern on Monday, October 20, 2014**.

Instructions for Balloting

In the final ballot, votes are counted by exception. Only members of the ballot pool may cast a ballot; all ballot pool members may change their previously cast votes. A ballot pool member who failed to cast a vote during the last ballot window may cast a vote in the final ballot window. If a ballot pool member cast a vote in the previous ballot and does not participate in the final ballot, that member's vote will be carried over in the final ballot.

Members of the ballot pools associated with this project may log in and submit their vote for the standards, definitions, implementation plan and associated VRFs and VSLs as described above by clicking here**.**

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Mark Olson.

Standards Announcement

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Final Ballot and Non-Binding Poll Results

Now Available

Final ballots for **TOP-002-4, TOP-003-3, IRO-008-2, IRO-014-3, and IRO-017-1** concluded at **8 p.m. Eastern, Monday, October 20, 2014**. The non-binding polls of the associated Violation Risk Factors and Violation Severity Levels concluded at **8 p.m. Eastern, Wednesday, October 22, 2014**

Additionally, final ballots for **IRO-001-4, IRO-002-4, IRO-010-2, two Definitions, and Implementation Plan** concluded at **8 p.m. Eastern, Monday, October 20, 2014.**

The standards achieved a quorum and sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballots.

	Ballot Results	Non-Binding Poll Results
	Quorum /Approval	Quorum/Supportive Opinions
IRO-001-4	90.77% / 82.64%	N/A
IRO-002-4	89.97% / 85.96%	N/A
IRO-008-2	89.71% / 83.73%	78.59% / 85.88%
IRO-010-2	89.97% / 86.22%	N/A
IRO-014-3	89.71% / 89.88%	78.59% / 91.33%
IRO-017-1	89.97% / 82.58%	78.89% / 92.18%
TOP-002-4	89.71% / 84.76%	78.89% / 86.77%
TOP-003-3	90.50% / 86.55%	78.30% / 82.29%
2 Definitions	88.39% / 94.07%	NA
Implementation Plan	88.39% / 91.84%	NA

Background information for this project can be found on the project page.

Next Steps

The standards and associated documents will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Mark Olson,
Standards Developer, or by telephone at 404-446-2560.

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Non-Binding Poll Results	
Non-Binding Poll Name:	Project 2014-03 TOP-002-4
Poll Period:	10/10/2014 - 10/22/2014
Total # Opinions:	269
Total Ballot Pool:	341
Summary Results:	78.89% of those who registered to participate provided an opinion or an abstention; 86.77% of those who provided an opinion indicated support for the VRFs and VSLs.

Individual Ballot Pool Results

Segment	Organization	Member	Opinions	NERC Notes
1	Ameren Services	Eric Scott	Abstain	
1	American Electric Power	Paul B Johnson		
1	Arizona Public Service Co.	Brian Cole	Affirmative	
1	Associated Electric Cooperative, Inc.	John Bussman	Abstain	
1	Austin Energy	James Armke	Affirmative	
1	Avista Utilities	Heather Rosentrater		
1	Balancing Authority of Northern California	Kevin Smith	Affirmative	
1	BC Hydro and Power Authority	Patricia Robertson	Abstain	
1	Bonneville Power Administration	Donald S. Watkins		
1	Brazos Electric Power Cooperative, Inc.	Tony Kroskey		
1	Bryan Texas Utilities	John C Fontenot	Affirmative	
1	CenterPoint Energy Houston Electric, LLC	John Brockhan	Abstain	
1	Central Electric Power Cooperative	Michael B Bax	Abstain	
1	Central Iowa Power Cooperative	Kevin J Lyons

Non-Binding Poll Results

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Non-Binding Poll Results	
Non-Binding Poll Name:	Project 2014-03 IRO-014-3
Poll Period:	10/10/2014 - 10/22/2014
Total # Opinions:	268
Total Ballot Pool:	341
Summary Results:	78.59% of those who registered to participate provided an opinion or an abstention; 91.33% of those who provided an opinion indicated support for the VRFs and VSLs.

Individual Ballot Pool Results

Segment	Organization	Member	Opinions	NERC Notes
1	Ameren Services	Eric Scott	Abstain

Non-Binding Poll Results

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Non-Binding Poll Results	
Non-Binding Poll Name:	Project 2014-03 IRO-017-1
Poll Period:	10/10/2014 - 10/22/2014
Total # Opinions:	269
Total Ballot Pool:	341
Summary Results:	78.89% of those who registered to participate provided an opinion or an abstention; 92.18% of those who provided an opinion indicated support for the VRFs and VSLs.

Individual Ballot Pool Results

Segment	Organization	Member	Opinions	NERC Notes
1	Ameren Services	Eric Scott	Abstain

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted for comment February 21, 2014 to March 24, 2014

First posting May 19, 2014 to July 2, 2014

Second posting August 6, 2014 to September 19, 2014

Proposed Action Plan and Description of Current Draft

This is the third posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date
Final ballot	October 2014
BOT	November 2014

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
1a	May 12, 2010	Added Appendix 1 – Interpretation of R8 approved by BOT on May 12, 2010	Interpretation
1a	September 15, 2011	FERC Order issued approved the Interpretation of R8 (FERC Order became effective November 21, 2011)	Interpretation
2	May 6, 2012	Revised under Project 2007-03	Revised
2	May 9, 2012	Adopted by Board of Trustees	Revised
3	TBD	Revisions under Project 2014-03	Revised

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Rationale - The definition for Reliability Directive is not needed due to the work in proposed COM-002-4 on the definition of Operating Instruction (see NOPR paragraph 64).

Real-time Assessment - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

Operational Planning Analysis - An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Transmission Operations**
2. **Number: TOP-001-3**
3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Interconnection by ensuring prompt action to prevent or mitigate such occurrences.
4. **Applicability:**
   - **4.1.** Balancing Authority
   - **4.2.** Transmission Operator
   - **4.3.** Generator Operator
   - **4.4.** Distribution Provider
   - **4.5.** Load-Serving Entity
5. **Effective Date:**

   See Implementation Plan.
6. **Background:**

   See Project 2014-03 project page.

B. Requirements and Measures

Rationale: The NERC Glossary term Reliability Directive has been replaced throughout by Operating Instruction. The new definition covers the Project 2014-03 SDT intent.

New Requirements R1 and R2 added in response to IERP Report recommendations.

R1. Each Transmission Operator shall act to address the reliability of its Transmission Operator Area via direct actions or by issuing Operating Instructions. *[Violation Risk Factor: High][Time Horizon: Same-Day Operations, Real-time Operations]*

M1. Each Transmission Operator shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to ensure the reliability of its Transmission Operator Area via direct actions or by issuing Operating Instructions.

R2. Each Balancing Authority shall act to address the reliability of its Balancing Authority Area via direct actions or by issuing Operating Instructions. *[Violation Risk Factor: High][Time Horizon: Same-Day Operations, Real-time Operations]*

M2. Each Balancing Authority shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to address the reliability of its Balancing Authority Area via direct actions or by issuing Operating Instructions.

Rationale for Requirement R3: Additional phrasing 'cannot be physically implemented' included for consistency with proposed IRO-001-4, Requirement R2. This term means that a Transmission Operator may request something to be done that is not physically possible due its lack of knowledge of the system involved.

R3. Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]*

M3. Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall make available upon request, evidence that it complied with each

Operating Instruction issued by the Transmission Operator(s) unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Transmission Operator's Operating Instruction. If such a situation has not occurred, the Balancing Authority, Generator Operator, Distribution Provider, or Load-Serving Entity may provide an attestation.

R4. Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Transmission Operator of its inability to perform an Operating Instruction issued by its Transmission Operator. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]*

M4. Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Transmission Operator of its inability to comply with its Operating Instruction issued. If such a situation has not occurred, the Balancing Authority, Generator Operator, Distribution Provider, or Load-Serving Entity may provide an attestation.

Rationale: Requirements R5 and R6 added for consistency with requirements applying to Transmission Operators. Entity list compiled from Functional Model v5 items 27 and 28 for Balancing Authority.

R5. Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Balancing Authority, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]*

M5. Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall make available upon request, evidence that it complied with each Operating Instruction issued by the Balancing Authority(s) unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Balancing Authority's Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, Distribution Provider, or Load-Serving Entity may provide an attestation.

R6. Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Balancing Authority of its inability to perform an Operating Instruction issued by that Balancing Authority. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]*

M6. Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Balancing Authority of its inability to comply with its Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, Distribution Provider, or Load-Serving Entity may provide an attestation.

Rationale for Requirement R7: 'Emergency' deleted as the assistance is assistance in response to the other entities' emergency. 'Comparable' deleted as it is impossible to measure comparability and the main concept is that the originating entity has implemented its emergency procedures. These changes are in response to IERP recommendations.

R7. Each Transmission Operator shall assist other Transmission Operators, if requested and able, provided that the requesting entity has implemented its Emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

M7. Each Transmission Operator shall make available upon request, evidence that requested assistance, if able, was provided to other Transmission Operators unless such assistance cannot be physically implemented or would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. If no request for assistance was received, the Transmission Operator may provide an attestation.

Rationale for Requirement R8: Original Requirement R3 has been merged with original Requirement R5 in response to concerns raised in NOPR paragraphs 80 - 83 to have consistent terminology and actions across all time horizons.

R8. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-Time Operations]*

M8. Each Transmission Operator shall make available upon request, evidence that it informed its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If no Emergency has occurred, the Transmission Operator may provide an attestation.

Rationale for Requirement R9: Additional terms added in response to SW Outage Report recommendation 15. The term 'sustained' was added to the requirement to indicate that notification is not required for momentary events.

R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected entities of sustained outages of telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-Time Operations]*

M9. Each Balancing Authority and Transmission Operator shall make available upon request, evidence that it notified its Reliability Coordinator and impacted interconnected entities of sustained outages of telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels . Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Balancing Authority or Transmission Operator may provide an attestation.

Rationale for Requirement R10: New proposed Requirement R10 is derived from approved IRO-003-2, Requirement R1, adapted to the Transmission Operator Area. This new requirement is in response to NOPR paragraph 60 concerning monitoring capabilities for the Transmission Operator. New Requirement R11 covers the Balancing Authorities. Monitoring of external systems can be accomplished via data links.

R10. Each Transmission Operator shall monitor the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

10.1. Within its Transmission Operator Area:

10.1.1. Facilities,

10.1.2. The status of Special Protection Systems, and

10.1.3. Non-BES facilities identified as necessary by the Transmission Operator and

10.2. Within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator:

10.2.1. Facilities,

10.2.2. Status of Special Protection Systems, and

10.2.3. Non-BES facilities.

M10. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitors Facilities, the status of Special Protection Systems, and non-BES facilities as required to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area.

R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order for it to be able to perform its reliability functions. *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

M11. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to system description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitors its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order for it to be able to perform its reliability functions.

R12. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M12. Each Transmission Operator shall make available evidence for any occasion in which it has operated outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. Such evidence could include but is not limited to dated computer logs or reports in electronic or hard copy format specifying the date, time, duration, and details of the excursion. If such a situation has not occurred, the Transmission Operator may provide an attestation that an event has not occurred.

Rationale for Requirement R13: The new Requirement R13 is in response to NOPR paragraphs 55 and 60 concerning Real-time analysis responsibilities for Transmission Operators and is copied from approved IRO-008-1, Requirement R2.

R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M13. Each Transmission Operator shall have, and make available upon request, evidence to show it ensured that a Real-Time Assessment was performed at least once every 30 minutes. This evidence could include but is not limited to dated computer logs showing times the assessment was conducted, dated checklists, or other evidence.

Rationale for Requirement R14: The original Requirement R8 was deleted and original Requirements R9 and R11 were revised in order to respond to NOPR paragraph 42 which raised the issue of handling all SOLs and not just a sub-set of SOLs. The SDT has developed a white paper on SOL exceedances that explains its intent on what needs to be contained in such an Operating Plan. These Operating Plans are developed and documented in advance of Real-time and may be developed from Operational Planning Assessments required per proposed TOP-002-4 or other assessments. Operating Plans could be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an Operational Planning Assessment or a Real-time Assessment. The intent is not to have a 1,000 page document with every possible Contingency cited but to have a plan and philosophy that can be followed by an operator.

R14. Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M14. Each Transmission Operator shall have evidence that it initiated its Operating Plan for mitigating SOL exceedances identified as part of its Real-time monitoring or Real-time

Assessments. This evidence could include but is not limited to dated computer logs showing times the Operating Plan was initiated, dated checklists, or other evidence.

R15. Each Transmission Operator shall inform its Reliability Coordinator of actions taken to return the system to within limits when a SOL has been exceeded. *[Violation Risk Factor: Medium] [Time Horizon: Real-Time Operations]*

M15. Each Transmission Operator shall make available evidence that it informed its Reliability Coordinator of actions taken to return the system to within limits when a SOL was exceeded. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, or dated computer printouts. If such a situation has not occurred, the Transmission Operator may provide an attestation.

Rationale for Requirements R16 and R17: In response IERP Report recommendation 3 on authority.

R16. Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunication, and analysis capabilities. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M16. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Transmission Operator has provided its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunication, and analysis capabilities.

R17. Each Balancing Authority shall provide its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunications, and analysis capabilities. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M17. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Balancing Authority has provided its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunications, and analysis capabilities.

Rationale for Requirement R18: Moved from approved IRO-005-3.1a, Requirement R10. Transmission Service Provider, Distribution Provider, Load-Serving Entity, Generator Operator, and Purchasing-Selling Entity deleted as those entities will receive instructions on limits from the responsible entities cited in the requirement. Note – Derived limits replaced by SOLs for clarity and specificity. SOLs include voltage, Stability, and thermal limits and are thus the most limiting factor.

R18. Each Transmission Operator shall operate to the most limiting parameter in instances where there is a difference in SOLs. [*Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M18. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to operator logs, voice recordings, electronic communications, or equivalent evidence that will be used to determine if it operated to the most limiting parameter in instances where there is a difference in SOLs.

Rationale for Requirements R19 and R20: Added for consistency with proposed IRO-002-4, Requirement R1. Data exchange capabilities are required to support the data specification concept in proposed TOP-003-3.

R19. Each Transmission Operator shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Transmission Operator Area . *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M19. Each Transmission Operator shall have, and provide upon request, evidence that could include, but is not limited to, operator logs, system specifications, or other evidence that it has data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Transmission Operator Area.

R20. Each Balancing Authority shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Balancing Authority Area. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M20. Each Balancing Authority shall have, and provide upon request, evidence that could include, but is not limited to, operator logs, system specifications, or other evidence that it has data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Balancing Authority Area.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Balancing Authority, Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall each keep data or evidence for each applicable Requirement R1 through R11, and R14 through R20 and Measure M1 through M11, and M14 through M20 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of ninety calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

Each Transmission Operator shall retain evidence for three calendar years of any occasion in which it has exceeded an identified IROL and its associated IROL T_v as specified in Requirement R12 and Measure M12 and that it initiated its Operating Plan to mitigate a SOL exceedance as specified in Requirement R14 and Measurement M14.

Each Transmission Operator shall each keep data or evidence for Requirement R13 and Measure M13 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Balancing Authority, Transmission Operator, Generator Operator, Distribution Provider, or Load-Serving Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Transmission Operator failed to act to address the reliability of its Transmission Operator Area via direct actions or by issuing Operating Instructions.
R2	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Balancing Authority failed to act to address the reliability of its Balancing Authority Area via direct actions or by issuing Operating Instructions.
R3	Operations Planning, Same-Day Operations, Real-Time Operations	High	N/A	N/A	N/A	The responsible entity did not comply with an Operating Instruction issued by the Transmission Operator, and such action could have been physically implemented and would not have violated safety, equipment, regulatory, or statutory requirements.
R4	Operations Planning, Same-Day Operations, Real-Time Operations	High	N/A	N/A	N/A	The responsible entity did not inform its Transmission Operator of its inability to perform an Operating Instruction issued by its Transmission Operator.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The responsible entity did not comply with an Operating Instruction issued by the Balancing Authority, and such action could have been physically implemented and would not have violated safety, equipment, regulatory, or statutory requirements.
R6	Operations Planning, Same-Day Operations, Real-Time Operations	High	N/A	N/A	N/A	The responsible entity did not inform its Balancing Authority of its inability to perform an Operating Instruction issued by that Balancing Authority.
R7	Real-Time Operations	High	N/A	N/A	N/A	The Transmission Operator did not provide assistance to other Transmission Operators, when requested and able, and the requesting entity had implemented its Emergency procedures, and such actions could have been physically implemented and would not have violated safety, equipment, regulatory, or statutory requirements.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
For the Requirements R8 and R9 VSLs only, the intent of the SDT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.						
R8	Operations Planning, Same-Day Operations, Real-Time Operations	High	The Transmission Operator did not inform one known impacted Transmission Operator or 5% or less of the known impacted other Transmission Operators, whichever is greater, of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas when conditions did permit such communications. OR, The Transmission Operator did not inform one known	The Transmission Operator did not inform two known impacted Transmission Operators or more than 5% and less than or equal to 10% of the known impacted other Transmission Operators, whichever is greater, of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas when conditions did permit such communications. OR, The Transmission Operator did not inform two known	The Transmission Operator did not inform three known impacted Transmission Operators or more than 10% and less than or equal to 15% of the known impacted other Transmission Operators, whichever is greater, of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas when conditions did permit such communications. OR, The Transmission Operator did not inform three known impacted Balancing Authorities or more than 10% and less than or equal to 15% of	The Transmission Operator did not inform its Reliability Coordinator of its actual or expected operations that resulted in, or could have resulted in, an Emergency on those respective Transmission Operator Areas when conditions did permit such communications. OR The Transmission Operator did not inform four or more other known impacted Transmission Operators or more than 15% of the known impacted other Transmission Operators of its actual or expected operations that resulted in, or could have resulted in, an Emergency on those respective Transmission Operator Areas when conditions did permit such communications. OR,

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL

			Lower VSL	Moderate VSL	High VSL	Severe VSL
			applicable entities, whichever is greater.	of the applicable entities, whichever is greater.	the applicable entities, whichever is greater.	
R20	Operations Planning, Same-Day Operations, Real-time Operations	High	The Balancing Authority did not have data exchange capabilities with one identified entity, or 5% or less of the applicable entities, whichever is greater.	The Balancing Authority did not have data exchange capabilities with two identified entity, or more than 5% or less than or equal to 10% of the applicable entities, whichever is greater.	The Balancing Authority did not have data exchange capabilities with three identified entity, or more than 10% or less than or equal to 15% of the applicable entities, whichever is greater.	The Balancing Authority did not have data exchange capabilities with four or more identified entities or greater than 15% of the applicable entities, whichever is greater.

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

White paper on SOL Exceedances to be placed here.

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific SOL or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures, including electronic data exchange, which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator's disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific SOL or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible SOL or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those SOLs or IROLs, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day SOL or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of "the Operating Plan document" for compliance purposes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted for comment February 21, 2014 to March 24, 2014

First posting May 19, 2014 to July 2, 2014

Second posting August 6, 2014 to September 19, 2014

Proposed Action Plan and Description of Current Draft

This is the ~~second~~third posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date
Final ballot	October 2014
BOT	November 2014

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
1a	May 12, 2010	Added Appendix 1 – Interpretation of R8 approved by BOT on May 12, 2010	Interpretation
1a	September 15, 2011	FERC Order issued approved the Interpretation of R8 (FERC Order became effective November 21, 2011)	Interpretation
2	May 6, 2012	Revised under Project 2007-03	Revised
2	May 9, 2012	Adopted by Board of Trustees	Revised
3	TBD	Revisions under Project 2014-03	Revised

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Rationale - The definition for Reliability Directive is not needed due to the work in proposed COM-002-4 on the definition of Operating Instruction (see NOPR paragraph 64).

Real-time Assessment - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

Operational Planning Analysis - An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Transmission Operations**
2. **Number: TOP-001-3**
3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Interconnection by ensuring prompt action to prevent or mitigate such occurrences.
4. **Applicability:**
   - **4.1.** Balancing Authority
   - **4.2.** Transmission Operator
   - **4.3.** Generator Operator
   - **4.4.** Distribution Provider
   - **4.5.** Load-Serving Entity
5. **Effective Date:**

   ~~The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

   See Implementation Plan.
6. **Background:**

   See Project 2014-03 project page.

B. Requirements and Measures

Rationale: The NERC Glossary term Reliability Directive has been replaced throughout by Operating Instruction. The new definition covers the Project 2014-03 SDT intent.

New Requirements R1 and R2 added in response to IERP Report recommendations.

R1. Each Transmission Operator shall act~~, or direct others to act by issuing Operating Instructions,~~ to ~~ensure~~address the reliability of its Transmission Operator Area via direct actions or by issuing Operating Instructions. *[Violation Risk Factor: High][Time Horizon: ~~Operations Planning,~~ Same-Day Operations, Real-time Operations]*

M1. Each Transmission Operator shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted~~, or directed others to act by issuing Operating Instructions~~ to ensure the reliability of its Transmission Operator Area via direct actions or by issuing Operating Instructions.

R2. Each Balancing Authority shall act~~, or direct others to act by issuing Operating Instructions,~~ to ~~ensure~~address the reliability of its Balancing Authority Area via direct actions or by issuing Operating Instructions. *[Violation Risk Factor: High][Time Horizon: ~~Operations Planning,~~ Same-Day Operations, Real-time Operations]*

M2. Each Balancing Authority shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted~~, or directed others to act by issuing Operating Instructions~~ to ~~ensure~~address the reliability of its Balancing Authority Area via direct actions or by issuing Operating Instructions.

Rationale for Requirement R3: Additional phrasing 'cannot be physically implemented' included for consistency with proposed IRO-001-4, Requirement R2. This term means that a Transmission Operator may request something to be done that is not physically possible due its lack of knowledge of the system involved.

R3. Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: ~~Operations Planning,~~ Same-Day Operations, Real-Time Operations]*

M3. Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall make available upon request, evidence that it complied with each Operating Instruction issued by the Transmission Operator(s) unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Transmission Operator's Operating Instruction. If such a situation has not occurred, the Balancing Authority, Generator Operator, Distribution Provider, or Load-Serving Entity may provide an attestation.

R4. Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Transmission Operator of its inability to perform an Operating Instruction issued by its Transmission Operator. *[Violation Risk Factor: High] [Time Horizon: ~~Operations Planning,~~ Same-Day Operations, Real-Time Operations]*

M4. Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Transmission Operator of its inability to comply with its Operating Instruction issued. If such a situation has not occurred, the Balancing Authority, Generator Operator, Distribution Provider, or Load-Serving Entity may provide an attestation.

Rationale: Requirements R5 and R6 added for consistency with requirements applying to Transmission Operators. Entity list compiled from Functional Model v5 items 27 and 28 for Balancing Authority.

R5. Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Balancing Authority, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: ~~Operations Planning,~~ Same-Day Operations, Real-Time Operations]*

M5. Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall make available upon request, evidence that it complied with each Operating Instruction issued by the Balancing Authority(s) unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Balancing Authority's Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, Distribution Provider, or Load-Serving Entity may provide an attestation.

R6. Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Balancing Authority of its inability to perform an Operating Instruction issued by that Balancing Authority. *[Violation Risk Factor: High] [Time Horizon: ~~Operations Planning,~~ Same-Day Operations, Real-Time Operations]*

M6. Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Balancing Authority of its inability to comply with its Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, Distribution Provider, or Load-Serving Entity may provide an attestation.

Rationale for Requirement R7: 'Emergency' deleted as the assistance is assistance in response to the other entities' emergency. 'Comparable' deleted as it is impossible to measure comparability and the main concept is that the originating entity has implemented its emergency procedures. These changes are in response to IERP recommendations.

R7. Each Transmission Operator shall assist other Transmission Operators, if requested and able, provided that the requesting entity has implemented its ~~e~~Emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

M7. Each Transmission Operator shall make available upon request, evidence that requested assistance, if able, was provided to other Transmission Operators unless such assistance cannot be physically implemented or would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. If no request for assistance was received, the Transmission Operator may provide an attestation.

Rationale for Requirement R8: Original Requirement R3 has been merged with original Requirement R5 in response to concerns raised in NOPR paragraphs 80 -83 to have consistent terminology and actions across all time horizons.

R8. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known ~~other~~ impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-Time Operations]*

M8. Each Transmission Operator shall make available upon request, evidence that it informed its Reliability Coordinator, known impacted Balancing Authorities, and known ~~other~~ impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If no Emergency has occurred, the Transmission Operator may provide an attestation.

Rationale for Requirement R9: Additional terms added in response to SW Outage Report recommendation 15. The term 'sustained' was added to the requirement to indicate that notification is not required for momentary events.

R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected ~~NERC registered~~ entities of sustained outages of telemetering ~~equipment,~~ and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-Time Operations]*

M9. Each Balancing Authority and Transmission Operator shall make available upon request, evidence that it notified its Reliability Coordinator and impacted interconnected ~~NERC registered~~ entities of ~~planned~~ sustained outages of telemetering ~~equipment,~~ and control equipment, monitoring and assessment capabilities, and associated communication channels . Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Balancing Authority or Transmission Operator may provide an attestation.

Rationale for Requirement R10: New proposed Requirement R10 is derived from approved IRO-003-2, Requirement R1, adapted to the Transmission Operator Area. This new requirement is in response to NOPR paragraph 60 concerning monitoring capabilities for the Transmission Operator. New Requirement R11 covers the Balancing Authorities. Monitoring of external systems can be accomplished via data links.

R10. Each Transmission Operator shall monitor the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

10.1. Within its Transmission Operator Area:

10.1.1. Facilities,

10.1.2. ~~t~~The status of Special Protection Systems, and

~~**10.1.1.**~~**10.1.3.** ~~sub-100 kV~~Non-BES facilities identified as necessary by the Transmission Operator~~, within its Transmission Operator Area~~ and

10.2. Within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator:

10.2.1. Facilities,

10.2.2. Status of Special Protection Systems, and

~~**10.1.2.**~~**10.2.3.** Non-BES facilities. ~~neighboring Transmission Operator Areas to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area. *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*~~

M10. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitors Facilities, the status of Special ~~p~~Protection Systems, and ~~sub-100 kV~~non-BES facilities ~~identified as necessary by the Transmission Operator, within its Transmission Operator Area and neighboring Transmission Operator Areas~~ as required to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area.

R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, ~~to ensure~~in order for ~~that~~ it ~~is~~to be able to perform its reliability functions. *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

M11. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to system description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitors its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, ~~to ensure~~in order for ~~that~~ it ~~is~~to be able to perform its reliability functions.

R12. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M12. Each Transmission Operator shall make available evidence for any occasion in which it has operated outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. Such evidence could include but is not limited to dated computer logs or reports in electronic or hard copy format specifying the date, time, duration, and details of the excursion. If such a situation has not occurred, the Transmission Operator may provide an attestation that an event has not occurred.

Rationale for Requirement R13: The new Requirement R13 is in response to NOPR paragraphs 55 and 60 concerning Real-time analysis responsibilities for Transmission Operators and is copied from approved IRO-008-1, Requirement R2.

R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M13. Each Transmission Operator shall have, and make available upon request, evidence to show it ensured that a Real-Time Assessment was performed at least once every 30 minutes. This evidence could include but is not limited to dated computer logs showing times the assessment was conducted, dated checklists, or other evidence.

Rationale for Requirement R14: The original Requirement R8 was deleted and original Requirements R9 and R11 were revised in order to respond to NOPR paragraph 42 which raised the issue of handling all SOLs and not just a sub-set of SOLs. The SDT has developed a white paper on SOL exceedances that explains its intent on what needs to be contained in such an Operating Plan. These Operating Plans are developed and documented in advance of Real-time and may be developed from Operational Planning Assessments required per proposed TOP-002-4 or other assessments. Operating Plans could be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an Operational Planning Assessment or a Real-time Assessment. The intent is not to have a 1,000 page document with every possible Contingency cited but to have a plan and philosophy that can be followed by an operator.

R14. Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M14. Each Transmission Operator shall have evidence that it initiated its Operating Plan for mitigating SOL exceedances identified as part of its Real-time monitoring or Real-time Assessments. This evidence could include but is not limited to dated computer logs showing times the Operating Plan was initiated, dated checklists, or other evidence.

R15. Each Transmission Operator shall inform its Reliability Coordinator of ~~its~~ actions taken to return the system to within limits when a SOL has been exceeded. *[Violation Risk Factor: Medium] [Time Horizon: Real-Time Operations]*

M15. Each Transmission Operator shall make available evidence that it informed its Reliability Coordinator of actions taken to return the system to within limits when a SOL was exceeded. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, or dated computer printouts. If such a situation has not occurred, the Transmission Operator may provide an attestation.

Rationale for Requirements R16 and R17: In response IERP Report recommendation 3 on authority.

R16. Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunication, and ~~Real-time Assessment~~analysis capabilities. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M16. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Transmission Operator has provided its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunication, and ~~Real-time Assessment~~analysis capabilities.

R17. Each Balancing Authority shall provide its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunications, and analysis capabilities. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M17. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Balancing Authority has provided its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunications, and analysis capabilities.

Rationale for Requirement R18: Moved from approved IRO-005-3.1a, Requirement R10. Transmission Service Provider, Distribution Provider, Load-Serving Entity, Generator Operator, and Purchasing-Selling Entity deleted as those entities will receive instructions on limits from the responsible entities cited in the requirement. Note – Derived limits replaced by SOLs for clarity and specificity. SOLs include voltage, Stability, and thermal limits and are thus the most limiting factor.

R18. Each Transmission Operator ~~and Balancing Authority~~ shall ~~always~~ operate to the most limiting parameter in instances where there is a difference in SOLs. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M18. Each Transmission Operator ~~and Balancing Authority~~ shall have, and provide upon request, evidence that could include but is not limited to operator logs, voice recordings, electronic communications, or equivalent evidence that will be used to determine if it operated to the most limiting parameter in instances where there is a difference in SOLs.

Rationale for Requirements R19 and R20 added for consistency with proposed IRO-002-4, Requirement R~~2~~1. Data exchange capabilities are required to support the data specification concept in proposed TOP-003-3.

R19. Each Transmission Operator shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Transmission Operator Area ~~(Balancing Authority Area)~~. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M19. Each Transmission Operator shall have, and provide upon request, evidence that could include, but is not limited to, operator logs, system specifications, or other evidence that it has data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Transmission Operator Area.

R20. Each Balancing Authority shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its ~~Transmission Operator Area (~~Balancing Authority Area~~)~~. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M20. Each Balancing Authority shall have, and provide upon request, evidence that could include, but is not limited to, operator logs, system specifications, or other evidence that it has data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Balancing Authority Area.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Balancing Authority, Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall each keep data or evidence for each applicable Requirement R1 through R11, and R14 through R20 and Measure M1 through M11, and M14 through M20 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of ninety calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

Each Transmission Operator shall retain evidence for three calendar years of any occasion in which it has exceeded an identified IROL and its associated IROL T_v as specified in Requirement R12 and Measure M12 and that it initiated its Operating Plan to mitigate a SOL exceedance as specified in Requirement R14 and Measurement M14.

Each Transmission Operator shall each keep data or evidence for Requirement R13 and Measure M13 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Balancing Authority, Transmission Operator, Generator Operator, Distribution Provider, or Load-Serving Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Transmission Operator failed to act~~, or direct others within its Transmission Operator Area to act,~~ to ~~ensure~~address the reliability of its Transmission Operator Area via direct actions or by issuing Operating Instructions.
R2	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Balancing Authority failed to act ~~or direct others within its Balancing Authority Area to act,~~ to ~~ensure~~address the reliability of its Balancing Authority Area via direct actions or by issuing Operating Instructions.
R3	Operations Planning, Same-Day Operations, Real-Time Operations	High	N/A	N/A	N/A	The responsible entity did not comply with an Operating Instruction issued by the Transmission Operator, and such action could have been physically implemented and would not have violated safety, equipment, regulatory, or statutory requirements.
R4	Operations Planning,	High	N/A	N/A	N/A	The responsible entity did not inform its Transmission

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
	Same-Day Operations, Real-Time Operations					Operator of its inability to perform an Operating Instruction issued by its Transmission Operator.
R5	Operations Planning, Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The responsible entity did not comply with an Operating Instruction issued by the Balancing Authority, and such action could have been physically implemented and would not have violated safety, equipment, regulatory, or statutory requirements.

R7	Real-Time Operations	High	N/A	N/A	N/A	The Transmission Operator did not provide assistance to other Transmission Operators, ~~if~~when requested and able, ~~when~~and the requesting entity had implemented its ~~e~~Emergency procedures, and such actions could have been physically implemented and

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						would not have violated safety, equipment, regulatory, or statutory requirements.
For the Requirements R8 and R9 VSLs only, the intent of the SDT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.						
R8	Operations Planning, Same-Day Operations, Real-Time Operations	High	The Transmission Operator did not inform one ~~other~~ known impacted Transmission Operator or 5% or less of the known impacted other Transmission Operators, whichever is ~~less~~greater, of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas when conditions did permit such communications. White paper on SOL Exceedances to be placed here.

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific SOL or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures, including electronic data exchange, which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator's disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific SOL or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible SOL or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those SOLs or IROLs, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day SOL or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of “the Operating Plan document” for compliance purposes.

Unofficial Comment Form

Project 2014-03 Revisions to TOP/IRO Reliability Standards
TOP-001-3

Please **DO NOT** use this form for submitting comments. Please use the electronic form to submit comments on the Standard. The electronic comment form must be completed by 8:00 p.m. EST **Monday, November 10, 2014**.

If you have questions please contact Ed Dobrowolski at ed.dobrowolski@nerc.net or by telephone at 609-947-3673.

Additional information about this project is available on the project page.

Background Information - Project 2014-03 – Revisions to TOP/IRO Reliability Standards

On November 21, 2013, FERC issued a NOPR proposing to remand three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) to replace the eight currently-effective TOP standards and four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) to replace six currently-effective IRO standards. In the NOPR, FERC stated that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards."

In response, NERC filed a motion requesting that FERC defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR and afford time to review the proposed TOP and IRO Standards through the NERC standards development process. That motion to defer action was granted on January 14, 2014.

The drafting team formed to address those concerns has made revisions to the TOP and IRO standards proposed to be remanded, along with several other IRO standards to provide consistency amongst the TOP and IRO standards, to address NOPR issues and recommendations made by the Independent Expert Review Panel, the IRO five-year review team, and the 2011 SW Outage Report. In the ballot that ended September 19, 2014, all of the standards except TOP-001-3 achieved greater than the required two thirds ballot pool approval. The SDT has reviewed stakeholder comments submitted in that comment period and made only clarifying and non-substantive changes to all of the standards except TOP-001. No changes were made to the definitions or implementation plan.

The SDT has made numerous changes in the third posting for proposed TOP-001-3 in order to respond to industry comments raised in the second posting.

Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

Commenters are reminded that this is not a forum for questioning the issues raised in the FERC NOPR of November 21, 2013 but to objectively evaluate the work of the SDT in responding to the issues raised in the NOPR, and the recommendations made by the Independent Expert Review Panel (IERP), the IRO FYRT, and the SW Outage Report.

Questions

1. Do you agree with the changes made to respond to industry comments to proposed TOP-001-3? If not, please provide technical rationale for your disagreement along with suggested language changes.

   No:

   Comments:

Notice of Request to Waive the Standard Process

Project 2014-03 – Revisions to TOP and IRO Reliability Standards

As required by Section 16 of the NERC Standard Processes Manual (SPM), this is official notice to stakeholders that the leadership of the Project 2014-03 Revisions to TOP and IRO Reliability Standards Drafting Team, the Project Management Oversight Subcommittee (PMOS) liaison for that project, Standards Committee (SC) chair, and NERC Standards Staff (Requesters) are requesting that the SC consider a waiver of the Standard Processes Manual. The Requesters ask to shorten the next formal comment and ballot period for draft standard TOP-001-3, and any subsequent comment formal comment and ballot periods prior to final ballot for that standard, from 45 days to 30 days, and to shorten the final ballot for TOP-001-3 from ten days to seven days, in order to meet a regulatory deadline. Section 16 of the SPM provides for the granting of waivers for regulatory deadlines and where the SC determines that a modification to a proposed Reliability Standard has already been vetted by the industry through the standard development process.

The SC will meet via teleconference to consider this waiver request no earlier than Thursday, October 9, 2014 (to comply with the five business day notice required by Section 16 of the SPM). The Standards Committee's teleconference will be noticed through an announcement and posted on the NERC website. Additional details about the waiver request are included below, and should a waiver be granted by the SC, it will be posted on the project page.

Justification for Current Waiver Request

On April 16, 2013, NERC submitted two petitions requesting FERC approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) (collectively, the "TOP Standards") to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) (collectively, the "IRO Standards") to replace six currently-effective IRO standards.

On November 21, 2013, the Federal Energy Regulatory Commission (FERC) issued a Notice of Proposed Rulemaking (NOPR) proposing to remand three revised TOP Reliability Standards and four revised IRO Reliability Standards. In the NOPR FERC stated that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR and afford time to review the proposed

TOP and IRO Standards through the NERC standards development process to ensure that a technically justified set of solutions is in place for reliability.

NERC's motion to defer action was granted on January 14, 2014.

The drafting team has developed a set of eight revised standards and one new standard to replace the standards that the NOPR proposed to remand. The standards have been posted for two 45-day comment periods and ballots, and in the ballot ending September 19, 2014, eight of the nine standards achieved greater than the required two-thirds weighted segment approval.

The drafting team met to review stakeholder feedback on September 30 and October 1, and based on that feedback has made substantive revisions to TOP-001-3. The shortened comment period and ballot for TOP-001-3 serves two important purposes. First, should it be necessary to conduct more than one additional ballot to reach consensus on TOP-001-3, the shortened comment period will allow for one additional comment period and ballot while still allowing the nine standards to be filed with FERC by the January 31, 2015 deadline. Second, shortening the ballot period from ten days to seven days provides additional time during the comment period for drafting team outreach prior to the start of the ballot. This outreach may be important to ensure stakeholder support for the standard.

Finally, shortening the final ballot period for TOP-001-3 from ten days to seven days provides scheduling flexibility that may be required to achieve the necessary milestones prior to filing (including possibly scheduling a special call for NERC Board adoption), while still allowing NERC and the industry to successfully meet the January 31, 2015 filing deadline. If NERC is unable to meet the January 31, 2015 deadline, FERC may proceed with its proposed remand of the TOP and IRO standards.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Laura Hussey,
Director of Standards Development, at laura.hussey@nerc.net or at 404-446-2560.

Agenda Item 2
Standards Committee
October 9, 2014

Waiver Authorization for Project 2014-03: Revisions to TOP and IRO Reliability Standards

Action

Authorize a waiver of the Standard Processes Manual (SPM) to:

a) shorten the next additional formal comment period (and any subsequent additional formal comment periods) for draft standard TOP-001-3 from 45 days to 30 days, with a ballot and non-binding poll during the last seven days of the 30 day period; and

b) shorten the final ballot period from ten days to seven days.

Background

The leadership of the TOP/IRO Standard Drafting Team, NERC staff, and the PMOS liaison and Standards Committee (SC) chair have requested a waiver of the NERC Standards Processes Manual (SPM) as described in the actions above. Section 16 of the SPM provides for the granting of waivers for regulatory deadlines and where the SC determines that a modification to a proposed Reliability Standard has already been vetted by the industry through the standard development process. As required in Section 16, NERC provided stakeholders with notice of these waiver requests on October 2, 2014. If a waiver is authorized, NERC staff will post notice of the waiver on the project page and notify the NERC Board of Trustees Standards Oversight and Technology Committee.

On April 16, 2013, NERC submitted two petitions requesting FERC approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) (collectively, the "TOP Standards") to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) (collectively, the "IRO Standards") to replace six currently-effective IRO standards.

On November 21, 2013, the Federal Energy Regulatory Commission (FERC) issued a Notice of Proposed Rulemaking (NOPR) proposing to remand three revised TOP Reliability Standards and four revised IRO Reliability Standards. In the NOPR FERC stated that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR and afford time to review the proposed TOP and IRO Standards through the NERC standards development process to ensure that a technically justified set of solutions is in place for reliability.

NERC's motion to defer action was granted on January 14, 2014.

The drafting team has developed a set of eight revised standards and one new standard to replace the standards that the NOPR proposed to remand. The standards have been posted for two 45-day comment periods and ballots, and in the ballot ending September 19, 2014, eight of the nine standards achieved greater than the required two-thirds weighted segment approval.

The drafting team met to review stakeholder feedback on September 30 and October 1, and based on that feedback has made substantive revisions to TOP-001-3. The shortened comment period and ballot for TOP-001-3 serves two important purposes. First, should it be necessary to conduct more than one additional ballot to reach consensus on TOP-001-3, the shortened comment period will allow for one additional comment period and ballot while still allowing the nine standards to be filed with FERC by the January 31, 2015 deadline. Second, shortening the ballot period from ten days to seven days provides additional time during the comment period for drafting team outreach prior to the start of the ballot. This outreach may be important to ensure stakeholder support for the standard.

Finally, shortening the final ballot period for TOP-001-3 from ten days to seven days provides scheduling flexibility that may be required to achieve the necessary milestones prior to filing (including possibly scheduling a special call for NERC Board adoption), while still allowing NERC and the industry to successfully meet the January 31, 2015 filing deadline. If NERC is unable to meet the January 31, 2015 deadline, FERC may proceed with its proposed remand of the TOP and IRO standards.

SAR Type (Check as many as applicable)			
☒ New Standard		☐ Withdrawal of existing Standard	
☒ Revision to existing Standard		☐ Urgent Action	

SAR Information

Industry Need (What is the industry problem this request is trying to solve?):

On April 16, 2013, NERC submitted two petitions requesting Commission approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) (collectively, the "TOP Standards") to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) (collectively, the "IRO Standards") to replace six currently-effective IRO standards.

On November 21, 2013, the Commission issued a NOPR in response to these petitions. The NOPR proposed to remand the proposed TOP and IRO Standards. In the NOPR, the Commission raises a concern that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." For example, the Commission cites the fact that the proposed TOP standards do not require Transmission Operators to plan and operate within all System Operating Limits ("SOLs"), which is a requirement in the currently effective standards.

On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR. This deferral would provide an opportunity for the industry, NERC, and FERC to work toward a common understanding and afford time to review the proposed TOP and IRO standards through the NERC standards development process to address the concerns set forth in the NOPR. That motion to defer action was granted by the Commission on January 14, 2014.

SAR Information

Purpose or Goal (How does this request propose to address the problem described above?):

The primary goal of this SAR is to allow the Standard Drafting Team (SDT) for Project 2014-03 Revisions to TOP/IRO Reliability Standards to address the concerns expressed in the NOPR while fulfilling the goals of the original projects: Project 2006-06 Reliability Coordination and Project 2007-03 Real-time Operations. In addition, the SDT should review the goals of Project 2009-02 Real-time Monitoring and Analysis Capabilities and consider whether to incorporate revisions to the TOP and/or IRO standards to address those goals in Project 2014-03.

SAR Information
Identify the Objectives of the proposed standard’s requirements (What specific reliability deliverables are required to achieve the goal?):
Provide clear, unambiguous requirements and standards to allow Reliability Coordinators, Transmission Operators, and Balancing Authorities to operate the interconnected transmission system in a safe and reliable manner.
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The SDT shall modify the TOP and IRO Reliability Standards to address the issues raised in the NOPR, while ensuring that the revisions continue to address directives previously assigned to the TOP and IRO standards under Projects 2007-03 and 2006-06. If it is decided to handle the goals of Project 2009-02 within Project 2014-03, then the directives assigned to Project 2009-02 will be addressed as well. In addition, the recommendations from the Independent Expert Review Project and the SW Outage Report will be reviewed, a directive dealing with monitoring responsibilities for the Reliability Coordinator will be resolved, and other IRO standards will be examined for consistency purposes.
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
The SDT shall: 1. Revise the TOP/IRO Reliability Standards to address concerns expressed in the NOPR a. Consider the inputs from technical conferences 2. Consider the recommendations in the Independent Expert Review Report and the SW Outage Report 3. Review the IRO Reliability Standards not included in the original Project 2006-06 for coordination with any changes made for this project (see list of related standards) 4. Preserve the intent of the reliability objectives in the current, approved standards so that no reliability gaps are created 5. Decide whether to handle the goals of Project 2009-02 within Project 2014-03; and if it does so decide, then also address the directives assigned to Project 2009-02. 6. Address the directives from Order 693 originally assigned to Projects 2006-06 and 2007-03.

SAR Information
7. Address the following directive from Order 693, paragraph 1855: *"Since a reliability coordinator is the highest level of authority overseeing the reliability of the Bulk-Power System, the Commission believes that it is important to include the reliability coordinator as an applicable entity to assure that adequate voltage and reactive resources are being maintained. As MISO points out, other Reliability Standards address responsibilities of reliability coordinators, but we agree with EEI that it is important to include reliability coordinators in VAR-001-1 as well. Reliability coordinators have responsibilities in the IRO and TOP Reliability Standards, but not the specific responsibilities for voltage levels and reactive resources addressed by VAR-001-1, which have a great impact on system reliability. For example, voltage levels and reactive resources are important factors to ensure that IROLs are valid and operating voltages are within limits, and that reliability coordinators should have responsibilities in VAR-001-1 to monitor that sufficient reactive resources are available for reliable system operations. Accordingly, the ERO should modify VAR-001-1 to include reliability coordinators as applicable entities and include a new requirement(s) that identifies the reliability coordinator's monitoring responsibilities*."
8. Modify the measures, Violation Risk Factors (VRF), and Violation Severity Levels (VSL) as necessary to address modified requirements.
9. Address the issue of outage coordination as pointed out by the Independent Experts Review Panel through the creation of a new standard.
10. Address the recommendations of the IRO Five Year Review Team (Project 2012-09) for the IRO standards revised in this project.

Reliability Functions	
The Standard will Apply to the Following Functions (Check each one that applies.)	
☐ Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.

Reliability Functions		
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☒	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☒	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☒	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☒	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.

Reliability Functions	
☒ Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Project 2014-03 – Revisions to TOP and IRO Reliability Standards

Mapping Document | Updated August 2014

This mapping document showing the translation of Requirements in the following currently-enforceable standards to revised or new standards developed in Project 2014-03:

- IRO-001-1.1 — Reliability Coordination - Responsibilities and Authorities
- IRO-002-2 — Reliability Coordination - Facilities
- IRO-003-2 — Reliability Coordination – Wide-Area View
- IRO-004-2 — Reliability Coordination — Operations Planning
- IRO-005-3.1a — Reliability Coordination - Current Day Operations
- IRO-008-1 — Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-010-1a — Reliability Coordinator Data Specification and Collection
- IRO-014-1 — Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators
- IRO-015-1 — Notifications and Information Exchange Between Reliability Coordinators
- IRO-016-1 — Coordination of Real-time Activities Between Reliability Coordinators
- PER-001-0.2 — Operating Personnel Responsibility and Authority
- TOP-001-1a — Reliability Responsibilities and Authorities
- TOP-002-2.1b — Normal Operations Planning
- TOP-003-1 — Planned Outage Coordination
- TOP-004-2 — Transmission Operations
- TOP-005-2a — Operational Reliability Information
- TOP-006-3 — Monitoring System Conditions[1]
- TOP-007-0 — Reporting System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) Violations
- TOP-008-1 — Response to Transmission Limit Violations

[1] TOP-006-2 is the currently enforceable version of this standard; TOP-006-3 was developed in response to a request for interpretation seeking clarification of Requirement R1 and does not substantively change the Requirements of TOP-006-2. In its NOPR proposing to remand the TOP and IRO standard, FERC proposed to approve TOP-006-3. The drafting team has mapped the Requirements in the new standards to TOP-006-3 because the Parts of Requirement R1 in TOP-006-3 more clearly delineate which entity has responsibility.

Standard IRO-001-1.1 — Reliability Coordination - Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Regional Reliability Organization, subregion, or interregional coordinating group shall establish one or more Reliability Coordinators to continuously assess transmission reliability and coordinate emergency operations among the operating entities within the region and across the regional boundaries.	The SDT proposes retiring the requirement as it is addressed in the NERC Rules of Procedure, January 30, 2014: **Section 503.2 (2.1)** "Regional Entities shall verify that all Reliability Coordinators, Balancing Authorities, and Transmission Operators meet the Registration requirements of Section 501(1.4)." **Section 501 (1.4)** "**1.4** For all geographical or electrical areas of the Bulk Power System, the Registration process shall ensure that (1) no areas are lacking any entities to perform the duties and tasks identified in and required by the Reliability Standards to the fullest extent practical, and (2) there is no unnecessary duplication of such coverage or of required oversight of such coverage. In particular the process shall: **1.4.1** Ensure that all areas are under the oversight of one and only one Reliability Coordinator. **1.4.2** Ensure that all Balancing Authorities and Transmission operator entities are under the responsibility of one and only one Reliability Coordinator. **1.4.3** Ensure that all transmission Facilities of the Bulk Power System are the responsibility and under the control of one and only one Transmission Planner, Planning Authority, and Transmission Operator. **1.4.4** Ensure that all loads and generators are under the responsibility and control of one and only one Balancing Authority."
R2. The Reliability Coordinator shall comply with a regional reliability plan approved by the NERC Operating Committee.	**The SDT is proposing to retire this requirement.** The SDT proposes retiring Requirement R2 as the regional reliability plan is a high level overview "how" document that shows how a Reliability Coordinator will comply with other NERC Standards. As a result, this requirement is administrative and redundant to other measureable and enforceable requirements within the standards. Since the requirement is generally administrative, it does not materially impact the reliability of the BES. The Reliability Plan concept is a holdover from the transition period from the Operating Policies to the Version 0 standards and was used extensively in the readiness evaluation process by the Operating Committee. The template used for the Reliability Plan is actually an outline of Operating Policy 9. The material included in the plan was a description of how an entity satisfied the specific functional areas under Policy 9. With the transition of Policy 9 to the IRO and other standards, the items addressed in

Standard IRO-001-1.1 — Reliability Coordination - Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	the reliability plans are inherently addressed in the body of other more measurable Reliability Standards.
R3. The Reliability Coordinator shall have clear decision-making authority to act and direct actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities and Purchasing-Selling Entities within its Reliability Coordinator Area to preserve the integrity and reliability of the Bulk Electric System. These actions shall be taken without delay, but no longer than 30 minutes.	**This requirement is replaced by proposed IRO-001-4, Requirements R1 and R2.** The SDT does not believe that there is a need for a decision-making authority requirement as the decision-making authority is inherent when the requirement states that the Reliability Coordinator must act, or by issuing Operating Instructions. **Proposed IRO-001-4, Requirements R1 and R2:** **R1**. Each Reliability Coordinator shall act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions. **R2.** Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with its Reliability Coordinator's Operating Instructions unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements.
R4. Reliability Coordinators that delegate tasks to other entities shall have formal operating agreements with each entity to which tasks are delegated. The Reliability Coordinator shall verify that all delegated tasks are understood, communicated, and addressed within its Reliability Coordinator Area. All responsibilities for complying with NERC and regional standards applicable to Reliability Coordinators shall remain with the Reliability Coordinator.	**The SDT is proposing to retire this requirement.** The SDT contends that approved IRO-001-1.1, Requirement R4 is redundant with NERC Rules of Procedure, Section 500 (January 30, 2014) and should be retired from the standard. **(Section 501)** "The purpose of the Organization Registration Program is to clearly identify those entities that are responsible for compliance with the FERC approved Reliability Standards. Organizations that are registered are included on the NERC Compliance Registry (NCR) and are responsible for knowing the content of and for complying with all applicable Reliability Standards." **(Section 508)** Provisions Relating to Coordinated Functional Registration (CFR) Entities In addition to registering as an entity responsible for all functions that it performs itself, multiple entities may each register using a CFR for one or more Reliability Standard(s) and/or for one or more Requirements/sub-Requirements within particular Reliability Standard(s) applicable to a specific function. The CFR submission must include a written agreement that governs itself and clearly specifies the entities' respective compliance responsibilities. The Registration of the CFR is the complete

Standard IRO-001-1.1 — Reliability Coordination - Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Registration for each entity. Additionally, each entity shall take full compliance responsibility for those Reliability Standards and/or Requirements/sub-Requirements it has registered for in the CFR. Neither NERC nor the Regional Entity shall be parties to any such agreement, nor shall NERC or the Regional Entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the CFR.
R5. The Reliability Coordinator shall list within its reliability plan all entities to which the Reliability Coordinator has delegated required tasks.	The SDT is proposing to retire this requirement consistent with Paragraph 81 criteria as it is strictly administrative in nature.
R6. The Reliability Coordinator shall verify that all delegated tasks are carried out by NERC-certified Reliability Coordinator operating personnel.	The SDT is proposing to retire this requirement. The Reliability Coordinator may delegate tasks but cannot delegate the responsibility for these tasks. Therefore, it is not necessary to mandate that delegated tasks must be carried out by certified personnel as it is the responsibility of the Reliability Coordinator to ensure that the task is carried out.
R7. The Reliability Coordinator shall have clear, comprehensive coordination agreements with adjacent Reliability Coordinators to ensure that System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) violation mitigation requiring actions in adjacent Reliability Coordinator Areas are coordinated.	This requirement is replaced by proposed IRO-014-3, Requirement R1. **Proposed IRO-014-3, Requirement R1:** **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability.
R8: Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall comply with Reliability Coordinator directives unless such actions would violate safety, equipment, or regulatory or statutory requirements. Under these circumstances, the Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, Load-Serving Entity, or Purchasing-Selling Entity shall immediately inform the Reliability Coordinator of the inability to perform the directive so that the Reliability	This requirement is replaced by proposed IRO-001-4, Requirements R2 and R3. **Proposed IRO-001-4, Requirements R2 and R3:** **R2.** Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with its Reliability Coordinator's Operating Instructions unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements. **R3.** Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall inform its Reliability Coordinator upon recognition of its inability to perform an Operating Instruction in accordance with Requirement R2.

Standard IRO-001-1.1 — Reliability Coordination - Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
Coordinator may implement alternate remedial actions.	
R9. The Reliability Coordinator shall act in the interests of reliability for the overall Reliability Coordinator Area and the Interconnection before the interests of any other entity.	The SDT is proposing to retire this requirement as it is redundant with the definition of Reliability Coordinator in Functional Model v5. The NERC Functional Model Version 5 defines the Reliability Coordinator function as follows: "The functional entity that maintains the Real-time operating reliability of the Bulk Electric System within a Reliability Coordinator Area." An entity performing Reliability Coordinator services must meet this definition.

Standard IRO-002-2 — Reliability Coordination – Facilities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Reliability Coordinator shall have adequate communications facilities (voice and data links) to appropriate entities within its Reliability Coordinator Area. These communications facilities shall be staffed and available to act in addressing a real-time emergency condition.	The first sentence of this requirement is replaced by proposed COM-001-2 Requirement R1 for voice links and proposed IRO-002-2 Requirement R1 for data links. The second sentence of this requirement is covered by approved PER-004-2 Requirement R1 so to eliminate redundancy, that part of the requirement is not proposed to be replaced. **Proposed COM-001-2, Requirement R1:** **R1.** Each Reliability Coordinator shall have Interpersonal Communication capability with the following entities (unless the Reliability Coordinator detects a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): 1.1 All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area. 1.2 Each adjacent Reliability Coordinator within the same Interconnection. **Proposed IRO-002-4, Requirement R1:** **R1.** Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Approved PER-004-2, Requirement R1:** **R1.** Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.
R2. Each Reliability Coordinator — or its Transmission Operators and Balancing Authorities — shall provide, or arrange provisions for, data exchange to other Reliability Coordinators or Transmission Operators and Balancing Authorities via a secure network.	This requirement is replaced by proposed IRO-010-2, Requirements R1 and R3, Part 3.3. **Proposed IRO-010-2, Requirements R1 and R3, Part 3.3:** **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **R3.** Part 3.3. A mutually agreeable security protocol
R3. Each Reliability Coordinator shall have multi-directional communications capabilities with its Transmission Operators and Balancing Authorities, and with neighboring Reliability	This requirement is replaced by proposed COM-001-2 Requirement R1 and proposed IRO-002-4 Requirement R2. **Proposed COM-001-2, Requirement R1:**

Standard IRO-002-2 — Reliability Coordination – Facilities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
Coordinators, for both voice and data exchange as required to meet reliability needs of the Interconnection.	**R1.** Each Reliability Coordinator shall have Interpersonal Communication capability with the following entities (unless the Reliability Coordinator detects a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): 1.1 All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area. 1.2 Each adjacent Reliability Coordinator within the same Interconnection. **Proposed IRO-002-4, Requirement R2:** **R2**. Each Reliability Coordinator shall have data exchange capabilities with Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R4. Each Reliability Coordinator shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas to ensure that potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations are identified. Each Reliability Coordinator shall have monitoring systems that provide information that can be easily understood and interpreted by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant and highly reliable infrastructure.	This requirement is replaced by proposed IRO-002-4, Requirements R3 and R4. **Proposed IRO-002-4, Requirements R3 and R4:** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **R4.** Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure.
R5. Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to	This requirement is replaced by proposed IRO-002-4, Requirement R3. **Proposed IRO-002-4, Requirement R3:** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

Standard IRO-002-2 — Reliability Coordination – Facilities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area.	
R6. Each Reliability Coordinator shall have adequate analysis tools such as state estimation, pre- and post-contingency analysis capabilities (thermal, stability, and voltage), and wide-area overview displays.	This requirement is replaced by proposed IRO-008-5, Requirement R5 and the proposed definition of Real-time Assessment. **Proposed IRO-008, Requirement R4:** **R4**. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Proposed definition:** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)
R7. Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area. Each Reliability Coordinator shall have provisions for backup facilities that shall be exercised if the main monitoring system is unavailable. Each Reliability Coordinator shall ensure SOL and IROL monitoring and derivations continue if the main monitoring system is unavailable.	This requirement is replaced by proposed IRO-002-4, Requirement R3 and approved EOP-008-1, Requirement R1, Part 1.6.2. **Proposed IRO-002-4, Requirement R3:** **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Approved EOP-008-1, Requirement R1, Part 1.6.2:** **R1. Part 1.6.2**. Actions to manage the risk to the BES during the transition from primary to backup functionality as well as during outages of the primary or backup functionality.
R8. Each Reliability Coordinator shall control its Reliability Coordinator analysis tools, including approvals for planned maintenance. Each Reliability Coordinator shall have	This requirement is replaced by proposed IRO-002, Requirement R2 and approved EOP-008-1, Requirement R1, Part 1.6.2. **Proposed IRO-002-4, Requirement R2:**

Standard IRO-002-2 — Reliability Coordination – Facilities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
procedures in place to mitigate the effects of analysis tool outages.	**R2.** Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance of its telecommunications, monitoring and analysis capabilities. **Approved EOP-008-1, Requirement R1, Part 1.6.2:** **R1. Part 1.6.2.** Actions to manage the risk to the BES during the transition from primary to backup functionality as well as during outages of the primary or backup functionality.

Standard IRO-003-2 — Reliability Coordination - Wide-Area View	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.	Replaced with proposed IRO-002-4, Requirement R3. **Proposed IRO-002-4, Requirement R3:** **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
R2. Each Reliability Coordinator shall know the current status of all critical facilities whose failure, degradation or disconnection could result in an SOL or IROL violation. Reliability Coordinators shall also know the status of any facilities that may be required to assist area restoration objectives.	Replaced with proposed IRO-002-4, Requirement R3 and revised definitions of Operational Planning Analysis and Real-time Assessment. **Proposed IRO-002-4, Requirement R3:** **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed definition:** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day

Standard IRO-003-2 — Reliability Coordination - Wide-Area View	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition:** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Standard IRO-004-2 — Reliability Coordination - Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Transmission Operator, Balancing Authority, and Transmission Service Provider shall comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events.	This requirement is replaced by proposed IRO-001-4, Requirement R1 since Operating Instructions, regardless of what timeframe they are issued for, are issued in a Real-time environment. In addition, roles for entities identified in the Operating Plans built from Operational Planning Analyses are communicated in proposed IRO-008-2, Requirement R3. **Proposed IRO-001-4, Requirement R1:** R1. Each Reliability Coordinator shall act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions. **Proposed IRO-008-2, Requirement R3:** R3. Each Reliability Coordinator shall notify impacted entities identified in its Operating Plan(s) cited in Requirement R2 as to their role in that plan(s).

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following: **R1.1** Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading. **R1.2.** Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope. **R1.3.** Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope. **R1.4.** System real and reactive reserves (actual versus required). **R1.5**. Capacity and energy adequacy conditions. **R1.6.** Current ACE for all its Balancing Authorities. **R1.7**. Current local or Transmission Loading Relief procedures in effect. **R1.8.** Planned generation dispatches. **R1.9.** Planned transmission or generation outages. **R1.10.** Contingency events.	Replaced by proposed IRO-002-4, Requirements R3 and R4. **Proposed IRO-002-4, Requirement R3:** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed IRO-002-4, Requirement R4:** **R4**. Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure.
R2. Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard (CPS) and	The first sentence is replaced by proposed IRO-002-4, Requirement R3. The second sentence is covered by approved EOP-002-3.1a, Requirement R8 and can be retired. **Proposed IRO-002-4 Requirement, R3**:

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
Disturbance Control Standard (DCS) requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.	**R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Approved EOP-002-3.1a, Requirement R8:** **R8.** A Reliability Coordinator that has any Balancing Authority within its Reliability Coordinator area experiencing a potential or actual Energy Emergency shall initiate an Energy Emergency Alert as detailed in Attachment 1-EOP-002 "Energy Emergency Alerts." The Reliability Coordinator shall act to mitigate the emergency condition, including a request for emergency assistance if required.
R3. Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.	The SDT proposes retiring this requirement as it has been superseded by approved EOP-010-1, Requirements R1 through R3. **Approved EOP-010-1, Requirements R1 to R3:** **R1** Each Reliability Coordinator shall develop, maintain, and implement a GMD Operating Plan that coordinates GMD Operating Procedures or Operating Processes within its Reliability Coordinator Area. At a minimum, the GMD Operating Plan shall include: **1.1** A description of activities designed to mitigate the effects of GMD events on the reliable operation of the interconnected transmission system within the Reliability Coordinator Area. **1.2** A process for the Reliability Coordinator to review the GMD Operating Procedures or Operating Processes of Transmission Operators within its Reliability Coordinator Area. **R2.** Each Reliability Coordinator shall disseminate forecasted and current space weather information to functional entities identified as recipients in the Reliability Coordinator's GMD Operating Plan. **R3.** Each Transmission Operator shall develop, maintain, and implement a GMD Operating Procedure or Operating Process to mitigate the effects of GMD events on the reliable

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	operation of its respective system. At a minimum, the Operating Procedure or Operating Process shall include: **3.1.** Steps or tasks to receive space weather information. **3.2**. System Operator actions to be initiated based on predetermined conditions. **3.3**. The conditions for terminating the Operating Procedure or Operating Process.
R4. The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.	This requirement has been replaced by proposed IRO-008-2, Requirements R3, R5 and R6. **Proposed IRO-008-2, Requirement R3:** **R3.** Each Reliability Coordinator shall notify impacted entities identified in its Operating Plan(s) cited in Requirement R2 as to their role in that plan(s). **Proposed IRO-008-2, Requirement R5:** **R5.** Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area. **Proposed IRO-008-2, Requirement R6:** **R6.** Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R5 has been prevented or mitigated.
R5. Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.	This requirement is replaced by proposed IRO-001-4, Requirement R1 and proposed IRO-002-34 Requirements R3 and R4. **Proposed IRO-001-4, Requirement R1:** **R1.** Each Reliability Coordinator shall act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions.

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed IRO-002-4, Requirement R3: **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed IRO-002-4, Requirement R4:** **R4.** Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure.
R6. The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, IROL, CPS or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.	The first sentence is replaced with proposed IRO-008-2, Requirement R2. The issue of CPS and DCS is covered in approved EOP-002-3.1, Requirements R6, R7, and R8. The second sentence is replaced by the proposed IRO-017-1, Requirement R1 as well as through the proposed definitions of Operational Planning Analysis and Real-time Assessments. Generator Operators are not included in proposed IRO-017-1 as the SDT believes that Generator Operator outage information will be sent to the respective Transmission Operators and Balancing Authorities and then sent on to the Reliability Coordinators through those entities. **Proposed IRO-008-2, Requirement R2:** **R2**. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. **Proposed definition:** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition:** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed IRO-017-1, Requirement R1:** **R1.** Each Reliability Coordinator shall develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area. **Approved EOP-002-3.1, Requirements R6, R7, and R8:** **R6.** If the Balancing Authority cannot comply with the Control Performance and Disturbance Control Standards, then it shall immediately implement remedies to do so. These remedies include, but are not limited to: R6.1. Loading all available generating capacity. **R6.2**. Deploying all available operating reserve. **R6.3.** Interrupting interruptible load and exports. **R6.4.** Requesting emergency assistance from other Balancing Authorities. **R6.5**. Declaring an Energy Emergency through its Reliability Coordinator; and **R6.6.** Reducing load, through procedures such as public appeals, voltage reductions, curtailing interruptible loads and firm loads.

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R7. Once the Balancing Authority has exhausted the steps listed in Requirement 6, or if these steps cannot be completed in sufficient time to resolve the emergency condition, the Balancing Authority shall: R7.1. Manually shed firm load without delay to return its ACE to zero; and **R7.2**. Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002 "Energy Emergency Alerts." **R8.** A Reliability Coordinator that has any Balancing Authority within its Reliability Coordinator area experiencing a potential or actual Energy Emergency shall initiate an Energy Emergency Alert as detailed in Attachment 1-EOP-002 "Energy Emergency Alerts." The Reliability Coordinator shall act to mitigate the emergency condition, including a request for emergency assistance if required.
R8. The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.	The first sentence is replaced by proposed IRO-002-4, Requirements R3 and R4. The second sentence is replaced by proposed IRO-001-4, Requirement R1. **Proposed IRO-002-4, Requirement R3:** **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed IRO-002-4, Requirement R4:** **R4.** Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure. **Proposed IRO-001-4, Requirement R1:** **R1.** Each Reliability Coordinator shall act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions.
R9. Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator	The first sentence is replaced by proposed IRO-002-4, Requirements R3 and R4. The second sentence is replaced by proposed IRO-010-2, Requirements R1, Part 1.2, and R3.

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.	**Proposed IRO-002-4, Requirement R3:** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed IRO-002-4, Requirement R4:** **R4.** Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure. **Proposed IRO-010-4, Requirement R1, Part 1.2:** **R1**. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: **1.2** Provisions for notification of current Protection System and Special Protection System status, failure, or degradation that impacts System reliability. **Proposed IRO-010-4, Requirement R3:** **R3**. Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications.
R10. In instances where there is a difference in derived limits, the Reliability Coordinator and its Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.	For Reliability Coordinators, this requirement is replaced by approved IRO-009-1, Requirement R5. For Transmission Operators, Balancing Authorities, and Generator Operators, this requirement is replaced by proposed TOP-001-3, Requirement R18. The Transmission Service Provider and Purchasing-Selling Entity will receive instructions on limits from the previously cited entities and can thus be deleted from the requirement. **Approved IRO-009-1, Requirement R5:**

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R5. If unanimity cannot be reached on the value for an IROL or its Tv, each Reliability Coordinator that monitors that Facility (or group of Facilities) shall, without delay, use the most conservative of the values (the value with the least impact on reliability) under consideration. **Proposed TOP-001-3, Requirement R18:** **R18**. Each Transmission Operator shall operate to the most limiting parameter in instances where there is a difference in SOLs.
R11. The Transmission Service Providers shall respect these SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.	This requirement is replaced by proposed MOD-001-2, Requirement R2. **Proposed MOD-001-2, Requirement R2:** **R2**. Each Transmission Service Provider that determines Available Flowgate Capability (AFC) or Available Transfer Capability (ATC) shall develop an Available Transfer Capability Implementation Document (ATCID) that describes the methodology (or methodologies) for determining AFC or ATC values. The methodology (or methodologies) shall reflect the Transmission Service Provider's current practices for determining AFC or ATC values. **2.1.** Each methodology shall describe the method used to account for the following elements, provided such elements impact the determination of AFC or ATC: **2.1.1.** The simulation of transfers performed through the adjustment of generation, Load, or both; **2.1.2.** Transmission topology, including, but not limited to, additions and retirements; **2.1.3.** Expected transmission uses; **2.1.4.** Planned outages**;** **2.1.5.** Parallel path (loop flow) adjustments; **2.1.6.** Load forecast; and **2.1.7.** Generator dispatch, including, but not limited to, additions and retirements. **2.2.** Each Transmission Service Provider that uses the Flowgate Methodology shall, for reliability-related constraints identified in part 1.3, use the AFC determined by the Transmission Service Provider for that constraint.
R12. Each Reliability Coordinator who foresees a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area shall	The requirement is replaced by proposed IRO-008-2, Requirements R3, R5, and R6. **Proposed IRO-008-2, Requirement R3:**

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. The Reliability Coordinator shall notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem has been mitigated.	**R3.** Each Reliability Coordinator shall notify impacted entities identified in its Operating Plan(s) cited in Requirement R2 as to their role in that plan(s). **Proposed IRO-008-2, Requirement R5:** **R5**. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area. **Proposed IRO-008-2, Requirement R6:** **R6**. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R5 has been prevented or mitigated.

IRO-008-1 Reliability Coordination Operational Analyses and Real-time Assessments	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Reliability Coordinator shall perform an Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions.	This requirement is replaced by proposed IRO-008-2, Requirement R1. **Proposed IRO-008-2, Requirement R1:** **R1.** Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area.
R2. Each Reliability Coordinator shall perform a Real-Time Assessment at least once every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs.	This requirement is replaced by proposed IRO-008-2, Requirement R4. **Proposed IRO-008-2, Requirement R4:** **R4.** Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
R3. When a Reliability Coordinator determines that the results of an Operational Planning Analysis or Real-Time Assessment indicates the need for specific operational actions to prevent or mitigate an instance of exceeding an IROL, the Reliability Coordinator shall share its results with those entities that are expected to take those actions.	This requirement is replaced by proposed IRO-008-2, Requirements R3 and R5. **Proposed IRO-008-2, Requirements R3 and R5:** **R3.** Each Reliability Coordinator shall notify impacted entities identified in its Operating Plan(s) cited in Requirement R2 as to their role in that plan(s). **Proposed IRO-008-2, R6:** **R5**. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area.

<tr><th colspan="2">Standard IRO-010-1a Reliability Coordinator Data Specification and Collection</th></tr>
<tr><th>Requirement in Approved Standard</th><th>Proposed Language in New Standard or Comment</th></tr>
<tr><td>R1. The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following:

R1.1. List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.

R1.2. Mutually agreeable format.

R1.3. Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).

R1.4. Process for data provision when automated Real-Time system operating data is unavailable.</td><td>This requirement is replaced by proposed IRO-010-2, Requirements R1 and R3.

Proposed IRO-010-2, Requirement R1:
R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to:

1.1 A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator.

1.2 Provisions for notification of current Protection System and Special Protection System status, failure, or degradation that impacts System reliability.

1.3 A periodicity for providing data.

1.4 The deadline by which the respondent is to provide the indicated data.

Proposed IRO-010-2, Requirement R3:
R3. Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications using:

3.1 A mutually agreeable format

3.2 A mutually agreeable process for resolving data conflicts

3.3 A mutually agreeable security protocol</td></tr>
<tr><td>R2. The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.</td><td>This requirement is replaced by proposed IRO-010-2, Requirement R2.

Standard IRO-010-1a Reliability Coordinator Data Specification and Collection	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship.	This requirement is replaced by proposed IRO-010-2, Requirement R3. **Proposed IRO-010-2, Requirement R3:** **R3.** Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications using: **3.1** A mutually agreeable format **3.2** A mutually agreeable process for resolving data conflicts **3.3** A mutually agreeable security protocol

Standard IRO-014-1 — Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. The Reliability Coordinator shall have Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with one or more other Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall address Scenarios that affect other Reliability Coordinator Areas as well as those developed in coordination with other Reliability Coordinators **R1.1** These Operating Procedures, Processes, or Plans shall collectively address, as a minimum, the following: **R1.1.1** Communications and notifications, including the conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and	This requirement is replaced by proposed IRO-014-3, Requirement R1. Data is covered in proposed IRO-010-2, Requirement R1. **Proposed IRO-014-3, Requirement R1:** **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: **1.1** Communications and notifications, and the process to follow in making those notifications. **1.2** Energy and capacity shortages. **1.3** Control of voltage, including the coordination of reactive resources. **1.4** Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and Real-time Assessments.

Standard IRO-014-1 — Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
information to be exchanged with other Reliability Coordinators. **R1.1.2** Energy and capacity shortages. **R1.1.3** Planned or unplanned outage information. **R1.1.4** Voltage control, including the coordination of reactive resources for voltage control. **R1.1.5** Coordination of information exchange to support reliability assessments. **R1.1.6** Authority to act to prevent and mitigate instances of causing Adverse Reliability Impacts to other Reliability Coordinator Areas.	**1.5** Authority to act to prevent and mitigate system conditions which could adversely impact other Reliability Coordinator Areas. **1.6** Provisions for weekly conference calls. **Proposed IRO-010-2, Requirement R1:** **R1**. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R2. Each Reliability Coordinator's Operating Procedure, Process, or Plan that requires one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) shall be: **R2.1.** Agreed to by all the Reliability Coordinators required to take the indicated action(s). **R2.2**. Distributed to all Reliability Coordinators that are required to take the indicated action(s).	This requirement is replaced by proposed IRO-014-3, Requirement R2. **Proposed IRO-014-3, Requirement R2:** **R2.** Each Reliability Coordinator shall maintain its Operating Procedure, Operating Process, or Operating Plan identified in Requirement R1 as follows: **2.1** Review and update annually with no more than 15 months between reviews. **2.2** Obtain written agreement from all of the Reliability Coordinators required to take the indicated action(s) for each update. **2.3** Distribute to all Reliability Coordinators that are required to take the indicated action(s) within 30 days of an update.
R3. A Reliability Coordinator's Operating Procedures, Processes, or Plans developed to support a Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan shall include: **R3.1.** A reference to the associated Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan.	R3.1 is a strictly administrative requirement with no reliability benefit and is proposed to be retired under the P81 criteria. R3.2 is replaced by proposed IRO-014-3, Requirement R1, Part 1.5. **Proposed IRO-014-3, Requirement R1**: **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection

Standard IRO-014-1 — Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R3.2. The agreed-upon actions from the associated Reliability Coordinator-to- Reliability Coordinator Operating Procedure, Process, or Plan.	reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: **1.1** Criteria and processes for notifications. **1.2** Energy and capacity shortages. **1.3** Control of voltage, including the coordination of reactive resources. **1.4** Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and Real-time Assessments. **1.5** Provisions for periodic communications to support reliable operations.
R4. Each of the Operating Procedures, Processes, and Plans addressed in Reliability Standard IRO-014 Requirement 1 and Requirement 3 shall: **R4.1.** Include version control number or date. **R4.2.** Include a distribution list. **R4.3**. Be reviewed, at least once every three years, and updated if needed	This requirement is proposed to be retired as it is strictly an administrative requirement with no reliability benefit.

Standard IRO-015-1 - Notifications and Information Exchange Between Reliability Coordinators	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. The Reliability Coordinator shall follow its Operating Procedures, Processes, or Plans for making notifications and exchanging reliability-related information with other Reliability Coordinators. **R1.1** The Reliability Coordinator shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas.	This requirement is replaced by proposed IRO-014-3, Requirement R1. **Proposed IRO-014-3, Requirement R1:** **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following:
R2. The Reliability Coordinator shall participate in agreed upon conference calls and other communication forums with adjacent Reliability Coordinators. **R2.1** The frequency of these conference calls shall be agreed upon by all involved Reliability Coordinators and shall be at least weekly.	This requirement is replaced by proposed IRO-014-3, Requirement R1, Part 1.5. **Proposed IRO-014-3, Requirement R1, Part 1.5:** **R1, Part 1.5:** Provisions for periodic communications to support reliable operations.
R3. A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows. **R3.1**. Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority. **R3.2.** Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.	This requirement is replaced by approved PRC-001-1.1, Requirement R3. **Approved PRC-001-1.1, Requirement R3:** **R3.** A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows. **3.1** Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority. **3.2** Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.

Standard IRO-016-1 - Coordination of Real-time Activities Between Reliability Coordinators	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. The Reliability Coordinator that identifies a potential, expected, or actual problem that requires the actions of one or more other Reliability Coordinators shall contact the other Reliability Coordinator(s) to confirm that there is a problem and then discuss options and decide upon a solution to prevent or resolve the identified problem. **R1.1** If the involved Reliability Coordinators agree on the problem and the actions to take to prevent or mitigate the system condition, each involved Reliability Coordinator shall implement the agreed-upon solution, and notify the involved Reliability Coordinators of the action(s) taken. **R1.2** If the involved Reliability Coordinators cannot agree on the problem(s) each Reliability Coordinator shall re-evaluate the causes of the disagreement (bad data, status, study results, tools, etc.). **R1.2.1** If time permits, this re-evaluation shall be done before taking corrective actions. **R1.2.2** If time does not permit, then each Reliability Coordinator shall operate as though the problem(s) exist(s) until the conflicting system status is resolved **R1.3** If the involved Reliability Coordinators cannot agree on the solution, the more conservative solution shall be implemented.	Proposed IRO-014-3, Requirements R3 through R6 are revised versions of approved IRO-016-1, Requirement R1 and its sub-requirements. **Proposed IRO-014-3, Requirement R3:** **R3.** Each Reliability Coordinator, upon identification of an expected or actual Emergency in its Reliability Coordinator Area, shall notify other impacted Reliability Coordinators. **Proposed IRO-014-3, Requirement R4:** **R4.** Each impacted Reliability Coordinator shall operate as though the Emergency exists during each instance where Reliability Coordinators disagree on the existence of an Emergency. **Proposed IRO-014-3, Requirement R5:** **R5**. Each Reliability Coordinator that Identifies an Emergency in its Reliability Coordinator Area shall develop an action plan to resolve the Emergency during those instances where impacted Reliability Coordinators disagree on the existence of an Emergency. **Proposed IRO-014-3, Requirement R6:** **R6.** Each impacted Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identifies the Emergency during those instances where Reliability Coordinators disagree on the existence of an Emergency, unless such actions would violate safety, equipment, regulatory, or statutory requirements.
R2. The Reliability Coordinator shall document (via operator logs or other data sources) its actions taken for either the event or for the disagreement on the problem(s) or for both.	This retirement of this Requirement was approved by FERC effective January 21, 2014 as part of the Paragraph 81 Project.

Standard PER-001-0.2 – Operating Personnel Responsibility and Authority	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Transmission Operator and Balancing Authority shall provide operating personnel with the responsibility and authority to implement real-time actions to ensure the stable and reliable operation of the Bulk Electric System	The SDT is proposing to retire this requirement. In FERC Order 693a, paragraph 112, the Commission clarifies that a Reliability Coordinator's authority to issue directives arises out of the Commission's approval of Reliability Standards that mandate compliance with such directives. The SDT reasonably applied this same logic to Transmission Operators and Balancing Authorities and that makes this requirement superfluous and thus it can be deleted. FERC Order 693a, paragraph 112: In response to Avista, the Commission clarifies that a reliability coordinator's authority to issue directives arises out of the Commission's approval of Reliability Standards that mandate compliance with such directives. Avista is correct that contracts are unnecessary to authorize reliability coordinators to issue directives. Under the voluntary reliability scheme in place prior to section 215 of the FPA, a contractual basis was needed to assure that entities would comply with a reliability coordinator's directive. Pursuant to the current, mandatory reliability scheme established by statute, contracts are no longer needed. We view the concerns raised by Avista as part of the transition from a voluntary to mandatory scheme. Although, as noted by Avista, IRO-001-1 retains references to contracts, we view these as vestiges of an earlier program that no longer control given the current, mandatory mechanism.

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Transmission Operator shall have the responsibility and clear decision-making authority to take whatever actions are needed to ensure the reliability of its area and shall exercise specific authority to alleviate operating emergencies.	This is a generic requirement that is no longer necessary since there are now specific requirements that cover all needed reliability actions. Deletion of this requirement doesn't alleviate responsibility for actions as each individual requirement in the Reliability Standards now specifies an action and a responsible entity. These needed actions required for reliability of the Bulk Power System have been more clearly laid out in revised standards. (See FERC Order 693a, paragraph 112.) The requirement is also non-specific, ambiguous, and not performance oriented. If an entity doesn't perform as specified in an individual requirement, then they are held accountable at that level. All of this makes this requirement redundant. The overall reliability of the Bulk Power System is not adversely affected by the deletion of this requirement. In FERC Order 693a, paragraph 112, the Commission clarifies that a Reliability Coordinator's authority to issue directives arises out of the Commission's approval of Reliability Standards that mandate compliance with such directives. The SDT believes that this same logic applies to Transmission Operators and Balancing Authorities, makes this requirement superfluous, and, thus, it can be deleted. FERC Order 693a, paragraph 112: "In response to Avista, the Commission clarifies that a reliability coordinator's authority to issue directives arises out of the Commission's approval of Reliability Standards that mandate compliance with such directives. Avista is correct that contracts are unnecessary to authorize reliability coordinators to issue directives. Under the voluntary reliability scheme in place prior to section 215 of the FPA, a contractual basis was needed to assure that entities would comply with a reliability coordinator's directive. Pursuant to the current, mandatory reliability scheme established by statute, contracts are no longer needed. We view the concerns raised by Avista as part of the transition from a voluntary to mandatory scheme. Although, as noted by Avista, IRO-001-1 retains references to contracts, we view these as vestiges of an earlier program that no longer control given the current, mandatory mechanism. The SDT does not believe that there is a need for a decision-making authority requirement as the decision-making authority is inherent in proposed TOP-001-4, Requirement R1 which states that the Transmission Operator must act or issue Operating Instructions.

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed TOP-001-3, Requirement R1: **R1.** Each Transmission Operator shall act to address the reliability of its Transmission Operator Area via direct actions or by issuing Operating Instructions.
R2. Each Transmission Operator shall take immediate actions to alleviate operating emergencies including curtailing transmission service or energy schedules, operating equipment (e.g., generators, phase shifters, breakers), shedding firm load, etc.	This requirement replaced by proposed TOP-001-3, Requirements R12 and R14. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall comply with reliability directives issued by the Reliability Coordinator, and each Balancing Authority and Generator Operator shall comply with reliability directives issued by the Transmission Operator, unless such actions would violate safety, equipment, regulatory or statutory requirements. Under these circumstances the Transmission Operator, Balancing Authority or Generator Operator shall immediately inform the Reliability Coordinator or Transmission Operator of the inability to perform the directive so that the Reliability Coordinator or Transmission Operator can implement alternate remedial actions.	This requirement replaced by proposed IRO-001-2, Requirements R2 and R3 and proposed TOP-001-3, Requirements R3 and R4. Proposed IRO-001-2, R2: **Proposed IRO-001-2, Requirement R2:** **R2.** Each Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, and Distribution Provider shall comply with its Reliability Coordinator's Operating Instructions unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements. **Proposed IRO-001-2, Requirement R3:** **R3.** Each Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, and Distribution Provider shall inform its Reliability Coordinator upon recognition of its inability to perform an Operating Instruction in accordance with Requirement R2. **Proposed TOP-001-3, Requirement R3:** **R3.** Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements.

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed TOP-001-3, Requirement R4: **R4.** Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Transmission Operator of its inability to perform an Operating Instruction issued by that Transmission Operator in Requirement R3.
R4. Each Distribution Provider and Load Serving Entity shall comply with all reliability directives issued by the Transmission Operator, including shedding firm load, unless such actions would violate safety, equipment, regulatory or statutory requirements. Under these circumstances, the Distribution Provider or Load Serving Entity shall immediately inform the Transmission Operator of the inability to perform the directive so that the Transmission Operator can implement alternate remedial actions.	This requirement replaced by proposed TOP-001-3, Requirements R3 and R4. **Proposed TOP-001-3, Requirements R3 and R4:** **R3.** Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. Proposed TOP-001-3, R4: **R4.** Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Transmission Operator of its inability to perform an Operating Instruction issued by that Transmission Operator in Requirement R3.
R5. Each Transmission Operator shall inform its Reliability Coordinator and any other potentially affected Transmission Operators of real time or anticipated emergency conditions, and take actions to avoid, when possible, or mitigate the emergency.	This requirement replaced by proposed TOP-001-3, Requirements R8, R12, and R14. **Proposed TOP-001-3, Requirement R8:** **R8**. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
R6. Each Transmission Operator, Balancing Authority, and Generator Operator shall render all available emergency	The Generator Operator was deleted from this requirement since it will only respond to such requests if they were in the form of an Operating Instruction from its Transmission Operator

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
assistance to others as requested, provided that the requesting entity has implemented its comparable emergency procedures, unless such actions would violate safety, equipment, or regulatory or statutory requirements.	or Balancing Authority which is covered in proposed TOP-001-3, Requirements R3, R4, R5 and R6. Assistance at the Transmission Operator level is provided through proposed TOP-001-3, Requirement R7. 'Emergency' deleted as the assistance is assistance in response to the other entities' emergency. Balancing Authorities provide assistance under approved EOP-001-2.1b, Requirement R1. **Approved EOP-001.2.1b, Requirement R1:** **R1.** Balancing Authorities shall have operating agreements with adjacent Balancing Authorities that shall, at a minimum, contain provisions for emergency assistance, including provisions to obtain emergency assistance from remote Balancing Authorities**.** **Proposed TOP-001-3, Requirement R3:** **R3.** Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. **Proposed TOP-001-3, Requirement R4:** R4. Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Transmission Operator of its inability to perform an Operating Instruction issued by that Transmission Operator in Requirement R3. **Proposed TOP-001-3, Requirement R5:** **R5.** Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Balancing Authority, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. **Proposed TOP-001-3, Requirement R6:** **R6.** Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Balancing Authority of its inability to perform an Operating Instruction issued by that Balancing Authority. **Proposed TOP-001-3, Requirement R7:**

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R7. Each Transmission Operator shall assist other Transmission Operators, if requested and available, provided that the requesting entity has implemented its emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements.
R7. Each Transmission Operator and Generator Operator shall not remove Bulk Electric System facilities from service if removing those facilities would burden neighboring systems unless: **R7.1** For a generator outage, the Generator Operator shall notify and coordinate with the Transmission Operator. The Transmission Operator shall notify the Reliability Coordinator and other affected Transmission Operators, and coordinate the impact of removing the Bulk Electric System facility. **R7.2** For a transmission facility, the Transmission Operator shall notify and coordinate with its Reliability Coordinator. The Transmission Operator shall notify other affected Transmission Operators, and coordinate the impact of removing the Bulk Electric System facility. **R7.3** When time does not permit such notifications and coordination, or when immediate action is required to prevent a hazard to the public, lengthy customer service interruption, or damage to facilities, the Generator Operator shall notify the Transmission Operator, and the Transmission Operator shall notify its Reliability Coordinator and adjacent Transmission Operators, at the earliest possible time.	The Generator Operator can't know if their actions will burden neighboring systems since they do not have reliability data. The Transmission Operator will know if the Generator Operator actions will burden neighboring systems and will receive this data through proposed TOP-003-3, Requirements R1 and R5 and is required to act on this information as per proposed TOP-001-3, Requirement R8. Proposed IRO-010-2, Requirements R1 and R3 handle the notifications from the Transmission Operator to the Reliability Coordinator. **Proposed TOP-001-3, Requirement R8**: **R8.** Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. **Proposed TOP-003-3, Requirement R1:** **R1**. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications … **Proposed IRO-010-2, Requirement R1:** **R1**. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed IRO-010-2, Requirement R3:**

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R3. Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications …
R8. During a system emergency, the Balancing Authority and Transmission Operator shall immediately take action to restore the Real and Reactive Power Balance. If the Balancing Authority or Transmission Operator is unable to restore Real and Reactive Power Balance it shall request emergency assistance from the Reliability Coordinator. If corrective action or emergency assistance is not adequate to mitigate the Real and Reactive Power Balance, then the Reliability Coordinator, Balancing Authority, and Transmission Operator shall implement firm load shedding.	First sentence – real power: For the Balancing Authority part of the requirement, replaced by approved EOP-002-2.1, Requirement R6. The Transmission Operator does not balance real power so that part of the sentence can be deleted per the NERC Functional Model V5. First sentence – reactive power: Replaced by approved VAR-001-4, Requirement R3 for the Transmission Operator which covers reactive power requirements and the meaning of balancing reactive power for the Transmission Operator. The Balancing Authority must be told by the Transmission Operator to take actions regarding reactive power per the NERC Functional Model V5 and therefore the Balancing Authority can be deleted from this part of the requirement. Second sentence – The Balancing Authority must be told by the Transmission Operator to take actions regarding reactive power and thus the Balancing Authority is not necessary. Replaced by approved VAR-001-4, Requirements R1 for the Transmission Operator. Third sentence – Replaced by approved IRO-009-1, Requirements R1 and R2 for the Reliability Coordinator. Replaced by approved EOP-003-2, Requirement R1 for the Transmission Operator and Balancing Authority. **Approved EOP-002-3.1, Requirement R6:** **R6**. If the Balancing Authority cannot comply with the Control Performance and Disturbance Control Standards, then it shall immediately implement remedies to do so. **Approved VAR-001-4, Requirement R1:** **R1.** Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits.

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Approved VAR-001-4, Requirement R3: **R3**. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary. **Approved IRO-009-1, Requirement R1:** **R1.** For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs. **Approved IRO-009-1, Requirement R2:** **R2.** For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's Tv. **Approved EOP-003-2, Requirement R1:** **R1.** After taking all other remedial steps, a Transmission Operator or Balancing Authority operating with insufficient generation or transmission capacity shall shed customer load rather than risk an uncontrolled failure of components or cascading outages of the Interconnection.

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Balancing Authority and Transmission Operator shall maintain a set of current plans that are designed to evaluate options and set procedures for reliable operation through a reasonable future time period. In addition, each Balancing Authority and Transmission Operator shall be responsible for using available personnel and system equipment to implement these plans to ensure that interconnected system reliability will be maintained.	First sentence, retained for Balancing Authority and Transmission Operator and moved to proposed TOP-002-4, Requirements R2 and R4. Second sentence – Replaced by proposed TOP-001-3, Requirements R1 and R2 for Balancing Authority and Transmission Operator, which requires action to resolve issues. **Proposed TOP-002-4, Requirement R2:** **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. **Proposed TOP-002-4, Requirement R4:** **R4.** Each Balancing Authority shall have an Operating Plan(s) for the next-day … **Proposed TOP-001-3, Requirement R1:** **R1.** Each Transmission Operator shall act to address the reliability of its Transmission Operator Area via direct actions or by issuing Operating Instructions. **Proposed TOP-001-3, Requirement R2:** **R2.** Each Balancing Authority shall act to address the reliability of its Balancing Authority Area via direct actions or by issuing Operating Instructions.
R2. Each Balancing Authority and Transmission Operator shall ensure its operating personnel participate in the system planning and design study processes, so that these studies contain the operating personnel perspective and system operating personnel are aware of the planning purpose.	The SDT is proposing to retire this requirement. While it may be good utility practice to do this, it is of marginal benefit to reliability and is more of a 'how' to conduct business as opposed to a definitive 'what' to do.
R3. Each Load Serving Entity and Generator Operator shall coordinate (where confidentiality agreements allow) its current-day, next-day, and seasonal operations with its Host Balancing Authority and Transmission Service Provider. Each Balancing Authority and Transmission Service Provider shall coordinate its current-day, next-day, and seasonal operations with its Transmission Operator.	The Transmission Operator and Balancing Authority will receive the necessary data in proposed TOP-003-3, Requirement R5. The Transmission Service Provider provisions are covered in approved MOD-001-1a, Requirement R1; approved MOD-030-2, Requirement R3; and approved MOD-001-1a, Requirement R2. The coordination of plans is in proposed IRO-017-1, Requirement R2. **Proposed TOP-003-3, Requirement R5:**

<table>

Approved MOD-001-1a, Requirement R1:
R1. Each Transmission Operator shall select one of the methodologies1 listed below for calculating Available Transfer Capability (ATC) or Available Flowgate Capability (AFC) for each ATC Path per time period identified in R2 for those Facilities within its Transmission operating area.

Approved MOD-030-2, Requirement R3:
R3. The Transmission Operator shall make available to the Transmission Service Provider a Transmission model to determine Available Flowgate Capability (AFC) that …

Approved MOD-001-1a, Requirement R2:
R2. Each Transmission Service Provider shall calculate ATC or AFC values as listed below using the methodology or methodologies selected by its Transmission Operator(s).

Proposed IRO-017-1, Requirement R2:
R2. Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator’s outage coordination process.</td></tr>
<tr><td>R4. Each Balancing Authority and Transmission Operator shall coordinate (where confidentiality agreements allow) its current-day, next-day, and seasonal planning and operations with neighboring Balancing Authorities and Transmission Operators and with its Reliability Coordinator, so that normal Interconnection operation will proceed in an orderly and consistent manner.</td><td>Coordination of plans is covered in proposed IRO-017-1, Requirement R2 and proposed IRO-008-2, Requirement R2.

Proposed IRO-017-1, Requirement R2:
R2. Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator’s outage coordination process.

Proposed iRO-008-2, Requirement R2:
R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.</td></tr>
</table>

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R5. Each Balancing Authority and Transmission Operator shall plan to meet scheduled system configuration, generation dispatch, interchange scheduling and demand patterns.	This requirement has been moved to proposed TOP-002-4, Requirements R2 and R4. **Proposed TOP-002-4, Requirement R2:** **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. **Proposed TOP-002-4, Requirement R4:** **R4.** Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: **4.1** Expected generation resource commitment and dispatch. **4.2** Interchange scheduling **4.3** Demand patterns **4.4** Capacity and energy reserve requirements, including deliverability capability
R6. Each Balancing Authority and Transmission Operator shall plan to meet unscheduled changes in system configuration and generation dispatch (at a minimum N-1 Contingency planning) in accordance with NERC, Regional Reliability Organization, subregional, and local reliability requirements.	The part of the requirement dealing with the Balancing Authority and Transmission Operator is replaced by proposed TOP-002-4, Requirements R2 and R4. The n-1 Contingency planning is 'built in' to the Operational Planning Analysis since SOLs are derived according to the approved FAC standards which include Contingency planning. In addition, the definition of Operational Planning Analysis has been revised to better show the intent of the Contingency aspects of the analysis. The SDT does not believe that there is a need to replace the last part of the sentence 'in accordance with…' with the advent of the ERO and enforceable reliability standards. **Proposed TOP-002-4, Requirement R2:** **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. **Proposed TOP-002-4, Requirement R4:**

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch. 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed definition: Operational Planning Analysis** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
R7. Each Balancing Authority shall plan to meet capacity and energy reserve requirements, including the deliverability/capability for any single Contingency.	This requirement is replaced by proposed TOP-002-4, Requirement R4. **Proposed TOP-002-4, Requirement R4:** **R4.** Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: **4.1** Expected generation resource commitment and dispatch. **4.2** Interchange scheduling **4.3** Demand patterns **4.4** Capacity and energy reserve requirements, including deliverability capability
R8. Each Balancing Authority shall plan to meet voltage and/or reactive limits, including the deliverability/capability for any single contingency.	Voltage and reactive power balance are the responsibility of the Transmission Operator and are replaced by approved VAR-001-4, Requirement R1. Deliverability by the Balancing Authority is covered by proposed TOP-002-4, Requirement R4. **Approved VAR-001-4, Requirement R1:** **R1.** Each Transmission Operator shall specify a system voltage schedule (which is either a range or a

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits. **Proposed TOP-002-4, Requirement R4:** R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: **4.1** Expected generation resource commitment and dispatch. **4.2** Interchange scheduling **4.3** Demand patterns **4.4** Capacity and energy reserve requirements, including deliverability capability
R9. Each Balancing Authority shall plan to meet Interchange Schedules and ramps.	This requirement is replaced by approved INT-006-4, Requirement R5, and proposed TOP-002-4, Requirement R4. **Approved INT-006-4, Requirement R5:** **R5**. For each Arranged Interchange that is transitioned to Confirmed Interchange, the Sink Balancing Authority shall notify the following entities of the on-time Confirmed Interchange such that the notification is delivered in time to be incorporated into scheduling systems prior to ramp start as specified in Attachment 1, Column D: **Proposed TOP-002-4, Requirement R4:** **R4.** Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: **4.1** Expected generation resource commitment and dispatch. **4.2** Interchange scheduling **4.3** Demand patterns **4.4** Capacity and energy reserve requirements, including deliverability capability
R10. Each Balancing Authority and Transmission Operator shall plan to meet all System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs).	Balancing Authority - The Balancing Authority is only responsible to respond to Operating Instructions as per the definition of Balancing Authority in the NERC Glossary and, thus, consistent with the Commission-approved interpretation of Requirement R10, Balancing

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Authorities have been removed from the applicability of this requirement. SOLs and IROLs are limits which the Balancing Authority may not have (and is not required to have) the ability to monitor or control. The Transmission Operator, who is required to monitor SOLs, instructs the Balancing Authority as to what to do in these situations. As stated in the NERC Functional Model V5, "the Balancing Authority's mission is to maintain the balance between loads and resources in real time within its Balancing Authority Area by keeping its actual interchange equal to its scheduled interchange and meeting its frequency bias obligation". The Balancing Authority does not possess the Bulk Power System information necessary to manage Transmission flows. Therefore, the Balancing Authority can only plan to meet SOLs and IROLs by responding to directions (as shown in proposed TOP-001-3, Requirement R3) from the Transmission Operator, including scheduling and operating resources within the limits prescribed by the Transmission Operator. The Balancing Authority must coordinate outage information and exchange data required to allow the Transmission Operator to deal with SOLs. Those items are in proposed IRO-017-1, Requirement R2 and proposed TOP-003-3, Requirement R5. That information is considered by the Transmission Operator when formulating its Operating Plans and since IROLs are a sub-set of SOLs, this is covered in proposed TOP-002-4, requirement R2. **Proposed TOP-001-3, Requirement R3:** **R3.** Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. **Proposed IRO-017-1, Requirement R2:** **R2.** Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator's outage coordination process. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications **Proposed TOP-002-4, Requirement R2:** **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.
R11. The Transmission Operator shall perform seasonal, next-day, and current-day Bulk Electric System studies to determine SOLs. Neighboring Transmission Operators shall utilize identical SOLs for common facilities. The Transmission Operator shall update these Bulk Electric System studies as necessary to reflect current system conditions; and shall make the results of Bulk Electric System studies available to the Transmission Operators, Balancing Authorities (subject confidentiality requirements), and to its Reliability Coordinator.	First sentence replaced by proposed TOP-002-4, Requirement R1, proposed TOP-001-3, Requirement R13. Specific requirements for seasonal studies are not necessary as proposed IRO-017-1 allows for the Reliability Coordinator to determine the timeframe of the studies that it needs. Second sentence – SOLs are set by the Transmission Operator in approved FAC-014-2, Requirement R2 according to the methodology distributed by the Reliability Coordinator in approved FAC-011-2, Requirement R4, Part 4.3. This should assure that SOLs are consistent for common facilities. Third sentence – Replaced by proposed TOP-001-3, Requirement R13 and proposed TOP-001-3, Requirement R8. **Proposed TOP-002-4, Requirement R1:** **R1**. Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed TOP-001-3, Requirement R13:** **R13**. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Approved FAC-014-2, Requirement R2:**

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R2. The Transmission Operator shall establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology. **Approved FAC-011-2, Requirement R4:** **R4.** The Reliability Coordinator shall issue its SOL Methodology and any changes to that methodology, prior to the effectiveness of the Methodology or of a change to the Methodology, to all of the following: 4.3 Each Transmission Operator that operates in the Reliability Coordinator Area. **Proposed TOP-001-3, Requirement R8:** **R8**. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency.
R12. The Transmission Service Provider shall include known SOLs or IROLs within its area and neighboring areas in the determination of transfer capabilities, in accordance with filed tariffs and/or regional Total Transfer Capability and Available Transfer Capability calculation processes.	Replaced by approved MOD-028-2, Requirement R6.1; approved MOD-029-1a, Requirement R3; and approved MOD-030-2, Requirement R2.4. Because IROLs by definition are a subset of SOLs, IROLs are included. **Approved MOD-028-2, Requirement R6.1:** **6.1** Determine the incremental Transfer Capability for each ATC Path by increasing generation and/or decreasing load within the source Balancing Authority area and decreasing generation and/or increasing load within the sink Balancing Authority area until either: • A System Operating Limit is reached on the Transmission Service Provider's system, or • A SOL is reached on any other adjacent system in the Transmission model that is not on the study path and the distribution factor is 5% or greater. **Approved MOD-029-1a, Requirement R3:** **R3.** Each Transmission Operator shall establish the TTC at the lesser of the value calculated in R2 or any System Operating Limit (SOL) for that ATC Path. **Approved MOD-030-2, Requirement R2.4:**

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	2.4 Establish the TFC of each of the defined Flowgates as equal to: - For thermal limits, the System Operating Limit (SOL) of the Flowgate. - For voltage or stability limits, the flow that will respect the SOL of the Flowgate.
R13. At the request of the Balancing Authority or Transmission Operator, a Generator Operator shall perform generating real and reactive capability verification that shall include, among other variables, weather, ambient air and water conditions, and fuel quality and quantity, and provide the results to the Balancing Authority or Transmission Operator operating personnel as requested.	This requirement is replaced by proposed TOP-001-3, Requirement R2 where a Balancing Authority can issue Operating instructions to the Generator Operator which could include verification. The SDT believes that this requirement does not apply to the Transmission Operator since it is dealing exclusively with generation. The data coming back from the verification effort would be included in the Balancing Authority data specification as shown in proposed TOP-003-3, Requirements R2 and R5. **Proposed TOP-001-3, Requirement R2:** **R2.** Each Balancing Authority shall act, or direct others to act by issuing Operating Instructions, to ensure the reliability of its Balancing Authority Area. **Proposed TOP-003-3, Requirement R2:** **R2.** Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications.
R14. Generator Operators shall, without any intentional time delay, notify their Balancing Authority and Transmission Operator of changes in capabilities and characteristics including but not limited to: **14.1** Changes in real and reactive output capabilities. (Retired August 1, 2007)	This requirement is replaced by proposed TOP-003-3, Requirement R5. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications …

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
14.2 Changes in real output capabilities(Effective August 1, 2007) **14.3** Automatic Voltage Regulator status and mode setting. (Retired August 1, 2007)	
R15. Generation Operators shall, at the request of the Balancing Authority or Transmission Operator, provide a forecast of expected real power output to assist in operations planning (e.g., a seven-day forecast of real output).	This requirement is replaced by proposed TOP-003-3, Requirement R5. **Proposed TOP-003-3, Requirement R5:** **R5**. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications.
R16. Subject to standards of conduct and confidentiality agreements, Transmission Operators shall, without any intentional time delay, notify their Reliability Coordinator and Balancing Authority of changes in capabilities and characteristics including but not limited to: **16.1** - Changes in transmission facility status. **16.2** - Changes in transmission facility rating	This requirement replaced by proposed IRO-010-2, Requirement R3. **Proposed IRO-010-2, Requirement R3:** **R3**. Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications
R17. Balancing Authorities and Transmission Operators shall, without any intentional time delay, communicate the information described in the requirements R1 to R16 above to their Reliability Coordinator.	This requirement replaced by proposed IRO-010-2, Requirement R3. **Proposed IRO-010-2, Requirement R3:** **R3.** Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications using:
R18. Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use uniform line identifiers when referring to transmission facilities of an interconnected network.	This requirement is proposed for retirement as it adds no reliability benefit. Entities have existing processes that handle this issue. There has never been a documented case of the lack of uniform line identifiers contributing to a system reliability issue. This is an administrative item as seen in the measure which simply requires a list of line identifiers. The true reliability issue is not the name of a line but what is happening to it, pointing out the

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	difficulty in assigning compliance responsibility for such a requirement, as well as the near impossibility of coming up with truly unique identifiers on a nation-wide basis. The bottom line is that this situation is handled by the operators as part of their normal responsibilities and no one is aware of a switching error caused by confusion over line identifiers.
R19. Each Balancing Authority and Transmission Operator shall maintain accurate computer models utilized for analyzing and planning system operations.	Accuracy is a relative term that would be difficult to objectively measure and assess compliance with. Proposed TOP-003-3, Requirement R1 stipulates that entities must supply the data needed for reliability. The expectation is that the Transmission Operator would specify the data it requires to perform its functions which would include all of the data it needs to create the model for its analyses and studies. The requirement language allows the entity to specify accuracy of the data provided as part of its data specification. This will, in turn, lead to the creation of an accurate model based on accurate data received. In addition, proposed TOP-003-3, Requirement R5, Part 5.2 allows for the resolution of any data causing conflicts that could affect the models. **Proposed TOP-003-3, Requirement R1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **Proposed TOP-003-3, Requirement R5, Part 5.2:** **5.2** A mutually agreeable process for resolving data conflicts

Standard TOP-003-1 — Planned Outage Coordination	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Generator Operators and Transmission Operators shall provide planned outage information. **1.1** Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements. **1.2** Each Transmission Operator shall provide outage information daily to its Reliability Coordinator, and to affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. The Reliability Coordinator shall establish the outage reporting requirements. **1.3** Such information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.	Parts 1.1, 1.2, and 1.3 are addressed as follows: **1.1** Generator Operators will provide planned outage information to Transmission Operators through proposed TOP-003-3, Requirement R5. Reporting requirements are set in proposed TOP-003-3, Requirement R1. **1.2** Transmission Operators will provide planned outage information to Reliability Coordinators through proposed IRO-010-2, Requirement R3. Reporting requirements are set in proposed IRO-010-2, Requirement R1. **1.3** Reporting requirements are set in proposed TOP-003-3, Requirement R1 and proposed IRO-010-2, Requirement R1. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications … **Proposed TOP-003-3, Requirement R1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification … **Proposed IRO-010-2, Requirement R3:** **R3.** Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications. **Proposed IRO-010-2, Requirement R1:** **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

<table>
<tr><th colspan="2">Standard TOP-003-1 — Planned Outage Coordination</th></tr>
<tr><th>Requirement in Approved Standard</th><th>Proposed Language in New Standard or Comment</th></tr>
<tr><td>R2. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators as required.</td><td>Generator Operators will provide planned outage information to Transmission Operators and Balancing Authorities through proposed TOP-003-3, Requirement R5. Reporting requirements are set in proposed TOP-003-3, Requirement R1. Transmission Operators and Balancing Authorities coordinate outages through proposed IRO-017-1, Requirement R2.

Proposed TOP-003-3, Requirement R5:

R5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications …

Proposed TOP-003-3, Requirement R1:

R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification …

Proposed IRO-017-1, Requirement R2:

R2. Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator's outage coordination process.</td></tr>
<tr><td>R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.</td><td>This requirement is replaced by proposed TOP-001-3, Requirement R9. The data specification concept in proposed TOP-003-3 requires entities to provide data as requested. If there are outages of the equipment needed for providing that data, the entity experiencing the outage must notify the entity it is sending data to so that proper arrangements can be made for replacing the data or coming up with a plan to live without it. It is expected that the data specifications would incorporate such concepts.

Proposed TOP-001-3, Requirement R9:
R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected entities of sustained outages of telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities.</td></tr>
</table>

Standard TOP-003-1 — Planned Outage Coordination	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R4. Each Reliability Coordinator shall resolve any scheduling of potential reliability conflicts.	This requirement is replaced by proposed IRO-008-2, Requirement R2 and proposed IRO-017-1, Requirement R1, Part 1.4. **Proposed IRO-017-1, Requirement R1, Part 1.4**: **1.4** Define the process to coordinate the resolution of identified outage conflicts with its Transmission Operators and Balancing Authorities, and other Reliability Coordinators **Proposed IRO-008-2, Requirement R2:** **R2.** Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Transmission Operator shall operate within the Interconnection Reliability Operating Limits (IROLs) and System Operating Limits (SOLs).	This requirement has been replaced by proposed TOP-001-3, Requirements R12 and R14. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14**. Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
R2. Each Transmission Operator shall operate so that instability, uncontrolled separation, or cascading outages will not occur as a result of the most severe single contingency.	The SDT has revised the definitions of Operational Planning Analysis and Real-time Assessment to address all Contingencies, not just the single most severe Contingency and operations follow suit as shown in proposed TOP-001-3, Requirement R14 and proposed TOP-002-4, Requirement R2.

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed definition: **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed definition:** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Proposed TOP-002-4, Requirement R2:** **R2**. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.
R3. Each Transmission Operator shall operate to protect against instability, uncontrolled separation, or cascading outages resulting from multiple outages, as specified by its Reliability Coordinator.	This requirement is replaced by proposed TOP-001-3, Requirements R12 and R14. These requirements are not limited by single or multiple Contingencies. Approved FAC-011-2 and FAC-014-2 work collectively to establish how multiple Contingencies are considered in IROLs and SOLs. Approved FAC-014-2, Requirement R6 requires the Planning Coordinator to identify the subset of multiple Contingencies and to provide this list to the Reliability

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Coordinators. Approved FAC-011-2, Requirement R3.3 requires the Reliability Coordinator to include in its SOL methodology a process for determining which of the Stability limits associated with multiple Contingencies are used to establish SOLs. Approved FAC-014-2, Requirement R1 requires the Reliability Coordinator to determine which subset of SOLs qualify as IROLS. Approved FAC-014-2, Requirement R1 also requires the Reliability Coordinator to ensure SOLs, including IROLs, are established for its Reliability Coordinator Area while approved FAC-014-2, Requirement R2 also requires the Transmission Operator to establish SOLs for its area. Thus, IROLs and SOLs that consider multiple outages will be developed appropriately and the Transmission Operator will operate to them. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Approved FAC-011-2, Requirement R1:** **R1**. The Reliability Coordinator shall have a documented methodology for use in developing SOLs (SOL Methodology) within its Reliability Coordinator Area. This SOL Methodology shall: **R1.1**. Be applicable for developing SOLs used in the planning horizon **R1.2.** State that SOLs shall not exceed associated Facility Ratings. **R1.3.** Include a description of how to identify the subset of SOLs that qualify as IROLs. **Approved FAC-011-2, Requirement R3:** **R3.** The Reliability Coordinator's methodology for determining SOLs, shall include, as a minimum, a description of the following, along with any reliability margins applied for each: **R3.3**. A process for determining which of the stability limits associated with the list of multiple contingencies (provided by the Planning Authority in accordance with

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	FAC-014 Requirement 6) are applicable for use in the operating horizon given the actual or expected system conditions. **R3.3.1**. This process shall address the need to modify these limits, to modify the list of limits, and to modify the list of associated multiple contingencies. **Approved FAC-014-2, Requirement R1:** **R1.**The Reliability Coordinator shall ensure that SOLs, including Interconnection Reliability Operating Limits (IROLs), for its Reliability Coordinator Area are established and that the SOLs (including Interconnection Reliability Operating Limits) are consistent with its SOL Methodology. **Approved FAC-014-2, Requirement R2:** **R2.** The Transmission Operator shall establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology. **Approved FAC-014-2, Requirement R6:** **R6.** The Planning Authority shall identify the subset of multiple contingencies (if any), from Reliability Standard TPL-003 which result in stability limits. **R6.1.** The Planning Authority shall provide this list of multiple contingencies and the associated stability limits to the Reliability Coordinators that monitor the facilities associated with these contingencies and limits. **R6.2.** If the Planning Authority does not identify any stability related multiple contingencies, the Planning Authority shall so notify the Reliability Coordinator.
R4. If a Transmission Operator enters an unknown operating state (i.e., any state for which valid operating limits have not been determined), it will be considered to be in an emergency and shall restore operations to respect proven reliable power system limits within 30 minutes.	The SDT believes that given the revised definitions for Operational Planning Analysis and Real-time Assessment, as well as the new requirement for TOPs to update their OPA results through the performance of a Real-time Assessment every 30 minutes, that entities will always be operating to valid operating limits. Therefore, this requirement is replaced by proposed TOP-001-3, Requirements R12, R13, and R14 along with the revised definitions of Operational Planning Analysis and Real-time Assessment. This allows the operator sufficient flexibility within a structured environment to take the necessary actions for the reliability of the Bulk Power System.

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed TOP-001-3, Requirement R12: **R12**. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R13:** **R13**. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Proposed definition:** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition:** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)
R5. Each Transmission Operator shall make every effort to remain connected to the Interconnection. If the Transmission Operator determines that by remaining interconnected, it is in imminent danger of violating an IROL or SOL, the Transmission	Normally, the Transmission Operator does not have the right to unilaterally separate – that can only be done through the authorization of the Reliability Coordinator, unless failure to act immediately would violate safety, equipment, or regulatory or statutory requirements, thus this requirement is proposed for retirement by the SDT. In the Functional Model v5, the

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
Operator may take such actions, as it deems necessary, to protect its area.	Transmission Operator responsibilities and duties are clearly spelled out. Item 14 states that a Transmission Operator sheds load under the auspices of the Reliability Coordinator. Functional model v5: 14. Coordinates load shedding with, or as directed by, the Reliability Coordinator
R6. Transmission Operators, individually and jointly with other Transmission Operators, shall develop, maintain, and implement formal policies and procedures to provide for transmission reliability. These policies and procedures shall address the execution and coordination of activities that impact inter- and intra-Regional reliability, including: **6.1** Monitoring and controlling voltage levels and real and reactive power flows. **6.2** Switching transmission elements. **6.3** Planned outages of transmission elements. **6.4** Responding to IROL and SOL violations.	The first sentence has been superseded by the NERC Reliability Standards taken as a whole and is proposed to be retired. The second sentence was replaced as follows: **R6.1** is duplicative of approved VAR-001-4, Requirement R1 for reactive power. Real power flows are covered in proposed TOP-001-3, Requirements R10, R12 and R14. **R6.2** has been replaced by proposed TOP-001-3, Requirement R8. **R6.3** has been replaced by proposed IRO-017-1, Requirement R2. **R6.4** has been replaced by proposed TOP-001-3, Requirements R12 and R14. **Approved VAR-001-4, Requirement R1:** **R1.** Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits. **Proposed TOP-001-3, Requirement R8:** **R8**. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. **Proposed TOP-001-3, Requirement R10:** **R10.** Each Transmission Operator shall monitor the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: R1.1. Within its Transmission Operator Area:

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R1.1.1. Facilities, **R1.1.2.** The status of Special Protection Systems, and **R1.1.3.** Non-BES facilities identified as necessary by the Transmission Operator and R1.2. Within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator: **R1.2.1.** Facilities, **R1.2.2.** Status of Special Protection Systems, and **R1.2.3.** Non-BES facilities. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Proposed IRO-017-1, Requirement R2:** **R2.** Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator's outage coordination process.

Standard TOP-005-2a — Operational Reliability Information	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. As a condition of receiving data from the Interregional Security Network (ISN), each ISN data recipient shall sign the NERC Confidentiality Agreement for "Electric System Reliability Data."	Recognizing security concerns, the SDT has added security protocols to proposed IRO-010-2, Requirement R3, Part 3.3 and to proposed TOP-003-3, Requirement R5, Part 5.3 to address overall security concerns. **Proposed IRO-010-2, Requirement R3, Part 3.3:** **3.3** A mutually agreeable security protocol **Proposed TOP-003-3, Requirement R5, Part 5.3:** **5.3** A mutually agreeable security protocol.
R2. Upon request, each Balancing Authority and Transmission Operator shall provide to other Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability, the operating data that are necessary to allow these Balancing Authorities and Transmission Operators to perform operational reliability assessments and to coordinate reliable operations. Balancing Authorities and Transmission Operators shall provide the types of data as listed in Attachment 1-TOP-005-2a "Electric System Reliability Data," unless otherwise agreed to by the Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability.	This requirement replaced by proposed TOP-003-3, Requirement R1, R2, and R5. **Proposed TOP-003-3, Requirement R1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed TOP-003-3, Requirement R2:** **R2**. Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications.
R3. Each Purchasing-Selling Entity shall provide information as requested by its Host Balancing Authorities and Transmission Operators to enable them to conduct operational reliability assessments and coordinate reliable operations.	Deleted as redundant to NAESB standards – All operating data that a Purchasing-Selling Entity has that a Transmission Operator or Balancing Authority needs is part of eTag and is acquired through that system.

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use. **1.1** - Each Generator Operator shall inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use. **1.2** - Each Transmission Operator shall inform the Reliability Coordinator and other affected Transmission Operators of all transmission resources available for use. **1.3 -** Each Balancing Authority shall inform its Reliability Coordinator of all generation resources available for use.	The main body of the requirement is replaced by proposed TOP-001-3, Requirements R10 and R11. **1.1** This Part is replaced by proposed TOP-003-3, Requirement R5. **1.2** This Part is replaced by proposed IRO-101-2, Requirement R3. **1.3** This Part is replaced by proposed IRO-010-2, Requirement R3. **Proposed TOP-001-3, Requirement R10:** **R10.** Each Transmission Operator shall monitor the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: R1.1. Within its Transmission Operator Area: **R1.1.1.** Facilities, **R1.1.2.** The status of Special Protection Systems, and **R1.1.3.** Non-BES facilities identified as necessary by the Transmission Operator and R1.2. Within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator: **R1.2.1.** Facilities, **R1.2.2.** Status of Special Protection Systems, and **R1.2.3.** Non-BES facilities. **Proposed TOP-001-3, Requirement R11:** **R11.** Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order for it to be able to perform its reliability functions. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications. **Proposed IRO-010-2, Requirement R3:** **R3.** Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications.
R2. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources.	This requirement is replaced by proposed IRO-002-4, Requirement R3, proposed TOP-001-3, Requirement R10, and proposed TOP-001-3, R11. The requirements mandate that any Facility needed for an entity to perform its reliability-based functions must be monitored. This would include load-tap changers, rotating and static reactive resources, etc. **Proposed IRO-002-4, Requirement R3:** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed TOP-001-3, Requirement R10:** **R10.** Each Transmission Operator shall monitor the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: R1.1. Within its Transmission Operator Area: **R1.1.1.** Facilities, **R1.1.2.** The status of Special Protection Systems, and **R1.1.3.** Non-BES facilities identified as necessary by the Transmission Operator and R1.2. Within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator:

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R1.2.1. Facilities, **R1.2.2.** Status of Special Protection Systems, and **R1.2.3.** Non-BES facilities. **Proposed TOP-001-3, Requirement R11:** **R11.** Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order for it to be able to perform its reliability functions.
R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall provide its operating personnel with appropriate technical information concerning protective relays within the Reliability Coordinator Area, the Transmission Operator Area, and the Balancing Authority Area, respectively.	This requirement replaced by proposed IRO-010-2, Requirement R1, Part 1.2; proposed TOP-003-3, Requirement R1, Part 1.2; and proposed TOP-003-3, Requirement R2, Part 2.2.; and the proposed changes to the definitions of Operational Planning Analysis and Real-time Assessment. **Proposed definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed IRO-010-2, Requirement R1, Part 1.2: **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: **1.2** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **Proposed TOP-003-3, Requirement R1, Part 1.2:** **R 1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **1.2** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **Proposed TOP-003-3, Requirement R2, Part 2.2:** **R2**. Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. The data specification shall include, but not be limited to: **2.2** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.
R4. Each Transmission Operator, and Balancing Authority shall have information, including weather forecasts and past load patterns, available to predict the system's near-term load pattern.	This requirement replaced by proposed TOP-003-3, Requirement R1 and R2 with regard to load patterns. Weather forecasts are a necessary element for load forecasts which are required for Operational Planning Analysis. Therefore, this requirement can be retired. **Proposed TOP-003-3, Requirement R1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed TOP-003-3, Requirement R2:** **R2.** Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring.

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed definition: **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
R5. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use monitoring equipment to bring to the attention of operating personnel important deviations in operating conditions and to indicate, if appropriate, the need for corrective action.	This requirement replaced by proposed TOP-001-3, Requirements R10 and R11, and proposed IRO-002-4, Requirement R3. **Proposed TOP-001-3, Requirement R10:** **R10.** Each Transmission Operator shall monitor the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: R1.1. Within its Transmission Operator Area: **R1.1.1.** Facilities, **R1.1.2.** The status of Special Protection Systems, and **R1.1.3.** Non-BES facilities identified as necessary by the Transmission Operator and R1.2. Within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator: **R1.2.1.** Facilities, **R1.2.2.** Status of Special Protection Systems, and **R1.2.3.** Non-BES facilities. **Proposed TOP-001-3, Requirement R11:** **R11.** Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order for it to be able to perform its reliability functions.

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed IRO-002-4, Requirement R3: **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
R6. Each Balancing Authority and Transmission Operator shall use sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions under both normal and emergency situations.	The requirement is replaced by proposed TOP-003-3, Requirements R1 and R2 which state that data specifications can include, but are not limited to the 4 criteria listed. This allows for an entity to create specifications that would include items such as range of metering, accuracy, etc. **Proposed TOP-003-3, Requirement R1:** **R1**. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **Proposed TOP-003-3, Requirement R2:** **R2**. Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. The data specification shall include, but not be limited to:
R7. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor system frequency.	This requirement is replaced by proposed IRO-002-4, Requirement R3, and proposed TOP-001-3, Requirements R10 and R11. **Proposed IRO-002-4, Requirement R3**: **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed TOP-001-3, Requirement R10: **R10.** Each Transmission Operator shall monitor the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: R1.1. Within its Transmission Operator Area: **R1.1.1.** Facilities, **R1.1.2.** The status of Special Protection Systems, and **R1.1.3.** Non-BES facilities identified as necessary by the Transmission Operator and R1.2. Within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator: **R1.2.1.** Facilities, **R1.2.2.** Status of Special Protection Systems, and **R1.2.3.** Non-BES facilities. **Proposed TOP-001-3, Requirement R11:** **R11.** Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order for it to be able to perform its reliability functions.

Standard TOP-007-0 - Reporting System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) Violations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. A Transmission Operator shall inform its Reliability Coordinator when an IROL or SOL has been exceeded and the actions being taken to return the system to within limits.	This requirement is replaced by proposed TOP-001-3, Requirement R15. The Reliability Coordinator has the primary responsibility for IROLs and will be in communication with Transmission Operators to mitigate the situation. This is shown in proposed IRO-008-2, Requirements R5 and R6. **Proposed TOP-001-3, Requirement R15:** **R15.** Each Transmission Operator shall inform its Reliability Coordinator of actions taken to return the system to within limits when a SOL has been exceeded.

Standard TOP-007-0 - Reporting System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) Violations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed IRO-008-2, Requirement R5: **R5.** Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area. **Proposed IRO-008-2, Requirement R6:** **R6.** Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R5 has been prevented or mitigated.
R2. Following a Contingency or other event that results in an IROL violation, the Transmission Operator shall return its transmission system to within IROL as soon as possible, but not longer than 30 minutes.	This requirement is replaced by proposed TOP-001-3, Requirement R12 and approved IRO-009-1, Requirement R4. **Approved IRO-009-1, Requirement R4:** **R4.** When actual system conditions show that there is an instance of exceeding an IROL in its Reliability Coordinator Area, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's Tv. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v.
R3. A Transmission Operator shall take all appropriate actions up to and including shedding firm load, or directing the shedding of firm load, in order to comply with Requirement R2.	This requirement replaced by approved EOP-003-2, Requirement R1 and approved IRO-009-1, Requirement R4. **Approved IRO-=009-1, Requirement R4:** **R4**. When actual system conditions show that there is an instance of exceeding an IROL in

Standard TOP-007-0 - Reporting System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) Violations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	its Reliability Coordinator Area, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's Tv. **Approved EOP-003-2, Requirement R1:** **R1**. After taking all other remedial steps, a Transmission Operator or Balancing Authority operating with insufficient generation or transmission capacity shall shed customer load rather than risk an uncontrolled failure of components or cascading outages of the Interconnection.
R4. The Reliability Coordinator shall evaluate actions taken to address an IROL or SOL violation and, if the actions taken are not appropriate or sufficient, direct actions required to return the system to within limits.	This requirement replaced by proposed IRO-008-2, Requirement R6. **Proposed IRO-008-2, Requirement R6:** **R6**. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R5 has been prevented or mitigated.

Standard TOP-008-1 - Response to Transmission Limit Violations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. The Transmission Operator experiencing or contributing to an IROL or SOL violation shall take immediate steps to relieve the condition, which may include shedding firm load.	This requirement replaced by approved EOP-003-1, Requirement R1 and proposed TOP-001-3, Requirements R12 and R14. **Approved EOP-003-2, Requirement R1:** **R1.** After taking all other remedial steps, a Transmission Operator or Balancing Authority operating with insufficient generation or transmission capacity shall shed customer load rather than risk an uncontrolled failure of components or cascading outages of the Interconnection. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
R2. Each Transmission Operator shall operate to prevent the likelihood that a disturbance, action, or inaction will result in an IROL or SOL violation in its area or another area of the Interconnection. In instances where there is a difference in derived operating limits, the Transmission Operator shall always operate the Bulk Electric System to the most limiting parameter.	First sentence – Replaced by proposed TOP-001-3, Requirements R12 and R14. Second sentence – Replaced by proposed TOP-001-3, Requirement R18. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Proposed TOP-001-3, Requirement R18:** **R18**. Each Transmission Operator shall operate to the most limiting parameter in instances where there is a difference in SOLs.
R3. The Transmission Operator shall disconnect the affected facility if the overload on a transmission facility or abnormal voltage or reactive condition persists and equipment is endangered. In doing so, the Transmission Operator shall	First sentence - Placing this procedure in a requirement when it is only one of the possible options for alleviating the condition is bad practice and should not be mandated in standards. A standard should not be mandating disconnection. This is in conflict with other Reliability Standards where disconnection is dependent on System conditions and coordination with

Standard TOP-008-1 - Response to Transmission Limit Violations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
notify its Reliability Coordinator and all neighboring Transmission Operators impacted by the disconnection prior to switching, if time permits, otherwise, immediately thereafter.	other functional entities. Such actions, taken unilaterally, could make conditions worse. Therefore, the SDT is proposing to retire this requirement. Second sentence – In general, notification is replaced by proposed TOP-001-3, Requirement R8. **Proposed TOP-001-3, Requirement R8:** **R8**. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency.
R4. The Transmission Operator shall have sufficient information and analysis tools to determine the cause(s) of SOL violations. This analysis shall be conducted in all operating timeframes. The Transmission Operator shall use the results of these analyses to immediately mitigate the SOL violation.	The part of the requirement dealing with data is replaced by proposed TOP-003-3, Requirement R1. The part of the requirement dealing with analysis is replaced by proposed TOP-002-4, Requirement R1 and proposed TOP-001-3, Requirement R13. **Proposed TOP-003-3, Requirement R1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed TOP-002-4, Requirement R1:** **R1.** Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed TOP-001-3, Requirement R13:** **R13**. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

RELIABILITY CORPORATION

System Operating Limit Definition and Exceedance Clarification

The NERC-defined term System Operating Limit (SOL) is used extensively in the NERC Reliability Standards; however, there is much confusion with – and many widely varied interpretations and applications of – the SOL term. This whitepaper describes the Standard Drafting Team's (SDT) intent with regard to the SOL concept and brings clarity and consistency to the notion of establishing SOLs, exceeding SOLs, and implementing Operating Plans to mitigate SOL exceedances.

System Operating Limit Definition Clarification:
As stated in the NERC Glossary of Terms Used in Reliability Standards, a SOL is defined as the value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. SOLs are based upon certain operating criteria. These include, but are not limited to:

- Facility Ratings (Applicable pre- and post- Contingency equipment or Facility ratings)
- Transient Stability Ratings (Applicable pre- and/or post-Contingency Stability Limits)
- Voltage Stability Ratings (Applicable pre- and/or post- Contingency Voltage Stability)
- System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits)

The concept of SOL determination is not complete without looking at the approved NERC FAC standards FAC-008-3, FAC-011-2, and FAC-014-2:

1. The purpose of approved FAC-008-3, which is applicable to both Generation and Transmission Owners, is to ensure that Facility Ratings used in the reliable planning and operation of the BES are determined based on technically sound principles. A Facility Rating is essential for the determination of SOLs. The standard requires both Generation Owners and Transmission Owners to have a documented Facility Rating that respects the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility. The scope of the Ratings addressed shall include, as a minimum, both Normal and Emergency (short-term) Ratings (approved FAC-008-3, Requirement R3, part 3.4.2). A 24-hour continuous rating is an example of a Normal rating; however, rating practices vary from entity to entity and may include ratings that vary with ambient temperature. Typical Emergency (short-term) Ratings have a finite duration of less than 24 hours (e.g., 4 hours, 2 hours, 1 hour, 30 minutes, or 15 minutes).

2. The purpose of approved FAC-011-2, which is applicable to Reliability Coordinators, is to ensure that SOLs used in the reliable operation of the BES are determined based on an established methodology or methodologies. Approved FAC-011-2, Requirement R2 requires that the Reliability Coordinator's SOL Methodology include a requirement that SOLs provide a certain level of BES performance for the pre- and post-Contingency state. Specifically:

   Pre-Contingency: Acceptable system performance for the pre-Contingency state is characterized by the following:

   a. The BES shall demonstrate transient, dynamic, and voltage Stability.
   b. All Facilities shall be within their applicable Facility Ratings and thermal limits.
   c. All Facilities shall be within their pre-Contingency voltage limits.
   d. All Facilities shall be within their Stability limits.

   Post-Contingency: Acceptable system performance for the post-Contingency state for single Contingencies is characterized by the following (approved Reliability Standard FAC-011-2, Requirement R2, part 2.2):

   a. The BES shall demonstrate transient, dynamic, and voltage Stability.
   b. All Facilities shall be within their applicable Facility Ratings and thermal limits.
   c. All Facilities shall be within their post-Contingency voltage limits.
   d. All Facilities shall be within their Stability limits.
   e. Cascading or uncontrolled separation shall not occur.

3. Approved FAC-014-2, Requirement R2 requires that Transmission Operators establish SOLs for their portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology.

Some have interpreted the language in approved FAC-011-2, Requirement R2 to imply that the objective is to perform prior studies to determine a specific MW flow value (SOL) that ensures operation within the criteria specified in approved FAC-011-2, Requirement R2 sub-requirements, the assumption being that if the system is operated within this pre-determined SOL value, then all of the pre- and post-Contingency requirements described in approved FAC-011-2, Requirement R2 will be met. The SDT believes this

approach may not capture the complete intent of the SOL concept within approved FAC-011-2, which is both:

1. Know the Facility Ratings, voltage limits, transient Stability limits, and voltage Stability limits, and
2. Ensure that they are all observed in both the pre- and post-Contingency state by performing a Real-time Assessment.

SOLs are based on Normal and Emergency (short-term) Facility Ratings, voltage limits, transient Stability limits, and voltage Stability limits – any of which can be the most restrictive limit at any point in time pre- or post-Contingency. For example, if an area of the BES is at no risk of encroaching upon Stability or voltage limitations in the pre- or post-Contingency state, and the most restrictive limitations in that area are pre- or post-Contingency exceedance of Facility Ratings, then the thermal Facility Ratings in that area are the most limiting SOLs. Conversely, if an area is not at risk of instability and no Facilities are approaching their thermal Facility Ratings, but the area is prone to pre- or post-Contingency low voltage conditions, then the voltage limits in that area are the most limiting SOLs.

It is important to distinguish operating practices and strategies from the SOL itself. As stated earlier, the SOL is based on the actual set of Facility Ratings, voltage limits, or Stability limits that are to be monitored for the pre- and post-Contingency state. How an entity remains within these SOLs can vary depending on the planning strategies, operating practices, and mechanisms employed by that entity. For example, one Transmission Operator may utilize line outage distribution factors or other similar calculations as a mechanism to ensure SOLs are not exceeded, while another may utilize advanced network applications to achieve the same reliability objective.

In order to ensure an SOL is not exceeded, the following SOL performance must be maintained:

1. **Facility Ratings:**
   In the pre- and post-Contingency state, operate within Facility capability by utilizing Normal and Emergency (short-term) Ratings, as applicable, within their associated time parameters.
2. **Voltage Limits:**
   In the pre-Contingency state, operate within normal voltage limits. In the post-Contingency state, operate within applicable emergency voltage limits.
3. **Transient Stability Limits:**
   Transmission Operators establish SOLs to prevent intra-area instability, inter-area instability, or tripping of Facilities due to out-of-step conditions. Transient Stability limits are typically defined as the

maximum power transfer or load level that ensures critical transient reliability criteria are met. Calculated flows must be maintained within appropriate pre- and/or post-Contingency limit.

4. **Voltage Stability Limits:**
Transmission Operators typically stress Transmission Paths/Interfaces or load areas to the reasonably expected maximum transfer conditions or area load levels to determine whether steady state voltage Stability limits exist. Voltage Stability limits are typically defined as the maximum power transfer or load level that ensures voltage Stability criteria are met. Calculated flows must be maintained within appropriate pre- and/or post-Contingency limits.

System Operating Limit Exceedance Clarification:

The combination of requirements contained within the approved FAC and proposed TOP standards, as well as the use of defined terms contained within those standards such as Operational Planning Analysis, Real-time Assessment, and Operating Plans when executed properly result in maintaining reliable BES performance. Specifically,

1. Approved FAC standards require clear determination of Facility Ratings and describe acceptable system performance criteria for the pre- and post-Contingency state.
2. Proposed TOP-001-3, Requirement R13 requires that a Transmission Operator perform a Real-time Assessment at least once every 30 minutes.
3. Proposed TOP-002-4, Requirement R2 requires that each Transmission Operator have an Operating Plan to address potential SOL exceedances identified as a result of its Operational Planning Analysis.
4. Proposed TOP-001-3, Requirement R14 requires the Transmission Operator to initiate Operating Plan(s) to mitigate SOL exceedances.

<u>Facility Rating Exceedance</u>

Facility Rating exceedance is a function of the available limit set and the magnitude of pre- or post-Contingency flows in relation to those limits as observed in Real-time monitoring or Real-time Assessments. Figure 1 illustrates an SOL Performance Summary for Facility Ratings.

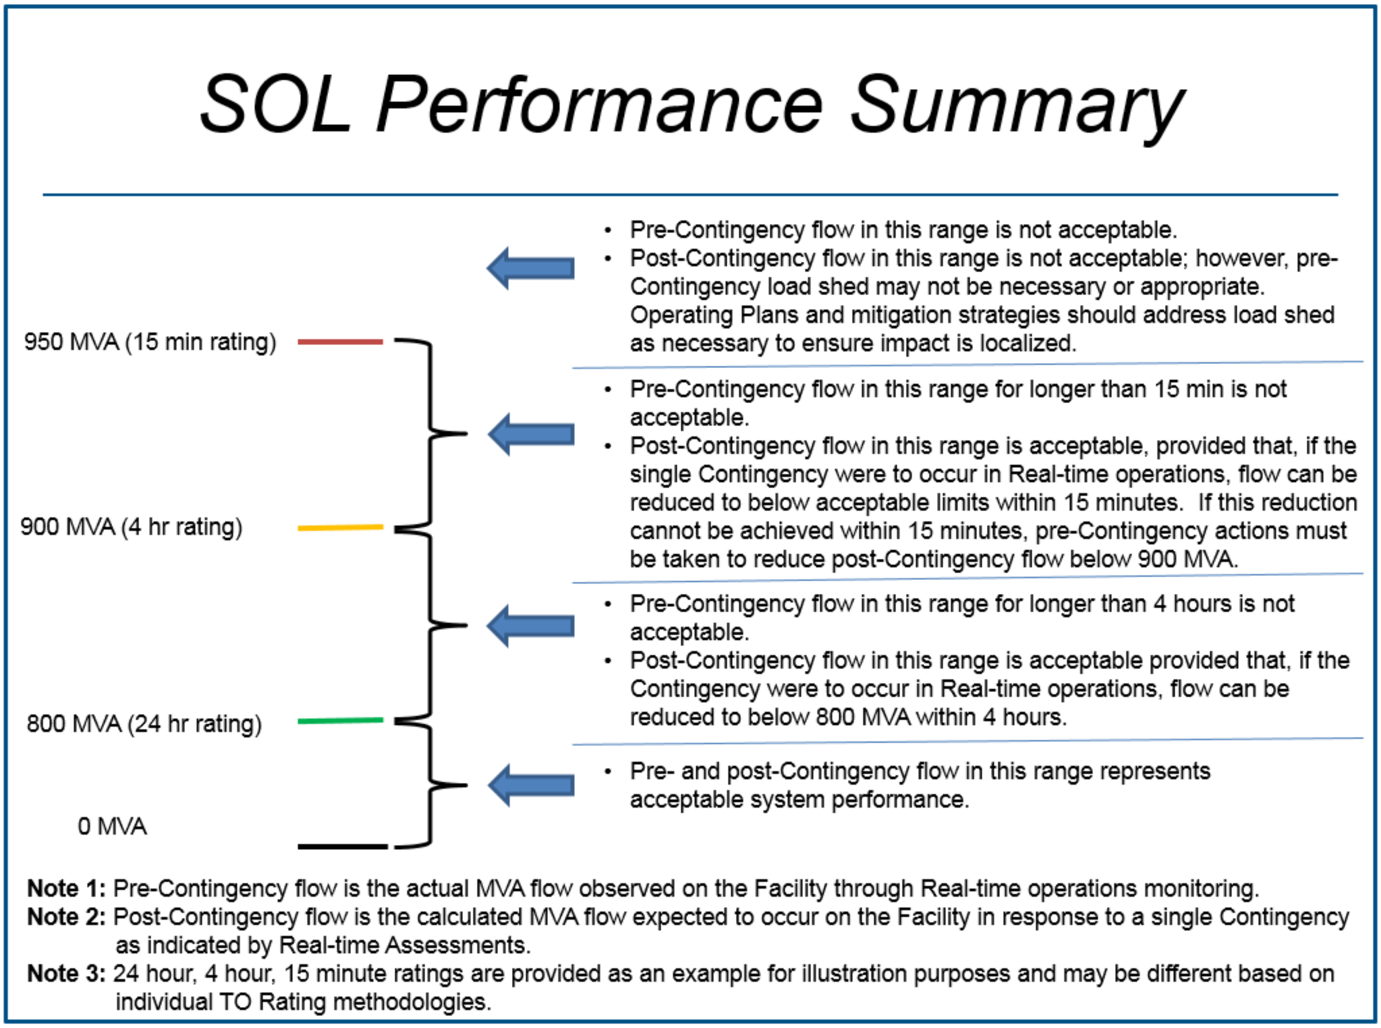

Figure 1. Facility Rating System Operating Limit Performance Summary

In cases where post-Contingency flow exceeds the highest available Facility Rating as shown in Figure 1, Transmission Operators are expected to take pre-Contingency action to relieve the condition (including redispatch, reconfiguration, and making adjustments to the uses of the transmission system); however, the operating condition may not warrant shedding load pre-Contingency to relieve the condition. Pre-Contingency Load shed is generally utilized as a last resort in conditions where the next Contingency could result in Cascading or widespread instability. An entity's Operating Plan is expected to define when it is appropriate to shed Load pre-Contingency versus post-Contingency while ensuring the BES remains N-1 secure.

Steady State Voltage Limit Exceedance

SOL performance for steady state voltage limits is determined through Real-time Assessments. Normal and emergency voltage limits are expected to respect any voltage limitations specified in the Transmission

Owner or the Generation Owner's Facility Ratings Methodology per approved FAC-008-3. Normal voltage limits are typically applicable for the pre-Contingency state while emergency voltage limits are applicable for the post-Contingency state. SOL exceedance with respect to these voltage limits occurs when either actual bus voltage is outside acceptable pre-Contingency (normal) bus voltage limits, or when Real-time Assessments indicate that bus voltages are expected to fall outside acceptable emergency limits in response to a Contingency event. Real-time Assessments should recognize the impact of auto-reactive devices and whether or not those devices are sufficient for maintaining voltages within acceptable limits pre- or post-Contingency.

Stability Limit Exceedance

Transient and voltage Stability limits can be determined through prior studies, or they can be determined in Real-time.

Transient Stability limits are often expressed as flow limits on a defined interface or cut plane that, if operated within, ensures that the system will remain transiently stable should the identified Contingency(s) occur. Transient instability could take several forms, including undamped oscillations, or angular instability resulting in portions of the system losing synchronism.

Though voltage Stability limits can be determined, expressed, and monitored in several ways, the general principle is universal – voltage Stability limits are intended to ensure that the system does not experience voltage collapse in the pre- or post-Contingency state.

SOL exceedance for Stability limits occurs when the system enters into an operating state where the next Contingency could result in transient or voltage instability. Figure 2 depicts a wide-area voltage Stability based SOL that qualifies as an IROL. In this example, SOL (IROL) exceedance occurs when power transfers over the monitored Facility(s) exceeds the P_{IROL} value. Note - A localized voltage collapse may not qualify as an IROL.

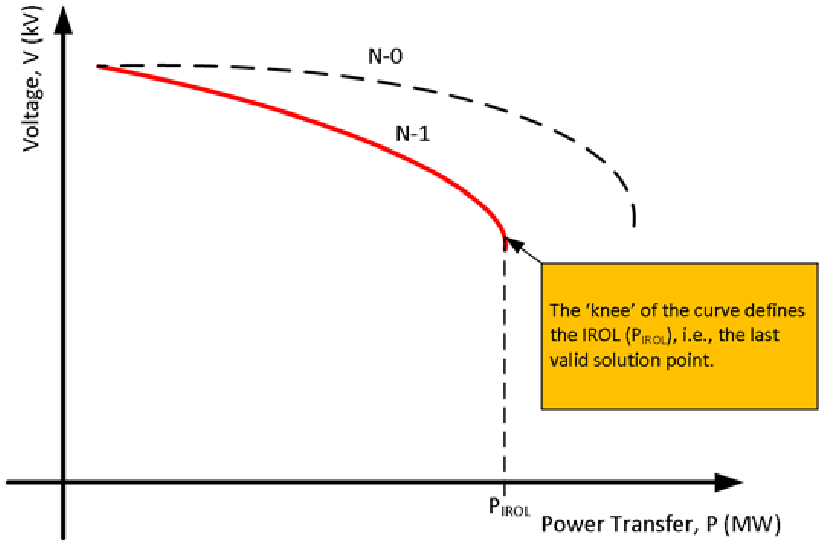

Figure 2. Voltage Stability System Operating Limit Performance Summary

SOL exceedance occurs when acceptable system performance as described in approved FAC-011-2 is not occurring in Real-time operations as determined by Real-time Assessments. In other words, unacceptable system performance as indicated by Real-time Assessments equates to SOL exceedance. An SOL is exceeded when any of the following occur or are observed as part of a Real-time Assessment:

- Actual flow on a Facility is above the Facility Rating for an unacceptable time duration
- Calculated Post-Contingency flow on a Facility is above the highest available Facility Rating
- Actual bus voltage is outside acceptable pre-Contingency (normal) bus voltage limits
- Post-Contingency bus voltage is outside acceptable post-Contingency (emergency) bus voltage limits
- Defined transient or voltage Stability limits are exceeded (techniques for determining and observing Stability limits can vary)

SOL Exceedance and Operating Plans:

When an SOL is being exceeded in Real-time operations, the Transmission Operator is required to implement mitigating strategies consistent with its Operating Plan(s). Operating Plans can include specific Operating Procedures or more general Operating Processes. Operating Plans include both pre- and post-Contingency mitigation plans/strategies. Pre-Contingency mitigation plans/strategies are actions that are implemented before the Contingency occurs to prevent the potential negative impacts on reliability of the

Contingency. Post-Contingency mitigation plans/strategies are actions that are implemented after the Contingency occurs to bring the system back within limits. Operating Plans contain details to include appropriate timelines to escalate the level of mitigating plans/strategies to ensure BES performance is maintained as per approved FAC-011-2, Requirement R2, preventing SOL exceedances from becoming an IROL. Operating Plan(s) must include the appropriate time element to return the system to within acceptable Normal and Emergency (short-term) Ratings and/or operating limits identified above. For example, in Figure 1, operating above the 950 MVA 15 minute limit would be an SOL exceedance for actual flows and may also be an exceedance for projected post-Contingency flows if a communicated post-Contingency load shed plan cannot be implemented in a timely fashion in order to prevent post-Contingency equipment damage and/or non-localized Cascading outages. However, operating between 900 MVA and 950 MVA is not an SOL exceedance unless the associated Operating Plan time parameter is exceeded as explained in Figure 1.

An example Operating Plan is shown in Table 1.

Thermal Limit Exceeded	Pre-Contingency (actual) Loading	Post-Contingency (calculated) Loading
Normal (24 hr)	Reconfiguration actions, Redispatch actions, emergency procedures except Load shed consistent with timelines identified in Operating Plan.	Trend – continue to monitor. Take reconfiguration actions to prevent Contingency from exceeding emergency limit consistent with timelines identified in Operating Plan.
Emergency (4 hr)	All of the above plus Load shed only if necessary and appropriate to control loading below 4 hr Emergency Rating consistent with timelines identified in Operating Plan.	Use available effective actions and emergency procedures except Load shed consistent with timelines identified in Operating Plan.
Emergency (15 min)	All of the above plus Load shed to control loading below 15 min Emergency Rating consistent with timelines identified in Operating Plan.	All of the above however, Load shed only if necessary and appropriate to avoid post-Contingency Cascading consistent with timelines identified in Operating Plan.

Table 1. Operating Plan Example

APPLICABLE DEFINITIONS

Real-time Assessment – An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Operational Planning Analysis – An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Changes made to the definitions of Real-time Assessment and Operational Planning Analysis were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments and Operational Planning Analysis contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

Operating Plan – A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.

Operating Process – A document that identifies general steps for achieving a generic operating goal. An Operating Process includes steps with options that may be selected depending upon Real-time conditions. A guideline for controlling high voltage is an example of an Operating process.

Operating Procedure – A document that identifies specific steps or tasks that should be taken by one or more specific operating positions to achieve specific operating goal(s). The steps in an Operating Procedure should be followed in the order in which they are presented, and should be performed by the position(s) identified. A document that lists the specific steps for a System Operator to take in removing a specific transmission line from service is an example of an Operating Procedure.

Time Horizons
When establishing a time horizon for each requirement, the following criteria should be used:

- **Long-term Planning –** a planning horizon of one year or longer.
- **Operations Planning** – operating and resource plans from day-ahead up to and including seasonal.
- **Same-Day Operations** – routine actions required within the timeframe of a day, but not Real-time.
- **Real-time Operations** – actions required within one hour or less to preserve the reliability of the Bulk Electric System.

Facility Rating – The maximum or minimum voltage, current, frequency, or real or reactive power flow through a facility that does not violate the applicable equipment rating of any equipment comprising the facility.

Normal Rating – The rating as defined by the equipment owner that specifies the level of electrical loading, usually expressed in megawatts (MW) or other appropriate units that a system, facility, or element can support or withstand through the daily demand cycles without loss of equipment life.

Emergency Rating – The rating as defined by the equipment owner that specifics the level of electrical loading or output, usually expressed in megawatts (MW) or Mvar, or other appropriate units, that a system, facility, or element can support, procedure, or withstand for a finite period. The rating assumes acceptable loss of equipment life or other physical or safety limitations for the equipment involved.

System Operating Limit Definition and Exceedance Clarification

The NERC-defined term System Operating Limit (SOL) is used extensively in the NERC Reliability Standards; however, there is much confusion with – and many widely varied interpretations and applications of – the SOL term. This whitepaper describes the Standard Drafting Team's (SDT) intent with regard to the SOL concept and brings clarity and consistency to the notion of establishing SOLs, exceeding SOLs, and implementing Operating Plans to mitigate SOL exceedances.

System Operating Limit Definition Clarification:
As stated in the NERC Glossary of Terms Used in Reliability Standards, a SOL is defined as the value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. SOLs are based upon certain operating criteria. These include, but are not limited to:

- Facility Ratings (Applicable pre- and post- Contingency equipment or Facility ratings)
- Transient Stability Ratings (Applicable pre- and/or post-Contingency Stability Limits)
- Voltage Stability Ratings (Applicable pre- and/or post- Contingency Voltage Stability)
- System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits)

The concept of SOL determination is not complete without looking at the approved NERC FAC standards FAC-008-3, FAC-011-2, and FAC-014-2:

1. The purpose of approved FAC-008-3, which is applicable to both Generation and Transmission Owners, is to ensure that Facility Ratings used in the reliable planning and operation of the BES are determined based on technically sound principles. A Facility Rating is essential for the determination of SOLs. The standard requires both Generation Owners and Transmission Owners to have a documented Facility Rating that respects the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility. The scope of the Ratings addressed shall include, as a minimum, both Normal and Emergency (short-term) Ratings (approved FAC-008-3, Requirement R3, part 3.4.2). A 24-hour continuous rating is an example of a Normal rating; however, rating practices vary from entity to entity and may include ratings that vary with ambient temperature. Typical Emergency (short-term) Ratings have a finite duration of less than 24 hours (e.g., 4 hours, 2 hours, 1 hour, 30 minutes, or 15 minutes).

2. The purpose of approved FAC-011-2, which is applicable to Reliability Coordinators, is to ensure that SOLs used in the reliable operation of the BES are determined based on an established methodology or methodologies. Approved FAC-011-2, Requirement R2 requires that the Reliability Coordinator's SOL Methodology include a requirement that SOLs provide a certain level of BES performance for the pre- and post-Contingency state. Specifically:

   Pre-Contingency: Acceptable system performance for the pre-Contingency state is characterized by the following:

   a. The BES shall demonstrate transient, dynamic, and voltage Stability.
   b. All Facilities shall be within their ~~Normal~~ applicable Facility Ratings and thermal limits.
   c. All Facilities shall be within their pre-Contingency voltage limits.
   d. All Facilities shall be within their Stability limits.

   Post-Contingency: Acceptable system performance for the post-Contingency state for single Contingencies is characterized by the following (approved Reliability Standard FAC-011-2, Requirement R2, part 2.2):

   a. The BES shall demonstrate transient, dynamic, and voltage Stability.
   b. All Facilities shall be within their applicable ~~Emergency (short-term)~~ Facility Ratings and thermal limits.
   c. All Facilities shall be within their post-Contingency voltage limits.
   d. All Facilities shall be within their Stability limits.
   e. Cascading or uncontrolled separation shall not occur.

3. Approved FAC-014-2, Requirement R2 requires that Transmission Operators establish SOLs for their portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology.

Some have interpreted the language in approved FAC-011-2, Requirement R2 to imply that the objective is to perform prior studies to determine a specific MW flow value (SOL) that ensures operation within the criteria specified in approved FAC-011-2, Requirement R2 sub-requirements, the assumption being that if the system is operated within this pre-determined SOL value, then all of the pre- and post-Contingency requirements described in approved FAC-011-2, Requirement R2 will be met. The SDT believes this

approach may not capture the complete intent of the SOL concept within approved FAC-011-2, which is both:

1. Know the Facility Ratings, voltage limits, transient Stability limits, and voltage Stability limits, and
2. Ensure that they are all observed in both the pre- and post-Contingency state by performing a Real-time Assessment.

SOLs are based on Normal and Emergency (short-term) Facility Ratings, voltage limits, transient Stability limits, and voltage Stability limits – any of which can be the most restrictive limit at any point in time pre- or post-Contingency. For example, if an area of the BES is at no risk of encroaching upon Stability or voltage limitations in the pre- or post-Contingency state, and the most restrictive limitations in that area are pre- or post-Contingency exceedance of Facility Ratings, then the thermal Facility Ratings in that area are the most limiting SOLs. Conversely, if an area is not at risk of instability and no Facilities are approaching their thermal Facility Ratings, but the area is prone to pre- or post-Contingency low voltage conditions, then the voltage limits in that area are the most limiting SOLs. ~~Conversely, if an area has plenty of headroom on thermal Facility Ratings and has no risk of instability but is prone to low voltages pre- or post-Contingency, then the voltage limits in that area are the limiting SOLs.~~

It is important to distinguish operating practices and strategies from the SOL itself. As stated earlier, the SOL is based on the actual set of Facility Ratings, voltage limits, or Stability limits that are to be monitored for the pre- and post-Contingency state. How an entity remains within these SOLs can vary depending on the planning strategies, operating practices, and mechanisms employed by that entity~~How an entity remains within these SOLs can vary depending on the practices and mechanisms employed by that entity~~. For example, one Transmission Operator may utilize line outage distribution factors or other similar calculations as a mechanism to ensure SOLs are not exceeded, while another may utilize advanced network applications to achieve the same reliability objective.

In order to ensure an SOL is not exceeded, the following SOL performance must be maintained:

1. **Facility Ratings:**
   In the pre- and post-Contingency state, operate within Facility capability by utilizing Normal and Emergency (short-term) Ratings, as applicable, within their associated time parameters.
2. **Voltage Limits:**
   In the pre-Contingency state, operate within normal voltage limits. In the post-Contingency state, operate within applicable emergency voltage limits.

3. **Transient Stability Limits:**
Transmission Operators establish SOLs to prevent ~~unit/intra-area instability,~~ intra-area instability, inter-area instability, or tripping of Facilities due to out-of-step conditions. Transient Stability limits are typically defined as the maximum power transfer or load level that ensures critical transient reliability criteria are met. Calculated flows must be maintained within appropriate pre- and/or post-Contingency limit.

4. **Voltage Stability Limits:**
Transmission Operators typically stress Transmission Paths/Interfaces or load areas to the reasonably expected maximum transfer conditions or area load levels to determine whether steady state voltage Stability limits exist. Voltage Stability limits are typically defined as the maximum power transfer or load level that ensures voltage ~~s~~Stability criteria are met.~~Voltage Stability limits are typically defined as the maximum power transfer or load level for which a post-Contingency solution can be reached.~~ Calculated flows must be maintained within appropriate pre- and/or post-Contingency limits.

System Operating Limit Exceedance Clarification:

The combination of requirements contained within the approved FAC and proposed TOP standards, as well as the use of defined terms contained within those standards such as Operational Planning Analysis, Real-time Assessment, and Operating Plans when executed properly result in maintaining reliable BES performance. Specifically,

1. Approved FAC standards require clear determination of Facility Ratings and describe acceptable system performance criteria for the pre- and post-Contingency state.
2. Proposed TOP-001-3, Requirement R13 requires that a Transmission Operator perform a Real-time Assessment at least once every 30 minutes.
3. Proposed TOP-002-4, Requirement R2 requires that each Transmission Operator have an Operating Plan to address potential SOL exceedances identified as a result of its Operational Planning Analysis.
4. Proposed TOP-001-3, Requirement R14 requires the Transmission Operator to initiate Operating Plan(s) to mitigate SOL exceedances.

Facility Rating Exceedance

Facility Rating exceedance is a function of the available limit set and the magnitude of pre- or post-Contingency flows in relation to those limits as observed in Real-time monitoring or Real-time Assessments. Figure 1 illustrates an SOL Performance Summary for Facility Ratings.

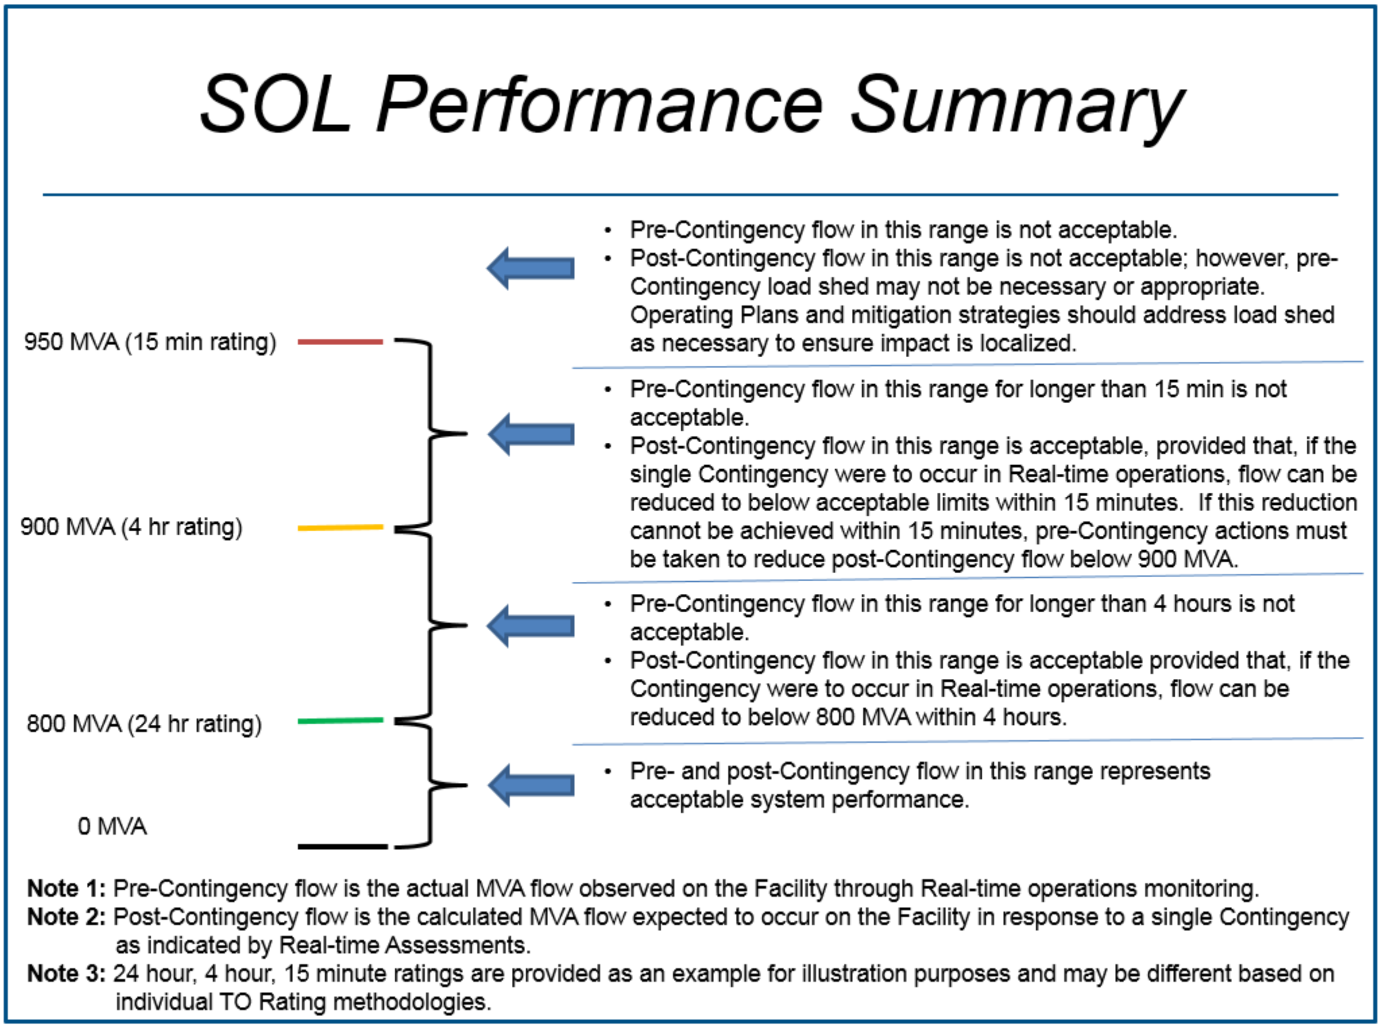

Figure 1. Facility Rating System Operating Limit Performance Summary

In cases where post-Contingency flow exceeds the highest available Facility Rating as shown in Figure 1, Transmission Operators are expected to take pre-Contingency action to relieve the condition (including redispatch, reconfiguration, and making adjustments to the uses of the transmission system); however, the operating condition may not warrant shedding load pre-Contingency to relieve the condition. Pre-Contingency Load shed is generally utilized as a last resort in conditions where the next Contingency could result in Cascading or widespread instability. An entity's Operating Plan is expected to define when it is appropriate to shed Load pre-Contingency versus post-Contingency while ensuring the BES remains N-1 secure.

<u>Steady State Voltage Limit Exceedance</u>

SOL performance for steady state voltage limits is determined through Real-time Assessments. Normal and emergency voltage limits are expected to respect any voltage limitations specified in the Transmission

Owner or the Generation Owner's Facility Ratings Methodology per approved FAC-008-3. Normal voltage limits are typically applicable for the pre-Contingency state while emergency voltage limits are applicable for the post-Contingency state. SOL exceedance with respect to these voltage limits occurs when either actual bus voltage is outside acceptable pre-Contingency (normal) bus voltage limits, or when Real-time Assessments indicate that bus voltages are expected to fall outside acceptable emergency limits in response to a Contingency event. Real-time Assessments should recognize the impact of auto-reactive devices and whether or not those devices are sufficient for maintaining voltages within acceptable limits pre- or post-Contingency.

Stability Limit Exceedance

Transient and voltage Stability limits can be determined through prior studies, or they can be determined in Real-time.

Transient Stability limits are often expressed as flow limits on a defined interface or cut plane that, if operated within, ensures that the system will remain transiently stable should the identified Contingency(s) occur. Transient instability could take several forms, including undamped oscillations, or angular instability resulting in portions of the system losing synchronism.

Though voltage Stability limits can be determined, expressed, and monitored in several ways, the general principle is universal – voltage Stability limits are intended to ensure that the system does not experience voltage collapse in the pre- or post-Contingency state.

SOL exceedance for Stability limits occurs when the system enters into an operating state where the next Contingency could result in transient or voltage instability. Figure 2 depicts a wide-area voltage Stability based SOL that qualifies as an IROL. In this example, SOL (IROL) exceedance occurs when power transfers over the monitored Facility(s) exceeds the P_{IROL} value. Note - A localized voltage collapse may not qualify as an IROL.

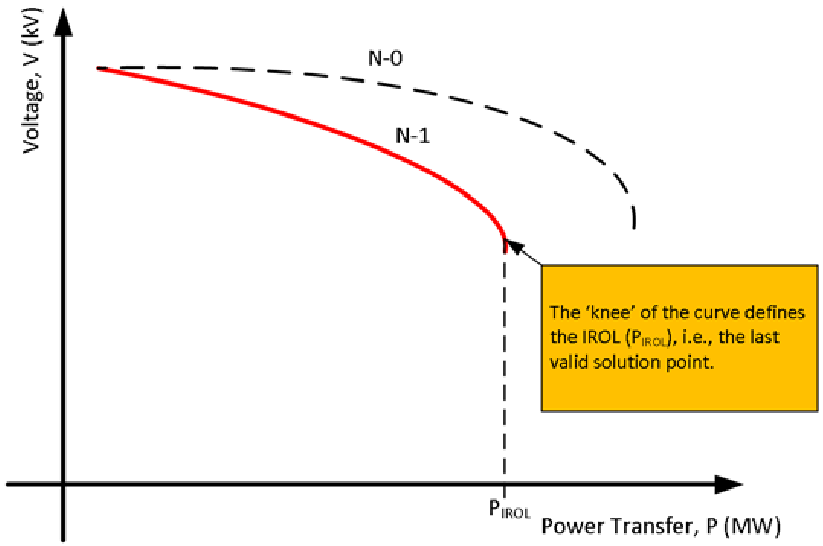

Figure 2. Voltage Stability System Operating Limit Performance Summary

SOL exceedance occurs when acceptable system performance as described in approved FAC-011-2 is not occurring in Real-time operations as determined by Real-time Assessments. In other words, unacceptable system performance as indicated by Real-time Assessments equates to SOL exceedance. An SOL is exceeded when any of the following occur or are observed as part of a Real-time Assessment:

- Actual flow on a Facility is above the Facility Rating for an unacceptable time duration
- Calculated Post-Contingency flow on a Facility is above the highest available Facility Rating
- Actual bus voltage is outside acceptable pre-Contingency (normal) bus voltage limits
- Post-Contingency bus voltage is outside acceptable post-Contingency (emergency) bus voltage limits
- Defined transient or voltage Stability limits are exceeded (techniques for determining and observing Stability limits can vary)

SOL Exceedance and Operating Plans:

When an SOL is being exceeded in Real-time operations, the Transmission Operator is required to implement mitigating strategies consistent with its Operating Plan(s). Operating Plans can include specific Operating Procedures or more general Operating Processes. Operating Plans include both pre- and post-Contingency mitigation plans/strategies. Pre-Contingency mitigation plans/strategies are actions that are implemented before the Contingency occurs to prevent the potential negative impacts on reliability of the

Contingency. Post-Contingency mitigation plans/strategies are actions that are implemented after the Contingency occurs to bring the system back within limits. Operating Plans contain details to include appropriate timelines to escalate the level of mitigating plans/strategies to ensure BES performance is maintained as per approved FAC-011-2, Requirement R2, preventing SOL exceedances from becoming an IROL. Operating Plan(s) must include the appropriate time element to return the system to within acceptable Normal and Emergency (short-term) Ratings and/or operating limits identified above.   For example, in Figure 1, operating above the 950 MVA 15 minute limit would be an SOL exceedance for actual flows and may also be an exceedance for projected post-Contingency flows if a communicated post-Contingency load shed plan cannot be implemented in a timely fashion in order to prevent post-Contingency equipment damage and/or non-localized Cascading outages. However, operating between 900 MVA and 950 MVA is not an SOL exceedance unless the associated Operating Plan time parameter is exceeded as explained in Figure 1.

An example Operating Plan is shown in Table 1.

Thermal Limit Exceeded	**Pre-Contingency (actual) Loading**	**Post-Contingency (calculated) Loading**
Normal (24 hr)	**~~Non-cost~~Reconfiguratione actions, Redispatch~~off-cost~~ actions, emergency procedures except ~~l~~Load shed consistent with timelines identified in Operating Plan.**	**Trend – continue to monitor. Take reconfiguration ~~non-cost~~ actions to prevent Contingency from exceeding emergency limit consistent with timelines identified in Operating Plan.**
Emergency (4 hr)	**All of the above plus ~~l~~Load shed only if necessary and appropriate to control loading below 4 hr ~~violation below~~ Emergency Rating consistent with timelines identified in Operating Plan.**	**Use available~~all~~ effective actions and emergency procedures except ~~l~~Load shed consistent with timelines identified in Operating Plan.**
Emergency (15 min)	**All of the above plus ~~l~~Load shed to control loading ~~violation~~ below 15 min Emergency Rating consistent with timelines identified in Operating Plan.**	**All of the above however, ~~l~~Load shed only if necessary and appropriate to avoid post-Contingency Cascading consistent with timelines identified in Operating Plan.**

~~OFF-COST~~REDISPATCH

~~LOAD SHEDDING~~

Table 1. Operating Plan Example

APPLICABLE DEFINITIONS

Real-time Assessment – An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Operational Planning Analysis – An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Changes made to the definitions of Real-time Assessment and Operational Planning Analysis were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments and Operational Planning Analysis contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

Operating Plan – A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.

Operating Process – A document that identifies general steps for achieving a generic operating goal. An Operating Process includes steps with options that may be selected depending upon Real-time conditions. A guideline for controlling high voltage is an example of an Operating process.

Operating Procedure – A document that identifies specific steps or tasks that should be taken by one or more specific operating positions to achieve specific operating goal(s). The steps in an Operating Procedure should be followed in the order in which they are presented, and should be performed by the position(s) identified. A document that lists the specific steps for a System Operator to take in removing a specific transmission line from service is an example of an Operating Procedure.

Time Horizons
When establishing a time horizon for each requirement, the following criteria should be used:

- **Long-term Planning –** a planning horizon of one year or longer.
- **Operations Planning** – operating and resource plans from day-ahead up to and including seasonal.
- **Same-Day Operations** – routine actions required within the timeframe of a day, but not Real-time.
- **Real-time Operations** – actions required within one hour or less to preserve the reliability of the Bulk Electric System.

Facility Rating – The maximum or minimum voltage, current, frequency, or real or reactive power flow through a facility that does not violate the applicable equipment rating of any equipment comprising the facility.

Normal Rating – The rating as defined by the equipment owner that specifies the level of electrical loading, usually expressed in megawatts (MW) or other appropriate units that a system, facility, or element can support or withstand through the daily demand cycles without loss of equipment life.

Emergency Rating – The rating as defined by the equipment owner that specifics the level of electrical loading or output, usually expressed in megawatts (MW) or Mvar, or other appropriate units, that a system, facility, or element can support, procedure, or withstand for a finite period. The rating assumes acceptable loss of equipment life or other physical or safety limitations for the equipment involved.

TOP/IRO Standards - Items for SDT Discussion from FERC NOPR (*Updated August 2014*)

Monitoring System Conditions - Transmission Operations Reliability Standard
Transmission Operations Reliability Standards
Interconnection Reliability Operations and Coordination Reliability Standards
145 FERC ¶ 61,158 (2014)

Plan and Operate within all System Operating Limits

Para 42: Without a requirement to analyze and operate within all SOLs in the proposed standards and by limiting non-IROL SOLs to only those identified by the transmission operator internal to its area, system reliability is reduced and negative consequences can occur outside of the transmission operator's internal area.

Para 43: … affects at least proposed Reliability Standard TOP-002-3, Requirements R1 and R2 as well as proposed Reliability Standard TOP-001-2, Requirements R8 through R11

SDT Consideration:

The Project 2014-03 SDT has changed the proposed requirements to include all SOLs. This resolves the first issue (analyze and operate within all SOLs) identified in paragraph 42. See proposed TOP-001-3, Requirements R14 and R15.

> Proposed TOP-001-3, Requirement R14: Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
>
> Proposed TOP-001-3, Requirement R15: Each Transmission Operator shall inform its Reliability Coordinator of actions taken to return the system to within limits when a SOL has been exceeded.

Approved FAC-011-2, Requirement R1 states that the Reliability Coordinator shall have a documented methodology for determining SOLs within its area. Approved FAC-011-2, Requirement R3, Part 3.1 states that the model used by the Reliability Coordinator must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study. Approved FAC-011-2, Requirement R4, Part 4.3 requires the Reliability Coordinator to issue its SOL methodology to Transmission Operators. Approved FAC-014-2, Requirement R2 requires each Transmission Operator to establish SOLs for its Transmission system that are consistent with the established Reliability Coordinator SOL methodology. In addition, proposed IRO-008-2, Requirements R1, R3, R6, R7, and R8 have been revised to include System Operating Limits. This resolves the second issue (only those identified… internal to its area) in paragraph 42.

> Approved FAC-011-2, Requirement R1: The Reliability Coordinator shall have a documented methodology for use in developing SOLs (SOL Methodology) within its Reliability Coordinator Area.

Approved FAC-011-2, Requirement R3, Part 3.1: Study model (must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study.) Approved FAC-011-2, Requirement R4, Part 4.3: Each Transmission Operator that operates in the Reliability Coordinator Area.

Approved FAC-014-2, Requirement R2: The Transmission Operator shall establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology.

Proposed IRO-008-2, Requirement R1: Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area.

Proposed IRO-008-2, Requirement R2: Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1 considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.

Proposed IRO-008-2, Requirement R4: Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Reliability Coordinator Wide Area.

Proposed IRO-008-2, Requirement R5: Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area.

Proposed IRO-008-2, Requirement R6: Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R5 has been prevented or mitigated.

A remaining issue would be where SOLs overlap Transmission Operator Areas as pointed out in the Technical Conferences. If the SOL overlaps Transmission Operator Areas, then the Transmission Operator would coordinate with its Reliability Coordinator with its wide-area view to cover that SOL. This topic is already covered by the SOL methodology defined in approved FAC-011-2, Requirement R1, and the requirement to coordinate operations between Reliability

Coordinators as shown in proposed IRO-014-3, Requirement R1. See also proposed IRO-002-4, Requirement R4.

> Approved FAC-011-2, Requirement R1: The Reliability Coordinator shall have a documented methodology for use in developing SOLs (SOL Methodology) within its Reliability Coordinator Area.
>
> Proposed IRO-014-3, Requirement R1: Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following:
>
> Proposed IRO-002-4, Requirement R3: Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

Para 52: During deteriorating system conditions, an SOL can rapidly degrade into an IROL. … NERC has not explained adequately why the only "true reliability requirement is to operate within IROLs and that non-IROL SOLs are a local operating issue." Major cascading events including the Northeast Blackout of 2003 and the 2011 Southwest Outage were initiated by a non-IROL SOL exceedance, followed by a series of non-IROL SOL exceedances until the system cascaded.

SDT consideration:

The Project 2014-03 SDT has added all SOLs thus addressing this issue.

Para 53: We recognize that, if IROLs and non-IROL SOLs are determined accurately, the reliability consequences of an exceedance should usually be greater for the former than the latter. If NERC or commenters believe this probability warrants general exclusion of the latter from the TOP Reliability Standards (subject to an entity's specific inclusions), they should explain this view in more detail and present any information that may help us weigh its merit.

SDT consideration:

The Project 2014-03 SDT has added all SOLs thus addressing this issue.

Para 54: We believe that the transmission operator should have operational or mitigation plans for all Bulk-Power System IROLs and SOLs that can be implemented within 30 minutes or less to return the system to a secure state.

SDT consideration:

The original project teams (Projects 2006-06 and 2007-03) established the concept of operating within IROL T_v. T_v is always less than or equal to 30 minutes so the issue for IROLs is covered.

The Project 2014-03 SDT has agreed to the addition of all SOLs as explained above (see paragraph 43 response). Requirements for handling SOLs within a specified timeframe are covered under approved FAC-008-3, Requirement R6 where each Transmission Owner and Generator Owner shall have Facility Ratings for its solely and jointly owned Facilities that are consistent with the associated Facility Ratings methodology or documentation for determining its Facility Ratings. These Facility Ratings are part of the data required in the data specifications mandated in proposed TOP-003-3, Requirement R1. The Project 2014-03 SDT agrees the Transmission Operator shall have operational or mitigation plans for all SOLs that consider time-based rating methodology. See proposed TOP-001-3, Requirement R14. The SDT agrees that the Transmission Operator shall develop and coordinate these mitigation plans with its Reliability Coordinator – see proposed TOP-002-4, Requirement R6. Such plans shall also include steps that ensure BES performance consistent with approved FAC-011-2 Requirement R2, including provisions for pre-Contingency load shed to avoid voltage instability, uncontrolled Cascading, or separation.

> Approved FAC-008-3, Requirement R6: Each Transmission Owner and Generator Owner shall have Facility Ratings for its solely and jointly owned Facilities that are consistent with the associated Facility Ratings methodology or documentation for determining its Facility Ratings.
>
> Proposed TOP-003-3, Requirement R1: Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
>
> Proposed TOP-001-3, Requirement R14: Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
>
> Proposed TOP-002-4, Requirement R6: Each Transmission Operator shall provide its Operating Plan(s) for next-day operations identified in Requirement R2 to its Reliability Coordinator.
>
> Approved FAC-011-2, Requirement R2: The Reliability Coordinator's SOL Methodology shall include a requirement that SOLs provide BES performance

Para 55: Because proposed Reliability Standard TOP-001-2, Requirement R8 requires a transmission operator's notification of only those SOLs identified in a next-day Operational Planning Analysis, the Commission believes it is possible for additional SOLs to develop or occur in the same-day or real-time operational time horizon. This could impose an operational risk to the interconnected transmission network. For example, if real-time system load levels are unexpectedly higher than forecasted load

conditions used in the Operational Planning Analysis, this condition could result in real-time SOLs not identified in the Operational Planning Analysis because facility ratings and stability limits are now exceeded under high load levels whereas under the forecasted load levels (lower load levels), facility ratings and stability limits were not expected to be exceeded. … we believe that the Requirement R8 operational responsibilities and actions should pertain to all IROLs and all SOLs for all operating time horizons.

SDT consideration:

The Project 2014-03 SDT views the time horizon item as an issue that involves analysis tools in a Real-time environment. The intent of the original SDTs was that any aspect of analysis tools would be covered in Project 2009-02. For various reasons, that project has been delayed. Therefore the Project 2014-03 SDT has adapted approved IRO-008-1, Requirement R2 to the SOL and Transmission Operator Area – see proposed TOP-001-3, Requirement R13. In addition, the SDT has added proposed TOP-001-3, Requirement R16 concerning operator control of monitoring and analysis capability outages.

> Proposed TOP-001-3, Requirement R13: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
>
> Proposed TOP-001-3, Requirement R16: Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunication, and analysis capabilities.

As part of this process, the definition of Real-time Assessment has been revised to provide greater clarity as to the intent of the defined term.

> **Proposed: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

The Project 2014-03 SDT believes that approved EOP-008-1, Requirement R1, Part 1.6.2 assures that any solution to the analysis issue in the preceding paragraphs is adequately covered as to redundancy and back-up concerns.

> Approved EOP-008-1, Requirement R1, Part 1.6.2: Actions to manage the risk to the BES during the transition from primary to backup functionality as well as during outages of the primary or backup functionality.

In addition, due to concerns raised in the Technical Conferences, the Project 2014-03 SDT has provided guidance as to when an entity has exceeded a limit. This guidance is provided in a white paper that will be shown in the Associated Documents (Section F) of proposed TOP-001-3.

Para 56: Specifically, we propose to direct that NERC develop modifications to Reliability Standard TOP-002-3, Requirements R1 and R2 that address our concerns discussed above to ensure that transmission operators develop mitigation plans for all IROLs and SOLs expected to be exceeded. Similarly, for proposed Reliability Standard TOP-001-2, Requirement R8, we propose to direct that NERC develop modifications to require that transmission operator actions apply to all SOLs identified in all operational time horizons (operations planning, same-day operations and real-time operations). Further, for proposed Reliability Standard TOP-001-2, Requirements R9 through R11, we propose to direct that NERC develop modifications to require that transmission operator specified actions apply to all SOLs related responsibilities in the real-time operations time horizon.

SDT consideration:

See responses above to previous cited paragraphs on SOLs. .

System Models, Monitoring and Tools

Para 60: Monitoring and analysis capabilities are essential in establishing and maintaining situational awareness. While NERC indicates that these functions are assured through the certification process, we are not convinced that NERC's certification process is a suitable substitute for a mandatory Reliability Standard. … certification is a one-time process that may not adequately assure continual operational responsibility would occur if these requirements were in a Reliability Standard.

SDT consideration:

With respect to monitoring, the Project 2014-03 SDT has adapted approved IRO-003-2, Requirement R1 for the Transmission Operator and Balancing Authority Areas. See proposed TOP-001-3, Requirements R10 & R11.

Proposed TOP-001-3, Requirement R10: Each Transmission Operator shall monitor the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area:

1.1. Within its Transmission Operator Area:

1.1.1. Facilities,

1.1.2. The status of Special Protection Systems, and

1.1.3. Non-BES facilities identified as necessary by the Transmission Operator and

1.2. Within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator:

1.2.1. Facilities,

1.2.2. Status of Special Protection Systems, and

Non-BES facilities.

> Proposed TOP-001-3, Requirement R11: Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order for it to be able to perform its reliability functions

With respect to analysis, the Project 2014-03 SDT has adapted approved IRO-008-1, Requirement R2 for the Transmission Operator. See proposed TOP-001-3, Requirement R13.

> Proposed TOP-001-3, Requirement R13: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

Para 61: The retirement of the current IRO and TOP requirements that address monitoring and analysis capabilities should not occur until the completion and implementation of Project 2009-02. Thus, in its NOPR comments NERC should propose a schedule that it will follow to ensure it completes and implements Project 2009-02 prior to any retirement of the standard such that there would be no gap.

SDT consideration:

See previous response.

Compliance with Reliability Directives

Para 64: The currently-effective TOP Reliability Standards use "reliability directive," which, as an undefined term, does not appear to be limited to a specific set of circumstances. … In contrast, application of the proposed definition of "Reliability Directive" appears to require compliance with transmission operator directives only in emergencies, not normal or pre-emergency times. … We believe that directives from a reliability coordinator or transmission operator should be mandatory at all times, and not just during emergencies (unless contrary to safety, equipment, regulatory or statutory requirements).

SDT consideration:

The Project 2014-03 SDT is replacing the term 'reliability directive' with the defined term 'Operating Instruction' throughout the proposed standards. The proposal to use a new defined term 'Reliability Directive' is no longer being considered.

Para 65: NERC's TOP and IRO petitions do not explain the proposed, defined term "Reliability Directive," or why compliance with a transmission operator's directives should be required only during emergencies (if this is the intent). Accordingly, we seek from NERC and other interested entities clarification and technical explanation regarding the scope and intent of the defined term, as well as the anticipated reliability benefits and/or drawbacks of the proposed term.

SDT consideration:

See previous response for paragraph 64.

Para 66: … NERC has not explained or justified its request for approval of the revised definition.

SDT consideration:

See previous response for paragraph 64.

Consideration of External Networks and sub-100 kV Facilities and Contingencies in Operational Planning Analysis

Para 67: In proposed Reliability Standard TOP-002-3, Requirement R1, NERC proposes to require transmission operators to prepare an Operational Planning Analysis, i.e., next day study, which represents "projected System conditions" to determine if their planned operations will exceed facility ratings and stability limits for normal and contingency conditions. NERC does not indicate whether this includes external networks or sub-100 kV facilities.

SDT consideration:

The Project 2014-03 SDT believes that standards must be viewed in aggregate to provide the complete picture of what is covered. The proposed TOP-003-3 requires applicable entities to develop a data specification that covers its needs for monitoring and analysis purposes. There is no restriction on what voltage level or area that data can be pulled from. Proposed TOP-003-3, Requirement R5 shows a Transmission Operator being required to supply requested data to another Transmission Operator which clearly shows that a Transmission Operator can request and receive data from outside of its immediate area. The original SDTs have been clear in response to questions on this matter that they did not intend to place any restrictions on the type and location of data involved as long as the request was reliability based. However, to clear up any possible misconceptions, the Project 2014-03 SDT has amended proposed TOP-003-3, Requirement R1, Part 1.1 to explicitly specify that sub-100 kV data and external data should be part of the data specification for Transmission Operators. Similar requirements exist in proposed IRO-010-2 for the Reliability Coordinator.

> Proposed TOP-003-3, Requirement R1, Part 1.1 A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES

data and external network data as deemed necessary by the Transmission Operator.

Proposed IRO-010-2, Requirement R1, Part 1.1: A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator.

Concerns were raised during the Technical Conferences that proposed TOP-003-2 did not require that an entity actually use the data acquired in its monitoring and analysis functions. The Project 2014-03 SDT discussed this concern and concluded that an explicit requirement to use the data was an unnecessary administrative concern.

Approved FAC-011-2, Requirement R1 states that the Reliability Coordinator shall have a documented methodology for determining SOLs within its area. Approved FAC-011-2, Requirement R3, Part 3.1 states that the model used by the Reliability Coordinator must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study. Approved FAC-011-2, Requirement R4, Part 4.3 then requires the Reliability Coordinator to issue its SOL methodology to Transmission Operators. These requirements will dictate what external data a Transmission Operator needs to acquire.

Approved FAC-011-2, Requirement R1: The Reliability Coordinator shall have a documented methodology for use in developing SOLs (SOL Methodology) within its Reliability Coordinator Area.

Approved FAC-011-2, Requirement R3, Part 3.1: Study model (must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study.)

Approved FAC-011-2, Requirement R4, Part 4.3: Each Transmission Operator that operates in the Reliability Coordinator Area.

Para 68: In Order No. 693, the Commission directed a modification to planned outage coordination to require consideration of facilities below 100 kV that, in the opinion of the registered entity (such as a transmission operator) “will have a direct impact on the reliability of the Bulk-Power System…. The 2011 Southwest Outage Blackout Report includes similar recommendations that transmission operators should ensure their next-day studies include updated external networks and internal and external facilities (including those below 100 kV) that can impact Bulk-Power System reliability.

SDT consideration:

See previous response for data (paragraph 67).

In addition, the Project 2014-03 SDT has developed a new standard, IRO-017-1 Outage Coordination, to address all aspects of outage coordination between the Reliability Coordinator, Transmission Operator, Balancing Authority, Planning Coordinator, and Transmission Planner.

Para 69: The Commission seeks clarification and technical explanation from NERC whether the term "projected System conditions" in proposed Reliability Standard TOP-002-3 Requirement R1 includes updated external networks to reflect operating conditions external to their systems and sub-100 kV facilities (internal and external) in their operational planning analyses. If not, the Commission seeks comment on the associated reliability risks and, whether it is appropriate to include updated external networks to reflect operating conditions and external and sub-100 kV facilities (internal and external) in the operational planning analyses.

SDT consideration:

See previous responses under this heading.

Operating to Respect the Most Severe Single Contingency in Real-time Operations and Unknown Operating States

Para 70: NERC proposes to delete Reliability Standard TOP-004-2, Requirement R2, which provides that each transmission operator "shall operate so that instability, uncontrolled separation, or cascading outages will not occur as a result of the most severe single contingency." NERC's Petition does not provide an explanation for the deletion. However, the NERC "mapping document," which is included as an exhibit to the TOP Petition indicates that NERC intends that Requirement R2 be replaced by proposed Reliability Standards TOP-001-2, Requirements R7 and R9.

SDT consideration:

The Project 2014-03 SDT believes that the concept of stating an explicit requirement to operate to the most severe single Contingency is not necessary as the FAC standards require an entity to analyze and operate for all Contingencies and not just the most severe single Contingency. The definitions of Operational Planning Analysis and Real-time Assessment have been strengthened to clarify this point.

Proposed: Real-time Assessment - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility

Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Proposed: Operational Planning Analysis - An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Para 73: NERC has proposed to retire three key rules here, i.e., the requirements to be ready for the single largest contingency …

SDT consideration:

See previous response.

… to move quickly from an "unknown operating state" to within proven limits …

SDT consideration:

See previous responses for this heading.

… and to determine the cause of SOL violations in all time-frames, including real-time. We believe these three rules represent the bedrock core of real-time operating rules and practices, and it is therefore incumbent upon NERC to provide a more thorough and comprehensive explanation of how the proposed replacement standards compare in meeting the same objectives as the current standards.

SDT consideration:

The Project 2014-03 SDT agrees that a Transmission Operator needs to take appropriate action to mitigate the exceedance but does not agree to the inclusion of determining the 'cause' of the violation in Real-time. Real-time is not when to investigate or to do detailed analysis – but instead is the time to 'fix' the problem. Causes can be determined later and off-line. The Project 2014-03 SDT, as previously stated, has agreed to include the concept of Real-time Assessment for Transmission Operators. This assessment is believed to be sufficient in identifying 'cause' for operators in Real-time. See proposed TOP-001-3, Requirement R13 and the revised definition of Real-time Assessment.

Proposed TOP-001-3, Requirement R13: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

Proposed: Real-time Assessment - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Para 74: In particular, NERC should address whether its proposal would allow a different approach to real-time operational assessments and operation to the most severe single contingencies and, if so, NERC should explain and technically support the nature and associated reliability effects of any different approaches.

<u>SDT consideration:</u>

The Project 2014-03 SDT does not feel that it is advocating a different approach as shown in the previous responses above.

How are the proposed requirements to not exceed IROLs or certain SOLs for more than the specified times are the functional or implicit equivalent of the current rules?

<u>SDT consideration:</u>

The Project 2014-03 SDT has added all SOLs thus addressing this issue.

For example, do the proposed rules allow reliance on post-contingency mitigation at times when the current rules would require pre-contingency mitigation?

<u>SDT consideration:</u>

The Project 2014-03 SDT sees this item as having been addressed due to the commitments made above such as adding all SOLs to the standards and performing Real-time Assessments.

In addition, approved FAC-011-2, Requirement R2 compels the Reliability Coordinator to develop an SOL methodology that considers voltage, thermal, and Stability limits (including voltage) while demonstrating that the BES remains stable (transient, dynamic, and voltage) during pre-contingent (Requirement R2, Part 2.1) and post-contingent (Requirement R2, Part 2.2) conditions. Approved FAC-014-

2, Requirement R2 requires each Transmission Operator to establish SOLs for its Transmission system that are consistent with the established Reliability Coordinator SOL methodology. Approved FAC-014-2, Requirement R5, Part 2 compels the Transmission Operator to communicate its SOLs to its Reliability Coordinator and Transmission Service Provider and approved FAC-014-2, Requirement R5, Part 1 compels the Reliability Coordinator to communicate the SOLs to neighboring Reliability Coordinators and other Transmission Operators among a list of other entities.

> Approved FAC-011-2, Requirement R2, and Parts 2.1 and 2.2: The Reliability Coordinator's SOL Methodology shall include a requirement that SOLs provide BES performance consistent with the following:
> 2.1 In the pre-contingency state, the BES shall demonstrate transient, dynamic and voltage stability; all Facilities shall be within their Facility Ratings and within their thermal, voltage and stability limits. In the determination of SOLs, the BES condition used shall reflect current or expected system conditions and shall reflect changes to system topology such as Facility outages.
> 2.2 Following the single Contingencies identified in Requirement 2.2.1 through Requirement 2.2.3, the system shall demonstrate transient, dynamic and voltage stability; all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur.

> Approved FAC-014-2, Requirement R2: The Transmission Operator shall establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology.

> Approved FAC-014-2, Requirement R5, Part 1: The Reliability Coordinator shall provide its SOLs (including the subset of SOLs that are IROLs) to adjacent Reliability Coordinators and Reliability Coordinators who indicate a reliability-related need for those limits, and to the Transmission Operators, Transmission Planners, Transmission Service Providers and Planning Authorities within its Reliability Coordinator Area.

If so, is the difference significant for reliability purposes?

> <u>SDT consideration:</u>
>
> See previous response.

Do both the current and proposed rules prohibit an entity from operating for more than 30 minutes in a state where loss of a particular line would cause the loss of enough resources or load to risk cascading outages or instability?

> <u>SDT consideration:</u>
>
> Yes, industry operates to T_v for all IROLs which is 30 minutes or less. By definition, only IROLs can cause Cascading or instability.

Or, if the entity is not yet operating beyond the pre-determined ratings of the particular line, would the proposed rules allow doing so while the current rules do not?

> <u>SDT consideration:</u>
>
> The Project 2014-03 SDT does not see that any changes are being suggested that would change the way these situations are handled today.

Should all transmission operators be required to run a real-time contingency analysis (RTCA) frequently, since the lack of such analysis can impair situational awareness substantially?

> <u>SDT consideration:</u>
>
> The SDT proposes to use approved IRO-008-1, Requirement R2 as the model for development for such capabilities for Transmission Operators as described above. See proposed TOP-001-3, Requirement R13 and the revised definition of Real-time Assessment.
>
> > Proposed TOP-001-3, Requirement R13: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
> >
> > **Proposed: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency)

> and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Or is the value of such information outweighed for smaller entities with such limited facilities and operations that they generally can maintain similar reliability based on operator experience and judgment without any extra staffing and procedures needed to ensure that the RTCA's informational inputs and modeling are valid and useful?

SDT consideration:

Proposed TOP-001-3, Requirement R13 states that a Transmission Operator must perform a Real-time Assessment every 30 minutes. This is 'what' must be accomplished but doesn't explain 'how' it can be done. That is left to the applicable entity. Smaller entities are free to devise equal and effective methods to accomplish this task. The ERO Rules of Procedure also allow them to contract out services for performing such assessments as long as they retain the responsibility for the final result. To clarify this concept, the Project 2014-03 SDT has added language to the definition of Real-time Assessment on the topic of contracted services.

> Proposed TOP-001-3, Requirement R13: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
>
> **Proposed: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Para 75: With regard to mitigation of unknown operating states, while NERC asserts that "unknown states" cannot exist, a transmission provider could have valid operating limits for all facilities but lack situational awareness when valid limits are exceeded. … the Commission seeks comment and technical explanation from NERC and other interested entities on the proposed retirement.

SDT consideration:

The Project 2014-03 SDT believes that standards must be viewed in aggregate to provide the complete picture of what is covered. Approved EOP-008-1, Requirement R1, Part 1.6.2 covers this situation.

Approved EOP-008-1, Requirement R1, Part 1.6.2: Actions to manage the risk to the BES during the transition from primary to backup functionality as well as during outages of the primary or backup functionality.

System Protection Coordination

Para 78: The Commission seeks comment and technical explanation from NERC and other interested entities on how current Reliability Standard PRC-001-1 Requirement R2's requirement for corrective action (i.e., return a system to a stable state) is addressed in its proposal. Further, the Commission proposes that NERC issue guidance on data needed for protection system coordination that addresses the applicable Order No. 693 directives and the proposed retirement of the Reliability Standard PRC-001-1 requirements.

SDT consideration:

Project 2014-03 SDT is no longer revising PRC-001-1. Project 2007-06 is responsible for PRC-001-1 revisions.

Notification of Emergencies

Para 80: NERC's proposed revisions warrant clarification. Read one way, proposed Requirement R3 is less comprehensive than the currently-effective requirements pertaining to notification of emergencies. Yet, it also contains provisions that, read another way, could require TOPs to notify others of all emergencies, not just day-ahead.

Para 81: Similarly, it is not clear whether proposed Reliability Standard TOP-001-2, Requirement R5 would address same-day and real-time operating emergencies not covered by TOP-001-2, Requirement R3. An Adverse Reliability Impact is an event that results in instability, or cascade conditions, while an Emergency includes conditions that could be a precursor to an Adverse Reliability Impact. Thus, the notification provisions of Requirement R5 do not cure the possible ambiguity in proposed Requirement R3.

Para 82: While NERC states that the obligation to notify for real-time emergency conditions was replaced by proposed Requirement R3, NERC does not indicate in its petition that the real-time or same-day obligation was purposely deleted or offer an explanation for the deletion. … We believe that, consistent with the currently-effective TOP Reliability Standards, the notification requirement of proposed Reliability Standard TOP-001-2 should apply to all emergencies, including real-time and same day emergencies. The Commission seeks comment from NERC and other interested entities regarding (1) the proper understanding of the scope of the notification provisions in the proposed requirements and (2) if the notification does not include all operational time horizons, technical justification for why transmission operators should not be required to notify reliability coordinators and other affected transmission operators of all emergencies in all operating time horizons.

SDT consideration:

The Project 2014-03 SDT has combined the previously proposed TOP-001-2, Requirements R3 & R5 into one requirement in proposed TOP-001-3, Requirement R5 that uses only actual and projected Emergency covering all time horizons.

> Proposed TOP-001-3, Requirement R8: Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known other impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency.

Para 83: … NERC uses two different definitions of Adverse Reliability Impact in the TOP and IRO Petitions. … In addition, if the definition NERC is proposing no longer includes the phrase "uncontrolled separation" NERC should explain the removal of the statutory phrase "uncontrolled separation."

SDT consideration:

See previous response.

Primary Decision-Making Authority for Mitigation of IROLs/SOLs

Para 84: NERC's proposal contains a potential overlap in authority between the transmission operator and reliability coordinator with regard to the provisions pertaining to mitigation of IROLs and SOLs as set forth in the proposed TOP and IRO Standards.

Para 87: NERC's proposal with respect to mitigating IROLs appears to give both the transmission operator and reliability coordinator authority to act. Therefore, we seek clarification and technical explanation whether the reliability coordinator or the transmission operator has primary responsibility for IROLs.

SDT consideration:

The Reliability Coordinator has the responsibility for IROLs and the Transmission Operator has the responsibility for SOLs. This split in responsibilities is an important concept for the preservation of reliability within the BES and needs to be clear in the various standards and requirements. However, as discussed above, the Reliability Coordinator shall provide oversight on SOLs and assistance in mitigating SOLs as necessary.

See previous response to paragraph 43 on SOL overlap issues.

Planned Outage Coordination

Paragraph 90: The Commission is concerned with NERC's proposal because Reliability Standards IRO-008-1, Requirement R3 and IRO-010-1a do not require coordination of outages. Outage coordination is a critical reliability function that should be performed by the reliability coordinator. Outage coordination is an integral part of the operational planning process with generation outages being scheduled from three to five years in advance and transmission maintenance and construction outages being scheduled one to three years in advance. Outages that have been planned well in advance still must go through a month-ahead, week-ahead, and sometimes even a day-ahead approval process depending on system topography and system conditions that may change as the scheduled maintenance outage approaches. For instance, forced outages often disrupt planned outage schedules. Therefore, the Commission believes it is essential that, as the functional entity with the wide-area view, the reliability coordinator coordinates this critical area of operational planning.

SDT consideration:

The SDT has developed a new standard, IRO-017-1 Outage Coordination, to address the overall topic of outage coordination. In addition, the SDT has revised proposed IRO-014-2, Requirement R1, Part 1.4 to show that outage information must be made available and analyzed. Also, the Planning Coordinator and Transmission Planner have been added to proposed IRO-010-2 as applicable entities to ensure the sharing of planning information with the Reliability Coordinator.

Proposed IRO-014-2, Requirement R1, Part 1.4: Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and Real-time Assessments.

Proposed IRO-017-1, Requirement R1: Each Reliability Coordinator shall develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area. The outage coordination process shall:
Identify applicable roles and reporting responsibilities.
1.1.1 Development and communication of outage schedules.
1.1.2 Assignment of coordination responsibilities for outage schedules between Transmission Operator(s) and Balancing Authority(s).
1.2 Specify outage submission timing requirements.

1.3 Define the process to evaluate the impact of Transmission and generation outages within its Wide Area.
1.4 Define the process to coordinate the resolution of identified outage conflicts with its Transmission Operators and Balancing Authorities, and other Reliability Coordinators.

Proposed IRO-017-1, Requirement R2: Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator's outage coordination process.

Proposed IRO-017-1, Requirement R3: Each Planning Coordinator and Transmission Planner shall provide its Planning Assessment to impacted Reliability Coordinators.

Proposed IRO-017-1, Requirement R4: Each Planning Coordinator and Transmission Planner shall jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts with planned outages in its Planning Assessment for the Near-term Transmission Planning Horizon.

Secure Network

Paragraphs 92 & 93: Currently-effective Reliability Standard IRO-002-2, Requirement R2, requires that the data exchange between the reliability coordinator, transmission operator, and balancing authority be accomplished "via a secure network." According to NERC, the requirement to provide information via a "secure network" is now addressed in NERC Rules of Procedure, Section 1002 (Reliability Support Services). NERC also indicates that Requirement R2 is now addressed in proposed Reliability Standard IRO-014-2, Requirements R1, R2, and R3. Although NERC cites Section 1002 of the Rules of Procedure and proposed Reliability Standard IRO-014-2 as providing for the use of a secured data network, NERC does not explain how secured networks are covered in those sections. While Section 1002 of the NERC Rules and Reliability Standard IRO-014-2, Requirements R1, R2, and R3 address notification and exchange of information and data and coordination of actions, no language in these provisions appears to require the data exchange or notifications to be conducted in a secure mode.

SDT consideration:

The Project 2014-03 SDT understands the sensitivity around the concept of secure networks for transfer of data and has made appropriate changes to proposed TOP-003-3, Requirement R5, Part 5.3 and proposed IRO-010-2, Requirement R3, Part 3.3, to allow for the concept of security to be part of the mutually agreed upon data specification.

Proposed TOP-003-3, Requirement R5, Part 5.3: Mutually agreeable security protocol(s).

Proposed IRO-010-2, Requirement R3, Part 3.3: Mutually agreeable security protocol(s).

Reliability Coordinator Monitoring of SOLs

Paragraph 96: Although NERC's petition focuses on the appropriate entity to identify SOLs, it does not adequately explain the proposed retirement of the currently-effective Reliability Standard IRO-002-2 that establishes the obligation for reliability coordinators to monitor SOLs. With regard to NERC's explanation that Reliability Standard IRO-002-2 Requirement R4 is redundant with the requirements contained in IRO-010-1a and EOP-008-1, neither of these Reliability Standards requires the reliability coordinator to monitor SOLs.

SDT consideration:

The Project 2014-03 SDT believes that monitoring SOLs is intrinsic to the duties of a Reliability Coordinator as spelled out in Functional Model v5. However, to provide clarity, the Project 2014-03 SDT has provided explicit requirement language to address the need for monitoring SOLs at the Reliability Coordinator level. See proposed IRO-002-4, Requirement R4. As pointed out starting in paragraph 84 of the NOPR, only one entity can be responsible for SOLs and that is the Transmission Operator.

Approved FAC-011-2, Requirement R1 states that the Reliability Coordinator shall have a documented methodology for determining SOLs within its area. Approved FAC-011-2, Requirement R3, Part 3.1 states that the model used by the Reliability Coordinator must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study. These requirements will dictate what external data a Reliability Coordinator needs to acquire to effectively monitor SOLs.

Proposed IRO-010-2, Requirement R1, Parts 1.1 – 1.2 show additions to the data specification concept to clarify that external data, sub-100 kV data, and applicable relay data are included.

Proposed IRO-002-4, Requirement R3: Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

Approved FAC-011-2, Requirement R1: The Reliability Coordinator shall have a documented methodology for use in developing SOLs (SOL Methodology) within its Reliability Coordinator Area.

Approved FAC-011-2, Requirement R3, Part 3.1: Study model (must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study.)

Proposed IRO-010-2, Requirement R1, Part 1.1: A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator.

Proposed IRO-010-2, Requirement R1, Part 1.2: Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.

Mapping of Revised TOP and IRO Reliability Standards to Address 2011 Southwest Outage Report Recommendations

The following table provides a mapping of the recommendations applicable to the Reliability Coordinator, Transmission Operator, and/or Balancing Authority contained in the 2011 Southwest Outage Report. Several of the recommendations are specific to the particular facts and circumstances of the 2011 Southwest Outage and are therefore not addressed here.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
1	All TOPs should conduct next-day studies and share the results with neighboring TOPs and the RC (before the next day) to ensure that all contingencies that could impact the BPS are studied.	Next-day studies are required by proposed TOP-002-4, Requirement R1. Sharing the results of those studies is required in proposed TOP-002-4, Requirement R3. Providing results to the Reliability Coordinator is required in proposed TOP-002-4, Requirement R6. **Proposed TOP-002-4, Requirement R1**: Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed TOP-002-4, Requirement R3:** Each Transmission Operator shall notify impacted NERC registered entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in those plan(s). **Proposed TOP-002-4, Requirement R6**: Each Transmission Operator shall provide its Operating Plan(s) for next-day operations identified in Requirement R2 to its Reliability Coordinator.
2	TOPs and BAs should ensure that their next-day studies are updated to reflect next-day operating conditions external to their systems, such as generation and	This is addressed in proposed TOP-002-4, through the revised definition of Operational Planning Analysis, and by the data specification standard

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
	transmission outages and scheduled interchanges, which can significantly impact the operation of their systems.	which dictates that external system data must be part of the data specification. **Proposed TOP-002-4, Requirement R1**: Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed TOP-003-3, Requirement R1, part 1.1:** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **1.1** A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
	TOPs and BAs should take the necessary steps, such as executing nondisclosure agreements, to allow the free exchange of next-day operations data between operating entities.	This item is addressed through proposed TOP-003-3. **Proposed TOP-003-3, Requirement R1:** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **Proposed TOP-003-3, Requirement R2:** Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. The data specification shall include, but not be limited to: **Proposed TOP-003-3, Requirement R5**: Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications using:
	Also, RCs should review the procedures in the region for coordinating next-day studies, ensure adequate data exchange among BAs and TOPs, and facilitate the next-day studies of BAs and TOPs.	Proposed IRO-008-2, Requirement R2 requires the Reliability Coordinator to have a coordinated Operating Plan(s) which will have required the Reliability Coordinator to have reviewed the plans submitted by its Transmission Operators and Balancing Authorities. **Proposed IRO-008-2, Requirement R2:** Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1 considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
3	TOPs and RCs should ensure that their next-day studies include all internal and external facilities (including those below 100 kV) that can impact BPS reliability.	This is addressed in the data specification standards. **Proposed TOP-003-3, Requirement R1, part 1.1:** A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. **Proposed IRO-010-2, Requirement R1, Part 1.1:** A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator.
4	WECC RC should improve its process for predicting interchanges in the day-ahead timeframe.	Interchange is now part of the list of things that a Reliability Coordinator must consider in the revised definition of Operational Planning Analysis. **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
5	WECC RE should ensure better integration and coordination of the various subregions' seasonal studies for the entire WECC system. To ensure a thorough seasonal planning process, at a minimum, WECC RE should require a full contingency analysis of	This recommendation is not applicable to the Reliability Coordinator, Transmission Operator, and/or Balancing Authority and is therefore not addressed here.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
	the entire WECC system, using one integrated seasonal study, and should identify and eliminate gaps between subregional studies. Individual TOPs should also conduct a full contingency analysis to identify contingencies outside their own systems that can impact the reliability of the BPS within their system and should share their seasonal studies with TOPs shown to affect or be affected by their contingencies.	The proposed TOP-003-3 states that Transmission Operators must gather external network data and proposed TOP-002-4 mandates sharing the results of studies. **Proposed TOP-003-3, Requirements R1, Part 1.1**: A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. **Proposed TOP-002-4, Requirement R3**: Each Transmission Operator shall notify impacted entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in those plan(s). While there is no explicit requirement for seasonal studies, the Reliability Coordinator has the authority to request such a study if it believes it is needed for reliability.
6	TOPs should expand the focus of their seasonal planning to include external facilities and internal and external sub-100 kV facilities that impact BPS reliability.	The proposed TOP-003-3 explicitly states that Transmission Operators must obtain external network and sub-100 kV data. **Proposed TOP-003-3, Requirements R1, Part 1.1** A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
		While there is no explicit requirement for seasonal studies, the Reliability Coordinator has the authority to request such a study if it believes it is needed for reliability.
7	TOPs should expand the cases on which they run their individual planning studies to include multiple base cases, as well as generation maintenance outages and dispatch scenarios during high load shoulder periods.	The revised definition of Operational Planning Analysis states that "projected system conditions" must be considered which would include generator outages and high load periods. **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
8	TOPs should include in the information they share during the seasonal planning process the overload relay trip settings on transformers and transmission lines that impact the BPS, and separately identify those that have overload trip settings below 150% of their normal rating, or below 115% of the highest emergency rating, whichever of these two values is greater.	The proposed TOP-003-3 states that Protection System data must be obtained. And the revised definition of Operational Planning Analysis states explicitly that Protection Systems must be included in studies. Sharing of results is addressed in proposed TOP-002-4. **Proposed TOP-003-3, Requirements R1, Part 1.2**: Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
		System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed TOP-002-4, Requirement R3**: Each Transmission Operator shall notify impacted entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in those plan(s). While there is no explicit requirement for seasonal studies, the Reliability Coordinator has the authority to request such a study if it believes it is needed for reliability.
9	WECC RE should take actions to mitigate these and any other identified gaps in the procedures for conducting near- and long-term planning studies. The September 8th event and other major events should be used to identify shortcomings when developing valid cases over the planning horizon and to identify flaws in the existing planning structure. WECC RE should then propose changes to improve the performance of planning studies on a subregional- and Interconnection-wide basis and ensure a coordinated review of TPs' and PCs' studies. TOPs, TPs, and PCs should develop study cases that cover critical system conditions over the planning horizon; consider the benefits and potential adverse effects of all protection systems, including RASs, Safety Nets (such as the SONGS separation scheme), and overload protection schemes; study the interaction of RASs and Safety Nets; and consider the impact of	This recommendation is not applicable to the Reliability Coordinator, Transmission Operator, and/or Balancing Authority and is therefore not addressed here. The proposed TOP-003-3 addresses these items. **Proposed TOP-003-3, Requirements R1, Parts1.1 and 1.2:** 1.1 A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
	elements operated at less than 100 kV on BPS reliability.	1.2 Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. Planning Coordinators and Transmission Planners are outside the scope of this project.
10	WECC dynamic models should be benchmarked by TPs against actual data from the September 8th event to improve their conformity to actual system performance. In particular, improvements to model performance from validation would be helpful in analysis of under and/or over frequency events in the Western Interconnection and the stability of islanding scenarios in the SDG&E and CFE areas.	This recommendation is not applicable to the Reliability Coordinator, Transmission Operator, and/or Balancing Authority and is therefore not addressed here.
11	TOPs should engage in more real-time data sharing to increase their visibility and situational awareness of external contingencies that could impact the reliability of their systems. They should obtain sufficient data to monitor significant external facilities in real time, especially those that are known to have a direct bearing on the reliability of their system, and properly assess the impact of internal contingencies on the SOLs of other TOPs. In addition, TOPs should review their real-time monitoring tools, such as State Estimator and RTCA, to ensure that such tools represent critical facilities needed for the reliable operation of the BPS.	Proposed TOP-003-3, Requirement R1, part 1.1 states that Transmission Operators must include external network data in their respective data specifications. **Proposed TOP-003-3, Requirement R1, Part 1.1**: A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. **Proposed TOP-001-3, Requirement R13:** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. The revised definition of Real-time Assessment includes potential post-contingency operating conditions.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
		Proposed Definition: Real-time Assessment - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed TOP-001-3, Requirement R13**: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
12	TOPs should take measures to ensure that their real-time tools are adequate, operational, and run frequently enough to provide their operators the situational awareness necessary to identify and plan for contingencies and reliably operate their systems.	The Project 2014-03 SDT has developed a requirement for the performance of a Real-time Assessment for Transmission Operators. **Proposed TOP-001-3, Requirement R13:** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
13	TOPs should review existing operating processes and procedures to ensure that post-contingency mitigation plans reflect the time necessary to take mitigating actions, including control actions, to return the system to a secure N-1 state as soon as possible but no longer than 30 minutes following a single contingency.	Proposed TOP-002-4, Requirement R2 states that Transmission Operators must have an Operating Plan to address SOL exceedances. Proposed TOP-001-3, Requirement R14 then states that the Transmission Operator must initiate its Operating Plan for mitigating and SOL exceedance. In addition, the SDT has developed a white paper on SOL Exceedance that clarifies the SDT position on SOL performance and SOL exceedance. **Proposed TOP-002-4, Requirement R2**: Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
	As part of this review, TOPs should consider the effect of relays that automatically isolate facilities without providing operators sufficient time to take mitigating measures**.**	**Proposed TOP-001-3, Requirement R14**: Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. The proposed TOP-003-3 explicitly requires the acquisition of Protection System data and the revised definitions of Operational Planning Analysis and Real-time Assessment call out Protection Systems as an item to be studied. **Proposed TOP-003-3, Requirement R1, Part 1.2:** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **Proposed: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations.

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
		(Real-time Assessment may be provided through internal systems or through third-party services.)
14	WECC RC should evaluate the effectiveness of its staffing level, training and tools. Based on the results of this evaluation, it should determine what actions are necessary to perform its functions appropriately as the RC and address any identified deficiencies.	This recommendation is specific to the WECC Reliability Coordinator and is therefore not addressed here.
15	TOPs should ensure procedures and training are in place to notify WECC RC and neighboring TOPs and BAs promptly after losing RTCA capabilities.	Proposed TOP-001-3, Requirement R9 states that Transmission Operators must notify impacted NERC registered entities of outages to monitoring and assessment capabilities. Training is outside the scope of this project. **Proposed TOP-001-3, Requirement R9**: Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected entities of sustained outages of telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities.
16	WECC should ensure consistencies in model parameters between its planning model and its RTCA model and should review all model parameters on a consistent basis to make sure discrepancies do not occur.	Model parameters are outside the scope of this project.
17	WECC, as the RE, should lead other entities, including TOPs and BAs, to ensure that all facilities that can adversely impact BPS reliability are either designated as part of the BES or otherwise incorporated into planning and operations studies and actively monitored and alarmed in RTCA systems.	Designation of BES facilities is outside the scope of this project. However, the revised standards do incorporate the need for sub-100 kV data and monitoring as deemed necessary by the reliability entities. **Proposed TOP-003-3, Requirement R1, Part 1.1**: A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
		Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. **Proposed IRO-010-2, Requirement R1, Part 1.1**: A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **Proposed TOP-001-3, Requirement R10**: Each Transmission Operator shall monitor the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: **1.1.** Within its Transmission Operator Area: **1.1.1.** Facilities, **1.1.2.** The status of Special Protection Systems, and **1.1.3.** Non-BES facilities identified as necessary by the Transmission Operator and **1.2.** Within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator: **1.2.1.** Facilities, **1.2.2.** Status of Special Protection Systems, and **1.2.3.** Non-BES facilities. **Proposed IRO-002-4, Requirement R4**: Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
		the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
19, 20, 22, 23, 25, 26	About coordination of SPS/RAS at the RC and TOP level.	Coordination of Special Protection Systems and Remedial Action Schemes is addressed in approved PRC-001-1.1a. Any changes to Protection System coordination issues is outside the scope of this project. Monitoring is addressed in proposed TOP-001-3, Requirement R10 and proposed IRO-002-4, Requirement R4. **Proposed TOP-001-3, Requirement R10**: Each Transmission Operator shall monitor the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: **1.3.** Within its Transmission Operator Area: **1.3.1.** Facilities, **1.3.2.** The status of Special Protection Systems, and **1.3.3.** Non-BES facilities identified as necessary by the Transmission Operator and **1.4.** Within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator: **1.4.1.** Facilities, **1.4.2.** Status of Special Protection Systems, and **1.4.3.** Non-BES facilities. **Proposed IRO-002-4, Requirement R4:**

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
		Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
27	TOPs should have: (1) the tools necessary to determine phase angle differences following the loss of lines; and (2) mitigation and operating plans for reclosing lines with large phase angle differences.	(1) Phase angle calculation tools are outside the scope of this project. (2) Consideration of phase angle limitations has been added to the proposed definitions of Real-time Assessment (RTA) and Operational Planning Analysis (OPA). **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed Definition: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment

#	Recommendation	Mapping to Proposed TOP/IRO Reliability Standards
	TOPs should also train operators to effectively respond to phase angle differences. These plans should be developed based on the seasonal and next-day contingency analyses that address the angular differences across opened system elements.	limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) While there is no explicit requirement for seasonal studies, the Reliability Coordinator has the authority to request such a study if it believes it is needed for reliability. Training is outside the scope of this project.

Project 2014-03 - Revision of TOP/IRO Reliability Standards

Resolution of Issues and Directives

The following table contains a list of all FERC directives, industry issues, and Independent Expert Review Panel (IERP) recommendations associated with the standards being revised in Project 2014-03, with proposed resolutions.

Standard	Source	Language	Resolution
IRO-001-3	FERC Order 693	892. Consider commenters' suggestions as part of the standards development process. APPA supports the approval of the Reliability Standard but expresses concern that the Version 1 standard does not include Measures that correspond to Requirements R2 and R9. APPA emphasizes the need for Measures corresponding to Requirement R9, which requires the reliability coordinator to act in the interests of reliability for the overall reliability coordinator area and the Interconnection before the interests of any other entity. APPA supports Requirement R8 with the extended applicability, provided that applicability is determined by reference to the NERC compliance registry. APPA agrees that the regional reliability organization should be eliminated as an applicable entity and suggests it be replaced with Regional Entities.	The SDT has added measures for all requirements. The Regional Reliability Organization has been removed from the standards.
IRO-001-3	FERC Order 693	893. Consider commenters' suggestions as part of the standards development process. FirstEnergy	The SDT has considered the commenter's suggestions and believes that safety refers to any

Standard	Source	Language	Resolution
		suggests that NERC clarify whether Requirement R8, which requires entities to comply with a reliability coordinator directive "unless such actions would violate safety, equipment or regulatory or statutory requirements," refers to personnel safety, equipment safety or both. In addition, it suggests the establishment of a chain of command so that, for example, if a generator receives conflicting instructions from a balancing authority and a transmission operator, it can determine which instruction governs.	type of safety including personal or equipment and that no additional wording is necessary. If a generator receives conflicting Operating Instructions, the generator should contact the Reliability Coordinator for clarification. The NERC Functional model refers to the Reliability Coordinator as overall authority.
IRO-001-3	FERC Order 693	895. California Cogeneration comments that the Reliability Standard fails to address the operational limitations of QFs because they have contractual obligations to provide thermal energy to their industrial hosts. It contends that a QF can be directed to change operations only in the case of a system emergency, pursuant to 18 CFR § 292.307.	The SDT has considered the comments and believes that a Reliability Coordinator can direct a Qualifying Facility (registered as a GO or GOP) to act through the issuance of Operating Instructions. Therefore, no additional requirements are necessary.
IRO-001-3	FERC Order 693	896. Eliminate the references to the regional reliability organization as an applicable entity. Paragraph 896. In the NOPR, the Commission proposed to approve the Reliability Standard as mandatory and enforceable. In addition, as a separate action under section 215(d)(5), the NOPR proposed to direct the ERO to develop modifications to Requirement R1 to substitute "Regional Entity" for "regional reliability organization" and reflect	The SDT has removed all references to the Regional Reliability Organization from the standards.

Standard	Source	Language	Resolution
		NERC's Rules of Procedure for registering, certifying and verifying entities, including reliability coordinators. Commenters do not raise any concerns regarding the proposed action. Accordingly, for the reasons stated in the NOPR, the Commission approves IRO-001-1 as mandatory and enforceable. In addition, for the reasons discussed in the NOPR, the Commission directs the ERO to develop modifications to the Reliability Standard through the Reliability Standards development process that reflect the process set forth in the NERC Rules of Procedures and eliminate the regional reliability organization as an applicable entity.	
IRO-001-3	FERC Order 693	897. Consider adding measures and levels of non-compliance. Further, the Commission directs the ERO to consider adding Measures and Levels of Non-Compliance in the Reliability Standard as requested by APPA.	The SDT has added measures and Violation Severity levels (VSLs) (which replaced levels of non-compliance) for each requirement.
IRO-001-3	FERC's December 20, 2007 and April 4, 2008 Orders	On March 4, 2008, NERC submitted a compliance filing in response to a December 20, 2007 Order, in which the Commission reversed a NERC decision to register three retail power marketers to comply with Reliability Standards applicable to load serving entities (LSEs) and directed NERC to submit a plan describing how it would address a possible "reliability gap" that NERC asserted would result if the LSEs were not registered. NERC's compliance	The SDT has established requirements that apply to the Load-Serving Entity. **Proposed TOP-001-3, Requirement R3**: **R3.** Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it

Standard	Source	Language	Resolution
		filing included the following proposal for a short-term plan and a long-term plan to address the potential gap: Short-term: Using a posting and open comment process, NERC will revise the registration criteria to define “Non-Asset Owning LSEs” as a subset of Load Serving Entities and will specify the reliability standards applicable to that subset. · Longer-term: NERC will determine the changes necessary to terms and requirements in reliability standards to address the issues surrounding accountability for loads served by retail marketers/suppliers and process them through execution of the three-year Reliability Standards Development Plan. In this revised Reliability Standards Development Plan, NERC is commencing the implementation of its stated long-term plan to address the issues surrounding accountability for loads served by retail marketers/suppliers. The NERC Reliability Standards Development Procedure will be used to identify the changes necessary to terms and requirements in reliability standards to address the issues surrounding accountability for loads served by retail marketers/suppliers. Specifically, the following description has been	would violate safety, equipment, regulatory, or statutory requirements.

Standard	Source	Language	Resolution
		incorporated into the scope for affected projects in this revised Reliability Standards Development Plan that includes a standard applicable to Load Serving Entities: Source: FERC's December 20, 2007 Order in Docket Nos. RC07-004-000, RC07-6-000, and RC07-7-000 Issue: In FERC's December 20, 2007 Order, the Commission reversed NERC's Compliance Registry decisions with respect to three load serving entities in the Reliability First (RFC) footprint. The distinguishing feature of these three LSEs is that none own physical assets. Both NERC and RFC assert that there will be a "reliability gap" if retail marketers are not registered as LSEs. To avoid a possible gap, a consistent, uniform approach to ensure that appropriate Reliability Standards and associated requirements are applied to retail marketers must be followed. Each drafting team responsible for reliability standards that are applicable to LSEs is to review and change as necessary, requirements in the reliability standards to address the issues surrounding accountability for loads served by retail marketers/suppliers. For additional information see: · FERC's December 20, 2007 Order (http://www.nerc.com/files/LSE_decision_order.pdf)	

Standard	Source	Language	Resolution
		· NERC's March 4, 2008 (http://www.nerc.com/files/FinalFiledLSE3408.pdf), · FERC's April 4, 2008 Order (http://www.nerc.com/files/AcceptLSECompFiling-040408.pdf), and · NERC's July 31, 2008 (http://www.nerc.com/files/FinalFiled-CompFiling-LSE-07312008.pdf) compliance filings to FERC on this subject.	
IRO-001-3	Fill in the Blank Team	Remove ", sub-region, or interregional coordinating group" from R1	Terms have been removed from the standard.
IRO-001-3	Version 0 Team	Inability to perform needs to be communicated	Clarity has been provided to address this issue throughout the various standards.
IRO-001	Version 0 Team	What is meant by 'interest of other entity'?	The SDT proposes to retire Requirement R9. All Reliability Coordinator Standard Requirements are developed so that the Reliability Coordinator shall act in the interest of reliability for the Reliability Coordinator Area and the Interconnection.
IRO-001-3	Fill in the Blank Team	Consider removing "Standards of conduct are necessary to ensure the Reliability Coordinator does not act in a manner that favors one market	The purpose statement has been revised accordingly.

Standard	Source	Language	Resolution
		participant over another." from the Purpose section of the standard.	Purpose: To establish the responsibility of Reliability Coordinators to act or direct other entities to act to prevent an Emergency.
IRO-001-3	NERC Audit Observation Team	All applicable registered functions shall comply with RC directives unless such actions would violate safety, equipment or regulatory or statutory requirements. Inform the RC immediately of the inability to perform such directives. For audit purposes, what is acceptable evidence?	Measure M2 contains the provisions for suitable evidence. **Proposed IRO-001-4, Measure M2**: **M2**. Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall have and provide evidence which may include, but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it complied with its Reliability Coordinator's Operating Instruction, unless the instruction could not be physically implemented, or such actions would have violated safety, equipment, regulatory or statutory requirements. In such cases, the Transmission Operator, Balancing Authority, Generator Operator, or Distribution Provider shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Reliability Coordinator’s Operating Instruction. If no event has occurred, the Transmission Operator, Balancing Authority, Generator Operator, or

Standard	Source	Language	Resolution
			Distribution Provider may provide an attestation that an event has not occurred.
IRO-001-3	VRFs Team	R6 - Since the RC must be NERC certified, it stands to reason that anyone performing RC tasks should be certified. However, since the RC still retains the accountability for actions, and requirement 4 handles the agreements, this requirement is a medium risk.	The SDT is proposing to retire this requirement. The Reliability Coordinator may delegate tasks but cannot delegate the responsibility for these tasks. Therefore, it is not necessary to mandate that delegated tasks must be carried out by certified personnel as it is the responsibility of the Reliability Coordinator to ensure that the task is carried out.
IRO-001-3	IERP	Requirement R1 content is incomplete. IERP recommended addressing 3 concepts as follows: RC has the authority to direct others to act. RC has the obligation to direct others to act to prevent identified events or mitigate the magnitude or duration of actual events that result in an Emergency or Adverse Reliability Impact.	The NERC Functional Model v5 spells out the authority of the Reliability Coordinator on page 30 under the description of the Reliability Coordinator functional entity. Proposed IRO-001-4, Requirement addresses the obligation of the Reliability Coordinator to direct others to act. **Proposed IRO-001-4, Requirement R1**: **R1**. Each Reliability Coordinator shall act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions. The term 'Reliability Directive' has been replaced with the defined term 'Operating Instruction.' Proposed COM-002-4 determines the protocol for issuing Operating Instructions.

Standard	Source	Language	Resolution
		When directing others to act in accordance with this requirement, a RC must identify its directive as a "Reliability Directive". Consider consolidating with other authority-related standards and COM-003 in a single Authority standard as follows: Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have the requirement and authority to take actions, including issuing a Reliability Directive, to prevent, mitigate and respond to an Emergency or Adverse Reliability Impact.	The SDT believes that a separate authority standard is not necessary. Existing standards and requirements in conjunction with the Functional Model v5 are sufficient to address the authority issue raised here.
IRO-001-3	IERP	IERP viewed Requirement R2 language as unclear and unable to be practically implemented. Questioned whether equipment requirements were a valid reason for not complying with RC direction. IERP proposed covering this requirement under a single Authority standard as follows: Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with directions from a Reliability Coordinator, Transmission Operator or Balancing Authority under R1 unless it communicates to the RC, TOP or BA that it cannot because the direction cannot be physically implemented or unless such actions would violate	The SDT does not agree with the IERP statement/suggestion. The SDT feels this is more of a compliance issue and should not be addressed in Real-time.

Standard	Source	Language	Resolution
		safety, equipment, regulatory, or statutory requirements.	
IRO-001-3	IERP	IERP viewed content of Requirement R3 as incomplete by not requiring a reason for not complying with the RC's direction IERP recommended consolidating into a single Authority standard (see requirement above, which would replace both IRO-001 requirements R2 and R3)	The SDT does not agree with the IERP statement/suggestion. The SDT feels this is more of a compliance issue and should not be addressed in Real-time.
IRO-002-1	FERC Order 693	905 - Require a minimum set of tools that must be made available to the reliability coordinator. Further, consistent with the NOPR, the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe that this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions.	This directive is beyond the scope of this project and will be resolved in a future project.
IRO-002	Version 0 Team	R5 – define synchronized information system	The term is not used in the revised standards.
IRO-002	Version 0 Team	R7 – define 'adequate' tools and 'wide-area'	The terms are not used in the revised standards
IRO-002-1	Version 0 Team	Words such as 'easily understood' and 'particular emphasis' need to be tightened	The terms are not used in the revised standards
IRO-002-3	IERP	IERP viewed Requirement R1 as incomplete. RC also needs to approve any other work being done on the tools, hardware/software/telecom systems within the RC that could affect the quality and the content of the data coming into the control center.	Proposed IRO-002-4, Requirement R2 addresses this issue. **Proposed IRO-002-4, Requirement R2**: **R2**. Each Reliability Coordinator shall provide its System Operators with the authority to approve

Standard	Source	Language	Resolution
		Also consider consolidating with Project 2009-02 Requirement R1 was proposed for consolidation under a new Authority standard: Authority R2 Each RC, TOP and BA shall have the requirement and authority to approve, deny or cancel planned outages of its EMS, telecom and other hardware, and associated analysis tools.	planned outages and maintenance of its telecommunication, monitoring and analysis capabilities. The Project 2014-03 SDT is addressing directives assigned to Project 2009-02 as well as issues identified in the NOPR on the TOP/IRO standards. The SDT believes that a separate authority standard is not necessary. Existing standards and requirements in conjunction with the Functional Model v5 are sufficient to address the authority issue raised here.
IRO-002-3	IERP	IERP viewed Requirement R2 as incomplete. Procedures need to address not only tools outages, but also tools maintenance or other inhibitors to quality performance of analysis tools. Also consider consolidating with Project 2009-02	The SDT added 'maintenance' approval to proposed IRO-002-3, Requirement R3. This includes all work being done on monitoring and analysis capabilities and not just those that will cause an outage. **Proposed IRO-002-4, Requirement R2**: **R2.** Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities.

Standard	Source	Language	Resolution
			The Project 2014-03 SDT is addressing directives assigned to Project 2009-02 as well as issues identified in the NOPR on the TOP/IRO standards.
IRO-003	Order 693	914. … we adopt in the Final Rule the proposal to direct that the ERO develop a modification to the Reliability Standard through the Reliability Standards development process to create criteria to define the term "critical facilities" in a reliability coordinator's area …	The term is not used in the revised standards. The proposed data specification concept allows for the Reliability Coordinator to ask for any reliability related data that it needs in order to fulfill its reliability tasks thus obviating the need for a specific criteria for determining critical facilities. And specific requirements for monitoring have been added for the Reliability Coordinator. **Proposed IRO-010-2, Requirement R1:** **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed IRO-002-4, Requirement R3:** **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
IRO-004-1	Order 693	934. In response to APPAs concern that NERC did not provide a Measure for each Requirement, we reiterate that it is in the EROs discretion whether each	Measures have been added to all requirements.

Standard	Source	Language	Resolution
		Requirement requires a corresponding Measure. The ERO should consider this issue through the Reliability Standards development process.	
IRO-004-1	Order 693	935. …direct the ERO to modify IRO-004-1 through the Reliability Standards development process to require the next-day analysis to identify control actions that can be implemented and effective within 30 minutes after a contingency	The SDT has addressed this issue in proposed IRO-008-2 and TOP-002-4 as well as through the revised definitions of Operational Planning Analysis and Real-time Assessment. SOLs must be controlled according to the Operating Plan which is set up on time-based facility ratings (see SOL Exceedance White Paper for further details). IROLs are controlled to the IROL T_v which by definition is always less than 30 minutes. Approved IRO-009-1, Requirement R1 also addresses this item. **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Standard	Source	Language	Resolution
			Proposed Definition: Real-time Assessment - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment may reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed IRO-008-2, Requirement R1**: **R1**. Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area. **Proposed IRO-008-2, Requirement R2**: **R2**. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.

Standard	Source	Language	Resolution
			Proposed TOP-002-4, Requirement R1: **R1.** Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed TOP-002-4, Requirement R2**: **R2**. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. **Proposed IRO-009-1, Requirement R1**: **R1.** For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs.
IRO-005	FERC Order 693	520. Further, we clarify that we did not propose to require an entity to inform its reliability coordinator of every action it takes. Instead, the proposed directive included a Requirement for the reliability coordinator to assess and approve only those actions that have	The SDT addresses the need for Reliability Coordinator assessment and approval on a requirement by requirement basis. For example, see proposed IRO-008-2, Requirements R3 and R6.

Standard	Source	Language	Resolution
		impacts beyond the area views of transmission operators and balancing authorities. We remain convinced that it is the reliability coordinator's responsibility to ensure Reliable Operation of its reliability coordinator area. The reliability coordinator must also ensure that actions taken by operating entities under its authority will not have wide-area impacts that would adversely impact Reliable Operation of the Bulk-Power System. Therefore, we adopt the proposed directive as stated in the NOPR. 525. Accordingly, we direct the ERO to include a Requirement for the reliability coordinator to assess and approve actions that have impacts beyond the area views of transmission operators or balancing authorities, including how to determine whether an action needs to be assessed by the reliability coordinator. This Requirement is best developed under the Reliability Standards development process including the consideration whether this Requirement should be included in this communications Reliability Standard or an operating Reliability Standard.	**Proposed IRO-008-2, Requirement R2**: **R2**. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. **Proposed IRO-008-2, Requirement R5**: **R5**. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area.
IRO-005-1	FERC Order 693	946. "Conduct a survey on IROL practices and actual operating experiences by requiring reliability coordinators to report any violations of IROLS, their causes, the date and time, the durations and magnitudes in which actual operations exceeds IROLs to NERC.	Completed and filed in Oct 2008
IRO-005-1	FERC Order 693	950- Provide further clarification that reliability coordinators and transmission operators direct control	The SDT has proposed IRO-001-4, Requirement R1 to address the Commission's suggestion for

Standard	Source	Language	Resolution
		actions, not LSEs as part of the standard development process. We do not share TAPS' concern regarding LSEs initiating load shedding as their own control action to respect IROLs or SOLs. The appropriate control actions to respect IROLs and SOLs are the responsibilities of a reliability coordinator and transmission operator. If load shedding is required, it is the responsibility of a reliability coordinator or a transmission operator to direct the appropriate entities including LSEs to carry it out. However, we urge the ERO to provide further clarification in this regard and include TAPS' concern in developing the modification of this Reliability Standard.	clarification. Proposed TOP-001-4, Requirement R1 also addresses this issue. **Proposed IRO-001-4, Requirement R1**: **R1**. Each Reliability Coordinator shall act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions. **Proposed TOP-001-4, Requirement R1:** **R1.** Each Transmission Operator shall act to address the reliability of its Transmission Operator Area via direct actions or by issuing Operating Instructions.
IRO-005-1	FERC Order 693	951-"Measures and levels of non-compliance specific to IROL violations must be commensurate with the magnitude, duration, frequency, and causes of the violations and whether these occur during normal or contingency conditions. Accordingly, the Commission approves Reliability Standard IRO-005-1 as mandatory and enforceable. Further, because IRO-005-1 has no Measures or Levels of Non-Compliance, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission directs the ERO to develop a modification to IRO-005-1through the Reliability Standards development process that includes Measures and Levels of Non-Compliance. The Commission further directs that the Measures and Levels of Non-Compliance specific to IROL violations must be commensurate with the magnitude, duration,	The SDT has added measures and VSLs (which replaced levels of non-compliance) for each requirement.

Standard	Source	Language	Resolution
		frequency and causes of the violations and whether these occur during normal or contingency conditions.	
IRO-005-1	Fill in the Blank Team	R14 has regional reference	The term is not used in the revised standards.
IRO-005-1	Version 0 Team	R10, 11 & 12 – RA not empowered to do this	RA is no longer an applicable entity in the revised standards.
IRO-005-4	IERP	Requirement R1 is incomplete--needs to include Emergency. Requirement R1 reads: When the results of an Operational Planning Analysis or Real-time Assessment indicate an anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area, each Reliability Coordinator shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. Also - there are gaps between the old std IRO-005-3 R2 to IRO-005-4: missing is: There is a possible gap for RC in IRO-005-4 regarding RC handling emergencies as this has been dropped from IRO-005-3.1 Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard	The SDT replaced Adverse Reliability Impact with Emergency in all requirements. Emergency is a broader term. Proposed IRO-002-4, Requirement R3 addresses the issue of monitoring. **Proposed IRO-002-4, Requirement R3**:

Standard	Source	Language	Resolution
		and Disturbance Control Standard requirements. (Minus strikethrough) FROM IRO-005-3 R9: Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows.	**R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. The SDT believes all appropriate items, including Special Protection System evaluation and awareness is addressed through the revised definitions of Real-time Assessment and Operations Planning Analysis. The data specification has been revised to explicitly address Special Protection Systems. **Proposed: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment may reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Standard	Source	Language	Resolution
			Proposed: Operational Planning Analysis - An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed IRO-010-2, Requirement R1, Part 1.2:** **R1. Part 1.2** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.
		From IRO-005-3 R10: In instances where there is a difference in derived limits, the Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.	The SDT has addressed the issue of resolving differences in limits in proposed TOP-001-3, Requirement R18. **Proposed TOP-001-3, Requirement R18**: **R18.** Each Transmission Operator shall operate to the most limiting parameter in instances where there is a difference in SOLs.

Standard	Source	Language	Resolution
		Recommend consolidating with IRO-008 R3.	The SDT has consolidated requirements and standards as it believes appropriate.
IRO-005-4	IERP	The proposed standard creates a gap in outage coordination by proposing to retire IRO-005-3 R6. This could be resolved through an Authority standard as proposed by the IERP From IRO-005-3 R6: The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.	The SDT has proposed a new standard, IRO-017-1 Outage Coordination, to address this issue.
IRO-005-4	IERP	Requirement R2 should also include Emergency Requirement R2 reads: Each Reliability Coordinator that identifies an anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when the problem has been mitigated. Note: there is a possible gap for RC in IRO-005-4 regarding RC handling emergencies as this has been dropped from IRO-005-3.1	The SDT replaced Adverse Reliability Impact with Emergency in all requirements for consistency. The definition of Adverse Reliability Impact is encompassed in Emergency.

Standard	Source	Language	Resolution
		Recommend moving to IRO-008 and create an R4	
IRO-014-2	IERP	Gap in Requirement R1 - Need to identify RC's authority to direct another RC to take action - suggestion: create another Requirement, i.e., R6 (in proposed authority standard). Each RC shall comply with directions from another RC under R1 unless it communicates to the other RC that it cannot because compliance with the direction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements.	The SDT does not agree with this recommendation. A Reliability Coordinator does not direct another Reliability Coordinator. Proposed IRO-014-3 describes how to coordinate between Reliability Coordinators.
IRO-014-2	IERP	R2 is administrative and should be deleted	The SDT believes that this is not strictly an administrative requirement and serves a reliability purpose.
IRO-014-2	IERP	R3 implements plan from R1; it should be combined with R1	The SDT believes that combining the requirements would create a complex requirement with multiple objectives that would be difficult to measure for compliance.
IRO-014-2	IERP	Requirement R4 is administrative and should be deleted.	The SDT believes that this is not strictly an administrative requirement and serves a reliability purpose.
IRO-014-2	IERP	R5 should require notification of “all IMPACTED RCs"; not "ALL"	The SDT has added ‘impacted’ to appropriate locations in the standards.
IRO-014-2	IERP	R6 should be consolidated with other standards that incorporate the concept of operating to the most conservative for reliability - IRO-009-1 R5	Approved IRO-009-1 only addresses IROLs. Proposed IRO-014-3 addresses all limits.

Standard	Source	Language	Resolution
		R6 reads: During each instance where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact each impacted Reliability Coordinator shall operate as though the problem exists.	
IRO-014-2	IERP	Requirement R7 should be retired. The reliability objective is covered under R6, and also supported by IRO-009-1 R5	The SDT believes that the two requirements are sufficiently distinct to warrant separateness. Requirement R6 speaks to actual operations. Requirement R7 speaks to having an established plan. The SDT believes that reliability is best served by having a plan to follow.
IRO-014-2	IERP	Requirement R8 should be retired. The reliability objective is covered under R6.	The SDT does not agree with this recommendation. Requirement R8 is a separate requirement.
IRO-016	VRF's Team	R1.2.1 & R2 – ambiguous	Requirement R2 was approved for retirement by FERC effective January 2014. Requirement R1, part 1.2.1 was incorporated in the set of requirements in proposed IRO-014-3, and ambiguous language has been deleted.
TOP-001-1	FERC Order 693	1580 - Consider adding other measures and levels of non-compliance.	Measures and VSLs have been assigned to all requirements.
TOP-001-1	FERC Order 693	1585 - Clarify the definition of "emergency" and define the criteria for entering into the various states. Also define the authority for declaring these states.	The SDT feels that the TOP-001 standard should be restricted to Transmission System operations and that definition of operating states more correctly belong in EOP-001 as pointed out in Order 693, paragraph 560. To make certain that the issue is handled there, the SDT has entered an official item in

Standard	Source	Language	Resolution
			the NERC database of project issues in this regard. This will require the SDT working on revisions to EOP-001 to formally address this concern. EOP-001 is listed in the Reliability Standards Development Plan under Project 2009-03.
TOP-001-1	FERC Order 693	1588 - Consider Santa Clara's comments to provide that the transmission operator may notify the reliability coordinator or the balancing authority that it is removing facilities from service as part of the standards development process.	This concern is addressed in proposed TOP-001-3, Requirement R8. **Proposed TOP-001-3, Requirement R8**: **R8.** Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency.
TOP-001-1	Version 0 Team	What is 'clear decision making authority'?	The term is not used in the revised standards
TOP-001-1	Version 0 Team	Need to define single, central communications point during emergencies	This is an issue for COM standards.
TOP-001-1	Version 0 Team	Some emergencies will require follow up notification as opposed to immediate	Requirements have been revised to eliminate confusion.
TOP-001-1	Version 0 Team	Define emergency	The SDT feels that the TOP-001 standard should be restricted to Transmission System operations and that definition of operating states more correctly belong in EOP-001 as pointed out in Order 693, paragraph 560. To make certain that the issue is handled there, the SDT has entered an official item in the NERC database of project issues in this regard. This will require the SDT working on revisions to EOP-001 to formally address this concern. EOP-001 is

Standard	Source	Language	Resolution
			listed in the Reliability Standards Development Plan under Project 2009-03.
TOP-001-1	Version 0 Team	Need to expand included entities	Applicability has been reviewed by the SDT and changed as required.
TOP-001-2	IERP	Requirement R1 phrase "unless it violates requirements" is too permissive or there may be a better way to phrase it Consider consolidating TOP-001-2 Requirements R1 and R2 and all other standards requirements related Authority to into a single Authority standard as follows: Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with directions from a Reliability Coordinator, Transmission Operator or Balancing Authority under [Authority standard R1] unless it communicates to the RC, TOP or BA that it cannot because the direction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements.	The SDT believes that this is well understood language. The SDT believes that a separate authority standard is not necessary. Existing standards and requirements in conjunction with the Functional Model v5 are sufficient to address the authority issue raised here.
TOP-001-2	IERP	The language “emergency assistance” in Requirement R4 is unclear. When and how must assistance be rendered, and what type? BA’s should be included as functional entity. Consider moving R4 to EOP standards (this is an "emergency" operating requirement)	The SDT revised the language for clarity and included the Balancing Authority. **Proposed TOP-001-3, Requirement R7:** **R7**. Each Transmission Operator shall assist other Transmission Operators, if requested and able, provided that the requesting entity has implemented its Emergency procedures, unless such assistance cannot be physically implemented or would violate

Standard	Source	Language	Resolution
			safety, equipment, regulatory, or statutory requirements.
TOP-001-2	IERP	Requirement R5 should also include notification of Emergencies (in addition to ARI), and should include Bas. R5 states: Each Transmission Operator shall inform its Reliability Coordinator and other Transmission Operators of its operations known or expected to result in an Adverse Reliability Impact on those respective Transmission Operator Areas unless conditions do not permit such communications. Examples of such operations are relay or equipment failures, and changes in generation, Transmission, or Load.	The SDT added impacted Balancing Authorities. The SDT replaced Adverse Reliability Impact with Emergency in all requirements for consistency. The definition of Adverse Reliability Impact is encompassed in Emergency. **Proposed TOP-001-3, Requirement R8:** **R8**. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency.
TOP-001-2	IERP	R6 needs to include real time outages of telecom as well as planned outages. Requirement should be covered under COM-001	The SDT added telecommunications to the requirement. **Proposed TOP-001-2, Requirement R9:** **R9**. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and known impacted interconnected entities of outages of telemetering and telecommunication equipment, control equipment, monitoring and assessment capabilities, and associated communication channels between it and the affected entities. COM standards are not in scope for this project.

Standard	Source	Language	Resolution
TOP-001-2	IERP	Requirement R8 does not cover all information needed for reliability. It should cover 1) SOLs within a TOP's/RC's footprint, 2) SOLs that are within one TOP's/RC's footprint that could affect another entity and 3) an SOL that spans into 2 TOP's/RC's footprints The requirement should also obligate the TOP to also inform impacted TOPs (The entity that could be impacted must tell the TOP that could impact them that it needs the info)	The SDT has addressed issue 1 in proposed TOP-001-3, Requirement R15. SOLs that cross boundaries are taken care of at the Reliability Coordinator level. **Proposed TOP-001-3, Requirement R15:** **R15**. Each Transmission Operator shall inform its Reliability Coordinator of actions taken to return the system to within limits when a SOL has been exceeded.
TOP-002-3	Order 693	1597. Consider ISO-NE recommendation that the reference to "transmission service provider" in TOP-002-2 R12 be replaced by TOP and/or TO. Requirement R12 states: The Transmission Service Provider shall include known SOLs and IROLs within its area and neighboring areas in the determination of transfer capabilities, in accordance with filed tariffs, and or regional Total Transfer Capability and Available Transfer Capability calculation processes.	This requirement is now addressed by approved MOD-028-2, Requirement R6.1; approved MOD-029-1a, Requirement R3; and approved MOD-030-2, Requirement R2.4. Because IROLs by definition are a subset of SOLs, IROLs are included. **Approved MOD-028-2, Requirement R6.1:** **R6.1** Determine the incremental Transfer Capability for each ATC Path by increasing generation and/or decreasing load within the source Balancing Authority area and decreasing generation and/or increasing load within the sink Balancing Authority area until either: A System Operating Limit is reached on the Transmission Service Provider's system, or

Standard	Source	Language	Resolution
			A SOL is reached on any other adjacent system in the Transmission model that is not on the study path and the distribution factor is 5% or greater. **Approved MOD-029-1a, Requirement R3**: **R3.** Each Transmission Operator shall establish the TTC at the lesser of the value calculated in R2 or any System Operating Limit (SOL) for that ATC Path. Approved MOD-030-2, Requirement R2.4: Establish the TFC of each of the defined Flowgates as equal to: For thermal limits, the System Operating Limit (SOL) of the Flowgate. For voltage or stability limits, the flow that will respect the SOL of the Flowgate.
TOP-002-3	Order 693	1598. Requires next-day analysis of minimum voltages at nuclear power plants auxiliary power buses.	The data specification standard require that a Reliability Coordinator and Transmission Operator acquire all of the data necessary for them to fulfill their reliability functions including non-BES data as necessary. Next-day analysis is performed using Operational Planning Analysis. Approved NUC-001-2.1 also applies here. **Proposed IRO-010-2, Requirement R1 and Part 1.1:** **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-

Standard	Source	Language	Resolution
			time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: 1.1 A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **Proposed TOP-003-3, Requirement R1 and Part 1.1**: **R1**. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1 A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. **Proposed Definition: Operational Planning Analysis** - An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs

Standard	Source	Language	Resolution
			including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
TOP-002-3	Order 693	1600. Address critical energy infrastructure confidentiality as part of the routine standard development process	The data specification standards now contain provisions for addressing security of data. **Proposed IRO-010-2, Requirement R3, Part 3.3**: **R3. Part 3.3** A mutually agreeable security protocol. **Proposed TOP-003-3, Requirement R5, Part 5.3:** **R5. Part 5.3** A mutually agreeable security protocol.
TOP-002-3	Order 693	1601. …direct the ERO to modify Reliability Standard TOP-002-2 to require the next-day analysis for all IROLs to identify and communicate control actions to system operators that can be implemented within 30 minutes following a contingency to return the system to a reliable operating state and prevent cascading outages	SOLs are the responsibility of the Transmission Operator and IROLs are the responsibility of the Reliability Coordinator. This issue is addressed in proposed changes to the IRO standards. Approved IRO-009-1, Requirement R1 also applies. **Proposed IRO-008-2, Requirement R1**: **R1**. Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area.

Standard	Source	Language	Resolution
			Proposed IRO-008-2, Requirement R2: **R2**. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. **Proposed IRO-008-2, Requirement R3**: **R3**. Each Reliability Coordinator shall notify impacted entities identified in its Operating Plan(s) cited in Requirement R2 as to their role in that plan(s). **Approved IRO-009-1, Requirement R1:** **R1.** For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs.
TOP-002-3	Order 693	1606. Commenters did not take issue with the proposed interpretation of the term deliverability as the ability to deliver the output from generation resources to firm	The SDT agrees and has addressed the issue in proposed TOP-002-3, Requirement R4, part 4.4:

Standard	Source	Language	Resolution
		load without any reliability criteria violations for plausible generation dispatches. The Commission adopts this proposed interpretation. In order to ensure the necessary clarity, the term as used in Requirement R7 of TOP-002-2 should be understood in this manner.	Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.4 Capacity and energy reserve requirements, including deliverability capability.
TOP-002-3	Order 693	1608. Require simulation contingencies to match what will actually happen in the field	The SDT has revised the definitions of Operational Planning Analysis and Real-time Assessment accordingly. The definitions require Contingencies to match field conditions as they require evaluations against projected system conditions for Operational Planning Analysis and system conditions for Real-time Assessment. **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed Definition: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The

Standard	Source	Language	Resolution
			assessment may reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)
TOP-002-3	IERP	Requirement R1. TOP-008-1 R4 needs to be incorporated into TOP-002-3 requirement R1. Also - the definition of "Operational Planning Analysis" provides too much latitude in time. Recommend removing the parenthesis in the definition; the entity will make the determination and document (documentation is evidence) the applicability of what it uses for their next day study	The SDT revised the definition of Operating Planning Analysis and Requirement R1. **Proposed: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed TOP-002-3, Requirement R1**: **R1.** Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next

Standard	Source	Language	Resolution
			day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs).
TOP-003-0	FERC Order 693	1620. …direct the ERO to develop a modification to TOP-003-0 that requires the communication of scheduled outages to all affected entities well in advance to ensure reliability and accuracy of ATC calculations.	The SDT has developed proposed IRO-017-1 Outage Coordination to address these type of issues, specifically proposed IRO-017-1, Requirement R1. This new standard takes into account the recommendations from the Independent Expert Review Panel and SW Outage Report and brings all of the various outage coordination issues into one cohesive standard. **Proposed IRO-017-1, Requirement R1:** **R1**. Each Reliability Coordinator shall develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area.
TOP-003-0	FERC Order 693	1621 - Incorporate an appropriate lead time for planned outages using suggestions from the various commenters. We direct the ERO to modify the Reliability Standard to incorporate an appropriate lead time for planned outages.	The SDT posed a question on this issue as a fact finding exercise in the second posting of Project 2007-03 in order to assist them in making a decision on how to respond to the FERC directive as requested in Order 693 – "The ERO should utilize the information filed by commenters in the Reliability Standards development process." The majority of respondents indicated that they do not feel that there is a reliability based need for such a North American requirement. Several respondents pointed out that such a requirement (if needed at all for reliability) would be better suited to a regional

Standard	Source	Language	Resolution
			standard and several others stated that such requirements already exist in their particular regions. There are several regions that have existing rules for lead times but they are all different and are based on the requirements of their regional markets. Any attempt to impose a North American standard runs the risk of interfering with those FERC approved markets. While NERC Reliability Standards are intended to promote reliability, they must at the same time accommodate competitive electricity markets. In response to concerns raised by the IERP and the SW Outage Report, the SDT has developed proposed IRO-017-1 Outage Coordination. This standard requires the development of a coordinated outage process between the Reliability Coordinator, Transmission Operator, Balancing Authority, Planning Coordinator, and Transmission Planner. If so desired, a Reliability Coordinator could include lead times in its process. (See proposed IRO-017-1, Requirement R1, Part 1.2.) In addition, proposed IRO-010-2 and TOP-003-2 dealing with data specifications could also cover this issue. The data specification must include any and all data required by the Reliability Coordinator, Transmission Operator and Balancing Authority. Planned outage data and timings could be included in such a data specification.

Standard	Source	Language	Resolution
			Therefore, the SDT has not included a standard lead time in the revised requirements. **Proposed IRO-017-1, Requirement R1, Part 1.2:** **1.2** Specify outage submission timing requirements.
TOP-003-0	Order 693	1622. Consider TVAs suggestion for including breaker outages within the meaning of facilities that are subject to advance notice for planned outages.	The SDT has developed proposed IRO-017-1 Outage Coordination to address these types of issues. **Proposed IRO-017-1, Requirement R1:** **R1.** Each Reliability Coordinator shall develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area.
TOP-003-0	Order 693	1624. Direct the ERO to modify the Reliability Standard to require that any facility below the thresholds that, in the opinion of the transmission operator, balancing authority, or reliability coordinator will have a direct impact on the reliability of the Bulk-Power System be subject to Requirement R1 for planned outage coordination.	The data specification standard require that a Reliability Coordinator and Transmission Operator acquire all of the data necessary for them to fulfill their reliability functions including sub-100 kV data as necessary. **Proposed IRO-010-2, Requirement R1 and Part 1.1**: **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: 1.1 A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time

Standard	Source	Language	Resolution
			monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **Proposed TOP-003-3, Requirement R1 and Part 1.1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1 A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator.
TOP-003-2	IERP	Requirements R1 and R2 do not address level of accuracy required; see if this is provided elsewhere (i.e. project 2009-02) Consolidate R1 and R2 at minimum; at max consolidate with RC (IRO-010-1a R1)	Level of accuracy is one of the issues identified in the Real-Time Tools Best Practices Task Force Report. NERC is currently instituting a review of all of the recommendations in various reports, including the Real-time Tools Best Practices Task Force report, to see what actions should be taken, if any are still required, to address recommendations in the reports. The SDT does not want to consolidate the two responsibilities. The industry has clearly indicated a desire for separate standards for the Reliability

Standard	Source	Language	Resolution
			Coordinator and Transmission Operator where possible.
TOP-003-2	IERP	Consolidate R3 and R4 at minimum; at max consolidate with RC (IRO-010-1a R2)	The SDT does not want to consolidate the two requirements or the two standards. The SDT feels Requirements R3 and R4 are for different tasks. The industry has clearly indicated a desire for separate standards for the Reliability Coordinator and Transmission Operator where possible.
TOP-003-2	IERP	Requirement R5 should be consolidated with IRO-010-1a R3	The industry has clearly indicated a desire for separate standards for the Reliability Coordinator and Transmission Operator where possible.
TOP-004-1	FERC Order 693	1636 - Modify requirement R4 to state that the system should be restored to respect proven limits as soon as possible taking no more than 30 minutes.	The SDT believes that this issue has been addressed through the more stringent definitions proposed for Operational Planning Analysis, Real-time Assessment, and the requirement for the Transmission Operator to perform an Operational Planning Analysis as well as a Real-time Assessment every 30 minutes and to create an Operating Plan for mitigation of SOL exceedances. The SDT has developed a white paper on the topic of SOL exceedance to explain the technical rationale behind this resolution. **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known

Standard	Source	Language	Resolution
			Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed Definition: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment may reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed TOP-002-4, Requirement R1**: **R1**. Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed TOP-002-4, Requirement R2**: **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances

Standard	Source	Language	Resolution
			identified as a result of its Operational Planning Analysis as required in Requirement R1. **Proposed TOP-001-3, Requirement R13**: **R13.** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Proposed TOP-001-3, Requirement R14**: **R14**. Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
TOP-004-1	Order 693	1637. …direct the ERO to conduct a survey on the operating practices and actual experiences surrounding drifting in and out of IROL violations.	Completed and filed in Oct 2008.
TOP-004-1	FERC Order 693	1638 - Defines high risk conditions under which the system must be operated to respect multiple outages in requirement R3. We direct the ERO to develop a modification to the Reliability Standard that explicitly incorporates this interpretation with the details identified in the Reliability Standards development process (… the Commission proposed to interpret “multiple outages” in the context of Requirement R3 to include multiple element outages resulting from high risk conditions such as hurricanes, wild fires, ice storms or periods of high solar magnetic disturbances during which the probability of multiple outages approaches that of a single element outage. This is not an	The SDT feels that approved EOP-001-2.1b dealing with emergency operations planning covers the intent of being prepared to react to the cited situations. The method chosen to respond to a given catastrophic challenge to a localized portion of the system cannot be predetermined by science; rather, it is an art. Reliability entities develop their response mechanisms based on experience in their local areas to achieve the maximum societal benefit during these periods. In addition, approved FAC-011-2 and FAC-014-2 deal with specific requirements for dealing with multiple contingencies.

Standard	Source	Language	Resolution
		exhaustive list but is meant to contain illustrative examples, and the Reliability Standards development process should develop a procedure to identify applicable high risk conditions. Under … high-risk conditions, the Commission understands that systems are normally operated in a more secure manner so that the Bulk-Power System can withstand multiple outages. These multiple outages exceed the normal N-1 criterion because the probability of multiple outages during high risk conditions approaches that of a single outage during normal conditions.)	
TOP-004-1	Order 693	1639. Consider Santa Clara's comment in the SDT process. Santa Clara states that Requirement R2 of the Reliability Standard should be revised to include frequency monitoring in addition to the monitoring of voltage, real and reactive power flows	The data specification standards require that entities obtain all of the data that they need to perform their reliability functions. This would include frequency, voltages, real and reactive power flows, and any other data that the entity needs. Proposed TOP-001-3, Requirements R10 and R11 also address this item. **Proposed IRO-010-2, Requirement R1**: **R1**. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed TOP-003-3, Requirement R1**: **R1**. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed TOP-001-3, Requirement R10**:

Standard	Source	Language	Resolution
			R10. Each Transmission Operator shall monitor the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: **1.1.** Within its Transmission Operator Area: **1.1.1.** Facilities, **1.1.2.** The status of Special Protection Systems, and **1.1.3.** Non-BES facilities identified as necessary by the Transmission Operator and **1.2.** Within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator: **1.2.1.** Facilities, **1.2.2.** Status of Special Protection Systems, and **1.2.3.** Non-BES facilities. **Proposed TOP-001-3, Requirement R11:** **R11**. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order for it to be able to perform its reliability functions.

Standard	Source	Language	Resolution
TOP-004-1	Version 0 Team	Vagueness in application of IROL limits	The SDT has clarified the issue. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL $T_{v.}$
TOP-005	Order 693	1648. ...direct the ERO to develop a modification to TOP-005-1 through the Reliability Standards development process regarding the operational status of special protection systems and power system stabilizers in Attachment 1.	The SDT has added specific parts to the data specification standards as well as revising the definitions of Operational Planning Analysis and Real-time Assessment to address this issue. **Proposed: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment may reflect applicable inputs including, but not

Standard	Source	Language	Resolution
			limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed IRO-010-2, Requirement R1, Part 1.2**: 1.2 Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **Proposed TOP-003-3, Requirement R1, Part 1.2**: 1.2 Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.
TOP-005	Order 693	1650. Consider FirstEnergy's modifications to Attachment 1 and ISO-NEs recommended revision to requirement R4 in the standards development process. FirstEnergy states that TOP-005-1 should also apply to transmission providers because some of the information listed in Attachment 1 to the Reliability Standard is in their possession. Attachment 1 should be modified so that it allows each entity to know what data it is expected to provide. ISO-NE recommends that the reference to "purchasing-selling entity" should be replaced with LSE.	Attachment 1 has been deleted and replaced by the new data specification requirement in proposed TOP-003-3. Requirement R4 has been superseded by proposed TOP-003-3 which does include the indicated entities and has deleted PSE. **Proposed TOP-003-3, Requirement R5**: **R5.**Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in

Standard	Source	Language	Resolution
			Requirement R3 or R4 shall satisfy the obligations of the documented specifications using:
TOP-005	Order 693	1651. … deletes references to confidentiality agreements, but addresses the issue separately to ensure that necessary protections are in place related to confidential information.	The SDT believes that confidentiality is a market issue and not a reliability issue and as such it does not belong in the Reliability Standards. However, security of information is a reliability concern and the SDT has addressed that issue through the addition of requirements for establishing security protocols in data exchanges. **Proposed TOP-003-3, Requirement R5, Part 5.3**: 5.3 A mutually agreeable security protocol. **Proposed IRO-010-2, Requirement R3, Part 3.3**: 3.3 A mutually agreeable security protocol.
TOP-005	Order 693	1660. Add requirement related to the provision of minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the bulk power system	This directive is beyond the scope of this project and will be resolved in a future project.
TOP-006	Order 693	1665. Clarify the meaning of appropriate technical information concerning protective relays	That term is no longer used in the standards. To address concerns about the status of protection systems, the SDT has incorporated explicit references in the definitions of Operational Planning Analysis and Real-time Assessment and the data specification standards. **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential

Standard	Source	Language	Resolution
			(post-Contingency) conditions for next-day operations. The evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed Definition: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment may reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed IRO-010-2, Requirement R1, Part 1.2**: 1.2 Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **Proposed TOP-003-3, Requirement R1, Part 1.2**:

Standard	Source	Language	Resolution
			1.2 Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.
TOP-006	Order 693	1664/1681. The ERO should consider APPA's comment regarding the missing Measures in the ERO's Reliability Standards development process.	All requirements now have measures.
TOP-006	Order 693	1673. Direct the ERO to consider NRC's comments in the Reliability Standards development process when addressing TOP-007-0 as part of its Work Plan. NRC states that some nuclear power plant voltage requirements would result in SOL, i.e., the nuclear power plant voltage limits would be an SOL as a result of the minimum and maximum voltages required at the nuclear power plant switchyard, which typically has a tighter operating band (a higher minimum and a lower maximum) than other nodes in the system. It therefore recommends adding a new requirement that states as follows: "Following discovery of a potential contingency that could result in an SOL being exceeded at a nuclear power plant (e.g., at post-trip voltage), the transmission owner shall notify the nuclear power plant operator as soon as possible but not longer than 30 minutes if the contingency has not been corrected." NRC also suggests modifying the Measures and Compliance sections and Table 1 to account for the new requirement, and provides specific language to be included in those places.	Analysis is required in proposed TOP-002-3, Requirement R1 and in proposed TOP-001-3, Requirement R13. A specified minimum voltage limit is by definition an SOL which must be studied in proposed TOP-002-3, Requirement R1 and proposed TOP-001-3, Requirement R13 as shown in the revised definition of Operational Planning Analysis and Real-time Assessment. Additionally, approved NUC-001-2.1, Requirements R3 & R4.1 require the transmission entity to incorporate NPIRs in their planning and operating analyses. Approved FAC-011-2 and approved FAC-014-2, Requirement R2 require the Transmission Operator to incorporate SOLs into their analyses. All data required for Operational Planning Analyses is stipulated in proposed TOP-003-3. Approved NUC-001-2, Requirements R3 & R8 cover the information flowing back to the nuclear plant operator. **Proposed Definition: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation may reflect applicable

Standard	Source	Language	Resolution
			inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed Definition: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment may reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed TOP-002-3, Requirement R1**: **R1.** Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed TOP-001-3, Requirement R13**:

Standard	Source	Language	Resolution
			R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Approved NUC-001-2.1, Requirement R3**: **R3**. Per the Agreements developed in accordance with this standard, the applicable Transmission Entities shall incorporate the NPIRs into their planning analyses of the electric system and shall communicate the results of these analyses to the Nuclear Plant Generator Operator. **Approved NUC-001-2.1, Requirement R4.1**: 4.1 Incorporate the NPIRs into their operating analyses of the electric system. **Approved NUC-001-2.1, Requirement R8:** **R8.** Per the Agreements developed in accordance with this standard, the applicable Transmission Entities shall inform the Nuclear Plant Generator Operator of actual or proposed changes to electric system design, configuration, operations, limits, Protection Systems, or capabilities that may impact the ability of the electric system to meet the NPIRs.
VAR-001-1	Order 693 Transferred from Project 2013-04 Voltage and Reactive Control	1855. Since a reliability coordinator is the highest level of authority overseeing the reliability of the Bulk-Power System, the Commission believes that it is important to include the reliability coordinator as an applicable entity to assure that adequate voltage and reactive resources are being maintained. As MISO points out, other Reliability Standards address responsibilities of	The SDT has clarified the issue of having the Reliability Coordinator provide oversight. The proposed requirement uses the term 'Facilities' which is defined as: "A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt

Standard	Source	Language	Resolution
		reliability coordinators, but we agree with EEI that it is important to include reliability coordinators in VAR-001-1 as well. Reliability coordinators have responsibilities in the IRO and TOP Reliability Standards, but not the specific responsibilities for voltage levels and reactive resources addressed by VAR-001-1, which have a great impact on system reliability. For example, voltage levels and reactive resources are important factors to ensure that IROLs are valid and operating voltages are within limits, and that reliability coordinators should have responsibilities in VAR-001-1 to monitor that sufficient reactive resources are available for reliable system operations. Accordingly, the ERO should modify VAR-001-1 to include reliability coordinators as applicable entities and include a new requirement(s) that identifies the reliability coordinator's monitoring responsibilities.	compensator, transformer, etc.)." Therefore, the requirement covers voltage and reactive resources. **Proposed IRO-002-4, Requirement R3**: **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
INT-006-1	Order 693 Transferred from Project 2008-12 Coordinate Interchange Standards	866. The Commission directs the ERO to develop a modification to INT-006-1 through the Reliability Standards development process that makes it applicable to reliability coordinators and transmission operators. The Commission directs the ERO to develop a modification to INT-006-1 through the Reliability Standards development process that requires reliability coordinators and transmission operators to review energy interchange transactions from the wide-area and local area reliability viewpoints respectively and, where their review	An equally efficient and effective method of addressing the directive was approved by the Board and filed with FERC by Project 2008-12 SDT by including the term 'Interchange' in the definition of Operational Planning Analysis. This change has been retained by Project 2014-03. Proposed IRO-008-2, Requirement R1 specifies that the Reliability Coordinator must perform an Operational Planning Analysis. By explicitly including "Interchange" in the definition of Operational Planning Analysis, the Reliability Coordinator must

Standard	Source	Language	Resolution
		indicates a potential detrimental reliability impact, communicate to the sink balancing authorities necessary transaction modifications before implementation.	consider Interchange when performing the study. Then, in proposed IRO-008-2, Requirement R2, the Reliability Coordinator must develop a plan for addressing the problem. Similar requirements exist for the Transmission Operator in proposed TOP-002-3. **Proposed: Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation may reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed IRO-008-2, Requirement R1:** **R1.** Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area. **Proposed IRO-008-2, Requirement R2**:

Standard	Source	Language	Resolution
			R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. **Proposed IRO-008-2, Requirement R3:** **R3**. Each Reliability Coordinator shall notify impacted entities identified in its Operating Plan(s) cited in Requirement R2 as to their role in that plan(s). **Proposed TOP-002-4, Requirement R1:** **R1**. Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed TOP-002-4, Requirement R2:** **R2**. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. **Proposed TOP-002-4, Requirement R3:**

Standard	Source	Language	Resolution
			R3. Each Transmission Operator shall notify impacted entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in those plan(s).

NERC Operating Committee Response to NERC Standards Committee / RISC Triage of IEPR Gaps

April 2, 2014

The NERC Operating Committee reviewed three perceived gaps, Outage Coordination, Governor Frequency Response, and Situational Awareness, as identified by the Independent Experts in their June 2013 report. As an important step in this review, the OC's Executive Committee met via WebEx with the Independent Experts to more thoroughly discuss and understand the thinking which led to these elements being cited as possible gaps. During the WebEx, the OCEC and the Independent Experts also reviewed all of the proposed requirements in the Independent Experts draft Authority matrix. The results of the OC's discussions, and the Project 2014-03 SDT's consideration within the revised TOP and IRO standards for two of the three perceived gaps (Outage Coordination and Situational Awareness) are presented below. The third gap identified by the Independent Experts, Governor Frequency Response, is outside the scope of Project 2014-03.

Outage Coordination

Draft requirements 3, 7, 8 and 9 of the Independent Experts draft Authority Standard focus on Outage Coordination. One concern recognized the fact that the Reliability Coordinators have a wide area view and broader situational awareness, allowing for early identification and resolution of conflicts. Therefore the RCs should have the most influence on outage coordination. Further concerns identify standards that are currently in flux, particularly those remanded standards in which requirements are being removed.

Operating Committee opinion

The Operating Committee concurs that Outage Coordination is an important grid reliability function. Outage coordination should originate from the TOPs and GOPs; with conflicts resolved by their respective RC. It makes sense for this process to begin with a set of previously approved scheduled long term outages with a sufficient time margin for results to be incorporated into seasonal operating studies. Further, the RC should retain the authority for final approval up to the time the asset is removed from service, as well as recall authority (if technically feasible and appropriate to recall) as needed to prevent or mitigate emergencies.

Longer term outage coordination is necessary for those assets that require long maintenance planning pursuant to the type of work required, such as turbine rebuilds, nuclear refueling, etc. This likely belongs in the scope of the Planning Coordinator (PC) for outages planned more than 12-months into the future. A Reliability Standard could be written that requires PCs to coordinate long term outages and which requires responsible entities (e.g., GOs, TOs) to request a time slot in which to perform whatever maintenance is required.

In either case, during the longer term planning horizon, or the Operations planning and real time operations time frame, each PC or RC should have an understanding of the impacts on neighboring PCs or RCs when those assets are planned to be out or are forced out, with notification/coordination requirements with these PCs or RCs.

SDT response:

To enhance reliability, the Project 2014-03 SDT has provided explicit requirement language to address the need for planned outage coordination at the Reliability Coordinator level. See proposed IRO-014-3, Requirement R1, part 1.4. The Project 2014-03 SDT has developed a new standard, IRO-017-1 Outage Coordination, to address overall outage coordination issues.

Proposed IRO-014-3, Requirement R1, part 1.4: Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and Real-time Assessments.

Situational Awareness (EMS RTCA models)

In this gap the Independent Experts recommend the development of a standard that defines the requirements for EMS RTCA models or performance expectations of the models (Project 2009-02 – Real Time Monitoring and Analyses Capabilities).

Operating Committee opinion

The Operating Committee has a concern that this gap could be interpreted as recommending a "HOW" standard where specific tools would be required even for the smallest TOPs, as opposed to a "WHAT" standard that would allow for other ways to accomplish the objective. In conversations with the Independent Experts it became clear that proper situational awareness was the primary concern. The OC concurs that real time contingency analysis process (real time updated topology and telemetry) should be performed on each BES facility. This functionality could be performed by use of an RTCA application at the TO or RC level, or coverage by alternate means would be appropriate.

SDT response:

The Project 2014-03 SDT has adapted approved IRO-008-1, Requirement R2 for the Transmission Operator. See proposed TOP-001-3, Requirement R13. In addition, the Project 2014-03 SDT has revised the definition of Real-time Assessment to allow for contracting needed services to accommodate concerns for smaller entities.

Proposed: Real-time Assessment - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase

angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Proposed TOP-001-3, Requirement R13: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

Remainder of the draft Authority Standard Requirements

Authority R1

Each RC, TOP and BA shall have the requirement and authority to take actions, including issuing a Reliability Directive, to prevent, mitigate and respond to an Emergency or Adverse Reliability Impact.

Operating Committee opinion

The current IRO-001-1.1 and TOP-001-1a are expected to be retired and replaced by IRO-001-3. In either case, these standards contain the authority to act, but the requirement to act appears to be implicit. The OC agrees that the RC, TOP and BA should explicitly be required to act.

SDT response:

The Project 2014-03 SDT agrees and has adjusted the wording in the standards to address this issue.

Proposed IRO-001-4, Requirement R1: Each Reliability Coordinator shall act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions.

Proposed TOP-001-3, Requirement R1: Each Transmission Operator shall act to address the reliability of its Transmission Operator Area via direct actions or by issuing Operating Instructions.

Proposed TOP-001-3, Requirement R2: Each Balancing Authority shall act to address the reliability of its Balancing Authority Area via direct actions or by issuing Operating Instructions.

Authority R2

Each RC, TOP and BA shall have the requirement and authority to approve, deny or cancel planned outages of its EMS, telecom and other hardware, and associated analysis tools.

Operating Committee opinion

The current IRO-002-2 provides for the RC to have control of its tools but does not include the TOP or BA. IRO-002-2 is expected to be retired and replaced by IRO-002-3, which clarifies that the system operators have the authority to approve outages of analysis tools (The OC suggests adding “under the direct control of their company”), but does not include TOPs or BAs. The OC concurs

with the clarification in IRO-002-3, and the OC further agrees that TOPs and BAs should be included.

SDT response:

The Project 2014-03 has added proposed TOP-001-3, Requirements R16 and R17 to provide Transmission Operators and Balancing Authorities with capabilities similar to those of the Reliability Coordinator.

> Proposed TOP-001-3, Requirement R16: Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunication, and analysis capabilities.

> Proposed TOP-001-3, Requirement R17: Each Balancing Authority shall provide its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunications, and analysis capabilities.

Authority R4

RC, TOP and BA shall provide its System Operators with the responsibility and authority to implement the actions under R1, R2 and R3.

Operating Committee opinion

During the OCEC/Independent Expert webex, the Independent Experts explained that the objective of this requirement is to mandate the posting of a letter in the control rooms granting authority to the system operators to carry out their required tasks. While the Operating Committee believes this is a good practice, it does not believe that it rises to the level of a Standards Requirement.

SDT response:

The Project 2014-03 SDT agrees with the position of the Operating Committee Executive Committee. A letter of authority located in the Control Room is an example of good utility practice. A change to the requirements is not warranted.

Authority R5

Each TOP, BA, GOP, and DP shall comply with directions from a RC, TOP or BA under R1 unless it communicates to the RC, TOP or BA that it cannot because the direction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements.

Operating Committee opinion

In relation to R1 above this understanding seems implicit. However, in the interest of clarity the OC would support this requirement.

SDT response:

The Project 2014-03 SDT agrees.

Proposed TOP-001-3, Requirement R3: Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements.

Proposed TOP-001-3, Requirement R5: Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Operating Instruction issued by its Balancing Authority, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements.

Proposed IRO-001-4, Requirement R2: Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with its Reliability Coordinator's Operating Instructions unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements.

Authority R6

Each RC shall comply with directions from another RC under R1 unless it communicates to the other RC that it cannot because compliance with the direction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements.

Operating Committee opinion

IRO-014-5, IRO-015-1 and IRO-016-1 describe inter RC procedures, Plans, notifications and coordination. These standards are expected to be retired and replaced by IRO-014-2 incorporating the pertinent requirements from the retiring standards. However, none of these standards explicitly include a requirement for one RC to comply with a directive from another RC.

The OC recognizes that coordination between RCs is vitally important. It is also recognized that an RC is the entity with the best understanding and situational awareness of its unique footprint. Therefore it is not believed to be beneficial for operational reliability for one RC to direct the actions of another RC. Rather, it is more appropriate to have this type of coordination documented within the requisite Joint Operating Agreements in which the appropriate assistance would be documented and understood in advance of such actions.

SDT response:

The Project 2014-03 SDT believes that proposed IRO-014-2 Requirements R3 – R6 already require Reliability Coordinators to coordinate and implement action plans even if the RC cannot agree that a problem exists or what the exact action plan is

> Proposed IRO-014-2, Requirement R3: Each Reliability Coordinator, upon identification of an expected or actual Emergency in its Reliability Coordinator Area, shall notify other impacted Reliability Coordinators.
>
> Proposed IRO-014-2, Requirement R4: Each impacted Reliability Coordinator shall operate as though the Emergency exists during each instance where Reliability Coordinators disagree on the existence of an Emergency.
>
> Proposed IRO-014-2, Requirement R5: Each Reliability Coordinator that identified an Emergency in its Reliability Coordinator Area shall develop an action plan to resolve the Emergency during those instances where impacted Reliability Coordinators disagree on the existence of an Emergency.
>
> Proposed IRO-014-2, Requirement R6: Each impacted Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identified the Emergency during those instances where Reliability Coordinators disagree on the existence of an Emergency, unless such actions would violate safety, equipment, regulatory, or statutory requirements.

Violation Risk Factor and Violation Severity Level Assignments

Project 2014-03 Revisions to TOP/IRO Reliability Standards

TOP-001-3 ONLY

Violation Risk Factor and Violation Severity Level Assignments

This document provides the Standard Drafting Team's (SDT) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in Project 2014-03.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The SDT applied the following NERC criteria when proposing VRFs for the requirements in Project 2014-03.

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to

lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

---

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on rehearing and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").

[2] Id. at footnote 15.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

There are twenty requirements in proposed TOP-001-3. None of the twenty requirements were assigned a "Lower" VRF. Requirements R9 and R15 were assigned a "Medium" VRF while all of the other requirements were given a "High" VRF.

VRF for Proposed TOP-001-3, Requirement R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements so only one VRF was assigned. Therefore, there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-001-1a that is assigned a High VRF. The requirements are viewed as similar since they both refer to taking action to ensure reliability. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to take action, or to direct others to take action, could directly affect the electrical state or the capability of the bulk power system and could lead to bulk power system instability, separation, or Cascading failures. Therefore, this requirement is assigned a High VRF.

- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R1 contains only one objective, therefore only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-001-1a that is assigned a High VRF. The requirements are viewed as similar since they both refer to taking action to ensure reliability: approved TOP-001-1a for a Transmission Operator and proposed TOP-001-3 for a Balancing Authority. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to take action, or to direct others to take action, could directly affect the electrical state or the capability of the bulk power system and could lead to bulk power system instability, separation, or Cascading failures. Therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R2 contains only one objective, therefore only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved TOP-001-1a that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to comply with issued Operating Instructions could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R3 contains only one objective, therefore only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R4:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.

- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved TOP-001-1a that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to comply with issued Operating Instructions could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R4 has only one objective, therefore only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R5:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, there is a similar requirement (Requirement R4) in approved TOP-001-1a that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to comply with issued Operating Instructions could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R5 contains only one objective. Therefore only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R6:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, there is a similar requirement (Requirement R4) in approved TOP-001-1a that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to comply with issued Operating Instructions could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R6 contains only one objective. Therefore only one VRF was assigned to the requirement.

VRF for Proposed TOP-001-3, Requirement R7:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (requirement R6) in approved TOP-001-1a which is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to provide requested assistance could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R7 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R8:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R7) in approved TOP-001-1a that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to inform other known impacted reliability entities of actions that may result in Emergencies could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R8 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R9:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R3) in approved TOP-003-1 which is assigned a Medium VRF. Hence, this requirement is also assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Bulk power system instability, separation, or Cascading failures are not likely to occur due to a failure to adhere to this requirement. Thus, this requirement meets the criteria for a Medium VRF.

- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R9 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R10:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, there is a similar requirement (Requirement R4) in proposed IRO-002-4 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF. The requirements are considered similar as proposed IRO-002-4, Requirement R4 is for Reliability Coordinators while proposed TOP-001-3, Requirement R10 is for Transmission Operators.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary by the Transmission Operator, could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 - Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R10 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R11:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, there is a similar requirement (Requirement R4) in approved IRO-002-4 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF. The requirements are considered similar as proposed IRO-002-4, Requirement R4 is for Reliability Coordinators while proposed TOP-001-3, Requirement R11 is for the Balancing Authority.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to monitor facilities could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R11 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R12:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.

- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-004-2 which has a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to operate within IROL T_v could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R12 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R13:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. This is a new requirement. However, there is a similar requirement (Requirement R2) in approved IRO-008-1 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF. The requirements are considered similar as approved IRO-008-1, Requirement R2 is for Reliability Coordinators while proposed TOP-001-3, Requirement R13 is for the Transmission Operator.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to ensure Real-time Assessments are performed at least every 30 minutes could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R13 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R14:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-004-2 which has a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to initiate the Operating Plan could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R14 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R15:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved TOP-007-0 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to inform the Reliability Coordinator of actions taken to return the system to within limits could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R15 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R16:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R8) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF. The requirements are considered similar as approved IRO-002-2, Requirement R8 is for Reliability Coordinators while proposed TOP-001-3, Requirement R16 is for the Transmission Operator.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to provide operators with authority to approve outages and maintenance of monitoring, telecommunication, and analysis capabilities could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R16 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R17:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R8) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF. The requirements are considered similar as approved IRO-002-2,

Requirement R8 is for Reliability Coordinators while proposed TOP-001-3, Requirement R17 is for the Balancing Authority.

- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to provide operators with authority to approve outages and maintenance of monitoring, telecommunications, and analysis capabilities could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R17 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R18:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R5) in approved IRO-009-1 that is assigned a High VRF. The requirements are considered similar since approved IRO-009-1 is about the Reliability Coordinator and proposed TOP-001-3, Requirement R18 is about the Transmission Operator. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to operate to the most limiting parameter when there is a difference in SOLs could lead to bulk power system instability, separation, or Cascading failures. Thus, this requirement meets the criteria for a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R18 addresses a single objective and has a single VRF.

VRF for Proposed TOP-001-3, Requirement R19:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have data exchange capability could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R19, contains only one objective; therefore, only one VRF was assigned.

VRF for Proposed TOP-001-3, Requirement R20:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. There is a similar requirement (Requirement R1) in approved IRO-002-2 that is assigned a High VRF. Hence, this requirement is also assigned a High VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have data exchange capability could lead to bulk power system instability, separation, or Cascading failures; therefore, this requirement is assigned a High VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. Proposed TOP-001-3, Requirement R20, contains only one objective; therefore, only one VRF was assigned.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the TOP/IRO standards, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance. The performance or product measured has significant value, as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance, or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement, or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of noncompliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of noncompliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of noncompliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation, per day basis is the "default" for penalty calculations.

VSLs for Proposed TOP-001-3, Requirement R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	Meets NERC's VSL guidelines – Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSL for a similar requirement is for the approved TOP-001-1a, Requirement R1. While similar, that requirement is not exactly the same as it had two clearly different objects. One of the objects has more to do with actions than the other and that part of the VSL is binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSL for a similar requirement is for the approved TOP-001-1a, Requirement R1. While similar, that requirement is not exactly the same as it had two clearly different objects. One of the objects has more to do with actions than the other and that part of the VSL is Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines – Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSL for a similar requirement is for the approved TOP-001-1a, Requirement R3. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSLs use the same terminology as used in the associated requirement, and are, therefore, consistent with the requirement.	The VSLs are based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R4:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSL for a similar requirement is for the approved TOP-001-1a, Requirement R3. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R5:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSLs for a similar requirement are for the approved TOP-001-1a, Requirement R4. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSLs use the same terminology as used in the associated requirement, and are, therefore, consistent with the requirement.	The VSLs are based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R6:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R6.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSLs for a similar requirement are for the approved TOP-001-1a, Requirement R4. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSLs use the same terminology as used in the associated requirement, and are, therefore, consistent with the requirement.	The VSLs are based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R7:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R7.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The proposed requirement is similar to approved TOP-001-1a, Requirement R6. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for TOP-001-2 Requirement R8:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R8.	Meets NERC's VSL guidelines. There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The most comparable VSLs for a similar requirement are for the approved TOP-001-1a, Requirement R7. Those VSLs are binary Severe. However, when assigning the VSLs for this requirement, the SDT believed that it was possible to provide a gradual increasing scale for the VSLs and assigned the VSLs appropriately.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R9:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R9.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The most comparable VSLs for a similar requirement are those for proposed TOP-003-1, Requirement R3. Those VSLs are binary Severe. However, when assigning the VSL for the new requirement, the SDT believed that it was possible to provide a gradual increasing scale for the VSL and assigned the VSLs appropriately.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R10:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R10.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance.	The most comparable VSLs for a similar requirement are for the proposed IRO-002-2, Requirement R4. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R11:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R11.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the proposed IRO-002-2, Requirement R4. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R12:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R12.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved TOP-004-2, Requirement R1. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R13:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R13.	Meets NERC's VSL guidelines - There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The most comparable VSLs for a similar requirement are for the approved IRO-008-1, Requirement R2. Those VSLs are gradated based on missing the timing requirement. Therefore, the SDT assigned gradated VSLs to this requirement on the same basis.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R14:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R14.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved TOP-004-2, Requirement R1. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R15:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R15.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved TOP-007-0, Requirement R1. Those VSLs are gradated based on delivering an incomplete message. The SDT believed that the message needed to be complete to preserve reliability. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R16:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R16.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved IRO-002-2, Requirement R8. Those VSLs are gradated based on splitting up the different approval rights. The SDT did not believe that there was any value to reliability by splitting up the approval rights. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R17:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R17.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved IRO-002-2, Requirement R8. Those VSLs are gradated based on splitting up the different approval rights. The SDT did not believe that there was any value to reliability by splitting up the approval rights. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R18:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R18.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved IRO-009-1, Requirement R5. Those VSLs are binary Severe. Therefore, the SDT assigned a binary Severe VSL to this requirement.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R19:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R19.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved IRO-002-2, Requirement R1. Those VSLs are gradated based on a degree of incompleteness of the needed data exchange capabilities and the SDT has adopted that philosophy here as well.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for Proposed TOP-001-3, Requirement R20:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R20.	Meets NERC's VSL guidelines - Severe: Missing most or all of the significant elements (or a significant percentage) of the required performance	The most comparable VSLs for a similar requirement are for the approved IRO-002-2, Requirement R1. Those VSLs are gradated based on a degree of incompleteness of the needed data exchange capabilities and the SDT has adopted that philosophy here as well.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2014-03 Revisions to TOP and IRO Standards IRO-001-3

Formal Comment Period Now Open through November 10, 2014

Now Available

A 30-day formal comment period for **TOP-001-3 – Transmission Operations** is open through **8 p.m. Eastern, Monday, November 10, 2014.**

On October 9, 2014, the NERC Standards Committee (SC) authorized a waiver of the standard development process, in accordance with Section 16 of the Standard Processes Manual, to meet the pending regulatory deadline for revisions to TOP and IRO standards. The SC approved a request to shorten the comment period for draft standard TOP-001-3 from 45 days to 30 calendar days, with an additional ballot and non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) to be conducted during the last 7 days of the comment period.

Instructions for Commenting

Please use the electronic form to submit comments on the standard. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

An additional ballot for the standard and non-binding poll of the associated VRFs and VSLs will be conducted **November 4-10, 2014.**

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Mark Olson.

Standards Announcement

Project 2014-03 Revisions to TOP/IRO Reliability Standards
TOP-001-3

Additional Ballot and Non-Binding Poll Results

Now Available

An additional ballot for **TOP-001-3 – Transmission Operations** and a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels concluded at **8 p.m. Eastern, Monday, November 10, 2014**.

The standard achieved a quorum but did not receive sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballot.

Ballot Results	Non-Binding Poll Results
Quorum /Approval	Quorum/Supportive Opinions
78.36% / 60.21%	79.18% / 63.33%

Background information for this project can be found on the project page.

Next Steps
The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard and post it for an additional ballot. If the comments do not show the need for significant revisions, the standard will proceed to a final ballot.

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Standards Developer, Mark Olson,
or by telephone at 404-446-2560.

Individual Ballot Pool Results

Segment	Organization	Member	Ballot	NERC Notes
1	Ameren Services	Eric Scott	Negative	SUPPORTS THIRD PARTY COMMENTS - (Ameren)
1	American Electric Power	Paul B Johnson	Affirmative	
1	American Transmission Company, LLC	Andrew Z Pusztai	Affirmative	
1	Arizona Public Service Co.	Brian Cole	Affirmative	
1	Associated Electric Cooperative, Inc.	John Bussman	Affirmative	
1	Austin Energy	James Armke	Abstain	
1	Avista Utilities	Heather Rosentrater	Affirmative	
1	Balancing Authority of Northern California	Kevin Smith	Affirmative	
1	Baltimore Gas & Electric Company	Christopher J Scanlon	Affirmative	
1	BC Hydro and Power Authority	Patricia Robertson		
1	Black Hills Corp	Wes Wingen	Affirmative	
1	Bonneville Power Administration	Donald S. Watkins	Negative	COMMENT RECEIVED
1	Brazos Electric Power Cooperative, Inc.	Tony Kroskey		
1	Bryan Texas Utilities	John C Fontenot	Affirmative	
1	CenterPoint Energy Houston Electric, LLC	John Brockhan	Negative	COMMENT RECEIVED
1	Central Electric Power Cooperative	Michael B Bax	Affirmative	
1	Central Iowa Power Cooperative	Kevin J Lyons	Negative	SUPPORTS THIRD PARTY COMMENTS - (ACES)
1	Central Maine Power Company	Joseph Turano Jr.		
1	City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	Chang G Choi	Affirmative	
1	City of Tallahassee	Daniel S Langston	Affirmative	
1	Clark Public Utilities	Jack Stamper	Negative	SUPPORTS THIRD PARTY COMMENTS - (NPCC)
1	Cleco Power LLC	Danny McDaniel	Affirmative	
1	Colorado Springs Utilities	Shawna Speer	Affirmative	
1	Consolidated Edison Co. of New York	Christopher L de Graffenried	Negative	COMMENT RECEIVED
1	CPS Energy	Glenn Pressler	Affirmative	
1	Dairyland Power Coop.	Robert W. Roddy	Negative	SUPPORTS THIRD PARTY COMMENTS - (NSRF)
1	Dominion Virginia Power	Larry Nash	Abstain	
1	Duke Energy Carolina	Doug E Hils	Negative	SUPPORTS THIRD PARTY COMMENTS - (Duke Energy)
1	Encari	Steven E Hamburg		
1	Entergy Transmission	Oliver A Burke	Affirmative	
1	FirstEnergy Corp.	William J Smith	Affirmative	
1	Florida Keys Electric Cooperative Assoc.	Dennis Minton	Affirmative	
1	Florida Power & Light Co.	Mike O'Neil	Affirmative	
1	Gainesville Regional Utilities	Richard Bachmeier		
1	Georgia Transmission Corporation	Jason Snodgrass	Negative	SUPPORTS THIRD PARTY COMMENTS - (Jason Snodgrass (GTC))
1	Great River Energy	Gordon Pietsch		
1	Hoosier Energy Rural Electric Cooperative, Inc.	Bob Solomon		

1	Hydro One Networks, Inc.	Muhammed Ali	Negative	SUPPORTS THIRD PARTY COMMENTS - (NPCC - RSC)
1	Hydro-Quebec TransEnergie	Martin Boisvert	Negative	SUPPORTS THIRD PARTY COMMENTS - (NPCC)
1	Idaho Power Company	Molly Devine	Affirmative	
1	International Transmission Company Holdings Corp	Michael Moltane	Negative	SUPPORTS THIRD PARTY COMMENTS - (MRO NSRF)
1	JDRJC Associates	Jim D Cyrulewski	Affirmative	
1	JEA	Ted E Hobson	Negative	COMMENT RECEIVED
1	KAMO Electric Cooperative	Walter Kenyon	Affirmative	
1	Kansas City Power & Light Co.	Daniel Gibson	Negative	COMMENT RECEIVED
1	Lakeland Electric	Larry E Watt		
1	Lee County Electric Cooperative	John Chin		
1	Lincoln Electric System	Doug Bantam	Negative	SUPPORTS THIRD PARTY COMMENTS - (. MRO NSRF)
1	Long Island Power Authority	Robert Ganley		
1	Los Angeles Department of Water & Power	faranak sarbaz	Affirmative	
1	Lower Colorado River Authority	Martyn Turner	Affirmative	
1	M & A Electric Power Cooperative	William Price	Affirmative	
1	Manitoba Hydro	Jo-Anne M Ross	Negative	COMMENT RECEIVED
1	MEAG Power	Danny Dees	Affirmative	
1	MidAmerican Energy Co.	Terry Harbour	Negative	SUPPORTS THIRD PARTY COMMENTS - (NSRF)
1	Minnkota Power Coop. Inc.	Daniel L Inman	Abstain	
1	Muscatine Power & Water	Andrew J Kurriger		
1	N.W. Electric Power Cooperative, Inc.	Mark Ramsey	Affirmative	
1	National Grid USA	Michael Jones	Negative	SUPPORTS THIRD PARTY COMMENTS - (National Grid supports NPCC's comments.)
1	NB Power Corporation	Alan MacNaughton	Negative	SUPPORTS THIRD PARTY COMMENTS - (Please see NPCC RSC comments)
1	Nebraska Public Power District	Jamison Cawley	Negative	SUPPORTS THIRD PARTY COMMENTS - (Support MRO NSRF Comments)
1	New York Power Authority	Bruce Metruck	Negative	SUPPORTS THIRD PARTY COMMENTS - (see NPCC comments)
1	Northeast Missouri Electric Power Cooperative	Kevin White	Affirmative	
1	Northeast Utilities	William Temple		
1	Northern Indiana Public Service Co.	Julaine Dyke	Negative	SUPPORTS THIRD PARTY COMMENTS - (Rob Fox on behalf of Dave Austin - NIPSCO)
1	NorthWestern Energy	John Canavan		
1	Ohio Valley Electric Corp.	Scott R Cunningham	Affirmative	
				SUPPORTS THIRD PARTY

1	Oklahoma Gas and Electric Co.	Terri Pyle	Negative	COMMENTS - (Oklahoma Gas & Electric)
1	Omaha Public Power District	Doug Peterchuck	Affirmative	
1	Oncor Electric Delivery	Jen Fiegel	Negative	COMMENT RECEIVED
1	Otter Tail Power Company	Daryl Hanson		
1	Pacific Gas and Electric Company	Bangalore Vijayraghavan		
1	Peak Reliability	Jared Shakespeare	Affirmative	
1	Platte River Power Authority	John C. Collins	Affirmative	
1	Portland General Electric Co.	John T Walker	Affirmative	
1	Potomac Electric Power Co.	David Thorne	Affirmative	
1	PPL Electric Utilities Corp.	Brenda L Truhe	Affirmative	
1	Public Service Electric and Gas Co.	Kenneth D. Brown		
1	Public Utility District No. 1 of Okanogan County	Dale Dunckel	Affirmative	
1	Puget Sound Energy, Inc.	Denise M Lietz	Negative	COMMENT RECEIVED
1	Rochester Gas and Electric Corp.	John C. Allen	Abstain	
1	Sacramento Municipal Utility District	Tim Kelley	Affirmative	
1	Salt River Project	Robert Kondziolka	Negative	SUPPORTS THIRD PARTY (NPCC)
1	SaskPower	Wayne Guttormson	Abstain	
1	Seattle City Light	Pawel Krupa	Negative	SUPPORTS THIRD PARTY COMMENTS - (Seattle City Light Paul Haase's comment)
1	Seminole Electric Cooperative, Inc.	Glenn Spurlock	Affirmative	
1	Sho-Me Power Electric Cooperative	Denise Stevens	Affirmative	
1	Snohomish County PUD No. 1	Long T Duong	Negative	SUPPORTS THIRD PARTY COMMENTS - (Northeast Power Coordinating Council (“NPCC”))
1	South Carolina Electric & Gas Co.	Tom Hanzlik	Affirmative	
1	South Carolina Public Service Authority	Shawn T Abrams	Abstain	
1	Southern California Edison Company	Steven Mavis	Affirmative	
1	Southern Company Services, Inc.	Robert A. Schaffeld	Affirmative	
1	Southern Illinois Power Coop.	William Hutchison		
1	Southwest Transmission Cooperative, Inc.	John Shaver	Affirmative	
1	Sunflower Electric Power Corporation	Noman Lee Williams		
1	Tampa Electric Co.	Beth Young		
1	Tennessee Valley Authority	Howell D Scott	Negative	COMMENT RECEIVED
1	Trans Bay Cable LLC	Steven Powell	Affirmative	
1	Tri-State Generation & Transmission Association, Inc.	Tracy Sliman	Affirmative	
1	U.S. Bureau of Reclamation	Richard T Jackson		
1	United Illuminating Co.	Jonathan Appelbaum	Affirmative	
1	Westar Energy	Allen Klassen		
1	Western Area Power Administration	Lloyd A Linke	Affirmative	
1	Wolverine Power Supply Coop., Inc.	Michelle Clements		
1	Xcel Energy, Inc.	Gregory L Pieper		
2	BC Hydro	Venkataramakrishnan Vinnakota	Abstain	
2	California ISO	Rich Vine	Affirmative	
2	Electric Reliability Council of Texas, Inc.	Cheryl Moseley	Negative	SUPPORTS THIRD PARTY COMMENTS - (IRC SRC)
2	Independent Electricity System Operator	Leonard Kula	Negative	COMMENT RECEIVED
2	ISO New England, Inc.	Matthew F Goldberg	Negative	COMMENT RECEIVED
2	MISO	Marie Knox	Abstain	
2	New York Independent System Operator	Gregory Campoli		

2	PJM Interconnection, L.L.C.	stephanie monzon	Affirmative	
2	Southwest Power Pool, Inc.	Charles H. Yeung		
3	AEP	Michael E Deloach	Affirmative	
3	Alabama Power Company	Robert S Moore	Affirmative	
3	Ameren Corp.	David J Jendras	Negative	COMMENT RECEIVED
3	APS	Sarah Kist		
3	Associated Electric Cooperative, Inc.	Todd Bennett	Affirmative	
3	Atlantic City Electric Company	NICOLE BUCKMAN	Affirmative	
3	Avista Corp.	Scott J Kinney		
3	BC Hydro and Power Authority	Pat G. Harrington	Abstain	
3	Central Electric Power Cooperative	Adam M Weber	Affirmative	
3	Central Lincoln PUD	Steve Alexanderson	Negative	COMMENT RECEIVED
3	City of Anaheim Public Utilities Department	Dennis M Schmidt		
3	City of Austin dba Austin Energy	Andrew Gallo	Affirmative	
3	City of Clewiston	Lynne Mila	Affirmative	
3	City of Farmington	Linda R Jacobson		
3	City of Garland	Ronnie C Hoeinghaus		
3	City of Green Cove Springs	Mark Schultz	Affirmative	
3	City of Redding	Bill Hughes	Affirmative

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Non-Binding Poll Results	
Non-Binding Poll Name:	Project 2014-03 TOP-001-3
Poll Period:	11/4/2014 - 11/10/2014
Total # Opinions:	270
Total Ballot Pool:	341
Summary Results:	79.18% of those who registered to participate provided an opinion or an abstention; 63.33% of those who provided an opinion indicated support for the VRFs and VSLs.

Individual Ballot Pool Results

Segment	Organization	Member	Opinions	NERC Notes
1	Ameren Services	Eric Scott	Negative	SUPPORTS THIRD PARTY COMMENTS - (Ameren)
1	American Electric Power	Paul B Johnson	Abstain	
1	Arizona Public Service Co.	Brian Cole	Affirmative	
1	Associated Electric Cooperative, Inc.	John Bussman	Affirmative	
1	Austin Energy	James Armke	Abstain	
1	Avista Utilities	Heather Rosentrater	Affirmative	
1	Balancing Authority of Northern California	Kevin Smith	Affirmative	
1	BC Hydro and Power Authority	Patricia Robertson		
1	Bonneville Power Administration	Donald S. Watkins	Negative	COMMENT RECEIVED
1	Brazos Electric Power Cooperative, Inc.	Tony Kroskey		
1	Bryan Texas Utilities	John C Fontenot	Affirmative	
1	CenterPoint Energy Houston Electric, LLC	John Brockhan	Abstain	
1	Central Electric Power Cooperative	Michael B Bax	Affirmative	
1	Central Iowa Power Cooperative	Kevin J Lyons	Negative	SUPPORTS THIRD PARTY COMMENTS - (ACES)
1	City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	Chang G Choi	Affirmative	
1	City of Tallahassee	Daniel S Langston	Affirmative	

1	Clark Public Utilities	Jack Stamper	Negative	SUPPORTS THIRD PARTY COMMENTS - (NPCC)
1	Colorado Springs Utilities	Shawna Speer	Affirmative	
1	Consolidated Edison Co. of New York	Christopher L de Graffenried	Negative	COMMENT RECEIVED
1	CPS Energy	Glenn Pressler	Affirmative	
1	Dairyland Power Coop.	Robert W. Roddy	Negative	NO COMMENT RECEIVED
1	Dominion Virginia Power	Larry Nash	Abstain	
1	Duke Energy Carolina	Doug E Hils	Negative	SUPPORTS THIRD PARTY COMMENTS - (Duke Energy)
1	Encari	Steven E Hamburg		
1	Entergy Transmission	Oliver A Burke	Affirmative	
1	FirstEnergy Corp.	William J Smith	Affirmative	
1	Florida Keys Electric Cooperative Assoc.	Dennis Minton	Affirmative	
1	Florida Power & Light Co.	Mike O'Neil	Affirmative	
1	Gainesville Regional Utilities	Richard Bachmeier		
1	Georgia Transmission Corporation	Jason Snodgrass	Negative	SUPPORTS THIRD PARTY COMMENTS - (Jason Snodgrass (GTC))
1	Great River Energy	Gordon Pietsch		
1	Hoosier Energy Rural Electric Cooperative, Inc.	Bob Solomon		
1	Hydro One Networks, Inc.	Muhammed Ali	Negative	SUPPORTS THIRD PARTY COMMENTS - (NPCC RSC)
1	Hydro-Quebec TransEnergie	Martin Boisvert	Negative	SUPPORTS THIRD PARTY COMMENTS - (NPCC)
1	Idaho Power Company	Molly Devine	Affirmative	
1	International Transmission Company Holdings Corp	Michael Moltane	Abstain	
1	JDRJC Associates	Jim D Cyrulewski	Affirmative	
1	JEA	Ted E Hobson	Negative	COMMENT RECEIVED
1	KAMO Electric Cooperative	Walter Kenyon	Affirmative	
1	Kansas City Power & Light Co.	Daniel Gibson	Negative	COMMENT RECEIVED
1	Lakeland Electric	Larry E Watt		
1	Lee County Electric Cooperative	John Chin		
1	Long Island Power Authority	Robert Ganley		
1	Los Angeles Department of Water & Power	faranak sarbaz	Abstain	
1	Lower Colorado River Authority	Martyn Turner	Affirmative	
1	M & A Electric Power Cooperative	William Price	Affirmative	
1	Manitoba Hydro	Jo-Anne M Ross	Negative	COMMENT RECEIVED
1	MEAG Power	Danny Dees	Affirmative	
1	MidAmerican Energy Co.	Terry Harbour	Negative	SUPPORTS THIRD PARTY COMMENTS - (NSRF)

Steve Alexanderson
Central Lincoln People's Utility District
Central Lincoln recently participated in a load shedding drill led by our Host BA/TOP. The single most glaring problem we saw was one of validation. In the past we had always thought we would validate an R3 Directive or Operating Instruction by calling the TOP back at a known phone number. Our TOP informed us that such a validation method would not be possible during a real event, since all phones and switchboards would likely be busy. While objecting to our validation method, the TOP has failed to offer a suitable one. This leaves Central Lincoln with the choice of responding to an Operating Instruction to shed load coming from a scammer who has easy access TOP-001 on line, or risking a possible violation. Suggest the SDT begin looking at the question of validation, since without a validation method R3 poses a greater risk to reliability than it addresses.
Group
Northeast Power Coordinating Council
Guy Zito
No
We commented in the last posting to replace the word “ensure” in requirements R1 and R2, and in the standard’s other requirements where applicable. We note that “ensure” has been replaced with “address”. The Purpose of the standard is “To prevent instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Interconnection by ensuring prompt action to prevent or mitigate such occurrences.” “Maintain” or “restore” are more appropriate words to use than “address”. The Time Horizon should only be “Real-time Operations”. “Ensure” in Measure M1 should also be replaced with the word selected to be used in R1. Regarding Requirement R3, Time Horizons should only be “Real-time Operations”. The 30 minute requirement in Requirement R13 is too restrictive and is inconsistent with EOP-008 which allows two hours to restore such functionality. If entities are permitted two hours to restore situational awareness following an evacuation, entities should be granted the same time consideration to restore Real-time assessment capability in R13. Therefore we recommend either of the following revisions to R13: • Each Transmission Operator shall perform a Real-time Assessment at least once every two hours. • Each Transmission Operator shall perform a Real-time Assessment at least once every 30 minutes when the EMS and SCADA are functional. Following the loss of EMS, a Transmission Operator shall regain ability to perform Real-time assessments within two hours. Requirement R7 has removed an important concept of TOP-001-1a Requirement R6. A supporting TOP should not be obligated to activate emergency procedures beyond those activated by the TOP that is in the emergency. As an example, a supporting TOP should not be obligated to go into voltage reduction if the TOP with the emergency as not take the same voltage reduction action first. Simply stating, ‘… has implemented its Emergency procedures,’ is not specific. TOP-001-1a Requirement R6 reads: R6. Each Transmission Operator, Balancing Authority, and Generator Operator shall render all available emergency assistance to others as requested, provided that the requesting entity has implemented its comparable emergency procedures, unless such actions would violate safety, equipment, or regulatory or statutory requirements. Recommend the following change to R7 to target the TOP’s requirement to assist other TOPs to those in the same RC area: R7. Each Transmission Operator shall assist other Transmission Operators within their Reliability Coordinator’s region, if requested and able, provided that the requesting entity has implemented its Emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations] In Part

10.2 the phrase '… as necessary by the TOP' is unclear. What TOP? Part 10.2 should be revised to be consistent with Part 10.1 and read: 10.2. Outside its Transmission Operator Area: Sub-parts 10.1.3 and 10.2.3 should be made consistent. "Ensure" remains in the posted requirement R13. Suggested rewording R13: Each Transmission Operator shall perform or have performed a Real-time Assessment at least once every 30 minutes. The "s" in system should be capitalized in Requirement R15. R3, M3, M4, R5, M5, M6 all use the words to comply with operating instructions, but R4 and R6 use the words perform an operating instruction. The wording should be consistent. Measure M7 should be corrected to be written like M3 and M5 in the past tense: "…unless such assistance could not be physically implemented…" Measure M8 should be revised since R8, and the first part of M8 refer to operations "that result in, or could result in, an Emergency". Therefore, the last sentence in M8 should read: "If no such situations have occurred, the TOP may provide an attestation." Requirement R11 directs the Balancing Authority to "…monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load…". Monitoring Special Protection Systems is not a function of the Balancing Authority. Requirement R11 can be removed. Should M11 use the same examples of evidence as does M10, for example Energy Management System description documents? M12 should have a broader scope. If the auditor is to verify that the TOP did not operate outside IROL for a duration exceeding IROL TV, then the TOP should provide information on all occasions in which he operated outside IROL for any period of time. This would reflect the RSAW's audit approach. M12 should read: "Each Transmission Operator shall make available evidence to show that for any occasion in which it operated outside any identified Interconnection Reliability Operating Limit (IROL), the continuous duration did not exceed its associated IROL Tv. Such evidence could include but is not limited to dated computer logs or reports in electronic or hard copy format specifying the date, time, duration, and details of the excursion. If such a situation has not occurred, the Transmission Operator may provide an attestation that an event has not occurred." For IROLs there is a maximum exceedance duration specified, but for SOLs in R14/M14 there is no leeway. Thus if a SOL is exceeded for 30 seconds, the TOP must have evidence it initiated its Operating Plan. This applies also for the VSL in the Table of Compliance Elements. No difference is made if the TOP initiates its Plan within the minute or after half an hour. Entities generally have very many SOL exceedances a year and to document each of them a proof of Implementation of a Plan is unrealistic. Whereas IROLs may be more severe than SOLs, the measure is less stringent. In the C. Compliance section, under 1.3 Data Retention, Measure M14 is mentioned in the second and third paragraphs giving it two different data retention periods. There is a typing error in the fourth paragraph referring to R13/M13: "Each TOP shall each keep data (…)". Remove the second "each". In the Table of Compliance Elements there is a typing error in the last paragraph for Severe VSL listing for R8: "or more than 15%". For R9, replace "and" with "or" because generally only one of the elements will be outaged. The VSLs should be revised to read "…sustained outage of telemetering or control equipment, or monitoring or assessment capabilities, or associated communication channels." R10 and R11 should have similar VSLs. Presently if the TOP does not monitor a facility, it will be a Moderate VSL but if the BA does not monitor a facility, it is a severe VSL. Everything is lumped together for the BA whereas in reality it is not an all or nothing situation. R11 should therefore have VSLs equivalent to those in R10. R14 should have different VSLs depending on the time it took the TOP to initiate its Operating Plan. R15 should have different VSLs depending on the time it took the TOP to inform its RC. Requirement R15 appears to be past tense, ' inform.. RC of actions taken…'. So one would believe that a pre-call is not required before actions are taken by the TOP. What is the purpose of this requirement? What is the added value in informing the RC after the fact of the actions that were taken to mitigate SOL exceedances? The TOP should be obligated to notify the RC if it cannot manage the exceedance on its own and needs assistance (another requirement). However, notifications via SCADA should be sufficient to address the concern. M15 – This measure does not include multi-modal communications. The TOP should be able to take credit for telemetered information (breaker operations) that communicates to the RC actions that have been taken. Also there is no time component for when to report. For example during, 5 minutes after, a day after. The word "own" should not be deleted from Requirement R16. It provides clarity that this is only pertaining to the equipment the Transmission Operator owns and not other equipment. The new requirement R19 addresses the data exchange capabilities needed. If non-BES facilities are to be included anywhere in the standard, they should be included in the BES by exception, especially since they are contributing to a SOL exceedance. R19 and R20 seem redundant with R10 and R11 since in R10 and R11 the TOP and BA are monitoring reliability required data, and they must have the data exchange

capabilities. Also, TOP-003-3 requires the TOP to develop data specifications to support Real-time monitoring and operation of the BES, and negotiate with data supplying entities the format, period and security protocol of the data exchange. This implies the requirement of a data exchange capability. We suggest removing R19 and R20. What defines a neighboring Transmission Operator Area? There are many instances where the loss of a facility in, let's say in Transmission Operator Area "A", which is not electrically "adjacent" to Transmission Operator Area "B", impacts Transmission Operator Area "B".

Requirement R10 presents a significant concern. A Transmission Operator cannot be held responsible for monitoring in a neighboring Transmission Operator Area; a Transmission Operator can only rely on data provided by a neighboring area. If a Transmission Operator was responsible for monitoring in a neighboring area, what is the TOP monitoring, how, what are the available actions and obligations, should the actions be taken unilaterally?
Individual

The current language in TOP-001 R1 and R2 has further expanded the applicable use of operating instructions encompassing all individuals to the point where the compliance risk of the requirement is not appropriately weighted with the benefit to reliability. R3 and R4 state that only the registered entities identified must comply with OI; they do not state that registered entities identified are the only entities that can receive OI. Therefore, without the lack of specificity in R1 and R2 (or in R3 and R4) to whom OI can be issued to, the standard now requires three point communication to any party or entity for actions that will affect the BES, even though that entity (unless identified in R3 and R4) does not have to comply. Although the NERC functional model states to whom a BA and TOP can direct, this is not referenced or mentioned in the standard, and must be inferred by not only the entity maintaining compliance, but also the individual performing an audit. It would seem very beneficial to specify this assumption within R1 and R2. Suggested Wording: R1 and R2: "Each Transmission Operator (Balancing Authority) shall act, or direct others (referenced in R3 and R4) to act by issuing Operating Instructions, to ensure the reliability of its Transmission Operator (Balancing Authority) Area." In R10, replace "necessary" with "applicable" to maintain consistency with the definitions of Real-Time Assessment and Operational Planning Analysis. Suggested Wording: Each Transmission Operator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary applicable by the Transmission Operator, within its Transmission Operator Area and neighboring Transmission Operator Areas to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area In R13, the OC Review Group suggests expanding the time interval to 45 minutes instead of 30 minutes. When new EMS models are brought online, they may require greater than 30 minutes to perform an assessment. Either the time could be expanded or some sort of allowance provided for the times when the new models are being placed in service. In the R13 VSL, the OC Review Group suggests the time graduations for each level of VSL be retained (30-35 minutes, 30-40 minutes, 40-45 minutes, >45 minutes). In R18, the OC Review Group suggests removing the word "always" before "operate" and provide graduated VSL to allow for when limits were determined to be incorrect due to mistake in entry of data. Suggested Wording: "R18: Each Transmission Operator and Balancing Authority shall always operate to the most limiting parameter in instances where there is a difference in SOLs." Should LSE be removed from applicable entities since LSE may be removed from the NERC Functional Model?

BC Hydro’s concern is that the Reliability Directive is replaced with Operating Instruction in the standard. The scope of “Operating Instructions” broadens to non-emergency situations. Requirement R3 and R4 have the BA’s complying with TOP’s Operating Instructions. BC Hydro’s concern is that there may be a conflict between the BA and the TOP. Requirement R3 provides exceptions for complying, but only for safety, equipment regulatory or statutory requirements. Nowhere does the Requirement address conflict in reliability requirements: for example, a TOP in our area issues an instruction to eliminate a voltage limit issue, and this action may cause another limits issue for another TOP. There appears to be no “out” clause based on reliability conflicts – such as deferring to an assessed lesser reliability impact. BC Hydro recommends revising these Requirements to allow for an “out” clause.

Definition of Real-Time Assessment contains provisions that will make compliance with the Requirements unattainable. First, the applicable inputs to the assessment include among other things, “known Protection System status or degradation.” Real time tools are generally incapable of consideration of the performance of protection systems, and accordingly conducting these assessments prescribed in the Requirements will fall short of the expectation.

No
We have concerns on what constitutes "Operating Instructions", and over how an entity is supposed to prove compliance once this standard becomes effective. We believe that "Reliability Directives", would be used infrequently under emergency type situations, compared to "Operating Instructions", everyday, common tasks, such as switching, would open up TOP's to an very burdensome way of documenting compliance. We are concerned that the operator will have to focus less attention on the actual operation of the system, and more attention to collecting evidence for future audits. We also have concerns about removing the terminology of EOP-001-1a; R1(and other requirements with similar language) that: “Each Transmission Operator shall have the responsibility and clear decision-making authority to take whatever actions are needed to ensure the reliability of its area and shall exercise specific authority to alleviate operating emergencies.” We believe that how entities choose to exercise that authority should be determined by each entity, based on their situation. Over the years the industry has clearly learned what a “Reliability Directive” means and we should not undo this concept, and avoid the confusion that it could create. In addition, the RSAWs introduce the concept of using BES events as a screening tool. We were not able locate any such information in the Reliability Standard itself, nor does the standard give guidance on when there are no BES events for the period being audited.

Bureau of Reclamation
Erika Doot
No
First, Reclamation continues to disagree with the use of the term Operating Instruction in TOP-001-3 R1–R6 and the entire TOP/IRO Revisions. In general, Reclamation believes that grid operations are a collaborative effort that balance competing obligations of generation, transmission, and distribution providers. Reclamation does not believe that Transmission Operators always understand or consider the equipment capabilities and limitations, or other obligations of generators. During normal operations, Reclamation does not believe that Transmission Operators should be able to always issue mandatory Operating Instructions to generators that may damage critical generating equipment or interfere with competing obligations (e.g., water delivery schedules for hydroelectric producers). Reclamation disagrees with the drafting team's assertion that "the definition for Reliability Directive is not needed due to work … on the definition of Operating Instruction." Reclamation believes that additional conversations with FERC may be necessary, and that TOP-001-3 should maintain the important concept that Balancing Authority and Transmission Operators only may issue Reliability Directives to address Emergencies or avoid Adverse Reliability Impacts. Reclamation also believes that Balancing Authories and Transmission Providers should be required to inform entities when they are issuing a Reliability Directive. In some instances, Balancing Authorities and Transmission Providers have decided after the fact that an instruction was a Reliability Directive. Reclamation does not believe that the requirements to comply with Reliability Directives in TOP-001 and IRO-001 should be invoked if an entity does not describe the instruction as a Reliability Directive. Second, Reclamation also continues to disagree with the drafting team's proposal to revise TOP-003-3 to require Generator Owners, Generator Operators, and Transmission Owners to meet any data specification outlined by Transmission Operators or Balancing Authorities. Like TOP-003-1, TOP-003-3 should outline a specific continent-wide standard like the submission of planned generation outages over 50MW by noon on the day before the outage, a requirement that has existed for 7 years. Reclamation does not support TOP-003-3 because it does not clearly define what types of data entities can request or may be required to provide, and will create significant operational challenges for entities operating in multiple Transmission Operator and Balancing Authority areas. As an example, Reclamation owns and operates over 50 hydroelectric facilities in seven control areas and this change would prevent Reclamation from adopting a uniform approach to demonstrating compliance with TOP-003. Under the current version of TOP-003, Reclamation can present a uniform approach to demonstrating that it submits planned outages before noon the day before the outage. In fact, like many generation entities, Reclamation generally submits planned outages more than a year in advance and plans non-routine outages as far in advance as practical. Under the proposed version of TOP-003-3, Reclamation would have to track and adjust individual generator Standard Operating Procedures (SOPs) to meet different and perhaps ever changing data specifications developed by each Transmission Operators, which could result in high costs for little reliability benefit.

Requirement R13 is problematic. The 30 minute requirement in R13 is too restrictive and inconsistent with EOP-008, which allows two hours to restore such functionality. If entities are permitted two hours to restore situational awareness following an evacuation, entities should be granted the same time consideration to restore real-time assessment capability in R13. Therefore we recommend either of the following revisions to R13: • Each Transmission Operator shall maintain that a Real-time Assessment is performed at least once every two hours. • Each Transmission Operator shall maintain that a Real-time Assessment is performed at least once every 30 minutes when the EMS & SCADA are functional. Following the loss of EMS, a Transmission Operator shall regain ability to perform real-time assessments within two hours. Requirement R7 raises jurisdictional concerns. We recommend the following change to R7 to target the TOP's requirement to assist other TOPs to those in the same RC area: R7. Each Transmission Operator shall assist other Transmission Operators within their Reliability Coordinator's region, if requested and able, provided that the requesting entity has implemented its Emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

MRO NERC Standards Review Forum
Joe DePoorter
No
R1 and R2 are ALL encompassing actions that cover every actionable NERC Requirement that the TOP and BA must accomplish. As written, "Each (BA, TOP) shall act to address the reliability of its (BA, TOP) Area via direct actions or by issuing Operating Instructions". EOP-002-3.1, R6, IRO-001-1.1, R8, are two examples where there must be "immediate" actions by the BA or TOP. If "via direct actions" is maintained in this proposed Standard, there will be a non-compliance double jeopardy impact if the BA or TOP violates an "immediate action" Requirement. Is the intent of R1 and R2 to issue Operating Instructions when the BA or TOP cannot maintain a reliability of their associated area? The NSRF wishes to points out that the Standards Process Manual section 2.4 describes a "Results Based Requirement" as "Each requirement of a reliability standard shall identify what Functional Entities shall do, and under what conditions, to achieve a specific reliability objective and not how that objective is achieved". R1 & R2 with their broad, general language do not meet the threshold for a "Results Based Requirement". The NSRF agrees with issuing Operating Instructions when required to maintain your system in a reliable state. But the all-encompassing "via direct actions", is applicable to over 460 Requirements that a BA must comply with. How is this going to be measured for the BA (or TOP)? Are voltage schedules going to be measured when that is covered in the VAR Standards? Is seems to be a catch all Requirement. A possible rewrite of R1 and R2 could read: "Each (BA, TOP) shall issue Operating Instructions to address the reliability of its area when direct actions require more assistance ". M1 does not reflect the current language of the rewritten R1. The word "ensure" still resides in M1. R9. Concerning "sustained outages", is there a minimum reporting threshold for this undefined term? EOP-004-2, Event Type "Complete loss of voice communication capability" and "Complete loss of monitoring capability" has a 30 minute continuous threshold. The NSRF recommends using the same bright line criteria of EOP-004-2 as stated above.

R13. Real-time Assessment: The NSRF still has concerns about how entities will incorporate "protection system status" into their real-time 30 minute assessment to be fully compliant. More clarity is needed for entities to verify that they have met the requirement. How are entities expected to show that their operators are aware of protection system status (as defined in the proposed Real-Time Assessment definition) and understand the system impact if a protection system is out-of-service? If policies, procedures, and snapshots of system operator tools are sufficient, this can be done. However, large scale state estimator real-time contingency assessments used have limitations. State estimators run DC powerflows based on programed line and node based contingencies. Protection system status changes that modify the lines and nodes studied may not be easily incorporated into state estimator systems in 30 minutes. Protection system coverage could easily change for known and unknown conditions. Known changes can include PRC testing. The PRC testing standards have mandated large amounts of testing for even moderately sized system so that daily testing must occur to meet mandatory testing timeframes. The large volume of PRC testing could make accounting for all protection system status changes within 30 minutes difficult to verify and puts entities at risk for maintaining perfect compliance to a large number of requirements since many of the TOP / IROL standards include the real-time assessment definition. Recommend that "protection system status" be deleted from the definition or at a minimum clarify that protection system status consideration by system operations is acceptable to be compliant, since "status consideration" equates to "situational awareness". As written in R13: R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. [Violation Risk Factor: High] [Time Horizon: Real-time Operations] M13.Each Transmission Operator shall have, and make available upon request, evidence to show it ensured that a Real-Time Assessment was performed at least once every 30 minutes. This evidence could include but is not limited to dated computer logs showing times the assessment was conducted, dated checklists, or other evidence. With regard to R13, we believe the SDT has improved the language by revisions such that the TOP shall "ensure that a Real-time Assessment is performed at least once every 30 minutes;" however, we continue to question the 30-minute requirement and believe that there will be tremendous difficulty in achieving this without defect. Rather, we would recommend the following language: R13: "Each TOP shall ensure that a Real-time Assessment is performed with such periodicity so as to ensure continuous situational awareness of the TOP." Measure M13 would need commensurate edits to conform with this R13 language. Entities have made these comments before and the SDT did not agree as they said; The SDT does not agree. The requirement allows for an entity to arrange for another entity to perform the assessment which aligns with requirements in approved EOP-008-1. Approved EOP-008-1 specifically requires entities to have tools and applications to ensure that System Operators have situational awareness of the BES. It goes on to require that entities take necessary actions to manage the risk to the BES during periods when primary or backup functionality may not be available. This requirement isn't about maintaining RTCA or any other specific tool, it's about maintaining situational awareness at all times. No change made. The first concern is the NSRF believes that without further clarification, System Operators will not have the "situational awareness" because they will not know "known Protection System and Special Protection System status or degradation…" per the Real-time Assessment definition, thus will most likely be non-compliant on a daily basis. A 4000 breaker Transmission system can have up to 20,000 (4000 x 5 parts of a Protection System) parts that would need to be tracked every 30 minutes. This is unrealistic and not physically possible. The SDT continues to use the words "have situational awareness" in their response to comments, and that the Requirement is not about an RTCA. But without using the RTCA, how will the System Operator prevent instability, uncontrolled separation or Cascading outages, per the Purpose of this proposed Standard? The Real-time assessment must consist of existing and potential operating conditions, per the definition. A System Operator cannot calculate all the minimum inputs every 30 minutes without using some type of calculating device. Please review the below violation which is based on Auditor notes (for TOP-002-2, R11). This shows that simple "situational awareness" is predicated on "system analysis", which the NSRF looks at as the entities RTCA. A second concern with the TOP-001-3 definition of Real time assessment, the recent TOP-002-2.1b R11 auditor guidance in the new RSAW, and a recent TOP-002-2.1b R11 violation cited below, is the proposed requirement is not technically feasible today. The three items listed just above in conjunction require an on-line dynamic stability assessment tool that can run multiple AC dynamic angular and voltage stability assessments in less than 30 minutes considering EMS input of the most recent alarm, SPS, and degraded state alarm statuses. The NSRF isn't aware of RTCA technology that can meet these requirements. Alternately, the assessment falls to human

manpower to perform these studies. Entities must identify a RTO, RC, or PA with staff available 24/7 to perform this or train its own 24/7 staff. It takes time to train dynamic stability staff and time to change the model to capture “known Protection System” statuses. TOP-001-3 Definition: Real-time Assessment - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) TOP-002-2.1b violation: (note this is publically posted in the most recent November compliance and enforcement spreadsheet) TOP-002-2.1b R11. On two occasions, SCS-Trans’ updated Bulk Electric System (BES) studies failed to reflect current system conditions. Specifically, two unscheduled outages of Protection System components, one for a 500 kV transmission line and one for a 230 kV transmission line, were not considered in SCS-Trans’ operating studies. TOP-002-2.1b RSAW auditor Guidance: Evaluation of Protection System Outages Protection Systems must operate and clear faults within the required clearing time to satisfy system performance requirements. All outages of Protection Systems or their components that affect the reliability performance of the transmission system must be evaluated for the periods they are scheduled, in the planning horizon in TPL assessments and in the operational planning timeframe through operating studies. For example, if a transmission line has A and B protection packages that are not functionally equivalent and the outage of one protection package affects the operating speed of the Protection System, the impact of slower fault clearing on the power delivery capability of the Bulk Power System (BPS) must be considered in the assessments and studies. Such impacts also must be considered when a transmission line has a single protection package and one component of the package (e.g., the communication system) is taken out of service

M1 – Replace ‘ensure’ with ‘address’ as in the requirement. R8 – With the removal of ‘other’ when referring to ‘known impacted Transmission Operators’ an overzealous auditor could require a Transmission Operator experiencing a condition which could be an Emergency or result in an Emergency would have to inform itself. Using ‘other known impacted Transmission Operators’ eliminates this situation. We recommend the drafting team return ‘other’, in the suggested location, to the requirement, measure and VSLs. R8 VSLs – If the drafting team decides not to make this suggested change, the term ‘other’ needs to be removed from the first ‘OR’ in the Severe VSL. In the last ‘OR’ of the Severe VSL insert the phrase ‘…, whichever is greater,…’ between ‘Authorities’ and ‘of’. R9 – We appreciate the drafting team attempting to add specificity to Requirement R9; however, ‘sustained’ is undefined. How does a Transmission Operator determine whether or not they are compliant with this requirement? What ensures auditors will consistently apply the terminology. We recommend the drafting team incorporate language consistent with COM-001-2, R10 which requires notification for outages lasting 30 minutes or more. If 30 minutes is determined to be too long, reduce the time to 15 minutes. We would like to suggest adding the term ‘known’ in front of ‘impacted’ in the second line of Requirement R9. We would like for the drafting team to help provide some clarity in Requirement R9….. does it apply to Planned Outages? Also, we noticed that the term ‘planned’ was removed from Measurement M9. Our question to the drafting team was this your intent to remove this term and if so would you provide clarity on why the term should be removed. We would like to suggest that the drafting team tie Requirement R9 to the Data Specifications of TOP-003-3 as suggested in the Mapping Document. Also, we would like to thank the drafting team for their willingness to adjust to many suggestions that are submitted and we truly appreciative for all or your time and efforts. R9 VSLs – Delete the phrase ‘NERC registered’ and insert the phrase ‘…, whichever is greater,…’ between ‘entities’ and ‘of’ in the ‘OR’ of the Severe VSL. R10 VSL – The drafting team should consider adding a 2nd ‘OR’ to the High VSL which states ‘The Transmission Operator did not monitor one of the items listed in Requirement R10, Part 10.1 and one of the items listed in Requirement R10, Part 10.2.’ R16 – We would like for the drafting team to provide more clarity on the word “telecommunication”. The word “telecommunication” should apply only to specific

outages or maintenance work done on the SCADA/EMS that affect the System Operators. R19 & R20 Moderate and High VSLs – Replace ‘entity’ with ‘entities’.

Ingleside Cogeneration LP
No
Ingleside Cogeneration L.P. (“ICLP”) understands that FERC has ordered that TOPs and RCs must be able to monitor “non-BES” systems that they determine will affect System Operating Limits. However, it naturally follows that such important facilities must be part of the BES – and addressed in a far more formal way. It seems to ICLP that just such an exception process was created in NERC’s Rules of Procedure when the Definition of the BES was modified. It allows the TOP/RC to make the case for the new addition – while the owner/operator has the opportunity to challenge it. Even if there needs to be an emergency bypass procedure to account for unexpected circumstances, at least a level of important control will exist. Otherwise, components and facilities can be essentially added to the BES without any recourse on the part of the affected entity. This raises the specter of the improper sharing of proprietary information and the chance of economic discrimination if such authority is misused. Secondly, a GOP will be expected to capture the fact that every Operating Instruction was performed unless it would “violate safety, equipment, regulatory, or statutory requirements.” ICLP will execute in good faith to every instruction, but we are not confident that our log entries will be up to auditor expectations – particularly if routine status or some other low-impact action is requested. The alternative offered by the project team (the RSAW only directs CEAs to review logs where a EOP-004-2 defined Event took place) is not binding. It is not hard to see that expectations will vary by Regional Entity and even change over time. Furthermore, the target of Operating Instructions will not be limited to BES Facilities. This could mean that as a Cogeneration Facility, we will be put into an untenable bind if ordered by a BA or TOP to re-direct capacity to the BES at the expense of our internal customer. Of course we are responsive to the needs of the greater system, but it should not be up to external entities to decide which needs take priority – keeping in mind that our installation is a critical part of the national chemical infrastructure.

Tennessee Valley Authority
Dennis Chastain
No
TVA feels that requiring a TOP to monitor neighboring facilities that are non-BES to determine SOL violations should not be required (see R10., 10.2.3). If non-BES facilities are required for the reliable operation of the transmission system they should first be included into the BES by use of the Rules of Procedure exceptions process.

The drafting team’s revisions significantly improve the proposed standard. However, requirements R3 and R5 continue to impose a high compliance burden on entities that receive Operating Instructions. For example, a Generator Operator could receive thousands of dispatch instructions each year. As the term is defined, each of these dispatch instructions would be an Operating Instruction and the GOP would be required to demonstrate that it complied with each of these Operating Instructions (or that it was unable to comply for the reasons specified in requirements R4 and R6). The standards drafting team for COM-002 recognized this issue when it developed a tiered approach for the communication protocols associated with Operating Instructions. The first tier requires an entity to periodically monitor compliance with its communications protocols and then

correct issues that are discovered during this monitoring. The second tier requires entities to comply fully with its communication protocols during Emergency conditions only. This approach recognizes the importance of formal communications during both normal and Emergency conditions, but appropriately minimizes the compliance burden that would be associated with demonstrating compliance with an entity's communication protocols for all Operating Instructions. The drafting team should model that approach in this standard.

ReliabilityFirst
No
ReliabilityFirst abstains and offers the following comment for consideration. 1. Requirement R1, R2, R3 and R4 - ReliabilityFirst continues to recommend there be a timeframe added to the requirement stating the allotted time the Entity has to inform its Transmission Operator of its inability to perform an Operating Instruction. Absent a timeframe, compliance to this requirement becomes subjective and difficult to enforce. ReliabilityFirst understands that a finite timeframe may not be appropriate to be stated in the standard to cover all circumstances, but offers a suggestion to require the TOP to define it when issuing Operating Instructions. ReliabilityFirst suggests the following revised language for consideration. R1 - Each Transmission Operator shall act to address the reliability of its Transmission Operator Area via direct actions or by issuing Operating Instructions [along with allocated time constraints for notification if the Operating Instructions cannot be performed]. R2 - Each Balancing Authority shall act to address the reliability of its Balancing Authority Area via direct actions or by issuing Operating Instruction [along with allocated time constraints for notification if the Operating Instructions cannot be performed]. R4 - Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Transmission Operator [within the time constraints allocated by the Transmission Operator] of its inability to perform an Operating Instruction issued by its Transmission Operator..." R6 - Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Balancing Authority [within the time constraints allocated by the Balancing Authority] of its inability to perform an Operating Instruction issued by that Balancing Authority."

Thank you SDT members for all of your work, the following were our comments on the proposed standard language. We will be voting affirmative, but think comments below crucial the final modifications to the standard. 1. "Ensure" was removed from R1 and R2 but please also remove it from M1 and M2. 2. R3 – LSE needs to be removed as this function is soon to be retired. 3. With the new definition of RAS just voted on, it would be best to replace RAS with SPS as "SPS" is going away. 4. Please change "maintain" to address in R19/M19 and R20/M20. This has similar implications of "ensure." Of course we should do all in our power to maintain and ensure the bulk electric system, but there will be situations (no matter how many standards are in place) where industry may not be able to ensure or maintain reliability. To use such language is putting an unrealistic expectation in place that gives the regulator the ability to use our own words to find fault, even when no fault is present.

We generally agree with the changes made to the proposed TOP-001-3 standard, but continue to have a serious concerns over the proposed retirement of Requirement R4 of TOP-004-2 without having it reinstated in TOP-001-3 or having some of the requirements in TOP-001-3 revised to addressing the reliability need for confirming or reestablishing valid SOLs/IROLs in an unknown or unstudied state. We strongly believe that the Requirement R4 of TOP-004-2 addresses a critical reliability aspect that ensures the bulk electric system is operated in a reliable manner during real-time operations. And, if is not actually replaced by any new or revised requirement in TOP-001-3, it will create a reliability gap that is critical to the reliable operation of the bulk electric system. Requirement R4 of TOP-004-2 stipulates that: R4. If a Transmission Operator enters an unknown operating state (i.e., any state for which valid operating limits have not been determined), it will be considered to be in an emergency and shall restore operations to respect proven reliable power system limits within 30 minutes. In previous postings, we expressed a concern that by retiring R4 of TOP-004-2, the responsible entity (TOP in this case) will no longer be required to reconfirm or reestablish valid SOLs or IROLs when entering an unknown (or unstudied) state. We recognize that by virtue of the proposed definition of Operational Planning Analysis (OPA) and Real-time Assessment (RTA), as well as the new requirement for TOPs to update their OPA results through the performance of a RTA every 30 minutes, that the entities will always be assessing the reliability of the BES. The SDT thus argues that this, together with the TOP-001-3 Requirements R12, R13, and R14, will allow the operators sufficient flexibility within a structured environment to take the necessary actions for the reliability of the Bulk Power System and hence Requirement R4 of TOP-004-2 can be retired. We continue to disagree with the SDT’s rationale for retiring R4 of TOP-001-3. Below is our point by point comment on the SDT’s response to our last round of comment. This is not meant to be a criticism of the SDT’s response. Rather, we choose to present our comment in this manner so that we can more clearly present our view on each of the technical arguments that the SDT made. a. The SDT [believes the existing requirements within the standard to perform a Real-time Assessment include reevaluation of SOL/IROL limits to either reestablish new limits or implement Operating Plans to stay within updated limits. The SDT does not believe that the proposed requirements and standards allow an entity to be in an unknown state consistent with established IROL Tv.] The IESO believes that an unknown state is one which has not been assessed before in IROL or SOL calculation or reliability assessment, and therefore there does not exist an updated, valid limit until it is re-determined (or reconfirmed). We further believe that the SDT’s view that “by complying with the proposed requirement, an entity will never enter into an unknown state” may be an oversimplified assumption, if not an oversight. An unknown operating state includes an unstudied state beyond those which the calculated SOLs or IROLs are intended to cover. b. [The premise of the SDT’s philosophy is that an Operational Planning Analysis must be available for next day and that this analysis must be periodically updated by performing a Real-time Assessment as per proposed TOP-001-4 Requirement R13.] The IESO believes that the OPA and RTA are good tolls, but they only look ahead at anticipated conditions and assess real-time situation in response to system changes and by themselves they are not a limit calculation mechanisms. Therefore, while these tasks will aid in assessing performance of the system against established limits, such limits may not exist; and OPA and RTA are not the tasks to calculate limits for the anticipated or prevailing conditions, especially for the stability restricted SOLs/IROLs. c. [Both of these functions require an established set of Facility Ratings be in use so that analysis can discern when these limits are being exceeded. It is the SDT’s belief that once these limits have been established that it does not matter what event occurs to cause an exceedance.] The IESO believes that this may be true for facility limited SOLs/IROLs, but not for voltage and/or stability restricted SOLs/IROLs. d. [The event takes place and is analyzed against the set of limits currently in place.] The IESO believes that a set of valid limit (voltage and stability limited type) may not exist for conditions that have not been studied and therefore there is no such “set of limits currently in place”. e. [It is these limits that an entity must restore the system to following the event as per proposed TOP-001-4 Requirement R14.] This is achievable if the limits already exist. But when the limits do not exist, as in the case of SOLs or IROLs that are restricted by stability and when the prevailing conditions are ones that have not been studied before, there is not a target (SOL or IROL) with which the system is to be restored to. f.

[Therefore, the SDT believes that approved TOP-004-2 Requirement R4 can be retired without creating a reliability gap. The SDT recognizes that not all entities are capable of performing Real-time transient Stability analysis within 30 minutes and would rely on Operating Plans. No change made. The IESO believes that an Operating Plan is only a plan for the anticipated conditions. Changes during real-time operation can render the assumptions and pre-determined limits invalid and hence the responsible entity cannot rely on the Operating Plan to provide SOLs/IROLs that are stability restricted. We agree that with the current technology, it is doubtful if any entities can rely on real-time tools to calculate SOLs/IROLs in 30 minutes. However, this should not be a reason to not reestablish SOLs/IROLs when an entity encounters a condition that is “unknown” or not studied before. There are various means to achieve such tasks, but a necessary first step to ensure entities reestablish valid SOLs/IROLs is to stipulate this in a standard. Retiring R4 of TOP-004-2 will do just the opposite: responsible entities will not be mandated to reestablish valid limits to begin with when entering an unstudied or unknown state. We once again urge the SDT to reinsert R4 of TOP-004-2 to TOP-001-3, or to expand Requirement R13 to require TOPs to reestablish valid SOLs when the prevailing conditions are beyond those that are covered by or have been studied in SOL calculations.

NV Energy
No
The comments of NV Energy, particluarly with regard to requirement R13, remain unaddressed in this latest posting. We continue to urge the SDT to depart from the zero defect approach on the language of R13. It seems unreasonable to expect perfect execution of the suggested real-time analyses, including the provisions for incorporation of the elements of SPS/RAS and protection system status,17,520 times per year. By the SDT's own response to NV Energy's comments in the prior ballot/comment period " This requirement isn’t about maintaining RTCA or any other specific tool, it’s about maintaining situational awareness at all times." Yet the SDT nevertheless declined to make any change to the language of R13. We continue to believe that the language suggested below is reasonable given the complexity of the requirements of TOP-001-3. We therefore suggest the following: R13: “Each TOP shall ensure that a Real-time Assessment is performed with such periodicity so as to ensure continuous situational awareness of the TOP.”

Proposed Standard TOP-001-3 R9 States: R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected entities of sustained outages of telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities. In response to R9, Oncor recommends for the requirement to make it mandatory for BAs and TOPs to notify only negatively impacted interconnected TOs, TOPs and GOPs. Oncor does not feel it necessary to notify registered entities that do not have reliability control functions to the BES. Oncor’s suggested rewording for R9: R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and negatively impacted interconnected TOs, TOPs and GOPs of sustained outages of telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities. Proposed Standard TOP-001-3 R10 States: R10. Each Transmission Operator shall monitor the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: 10.2. Within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator: 10.2.1. Facilities, 10.2.2. Status of

Special Protection Systems, and 10.2.3. Non-BES facilities. ERCOT region is structured to support a deregulated market in which ERCOT monitors facilities for all TOPS and has a centralized view of the entire region to maintain reliability. TOPs operating within ERCOT currently do not have the technical capability to monitor facilities of neighboring TOPs. This requirement imposes a "one size fits all" regional structure which would place an unreasonable financial burden on all TOPs to both install and maintain additional hardware in each station or install and maintain multiple ICCPs between control centers. This requirement would place this financial burden on TOPs for nothing more than to replicate an RC function with no benefit to the BES. At no point in proposed Standard TOP-001- 3 does it require TOs to supply neighboring TOs with this data. Oncor requests R1O.2, R10.2.1., R10.2.2 and R10.2.3 be removed from the standard due to lack of regional flexibility. Proposed R12 changes the existing requirement of operating outside an IROL for no longer than 30 minutes to "a continuous duration exceeding its associated IROL Tv". This requirement does not specify who determines the Tv of an IROL when multiple TOPs are involved in the circuit. Oncor believes that the 30 minute limit utilized in previous versions of this standard eliminates the possibility for disagreement. Oncor's recommendation is to keep the existing 30 minute time limit.

(1) GTC requests the drafting team remove the DP and LSE designation from Requirements R3 and R5 and develop separate requirements for the DP and LSE to comply with Operating Instructions to shed or shift load. By making this change, the requirements could be made clearer that the Operating Instructions that the DP and LSE receive from the TOP with respect to the defined term Operating Instruction, correspond to "impacting" the output of an Element of the BES (shed or shift load). Because the term Operating Instruction is tied to the BES, a standalone requirement is necessary to eliminate the ambiguity associated with entities with multiple registrations such as TOs who are also DP/LSE's that own BES equipment. It should be noted that this Standard does not apply to a Transmission Owner, but the field personnel who perform switching in substations of entities with both registration types are typically the same personnel. The level of Operating Instructions performed for multiple registration type (TO/DP/LSE) entities would be much more voluminous and burdensome due to the ownership of transmission equipment than the typical DP/LSE type entities for the same requirement. GTC believes the typical scenario the drafting team is considering is from a TOP control center to a DP/LSE dispatch center that does not own BES equipment, but can impact the output of an Element of the BES (by shedding or shifting load). GTC urges the drafting team to consider this additional exposure of field personnel of TO/DP entities that switch in transmission substations to which the standard does not apply. Per discussions with Standard Drafting Team members and industry personnel, the scenario for DP/LSE's to receive Operating Instructions are limited to load shed or shift scenarios to preserve the reliability of the BES by the defined term associated with "impacting" the output of an Element of the BES. Exposing these multiple registration type entities to a set of mandatory standard requirements to which they do not apply such as those TOs and DPs identified above, demonstrates the potential flaw with the current language. With the following changes made to the requirements, GTC would be comfortable voting affirmative on this standard: • Each Distribution Provider and Load Serving Entity shall comply with each Operating Instruction issued by its Transmission Operator to shed or shift load, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. • Each Distribution Provider and Load Serving Entity shall comply with each Operating Instruction issued by its Balancing Authority to shed load or shift load, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. (2) Please note that M1 should be changed from "ensure" to "address" to match R1. (3) Part 10.1.3 and 10.2.3's reference to "Non-BES facilities" is outside the scope of reliability standards. Reliability standards are applicable to the BES, which would be Facilities. Refer to NERC's memo dated April 10, 2012 with respect to use of the term BES in Reliability Standards. The revised BES definition addresses Elements and Facilities that should be subject to the reliability standards through the BES exception process. Although the TOP will monitor Non-BES facilities in practice, there is no reason to include non-BES Elements in the requirement subject to mandatory enforcement. Parts 10.1.3 and 10.2.3 that reference "non-BES facilities" should be struck.

For R4&5 the timing is vague. Should it be done immediately, within 30 minutes, etc. For R9 we are concerned that "sustained" is vague. If it lasted 2 minutes, was that a sustained outage? R10 should only include BES elements. Items of concern can be added through the inclusion process. R13 should have an exclusion that allows procedures to be implemented when system information is unavailable to reduce the risk instead of simply requiring real-time assessments be performed at least every 30 minutes. Even having a complete redundant EMS system might not prove sufficient to prevent a violation. R19 & 20 should require other BAs and TOPs to participate.

Duke Energy
Michael Lowman
No
General Comments: Duke Energy is concerned with the uncertainty surrounding the inclusion and/or exclusion of Load Serving Entity in various Standards Projects. This inconsistency among Standard Drafting Teams creates uncertainty in the industry as to the expectations of the LSE, or whether the LSE will even be a applicable function. A more consistent application of the LSE function in proposed NERC standards is needed. R1: Based upon the comments provided below, Duke Energy suggests that R1 be focused on the TOP issuing Operating Instructions and suggests the following revision to R1 for clarity: “Each Transmission Operator shall issue Operating Instructions, as necessary, to maintain the reliability of its Transmission Operator Area”. We believe the intent is for the TOP to “maintain” the reliability of the TOP Area by Issuing Operating Instructions. Duke Energy believes that by using the term “address” in the current draft, the standard would only be requiring an entity to identify the problem and take action without any stated goal or result. We feel that by using the term “maintain”, the standard would require the entity to identify the problem and maintain the reliability of its TOP Area. Lastly, Duke Energy has concerns with the use of the term “act” in R1 and R2. As currently worded, absent the TOP issuing an Operating Instruction, R1 states that the TOP shall “act”, in other words, do its job. If an entity fails to perform some action in an effort to maintain reliability in its Area, the entity would be in direct violation of this standard. In the event that an entity violated any other TOP standard, it could be argued that the entity failed to perform a certain “act”, which presents a possible double jeopardy situation wherein the failure to act, violating one standard could be construed as a violation of the proposed TOP-001-3. We suggest the use of the phrase “issue Operating Instructions” eliminates the possibility of a double jeopardy situation. R2: Based upon the comments provided below, Duke Energy suggests that R2 be focused on the BA issuing Operating Instructions and suggests the following revision to R2 for clarity: “Each Balancing Authority shall issue Operating Instructions, as necessary, to maintain the reliability of its Balancing Authority Area”. We believe the intent is for the BA to maintain the reliability of its BA Area by Issuing Operating Instructions. Duke Energy believes that by using the term “address” in the current draft, the standard would only be requiring an entity to identify the problem and take action without any stated goal or result. We feel that by using the term “maintain”, the standard would require the entity to identify the problem and maintain the reliability of its BA Area. Lastly, Duke Energy has concerns with the use of the term “act” in R1 and R2. As currently worded, absent the BA issuing an Operating Instruction, R2 states that the BA shall “act”, in other words, do its job. If the BA fails to perform some action in an effort to maintain reliability in its Area, the entity would be in direct violation of this standard. In the event that an entity violated any other BA standard, it could be argued that the entity failed to perform a certain “act”, which presents a possible double jeopardy situation wherein the failure to act, violating one standard could be construed as a violation of the proposed TOP-001-3. We suggest the use of the phrase “issue Operating Instructions” eliminates the

possibility of a double jeopardy situation. R9: Duke Energy would like the SDT to clarify the time duration of a “sustained outage”. It is unclear if an outage lasting longer than 10min, 20min, 30min, etc. would be considered a sustained outage. Was it the SDT’s intent to allow entities the flexibility to define what constitutes a “sustained outage”? SOL Exceedance document: (1) Duke Energy suggests replacing “Thermal Limit Exceeded” with “SOL Limit Exceeded” to provide clarity in the example given in Table 1. (2) Duke Energy does not believe that the System Operating Limit Definition and Exceedance Clarification document should be attached to the TOP-001-1 standard. Instead, we believe it should be a standalone guidance document for the industry. If this were to occur, Duke Energy would likely vote “Affirmative” for TOP-001-1 as written.

Jo-Anne Ross
Manitoba Hydro
No
Manitoba Hydro agrees with changing the term “ensure” to “address” throughout the standard, however in M1 the term “ensure” remains even though its associated requirement R1 has “address”. We believe the intent was to replace “ensure” with “address” as it is in M2. In Pages 15 and 16 of TOP-001-3, Table of Compliance Elements, “Operations Planning” in the Time Horizon column of R1 through R6 should be deleted because they were deleted in Requirements R1 through R6.

For smaller entities that do not own or operate a state estimator, the Real-time Assessment required in R13 would be overly burdensome, if not impossible, to meet internally. Although the drafting team indicates a third-party service may be utilized in lieu of an internal system, smaller entities would be wholly reliant on a third-party in order to maintain compliance with R13. This is of particular concern when considering that if a Protection System status were to change unexpectedly on a smaller entity's system, that entity would be expected to notify a third-party and then have that third-party perform a modified contingency analysis, pending availability, all within 30 minutes. Rather than treat all TOPs the same without consideration for size or risk to the BES, recommend that, at a minimum, the timeframe for conducting the Real-time Assessments be expanded or else allow the individual TOPs to establish the timeframe.

CenterPoint Energy Houston Electric LLC
No
R1. – CenterPoint Energy agrees with the addition of "…direct actions or by issuing Operating Instructions" as well as using 'address' rather than 'ensure', however CenterPoint Energy prefers the manner in which the previous R1 was drafted. CenterPoint Energy suggests the following language: "Each Transmission Operator shall take direct actions or issue Operating Instructions to address the reliability of its Transmission Operator Area." R10.2 – CenterPoint Energy strongly disagrees with the addition of 10.2 into the TOP Standards, specifically "neighboring Transmission Operator Areas". CenterPoint Energy agrees with the Functional Model that it is the Reliability Coordinator's responsibility to monitor the wide area. In addition, CenterPoint Energy believes the SDT has overreached in its interpretation of paragraph 60 of the NOPR. CenterPoint Energy's reading of paragraph 60 finds vague references to monitoring and analysis capabilities but no specific directives to expand the TOP's view into another TOP Area. Also, CenterPoint Energy is concerned this will create confusion among registered entities as to who exactly has the responsibility to monitor and take action. As long as R10.2 remains CenterPoint Energy cannot support the proposed Standard and therefore strongly recommends the SDT delete R10.2. R13. – CenterPoint Energy agrees that a Real-Time Assessment (RTA) should be run every 30 minutes, however the Company is concerned that events could occur that are outside of the Transmission Operator's control (Ex. Loss of ICCP data) that may prevent the Transmission Operator from performing a RTA as required; therefore there should be a caveat as to when exceeding the 30 minutes is allowed. CenterPoint Energy recommends the following language: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. In instances where a Real-Time Assessment cannot be performed (i.e. loss of ICCP data) the TOP shall take immediate action to restore Real-Time Assessment functionality. R14. – CenterPoint Energy suggests changing Operating Plan to Operating Plan(s).

Indiana Municipal Power Agency
No
Indiana Municipal Power Agency (IMPA) appreciates the hard work and effort the SDT has put into this standard. IMPA does not agree with using Operating Instructions within this standard. By using Operating Instructions within this standard, NERC has created an extremely administrative type of standard for entities to follow and to keep evidence to show they performed the Operating Instruction. This seems to be going in the opposite direction of what NERC is proposing in its RAI program with the theme of concentrating on the "risk" to the BES. IMPA acknowledges that the SDT writes the standard but also understands the influence NERC has on standard drafting teams. During high load times, an entity that has to follow its TOP's Operating Instructions will need to keep a good recording or log entry of the Operating Instruction and then proceed to keep documentation showing it was performed. Since the definition of an Operating Instruction is vague and not clear, an entity will have to do this for every instruction from its TOP regardless of how they see the instruction because an auditor may view it as an Operating Instruction. For example, a Generator Operator will have to keep a log and evidence to show it performed the Operating Instruction for every start, stop, and load command for all of its generating units within its fleet (PJM is the TOP for many GOPs). IMPA recommends the drafting of requirements that allow entities to focus on the "risk" to the BES and not write requirements which are administrative in nature (meet paragraph 81 criteria).
Group
ISO/RTO Council Standards Review Committee (SRC)
Greg Campoli
No
SRC members generally agrees with the modifications to TOP-001-3 with the following additional recommendations for clarity, consistency, and/or to eliminate redundancy: 1. In Requirement R1, it is recommended that "address" is ambiguous and should be revised to "maintain" or "preserve" and that "[V]ia direct actions or by issuing Operating Instructions" should be revised to state "by initiating direct actions or issuing Operating Instructions." Also, the measure M1 should be revised for consistency. 2. Review of modifications to IRO-001-4, Requirements R1, R2, and R3 to ensure consistency with the proposed revisions to TOP-001-3, Requirements R1 – R6. 3. Requirement R7

has not retained an important concept contained within the previous requirement (TOP-001-1a – R6), which is that a supporting TOP should not be obligated to activate emergency procedures beyond those activated by the TOP that is in the emergency. As an example, the supporting TOP should not be obligated to go into voltage reduction if the TOP with the emergency has not taken the same voltage reduction action first. Hence, the phrase '… has implemented its Emergency procedures,' is less specific than the previous standard and should be revised to provide '… has implemented its comparable Emergency procedures.' 4. Requirement 10 seems duplicative in function with IRO-003, which requires the RC to monitor facilities associated with System Operating Limits (SOLs) and represents an overlap of the RC's responsibility with the TOP draft requirement. Specifically, the TOP would have a requirement to monitor facilities outside of its TOP area that could affect SOL exceedences within its TOP area when the RC is already tasked with the "wide-area" view. This is in direct conflict with the Functional Model definition of a TOP which limits TOP responsibility to assets within its area. Further, it is recommended that the term "non-BES" Be removed from Requirement R10. The "inclusion" process should capture all equipment that are sub-100 kV, but that affect BES reliability and bring this equipment into scope. Finally, in Requirement R10.2, the phrase '… as necessary by the TOP' is unclear and should be redrafted to be consistent with 10.1 "10.2. In the neighboring Transmission Operator Area." Conforming changes should also be made to Requirements R10.1.3 and 10.2.3. NOTE: this comment is not supported by PJM 5. The SRC appreciates the SDT's effort to clarify the obligations of Balancing Authorities under Requirement R11. However, it respectfully submits that "in order to be able to perform its reliability functions" may still be ambiguous, resulting in subjective determinations of compliance. Additional revision is proposed to mitigate this ambiguity and to ensure that the reliability functions being referenced are clear: "Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain Load-interchange-generation balance within its Balancing Authority Area, and support Interconnection frequency in real-time." 6. The SRC respectfully submits that R15 is not necessary to ensure an Adequate Level of Reliability. Specifically, since the exceedance would have already been addressed or is being actively managed by the TOP and communication would already be occurring with impacted parties pursuant to other requirements, a requirement to inform the RC isn't needed. If R15 is maintained, the SRC suggests including SCADA information in the Measurement so that the TOP can "inform" the RC through this mechanism. NOTE: this comment is not supported by PJM 7. The SRC reiterates it serious concerns over the proposed retirement of Requirement R4 of TOP-004-2 without requirements in TOP-001-3 addressing the reliability need for confirming or reestablishing valid SOLs/IROLs in an unstudied state. In previous postings, the SRC expressed a concern that, by retiring R4 of TOP-004-2, the responsible entity (TOP in this case) will no longer be required to reconfirm or reestablish valid SOLs or IROLs when entering an unstudied state. We recognize that, by virtue of the proposed definition of Operational Planning Analysis (OPA) and Real-time Assessment (RTA), as well as the new requirement for TOPs to update their OPA results through the performance of a RTA every 30 minutes, entities will always be assessing the reliability of the BES. However, we continue to disagree with this rationale and provide additional information in response to the SDT's response to our last comment. In response to the SDT's indication that it does not believe that the proposed requirements and standards allow an entity to be in an unknown state consistent with established IROL Tv, the SRC responds that an unknown state is one which has not been assessed before in IROL or SOL calculation or reliability assessment, and, therefore, there does not exist an updated, valid limit until it is re-determined (or reconfirmed). Thus, if an unknown operating state includes an unstudied state beyond those which the calculated SOLs or IROLs are intended to cover, then entities may find themselves in an unknown operating state. For example, in the Northeast, such as Quebec, Ontario and New York, SOLs/IROLs are observed to guard against transient or dynamic instability. These limits are normally developed using off-line analyses, as they cannot be determined within a short time using any on-line analysis tools available today. Predetermined reduction or judgment may need to be applied when system conditions, such as two or more critical facilities are out of service, diverge from the assumptions utilized in reliability assessment and other studies. In these circumstances, e.g., when an unstudied state is encountered, a necessary first step for the operating entities in these areas is to reconfirm or recalculate the limits that are valid and applicable for the prevailing conditions. The reconfirmed or reestablished limits will become the target to which the system must be adjusted. Given the use of off-line studies to set limits and identify complex system conditions, the SRC believes that the OPA and RTA are good tools, but caution that these tools only look ahead at anticipated conditions and

assess real-time situations in response to system changes. Accordingly, by themselves, they are not limit calculation mechanisms. Therefore, while these tasks will aid in assessing performance of the system against established limits, where such limits may not exist, the OPA and RTA are not the tools to calculate limits for the anticipated or prevailing conditions, especially for stability restricted SOLs/IROLs. To summarize, it is possible for the system to be in an unstudied or unknown state where established limits either don't apply or limits have not yet been established. While the RTA, OPA, and established Operating Plans can be quickly and easily applied to anticipated conditions, changes during real-time operation can render the assumptions and pre-determined limits invalid and, hence, the responsible entity cannot rely on these tools should these circumstances occur. Thus, the SRC once again urges the SDT to modify TOP-001-3 to expand Requirement R13 to require TOPs to reestablish valid SOLs when the prevailing conditions are beyond those that are covered by or have been studied in off-line calculations. NOTE: this comment is not supported by CAISO; ERCOT; MISO or PJM.

(1) There are several issues with the draft standard of TOP-001-3. First, we disagree with the inclusion of the Load-Serving Entity (LSE) as an applicable entity. This function is being removed from the NERC Rules of Procedure and should not be included in the draft standard. TOP-001-3 already applies to the Distribution Provider (DP), so there will not be a gap in the future because LSEs are required to also be registered as DPs. We recommend removing the LSE from the applicability section for consistency with the revised NERC Rules of Procedure and to avoid a future standards project to correct this issue. In regards to timing, the NERC BOT will likely have approved removal of LSE before this is even approved in a final ballot by the ballot body. (2) Requirement R1 and Requirement R2 are problematic because they are vaguely written and could result in additional compliance burdens for a TOP or BA when there is an event. As currently written, any time that a TOP or BA has an outage there could be a violation because the entity did not address the reliability of its area. These requirements will be used in enforcement as additional fines without benefitting reliability because they do not state what actions should be taken. We also disagree with the High VRF and Severe VSL for these standards. These requirements are vague and need further refinement. (3) Requirements R3, R4, R5, and R6 should not apply to the LSE, as previously stated above. (4) Requirement R8 needs to be revised to remove the words "could result in an Emergency." There are numerous situations that "could" result in an Emergency, but do not. This language is ambiguous and immeasurable, and should be removed. (5) Requirement R9 has improved with the addition of "sustained outages" to clarify that notification is not required for momentary events. However, R9 is not clear as to the outage thresholds that would require a notification. When must the BA or TOP notify its RC? The requirement is ambiguous as written, which will lead to varying interpretations for compliance. This requirement needs to be revised to provide additional clarity when a notification to the RC is required. (6) Requirement R10 and part 10.1 are duplicative in listing "within its Transmission Operator Area." If taken as a whole, R10 states that "Each TOP shall monitor the following as necessary for determining SOL exceedances within its TOP Area: 10.1. Within its TOP Area: 10.1.1. Facilities…" This requirement needs to be revised to have proper sentence structure. (7) Part 10.3's reference to "Non-BES facilities" is outside the scope of reliability standards. Reliability standards are applicable to the BES, which would be Facilities. The revised BES definition addresses Elements and Facilities that should be subject to the reliability standards through the BES exception process. There is no reason to include non-BES Elements in the requirement. Parts 10.1.3 and 10.2.3 that reference "non-BES facilities" should be struck. (8) Thank you for the opportunity to comment.

M1 – Replace ‘ensure’ with ‘address’ as in the requirement. R8 – With the removal of ‘other’ when referring to ‘known impacted Transmission Operators’ an overzealous auditor could require a Transmission Operator experiencing a condition which could be an Emergency or result in an Emergency would have to inform itself. Using ‘other known impacted Transmission Operators’ eliminates this situation. We recommend the drafting team return ‘other’, in the suggested location, to the requirement, measure and VSLs. R8 VSLs – If the drafting team decides not to make this suggested change, the term ‘other’ needs to be removed from the first ‘OR’ in the Severe VSL. In the last ‘OR’ of the Severe VSL insert the phrase ‘…, whichever is greater,…’ between ‘Authorities’ and ‘of’. R9 – We appreciate the drafting team attempting to add specificity to Requirement R9; however, ‘sustained’ is undefined. How does a Transmission Operator determine whether or not they are compliant with this requirement? What ensures auditors will consistently apply the terminology. We recommend the drafting team incorporate language consistent with COM-001-2, R10 which requires notification for outages lasting 30 minutes or more. If 30 minutes is determined to be too long, reduce the time to 15 minutes. We would like to suggest adding the term ‘known’ in front of ‘impacted’ in the second line of Requirement R9. We would like for the drafting team to help provide some clarity in Requirement R9….. does it apply to Planned Outages? Also, we noticed that the term ‘planned’ was removed from Measurement M9. Our question to the drafting team was this your intent to remove this term and if so would you provide clarity on why the term should be removed. We would like to suggest that the drafting team tie Requirement R9 to the Data Specifications of TOP-003-3 as suggested in the Mapping Document. Also, we would like to thank the drafting team for their willingness to adjust to many suggestions that are submitted and we truly appreciative for all or your time and efforts. R9 VSLs – Delete the phrase ‘NERC registered’ and insert the phrase ‘…, whichever is greater,…’ between ‘entities’ and ‘of’ in the ‘OR’ of the Severe VSL. R10 VSL – The drafting team should consider adding a 2nd ‘OR’ to the High VSL which states ‘The Transmission Operator did not monitor one of the items listed in Requirement R10, Part 10.1 and one of the items listed in Requirement R10, Part 10.2.’ R19 & R20 Moderate and High VSLs – Replace ‘entity’ with ‘entities’.
Individual

HHWP
No
R16 states: "Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunication, and analysis capabilities." Organizations should be be free to designate its preferred method for approving planned outages of data equipment. This requirement imposes on all TOPs single process for data system outage approval. The requirement should be results based on not proscriptive of the method to acheive those results. This is a huge step backwards in the development of rational reliability requirements.

No
BPA reiterates its comments from the previous period on TOP-001-3: BPA suggests referencing the System Operating Limit (SOL) Definition and Exceedance Clarification white paper in the language of the Requirements, as Regional Entities are not required to audit to appendices, unless indicated by the language of a Requirement. BPA believes the language in requirement R8 is still ambiguous and open-ended regarding, “… operations that result in, or could result in, an Emergency.” It is unclear how entities are expected to determine events that could possibly happen. BPA suggests the drafting team include parameters for possible events, so applicable entities are not required to predict all possible future events. BPA also opposes language in the Standard which has the potential to conflate events that are happening with events that have a high probability of happening. BPA suggests the drafting team clearly separate these two concepts. Additionally, BPA disagrees with the change in R16 from “Real-Time Assessment” to “analysis”. This is a very broad and, in this case, undefined term. BPA believes this could lead to differences in interpretation between a TOP and an auditor. For example, R16 applies to the Operations Planning Horizon. A study engineer’s computer is part of an entity’s analysis capability for doing studies in the that horizon. Hence, as written, this

requirement could be interpreted to mean that an entity’s IT department would need to have System Operator approval prior to working on a study engineer’s computer. BPA does not believe that was the drafting team’s intent, but this broad language does leave that possible interpretation open.

Consideration of Comments

Project 2014-03 Revisions to TOP and IRO Standards

The Project 2014-03 Drafting Team thanks all commenters who submitted comments on the standard. These standards were posted for a 30-day public comment period from October 10, 2014 through November 10, 2014. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 47 sets of comments, including comments from approximately 133 different people from approximately 100 companies representing all 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

The SDT has made the following changes due to industry comments:

- Requirement R1 – removed the 'direct action' language to alleviate concerns about potential double jeopardy issues as direct actions are included in other standards and requirements where necessary; replaced 'address' with 'maintain'.
- Requirement R2 - removed the 'direct action' language to alleviate concerns about potential double jeopardy issues as direct actions are included in other standards and requirements where necessary; replaced 'address' with 'maintain'.
- Requirements R3, R4, R5, and R6 – removed the Load-Serving Entity as an applicable entity following the recent Board of Trustees (Board) action on removing Load-Serving Entity as a functional entity. (Note – Load-Serving Entity was not removed from proposed IRO-010-2 or proposed TOP-003-3 as those standards have already been approved by industry and adopted by the Board. Load-Serving Entity will be removed from those standards when the overarching project to remove Load-Serving Entity is initiated.)
- Requirement R7 – Added the phrases 'within its Reliability Coordinator Area' (as Transmission Operators will only be expected to react to requests from other Transmission Operators within the Reliability Coordinator Area and any assistance for Transmission Operator Areas outside the Reliability Coordinator Area will be done through requests from the Reliability Coordinators) and 'comparable' assistance (to assure that a Transmission Operator isn't asked to do go further than the requesting Transmission Operator has done).
- Requirement R9 – added 'known' as a qualifier for impacted entities; clarified that the requirement is for all outages by adding 'planned and unplanned' as qualifiers to outages; replaced 'sustained' by '30 minutes or more' to achieve clarity and consistency with other standards.
- Requirement R10 – deleted the phrase 'non-BES' as any need for non-BES data will be defined in the Reliability Coordinator SOL methodology and included in BES as part of BES Exception Process as necessary; clarified that an entity does not have to 'monitor' outside of its Transmission Operator Area – it only needs to utilize necessary data.

- Requirement R11 – replaced the phrase 'perform its reliability functions' with more specific language – 'maintain Load-interchange balance within its Balancing Authority Area and support Interconnection frequency'.
- Requirement R15 – capitalized 'System'
- Requirement R16 – made the language for the list of applicable outages consistent with that of the language in Requirement R9.
- Requirement R17 - made the language for the list of applicable outages consistent with that of the language in Requirement R9.
- Made commensurate changes in matching Measures and cleaned up language in Measures M8 and M12.
- Made commensurate changes to VSL language and changed the VSL for Requirement R11 from binary to incremental.
- Added language to the SOL Exceedance White Paper explaining that the Reliability Coordinator's SOL methodology will specify requirements to include any non-BES data or external data in order for a Transmission Operator to determine SOLs in accordance with the Reliability Coordinator's SOL methodology.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Director of Standards, Valerie Agnew, at 404-446-2566 or at valerie.agnew@nerc.net . In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

BEPC	Agree	Basin Electric agrees with the comments provided by the NRECA and Georgia Transmission Corporation.
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing		

1. **Do you agree with the changes made to respond to industry comments to proposed TOP-001-3? If not, please provide technical rationale for your disagreement along with suggested language changes**

Summary Consideration: The SDT has made the following changes due to industry comments:

R1. Each Transmission Operator shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions.

M1. Each Transmission Operator shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions.

R2. Each Balancing Authority shall act to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions.

M2. Each Balancing Authority shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions.

R3. Each Balancing Authority, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements.

M3. Each Balancing Authority, Generator Operator, and Distribution Provider shall make available upon request, evidence that it complied with each Operating Instruction issued by the Transmission Operator(s) unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Transmission Operator's Operating Instruction. If such a situation has not occurred, the Balancing Authority, Generator Operator, or Distribution Provider may provide an attestation.

R4. Each Balancing Authority, Generator Operator, and Distribution Provider shall inform its Transmission Operator of its inability to comply with an Operating Instruction issued by its Transmission Operator.

M4. Each Balancing Authority, Generator Operator, and Distribution Provider shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Transmission Operator of its inability to comply with its Operating Instruction issued. If such a situation has not occurred, the Balancing Authority, Generator Operator, or Distribution Provider may provide an attestation.

R5. Each Transmission Operator, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Balancing Authority, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements.

M5. Each Transmission Operator, Generator Operator, and Distribution Provider shall make available upon request, evidence that it complied with each Operating Instruction issued by the Balancing Authority(s) unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Balancing Authority's Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, or Distribution Provider may provide an attestation.

R6. Each Transmission Operator, Generator Operator, and Distribution Provider shall inform its Balancing Authority of its inability to comply with an Operating Instruction issued by that Balancing Authority.

M6. Each Transmission Operator, Generator Operator, and Distribution Provider shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Balancing Authority of its inability to comply with its Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, or Distribution Provider may provide an attestation.

R7. Each Transmission Operator shall assist other Transmission Operators within its Reliability Coordinator Area, if requested and able, provided that the requesting Transmission Operator has implemented its comparable Emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements.

M7. Each Transmission Operator shall make available upon request, evidence that comparable requested assistance, if able, was provided to other Transmission Operators within its Reliability Coordinator Area unless such assistance could not be physically implemented or would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. If no request for assistance was received, the Transmission Operator may provide an attestation.

M8. Each Transmission Operator shall make available upon request, evidence that it informed its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If no such situations have occurred, the Transmission Operator may provide an attestation.

R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and known impacted interconnected entities of all planned outages, and unplanned outages of 30 minutes or more, for telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities.

M9. Each Balancing Authority and Transmission Operator shall make available upon request, evidence that it notified its Reliability Coordinator and known impacted interconnected entities of all planned outages, and unplanned outages of 30 minutes or more, for telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Balancing Authority or Transmission Operator may provide an attestation.

R10. Each Transmission Operator shall perform the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area:

10.1 Within its Transmission Operator Area, monitor Facilities and the status of Special Protection Systems, and

10.2 Outside its Transmission Operator Area, obtain and utilize status, voltages, and flow data for Facilities and the status of Special Protection Systems.

M10. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitored or obtained and utilized status, voltages, and flow data for Facilities and the status of Special Protection Systems as required to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area.

R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.

M11. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitors its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.

M12. Each Transmission Operator shall make available evidence to show that for any occasion in which it operated outside any identified Interconnection Reliability Operating Limit (IROL), the continuous duration did not exceed its associated IROL T_v. Such evidence could include but is not limited to dated computer logs or reports in electronic or hard copy format specifying the date, time, duration, and details of the excursion. If such a situation has not occurred, the Transmission Operator may provide an attestation that an event has not occurred

R15. Each Transmission Operator shall inform its Reliability Coordinator of actions taken to return the System to within limits when a SOL has been exceeded.

M15. Each Transmission Operator shall make available evidence that it informed its Reliability Coordinator of actions taken to return the System to within limits when a SOL was exceeded. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, or dated computer printouts. If such a situation has not occurred, the Transmission Operator may provide an attestation.

R16. Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance of its telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities.

M16. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Transmission Operator has provided its System Operators with the authority to approve planned outages and maintenance of telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities.

R17. Each Balancing Authority shall provide its System Operators with the authority to approve planned outages and maintenance of its telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities.

M17. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Balancing Authority has provided its System Operators with the authority to approve planned outages and maintenance of its telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities.

Changes to VSLs due to industry comments are shown in the redlined version of the standard.

Changes to the SOL Exceedance White Paper are shown in the redlined version of the paper provide for the fourth posting.

Organization	Yes or No	Question 1 Comment
Northeast Power Coordinating Council	No	We commented in the last posting to replace the word “ensure” in requirements R1 and R2, and in the standard’s other requirements where applicable. We note that “ensure” has been replaced with “address”. The Purpose of the standard is “To prevent instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Interconnection by ensuring prompt action to prevent or mitigate such occurrences.” “Maintain” or “restore” are more appropriate words to use than “address”. The Time Horizon should only be “Real-time Operations”. “Ensure” in Measure M1 should also be replaced with the word selected to be used in R1. Regarding Requirement R3, Time Horizons should only be “Real-time Operations”. The 30 minute requirement in Requirement R13 is too restrictive and is inconsistent with EOP-008 which allows two hours to restore such functionality. If entities are permitted two hours to restore situational awareness following an evacuation, entities should be granted the same time consideration to restore Real-time assessment capability in R13. Therefore we recommend either of the following revisions to R13: o Each Transmission Operator shall perform a Real-time Assessment at least once every two hours. o Each Transmission Operator shall perform a Real-time Assessment at least once every 30 minutes when the EMS and SCADA are functional. Following the loss of EMS, a Transmission Operator shall regain ability to perform Real-time assessments within two hours.

Organization	Yes or No	Question 1 Comment
		Requirement R7 has removed an important concept of TOP-001-1a Requirement R6. A supporting TOP should not be obligated to activate emergency procedures beyond those activated by the TOP that is in the emergency. As an example, a supporting TOP should not be obligated to go into voltage reduction if the TOP with the emergency as not take the same voltage reduction action first. Simply stating, '... has implemented its Emergency procedures,' is not specific. TOP-001-1a Requirement R6 reads: R6. Each Transmission Operator, Balancing Authority, and Generator Operator shall render all available emergency assistance to others as requested, provided that the requesting entity has implemented its comparable emergency procedures, unless such actions would violate safety, equipment, or regulatory or statutory requirements. Recommend the following change to R7 to target the TOP's requirement to assist other TOPs to those in the same RC area: R7. Each Transmission Operator shall assist other Transmission Operators within their Reliability Coordinator's region, if requested and able, provided that the requesting entity has implemented its Emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations] In Part 10.2 the phrase '... as necessary by the TOP' is unclear. What TOP? Part 10.2 should be revised to be consistent with Part 10.1 and read: 10.2. Outside its Transmission Operator Area: Sub-parts 10.1.3 and 10.2.3 should be made consistent. "Ensure" remains in the posted requirement R13. Suggested rewording R13: Each Transmission Operator shall perform or have performed a Real-time Assessment at least once every 30 minutes. The "s" in system should be capitalized in Requirement R15.

Organization	Yes or No	Question 1 Comment
		R3, M3, M4, R5, M5, M6 all use the words to comply with operating instructions, but R4 and R6 use the words perform an operating instruction. The wording should be consistent. Measure M7 should be corrected to be written like M3 and M5 in the past tense: "...unless such assistance could not be physically implemented..." Measure M8 should be revised since R8, and the first part of M8 refer to operations "that result in, or could result in, an Emergency". Therefore, the last sentence in M8 should read: "If no such situations have occurred, the TOP may provide an attestation." Requirement R11 directs the Balancing Authority to "...monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load...". Monitoring Special Protection Systems is not a function of the Balancing Authority. Requirement R11 can be removed. Should M11 use the same examples of evidence as does M10, for example Energy Management System description documents? M12 should have a broader scope. If the auditor is to verify that the TOP did not operate outside IROL for a duration exceeding IROL TV, then the TOP should provide information on all occasions in which he operated outside IROL for any period of time. This would reflect the RSAW's audit approach. M12 should read: "Each Transmission Operator shall make available evidence to show that for any occasion in which it operated outside any identified Interconnection Reliability Operating Limit (IROL), the continuous duration did not exceed its associated IROL Tv. Such evidence could include but is not limited to dated computer logs or reports in electronic or hard copy format specifying the date, time, duration, and details of the excursion. If such a situation has not occurred, the

Organization	Yes or No	Question 1 Comment
		Transmission Operator may provide an attestation that an event has not occurred." For IROLs there is a maximum exceedance duration specified, but for SOLs in R14/M14 there is no leeway. Thus if a SOL is exceeded for 30 seconds, the TOP must have evidence it initiated its Operating Plan. This applies also for the VSL in the Table of Compliance Elements. No difference is made if the TOP initiates its Plan within the minute or after half an hour. Entities generally have very many SOL exceedances a year and to document each of them a proof of Implementation of a Plan is unrealistic. Whereas IROLs may be more severe than SOLs, the measure is less stringent. In the C. Compliance section, under 1.3 Data Retention, Measure M14 is mentioned in the second and third paragraphs giving it two different data retention periods. There is a typing error in the fourth paragraph referring to R13/M13: "Each TOP shall each keep data (...)". Remove the second "each". In the Table of Compliance Elements there is a typing error in the last paragraph for Severe VSL listing for R8: "or more than 15%". For R9, replace "and" with "or" because generally only one of the elements will be outaged. The VSLs should be revised to read "...sustained outage of telemetering or control equipment, or monitoring or assessment capabilities, or associated communication channels." R10 and R11 should have similar VSLs. Presently if the TOP does not monitor a facility, it will be a Moderate VSL but if the BA does not monitor a facility, it is a severe VSL. Everything is lumped together for the BA whereas in reality it is not an all or nothing situation. R11 should therefore have VSLs equivalent to those in R10.

Organization	Yes or No	Question 1 Comment
		R14 should have different VSLs depending on the time it took the TOP to initiate its Operating Plan. R15 should have different VSLs depending on the time it took the TOP to inform its RC. Requirement R15 appears to be past tense, ‘ inform.. RC of actions taken...’. So one would believe that a pre-call is not required before actions are taken by the TOP. What is the purpose of this requirement? What is the added value in informing the RC after the fact of the actions that were taken to mitigate SOL exceedances? The TOP should be obligated to notify the RC if it cannot manage the exceedance on its own and needs assistance (another requirement). However, notifications via SCADA should be sufficient to address the concern. M15 - This measure does not include multi-modal communications. The TOP should be able to take credit for telemetered information (breaker operations) that communicates to the RC actions that have been taken. Also there is no time component for when to report. For example during, 5 minutes after, a day after. The word “own” should not be deleted from Requirement R16. It provides clarity that this is only pertaining to the equipment the Transmission Operator owns and not other equipment. The new requirement R19 addresses the data exchange capabilities needed. If non-BES facilities are to be included anywhere in the standard, they should be included in the BES by exception, especially since they are contributing to a SOL exceedance. R19 and R20 seem redundant with R10 and R11 since in R10 and R11 the TOP and BA are monitoring reliability required data, and they must have the data exchange capabilities. Also, TOP-003-3 requires the TOP to develop data specifications to support Real-time monitoring and operation of the

Organization	Yes or No	Question 1 Comment
		BES, and negotiate with data supplying entities the format, period and security protocol of the data exchange. This implies the requirement of a data exchange capability. We suggest removing R19 and R20. What defines a neighboring Transmission Operator Area? There are many instances where the loss of a facility in, let's say in Transmission Operator Area "A", which is not electrically "adjacent" to Transmission Operator Area "B", impacts Transmission Operator Area "B".

Response: The SDT agrees and has replaced 'address' with 'maintain' as suggested by you and other commenters. See summary for language.

The SDT disagrees. Same-Day Operations is a legitimate time horizon when considering actions to maintain BES reliability. No change made.

The SDT agrees and has replaced 'ensure' with 'maintain' in Measure M1.

Since no change was made to the time horizons in Requirements R1 and R2, there is no change applicable to Requirement R3.

The SDT believes that approved EOP-008-1, Requirement R1, Part 1.5 deals with restoring functionality, allowing for a 2-hour time period to handle transitions from primary to backup functionality. Approved EOP-008-1, Requirement R1, Part 1.6.2 deals with what needs to happen during that transition. That requirement states that an entity is still responsible for managing the risk during transition. The SDT believes that ensuring that a Real-time Assessment is performed at least once every 30 minutes is in agreement with the principle espoused in approved EOP-008-1 and is not unrealistic or overly burdensome in today's operating environment. This is also consistent with approved IRO-008-1, Requirement R2. No change made.

The SDT agrees and has added the term. See summary for language.

Requirement R10, Part 10.2 is nested within the main body of Requirement R10. Everything that comes after the main body of Requirement R10 refers back to the subject of Requirement R10. Therefore the Transmission Operator cited in Requirement R10, Part 10.2 refers back to the original subject Transmission Operator.

The SDT agrees and has made the suggested change. See summary for language.

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 1 Comment</th></tr>
<tr><td colspan="3">The language in Requirement R10, Parts 10.1.3 and 10.2.3 is consistent. Part 10.1.3 specifically contains the phrase ‘as necessary by the Transmission Operator’ because Parts 10.1.1 and 10.1.2 do not have this constraint. That specific language is not needed in Part 10.2.3 because the language in Part 10.2 already states that condition as it applies to all 3 sub-parts. No change made.

The SDT believes that ‘ensure’ is the correct terminology in Requirement R13. The intent of the SDT is that the entity must make certain that someone, itself or another designated entity, is performing the Real-time Assessment as specified. “Ensure’ is the proper connotation for those actions. No change made.

The SDT agrees and has capitalized the term. See summary for language.

The SDT agrees and has made the suggested changes for consistency. See summary for language.

The SDT agrees and has changed Measure M7 as suggested. See summary for language.

The SDT agrees and has changed Measure M8 as suggested. See summary for language.

The SDT believes that knowledge of Special Protection Systems that impact generations is incumbent for the Balancing Authority. Item 19 of the Balancing Authority Functional Entity description in Functional Model v5 states: “Receives Real-time operating information from the Transmission Operator, adjacent Balancing Authorities and Generator Operators.” The SDT believes that this may include the status of Special Protection Systems that impact generation. Special Protection Systems could result in the tripping of multiple generation facilities, which may impact the Balancing Authority reserve requirements. No change made.

The SDT agrees and has changed Measure M11 as suggested. See summary for language.

The SDT agrees and has changed measure M12 as suggested. See summary for language.

The SDT believes that the assertion that there is no leeway for an SOL exceedance is incorrect. The SDT would agree that there is no leeway for an SOL violation but there are different response times based on the type of SOL Exceedance that has occurred. SOL’s are defined by the Reliability Coordinator and specific operator actions to mitigate SOL exceedances would be defined in that entity’s Operating Plan. An SOL Exceedance is further described in the SOL Exceedance White Paper. Please refer to the SOL White Paper for additional details. No action required.

The SDT agrees. The first instance of Measure M14 is incorrect and this error has been corrected.

The SDT agrees and has removed the second instance of ‘each’ as suggested.

The SDT agrees and has made the suggested correction to the Severe VSL.</td></tr>
</table>

Organization	Yes or No	Question 1 Comment
The SDT has replaced 'and' with 'or' in the Requirement R9 VSLs. The SDT agrees and has changed the Requirement R11 VSLs accordingly. The SDT disagrees as it believes that the Operating Plan initiation is a binary action. Waiting to initiate the plan is dangerous and such actions should not be tolerated. No change made. The SDT believes that it is counter to reliability to place a time tag on informing the Reliability Coordinator. The operator should be concentrating on the reliability issue and not be concerned with adhering to an arbitrary time period for informing entities. Since no time frame is deemed appropriate for the requirement itself, the SDT does not believe that time periods should be introduced in the VSLs. No change made. Requirement R15 is intentionally written in the past tense as it is feedback to the Reliability Coordinator after the fact. The Transmission Operator has primary responsibility for mitigating SOL exceedances. Pre-calls to a Reliability Coordinator are not ruled out by this standard and can take place at the discretion of the Transmission Operator if it believes they are necessary or if prior agreements between the Reliability Coordinator and Transmission Operator dictate such an action. Regardless, the SDT believes that it is an important for BES reliability for the Reliability Coordinator to know what actions were taken to mitigate the situation. How such notification is made is up to the entities involved as 'how' is not within scope of standards. If two entities agree that SCADA provides sufficient notification that is an acceptable method of notification. Nothing in this requirement or standard precludes that. No change made. Measure M15 is not a hard and fast listing of every method that can be used to impart the required information. The language states 'such as' so that there is some degree of flexibility in how to comply with the requirement. The SDT believes that telemetering data/information could be an acceptable method. The SDT can't introduce timing requirements in a measure if they are not cited specifically in the requirement. The SDT did not place timing requirements in the standards because the SDT believes that such inclusion could be detrimental to reliability as it would force a Transmission Operator to focus on how quickly to perform this task as opposed to concentrating on alleviating the reliability concern. No change made. 'Own' was removed due to multiple industry comments in a previous posting. The SDT agreed with the comments stating that the term was redundant. No change made. Requirement R19 does not directly address the concept of non-BES facilities. However, when that topic does occur the SDT has made several changes to the language of the requirement for clarity. Requirement R10, Parts 10.1.3 and 10.2.3 have been deleted. The SDT believes that non-BES facilities are already handled in the Reliability Standards. If a non-BES facility impacts the BES, such as by contributing to an SOL or IROL, then the SDT expects that facility to be incorporated into the BES through the official BES		

Organization	Yes or No	Question 1 Comment
Exception Process and it would be covered in Requirement R10, Parts 10.1 and 10.2 by use of the defined term 'Facilities'. If non-BES facilities do not impact the BES but are needed for completing models, then the SDT believes the situation is already covered in approved FAC-011-2, Requirement R3, Parts 3.1 and 3.4 which mandate that the Reliability Coordinator include external areas and the level of detail needed in models for determining SOLs within its established SOL methodology. See summary for language. Reliability Standards must include explicit requirements and can't make assumptions as to things being in place in order to be able to comply with a particular requirement. All requirements must be spelled out and applied as needed. This was made clear in the FERC NOPR delivered in response to the Project 2006-06 and 2007-03 filings. No change made. Due to your comment and others, 'neighboring' is no longer used in this standard.		
BC Hydro	No	BC Hydro's concern is that the Reliability Directive is replaced with Operating Instruction in the standard. The scope of "Operating Instructions" broadens to non-emergency situations. Requirement R3 and R4 have the BA's complying with TOP's Operating Instructions. BC Hydro's concern is that there may be a conflict between the BA and the TOP. Requirement R3 provides exceptions for complying, but only for safety, equipment regulatory or statutory requirements. Nowhere does the Requirement address conflict in reliability requirements: for example, a TOP in our area issues an instruction to eliminate a voltage limit issue, and this action may cause another limits issue for another TOP. There appears to be no "out" clause based on reliability conflicts - such as deferring to an assessed lesser reliability impact. BC Hydro recommends revising these Requirements to allow for an "out" clause.
Response: Reliability Directive was never approved by FERC and thus was never part of an officially approved standard. The SDT believes that the use of Operating Instruction in this standard is consistent with the purpose and intent of the COM standards and that the COM standards correctly captured the reliability need as indicated in FERC's acceptance of the standards. No change made. The standards have been set up so that the Transmission Operator determines SOLs and is the primary responsible entity for them. However, the Reliability Coordinator still maintains an obligation to monitor SOLs. This means that the Reliability Coordinator will be		

Organization	Yes or No	Question 1 Comment
able to apply its wide-are view on actions taking place and will step in as needed if actions are causing other problems that a specific Transmission Operator is unable to ascertain. No change made.		
PacifiCorp	No	Definition of Real-Time Assessment contains provisions that will make compliance with the Requirements unattainable. First, the applicable inputs to the assessment include among other things, “known Protection System status or degradation.” Real time tools are generally incapable of consideration of the performance of protection systems, and accordingly conducting these assessments prescribed in the Requirements will fall short of the expectation.
Response: The SDT recognizes that Real-Time Assessments may not automatically include “known Protection System status or degradation”. However, once the issue is communicated to the Transmission Operator, the Transmission Operator has the capability to determine if Contingency definitions need to be modified and analyze the impact of such changes. No change made.		
Bureau of Reclamation	No	First, Reclamation continues to disagree with the use of the term Operating Instruction in TOP-001-3 R1-R6 and the entire TOP/IRO Revisions. In general, Reclamation believes that grid operations are a collaborative effort that balance competing obligations of generation, transmission, and distribution providers. Reclamation does not believe that Transmission Operators always understand or consider the equipment capabilities and limitations, or other obligations of generators. During normal operations, Reclamation does not believe that Transmission Operators should be able to always issue mandatory Operating Instructions to generators that may damage critical generating equipment or interfere with competing obligations (e.g., water delivery schedules for hydroelectric producers). Reclamation disagrees with the drafting team's assertion that "the definition for Reliability Directive is not needed due to work ... on the definition of Operating Instruction." Reclamation believes that additional conversations with FERC may be necessary, and that TOP-001-3 should maintain the important concept that Balancing Authority and Transmission

Organization	Yes or No	Question 1 Comment
		Operators only may issue Reliability Directives to address Emergencies or avoid Adverse Reliability Impacts. Reclamation also believes that Balancing Authorities and Transmission Providers should be required to inform entities when they are issuing a Reliability Directive. In some instances, Balancing Authorities and Transmission Providers have decided after the fact that an instruction was a Reliability Directive. Reclamation does not believe that the requirements to comply with Reliability Directives in TOP-001 and IRO-001 should be invoked if an entity does not describe the instruction as a Reliability Directive. Second, Reclamation also continues to disagree with the drafting team's proposal to revise TOP-003-3 to require Generator Owners, Generator Operators, and Transmission Owners to meet any data specification outlined by Transmission Operators or Balancing Authorities. Like TOP-003-1, TOP-003-3 should outline a specific continent-wide standard like the submission of planned generation outages over 50MW by noon on the day before the outage, a requirement that has existed for 7 years. Reclamation does not support TOP-003-3 because it does not clearly define what types of data entities can request or may be required to provide, and will create significant operational challenges for entities operating in multiple Transmission Operator and Balancing Authority areas. As an example, Reclamation owns and operates over 50 hydroelectric facilities in seven control areas and this change would prevent Reclamation from adopting a uniform approach to demonstrating compliance with TOP-003. Under the current version of TOP-003, Reclamation can present a uniform approach to demonstrating that it submits planned outages before noon the day before the outage. In fact, like many generation entities, Reclamation generally submits planned outages more than a year in advance and plans non-routine outages as far in advance as practical. Under the proposed version of TOP-003-3, Reclamation would have to track and adjust individual generator Standard Operating Procedures (SOPs) to meet different and

Organization	Yes or No	Question 1 Comment
		perhaps ever changing data specifications developed by each Transmission Operators, which could result in high costs for little reliability benefit.
Response: Reliability Directive was never approved by FERC and thus was never part of an officially approved standard. The SDT believes that the use of Operating Instruction in this standard is consistent with the purpose and intent of the COM standards and that the COM standards correctly captured the reliability need as indicated in FERC's acceptance of the standards. In the FERC NOPR, it was made clear that the concept of a special type of communication for Emergency situations was not considered acceptable. Operating Instructions issued to generators are not intended to damage critical generating equipment or interfere with competing obligations (e.g., water delivery schedules for hydroelectric producers). Requirements R3 and R4 define provisions under which Balancing Authorities, Generator Operators, and Distribution Providers are not obligated to follow Operating Instructions issued by the Transmission Operator. No change made. Proposed TOP-003-3 was approved by the industry and is not a part of this current proceeding.		
Con Edison, Inc.	No	Requirement R13 is problematic. The 30 minute requirement in R13 is too restrictive and inconsistent with EOP-008, which allows two hours to restore such functionality. If entities are permitted two hours to restore situational awareness following an evacuation, entities should be granted the same time consideration to restore real-time assessment capability in R13. Therefore we recommend either of the following revisions to R13: o Each Transmission Operator shall maintain that a Real-time Assessment is performed at least once every two hours. o Each Transmission Operator shall maintain that a Real-time Assessment is performed at least once every 30 minutes when the EMS & SCADA are functional. Following the loss of EMS, a Transmission Operator shall regain ability to perform real-time assessments within two hours. Requirement R7 raises jurisdictional concerns. We recommend the following change to R7 to target the TOP's requirement to assist other TOPs to those in the same RC area: R7. Each Transmission Operator shall assist other Transmission Operators within their Reliability Coordinator's region, if requested and able, provided that the requesting entity has implemented

Organization	Yes or No	Question 1 Comment
		its Emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]
Response: The SDT believes that approved EOP-008-1, Requirement R1, Part 1.5 deals with restoring functionality, allowing for a 2-hour time period to handle transitions from primary to backup functionality. Approved EOP-008-1, Requirement R1, Part 1.6.2 deals with what needs to happen during that transition. That requirement states that an entity is still responsible for managing the risk during transition. The SDT believes that ensuring that a Real-time Assessment is performed at least once every 30 minutes is in agreement with the principle espoused in approved EOP-008-1 and is not unrealistic or overly burdensome in today's operating environment. One option is to have an Operating Procedure which has the Reliability Coordinator perform the Real-time Assessment on behalf of the Transmission Operator under an EOP-008 scenario. This is also consistent with approved IRO-008-1, Requirement R2. No change made. The SDT agrees and has made the suggested change. Any request for assistance from Transmission Operator A to Transmission Operator B in another Reliability Coordinator Area would be coordinated with its respective Reliability Coordinators to assure a wide-area view is being applied to the situation. See summary for language.		
MRO NERC Standards Review Forum	No	R1 and R2 are ALL encompassing actions that cover every actionable NERC Requirement that the TOP and BA must accomplish. As written, "Each (BA, TOP) shall act to address the reliability of its (BA, TOP) Area via direct actions or by issuing Operating Instructions". EOP-002-3.1, R6, IRO-001-1.1, R8, are two examples where there must be "immediate" actions by the BA or TOP. If "via direct actions" is maintained in this proposed Standard, there will be a non-compliance double jeopardy impact if the BA or TOP violates an "immediate action" Requirement. Is the intent of R1 and R2 to issue Operating Instructions when the BA or TOP cannot maintain a reliability of their associated area? The NSRF wishes to points out that the Standards Process Manual section 2.4 describes a "Results Based Requirement" as "Each requirement of a reliability standard shall identify what Functional Entities shall do, and under what conditions, to

Organization	Yes or No	Question 1 Comment
		achieve a specific reliability objective and not how that objective is achieved". R1 & R2 with their broad, general language do not meet the threshold for a "Results Based Requirement". The NSRF agrees with issuing Operating Instructions when required to maintain your system in a reliable state. But the all-encompassing "via direct actions", is applicable to over 460 Requirements that a BA must comply with. How is this going to be measured for the BA (or TOP)? Are voltage schedules going to be measured when that is covered in the VAR Standards? Is seems to be a catch all Requirement. A possible rewrite of R1 and R2 could read: "Each (BA, TOP) shall issue Operating Instructions to address the reliability of its area when direct actions require more assistance ". M1 does not reflect the current language of the rewritten R1. The word "ensure" still resides in M1. R9. Concerning "sustained outages", is there a minimum reporting threshold for this undefined term? EOP-004-2, Event Type "Complete loss of voice communication capability" and "Complete loss of monitoring capability" has a 30 minute continuous threshold. The NSRF recommends using the same bright line criteria of EOP-004-2 as stated above. R13. Real-time Assessment: The NSRF still has concerns about how entities will incorporate "protection system status" into their real-time 30 minute assessment to be fully compliant. More clarity is needed for entities to verify that they have met the requirement. How are entities expected to show that their operators are aware of protection system status (as defined in the proposed Real-Time Assessment definition) and understand the system impact if a protection system is out-of-service? If policies, procedures, and snapshots of system operator tools are sufficient, this can be done. However, large scale state estimator real-time contingency assessments used have limitations. State estimators run DC power flows based on programed line and node based contingencies. Protection system

Organization	Yes or No	Question 1 Comment
		status changes that modify the lines and nodes studied may not be easily incorporated into state estimator systems in 30 minutes. Protection system coverage could easily change for known and unknown conditions. Known changes can include PRC testing. The PRC testing standards have mandated large amounts of testing for even moderately sized system so that daily testing must occur to meet mandatory testing timeframes. The large volume of PRC testing could make accounting for all protection system status changes within 30 minutes difficult to verify and puts entities at risk for maintaining perfect compliance to a large number of requirements since many of the TOP / IROL standards include the real-time assessment definition. Recommend that "protection system status" be deleted from the definition or at a minimum clarify that protection system status consideration by system operations is acceptable to be compliant, since "status consideration" equates to "situational awareness". As written in R13:R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. [Violation Risk Factor: High] [Time Horizon: Real-time Operations] M13.Each Transmission Operator shall have, and make available upon request, evidence to show it ensured that a Real-Time Assessment was performed at least once every 30 minutes. This evidence could include but is not limited to dated computer logs showing times the assessment was conducted, dated checklists, or other evidence. With regard to R13, we believe the SDT has improved the language by revisions such that the TOP shall "ensure that a Real-time Assessment is performed at least once every 30 minutes;" however, we continue to question the 30-minute requirement and believe that there will be tremendous difficulty in achieving this without defect. Rather, we would recommend the following language: R13: "Each TOP shall ensure that a Real-time Assessment is performed with such periodicity so as to ensure continuous situational awareness of the TOP."

Organization	Yes or No	Question 1 Comment
		Measure M13 would need commensurate edits to conform with this R13 language. Entities have made these comments before and the SDT did not agree as they said; The SDT does not agree. The requirement allows for an entity to arrange for another entity to perform the assessment which aligns with requirements in approved EOP-008-1. Approved EOP-008-1 specifically requires entities to have tools and applications to ensure that System Operators have situational awareness of the BES. It goes on to require that entities take necessary actions to manage the risk to the BES during periods when primary or backup functionality may not be available. This requirement isn't about maintaining RTCA or any other specific tool, it's about maintaining situational awareness at all times. No change made. The first concern is the NSRF believes that without further clarification, System Operators will not have the "situational awareness" because they will not know "known Protection System and Special Protection System status or degradation..." per the Real-time Assessment definition, thus will most likely be non-compliant on a daily basis. A 4000 breaker Transmission system can have up to 20,000 (4000 x 5 parts of a Protection System) parts that would need to be tracked every 30 minutes. This is unrealistic and not physically possible. The SDT continues to use the words "have situational awareness" in their response to comments, and that the Requirement is not about an RTCA. But without using the RTCA, how will the System Operator prevent instability, uncontrolled separation or Cascading outages, per the Purpose of this proposed Standard? The Real-time assessment must consist of existing and potential operating conditions, per the definition. A System Operator cannot calculate all the minimum inputs every 30 minutes without using some type of calculating device. Please review the below violation which is based on Auditor notes (for TOP-002-2, R11). This shows that simple "situational awareness" is predicated on "system analysis", which the NSRF looks at as the entities RTCA. A second concern with the TOP-001-

Organization	Yes or No	Question 1 Comment
		3 definition of Real time assessment, the recent TOP-002-2.1b R11 auditor guidance in the new RSAW, and a recent TOP-002-2.1b R11 violation cited below, is the proposed requirement is not technically feasible today. The three items listed just above in conjunction require an on-line dynamic stability assessment tool that can run multiple AC dynamic angular and voltage stability assessments in less than 30 minutes considering EMS input of the most recent alarm, SPS, and degraded state alarm statuses. The NSRF isn't aware of RTCA technology that can meet these requirements. Alternately, the assessment falls to human manpower to perform these studies. Entities must identify a RTO, RC, or PA with staff available 24/7 to perform this or train its own 24/7 staff. It takes time to train dynamic stability staff and time to change the model to capture "known Protection System" statuses.TOP-001-3 Definition: Real-time Assessment - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)TOP-002-2.1b violation: (note this is publically posted in the most recent November compliance and enforcement spreadsheet) TOP-002-2.1b R11. On two occasions, SCS-Trans' updated Bulk Electric System (BES) studies failed to reflect current system conditions. Specifically, two unscheduled outages of Protection System components, one for a 500 kV transmission line and one for a 230 kV transmission line, were not considered in SCS-Trans' operating studies. TOP-002-2.1b RSAW auditor Guidance: Evaluation of Protection System Outages Protection Systems must operate and clear faults within the required clearing time to satisfy system performance requirements. All outages of

Organization	Yes or No	Question 1 Comment
		Protection Systems or their components that affect the reliability performance of the transmission system must be evaluated for the periods they are scheduled, in the planning horizon in TPL assessments and in the operational planning timeframe through operating studies. For example, if a transmission line has A and B protection packages that are not functionally equivalent and the outage of one protection package affects the operating speed of the Protection System, the impact of slower fault clearing on the power delivery capability of the Bulk Power System (BPS) must be considered in the assessments and studies. Such impacts also must be considered when a transmission line has a single protection package and one component of the package (e.g., the communication system) is taken out of service

Response: The SDT does not believe that Requirements R1 and R2 are problematic. The requirement simply states that an entity maintain the reliability of its area by the means it has at its disposal - either through its own actions or by issuing Operating Instructions. If the entity does that, then the SDT believes it has met the spirit and intent of the requirement. Specific actions for specific situations will be covered under the applicable standards. The wording of the requirements has been changed to provide additional clarity. See summary for changes.

Measure M1 has been corrected.

The SDT agrees and has made the suggested change. See summary for language.

The SDT recognizes that Real-Time Assessments may not automatically include “known Protection System status or degradation”. However, once the issue is communicated to the Transmission Operator, the Transmission Operator has the capability to determine if Contingency definitions need to be modified and analyze the impact of such changes. No change made.

The suggested language change to Requirement R13 presents ambiguity and is not measurable. No change made.

As there was no change to Requirement R13, there is no need for a corresponding change to Measure M13.

The SDT recognizes that Real-Time Assessments may not automatically include “known Protection System status or degradation”. The SDT also recognizes that not all entities are capable of performing Real-time transient Stability analysis within 30 minutes and would rely on Operating Plans. However, once the issue is communicated to the Transmission Operator, the Transmission Operator

Organization	Yes or No	Question 1 Comment
has the capability to determine if Contingency definitions need to be modified and analyze the impact of such changes. No change made.		
Oklahoma Gas & Electric SPP Standards Review Group	No	M1 - Replace 'ensure' with 'address' as in the requirement. R8 - With the removal of 'other' when referring to 'known impacted Transmission Operators' an overzealous auditor could require a Transmission Operator experiencing a condition which could be an Emergency or result in an Emergency would have to inform itself. Using 'other known impacted Transmission Operators' eliminates this situation. We recommend the drafting team return 'other', in the suggested location, to the requirement, measure and VSLs. R8 VSLs - If the drafting team decides not to make this suggested change, the term 'other' needs to be removed from the first 'OR' in the Severe VSL. In the last 'OR' of the Severe VSL insert the phrase '..., whichever is greater,...' between 'Authorities' and 'of'. R9 - We appreciate the drafting team attempting to add specificity to Requirement R9; however, 'sustained' is undefined. How does a Transmission Operator determine whether or not they are compliant with this requirement? What ensures auditors will consistently apply the terminology. We recommend the drafting team incorporate language consistent with COM-001-2, R10 which requires notification for outages lasting 30 minutes or more. If 30 minutes is determined to be too long, reduce the time to 15 minutes. We would like to suggest adding the term 'known' in front of 'impacted' in the second line of Requirement R9. We would like for the drafting team to help provide some clarity in Requirement R9..... does it apply to Planned Outages? Also, we noticed that the term 'planned' was removed from Measurement M9. Our question to the drafting team was this your intent to remove this term and if so would

Organization	Yes or No	Question 1 Comment
		you provide clarity on why the term should be removed. We would like to suggest that the drafting team tie Requirement R9 to the Data Specifications of TOP-003-3 as suggested in the Mapping Document. Also, we would like to thank the drafting team for their willingness to adjust to many suggestions that are submitted and we truly appreciative for all or your time and efforts. R9 VSLs - Delete the phrase 'NERC registered' and insert the phrase '..., whichever is greater,...' between 'entities' and 'of' in the 'OR' of the Severe VSL. R10 VSL - The drafting team should consider adding a 2nd 'OR' to the High VSL which states 'The Transmission Operator did not monitor one of the items listed in Requirement R10, Part 10.1 and one of the items listed in Requirement R10, Part 10.2.' R16 - We would like for the drafting team to provide more clarity on the word "telecommunication". The word "telecommunication" should apply only to specific outages or maintenance work done on the SCADA/EMS that affect the System Operators. R19 & R20 Moderate and High VSLs - Replace 'entity' with 'entities'.

Response: Measure M1 has been corrected.

The SDT removed 'other' due to multiple industry requests in a previous posting. The SDT agreed with the commenters that the term was redundant. The SDT believes that the situation cited where an entity would have to inform itself is not realistic and not indicative of actual operations. No change made.

The SDT agrees and has made the suggested correction to the Requirement R8 Severe VSL.

The SDT agrees and has made the suggested change. See summary for language.

Requirement R9 does apply to planned outages and the SDT has revised the language to provide clarity on the topic. See summary for language.

Organization	Yes or No	Question 1 Comment
The SDT agrees and has made the suggested change to the Requirement R9 Severe VSL. The SDT agrees and has made the suggested change to the High VSL for Requirement R10. The SDT has changed the language of the requirement to provide clarity. See summary for language. The SDT agrees and has made the suggested change to the Requirement R19 and R20 VSLs.		
Tennessee Valley Authority	No	TVA feels that requiring a TOP to monitor neighboring facilities that are non-BES to determine SOL violations should not be required (see R10., 10.2.3). If non-BES facilities are required for the reliable operation of the transmission system they should first be included into the BES by use of the Rules of Procedure exceptions process.
Response: The SDT has made several changes to the language of the requirement for clarity. Requirement R10, Parts 10.1.3 and 10.2.3 have been deleted. The SDT believes that non-BES facilities are already handled in the Reliability Standards. If a non-BES facility impacts the BES, such as by contributing to an SOL or IROL, then the SDT expects that facility to be incorporated into the BES through the official BES Exception Process and it would be covered in Requirement R10, Parts 10.1 and 10.2 by use of the defined term 'Facilities'. If non-BES facilities do not impact the BES but are needed for completing models, then the SDT believes the situation is already covered in approved FAC-011-2, Requirement R3, Parts 3.1 and 3.4 which mandate that the Reliability Coordinator include external areas and the level of detail needed in models for determining SOLs within its established SOL methodology.		
Colorado Springs Utilities	No	Thank you SDT members for all of your work, the following were our comments on the proposed standard language. We will be voting affirmative, but think comments below crucial the final modifications to the standard. 1. "Ensure" was removed from R1 and R2 but please also remove it from M1 and M2.2. 2. R3 - LSE needs to be removed as this function is soon to be retired. 3. With the new definition of RAS just voted on, it would be best to replace RAS with SPS as "SPS" is going away.

Organization	Yes or No	Question 1 Comment
		4. Please change "maintain" to address in R19/M19 and R20/M20. This has similar implications of "ensure." Of course we should do all in our power to maintain and ensure the bulk electric system, but there will be situations (no matter how many standards are in place) where industry may not be able to ensure or maintain reliability. To use such language is putting an unrealistic expectation in place that gives the regulator the ability to use our own words to find fault, even when no fault is present.
Response: The SDT agrees and has corrected the measures. The SDT agrees that the Load-Serving Entity function may soon be deleted as the functions assigned to it are in the process of being retired or assigned to other functional entities. At its November 2014 meeting, the Board adopted the deletion of the Load-Serving Entity as a functional entity and a future filing with FERC will ask for approval of this action. Therefore, the SDT agrees to delete Load-Serving Entity from proposed TOP-001-3. See summary for language. However, there are two other standards in this project (Proposed TOP-003-3 and proposed IRO-010-2) that also contain the Load-Serving Entity as an applicable entity. Since those two standards have already passed ballot and been adopted by the Board, the SDT is not going to put the industry through the effort and burden of re-opening those standards at this time. When the retirement of Load-Serving Entity is adopted, there will be a project initiated to review all standards for the term and to make applicable deletions or replacements as needed. Those two standards will be picked up by that overarching project. Similar to the situation with Load-Serving Entity above, Remedial Action Scheme and Special Protection System are in the midst of a possible change. At its November 2014 meeting, the Board adopted this change and a future filing with FERC will ask for approval of this action. The best approach for this project on this issue at this time is to leave Special Protection System in place as it is used in multiple places throughout the project in approved standards and the SDT would like to retain consistency in terminology and to let the subsequent project make all changes applying to Special Protection System so that industry can see them all at one time. No change made. 'Ensure' does not appear in Requirements R19 or R20. No change made.		
JEA	No	For R4&5 the timing is vague. Should it be done immediately, within 30 minutes, etc.

Organization	Yes or No	Question 1 Comment
		For R9 we are concerned that "sustained" is vague. If it lasted 2 minutes, was that a sustained outage? R10 should only include BES elements. Items of concern can be added through the inclusion process. R13 should have an exclusion that allows procedures to be implemented when system information is unavailable to reduce the risk instead of simply requiring real-time assessments be performed at least every 30 minutes. Even having a complete redundant EMS system might not prove sufficient to prevent a violation. R19 & 20 should require other BAs and TOPs to participate.

Response: The SDT believes that the timing issue will take care of itself. If an entity can't comply it is in its best interests to notify the Transmission Operator/Balancing Authority as soon as possible. Any attempt to mandate a specified time would be self-defeating and overly prescriptive and thus not in the best interest of BES reliability. No change made.

The SDT agrees and has changed the requirement accordingly. See summary for language.

The SDT has made several changes to the language of the requirement for clarity. Requirement R10, Parts 10.1.3 and 10.2.3 have been deleted. The SDT believes that non-BES facilities are already handled in the Reliability Standards. If a non-BES facility impacts the BES, such as by contributing to an SOL or IROL, then the SDT expects that facility to be incorporated into the BES through the official BES Exception Process and it would be covered in Requirement R10, Parts 10.1 and 10.2 by use of the defined term 'Facilities'. If non-BES facilities do not impact the BES but are needed for completing models, then the SDT believes the situation is already covered in approved FAC-011-2, Requirement R3, Parts 3.1 and 3.4 which mandate that the Reliability Coordinator include external areas and the level of detail needed in models for determining SOLs within its established SOL methodology.

The SDT has not stated how Requirement R13 is implemented as 'how' to do something is outside scope for Reliability Standards. If an entity can devise a procedure to accomplish the stated goal of the requirement then such a procedure would be an acceptable mechanism. One option is to have an Operating Plan which has the Reliability Coordinator perform the Real-time Assessment on behalf of the Transmission Operator under an EOP-008 scenario. No change made.

Organization	Yes or No	Question 1 Comment
The SDT believes that only one entity can be ultimately held responsible for these types of requirements and has written Requirements R19 and R20 accordingly. The ‘other’ entities will need to fall in line as they will be in violation of proposed TOP-003-3, Requirement R5 if they do not. No change made.		
Duke Energy	No	General Comments: Duke Energy is concerned with the uncertainty surrounding the inclusion and/or exclusion of Load Serving Entity in various Standards Projects. This inconsistency among Standard Drafting Teams creates uncertainty in the industry as to the expectations of the LSE, or whether the LSE will even be a applicable function. A more consistent application of the LSE function in proposed NERC standards is needed. R1: Based upon the comments provided below, Duke Energy suggests that R1 be focused on the TOP issuing Operating Instructions and suggests the following revision to R1 for clarity: ”Each Transmission Operator shall issue Operating Instructions, as necessary, to maintain the reliability of its Transmission Operator Area”. We believe the intent is for the TOP to “maintain” the reliability of the TOP Area by Issuing Operating Instructions. Duke Energy believes that by using the term “address” in the current draft, the standard would only be requiring an entity to identify the problem and take action without any stated goal or result. We feel that by using the term “maintain”, the standard would require the entity to identify the problem and maintain the reliability of its TOP Area. Lastly, Duke Energy has concerns with the use of the term “act” in R1 and R2. As currently worded, absent the TOP issuing an Operating Instruction, R1 states that the TOP shall “act”, in other words, do its job. If an entity fails to perform some action in an effort to maintain reliability in its Area, the entity would be in direct violation of this standard. In the event that an entity violated any other TOP standard, it could be argued that the entity failed to perform a certain “act”, which presents a possible double jeopardy situation wherein the failure to act, violating one standard could be construed as a violation of the proposed TOP-001-3. We suggest the use of the phrase “issue

Organization	Yes or No	Question 1 Comment
		Operating Instructions" eliminates the possibility of a double jeopardy situation. R2:Based upon the comments provided below, Duke Energy suggests that R2 be focused on the BA issuing Operating Instructions and suggests the following revision to R2 for clarity: "Each Balancing Authority shall issue Operating Instructions, as necessary, to maintain the reliability of its Balancing Authority Area". We believe the intent is for the BA to maintain the reliability of its BA Area by Issuing Operating Instructions. Duke Energy believes that by using the term "address" in the current draft, the standard would only be requiring an entity to identify the problem and take action without any stated goal or result. We feel that by using the term "maintain", the standard would require the entity to identify the problem and maintain the reliability of its BA Area. Lastly, Duke Energy has concerns with the use of the term "act" in R1 and R2. As currently worded, absent the BA issuing an Operating Instruction, R2 states that the BA shall "act", in other words, do its job. If the BA fails to perform some action in an effort to maintain reliability in its Area, the entity would be in direct violation of this standard. In the event that an entity violated any other BA standard, it could be argued that the entity failed to perform a certain "act", which presents a possible double jeopardy situation wherein the failure to act, violating one standard could be construed as a violation of the proposed TOP-001-3. We suggest the use of the phrase "issue Operating Instructions" eliminates the possibility of a double jeopardy situation. R9:Duke Energy would like the SDT to clarify the time duration of a "sustained outage". It is unclear if an outage lasting longer than 10min, 20min, 30min, etc., would be considered a sustained outage. Was it the SDT's intent to allow entities the flexibility to define what constitutes a "sustained outage"?

Organization	Yes or No	Question 1 Comment
		SOL Exceedance document: (1) Duke Energy suggests replacing "Thermal Limit Exceeded" with "SOL Limit Exceeded" to provide clarity in the example given in Table 1. (2) Duke Energy does not believe that the System Operating Limit Definition and Exceedance Clarification document should be attached to the TOP-001-1 standard. Instead, we believe it should be a standalone guidance document for the industry. If this were to occur, Duke Energy would likely vote "Affirmative" for TOP-001-1 as written.

Response: The SDT agrees that the Load-Serving Entity function may soon be deleted as the functions assigned to it are in the process of being retired or assigned to other functional entities. At its November 2014 meeting, the Board adopted the deletion of the Load-Serving Entity as a functional entity and a future filing with FERC will ask for approval of this action. Therefore, the SDT agrees to delete Load-Serving Entity from proposed TOP-001-3. See summary for language. However, there are two other standards in this project (Proposed TOP-003-3 and proposed IRO-010-2) that also contain the Load-Serving Entity as an applicable entity. Since those two standards have already passed ballot and been adopted by the Board, the SDT is not going to put the industry through the effort and burden of re-opening those standards at this time. When the retirement of Load-Serving Entity is adopted, there will be a project initiated to review all standards for the term and to make applicable deletions or replacements as needed. Those two standards will be picked up by that overarching project.

The SDT does not believe that Requirements R1 and R2 are problematic. The requirement simply states that an entity maintain the reliability of its area by the means it has at its disposal - either through its own actions or by issuing Operating Instructions. If the entity does that, then the SDT believes it has met the spirit and intent of the requirement. Specific actions for specific situations will be covered under the applicable standards. The wording of the requirements has been changed to provide additional clarity. See summary for changes

The SDT agrees and has changed Requirement R9 accordingly. See summary for language.

The SDT agrees and has made the suggested change in the redlined version of the SOL Exceedance White Paper.

The SOL Exceedance White Paper will not be attached to the standard but will be posted to a separate accessible place on the NERC web site. The exact URL is not available at this time but will be shown in Section F in the final posting of the approved standard.

Organization	Yes or No	Question 1 Comment
ISO/RTO Council Standards Review Committee (SRC)	No	SRC members generally agrees with the modifications to TOP-001-3 with the following additional recommendations for clarity, consistency, and/or to eliminate redundancy: 1. In Requirement R1, it is recommended that “address” is ambiguous and should be revised to “maintain” or “preserve” and that “[V]ia direct actions or by issuing Operating Instructions” should be revised to state “by initiating direct actions or issuing Operating Instructions.” Also, the measure M1 should be revised for consistency. 2. Review of modifications to IRO-001-4, Requirements R1, R2, and R3 to ensure consistency with the proposed revisions to TOP-001-3, Requirements R1 - R6.3. Requirement R7 has not retained an important concept contained within the previous requirement (TOP-001-1a - R6), which is that a supporting TOP should not be obligated to activate emergency procedures beyond those activated by the TOP that is in the emergency. As an example, the supporting TOP should not be obligated to go into voltage reduction if the TOP with the emergency has not taken the same voltage reduction action first. Hence, the phrase ‘... has implemented its Emergency procedures,’ is less specific than the previous standard and should be revised to provide ‘... has implemented its comparable Emergency procedures.’ 4. Requirement 10 seems duplicative in function with IRO-003, which requires the RC to monitor facilities associated with System Operating Limits (SOLs) and represents an overlap of the RC’s responsibility with the TOP draft requirement. Specifically, the TOP would have a requirement to monitor facilities outside of its TOP area that could affect SOL exceedances within its TOP area when the RC is already tasked with the “wide-area” view. This is in direct conflict with the Functional Model definition of a TOP which limits TOP responsibility to assets within its area.

Organization	Yes or No	Question 1 Comment
		Further, it is recommended that the term “non-BES” Be removed from Requirement R10. The “inclusion” process should capture all equipment that are sub-100 kV, but that affect BES reliability and bring this equipment into scope. Finally, in Requirement R10.2, the phrase ‘... as necessary by the TOP’ is unclear and should be redrafted to be consistent with 10.1 “10.2. In the neighboring Transmission Operator Area.” Conforming changes should also be made to Requirements R10.1.3 and 10.2.3. NOTE: this comment is not supported by PJM 5. The SRC appreciates the SDT’s effort to clarify the obligations of Balancing Authorities under Requirement R11. However, it respectfully submits that “in order to be able to perform its reliability functions” may still be ambiguous, resulting in subjective determinations of compliance. Additional revision is proposed to mitigate this ambiguity and to ensure that the reliability functions being referenced are clear: ”Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain Load-interchange-generation balance within its Balancing Authority Area, and support Interconnection frequency in real-time.” 6. The SRC respectfully submits that R15 is not necessary to ensure an Adequate Level of Reliability. Specifically, since the exceedance would have already been addressed or is being actively managed by the TOP and communication would already be occurring with impacted parties pursuant to other requirements, a requirement to inform the RC isn’t needed. If R15 is maintained, the SRC suggests including SCADA information in the Measurement so that the TOP can “inform” the RC through this mechanism. NOTE: this comment is not supported by PJM 7. The SRC reiterates it serious concerns over the proposed retirement of Requirement R4 of TOP-004-2 without requirements in TOP-001-3

Organization	Yes or No	Question 1 Comment
		addressing the reliability need for confirming or reestablishing valid SOLs/IROLs in an unstudied state. In previous postings, the SRC expressed a concern that, by retiring R4 of TOP-004-2, the responsible entity (TOP in this case) will no longer be required to reconfirm or reestablish valid SOLs or IROLs when entering an unstudied state. We recognize that, by virtue of the proposed definition of Operational Planning Analysis (OPA) and Real-time Assessment (RTA), as well as the new requirement for TOPs to update their OPA results through the performance of a RTA every 30 minutes, entities will always be assessing the reliability of the BES. However, we continue to disagree with this rationale and provide additional information in response to the SDT's response to our last comment. In response to the SDT's indication that it does not believe that the proposed requirements and standards allow an entity to be in an unknown state consistent with established IROL Tv, the SRC responds that an unknown state is one which has not been assessed before in IROL or SOL calculation or reliability assessment, and, therefore, there does not exist an updated, valid limit until it is re-determined (or reconfirmed). Thus, if an unknown operating state includes an unstudied state beyond those which the calculated SOLs or IROLs are intended to cover, then entities may find themselves in an unknown operating state. For example, in the Northeast, such as Quebec, Ontario and New York, SOLs/IROLs are observed to guard against transient or dynamic instability. These limits are normally developed using off-line analyses, as they cannot be determined within a short time using any on-line analysis tools available today. Predetermined reduction or judgment may need to be applied when system conditions, such as two or more critical facilities are out of service, diverge from the assumptions utilized in reliability assessment and other studies. In these circumstances, e.g., when an unstudied state is encountered, a necessary first step for the operating entities in these areas is to reconfirm or recalculate the limits that are valid and applicable for the prevailing

Organization	Yes or No	Question 1 Comment
		conditions. The reconfirmed or reestablished limits will become the target to which the system must be adjusted. Given the use of off-line studies to set limits and identify complex system conditions, the SRC believes that the OPA and RTA are good tools, but caution that these tools only look ahead at anticipated conditions and assess real-time situations in response to system changes. Accordingly, by themselves, they are not limit calculation mechanisms. Therefore, while these tasks will aid in assessing performance of the system against established limits, where such limits may not exist, the OPA and RTA are not the tools to calculate limits for the anticipated or prevailing conditions, especially for stability restricted SOLs/IROLs. To summarize, it is possible for the system to be in an unstudied or unknown state where established limits either don't apply or limits have not yet been established. While the RTA, OPA, and established Operating Plans can be quickly and easily applied to anticipated conditions, changes during real-time operation can render the assumptions and pre-determined limits invalid and, hence, the responsible entity cannot rely on these tools should these circumstances occur. Thus, the SRC once again urges the SDT to modify TOP-001-3 to expand Requirement R13 to require TOPs to reestablish valid SOLs when the prevailing conditions are beyond those that are covered by or have been studied in off-line calculations. NOTE: this comment is not supported by CAISO; ERCOT; MISO or PJM.

Response: 1. The SDT agrees and has made the suggested change. See summary for language.

The SDT agrees and has made the suggested change.

2. The SDT has reviewed the indicated requirements for consistency and believes that they are consistent. No change made.

The SDT agrees and has added the term. See summary for language.

4. The SDT does not believe that this requirement is duplicative. The SDT believes there is a distinction between 'identifying' (Reliability Coordinator task) versus 'determining' (Transmission Operator task). The Reliability Coordinator still retains responsibility

Organization	Yes or No	Question 1 Comment
for the 'wide-area' view – nothing the SDT has done affects that responsibility. However, Requirement R10 has been modified for clarification due to comments. See summary for language. The SDT has made several changes to the language of the requirement for clarity. Requirement R10, Parts 10.1.3 and 10.2.3 have been deleted. The SDT believes that non-BES facilities are already handled in the Reliability Standards. If a non-BES facility impacts the BES, such as by contributing to an SOL or IROL, then the SDT expects that facility to be incorporated into the BES through the official BES Exception Process and it would be covered in Requirement R10, Parts 10.1 and 10.2 by use of the defined term 'Facilities'. If non-BES facilities do not impact the BES but are needed for completing models, then the SDT believes the situation is already covered in approved FAC-011-2, Requirement R3, Parts 3.1 and 3.4 which mandate that the Reliability Coordinator include external areas and the level of detail needed in models for determining SOLs within its established SOL methodology. The SDT used the phrase 'as necessary by the Transmission Operator' to allow the Transmission Operators maximum flexibility in deciding what data it needs. Every situation is different across the country. Any attempt to create a national standard stating exactly what data a Transmission Operator needs would be fraught with error when applied to all of the unique and specific configurations employed throughout North America. Therefore the language was crafted to recognize this fact and to place the onus of responsibility as to what is required on the individual Transmission Operator. No change made. 5. The SDT agrees and has made the suggested change. See summary for language. 6. The SDT believes that it is an important for BES reliability for the Reliability Coordinator to know what actions were taken to mitigate the situation. How such notification is made is up to the entities involved as 'how' is not within scope of standards. If two entities agree that SCADA provides sufficient notification that is an acceptable method of notification. Nothing in this requirement or standard precludes that. No change made. 7. The SDT understands the concern of moving to an unknown state which it interprets as a condition that has not been previously studied. However, the SDT believes that there is always either a set of limits in service or an Operating Plan which provides guidance to adjust the limit until a new set of limits are analyzed and determined. The SDT has produced an SOL Exceedance White Paper that explains how an SOL Exceedance is to be determined, what to do upon experiencing an SOL exceedance, and acceptable timeframes to mitigate SOL exceedances. The SDT believes that the situation described has been covered in the proposed standards and requirements and that no further action is required. Specifically, the SDT points to Requirement R13, perform a Real-time Assessment every 30 minutes, and Requirement R14, implement Operating Plans to mitigate an SOL Exceedance, as well as the guidance provided on Operating Plans in Section F. Furthermore, the standard does not prohibit an entity from performing an RTA more frequently in response to a unplanned system event. No change made.		

Organization	Yes or No	Question 1 Comment
ACES Standards Collaborators	No	(1) There are several issues with the draft standard of TOP-001-3. First, we disagree with the inclusion of the Load-Serving Entity (LSE) as an applicable entity. This function is being removed from the NERC Rules of Procedure and should not be included in the draft standard. TOP-001-3 already applies to the Distribution Provider (DP), so there will not be a gap in the future because LSEs are required to also be registered as DPs. We recommend removing the LSE from the applicability section for consistency with the revised NERC Rules of Procedure and to avoid a future standards project to correct this issue. In regards to timing, the NERC BOT will likely have approved removal of LSE before this is even approved in a final ballot by the ballot body. (2) Requirement R1 and Requirement R2 are problematic because they are vaguely written and could result in additional compliance burdens for a TOP or BA when there is an event. As currently written, any time that a TOP or BA has an outage there could be a violation because the entity did not address the reliability of its area. These requirements will be used in enforcement as additional fines without benefitting reliability because they do not state what actions should be taken. We also disagree with the High VRF and Severe VSL for these standards. These requirements are vague and need further refinement. (3) Requirements R3, R4, R5, and R6 should not apply to the LSE, as previously stated above. (4) Requirement R8 needs to be revised to remove the words “could result in an Emergency.” There are numerous situations that “could” result in an Emergency, but do not. This language is ambiguous and immeasurable, and should be removed. (5) Requirement R9 has improved with the addition of “sustained outages” to clarify that notification is not required for momentary events. However,

Organization	Yes or No	Question 1 Comment
		R9 is not clear as to the outage thresholds that would require a notification. When must the BA or TOP notify its RC? The requirement is ambiguous as written, which will lead to varying interpretations for compliance. This requirement needs to be revised to provide additional clarity when a notification to the RC is required. (6) Requirement R10 and part 10.1 are duplicative in listing "within its Transmission Operator Area." If taken as a whole, R10 states that "Each TOP shall monitor the following as necessary for determining SOL exceedances within its TOP Area: 10.1. Within its TOP Area: 10.1.1. Facilities..." This requirement needs to be revised to have proper sentence structure. (7) Part 10.3's reference to "Non-BES facilities" is outside the scope of reliability standards. Reliability standards are applicable to the BES, which would be Facilities. The revised BES definition addresses Elements and Facilities that should be subject to the reliability standards through the BES exception process. There is no reason to include non-BES Elements in the requirement. Parts 10.1.3 and 10.2.3 that reference "non-BES facilities" should be struck. (8) Thank you for the opportunity to comment.

Response: 1. The SDT agrees that the Load-Serving Entity function may soon be deleted as the functions assigned to it are in the process of being retired or assigned to other functional entities. At its November 2014 meeting, the Board adopted the deletion of the Load-Serving Entity as a functional entity and a future filing with FERC will ask for approval of this action. Therefore, the SDT agrees to delete Load-Serving Entity from proposed TOP-001-3. See summary for language. However, there are two other standards in this project (Proposed TOP-003-3 and proposed IRO-010-2) that also contain the Load-Serving Entity as an applicable entity. Since those two standards have already passed ballot and been adopted by the Board, the SDT is not going to put the industry through the effort and burden of re-opening those standards at this time. When the retirement of Load-Serving Entity is adopted, there will be a project initiated to review all standards for the term and to make applicable deletions or replacements as needed. Those two standards will be picked up by that overarching project.

Organization	Yes or No	Question 1 Comment
2. The SDT does not believe that Requirements R1 and R2 are problematic. The requirement simply states that an entity maintain the reliability of its area by the means it has at its disposal - either through its own actions or by issuing Operating Instructions. If the entity does that, then the SDT believes it has met the spirit and intent of the requirement. Specific actions for specific situations will be covered under the applicable standards. The wording of the requirements has been changed to provide additional clarity. See summary for changes 3. The SDT agrees that the Load-Serving Entity function may soon be deleted as the functions assigned to it are in the process of being retired or assigned to other functional entities. At its November 2014 meeting, the Board adopted the deletion of the Load-Serving Entity as a functional entity and a future filing with FERC will ask for approval of this action. Therefore, the SDT agrees to delete Load-Serving Entity from proposed TOP-001-3. See summary for language. However, there are two other standards in this project (Proposed TOP-003-3 and proposed IRO-010-2) that also contain the Load-Serving Entity as an applicable entity. Since those two standards have already passed ballot and been adopted by the Board, the SDT is not going to put the industry through the effort and burden of re-opening those standards at this time. When the retirement of Load-Serving Entity is adopted, there will be a project initiated to review all standards for the term and to make applicable deletions or replacements as needed. Those two standards will be picked up by that overarching project. 4. The SDT believes that the language is correct as stated and consistent with the intent of the standards. If an entity performs an analysis and an Emergency situation is forecasted, then that entity should inform entities of this condition as per the requirement. An example could be the notification of an Emergency outage that would result in a known Stability issue requiring the execution of Operating Plans. No change made. 5. The SDT agrees and has made changes to the requirement. See summary for language. 6. The SDT disagrees. The first instance of 'within its Transmission Operator Area' refers specifically to the function of determining SOL exceedances. The second instance lays out what must be done within its own area to accomplish this task. No change made. 7. The SDT has made several changes to the language of the requirement for clarity. Requirement R10, Parts 10.1.3 and 10.2.3 have been deleted. The SDT believes that non-BES facilities are already handled in the Reliability Standards. If a non-BES facility impacts the BES, such as by contributing to an SOL or IROL, then the SDT expects that facility to be incorporated into the BES through the official BES Exception Process and it would be covered in Requirement R10, Parts 10.1 and 10.2 by use of the defined term 'Facilities'. If non-BES facilities do not impact the BES but are needed for completing models, then the SDT believes the situation is already covered in approved FAC-011-2, Requirement R3, Parts 3.1 and 3.4 which mandate that the Reliability Coordinator include external areas and the level of detail needed in models for determining SOLs within its established SOL methodology.		

Organization	Yes or No	Question 1 Comment
Bonneville Power Administration	No	BPA reiterates its comments from the previous period on TOP-001-3: BPA suggests referencing the System Operating Limit (SOL) Definition and Exceedance Clarification white paper in the language of the Requirements, as Regional Entities are not required to audit to appendices, unless indicated by the language of a Requirement. BPA believes the language in requirement R8 is still ambiguous and open-ended regarding, "... operations that result in, or could result in, an Emergency." It is unclear how entities are expected to determine events that could possibly happen. BPA suggests the drafting team include parameters for possible events, so applicable entities are not required to predict all possible future events. BPA also opposes language in the Standard which has the potential to conflate events that are happening with events that have a high probability of happening. BPA suggests the drafting team clearly separate these two concepts. Additionally, BPA disagrees with the change in R16 from "Real-Time Assessment" to "analysis". This is a very broad and, in this case, undefined term. BPA believes this could lead to differences in interpretation between a TOP and an auditor. For example, R16 applies to the Operations Planning Horizon. A study engineer's computer is part of an entity's analysis capability for doing studies in that horizon. Hence, as written, this requirement could be interpreted to mean that an entity's IT department would need to have System Operator approval prior to working on a study engineer's computer. BPA does not believe that was the drafting team's intent, but this broad language does leave that possible interpretation open.
Response: The definition of System Operating Limit is included in the NERC Glossary of Terms Used in Reliability Standards. By using the capitalized term, the requirements directly reference the defined term in the Glossary and are auditable. The SOL Exceedance White Paper is a guidance document and not intended to be part of a requirement. The paper outlines how the SDT interprets an		

Organization	Yes or No	Question 1 Comment
SOL exceedance to be determined and what to do when such occurs. The SDT believes that entities will be audited to Standards and Requirements that are referenced within the White Paper. The intent of the White Paper is to assist in providing a common understanding across the industry. No change made. The SDT believes that the language is correct as stated and consistent with the intent of the standards. If an entity performs an analysis and an Emergency situation is forecasted, then that entity should inform entities of this condition as per the requirement. An example could be the notification of an Emergency outage that would result in a known Stability issue requiring the execution of Operating Plans. No change made. The SDT has revised the wording of the requirement to provide additional clarity. See summary for language.		
Hydro One	No	Requirement R10 presents a significant concern. A Transmission Operator cannot be held responsible for monitoring in a neighboring Transmission Operator Area; a Transmission Operator can only rely on data provided by a neighboring area. If a Transmission Operator was responsible for monitoring in a neighboring area, what is the TOP monitoring, how, what are the available actions and obligations, should the actions be taken unilaterally?
Response: The SDT is not implying that an entity needs to establish monitoring capabilities such as its own RTU in another Transmission Operator's Area. In this requirement, monitoring outside of the Transmission Operator's Area means that a Transmission Operator is obtaining the data and presenting it to its operators as needed. For example, the Transmission Operator would obtain the status and MW flow on external facilities that are identified as having an impact on the Transmission Operators System Operating Limits. To provide clarification on this matter, the SDT has restructured the language of the requirement. See summary for language.		
Owensboro Municipal Utilities	No	The current language in TOP-001 R1 and R2 has further expanded the applicable use of operating instructions encompassing all individuals to the point where the compliance risk of the requirement is not appropriately weighted with the benefit to reliability. R3 and R4 state that only the registered entities identified must comply with OI; they do not state that registered entities identified are the only entities that can receive OI.

Organization	Yes or No	Question 1 Comment
		Therefore, without the lack of specificity in R1 and R2 (or in R3 and R4) to whom OI can be issued to, the standard now requires three point communication to any party or entity for actions that will affect the BES, even though that entity (unless identified in R3 and R4) does not have to comply. Although the NERC functional model states to whom a BA and TOP can direct, this is not referenced or mentioned in the standard, and must be inferred by not only the entity maintaining compliance, but also the individual performing an audit. It would seem very beneficial to specify this assumption within R1 and R2. Suggested Wording: R1 and R2: “Each Transmission Operator (Balancing Authority) shall act, or direct others (referenced in R3 and R4) to act by issuing Operating Instructions, to ensure the reliability of its Transmission Operator (Balancing Authority) Area.” In R10, replace “necessary” with “applicable” to maintain consistency with the definitions of Real-Time Assessment and Operational Planning Analysis. Suggested Wording: Each Transmission Operator shall monitor Facilities, the status of Special Protection Systems, and sub-100 kV facilities identified as necessary applicable by the Transmission Operator, within its Transmission Operator Area and neighboring Transmission Operator Areas to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area In R13, the OC Review Group suggests expanding the time interval to 45 minutes instead of 30 minutes. When new EMS models are brought online, they may require greater than 30 minutes to perform an assessment. Either the time could be expanded or some sort of allowance provided for the times when the new models are being placed in service. In the R13 VSL, the OC Review Group suggests the time graduations for each level of VSL be retained (30-35 minutes, 30-40 minutes, 40-45 minutes, >45 minutes).

Organization	Yes or No	Question 1 Comment
		In R18, the OC Review Group suggests removing the word "always" before "operate" and provide graduated VSL to allow for when limits were determined to be incorrect due to mistake in entry of data. Suggested Wording: "R18: Each Transmission Operator and Balancing Authority shall always operate to the most limiting parameter in instances where there is a difference in SOLs." Should LSE be removed from applicable entities since LSE may be removed from the NERC Functional Model?

Response: The Functional Model is always implicitly part of any determination of how a requirement is written and is always a consideration in auditing a specific requirement. It is never explicitly cited in a requirement for those reasons. The SDT does not believe that the suggested change adds clarity or is necessary for reliability. No change made.

The SDT does not agree that 'necessary' should be replaced by 'applicable' in this requirement. The SDT believes that 'necessary' is the term that provides the proper context. No change made.

30 minutes is an approved time period for such requirements as seen in approved IRO-008-1, Requirement R2. The SDT has not received a preponderance of justification to change this previously approved time period. No change made.

The VSLs have been maintained.

The word 'always' is not used in Requirement R18. From reading the comment, it appears that the request is to add the term to the language. The SDT does not believe that this is necessary for reliability or that it provides any additional clarity. No change made.

The SDT believes that the VSL as currently stated is correct in its binary form. An entity should be operating to the most limiting set of limits with no exceptions. If the limits are incorrect, then an Operating Plan would be followed to adjust the limit until a new limit is analyzed and determined. No change made.

The SDT agrees that the Load-Serving Entity function may soon be deleted as the functions assigned to it are in the process of being retired or assigned to other functional entities. At its November 2014 meeting, the Board adopted the deletion of the Load-Serving Entity as a functional entity and a future filing with FERC will ask for approval of this action. Therefore, the SDT agrees to delete Load-Serving Entity from proposed TOP-001-3. See summary for language. However, there are two other standards in this project (Proposed TOP-003-3 and proposed IRO-010-2) that also contain the Load-Serving Entity as an applicable entity. Since those two standards have already passed ballot and been adopted by the Board, the SDT is not going to put the industry through the effort and

Organization	Yes or No	Question 1 Comment
burden of re-opening those standards at this time. When the retirement of Load-Serving Entity is adopted, there will be a project initiated to review all standards for the term and to make applicable deletions or replacements as needed. Those two standards will be picked up by that overarching project.		
Hydro-Quebec Production	No	Inclusion of NON-BES at R10 is inacceptable
New York State Department of Public Service	No	The requirement to monitor non-bulk facilities raises jurisdictional questions which needs to be settled before inclusion.
Response: The SDT has made several changes to the language of the requirement for clarity. Requirement R10, Parts 10.1.3 and 10.2.3 have been deleted. The SDT believes that non-BES facilities are already handled in the Reliability Standards. If a non-BES facility impacts the BES, such as by contributing to an SOL or IROL, then the SDT expects that facility to be incorporated into the BES through the official BES Exception Process and it would be covered in Requirement R10, Parts 10.1 and 10.2 by use of the defined term 'Facilities'. If non-BES facilities do not impact the BES but are needed for completing models, then the SDT believes the situation is already covered in approved FAC-011-2, Requirement R3, Parts 3.1 and 3.4 which mandate that the Reliability Coordinator include external areas and the level of detail needed in models for determining SOLs within its established SOL methodology.		
Flathead Electric Cooperative, Inc.	No	I continue to disagree with the level of detail in M3 and M4 for entities on the receiving end of a recorded instruction at the Transmission Operator/Balancing Authority level. Why should this have to be auditably demonstrated at both ends when everything is recorded upstream?
Response: The measures cited provide a list of things that could be supplied as evidence but there is no hard and fast requirement that voice recordings be supplied by both entities. An entity can make its own determination of whether it wants to maintain voice recordings or supply some other evidence for proof of compliance. No change made.		
Ameren	No	We have concerns on what constitutes "Operating Instructions", and over how an entity is supposed to prove compliance once this standard becomes effective. We believe that "Reliability Directives", would be used infrequently under emergency type situations, compared to "Operating Instructions", everyday, common tasks, such as switching, would open up

Organization	Yes or No	Question 1 Comment
		TOP's to an very burdensome way of documenting compliance. We are concerned that the operator will have to focus less attention on the actual operation of the system, and more attention to collecting evidence for future audits. We also have concerns about removing the terminology of EOP-001-1a; R1(and other requirements with similar language) that: "Each Transmission Operator shall have the responsibility and clear decision-making authority to take whatever actions are needed to ensure the reliability of its area and shall exercise specific authority to alleviate operating emergencies." We believe that how entities choose to exercise that authority should be determined by each entity, based on their situation. Over the years the industry has clearly learned what a "Reliability Directive" means and we should not undo this concept, and avoid the confusion that it could create. In addition, the RSAWs introduce the concept of using BES events as a screening tool. We were not able locate any such information in the Reliability Standard itself, nor does the standard give guidance on when there are no BES events for the period being audited.
Response: Reliability Directive was never approved by FERC and thus was never part of an officially approved standard. The SDT believes that the use of Operating Instruction in this standard is consistent with the purpose and intent of the COM standards and that the COM standards correctly captured the reliability need as indicated in FERC's acceptance of the standards. No change made. The use of events in the RSAWs is designed to limit the scope of where an auditor should look for situations where these requirements may come into play. It should effectively reduce the amount of time where an auditor would be looking for evidence which should make an audit easier and more effective. In several locations, such as Measure M3, the SDT has addressed situations where no event may have occurred by allowing for attestations to that effect.		
NIPSCO	No	NIPSCO feels R19 and R20 should be in TOP-003 or are already covered in COM-001.

Organization	Yes or No	Question 1 Comment
		NIPSCO feels R16 and R17 are outage coordination and do not belong in TOP-001 which is Transmission Operations. These should be with the outage coordination standard.
Response: Approved COM-001-2 refers to voice communications and not data. Proposed TOP-003-3 defines operational reliability data specifications. FERC has made it clear in past transactions that data, in and of itself, is not sufficient for mandatory standards. There needs to be 'hardware' in place in order for the data to be exchanged and the SDT has written Requirements R19 and R20 accordingly. No change made. The proposed IRO-017-1 outage coordination standard is designed for Transmission and generation outages and coordination of same. Requirements R16 and R17 do not fit into that categorization and the SDT believes they are better suited to proposed TOP-001-3. No change made.		
Ingleside Cogeneration LP	No	Ingleside Cogeneration L.P. ("ICLP") understands that FERC has ordered that TOPs and RCs must be able to monitor "non-BES" systems that they determine will affect System Operating Limits. However, it naturally follows that such important facilities must be part of the BES - and addressed in a far more formal way. It seems to ICLP that just such an exception process was created in NERC's Rules of Procedure when the Definition of the BES was modified. It allows the TOP/RC to make the case for the new addition - while the owner/operator has the opportunity to challenge it. Even if there needs to be an emergency bypass procedure to account for unexpected circumstances, at least a level of important control will exist. Otherwise, components and facilities can be essentially added to the BES without any recourse on the part of the affected entity. This raises the specter of the improper sharing of proprietary information and the chance of economic discrimination if such authority is misused. Secondly, a GOP will be expected to capture the fact that every Operating Instruction was performed unless it would "violate safety, equipment, regulatory, or statutory requirements." ICLP will execute in good faith to every instruction, but we are not confident that our log entries will be up to

Organization	Yes or No	Question 1 Comment
		auditor expectations - particularly if routine status or some other low-impact action is requested. The alternative offered by the project team (the RSAW only directs CEAs to review logs where a EOP-004-2 defined Event took place) is not binding. It is not hard to see that expectations will vary by Regional Entity and even change over time. Furthermore, the target of Operating Instructions will not be limited to BES Facilities. This could mean that as a Cogeneration Facility, we will be put into an untenable bind if ordered by a BA or TOP to re-direct capacity to the BES at the expense of our internal customer. Of course we are responsive to the needs of the greater system, but it should not be up to external entities to decide which needs take priority - keeping in mind that our installation is a critical part of the national chemical infrastructure.
Response: The SDT has made several changes to the language of the requirement for clarity. Requirement R10, Parts 10.1.3 and 10.2.3 have been deleted. The SDT believes that non-BES facilities are already handled in the Reliability Standards. If a non-BES facility impacts the BES, such as by contributing to an SOL or IROL, then the SDT expects that facility to be incorporated into the BES through the official BES Exception Process and it would be covered in Requirement R10, Parts 10.1 and 10.2 by use of the defined term 'Facilities'. If non-BES facilities do not impact the BES but are needed for completing models, then the SDT believes the situation is already covered in approved FAC-011-2, Requirement R3, Parts 3.1 and 3.4 which mandate that the Reliability Coordinator include external areas and the level of detail needed in models for determining SOLs within its established SOL methodology. Given the guidance provided to the auditor in the proposed RSAWs, BES events will be used by the auditor to constrain the potential amount of data an entity will need to provide. The SDT believes that this guidance is being provided in good faith and with the view that it will be used on a national basis. No change made. Nothing in this proposed standard exposes non-BES facilities to any requirement in any standard. The only obligations with regard to non-BES facilities is for data as documented in proposed TOP-003-3. No change made.		
Puget Sound Energy	No	The drafting team's revisions significantly improve the proposed standard. However, requirements R3 and R5 continue to impose a high compliance burden on entities that receive Operating Instructions. For example, a

Organization	Yes or No	Question 1 Comment
		Generator Operator could receive thousands of dispatch instructions each year. As the term is defined, each of these dispatch instructions would be an Operating Instruction and the GOP would be required to demonstrate that it complied with each of these Operating Instructions (or that it was unable to comply for the reasons specified in requirements R4 and R6). The standards drafting team for COM-002 recognized this issue when it developed a tiered approach for the communication protocols associated with Operating Instructions. The first tier requires an entity to periodically monitor compliance with its communications protocols and then correct issues that are discovered during this monitoring. The second tier requires entities to comply fully with its communication protocols during Emergency conditions only. This approach recognizes the importance of formal communications during both normal and Emergency conditions, but appropriately minimizes the compliance burden that would be associated with demonstrating compliance with an entity's communication protocols for all Operating Instructions. The drafting team should model that approach in this standard.
Indiana Municipal Power Agency	No	Indiana Municipal Power Agency (IMPA) appreciates the hard work and effort the SDT has put into this standard. IMPA does not agree with using Operating Instructions within this standard. By using Operating Instructions within this standard, NERC has created an extremely administrative type of standard for entities to follow and to keep evidence to show they performed the Operating Instruction. This seems to be going in the opposite direction of what NERC is proposing in its RAI program with the theme of concentrating on the "risk" to the BES. IMPA acknowledges that the SDT writes the standard but also understands the influence NERC has on standard drafting teams. During high load times, an entity that has to follow its TOP's Operating Instructions will need to keep a good recording or log entry of the Operating Instruction and then proceed to keep documentation showing it was performed. Since the definition of an

Organization	Yes or No	Question 1 Comment
		Operating Instruction is vague and not clear, an entity will have to do this for every instruction from its TOP regardless of how they see the instruction because an auditor may view it as an Operating Instruction. For example, a Generator Operator will have to keep a log and evidence to show it performed the Operating Instruction for every start, stop, and load command for all of its generating units within its fleet (PJM is the TOP for many GOPs). IMPA recommends the drafting of requirements that allow entities to focus on the "risk" to the BES and not write requirements which are administrative in nature (meet paragraph 81 criteria).
Response: Given the guidance provided to the auditor in the proposed RSAWs, BES events will be used by the auditor to constrain the potential amount of data an entity will need to provide. The SDT believes that this guidance is being provided in good faith and with the view that it will be used on a national basis. No change made.		
ReliabilityFirst	No	ReliabilityFirst abstains and offers the following comment for consideration.1. Requirement R1, R2, R3 and R4 - ReliabilityFirst continues to recommend there be a timeframe added to the requirement stating the allotted time the Entity has to inform its Transmission Operator of its inability to perform an Operating Instruction. Absent a timeframe, compliance to this requirement becomes subjective and difficult to enforce. ReliabilityFirst understands that a finite timeframe may not be appropriate to be stated in the standard to cover all circumstances, but offers a suggestion to require the TOP to define it when issuing Operating Instructions. ReliabilityFirst suggests the following revised language for consideration. R1 - Each Transmission Operator shall act to address the reliability of its Transmission Operator Area via direct actions or by issuing Operating Instructions [along with allocated time constraints for notification if the Operating Instructions cannot be performed].R2 - Each Balancing Authority shall act to address the reliability of its Balancing Authority Area via direct actions or by issuing Operating Instruction [along with allocated time constraints for notification if the Operating Instructions

Organization	Yes or No	Question 1 Comment
		cannot be performed].R4 - Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Transmission Operator [within the time constraints allocated by the Transmission Operator] of its inability to perform an Operating Instruction issued by its Transmission Operator...” R6 - Each Transmission Operator, Generator Operator, Distribution Provider, and Load-Serving Entity shall inform its Balancing Authority [within the time constraints allocated by the Balancing Authority] of its inability to perform an Operating Instruction issued by that Balancing Authority.”
Response: The SDT believes that it is counter to reliability to place a time tag on these requirements. The operator should be concentrating on the reliability issue and not be concerned with adhering to an arbitrary time period for informing entities. No change made.		
Independent Electricity System Operator	No	We generally agree with the changes made to the proposed TOP-001-3 standard, but continue to have a serious concerns over the proposed retirement of Requirement R4 of TOP-004-2 without having it reinstated in TOP-001-3 or having some of the requirements in TOP-001-3 revised to addressing the reliability need for confirming or reestablishing valid SOLs/IROLs in an unknown or unstudied state. We strongly believe that the Requirement R4 of TOP-004-2 addresses a critical reliability aspect that ensures the bulk electric system is operated in a reliable manner during real-time operations. And, if is not actually replaced by any new or revised requirement in TOP-001-3, it will create a reliability gap that is critical to the reliable operation of the bulk electric system. Requirement R4 of TOP-004-2 stipulates that: R4. If a Transmission Operator enters an unknown operating state (i.e., any state for which valid operating limits have not been determined), it will be considered to be in an emergency and shall restore operations to respect proven reliable power system limits within 30 minutes. In previous postings, we expressed a concern that by retiring R4 of TOP-004-2, the responsible entity (TOP in this case) will no longer be

Organization	Yes or No	Question 1 Comment
		required to reconfirm or reestablish valid SOLs or IROLs when entering an unknown (or unstudied) state. We recognize that by virtue of the proposed definition of Operational Planning Analysis (OPA) and Real-time Assessment (RTA), as well as the new requirement for TOPs to update their OPA results through the performance of a RTA every 30 minutes, that the entities will always be assessing the reliability of the BES. The SDT thus argues that this, together with the TOP-001-3 Requirements R12, R13, and R14, will allow the operators sufficient flexibility within a structured environment to take the necessary actions for the reliability of the Bulk Power System and hence Requirement R4 of TOP-004-2 can be retired. We continue to disagree with the SDT's rationale for retiring R4 of TOP-001-3. Below is our point by point comment on the SDT's response to our last round of comment. This is not meant to be a criticism of the SDT's response. Rather, we choose to present our comment in this manner so that we can more clearly present our view on each of the technical arguments that the SDT made. a. The SDT [believes the existing requirements within the standard to perform a Real-time Assessment include reevaluation of SOL/IROL limits to either reestablish new limits or implement Operating Plans to stay within updated limits. The SDT does not believe that the proposed requirements and standards allow an entity to be in an unknown state consistent with established IROL Tv.] The IESO believes that an unknown state is one which has not been assessed before in IROL or SOL calculation or reliability assessment, and therefore there does not exist an updated, valid limit until it is re-determined (or reconfirmed). We further believe that the SDT's view that "by complying with the proposed requirement, an entity will never enter into an unknown state" may be an oversimplified assumption, if not an oversight. An unknown operating state includes an unstudied state beyond those which the calculated SOLs or IROLs are intended to cover. b. [The premise of the SDT's philosophy is that an Operational Planning Analysis must be available for next day and that this analysis must be periodically

Organization	Yes or No	Question 1 Comment
		updated by performing a Real-time Assessment as per proposed TOP-001-4 Requirement R13.]The IESO believes that the OPA and RTA are good tolls, but they only look ahead at anticipated conditions and assess real-time situation in response to system changes and by themselves they are not a limit calculation mechanisms. Therefore, while these tasks will aid in assessing performance of the system against established limits, such limits may not exist; and OPA and RTA are not the tasks to calculate limits for the anticipated or prevailing conditions, especially for the stability restricted SOLs/IROLs. c. [Both of these functions require an established set of Facility Ratings be in use so that analysis can discern when these limits are being exceeded. It is the SDT's belief that once these limits have been established that it does not matter what event occurs to cause an exceedance.]The IESO believes that this may be true for facility limited SOLs/IROLs, but not for voltage and/or stability restricted SOLs/IROLs. d. [The event takes place and is analyzed against the set of limits currently in place.]The IESO believes that a set of valid limit (voltage and stability limited type) may not exist for conditions that have not been studied and therefore there is no such "set of limits currently in place". e. [It is these limits that an entity must restore the system to following the event as per proposed TOP-001-4 Requirement R14.]This is achievable if the limits already exist. But when the limits do not exist, as in the case of SOLs or IROLs that are restricted by stability and when the prevailing conditions are ones that have not been studied before, there is not a target (SOL or IROL) with which the system is to be restored to. f. [Therefore, the SDT believes that approved TOP-004-2 Requirement R4 can be retired without creating a reliability gap. The SDT recognizes that not all entities are capable of performing Real-time transient Stability analysis within 30 minutes and would rely on Operating Plans. No change made. The IESO believes that an Operating Plan is only a plan for the anticipated conditions. Changes during real-time operation can render the assumptions and pre-determined limits invalid and hence the responsible

Organization	Yes or No	Question 1 Comment
		entity cannot rely on the Operating Plan to provide SOLs/IROLs that are stability restricted. We agree that with the current technology, it is doubtful if any entities can rely on real-time tools to calculate SOLs/IROLs in 30 minutes. However, this should not be a reason to not reestablish SOLs/IROLs when an entity encounters a condition that is "unknown" or not studied before. There are various means to achieve such tasks, but a necessary first step to ensure entities reestablish valid SOLs/IROLs is to stipulate this in a standard. Retiring R4 of TOP-004-2 will do just the opposite: responsible entities will not be mandated to reestablish valid limits to begin with when entering an unstudied or unknown state. We once again urge the SDT to reinsert R4 of TOP-004-2 to TOP-001-3, or to expand Requirement R13 to require TOPs to reestablish valid SOLs when the prevailing conditions are beyond those that are covered by or have been studied in SOL calculations.
Response: The SDT understands the concern of moving to an unknown state which it interprets as a condition that has not been previously studied. However, the SDT believes that there is always either a set of limits in service or an Operating Plan which provides guidance to adjust the limit until a new set of limits are analyzed and determined. The SDT has produced an SOL Exceedance White Paper that explains how an SOL Exceedance is to be determined, what to do upon experiencing an SOL exceedance, and acceptable timeframes to mitigate SOL exceedances. The SDT believes that the situation described has been covered in the proposed standards and requirements and that no further action is required. Specifically, the SDT points to Requirement R13, perform a Real-time Assessment every 30 minutes, and Requirement R14, implement Operating Plans to mitigate an SOL Exceedance, as well as the guidance provided on Operating Plans in Section F. Furthermore the standard does not prohibit an entity from performing an RTA more frequently in response to a unplanned system event. No change made.		
NV Energy	No	The comments of NV Energy, particularly with regard to requirement R13, remain unaddressed in this latest posting. We continue to urge the SDT to depart from the zero defect approach on the language of R13. It seems unreasonable to expect perfect execution of the suggested real-time analyses, including the provisions for incorporation of the elements of SPS/RAS and protection system status, 17,520 times per year. By the SDT's

Organization	Yes or No	Question 1 Comment
		own response to NV Energy's comments in the prior ballot/comment period " This requirement isn't about maintaining RTCA or any other specific tool, it's about maintaining situational awareness at all times." Yet the SDT nevertheless declined to make any change to the language of R13. We continue to believe that the language suggested below is reasonable given the complexity of the requirements of TOP-001-3. We therefore suggest the following: R13: "Each TOP shall ensure that a Real-time Assessment is performed with such periodicity so as to ensure continuous situational awareness of the TOP."
Response: The SDT has reviewed the suggested language change to Requirement R13 and concluded that the proposal presents ambiguity and is not measurable. Proposed IRO-008-1, Requirement R2 currently requires the Reliability Coordinator to conduct a Real-time Assessment at least once every 30 minutes. Approved EOP-008-1 specifically requires entities to have capabilities to ensure that System Operators have situational awareness of the BES. It goes on to require that entities take necessary actions to manage the risk to the BES during periods when primary or backup functionality may not be available. The SDT developed proposed TOP-001-3, Requirement R13 to be consistent with the intent of existing requirements. Proposed TOP-001-3, Requirement R13 has been previously modified to reflect industry comment in order to recognize that other entities may perform Real-time Assessment during EOP-008 scenarios. No change made.		
Oncor Electric Delivery LLC	No	Proposed Standard TOP-001-3 R9 States: R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and impacted interconnected entities of sustained outages of telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities. In response to R9, Oncor recommends for the requirement to make it mandatory for BAs and TOPs to notify only negatively impacted interconnected TOs, TOPs and GOPs. Oncor does not feel it necessary to notify registered entities that do not have reliability control functions to the BES. Oncor's suggested rewording for R9: R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and negatively impacted interconnected TOs, TOPs and GOPs of sustained outages of telemetering

Organization	Yes or No	Question 1 Comment
		and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities. Proposed Standard TOP-001-3 R10 States:R10. Each Transmission Operator shall monitor the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: 10.2. Within neighboring Transmission Operator Areas identified as necessary by the Transmission Operator:10.2.1. Facilities,10.2.2. Status of Special Protection Systems, and10.2.3. Non-BES facilities. ERCOT region is structured to support a deregulated market in which ERCOT monitors facilities for all TOPS and has a centralized view of the entire region to maintain reliability. TOPs operating within ERCOT currently do not have the technical capability to monitor facilities of neighboring TOPs. This requirement imposes a "one size fits all" regional structure which would place an unreasonable financial burden on all TOPs to both install and maintain additional hardware in each station or install and maintain multiple ICCPs between control centers. This requirement would place this financial burden on TOPs for nothing more than to replicate an RC function with no benefit to the BES. At no point in proposed Standard TOP-001- 3 does it require TOs to supply neighboring TOs with this data. Oncor requests R1O.2, R10.2.1., R10.2.2 and R10.2.3 be removed from the standard due to lack of regional flexibility. Proposed R12 changes the existing requirement of operating outside an IROL for no longer than 30 minutes to "a continuous duration exceeding its associated IROL Tv". This requirement does not specify who determines the Tv of an IROL when multiple TOPs are involved in the circuit. Oncor believes that the 30 minute limit utilized in previous versions of this standard eliminates the possibility for disagreement. Oncor's recommendation is to keep the existing 30 minute time limit.

Organization	Yes or No	Question 1 Comment
Response: The SDT removed the term 'negatively impacted' due to comments in a previous posting. The logic was that an entity would not be positively impacted by an outage so the term was redundant. No change made. The SDT believes that sufficient flexibility is provided in the revised language for Requirement R10. How an entity accomplishes the task is not in scope for standards. If there are lower cost alternatives available that meet the goal of the requirement, they may be used. In the situation cited, data exchanges will already be in place, or will need to be installed, to comply with other requirements such as proposed TOP-003-3, Requirement R5. Therefore, given the revised language, the SDT does not see any undue burden, financial or otherwise, to comply with this requirement. No change made. IROLs are, and always have been, determined by the Reliability Coordinator as per the approved FAC-011 and FAC-014 standards and passed along to Transmission Operators. T_v is part of this methodology. Whether multiple Transmission Operators are involved or not has no relevance as they must all adhere to what is provided by the Reliability Coordinator. No change made.		
Georgia Transmission Corporation	No	(1) GTC requests the drafting team remove the DP and LSE designation from Requirements R3 and R5 and develop separate requirements for the DP and LSE to comply with Operating Instructions to shed or shift load. By making this change, the requirements could be made clearer that the Operating Instructions that the DP and LSE receive from the TOP with respect to the defined term Operating Instruction, correspond to "impacting" the output of an Element of the BES (shed or shift load). Because the term Operating Instruction is tied to the BES, a standalone requirement is necessary to eliminate the ambiguity associated with entities with multiple registrations such as TOs who are also DP/LSE's that own BES equipment. It should be noted that this Standard does not apply to a Transmission Owner, but the field personnel who perform switching in substations of entities with both registration types are typically the same personnel. The level of Operating Instructions performed for multiple registration type (TO/DP/LSE) entities would be much more voluminous and burdensome due to the ownership of transmission equipment than the typical DP/LSE type entities for the same requirement. GTC believes the typical scenario the drafting team is considering is from a TOP control center to a DP/LSE dispatch center that

Organization	Yes or No	Question 1 Comment
		does not own BES equipment, but can impact the output of an Element of the BES (by shedding or shifting load). GTC urges the drafting team to consider this additional exposure of field personnel of TO/DP entities that switch in transmission substations to which the standard does not apply. Per discussions with Standard Drafting Team members and industry personnel, the scenario for DP/LSE's to receive Operating Instructions are limited to load shed or shift scenarios to preserve the reliability of the BES by the defined term associated with "impacting" the output of an Element of the BES. Exposing these multiple registration type entities to a set of mandatory standard requirements to which they do not apply such as those TOs and DPs identified above, demonstrates the potential flaw with the current language. With the following changes made to the requirements, GTC would be comfortable voting affirmative on this standard: o Each Distribution Provider and Load Serving Entity shall comply with each Operating Instruction issued by its Transmission Operator to shed or shift load, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. o Each Distribution Provider and Load Serving Entity shall comply with each Operating Instruction issued by its Balancing Authority to shed load or shift load, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. (2) Please note that M1 should be changed from "ensure" to "address" to match R1. (3) Part 10.1.3 and 10.2.3's reference to "Non-BES facilities" is outside the scope of reliability standards. Reliability standards are applicable to the BES, which would be Facilities. Refer to NERC's memo dated April 10, 2012 with respect to use of the term BES in Reliability Standards. The revised BES definition addresses Elements and Facilities that should be subject to the reliability standards through the BES exception process. Although the TOP will monitor Non-BES facilities in practice, there is no reason to include non-

Organization	Yes or No	Question 1 Comment
		BES Elements in the requirement subject to mandatory enforcement. Parts 10.1.3 and 10.2.3 that reference “non-BES facilities” should be struck.
Response: 1) Functional Model v5 determines what entities a Transmission Operator or Balancing Authority can issue Operating Instructions to and what those Operating Instructions can contain. Furthermore, the SDT believes that it would be counter-productive to set up individual requirements for entities that address specific types of operating Instructions. The resultant standard would be voluminous and impossible to understand. No change made. 2) The SDT has corrected the Measure. 3) The SDT has made several changes to the language of the requirement for clarity. Requirement R10, Parts 10.1.3 and 10.2.3 have been deleted. The SDT believes that non-BES facilities are already handled in the Reliability Standards. If a non-BES facility impacts the BES, such as by contributing to an SOL or IROL, then the SDT expects that facility to be incorporated into the BES through the official BES Exception Process and it would be covered in Requirement R10, Parts 10.1 and 10.2 by use of the defined term ‘Facilities’. If non-BES facilities do not impact the BES but are needed for completing models, then the SDT believes the situation is already covered in approved FAC-011-2, Requirement R3, Parts 3.1 and 3.4 which mandate that the Reliability Coordinator include external areas and the level of detail needed in models for determining SOLs within its established SOL methodology.		
Liberty Electric Power	No	The standard does not contain a requirement for the TO to identify the Operating Instruction as a reliablity instruction as opposed to a market instruction.
Response: Operating Instruction is a defined term and is used in this standard in that context. No change made.		
Manitoba Hydro	No	Manitoba Hydro agrees with changing the term “ensure” to “address” throughout the standard, however in M1 the term “ensure” remains even though its associated requirement R1 has “address”. We believe the intent was to replace “ensure” with “address” as it is in M2. In Pages 15 and 16 of TOP-001-3, Table of Compliance Elements, “Operations Planning” in the Time Horizon column of R1 through R6 should be deleted because they were deleted in Requirements R1 through R6.

Organization	Yes or No	Question 1 Comment
Response: The SDT has corrected Measure M1. This change was already made in the previously posted version. No change made.		
Lincoln Electric System	No	For smaller entities that do not own or operate a state estimator, the Real-time Assessment required in R13 would be overly burdensome, if not impossible, to meet internally. Although the drafting team indicates a third-party service may be utilized in lieu of an internal system, smaller entities would be wholly reliant on a third-party in order to maintain compliance with R13. This is of particular concern when considering that if a Protection System status were to change unexpectedly on a smaller entity's system, that entity would be expected to notify a third-party and then have that third-party perform a modified contingency analysis, pending availability, all within 30 minutes. Rather than treat all TOPs the same without consideration for size or risk to the BES, recommend that, at a minimum, the timeframe for conducting the Real-time Assessments be expanded or else allow the individual TOPs to establish the timeframe.
Response: The suggested language change to Requirement R13 presents ambiguity and is not measurable. There are many different ways for an entity to perform a Real-time Assessment. A small entity may be able to come up with any number of suitable methods that would not involve using Real-time Contingency Analysis. For example, the Reliability Coordinator or adjacent Transmission Operators could provide this service and data links should already be in place with these entities to comply with other requirements. No change made.		
CenterPoint Energy Houston Electric LLC	No	R1. - CenterPoint Energy agrees with the addition of "...direct actions or by issuing Operating Instructions" as well as using 'address' rather than 'ensure', however CenterPoint Energy prefers the manner in which the previous R1 was drafted. CenterPoint Energy suggests the following language: "Each Transmission Operator shall take direct actions or issue Operating Instructions to address the reliability of its Transmission Operator Area."

Organization	Yes or No	Question 1 Comment
		R10.2 - CenterPoint Energy strongly disagrees with the addition of 10.2 into the TOP Standards, specifically “neighboring Transmission Operator Areas”. CenterPoint Energy agrees with the Functional Model that it is the Reliability Coordinator’s responsibility to monitor the wide area. In addition, CenterPoint Energy believes the SDT has overreached in its interpretation of paragraph 60 of the NOPR. CenterPoint Energy’s reading of paragraph 60 finds vague references to monitoring and analysis capabilities but no specific directives to expand the TOP’s view into another TOP Area. Also, CenterPoint Energy is concerned this will create confusion among registered entities as to who exactly has the responsibility to monitor and take action. As long as R10.2 remains CenterPoint Energy cannot support the proposed Standard and therefore strongly recommends the SDT delete R10.2. R13. - CenterPoint Energy agrees that a Real-Time Assessment (RTA) should be run every 30 minutes, however the Company is concerned that events could occur that are outside of the Transmission Operator's control (Ex. Loss of ICCP data) that may prevent the Transmission Operator from performing a RTA as required; therefore there should be a caveat as to when exceeding the 30 minutes is allowed. CenterPoint Energy recommends the following language: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. In instances where a Real-Time Assessment cannot be performed (i.e. loss of ICCP data) the TOP shall take immediate action to restore Real-Time Assessment functionality. R14. - CenterPoint Energy suggests changing Operating Plan to Operating Plan(s).
Response: Requirement R1 has been changed due to comments received to provide additional clarity. See summary for language.		

Organization	Yes or No	Question 1 Comment
The SDT has changed the language of the requirement due to comments received. See summary for language. The SDT has clarified what it intended by monitoring in the revised language. The SDT believes that the suggested language is unnecessary. Obviously, a Transmission Operator is going to work as quickly as possible to restore functionality as it is in its best interests to do so. Loss of ICCP data is a major concern. Other standards point to redundancy for these situations that could alleviate the concern. Approved EOP-008-1, Requirement R1, Part 1.6.2 deals with what needs to happen due to loss of functionality. That requirement states that an entity is still responsible for managing the risk during such a situation. The SDT believes that ensuring that a Real-time Assessment is performed at least once every 30 minutes is not unrealistic or overly burdensome in today's operating environment. This is also consistent with approved IRO-008-1, Requirement R2. No change made. The SDT believes that the inclusion of guidance on what an Operating Plan should be in this situation as shown in Section F addresses the concern. No change made.		
HHWP	No	R16 states: "Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance of its monitoring, telecommunication, and analysis capabilities." Organizations should be free to designate its preferred method for approving planned outages of data equipment. This requirement imposes on all TOPs single process for data system outage approval. The requirement should be results based on not proscriptive of the method to achieve those results. This is a huge step backwards in the development of rational reliability requirements.
Response: The SDT believes that the requirement is written with sufficient flexibility to allow an entity to determine how to implement it and does not see how the requirement is overly prescriptive. The measure for this requirement does not specify a particular process or solution. No change made.		
American Transmission Company, LLC	Yes	ATC agrees with the changes to the proposed TOP-001-3, however, ATC recommends that Requirement R9 be modified by replacing "sustained" with "planned or sustained." This modification will provide clarity to the

Organization	Yes or No	Question 1 Comment
		requirement and align with comments made by the SDT during the October 16th TOP/IRO webinar that planned outages were in view.
Response: The SDT agrees that a change is required and has modified the language accordingly. See summary for language.		
Tri-State Generation and Transmission Association, Inc.	Yes	There was the addition of "sustained" for clarification in requirement R9. Tri-State wonders if the SDT meant to use the defined term "Sustained Outage" in this requirement or if they did not intend to use that defined term?
Response: The SDT did not intend to use the defined term, thus the lack of capitalization. The defined term applies only to Transmission outages which is not the condition here. The SDT has added a time element to the requirement language based on received comments. See summary for language.		
Central Lincoln People's Utility District		Central Lincoln recently participated in a load shedding drill led by our Host BA/TOP. The single most glaring problem we saw was one of validation. In the past we had always thought we would validate an R3 Directive or Operating Instruction by calling the TOP back at a known phone number. Our TOP informed us that such a validation method would not be possible during a real event, since all phones and switchboards would likely be busy. While objecting to our validation method, the TOP has failed to offer a suitable one. This leaves Central Lincoln with the choice of responding to an Operating Instruction to shed load coming from a scammer who has easy access TOP-001 on line, or risking a possible violation. Suggest the SDT begin looking at the question of validation, since without a validation method R3 poses a greater risk to reliability than it addresses.
Response: Communications is a concern for COM standards. For operating standards, such as the TOP standards, communication is considered to already be in place. The SDT suggests working with your Transmission Operator and Reliability Coordinator to work toward an acceptable resolution. Multiple technology options exist to address your concern. No change made.		

Organization	Yes or No	Question 1 Comment
DTE Electric Co.	Yes	We support the changes and have no concerns/comments to add.
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	Yes	
American Electric Power	Yes	
South Carolina Electric & Gas	Yes	

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted for comment February 21, 2014 to March 24, 2014

First posting May 19, 2014 to July 2, 2014

Second posting August 6, 2014 to September 19, 2014

Third posting October 10, 2014 to November 10, 2014

Proposed Action Plan and Description of Current Draft

This is the fourth posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date
Final ballot	January 2014
Presentation to the NERC Board of Trustees for adoption	January 2014

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
1a	May 12, 2010	Added Appendix 1 – Interpretation of R8 approved by Board of Trustees on May 12, 2010	Interpretation
1a	September 15, 2011	FERC Order issued approved the Interpretation of R8 (FERC Order became effective November 21, 2011)	Interpretation
2	May 6, 2012	Revised under Project 2007-03	Revised
2	May 9, 2012	Adopted by Board of Trustees	Revised
3	TBD	Revisions under Project 2014-03	Revised

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Rationale - The definition for Reliability Directive is not needed due to the work in proposed COM-002-4 on the definition of Operating Instruction (see NOPR paragraph 64).

Real-time Assessment - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

Operational Planning Analysis - An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Transmission Operations**
2. **Number: TOP-001-3**
3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Interconnection by ensuring prompt action to prevent or mitigate such occurrences.
4. **Applicability:**

    4.1. Balancing Authority

    4.2. Transmission Operator

    4.3. Generator Operator

    4.4. Distribution Provider

    4.5.

5. **Effective Date:**

    See Implementation Plan.

6. **Background:**

    See Project 2014-03 project page.

B. Requirements and Measures

Rationale: The NERC Glossary term Reliability Directive has been replaced throughout by Operating Instruction. The new definition covers the Project 2014-03 SDT intent.

New Requirements R1 and R2 added in response to IERP Report recommendations.

R1. Each Transmission Operator shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions. *[Violation Risk Factor: High][Time Horizon: Same-Day Operations, Real-time Operations]*

M1. Each Transmission Operator shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions.

R2. Each Balancing Authority shall act to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions. *[Violation Risk Factor: High][Time Horizon: Same-Day Operations, Real-time Operations]*

M2. Each Balancing Authority shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions.

Rationale for Requirement R3: Additional phrasing 'cannot be physically implemented' included for consistency with proposed IRO-001-4, Requirement R2. This term means that a Transmission Operator may request something to be done that is not physically possible due its lack of knowledge of the system involved.

R3. Each Balancing Authority, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]*

M3. Each Balancing Authority, Generator Operator, and Distribution Provider shall make available upon request, evidence that it complied with each Operating Instruction issued by the Transmission Operator(s) unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the Balancing Authority, Generator Operator, and Distribution Provider shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Transmission Operator's Operating Instruction. If such a situation has not occurred, the Balancing Authority, Generator Operator, or Distribution Provider may provide an attestation.

R4. Each Balancing Authority, Generator Operator, and Distribution Provider shall inform its Transmission Operator of its inability to comply with an Operating Instruction issued by its Transmission Operator. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]*

M4. Each Balancing Authority, Generator Operator, and Distribution Provider shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Transmission Operator of its inability to comply with its Operating Instruction issued. If such a situation has not occurred, the Balancing Authority, Generator Operator, or Distribution Provider may provide an attestation.

Rationale: Requirements R5 and R6 added for consistency with requirements applying to Transmission Operators. Entity list compiled from Functional Model v5 items 27 and 28 for Balancing Authority.

R5. Each Transmission Operator, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Balancing Authority, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]*

M5. Each Transmission Operator, Generator Operator, and Distribution Provider shall make available upon request, evidence that it complied with each Operating Instruction issued by the Balancing Authority(s) unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the Transmission Operator, Generator Operator, and Distribution Provider shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Balancing Authority's Operating

Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, or Distribution Provider may provide an attestation.

R6. Each Transmission Operator, Generator Operator, and Distribution Provider shall inform its Balancing Authority of its inability to comply with an Operating Instruction issued by that Balancing Authority. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]*

M6. Each Transmission Operator, Generator Operator, and Distribution Provider shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Balancing Authority of its inability to comply with its Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, or Distribution Provider may provide an attestation.

Rationale for Requirement R7: 'Emergency' deleted as the assistance is assistance in response to the other entities' emergency. 'This changes is in response to the Independent Experts Review Panel (IERP) recommendations. Any request for assistance from Transmission Operator A to Transmission Operator B in another Reliability Coordinator Area would be coordinated with its respective Reliability Coordinators to assure a wide-area view is being applied to the situation.

R7. Each Transmission Operator shall assist other Transmission Operators within its Reliability Coordinator Area, if requested and able, provided that the requesting Transmission Operator has implemented its comparable Emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

M7. Each Transmission Operator shall make available upon request, evidence that comparable requested assistance, if able, was provided to other Transmission Operators within its Reliability Coordinator Area unless such assistance could not be physically implemented or would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic

communications, or other equivalent evidence in electronic or hard copy format. If no request for assistance was received, the Transmission Operator may provide an attestation.

Rationale for Requirement R8: Original Requirement R3 has been merged with original Requirement R5 in response to concerns raised in NOPR paragraphs 80 -83 to have consistent terminology and actions across all time horizons.

R8. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-Time Operations]*

M8. Each Transmission Operator shall make available upon request, evidence that it informed its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If no such situations have occurred, the Transmission Operator may provide an attestation.

Rationale for Requirement R9: Additional terms added in response to SW Outage Report recommendation 15.

R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and known impacted interconnected entities of all planned outages, and unplanned outages of 30 minutes or more, for telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-Time Operations]*

M9. Each Balancing Authority and Transmission Operator shall make available upon request, evidence that it notified its Reliability Coordinator and known impacted interconnected entities of all planned outages, and unplanned outages of 30 minutes or more, for telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Balancing Authority or Transmission Operator may provide an attestation.

Rationale for Requirement R10: New proposed Requirement R10 is derived from approved IRO-003-2, Requirement R1, adapted to the Transmission Operator Area. This new requirement is in response to NOPR paragraph 60 concerning monitoring capabilities for the Transmission Operator. New Requirement R11 covers the Balancing Authorities. Monitoring of external systems can be accomplished via data links.

R10. Each Transmission Operator shall perform the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

10.1. Within its Transmission Operator Area, monitor Facilities and the status of Special Protection Systems, and

10.2. Outside its Transmission Operator Area, obtain and utilize status, voltages, and flow data for Facilities and the status of Special Protection Systems.

M10. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitored or obtained and utilized status, voltages, and flow data for Facilities and the status of Special Protection Systems as required to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area.

R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain Load-interchange balance within its Balancing Authority Area and support Interconnection frequency. *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

M11. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitors its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.

R12. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M12. Each Transmission Operator shall make available evidence to show that for any occasion in which it operated outside any identified Interconnection Reliability Operating Limit (IROL), the continuous duration did not exceed its associated IROL T_V. Such evidence could include but is not limited to dated computer logs or reports in electronic or hard copy format specifying the date, time, duration, and details of the excursion. If such a situation has not occurred, the Transmission Operator may provide an attestation that an event has not occurred.

Rationale for Requirement R13: The new Requirement R13 is in response to NOPR paragraphs 55 and 60 concerning Real-time analysis responsibilities for Transmission Operators and is copied from approved IRO-008-1, Requirement R2.

R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M13. Each Transmission Operator shall have, and make available upon request, evidence to show it ensured that a Real-Time Assessment was performed at least once every 30 minutes. This evidence could include but is not limited to dated computer logs showing times the assessment was conducted, dated checklists, or other evidence.

Rationale for Requirement R14: The original Requirement R8 was deleted and original Requirements R9 and R11 were revised in order to respond to NOPR paragraph 42 which raised the issue of handling all SOLs and not just a sub-set of SOLs. The SDT has developed a white paper on SOL exceedances that explains its intent on what needs to be contained in such an Operating Plan. These Operating Plans are developed and documented in advance of Real-time and may be developed from Operational Planning Assessments required per proposed TOP-002-4 or other assessments. Operating Plans could be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an Operational Planning Assessment or a Real-time Assessment. The intent is not to have a 1,000 page document with every possible Contingency cited but to have a plan and philosophy that can be followed by an operator.

R14. Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M14. Each Transmission Operator shall have evidence that it initiated its Operating Plan for mitigating SOL exceedances identified as part of its Real-time monitoring or Real-time Assessments. This evidence could include but is not limited to dated computer logs showing times the Operating Plan was initiated, dated checklists, or other evidence.

R15. Each Transmission Operator shall inform its Reliability Coordinator of actions taken to return the System to within limits when a SOL has been exceeded. *[Violation Risk Factor: Medium] [Time Horizon: Real-Time Operations]*

M15. Each Transmission Operator shall make available evidence that it informed its Reliability Coordinator of actions taken to return the System to within limits when a SOL was exceeded. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, or dated computer printouts. If such a situation has not occurred, the Transmission Operator may provide an attestation.

Rationale for Requirements R16 and R17: In response IERP Report recommendation 3 on authority.

R16. Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance of its telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M16. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Transmission Operator has provided its System Operators with the authority to approve planned outages and maintenance of telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities.

R17. Each Balancing Authority shall provide its System Operators with the authority to approve planned outages and maintenance of its telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M17. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Balancing Authority has provided its System Operators with the authority to approve planned outages and maintenance of its telemetering

Rationale for Requirement R18: Moved from approved IRO-005-3.1a, Requirement R10. Transmission Service Provider, Distribution Provider, Load-Serving Entity, Generator Operator, and Purchasing-Selling Entity deleted as those entities will receive instructions on limits from the responsible entities cited in the requirement. Note – Derived limits replaced by SOLs for clarity and specificity. SOLs include voltage, Stability, and thermal limits and are thus the most limiting factor.

and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities.

R18. Each Transmission Operator shall operate to the most limiting parameter in instances where there is a difference in SOLs. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M18. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to operator logs, voice recordings, electronic communications, or equivalent evidence that will be used to determine if it operated to the most limiting parameter in instances where there is a difference in SOLs.

Rationale for Requirements R19 and R20 added for consistency with proposed IRO-002-4, Requirement R1. Data exchange capabilities are required to support the data specification concept in proposed TOP-003-3.

R19. Each Transmission Operator shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Transmission Operator Area. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M19. Each Transmission Operator shall have, and provide upon request, evidence that could include, but is not limited to, operator logs, system specifications, or other evidence that it has data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Transmission Operator Area.

R20. Each Balancing Authority shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Balancing Authority Area. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M20. Each Balancing Authority shall have, and provide upon request, evidence that could include, but is not limited to, operator logs, system specifications, or other evidence that it has data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Balancing Authority Area.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider shall each keep data or evidence for each applicable Requirement R1 through R11, and R15 through R20 and Measure M1 through M11, and M15 through M20 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of ninety calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

Each Transmission Operator shall retain evidence for three calendar years of any occasion in which it has exceeded an identified IROL and its associated IROL T_v as specified in Requirement R12 and Measure M12 and that it initiated its Operating Plan to mitigate a SOL exceedance as specified in Requirement R14 and Measurement M14.

Each Transmission Operator shall keep data or evidence for Requirement R13 and Measure M13 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Balancing Authority, Transmission Operator, Generator Operator, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Transmission Operator failed to act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions.
R2	Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Balancing Authority failed to act to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions.
R3	Same-Day Operations, Real-Time Operations	High	N/A	N/A	N/A	The responsible entity did not comply with an Operating Instruction issued by the Transmission Operator, and such action could have been physically implemented and would not have violated safety, equipment, regulatory, or statutory requirements.
R4	Same-Day Operations, Real-Time Operations	High	N/A	N/A	N/A	The responsible entity did not inform its Transmission Operator of its inability to comply with an Operating Instruction issued by its Transmission Operator.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The responsible entity did not comply with an Operating Instruction issued by the Balancing Authority, and such action could have been physically implemented and would not have violated safety, equipment, regulatory, or statutory requirements.
R6	Same-Day Operations, Real-Time Operations	High	N/A	N/A	N/A	The responsible entity did not inform its Balancing Authority of its inability to comply with an Operating Instruction issued by that Balancing Authority.
R7	Real-Time Operations	High	N/A	N/A	N/A	The Transmission Operator did not provide comparable assistance to other Transmission Operators within its Reliability Coordinator Area, when requested and able, and the requesting entity had implemented its Emergency procedures, and such actions could have been physically implemented and would not have violated safety, equipment, regulatory, or statutory requirements.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
For the Requirements R8 and R9 VSLs only, the intent of the SDT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.						
R8	Operations Planning, Same-Day Operations, Real-Time Operations	High	The Transmission Operator did not inform one known impacted Transmission Operator or 5% or less of the known impacted other Transmission Operators, whichever is greater, of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas when conditions did permit such communications. OR, The Transmission Operator did not inform one known	The Transmission Operator did not inform two known impacted Transmission Operators or more than 5% and less than or equal to 10% of the known impacted other Transmission Operators, whichever is greater, of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas when conditions did permit such communications. OR, The Transmission Operator did not inform two known	The Transmission Operator did not inform three known impacted Transmission Operators or more than 10% and less than or equal to 15% of the known impacted other Transmission Operators, whichever is greater, of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas when conditions did permit such communications. OR, The Transmission Operator did not inform three known impacted Balancing Authorities or more than 10% and less than or equal to 15% of	The Transmission Operator did not inform its Reliability Coordinator of its actual or expected operations that resulted in, or could have resulted in, an Emergency on those respective Transmission Operator Areas when conditions did permit such communications. OR The Transmission Operator did not inform four or more known impacted Transmission Operators or more than 15% of the known impacted Transmission Operators of its actual or expected operations that resulted in, or could have resulted in, an Emergency on those respective Transmission Operator Areas when conditions did permit such communications. OR,

The Balancing Authority did not have data exchange capabilities with two identified entities, or more than 5% or less than or equal to 10% of the applicable entities, whichever is greater.	The Balancing Authority did not have data exchange capabilities with three identified entities, or more than 10% or less than or equal to 15% of the applicable entities, whichever is greater.	The Balancing Authority did not have data exchange capabilities with four or more identified entities or greater than 15% of the applicable entities, whichever is greater.

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

URL for SOL Exceedance White Paper to be placed here when final location is available.

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific SOL or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures, including electronic data exchange, which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator’s disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific SOL or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible SOL or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those SOLs or IROLs, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day SOL or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of “the Operating Plan document” for compliance purposes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

SAR posted for comment February 21, 2014 to March 24, 2014

First posting May 19, 2014 to July 2, 2014

Second posting August 6, 2014 to September 19, 2014

Third posting October 10, 2014 to November 10, 2014

Proposed Action Plan and Description of Current Draft

This is the ~~third~~fourth posting of the revised standard under Project 2014-03 Revisions to the TOP/IRO Reliability Standards. The SDT is working under a deadline for filing the revised standards with FERC of January 31, 2015.

Anticipated Actions	Anticipated Date
Final ballot	~~October~~January 2014
Presentation to the NERC Board of Trustees for adoption~~BOT~~	~~November~~January 2014

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
1a	May 12, 2010	Added Appendix 1 – Interpretation of R8 approved by ~~BOT~~ Board of Trustees on May 12, 2010	Interpretation
1a	September 15, 2011	FERC Order issued approved the Interpretation of R8 (FERC Order became effective November 21, 2011)	Interpretation
2	May 6, 2012	Revised under Project 2007-03	Revised
2	May 9, 2012	Adopted by Board of Trustees	Revised
3	TBD	Revisions under Project 2014-03	Revised

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Rationale - The definition for Reliability Directive is not needed due to the work in proposed COM-002-4 on the definition of Operating Instruction (see NOPR paragraph 64).

Real-time Assessment - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Rationale - Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

Operational Planning Analysis - An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title: Transmission Operations**
2. **Number: TOP-001-3**
3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Interconnection by ensuring prompt action to prevent or mitigate such occurrences.
4. **Applicability:**
   4.1. Balancing Authority
   4.2. Transmission Operator
   4.3. Generator Operator
   4.4. Distribution Provider
   4.5. ~~Load-Serving Entity~~
5. **Effective Date:**
   See Implementation Plan.
6. **Background:**
   See Project 2014-03 project page.

B. Requirements and Measures

Rationale: The NERC Glossary term Reliability Directive has been replaced throughout by Operating Instruction. The new definition covers the Project 2014-03 SDT intent.

New Requirements R1 and R2 added in response to IERP Report recommendations.

R1. Each Transmission Operator shall act to ~~address~~maintain the reliability of its Transmission Operator Area via ~~direct~~its own actions or by issuing Operating Instructions. *[Violation Risk Factor: High][Time Horizon: Same-Day Operations, Real-time Operations]*

M1. Each Transmission Operator shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to ~~ensure~~maintain the reliability of its Transmission Operator Area via ~~direct~~its own actions or by issuing Operating Instructions.

R2. Each Balancing Authority shall act to ~~address~~maintain the reliability of its Balancing Authority Area via ~~direct~~its own actions or by issuing Operating Instructions. *[Violation Risk Factor: High][Time Horizon: Same-Day Operations, Real-time Operations]*

M2. Each Balancing Authority shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to ~~address~~maintain the reliability of its Balancing Authority Area via ~~direct~~its own actions or by issuing Operating Instructions.

Rationale for Requirement R3: Additional phrasing 'cannot be physically implemented' included for consistency with proposed IRO-001-4, Requirement R2. This term means that a Transmission Operator may request something to be done that is not physically possible due its lack of knowledge of the system involved.

R3. Each Balancing Authority, Generator Operator, and Distribution Provider~~, and Load-Serving Entity~~ shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]*

M3. Each Balancing Authority, Generator Operator, and Distribution Provider~~, and Load-Serving Entity~~ shall make available upon request, evidence that it complied with each Operating Instruction issued by the Transmission Operator(s) unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the Balancing Authority, Generator Operator, and Distribution Provider~~, and Load-Serving Entity~~ shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Transmission Operator's Operating Instruction. If such a situation has not occurred, the Balancing Authority, Generator Operator, or Distribution Provider~~, or Load-Serving Entity~~ may provide an attestation.

R4. Each Balancing Authority, Generator Operator, and Distribution Provider~~, and Load-Serving Entity~~ shall inform its Transmission Operator of its inability to ~~perform~~comply with an Operating Instruction issued by its Transmission Operator. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]*

M4. Each Balancing Authority, Generator Operator, and Distribution Provider~~, and Load-Serving Entity~~ shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Transmission Operator of its inability to comply with its Operating Instruction issued. If such a situation has not occurred, the Balancing Authority, Generator Operator, or Distribution Provider~~, or Load-Serving Entity~~ may provide an attestation.

Rationale: Requirements R5 and R6 added for consistency with requirements applying to Transmission Operators. Entity list compiled from Functional Model v5 items 27 and 28 for Balancing Authority.

R5. Each Transmission Operator, Generator Operator, and Distribution Provider~~, and Load-Serving Entity~~ shall comply with each Operating Instruction issued by its Balancing Authority, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]*

M5. Each Transmission Operator, Generator Operator, and Distribution Provider~~, and Load-Serving Entity~~ shall make available upon request, evidence that it complied with each Operating Instruction issued by the Balancing Authority(s) unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the Transmission Operator, Generator Operator, and Distribution Provider~~, and Load-Serving Entity~~ shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Balancing Authority's Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, or Distribution Provider~~, or Load-Serving Entity~~ may provide an attestation.

R6. Each Transmission Operator, Generator Operator, and Distribution Provider~~, and Load-Serving Entity~~ shall inform its Balancing Authority of its inability to ~~perform~~comply with an Operating Instruction issued by that Balancing Authority. *[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]*

M6. Each Transmission Operator, Generator Operator, and Distribution Provider~~, and Load-Serving Entity~~ shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Balancing Authority of its inability to comply with its Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, or Distribution Provider~~, or Load-Serving Entity~~ may provide an attestation.

Rationale for Requirement R7: 'Emergency' deleted as the assistance is assistance in response to the other entities' emergency. '~~Comparable' deleted as it is impossible to measure comparability and the main concept is that the originating entity has implemented its emergency procedures.~~ Th~~ese~~is changes ~~are~~is in response to the Independent Experts Review Panel (IERP) recommendations. Any request for assistance from Transmission Operator A to Transmission Operator B in another Reliability Coordinator Area would be coordinated with its respective Reliability Coordinators to assure a wide-area view is being applied to the situation.

R7. Each Transmission Operator shall assist other Transmission Operators within its Reliability Coordinator Area, if requested and able, provided that the requesting ~~entity~~Transmission Operator has implemented its comparable Emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

M7. Each Transmission Operator shall make available upon request, evidence that comparable requested assistance, if able, was provided to other Transmission Operators within its Reliability Coordinator Area unless such assistance ~~cannot~~could not be physically implemented or would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic

communications, or other equivalent evidence in electronic or hard copy format. If no request for assistance was received, the Transmission Operator may provide an attestation.

Rationale for Requirement R8: Original Requirement R3 has been merged with original Requirement R5 in response to concerns raised in NOPR paragraphs 80 -83 to have consistent terminology and actions across all time horizons.

R8. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-Time Operations]*

M8. Each Transmission Operator shall make available upon request, evidence that it informed its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If no ~~Emergency has~~such situations have occurred, the Transmission Operator may provide an attestation.

Rationale for Requirement R9: Additional terms added in response to SW Outage Report recommendation 15. ~~The term 'sustained' was added to the requirement to indicate that notification is not required for momentary events.~~

R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and known impacted interconnected entities of all planned outages, and unplanned ~~sustained~~ outages of 30 minutes or more, for telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-Time Operations]*

M9. Each Balancing Authority and Transmission Operator shall make available upon request, evidence that it notified its Reliability Coordinator and known impacted interconnected entities of all planned outages, and unplanned ~~sustained~~ outages of 30 ~~continuous~~ minutes or more, for telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Balancing Authority or Transmission Operator may provide an attestation.

Rationale for Requirement R10: New proposed Requirement R10 is derived from approved IRO-003-2, Requirement R1, adapted to the Transmission Operator Area. This new requirement is in response to NOPR paragraph 60 concerning monitoring capabilities for the Transmission Operator. New Requirement R11 covers the Balancing Authorities. Monitoring of external systems can be accomplished via data links.

R10. Each Transmission Operator shall ~~monitor~~~~do~~perform the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

10.1. Within its Transmission Operator Area, monitor Facilities and the status of Special Protection Systems~~:~~, and

~~Facilities,~~

~~The status of Special Protection Systems, and~~

~~Non-BES facilities identified as necessary by the Transmission Operator and~~

10.2. ~~Within neighboring~~Outside its Transmission Operator Area,~~s identified as necessary by the Transmission Operator~~ obtain and utilize status, voltages, and flow data for Facilities and the s~~S~~tatus of Special Protection Systems.~~:~~

~~Facilities,~~

~~Status of Special Protection Systems, and~~

~~Non-BES facilities.~~

M10. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitor~~s~~ed or obtained and utilized status, voltages, and flow data for Facilities~~,~~ and the status of Special Protection Systems~~, and non-BES facilities~~ as required to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area.

R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order ~~for it~~ to maintain ~~be able to perform its reliability functions~~ Load-interchange balance within its Balancing Authority Area and support Interconnection frequency. *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

M11. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to Energy Management ~~s~~System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitors its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order ~~for it~~ to ~~be able to perform its reliability functions~~ maintain Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.

R12. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M12. Each Transmission Operator shall make available evidence to show that for any occasion in which it ~~has~~ operated outside any identified Interconnection Reliability Operating Limit (IROL), ~~for a~~the continuous duration did not exceed~~ing~~ its associated IROL T_v. Such evidence could include but is not limited to dated computer logs or reports in electronic or hard copy format specifying the date, time, duration, and details of the excursion. If such a situation has not occurred, the Transmission Operator may provide an attestation that an event has not occurred.

Rationale for Requirement R13: The new Requirement R13 is in response to NOPR paragraphs 55 and 60 concerning Real-time analysis responsibilities for Transmission Operators and is copied from approved IRO-008-1, Requirement R2.

R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M13. Each Transmission Operator shall have, and make available upon request, evidence to show it ensured that a Real-Time Assessment was performed at least once every 30 minutes. This evidence could include but is not limited to dated computer logs showing times the assessment was conducted, dated checklists, or other evidence.

Rationale for Requirement R14: The original Requirement R8 was deleted and original Requirements R9 and R11 were revised in order to respond to NOPR paragraph 42 which raised the issue of handling all SOLs and not just a sub-set of SOLs. The SDT has developed a white paper on SOL exceedances that explains its intent on what needs to be contained in such an Operating Plan. These Operating Plans are developed and documented in advance of Real-time and may be developed from Operational Planning Assessments required per proposed TOP-002-4 or other assessments. Operating Plans could be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an Operational Planning Assessment or a Real-time ~~-~~Assessment. The intent is not to have a 1,000 page document with every possible Contingency cited but to have a plan and philosophy that can be followed by an operator.

R14. Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

M14. Each Transmission Operator shall have evidence that it initiated its Operating Plan for mitigating SOL exceedances identified as part of its Real-time monitoring or Real-time Assessments. This evidence could include but is not limited to dated computer logs showing times the Operating Plan was initiated, dated checklists, or other evidence.

R15. Each Transmission Operator shall inform its Reliability Coordinator of actions taken to return the ~~s~~System to within limits when a SOL has been exceeded. *[Violation Risk Factor: Medium] [Time Horizon: Real-Time Operations]*

M15. Each Transmission Operator shall make available evidence that it informed its Reliability Coordinator of actions taken to return the ~~s~~System to within limits when a SOL was exceeded. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, or dated computer printouts. If such a situation has not occurred, the Transmission Operator may provide an attestation.

Rationale for Requirements R16 and R17: In response IERP Report recommendation 3 on authority.

R16. Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance of its ~~monitoring, telecommunication, and analysis capabilities~~ telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M16. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Transmission Operator has provided its System Operators with the authority to approve planned outages and maintenance of ~~its monitoring, telecommunication, and analysis capabilities~~ telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities.

R17. Each Balancing Authority shall provide its System Operators with the authority to approve planned outages and maintenance of its ~~monitoring, telecommunications, and analysis capabilities~~ telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M17. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Balancing Authority has provided its System Operators with the authority to approve planned outages and maintenance of its ~~monitoring, telecommunications, and analysis capabilities~~ telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities.

Rationale for Requirement R18: Moved from approved IRO-005-3.1a, Requirement R10. Transmission Service Provider, Distribution Provider, Load-Serving Entity, Generator Operator, and Purchasing-Selling Entity deleted as those entities will receive instructions on limits from the responsible entities cited in the requirement. Note – Derived limits replaced by SOLs for clarity and specificity. SOLs include voltage, Stability, and thermal limits and are thus the most limiting factor.

R18. Each Transmission Operator shall operate to the most limiting parameter in instances where there is a difference in SOLs. [*Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M18. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to operator logs, voice recordings, electronic communications, or equivalent evidence that will be used to determine if it operated to the most limiting parameter in instances where there is a difference in SOLs.

Rationale for Requirements R19 and R20 added for consistency with proposed IRO-002-4, Requirement R1. Data exchange capabilities are required to support the data specification concept in proposed TOP-003-3.

R19. Each Transmission Operator shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Transmission Operator Area. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M19. Each Transmission Operator shall have, and provide upon request, evidence that could include, but is not limited to, operator logs, system specifications, or other evidence that it has data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Transmission Operator Area.

R20. Each Balancing Authority shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Balancing Authority Area. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M20. Each Balancing Authority shall have, and provide upon request, evidence that could include, but is not limited to, operator logs, system specifications, or other evidence that it has data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Balancing Authority Area.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Compliance Monitoring and Assessment Processes

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Assessment Processes" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider~~, and Load-Serving Entity~~ shall each keep data or evidence for each applicable Requirement R1 through R11, and R1~~4~~5 through R20 and Measure M1 through M11, and M1~~4~~5 through M20 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of ninety calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

Each Transmission Operator shall retain evidence for three calendar years of any occasion in which it has exceeded an identified IROL and its associated IROL T_v as specified in Requirement R12 and Measure M12 and that it initiated its Operating Plan to mitigate a SOL exceedance as specified in Requirement R14 and Measurement M14.

Each Transmission Operator shall ~~each~~ keep data or evidence for Requirement R13 and Measure M13 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Balancing Authority, Transmission Operator, Generator Operator, or Distribution Provider~~, or Load-Serving Entity~~ is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Transmission Operator failed to act to ~~address~~maintain the reliability of its Transmission Operator Area via ~~direct~~its own actions or by issuing Operating Instructions.
R2	Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The Balancing Authority failed to act to ~~address~~maintain the reliability of its Balancing Authority Area via ~~direct~~its own actions or by issuing Operating Instructions.
R3	Same-Day Operations, Real-Time Operations	High	N/A	N/A	N/A	The responsible entity did not comply with an Operating Instruction issued by the Transmission Operator, and such action could have been physically implemented and would not have violated safety, equipment, regulatory, or statutory requirements.
R4	Same-Day Operations, Real-Time Operations	High	N/A	N/A	N/A	The responsible entity did not inform its Transmission Operator of its inability to ~~perform~~comply with an

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						Operating Instruction issued by its Transmission Operator.
R5	Same-Day Operations, Real-time Operations	High	N/A	N/A	N/A	The responsible entity did not comply with an Operating Instruction issued by the Balancing Authority, and such action could have been physically implemented and would not have violated safety, equipment, regulatory, or statutory requirements.
R6	Same-Day Operations, Real-Time Operations	High	N/A	N/A	N/A	The responsible entity did not inform its Balancing Authority of its inability to ~~perform~~comply with an Operating Instruction issued by that Balancing Authority.
R7	Real-Time Operations	High	N/A	N/A	N/A	The Transmission Operator did not provide comparable assistance to other Transmission Operators within its Reliability Coordinator Area, when requested and able, and the requesting entity had implemented its Emergency procedures, and such actions could have been physically implemented and would not have violated

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						safety, equipment, regulatory, or statutory requirements.
For the Requirements R8 and R9 VSLs only, the intent of the SDT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.						
R8	Operations Planning, Same-Day Operations, Real-Time Operations	High	The Transmission Operator did not inform one known impacted Transmission Operator or 5% or less of the known impacted other Transmission Operators, whichever is greater, of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas when conditions did permit such communications. OR,	The Transmission Operator did not inform two known impacted Transmission Operators or more than 5% and less than or equal to 10% of the known impacted other Transmission Operators, whichever is greater, of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas when conditions did permit such communications. OR,	The Transmission Operator did not inform three known impacted Transmission Operators or more than 10% and less than or equal to 15% of the known impacted other Transmission Operators, whichever is greater, of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas when conditions did permit such communications. OR, The Transmission Operator did not inform three known impacted Balancing Authorities or	The Transmission Operator did not inform its Reliability Coordinator of its actual or expected operations that resulted in, or could have resulted in, an Emergency on those respective Transmission Operator Areas when conditions did permit such communications. OR The Transmission Operator did not inform four or more ~~other~~ known impacted Transmission Operators or more than 15% of the known impacted ~~other~~ Transmission Operators of its actual or expected operations that resulted in, or could have resulted in, an Emergency on those respective Transmission Operator Areas when conditions did permit such communications.

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific SOL or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures, including electronic data exchange, which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator's disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific SOL or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible SOL or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those SOLs or IROLs, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day SOL or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of "the Operating Plan document" for compliance purposes.

Implementation Plan

Project 2014-03 Revisions to TOP/IRO Reliability Standards

Requested Approvals

- TOP-001-3 Transmission Operations
- TOP-002-4 Operations Planning
- TOP-003-3 Operational Reliability Data
- IRO-001-4 Reliability Coordination - Responsibilities and Authorities
- IRO-002-4 Reliability Coordination — Analysis Tools
- IRO-008-2 Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-010-2 Reliability Coordinator Data Specification and Collection
- IRO-014-3 Coordination Among Reliability Coordinators
- IRO-017-1 Outage Coordination

Requested Retirements (two groups of standards)

    - TOP-002—2.1b Normal Operations Planning
    - TOP-003-1 Planned Outage Coordination
    - TOP-004-2 Transmission Operations
    - TOP-005-2a Operational Reliability Information
    - TOP-006-2 Monitoring System Conditions
    - TOP-007-0 Reporting System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) Violations
    - TOP-008-1 Response to Transmission Limit Violations
    - IRO-001-1.1 Reliability Coordination — Responsibilities and Authorities
    - IRO-002-2 Reliability Coordination — Facilities
    - IRO-003-2 Reliability Coordination – Wide Area View
    - IRO-004-2 Reliability Coordination – Operations Planning
    - IRO-005-3.1a Reliability Coordination — Current Day Operations
    - IRO-008-1 Reliability Coordinator Operational Analyses and Real-time Assessments
    - IRO-010-1a Reliability Coordinator Data Specification and Collection
    - IRO-014-1 Coordination Among Reliability Coordinators
    - IRO-015-1 Notifications and Information Exchange Between Reliability Coordinators
    - IRO-016-1 Coordination of Real-time Activities Between Reliability Coordinators
    - PER-001-0.2 Operating Personnel Responsibility and Authority

2. **Filed with FERC but not approved** – these standards were filed with FERC but never approved and will be retired as part of this project. Upon Board approval of replacement standards, NERC will request the Board to rescind its approval of these standards and petition FERC to withdraw its petition for approval of these standards:
    - TOP-001-2 Transmission Operations
    - TOP-002-3 Operations Planning
    - TOP-003-2 Operational Reliability Data
    - IRO-001-3 Reliability Coordination - Responsibilities and Authorities
    - IRO-002-3 Reliability Coordination — Analysis Tools
    - IRO-005-4 Reliability Coordination — Current Day Operations
    - IRO-014-2 Coordination Among Reliability Coordinators
    - PRC-001-2 System Protection Coordination

Prerequisite Approvals[1]

Definition of Operating Instruction (filed with proposed COM-002-4).
COM-001-2 – Communications (filed with proposed COM-002-4)

Revisions to Defined Terms in the NERC Glossary

The Standards Drafting Team proposes retiring the following Board-approved definitions:	
Reliability Directive	Original definition – approved by the Board but never adopted by FERC; will be withdrawn as part of this project, consistent with the approach for the standards that were filed with FERC and not approved. Definition: *A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impacts.*
The Standards Drafting Team proposes revising the following Board-approved definitions:	
Operational Planning Analysis	**Original definition**: *An analysis of the expected system conditions for the next day's operation. (That analysis may be performed either a day ahead or as much as 12 months ahead.) Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).* **Revised definition**: *An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels;*

[1] In the event approval of COM-001-2 and the definition of Operating Instruction do not occur prior to the approval of the standards and definitions revised or developed in Project 2014-03, the currently enforceable standards and definitions would remain effective until those approvals have occurred, and the new or revised standards in Project 2014-03 shall become effective concurrent with the effective date of COM-001-2 and the definition of Operating Instruction.

	Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
Real-time Assessment	**Original definition**: *An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.* **Revised definition**: *An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)*

The definitions were revised in response to issues raised in NOPR paragraphs 55, 73, and 74 on analysis and monitoring of SOLs in all time horizons, NOPR paragraph 70 (updating study results in Real-time), and NOPR paragraph 78 (Protection System coordination). The phase angle item was added in response to SW Outage Report recommendation 27.

Background

On April 16, 2013, NERC submitted two petitions requesting Commission approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) (collectively, the "TOP Standards") to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) (collectively, the "IRO Standards") to replace six currently-effective IRO standards.

On November 21, 2013, the Commission issued a NOPR in response to these petitions. The NOPR proposed to remand the proposed TOP and IRO Standards. In the NOPR, the Commission raises a concern that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." For example, the Commission cites the fact that the proposed TOP standards do not require Transmission Operators to plan and operate within all System Operating Limits ("SOLs"), which is a requirement in the currently effective standards.

On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR. This deferral would provide an opportunity for the industry, NERC, and FERC to work toward a common understanding and afford time to review the proposed TOP and IRO standards through the NERC standards development process to address the concerns set forth in the NOPR. That motion to defer action was granted by the Commission on January 14, 2014.

On February 12, 2014, the Standards Committee appointed a Standard Drafting Team to take on the task of revising the aforementioned standards in response to the NOPR issues and the recommendations made by the Independent Expert Review Panel, the IRO FYRT, and the SW Outage Report and this implementation plan is developed from the changes made to the standards revised by that project.

General Considerations

The twelve month implementation period for all of the standards except TOP-003-3 and IRO-010-2 is intended to allow time for entities to update processes and train operators on the revised requirements. All of the Requirements in proposed TOP-003-3 and IRO-010-2 except TOP-003-3, Requirements R5 and IRO-010-2, Requirement R3 become effective three months earlier, in order to provide recipients of data requests from their Reliability Coordinators, Transmission Operators, and/or Balancing Authorities time to respond to the request for data.

Applicable Entities

- Reliability Coordinator
- Balancing Authority
- Transmission Owner
- Transmission Operator
- Distribution Provider
- Generator Owner
- Generator Operator
- Load-Serving Entity
- Planning Coordinator
- Transmission Planner

Effective Date for Standards

1. If the Prerequisite Approvals occur on or before Approval of the standards in Project 2014-03:

- **For all standards except proposed TOP-003-3 and proposed IRO-010-2:**
  The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

- **For proposed TOP-003-3:**
  All requirements except Requirement R5 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

  Requirement R5 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

  The reason for the difference in effective dates for proposed TOP-003-3 is to allow applicable entities to have time to properly respond to the data specification requests.

- **For proposed IRO-010-2:**
  Requirement R1 and R2 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R1 and R2 shall become

effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

The reason for the difference in effective dates for proposed IRO-010-2 is to allow applicable entities to have time to properly respond to the data specification requests.

2. **If the approval of the standards in Project 2014-03 occurs concurrent with or before the Prerequisite Approvals:**
    - **For all standards except proposed TOP-003-3 and proposed IRO-010-2:**
      The standard shall become effective concurrently with COM-001-2 and the definition of Operating Instruction.

    - **For proposed TOP-003-3:**
      All requirements except Requirement R5 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the definition of Operating Instruction is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date COM-001-2 is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

      Requirement R5 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the definition of Operating Instruction is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the definition of Operating Instruction is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

The reason for the difference in effective dates for proposed TOP-003-3 is to allow applicable entities to have time to properly respond to the data specification requests.

- **For proposed IRO-010-2:**
  Requirement R1 and R2 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date that the definition of Operating Instruction is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R1 and R2 shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
  Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the definition of Operating Instruction is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirement R3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

- **Standards for Retirement:**
  Midnight of the day before the first day of the first calendar quarter that is twelve (12) months after the date that the standards in Project 2014-03 are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standards shall be retired at midnight of the day before the first day of the first calendar quarter that is twelve (12) months after the date the standards in Project 2014-03 are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

- **Definition of Reliability Directive:**
  Midnight of the day before the first day of the first calendar quarter that is twelve (12) months after the date that the standards in Project 2014-03 are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the definition shall be retired at midnight of the day before the first day of the first calendar quarter that is twelve (12) months after the date the standards in Project 2014-03 are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for Definitions

The definitions of Operational Planning Analysis and Real-time Assessment shall become effective on the first day of the first calendar quarter that is ten (10) months after the date that the definitions are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a definitions to go into effect. Where approval by an applicable governmental authority is not required, the definitions shall become effective on the first day of the first calendar quarter that is ten (10) months after the date the definitions are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

The definitions are used in proposed IRO-010-2, Requirements R1 and R2 and in proposed TOP-003-3, Requirements R1 and R3 so it is necessary that the definitions become effective concurrent with those requirements.

The two definitions are also employed in the following proposed project standards: TOP-001-3, TOP-002-4, and IRO-008-2. These definitions are not used in any other standards, either approved or in development in any other project.

Additional information about this project is available on the project page.

Background Information - Project 2014-03 – Revisions to TOP/IRO Reliability Standards

On November 21, 2013, FERC issued a NOPR proposing to remand three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) to replace the eight currently-effective TOP standards and four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) to replace six currently-effective IRO standards. In the NOPR, FERC stated that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards."

In response, NERC filed a motion requesting that FERC defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR and afford time to review the proposed TOP and IRO Standards through the NERC standards development process. That motion to defer action was granted on January 14, 2014.

The drafting team formed to address those concerns has made revisions to the TOP and IRO standards proposed to be remanded, along with several other IRO standards to provide consistency amongst the TOP and IRO standards, to address NOPR issues and recommendations made by the Independent Expert Review Panel, the IRO five-year review team (FYRT), and the 2011 SW Outage Report. In the ballot that ended September 19, 2014, all of the standards except TOP-001-3 achieved greater than the required two thirds ballot pool approval. The SDT has reviewed stakeholder comments submitted in that comment period and made only clarifying and non-substantive changes to all of the standards except TOP-001. No changes were made to the definitions or implementation plan.

The SDT has made numerous changes in the fourth posting for proposed TOP-001-3 in order to respond to industry comments raised in the third posting.

- Requirement R1 – removed the ‘direct action’ language to alleviate concerns about potential double jeopardy issues as direct actions are included in other standards and requirements where necessary; replaced ‘address’ with ‘maintain’. .
- Requirement R2 - removed the ‘direct action’ language to alleviate concerns about potential double jeopardy issues as direct actions are included in other standards and requirements where necessary; replaced ‘address’ with ‘maintain’.
- Requirements R3, R4, R5, and R6 – removed the Load-Serving Entity as an applicable entity following the recent Board action on removing Load-Serving Entity as a functional entity. (Note – Load-Serving Entity was not removed from proposed IRO-010-2 or proposed TOP-003-3 as those standards have already been approved by industry and the Board. Load-Serving Entity will be removed from those standards when the overarching project to remove Load-Serving Entity is initiated.)
- Requirement R7 – Added the phrases ‘within its Reliability Coordinator Area’ (as Transmission Operators will only be expected to react to requests from other Transmission Operators within the Reliability Coordinator Area and any assistance for Transmission Operator Areas outside the Reliability Coordinator Area will be done through requests from the Reliability Coordinators) and ‘comparable’ assistance (to assure that a transmission Operator isn’t asked to do go further than the requesting Transmission Operator has done).
- Requirement R9 – added ‘known’ as a qualifier for impacted entities; clarified that the requirement is for all outages by adding ‘planned and unplanned’ as qualifiers to outages; replaced ‘sustained’ by ’30 minutes or more’ to achieve clarity and consistency with other standards.
- Requirement R10 – deleted the phrase ‘non-BES’ as any need for non-BES data will be defined in the Reliability Coordinator SOL methodology and included in BES as part of BES Exception Process as necessary; clarified that an entity does not have to ‘monitor’ outside of its Transmission Operator Area – it only needs to utilize necessary data.
- Requirement R11 – replaced the phrase ‘perform its reliability functions’ with more specific language – ‘maintain Load-interchange balance within its Balancing Authority Area and support Interconnection frequency’.
- Requirement R15 – capitalized ‘System’
- Requirement R16 – made the language for the list of applicable outages consistent with that of the language in Requirement R9.
- Requirement R17 - made the language for the list of applicable outages consistent with that of the language in Requirement R9.
- Made commensurate changes in matching Measures and cleaned up language in Measures M8 and M12.
- Made commensurate changes to VSL language and changed the VSL for Requirement R11 from binary to incremental.
- Added language to the SOL Exceedance White Paper explaining that the Reliability Coordinator’s SOL methodology will specify requirements to include any non-BES data or external data in order for a Transmission Operator to determine SOLs in accordance with the Reliability Coordinator’s SOL methodology.

Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

Commenters are reminded that this is not a forum for questioning the issues raised in the FERC NOPR of November 21, 2013 but to objectively evaluate the work of the SDT in responding to the issues raised in the NOPR, and the recommendations made by the Independent Expert Review Panel (IERP), the IRO FYRT, and the SW Outage Report.

Questions

1. Do you agree with the changes made to respond to industry comments to proposed TOP-001-3? If not, please provide technical rationale for your disagreement along with suggested language changes.

Notice of Request to Waive the Standard Process

Project 2014-03 – Revisions to TOP and IRO Reliability Standards

As required by Section 16 of the NERC Standard Processes Manual (SPM), this is official notice to stakeholders that the leadership of the Project 2014-03 Revisions to TOP and IRO Reliability Standards Drafting Team, the Project Management Oversight Subcommittee (PMOS) liaison for that project, Standards Committee (SC) chair, and NERC Standards Staff (Requesters) are requesting that the SC consider a waiver of the Standard Processes Manual. The Requesters ask to shorten the next formal comment and ballot period for draft standard TOP-001-3, and any subsequent comment formal comment and ballot periods prior to final ballot for that standard, from 45 days to 30 days, and to shorten the final ballot for TOP-001-3 from ten days to seven days, in order to meet a regulatory deadline. Section 16 of the SPM provides for the granting of waivers for regulatory deadlines and where the SC determines that a modification to a proposed Reliability Standard has already been vetted by the industry through the standard development process.

The SC will meet via teleconference to consider this waiver request no earlier than Thursday, October 9, 2014 (to comply with the five business day notice required by Section 16 of the SPM). The Standards Committee's teleconference will be noticed through an announcement and posted on the NERC website. Additional details about the waiver request are included below, and should a waiver be granted by the SC, it will be posted on the project page.

Justification for Current Waiver Request

On April 16, 2013, NERC submitted two petitions requesting FERC approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) (collectively, the "TOP Standards") to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) (collectively, the "IRO Standards") to replace six currently-effective IRO standards.

On November 21, 2013, the Federal Energy Regulatory Commission (FERC) issued a Notice of Proposed Rulemaking (NOPR) proposing to remand three revised TOP Reliability Standards and four revised IRO Reliability Standards. In the NOPR FERC stated that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR and afford time to review the proposed

TOP and IRO Standards through the NERC standards development process to ensure that a technically justified set of solutions is in place for reliability.

NERC's motion to defer action was granted on January 14, 2014.

The drafting team has developed a set of eight revised standards and one new standard to replace the standards that the NOPR proposed to remand. The standards have been posted for two 45-day comment periods and ballots, and in the ballot ending September 19, 2014, eight of the nine standards achieved greater than the required two-thirds weighted segment approval.

The drafting team met to review stakeholder feedback on September 30 and October 1, and based on that feedback has made substantive revisions to TOP-001-3. The shortened comment period and ballot for TOP-001-3 serves two important purposes. First, should it be necessary to conduct more than one additional ballot to reach consensus on TOP-001-3, the shortened comment period will allow for one additional comment period and ballot while still allowing the nine standards to be filed with FERC by the January 31, 2015 deadline. Second, shortening the ballot period from ten days to seven days provides additional time during the comment period for drafting team outreach prior to the start of the ballot. This outreach may be important to ensure stakeholder support for the standard.

Finally, shortening the final ballot period for TOP-001-3 from ten days to seven days provides scheduling flexibility that may be required to achieve the necessary milestones prior to filing (including possibly scheduling a special call for NERC Board adoption), while still allowing NERC and the industry to successfully meet the January 31, 2015 filing deadline. If NERC is unable to meet the January 31, 2015 deadline, FERC may proceed with its proposed remand of the TOP and IRO standards.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Laura Hussey,
Director of Standards Development, at laura.hussey@nerc.net or at 404-446-2560.

Waiver Authorization for Project 2014-03: Revisions to TOP and IRO Reliability Standards

Action

Authorize a waiver of the Standard Processes Manual (SPM) to:

a) shorten the next additional formal comment period (and any subsequent additional formal comment periods) for draft standard TOP-001-3 from 45 days to 30 days, with a ballot and non-binding poll during the last seven days of the 30 day period; and

b) shorten the final ballot period from ten days to seven days.

Background

The leadership of the TOP/IRO Standard Drafting Team, NERC staff, and the PMOS liaison and Standards Committee (SC) chair have requested a waiver of the NERC Standards Processes Manual (SPM) as described in the actions above. Section 16 of the SPM provides for the granting of waivers for regulatory deadlines and where the SC determines that a modification to a proposed Reliability Standard has already been vetted by the industry through the standard development process. As required in Section 16, NERC provided stakeholders with notice of these waiver requests on October 2, 2014. If a waiver is authorized, NERC staff will post notice of the waiver on the project page and notify the NERC Board of Trustees Standards Oversight and Technology Committee.

On April 16, 2013, NERC submitted two petitions requesting FERC approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) (collectively, the "TOP Standards") to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) (collectively, the "IRO Standards") to replace six currently-effective IRO standards.

On November 21, 2013, the Federal Energy Regulatory Commission (FERC) issued a Notice of Proposed Rulemaking (NOPR) proposing to remand three revised TOP Reliability Standards and four revised IRO Reliability Standards. In the NOPR FERC stated that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR and afford time to review the proposed TOP and IRO Standards through the NERC standards development process to ensure that a technically justified set of solutions is in place for reliability.

NERC's motion to defer action was granted on January 14, 2014.

The drafting team has developed a set of eight revised standards and one new standard to replace the standards that the NOPR proposed to remand. The standards have been posted for two 45-day comment periods and ballots, and in the ballot ending September 19, 2014, eight of the nine standards achieved greater than the required two-thirds weighted segment approval.

The drafting team met to review stakeholder feedback on September 30 and October 1, and based on that feedback has made substantive revisions to TOP-001-3. The shortened comment period and ballot for TOP-001-3 serves two important purposes. First, should it be necessary to conduct more than one additional ballot to reach consensus on TOP-001-3, the shortened comment period will allow for one additional comment period and ballot while still allowing the nine standards to be filed with FERC by the January 31, 2015 deadline. Second, shortening the ballot period from ten days to seven days provides additional time during the comment period for drafting team outreach prior to the start of the ballot. This outreach may be important to ensure stakeholder support for the standard.

Finally, shortening the final ballot period for TOP-001-3 from ten days to seven days provides scheduling flexibility that may be required to achieve the necessary milestones prior to filing (including possibly scheduling a special call for NERC Board adoption), while still allowing NERC and the industry to successfully meet the January 31, 2015 filing deadline. If NERC is unable to meet the January 31, 2015 deadline, FERC may proceed with its proposed remand of the TOP and IRO standards.

Industry Need (What is the industry problem this request is trying to solve?):

On April 16, 2013, NERC submitted two petitions requesting Commission approval of TOP and IRO standards. One petition addresses three revised TOP Reliability Standards: TOP-001-2 (Transmission Operations), TOP-002-3 (Operations Planning), TOP-003-2 (Operational Reliability Data), and one Protection Systems (PRC) Reliability Standard, PRC-001-2 (System Protection Coordination) (collectively, the "TOP Standards") to replace the eight currently-effective TOP standards. The second petition addresses four revised IRO Reliability Standards: IRO-001-3 (Responsibilities and Authorities), IRO-002-3 (Analysis Tools), IRO-005-4 (Current Day Operations), and IRO-014-2 (Coordination Among Reliability Coordinators) (collectively, the "IRO Standards") to replace six currently-effective IRO standards.

On November 21, 2013, the Commission issued a NOPR in response to these petitions. The NOPR proposed to remand the proposed TOP and IRO Standards. In the NOPR, the Commission raises a concern that NERC "has removed critical reliability aspects that are included in the currently-effective standards without adequately addressing these aspects in the proposed standards." For example, the Commission cites the fact that the proposed TOP standards do not require Transmission Operators to plan and operate within all System Operating Limits ("SOLs"), which is a requirement in the currently effective standards.

On December 20, 2013, NERC filed a motion requesting that the Commission defer action on the NOPR until January 31, 2015 to provide NERC and the industry the opportunity to thoroughly examine the technical concerns raised in the NOPR. This deferral would provide an opportunity for the industry, NERC, and FERC to work toward a common understanding and afford time to review the proposed TOP and IRO standards through the NERC standards development process to address the concerns set forth in the NOPR. That motion to defer action was granted by the Commission on January 14, 2014.

SAR Information

Purpose or Goal (How does this request propose to address the problem described above?):

The primary goal of this SAR is to allow the Standard Drafting Team (SDT) for Project 2014-03 Revisions to TOP/IRO Reliability Standards to address the concerns expressed in the NOPR while fulfilling the goals of the original projects: Project 2006-06 Reliability Coordination and Project 2007-03 Real-time Operations. In addition, the SDT should review the goals of Project 2009-02 Real-time Monitoring and Analysis Capabilities and consider whether to incorporate revisions to the TOP and/or IRO standards to address those goals in Project 2014-03.

SAR Information

Identify the Objectives of the proposed standard's requirements (What specific reliability deliverables are required to achieve the goal?):

Provide clear, unambiguous requirements and standards to allow Reliability Coordinators, Transmission Operators, and Balancing Authorities to operate the interconnected transmission system in a safe and reliable manner.

Brief Description (Provide a paragraph that describes the scope of this standard action.)

The SDT shall modify the TOP and IRO Reliability Standards to address the issues raised in the NOPR, while ensuring that the revisions continue to address directives previously assigned to the TOP and IRO standards under Projects 2007-03 and 2006-06.

If it is decided to handle the goals of Project 2009-02 within Project 2014-03, then the directives assigned to Project 2009-02 will be addressed as well.

In addition, the recommendations from the Independent Expert Review Project and the SW Outage Report will be reviewed, a directive dealing with monitoring responsibilities for the Reliability Coordinator will be resolved, and other IRO standards will be examined for consistency purposes.

Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)

The SDT shall:

1. Revise the TOP/IRO Reliability Standards to address concerns expressed in the NOPR
    a. Consider the inputs from technical conferences
2. Consider the recommendations in the Independent Expert Review Report and the SW Outage Report
3. Review the IRO Reliability Standards not included in the original Project 2006-06 for coordination with any changes made for this project (see list of related standards)
4. Preserve the intent of the reliability objectives in the current, approved standards so that no reliability gaps are created
5. Decide whether to handle the goals of Project 2009-02 within Project 2014-03; and if it does so decide, then also address the directives assigned to Project 2009-02.
6. Address the directives from Order 693 originally assigned to Projects 2006-06 and 2007-03.

SAR Information
7. Address the following directive from Order 693, paragraph 1855: *“Since a reliability coordinator is the highest level of authority overseeing the reliability of the Bulk-Power System, the Commission believes that it is important to include the reliability coordinator as an applicable entity to assure that adequate voltage and reactive resources are being maintained. As MISO points out, other Reliability Standards address responsibilities of reliability coordinators, but we agree with EEI that it is important to include reliability coordinators in VAR-001-1 as well. Reliability coordinators have responsibilities in the IRO and TOP Reliability Standards, but not the specific responsibilities for voltage levels and reactive resources addressed by VAR-001-1, which have a great impact on system reliability. For example, voltage levels and reactive resources are important factors to ensure that IROLs are valid and operating voltages are within limits, and that reliability coordinators should have responsibilities in VAR-001-1 to monitor that sufficient reactive resources are available for reliable system operations. Accordingly, the ERO should modify VAR-001-1 to include reliability coordinators as applicable entities and include a new requirement(s) that identifies the reliability coordinator’s monitoring responsibilities*.” 8. Modify the measures, Violation Risk Factors (VRF), and Violation Severity Levels (VSL) as necessary to address modified requirements. 9. Address the issue of outage coordination as pointed out by the Independent Experts Review Panel through the creation of a new standard. 10. Address the recommendations of the IRO Five Year Review Team (Project 2012-09) for the IRO standards revised in this project.

Reliability Functions		
The Standard will Apply to the Following Functions (Check each one that applies.)		
☐	Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.

Reliability Functions	
☒ Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒ Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☒ Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☒ Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐ Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☒ Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☒ Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒ Transmission Owner	Owns and maintains transmission facilities.
☒ Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒ Distribution Provider	Delivers electrical energy to the End-use customer.
☒ Generator Owner	Owns and maintains generation facilities.
☒ Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐ Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐ Market Operator	Interface point for reliability functions with commercial functions.

Reliability Functions	
☒ Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Project 2014-03 – Revisions to TOP and IRO Reliability Standards

Mapping Document | Updated December 2014

This mapping document showing the translation of Requirements in the following currently-enforceable standards to revised or new standards developed in Project 2014-03:

- IRO-001-1.1 — Reliability Coordination - Responsibilities and Authorities
- IRO-002-2 — Reliability Coordination - Facilities
- IRO-003-2 — Reliability Coordination – Wide-Area View
- IRO-004-2 — Reliability Coordination — Operations Planning
- IRO-005-3.1a — Reliability Coordination - Current Day Operations
- IRO-008-1 — Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-010-1a — Reliability Coordinator Data Specification and Collection
- IRO-014-1 — Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators
- IRO-015-1 — Notifications and Information Exchange Between Reliability Coordinators
- IRO-016-1 — Coordination of Real-time Activities Between Reliability Coordinators
- PER-001-0.2 — Operating Personnel Responsibility and Authority
- TOP-001-1a — Reliability Responsibilities and Authorities
- TOP-002-2.1b — Normal Operations Planning
- TOP-003-1 — Planned Outage Coordination
- TOP-004-2 — Transmission Operations
- TOP-005-2a — Operational Reliability Information
- TOP-006-3 — Monitoring System Conditions[1]
- TOP-007-0 — Reporting System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) Violations
- TOP-008-1 — Response to Transmission Limit Violations

---

[1] TOP-006-2 is the currently enforceable version of this standard; TOP-006-3 was developed in response to a request for interpretation seeking clarification of Requirement R1 and does not substantively change the Requirements of TOP-006-2. In its NOPR proposing to remand the TOP and IRO standard, FERC proposed to approve TOP-006-3. The drafting team has mapped the Requirements in the new standards to TOP-006-3 because the Parts of Requirement R1 in TOP-006-3 more clearly delineate which entity has responsibility.

Standard IRO-001-1.1 — Reliability Coordination - Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Regional Reliability Organization, subregion, or interregional coordinating group shall establish one or more Reliability Coordinators to continuously assess transmission reliability and coordinate emergency operations among the operating entities within the region and across the regional boundaries.	The SDT proposes retiring the requirement as it is addressed in the NERC Rules of Procedure, January 30, 2014: **Section 503.2 (2.1)** "Regional Entities shall verify that all Reliability Coordinators, Balancing Authorities, and Transmission Operators meet the Registration requirements of Section 501(1.4)." **Section 501 (1.4)** "**1.4** For all geographical or electrical areas of the Bulk Power System, the Registration process shall ensure that (1) no areas are lacking any entities to perform the duties and tasks identified in and required by the Reliability Standards to the fullest extent practical, and (2) there is no unnecessary duplication of such coverage or of required oversight of such coverage. In particular the process shall: **1.4.1** Ensure that all areas are under the oversight of one and only one Reliability Coordinator. **1.4.2** Ensure that all Balancing Authorities and Transmission operator entities are under the responsibility of one and only one Reliability Coordinator. **1.4.3** Ensure that all transmission Facilities of the Bulk Power System are the responsibility and under the control of one and only one Transmission Planner, Planning Authority, and Transmission Operator. **1.4.4** Ensure that all loads and generators are under the responsibility and control of one and only one Balancing Authority."
R2. The Reliability Coordinator shall comply with a regional reliability plan approved by the NERC Operating Committee.	**The SDT is proposing to retire this requirement.** The SDT proposes retiring Requirement R2 as the regional reliability plan is a high level overview "how" document that shows how a Reliability Coordinator will comply with other NERC Standards. As a result, this requirement is administrative and redundant to other measureable and enforceable requirements within the standards. Since the requirement is generally administrative, it does not materially impact the reliability of the BES. The Reliability Plan concept is a holdover from the transition period from the Operating Policies to the Version 0 standards and was used extensively in the readiness evaluation process by the Operating Committee. The template used for the Reliability Plan is actually an outline of Operating Policy 9. The material included in the plan was a description of how an entity satisfied the specific functional areas under Policy 9. With the transition of Policy 9 to the IRO and other standards, the items addressed in

Standard IRO-001-1.1 — Reliability Coordination - Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	the reliability plans are inherently addressed in the body of other more measurable Reliability Standards.
R3. The Reliability Coordinator shall have clear decision-making authority to act and direct actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities and Purchasing-Selling Entities within its Reliability Coordinator Area to preserve the integrity and reliability of the Bulk Electric System. These actions shall be taken without delay, but no longer than 30 minutes.	**This requirement is replaced by proposed IRO-001-4, Requirements R1 and R2.** The SDT does not believe that there is a need for a decision-making authority requirement as the decision-making authority is inherent when the requirement states that the Reliability Coordinator must act, or by issuing Operating Instructions. **Proposed IRO-001-4, Requirements R1 and R2:** **R1**. Each Reliability Coordinator shall act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions. **R2.** Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with its Reliability Coordinator's Operating Instructions unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements.
R4. Reliability Coordinators that delegate tasks to other entities shall have formal operating agreements with each entity to which tasks are delegated. The Reliability Coordinator shall verify that all delegated tasks are understood, communicated, and addressed within its Reliability Coordinator Area. All responsibilities for complying with NERC and regional standards applicable to Reliability Coordinators shall remain with the Reliability Coordinator.	**The SDT is proposing to retire this requirement.** The SDT contends that approved IRO-001-1.1, Requirement R4 is redundant with NERC Rules of Procedure, Section 500 (January 30, 2014) and should be retired from the standard. **(Section 501)** "The purpose of the Organization Registration Program is to clearly identify those entities that are responsible for compliance with the FERC approved Reliability Standards. Organizations that are registered are included on the NERC Compliance Registry (NCR) and are responsible for knowing the content of and for complying with all applicable Reliability Standards." **(Section 508)** Provisions Relating to Coordinated Functional Registration (CFR) Entities In addition to registering as an entity responsible for all functions that it performs itself, multiple entities may each register using a CFR for one or more Reliability Standard(s) and/or for one or more Requirements/sub-Requirements within particular Reliability Standard(s) applicable to a specific function. The CFR submission must include a written agreement that governs itself and clearly specifies the entities' respective compliance responsibilities. The Registration of the CFR is the complete

Standard IRO-001-1.1 — Reliability Coordination - Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Registration for each entity. Additionally, each entity shall take full compliance responsibility for those Reliability Standards and/or Requirements/sub-Requirements it has registered for in the CFR. Neither NERC nor the Regional Entity shall be parties to any such agreement, nor shall NERC or the Regional Entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the CFR.
R5. The Reliability Coordinator shall list within its reliability plan all entities to which the Reliability Coordinator has delegated required tasks.	The SDT is proposing to retire this requirement consistent with Paragraph 81 criteria as it is strictly administrative in nature.
R6. The Reliability Coordinator shall verify that all delegated tasks are carried out by NERC-certified Reliability Coordinator operating personnel.	The SDT is proposing to retire this requirement. The Reliability Coordinator may delegate tasks but cannot delegate the responsibility for these tasks. Therefore, it is not necessary to mandate that delegated tasks must be carried out by certified personnel as it is the responsibility of the Reliability Coordinator to ensure that the task is carried out.
R7. The Reliability Coordinator shall have clear, comprehensive coordination agreements with adjacent Reliability Coordinators to ensure that System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) violation mitigation requiring actions in adjacent Reliability Coordinator Areas are coordinated.	This requirement is replaced by proposed IRO-014-3, Requirement R1. **Proposed IRO-014-3, Requirement R1:** **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability.
R8: Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall comply with Reliability Coordinator directives unless such actions would violate safety, equipment, or regulatory or statutory requirements. Under these circumstances, the Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, Load-Serving Entity, or Purchasing-Selling Entity shall immediately inform the Reliability Coordinator of the inability to perform the directive so that the Reliability	This requirement is replaced by proposed IRO-001-4, Requirements R2 and R3. **Proposed IRO-001-4, Requirements R2 and R3:** **R2.** Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with its Reliability Coordinator's Operating Instructions unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements. **R3.** Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall inform its Reliability Coordinator upon recognition of its inability to perform an Operating Instruction in accordance with Requirement R2.

Standard IRO-001-1.1 — Reliability Coordination - Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
Coordinator may implement alternate remedial actions.	
R9. The Reliability Coordinator shall act in the interests of reliability for the overall Reliability Coordinator Area and the Interconnection before the interests of any other entity.	The SDT is proposing to retire this requirement as it is redundant with the definition of Reliability Coordinator in Functional Model v5. The NERC Functional Model Version 5 defines the Reliability Coordinator function as follows: "The functional entity that maintains the Real-time operating reliability of the Bulk Electric System within a Reliability Coordinator Area." An entity performing Reliability Coordinator services must meet this definition.

Standard IRO-002-2 — Reliability Coordination – Facilities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Reliability Coordinator shall have adequate communications facilities (voice and data links) to appropriate entities within its Reliability Coordinator Area. These communications facilities shall be staffed and available to act in addressing a real-time emergency condition.	The first sentence of this requirement is replaced by proposed COM-001-2 Requirement R1 for voice links and proposed IRO-002-2 Requirement R1 for data links. The second sentence of this requirement is covered by approved PER-004-2 Requirement R1 so to eliminate redundancy, that part of the requirement is not proposed to be replaced. **Proposed COM-001-2, Requirement R1:** **R1.** Each Reliability Coordinator shall have Interpersonal Communication capability with the following entities (unless the Reliability Coordinator detects a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): 1.1 All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area. 1.2 Each adjacent Reliability Coordinator within the same Interconnection. **Proposed IRO-002-4, Requirement R1:** **R1.** Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Approved PER-004-2, Requirement R1:** **R1.** Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.
R2. Each Reliability Coordinator — or its Transmission Operators and Balancing Authorities — shall provide, or arrange provisions for, data exchange to other Reliability Coordinators or Transmission Operators and Balancing Authorities via a secure network.	This requirement is replaced by proposed IRO-010-2, Requirements R1 and R3, Part 3.3. **Proposed IRO-010-2, Requirements R1 and R3, Part 3.3:** **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **R3.** Part 3.3. A mutually agreeable security protocol
R3. Each Reliability Coordinator shall have multi-directional communications capabilities with its Transmission Operators and Balancing Authorities, and with neighboring Reliability	This requirement is replaced by proposed COM-001-2 Requirement R1 and proposed IRO-002-4 Requirement R2. **Proposed COM-001-2, Requirement R1:**

Standard IRO-002-2 — Reliability Coordination – Facilities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
Coordinators, for both voice and data exchange as required to meet reliability needs of the Interconnection.	**R1.** Each Reliability Coordinator shall have Interpersonal Communication capability with the following entities (unless the Reliability Coordinator detects a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): 1.1 All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area. 1.2 Each adjacent Reliability Coordinator within the same Interconnection. **Proposed IRO-002-4, Requirement R2:** **R2**. Each Reliability Coordinator shall have data exchange capabilities with Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R4. Each Reliability Coordinator shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas to ensure that potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations are identified. Each Reliability Coordinator shall have monitoring systems that provide information that can be easily understood and interpreted by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant and highly reliable infrastructure.	This requirement is replaced by proposed IRO-002-4, Requirements R4 and R5. **Proposed IRO-002-4, Requirements R3 and R4:** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **R4.** Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure.
R5. Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to	This requirement is replaced by proposed IRO-002-4, Requirement R3. **Proposed IRO-002-4, Requirement R3:** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

Standard IRO-002-2 — Reliability Coordination – Facilities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area.	
R6. Each Reliability Coordinator shall have adequate analysis tools such as state estimation, pre- and post-contingency analysis capabilities (thermal, stability, and voltage), and wide-area overview displays.	This requirement is replaced by proposed IRO-008-5, Requirement R5 and the proposed definition of Real-time Assessment. **Proposed IRO-008, Requirement R4:** **R4**. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Proposed definition:** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)
R7. Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area. Each Reliability Coordinator shall have provisions for backup facilities that shall be exercised if the main monitoring system is unavailable. Each Reliability Coordinator shall ensure SOL and IROL monitoring and derivations continue if the main monitoring system is unavailable.	This requirement is replaced by proposed IRO-002-4, Requirement R3 and approved EOP-008-1, Requirement R1, Part 1.6.2. **Proposed IRO-002-4, Requirement R3:** **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Approved EOP-008-1, Requirement R1, Part 1.6.2:** **R1. Part 1.6.2**. Actions to manage the risk to the BES during the transition from primary to backup functionality as well as during outages of the primary or backup functionality.
R8. Each Reliability Coordinator shall control its Reliability Coordinator analysis tools, including approvals for planned maintenance. Each Reliability Coordinator shall have	This requirement is replaced by proposed IRO-002, Requirement R2 and approved EOP-008-1, Requirement R1, Part 1.6.2. **Proposed IRO-002-4, Requirement R2:**

Standard IRO-002-2 — Reliability Coordination – Facilities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
procedures in place to mitigate the effects of analysis tool outages.	**R2.** Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance of its telecommunications, monitoring and analysis capabilities. **Approved EOP-008-1, Requirement R1, Part 1.6.2:** **R1. Part 1.6.2.** Actions to manage the risk to the BES during the transition from primary to backup functionality as well as during outages of the primary or backup functionality.

Standard IRO-003-2 — Reliability Coordination - Wide-Area View	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.	Replaced with proposed IRO-002-4, Requirement R3. **Proposed IRO-002-4, Requirement R3:** **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
R2. Each Reliability Coordinator shall know the current status of all critical facilities whose failure, degradation or disconnection could result in an SOL or IROL violation. Reliability Coordinators shall also know the status of any facilities that may be required to assist area restoration objectives.	Replaced with proposed IRO-002-4, Requirement R3 and revised definitions of Operational Planning Analysis and Real-time Assessment. **Proposed IRO-002-4, Requirement R3:** **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed definition:** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day

Standard IRO-003-2 — Reliability Coordination - Wide-Area View	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition:** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Standard IRO-004-2 — Reliability Coordination - Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Transmission Operator, Balancing Authority, and Transmission Service Provider shall comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events.	This requirement is replaced by proposed IRO-001-4, Requirement R1 since Operating Instructions, regardless of what timeframe they are issued for, are issued in a Real-time environment. In addition, roles for entities identified in the Operating Plans built from Operational Planning Analyses are communicated in proposed IRO-008-2, Requirement R3. **Proposed IRO-001-4, Requirement R1:** R1. Each Reliability Coordinator shall act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions. **Proposed IRO-008-2, Requirement R3:** R3. Each Reliability Coordinator shall notify impacted entities identified in its Operating Plan(s) cited in Requirement R2 as to their role in that plan(s).

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following: **R1.1** Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading. **R1.2.** Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope. **R1.3.** Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope. **R1.4.** System real and reactive reserves (actual versus required). **R1.5**. Capacity and energy adequacy conditions. **R1.6.** Current ACE for all its Balancing Authorities. **R1.7**. Current local or Transmission Loading Relief procedures in effect. **R1.8.** Planned generation dispatches. **R1.9.** Planned transmission or generation outages. **R1.10.** Contingency events.	Replaced by proposed IRO-002-4, Requirements R3 and R4. **Proposed IRO-002-4, Requirement R3:** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed IRO-002-4, Requirement R4:** **R4**. Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure.
R2. Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard (CPS) and	The first sentence is replaced by proposed IRO-002-4, Requirement R3. The second sentence is covered by approved EOP-002-3.1a, Requirement R8 and can be retired. **Proposed IRO-002-4 Requirement, R3**:

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
Disturbance Control Standard (DCS) requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.	**R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Approved EOP-002-3.1a, Requirement R8:** **R8.** A Reliability Coordinator that has any Balancing Authority within its Reliability Coordinator area experiencing a potential or actual Energy Emergency shall initiate an Energy Emergency Alert as detailed in Attachment 1-EOP-002 "Energy Emergency Alerts." The Reliability Coordinator shall act to mitigate the emergency condition, including a request for emergency assistance if required.
R3. Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.	The SDT proposes retiring this requirement as it has been superseded by approved EOP-010-1, Requirements R1 through R3. **Approved EOP-010-1, Requirements R1 to R3:** **R1** Each Reliability Coordinator shall develop, maintain, and implement a GMD Operating Plan that coordinates GMD Operating Procedures or Operating Processes within its Reliability Coordinator Area. At a minimum, the GMD Operating Plan shall include: **1.1** A description of activities designed to mitigate the effects of GMD events on the reliable operation of the interconnected transmission system within the Reliability Coordinator Area. **1.2** A process for the Reliability Coordinator to review the GMD Operating Procedures or Operating Processes of Transmission Operators within its Reliability Coordinator Area. **R2.** Each Reliability Coordinator shall disseminate forecasted and current space weather information to functional entities identified as recipients in the Reliability Coordinator's GMD Operating Plan. **R3.** Each Transmission Operator shall develop, maintain, and implement a GMD Operating Procedure or Operating Process to mitigate the effects of GMD events on the reliable

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	operation of its respective system. At a minimum, the Operating Procedure or Operating Process shall include: **3.1.** Steps or tasks to receive space weather information. **3.2**. System Operator actions to be initiated based on predetermined conditions. **3.3**. The conditions for terminating the Operating Procedure or Operating Process.
R4. The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.	This requirement has been replaced by proposed IRO-008-2, Requirements R3, R5 and R6. **Proposed IRO-008-2, Requirement R3:** **R3.** Each Reliability Coordinator shall notify impacted entities identified in its Operating Plan(s) cited in Requirement R2 as to their role in that plan(s). **Proposed IRO-008-2, Requirement R5:** **R5.** Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area. **Proposed IRO-008-2, Requirement R6:** **R6.** Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R5 has been prevented or mitigated.
R5. Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.	This requirement is replaced by proposed IRO-001-4, Requirement R1 and proposed IRO-002-34 Requirements R3 and R4. **Proposed IRO-001-4, Requirement R1:** **R1.** Each Reliability Coordinator shall act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions.

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed IRO-002-4, Requirement R3: **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed IRO-002-4, Requirement R4:** **R4.** Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure.
R6. The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, IROL, CPS or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.	The first sentence is replaced with proposed IRO-008-2, Requirement R2. The issue of CPS and DCS is covered in approved EOP-002-3.1, Requirements R6, R7, and R8. The second sentence is replaced by the proposed IRO-017-1, Requirement R1 as well as through the proposed definitions of Operational Planning Analysis and Real-time Assessments. Generator Operators are not included in proposed IRO-017-1 as the SDT believes that Generator Operator outage information will be sent to the respective Transmission Operators and Balancing Authorities and then sent on to the Reliability Coordinators through those entities. **Proposed IRO-008-2, Requirement R2:** **R2**. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. **Proposed definition:** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition:** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed IRO-017-1, Requirement R1:** **R1.** Each Reliability Coordinator shall develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area. **Approved EOP-002-3.1, Requirements R6, R7, and R8:** **R6.** If the Balancing Authority cannot comply with the Control Performance and Disturbance Control Standards, then it shall immediately implement remedies to do so. These remedies include, but are not limited to: R6.1. Loading all available generating capacity. **R6.2**. Deploying all available operating reserve. **R6.3.** Interrupting interruptible load and exports. **R6.4.** Requesting emergency assistance from other Balancing Authorities. **R6.5**. Declaring an Energy Emergency through its Reliability Coordinator; and **R6.6.** Reducing load, through procedures such as public appeals, voltage reductions, curtailing interruptible loads and firm loads.

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R7. Once the Balancing Authority has exhausted the steps listed in Requirement 6, or if these steps cannot be completed in sufficient time to resolve the emergency condition, the Balancing Authority shall: R7.1. Manually shed firm load without delay to return its ACE to zero; and **R7.2**. Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002 "Energy Emergency Alerts." **R8.** A Reliability Coordinator that has any Balancing Authority within its Reliability Coordinator area experiencing a potential or actual Energy Emergency shall initiate an Energy Emergency Alert as detailed in Attachment 1-EOP-002 "Energy Emergency Alerts." The Reliability Coordinator shall act to mitigate the emergency condition, including a request for emergency assistance if required.
R8. The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.	The first sentence is replaced by proposed IRO-002-4, Requirements R3 and R4. The second sentence is replaced by proposed IRO-001-4, Requirement R1. **Proposed IRO-002-4, Requirement R3:** **R3**. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed IRO-002-4, Requirement R4:** **R4.** Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure. **Proposed IRO-001-4, Requirement R1:** **R1.** Each Reliability Coordinator shall act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions.
R9. Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator	The first sentence is replaced by proposed IRO-002-4, Requirements R3 and R4. The second sentence is replaced by proposed IRO-010-2, Requirements R1, Part 1.2, and R3.

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.	**Proposed IRO-002-4, Requirement R3:** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed IRO-002-4, Requirement R4:** **R4.** Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure. **Proposed IRO-010-4, Requirement R1, Part 1.2:** **R1**. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: **1.2** Provisions for notification of current Protection System and Special Protection System status, failure, or degradation that impacts System reliability. **Proposed IRO-010-4, Requirement R3:** **R3**. Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications.
R10. In instances where there is a difference in derived limits, the Reliability Coordinator and its Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.	For Reliability Coordinators, this requirement is replaced by approved IRO-009-1, Requirement R5. For Transmission Operators, Balancing Authorities, and Generator Operators, this requirement is replaced by proposed TOP-001-3, Requirement R18. The Transmission Service Provider and Purchasing-Selling Entity will receive instructions on limits from the previously cited entities and can thus be deleted from the requirement. **Approved IRO-009-1, Requirement R5:**

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R5. If unanimity cannot be reached on the value for an IROL or its Tv, each Reliability Coordinator that monitors that Facility (or group of Facilities) shall, without delay, use the most conservative of the values (the value with the least impact on reliability) under consideration. **Proposed TOP-001-3, Requirement R18:** **R18**. Each Transmission Operator shall operate to the most limiting parameter in instances where there is a difference in SOLs.
R11. The Transmission Service Providers shall respect these SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.	This requirement is replaced by proposed MOD-001-2, Requirement R2. **Proposed MOD-001-2, Requirement R2:** **R2**. Each Transmission Service Provider that determines Available Flowgate Capability (AFC) or Available Transfer Capability (ATC) shall develop an Available Transfer Capability Implementation Document (ATCID) that describes the methodology (or methodologies) for determining AFC or ATC values. The methodology (or methodologies) shall reflect the Transmission Service Provider's current practices for determining AFC or ATC values. **2.1.** Each methodology shall describe the method used to account for the following elements, provided such elements impact the determination of AFC or ATC: **2.1.1.** The simulation of transfers performed through the adjustment of generation, Load, or both; **2.1.2.** Transmission topology, including, but not limited to, additions and retirements; **2.1.3.** Expected transmission uses; **2.1.4.** Planned outages**;** **2.1.5.** Parallel path (loop flow) adjustments; **2.1.6.** Load forecast; and **2.1.7.** Generator dispatch, including, but not limited to, additions and retirements. **2.2.** Each Transmission Service Provider that uses the Flowgate Methodology shall, for reliability-related constraints identified in part 1.3, use the AFC determined by the Transmission Service Provider for that constraint.
R12. Each Reliability Coordinator who foresees a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area shall	The requirement is replaced by proposed IRO-008-2, Requirements R3, R5, and R6. **Proposed IRO-008-2, Requirement R3:**

Standard IRO-005-3.1a — Reliability Coordination - Current Day Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. The Reliability Coordinator shall notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem has been mitigated.	**R3.** Each Reliability Coordinator shall notify impacted entities identified in its Operating Plan(s) cited in Requirement R2 as to their role in that plan(s). **Proposed IRO-008-2, Requirement R5:** **R5**. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area. **Proposed IRO-008-2, Requirement R6:** **R6**. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R5 has been prevented or mitigated.

IRO-008-1 Reliability Coordination Operational Analyses and Real-time Assessments	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Reliability Coordinator shall perform an Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions.	This requirement is replaced by proposed IRO-008-2, Requirement R1. **Proposed IRO-008-2, Requirement R1:** **R1.** Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area.
R2. Each Reliability Coordinator shall perform a Real-Time Assessment at least once every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs.	This requirement is replaced by proposed IRO-008-2, Requirement R4. **Proposed IRO-008-2, Requirement R4:** **R4.** Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
R3. When a Reliability Coordinator determines that the results of an Operational Planning Analysis or Real-Time Assessment indicates the need for specific operational actions to prevent or mitigate an instance of exceeding an IROL, the Reliability Coordinator shall share its results with those entities that are expected to take those actions.	This requirement is replaced by proposed IRO-008-2, Requirements R3 and R5. **Proposed IRO-008-2, Requirements R3 and R5:** **R3.** Each Reliability Coordinator shall notify impacted entities identified in its Operating Plan(s) cited in Requirement R2 as to their role in that plan(s). **Proposed IRO-008-2, R6:** **R5**. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area.

Standard IRO-010-1a Reliability Coordinator Data Specification and Collection	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following: **R1.1.** List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. **R1.2.** Mutually agreeable format. **R1.3.** Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses). **R1.4.** Process for data provision when automated Real-Time system operating data is unavailable.	This requirement is replaced by proposed IRO-010-2, Requirements R1 and R3. **Proposed IRO-010-2, Requirement R1:** **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: **1.1** A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **1.2** Provisions for notification of current Protection System and Special Protection System status, failure, or degradation that impacts System reliability. **1.3** A periodicity for providing data. **1.4** The deadline by which the respondent is to provide the indicated data. **Proposed IRO-010-2, Requirement R3:** **R3.** Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications using: **3.1** A mutually agreeable format **3.2** A mutually agreeable process for resolving data conflicts **3.3** A mutually agreeable security protocol
R2. The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.	This requirement is replaced by proposed IRO-010-2, Requirement R2. **Proposed IRO-010-2, Requirement R2:** **R2.** The Reliability Coordinator shall distribute its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

Standard IRO-010-1a Reliability Coordinator Data Specification and Collection	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship.	This requirement is replaced by proposed IRO-010-2, Requirement R3. **Proposed IRO-010-2, Requirement R3:** **R3.** Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications using: **3.1** A mutually agreeable format **3.2** A mutually agreeable process for resolving data conflicts **3.3** A mutually agreeable security protocol

Standard IRO-014-1 — Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. The Reliability Coordinator shall have Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with one or more other Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall address Scenarios that affect other Reliability Coordinator Areas as well as those developed in coordination with other Reliability Coordinators **R1.1** These Operating Procedures, Processes, or Plans shall collectively address, as a minimum, the following: **R1.1.1** Communications and notifications, including the conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and	This requirement is replaced by proposed IRO-014-3, Requirement R1. Data is covered in proposed IRO-010-2, Requirement R1. **Proposed IRO-014-3, Requirement R1:** **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: **1.1** Communications and notifications, and the process to follow in making those notifications. **1.2** Energy and capacity shortages. **1.3** Control of voltage, including the coordination of reactive resources. **1.4** Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and Real-time Assessments.

Standard IRO-014-1 — Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
information to be exchanged with other Reliability Coordinators. **R1.1.2** Energy and capacity shortages. **R1.1.3** Planned or unplanned outage information. **R1.1.4** Voltage control, including the coordination of reactive resources for voltage control. **R1.1.5** Coordination of information exchange to support reliability assessments. **R1.1.6** Authority to act to prevent and mitigate instances of causing Adverse Reliability Impacts to other Reliability Coordinator Areas.	**1.5** Authority to act to prevent and mitigate system conditions which could adversely impact other Reliability Coordinator Areas. **1.6** Provisions for weekly conference calls. **Proposed IRO-010-2, Requirement R1:** **R1**. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R2. Each Reliability Coordinator's Operating Procedure, Process, or Plan that requires one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) shall be: **R2.1.** Agreed to by all the Reliability Coordinators required to take the indicated action(s). **R2.2**. Distributed to all Reliability Coordinators that are required to take the indicated action(s).	This requirement is replaced by proposed IRO-014-3, Requirement R2. **Proposed IRO-014-3, Requirement R2:** **R2.** Each Reliability Coordinator shall maintain its Operating Procedure, Operating Process, or Operating Plan identified in Requirement R1 as follows: **2.1** Review and update annually with no more than 15 months between reviews. **2.2** Obtain written agreement from all of the Reliability Coordinators required to take the indicated action(s) for each update. **2.3** Distribute to all Reliability Coordinators that are required to take the indicated action(s) within 30 days of an update.
R3. A Reliability Coordinator's Operating Procedures, Processes, or Plans developed to support a Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan shall include: **R3.1.** A reference to the associated Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan.	R3.1 is a strictly administrative requirement with no reliability benefit and is proposed to be retired under the P81 criteria. R3.2 is replaced by proposed IRO-014-3, Requirement R1, Part 1.5. **Proposed IRO-014-3, Requirement R1**: **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection

Standard IRO-014-1 — Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R3.2. The agreed-upon actions from the associated Reliability Coordinator-to- Reliability Coordinator Operating Procedure, Process, or Plan.	reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: **1.1** Criteria and processes for notifications. **1.2** Energy and capacity shortages. **1.3** Control of voltage, including the coordination of reactive resources. **1.4** Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and Real-time Assessments. **1.5** Provisions for periodic communications to support reliable operations.
R4. Each of the Operating Procedures, Processes, and Plans addressed in Reliability Standard IRO-014 Requirement 1 and Requirement 3 shall: **R4.1.** Include version control number or date. **R4.2.** Include a distribution list. **R4.3**. Be reviewed, at least once every three years, and updated if needed	This requirement is proposed to be retired as it is strictly an administrative requirement with no reliability benefit.

Standard IRO-015-1 - Notifications and Information Exchange Between Reliability Coordinators	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. The Reliability Coordinator shall follow its Operating Procedures, Processes, or Plans for making notifications and exchanging reliability-related information with other Reliability Coordinators. **R1.1** The Reliability Coordinator shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas.	This requirement is replaced by proposed IRO-014-3, Requirement R1. **Proposed IRO-014-3, Requirement R1:** **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following:
R2. The Reliability Coordinator shall participate in agreed upon conference calls and other communication forums with adjacent Reliability Coordinators. **R2.1** The frequency of these conference calls shall be agreed upon by all involved Reliability Coordinators and shall be at least weekly.	This requirement is replaced by proposed IRO-014-3, Requirement R1, Part 1.5. **Proposed IRO-014-3, Requirement R1, Part 1.5:** **R1, Part 1.5:** Provisions for periodic communications to support reliable operations.
R3. The Reliability Coordinator shall provide reliability-related information as requested by other Reliability Coordinators.	This requirement is replaced by proposed IRO-010-2, Requirement R3. **Proposed IRO-010-2, Requirement R3:** **R3.** Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications …

Standard IRO-016-1 - Coordination of Real-time Activities Between Reliability Coordinators	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. The Reliability Coordinator that identifies a potential, expected, or actual problem that requires the actions of one or more other Reliability Coordinators shall contact the other Reliability Coordinator(s) to confirm that there is a problem and then discuss options and decide upon a solution to prevent or resolve the identified problem. **R1.1** If the involved Reliability Coordinators agree on the problem and the actions to take to prevent or mitigate the system condition, each involved Reliability Coordinator shall implement the agreed-upon solution, and notify the involved Reliability Coordinators of the action(s) taken. **R1.2** If the involved Reliability Coordinators cannot agree on the problem(s) each Reliability Coordinator shall re-evaluate the causes of the disagreement (bad data, status, study results, tools, etc.). **R1.2.1** If time permits, this re-evaluation shall be done before taking corrective actions. **R1.2.2** If time does not permit, then each Reliability Coordinator shall operate as though the problem(s) exist(s) until the conflicting system status is resolved **R1.3** If the involved Reliability Coordinators cannot agree on the solution, the more conservative solution shall be implemented.	Proposed IRO-014-3, Requirements R3 through R6 are revised versions of approved IRO-016-1, Requirement R1 and its sub-requirements. **Proposed IRO-014-3, Requirement R3:** **R3.** Each Reliability Coordinator, upon identification of an expected or actual Emergency in its Reliability Coordinator Area, shall notify other impacted Reliability Coordinators. **Proposed IRO-014-3, Requirement R4:** **R4.** Each impacted Reliability Coordinator shall operate as though the Emergency exists during each instance where Reliability Coordinators disagree on the existence of an Emergency. **Proposed IRO-014-3, Requirement R5:** **R5**. Each Reliability Coordinator that Identifies an Emergency in its Reliability Coordinator Area shall develop an action plan to resolve the Emergency during those instances where impacted Reliability Coordinators disagree on the existence of an Emergency. **Proposed IRO-014-3, Requirement R6:** **R6.** Each impacted Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identifies the Emergency during those instances where Reliability Coordinators disagree on the existence of an Emergency, unless such actions would violate safety, equipment, regulatory, or statutory requirements.
R2. The Reliability Coordinator shall document (via operator logs or other data sources) its actions taken for either the event or for the disagreement on the problem(s) or for both.	This retirement of this Requirement was approved by FERC effective January 21, 2014 as part of the Paragraph 81 Project.

Standard PER-001-0.2 – Operating Personnel Responsibility and Authority	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Transmission Operator and Balancing Authority shall provide operating personnel with the responsibility and authority to implement real-time actions to ensure the stable and reliable operation of the Bulk Electric System	The SDT is proposing to retire this requirement. In FERC Order 693a, paragraph 112, the Commission clarifies that a Reliability Coordinator's authority to issue directives arises out of the Commission's approval of Reliability Standards that mandate compliance with such directives. The SDT reasonably applied this same logic to Transmission Operators and Balancing Authorities and that makes this requirement superfluous and thus it can be deleted. FERC Order 693a, paragraph 112: In response to Avista, the Commission clarifies that a reliability coordinator's authority to issue directives arises out of the Commission's approval of Reliability Standards that mandate compliance with such directives. Avista is correct that contracts are unnecessary to authorize reliability coordinators to issue directives. Under the voluntary reliability scheme in place prior to section 215 of the FPA, a contractual basis was needed to assure that entities would comply with a reliability coordinator's directive. Pursuant to the current, mandatory reliability scheme established by statute, contracts are no longer needed. We view the concerns raised by Avista as part of the transition from a voluntary to mandatory scheme. Although, as noted by Avista, IRO-001-1 retains references to contracts, we view these as vestiges of an earlier program that no longer control given the current, mandatory mechanism.

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Transmission Operator shall have the responsibility and clear decision-making authority to take whatever actions are needed to ensure the reliability of its area and shall exercise specific authority to alleviate operating emergencies.	This is a generic requirement that is no longer necessary since there are now specific requirements that cover all needed reliability actions. Deletion of this requirement doesn't alleviate responsibility for actions as each individual requirement in the Reliability Standards now specifies an action and a responsible entity. These needed actions required for reliability of the Bulk Power System have been more clearly laid out in revised standards. (See FERC Order 693a, paragraph 112.) The requirement is also non-specific, ambiguous, and not performance oriented. If an entity doesn't perform as specified in an individual requirement, then they are held accountable at that level. All of this makes this requirement redundant. The overall reliability of the Bulk Power System is not adversely affected by the deletion of this requirement. In FERC Order 693a, paragraph 112, the Commission clarifies that a Reliability Coordinator's authority to issue directives arises out of the Commission's approval of Reliability Standards that mandate compliance with such directives. The SDT believes that this same logic applies to Transmission Operators and Balancing Authorities, makes this requirement superfluous, and, thus, it can be deleted. FERC Order 693a, paragraph 112: "In response to Avista, the Commission clarifies that a reliability coordinator's authority to issue directives arises out of the Commission's approval of Reliability Standards that mandate compliance with such directives. Avista is correct that contracts are unnecessary to authorize reliability coordinators to issue directives. Under the voluntary reliability scheme in place prior to section 215 of the FPA, a contractual basis was needed to assure that entities would comply with a reliability coordinator's directive. Pursuant to the current, mandatory reliability scheme established by statute, contracts are no longer needed. We view the concerns raised by Avista as part of the transition from a voluntary to mandatory scheme. Although, as noted by Avista, IRO-001-1 retains references to contracts, we view these as vestiges of an earlier program that no longer control given the current, mandatory mechanism. The SDT does not believe that there is a need for a decision-making authority requirement as the decision-making authority is inherent in proposed TOP-001-4, Requirement R1 which states that the Transmission Operator must act or issue Operating Instructions.

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed TOP-001-3, Requirement R1: **R1.** Each Transmission Operator shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions.
R2. Each Transmission Operator shall take immediate actions to alleviate operating emergencies including curtailing transmission service or energy schedules, operating equipment (e.g., generators, phase shifters, breakers), shedding firm load, etc.	This requirement replaced by proposed TOP-001-3, Requirements R12 and R14. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall comply with reliability directives issued by the Reliability Coordinator, and each Balancing Authority and Generator Operator shall comply with reliability directives issued by the Transmission Operator, unless such actions would violate safety, equipment, regulatory or statutory requirements. Under these circumstances the Transmission Operator, Balancing Authority or Generator Operator shall immediately inform the Reliability Coordinator or Transmission Operator of the inability to perform the directive so that the Reliability Coordinator or Transmission Operator can implement alternate remedial actions.	This requirement replaced by proposed IRO-001-2, Requirements R2 and R3 and proposed TOP-001-3, Requirements R3 and R4. Proposed IRO-001-2, R2: **Proposed IRO-001-2, Requirement R2:** **R2.** Each Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, and Distribution Provider shall comply with its Reliability Coordinator's Operating Instructions unless compliance with the Operating Instructions cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements. **Proposed IRO-001-2, Requirement R3:** **R3.** Each Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, and Distribution Provider shall inform its Reliability Coordinator upon recognition of its inability to perform an Operating Instruction in accordance with Requirement R2. **Proposed TOP-001-3, Requirement R3:** **R3.** Each Balancing Authority, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements.

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed TOP-001-3, Requirement R4: **R4.** Each Balancing Authority, Generator Operator, and Distribution Provider shall inform its Transmission Operator of its inability to perform an Operating Instruction issued by that Transmission Operator in Requirement R3.
R4. Each Distribution Provider and Load Serving Entity shall comply with all reliability directives issued by the Transmission Operator, including shedding firm load, unless such actions would violate safety, equipment, regulatory or statutory requirements. Under these circumstances, the Distribution Provider or Load Serving Entity shall immediately inform the Transmission Operator of the inability to perform the directive so that the Transmission Operator can implement alternate remedial actions.	This requirement replaced by proposed TOP-001-3, Requirements R3 and R4. **Proposed TOP-001-3, Requirements R3 and R4:** **R3.** Each Balancing Authority, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. Proposed TOP-001-3, R4: **R4.** Each Balancing Authority, Generator Operator, and Distribution Provider shall inform its Transmission Operator of its inability to perform an Operating Instruction issued by that Transmission Operator in Requirement R3.
R5. Each Transmission Operator shall inform its Reliability Coordinator and any other potentially affected Transmission Operators of real time or anticipated emergency conditions, and take actions to avoid, when possible, or mitigate the emergency.	This requirement replaced by proposed TOP-001-3, Requirements R8, R12, and R14. **Proposed TOP-001-3, Requirement R8:** **R8**. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
R6. Each Transmission Operator, Balancing Authority, and Generator Operator shall render all available emergency	The Generator Operator was deleted from this requirement since it will only respond to such requests if they were in the form of an Operating Instruction from its Transmission Operator

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
assistance to others as requested, provided that the requesting entity has implemented its comparable emergency procedures, unless such actions would violate safety, equipment, or regulatory or statutory requirements.	or Balancing Authority which is covered in proposed TOP-001-3, Requirements R3, R4, R5 and R6. Assistance at the Transmission Operator level is provided through proposed TOP-001-3, Requirement R7. 'Emergency' deleted as the assistance is assistance in response to the other entities' emergency. Balancing Authorities provide assistance under approved EOP-001-2.1b, Requirement R1. **Approved EOP-001.2.1b, Requirement R1:** **R1.** Balancing Authorities shall have operating agreements with adjacent Balancing Authorities that shall, at a minimum, contain provisions for emergency assistance, including provisions to obtain emergency assistance from remote Balancing Authorities**.** **Proposed TOP-001-3, Requirement R3:** **R3.** Each Balancing Authority, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. **Proposed TOP-001-3, Requirement R4:** R4. Each Balancing Authority, Generator Operator, and Distribution Provider shall inform its Transmission Operator of its inability to perform an Operating Instruction issued by that Transmission Operator in Requirement R3. **Proposed TOP-001-3, Requirement R5:** **R5.** Each Transmission Operator, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Balancing Authority, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. **Proposed TOP-001-3, Requirement R6:** **R6.** Each Transmission Operator, Generator Operator, and Distribution Provider shall inform its Balancing Authority of its inability to perform an Operating Instruction issued by that Balancing Authority. **Proposed TOP-001-3, Requirement R7:**

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R7. Each Transmission Operator shall assist other Transmission Operators within its Reliability Coordinator Area, if requested and able, provided that the requesting entity has implemented its comparable Emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements.
R7. Each Transmission Operator and Generator Operator shall not remove Bulk Electric System facilities from service if removing those facilities would burden neighboring systems unless: **R7.1** For a generator outage, the Generator Operator shall notify and coordinate with the Transmission Operator. The Transmission Operator shall notify the Reliability Coordinator and other affected Transmission Operators, and coordinate the impact of removing the Bulk Electric System facility. **R7.2** For a transmission facility, the Transmission Operator shall notify and coordinate with its Reliability Coordinator. The Transmission Operator shall notify other affected Transmission Operators, and coordinate the impact of removing the Bulk Electric System facility. **R7.3** When time does not permit such notifications and coordination, or when immediate action is required to prevent a hazard to the public, lengthy customer service interruption, or damage to facilities, the Generator Operator shall notify the Transmission Operator, and the Transmission Operator shall notify its Reliability Coordinator and adjacent Transmission Operators, at the earliest possible time.	The Generator Operator can't know if their actions will burden neighboring systems since they do not have reliability data. The Transmission Operator will know if the Generator Operator actions will burden neighboring systems and will receive this data through proposed TOP-003-3, Requirements R1 and R5 and is required to act on this information as per proposed TOP-001-3, Requirement R8. Proposed IRO-010-2, Requirements R1 and R3 handle the notifications from the Transmission Operator to the Reliability Coordinator. **Proposed TOP-001-3, Requirement R8**: **R8.** Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. **Proposed TOP-003-3, Requirement R1:** **R1**. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications … **Proposed IRO-010-2, Requirement R1:** **R1**. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed IRO-010-2, Requirement R3: **R3.** Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications …
R8. During a system emergency, the Balancing Authority and Transmission Operator shall immediately take action to restore the Real and Reactive Power Balance. If the Balancing Authority or Transmission Operator is unable to restore Real and Reactive Power Balance it shall request emergency assistance from the Reliability Coordinator. If corrective action or emergency assistance is not adequate to mitigate the Real and Reactive Power Balance, then the Reliability Coordinator, Balancing Authority, and Transmission Operator shall implement firm load shedding.	First sentence – real power: For the Balancing Authority part of the requirement, replaced by approved EOP-002-2.1, Requirement R6. The Transmission Operator does not balance real power so that part of the sentence can be deleted per the NERC Functional Model V5. First sentence – reactive power: Replaced by approved VAR-001-4, Requirement R3 for the Transmission Operator which covers reactive power requirements and the meaning of balancing reactive power for the Transmission Operator. The Balancing Authority must be told by the Transmission Operator to take actions regarding reactive power per the NERC Functional Model V5 and therefore the Balancing Authority can be deleted from this part of the requirement. Second sentence – The Balancing Authority must be told by the Transmission Operator to take actions regarding reactive power and thus the Balancing Authority is not necessary. Replaced by approved VAR-001-4, Requirements R1 for the Transmission Operator. Third sentence – Replaced by approved IRO-009-1, Requirements R1 and R2 for the Reliability Coordinator. Replaced by approved EOP-003-2, Requirement R1 for the Transmission Operator and Balancing Authority. **Approved EOP-002-3.1, Requirement R6:** **R6**. If the Balancing Authority cannot comply with the Control Performance and Disturbance Control Standards, then it shall immediately implement remedies to do so. **Approved VAR-001-4, Requirement R1:** **R1.** Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits.

Standard TOP-001-1a — Reliability Responsibilities and Authorities	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Approved VAR-001-4, Requirement R3: **R3**. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary. **Approved IRO-009-1, Requirement R1:** **R1.** For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs. **Approved IRO-009-1, Requirement R2:** **R2.** For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's Tv. **Approved EOP-003-2, Requirement R1:** **R1.** After taking all other remedial steps, a Transmission Operator or Balancing Authority operating with insufficient generation or transmission capacity shall shed customer load rather than risk an uncontrolled failure of components or cascading outages of the Interconnection.

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Balancing Authority and Transmission Operator shall maintain a set of current plans that are designed to evaluate options and set procedures for reliable operation through a reasonable future time period. In addition, each Balancing Authority and Transmission Operator shall be responsible for using available personnel and system equipment to implement these plans to ensure that interconnected system reliability will be maintained.	First sentence, retained for Balancing Authority and Transmission Operator and moved to proposed TOP-002-4, Requirements R2 and R4. Second sentence – Replaced by proposed TOP-001-3, Requirements R1 and R2 for Balancing Authority and Transmission Operator, which requires action to resolve issues. **Proposed TOP-002-4, Requirement R2:** **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. **Proposed TOP-002-4, Requirement R4:** **R4.** Each Balancing Authority shall have an Operating Plan(s) for the next-day … **Proposed TOP-001-3, Requirement R1:** **R1.** Each Transmission Operator shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions. **Proposed TOP-001-3, Requirement R2:** **R2.** Each Balancing Authority shall act to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions.
R2. Each Balancing Authority and Transmission Operator shall ensure its operating personnel participate in the system planning and design study processes, so that these studies contain the operating personnel perspective and system operating personnel are aware of the planning purpose.	The SDT is proposing to retire this requirement. While it may be good utility practice to do this, it is of marginal benefit to reliability and is more of a 'how' to conduct business as opposed to a definitive 'what' to do.
R3. Each Load Serving Entity and Generator Operator shall coordinate (where confidentiality agreements allow) its current-day, next-day, and seasonal operations with its Host Balancing Authority and Transmission Service Provider. Each Balancing Authority and Transmission Service Provider shall coordinate its current-day, next-day, and seasonal operations with its Transmission Operator.	The Transmission Operator and Balancing Authority will receive the necessary data in proposed TOP-003-3, Requirement R5. The Transmission Service Provider provisions are covered in approved MOD-001-1a, Requirement R1; approved MOD-030-2, Requirement R3; and approved MOD-001-1a, Requirement R2. The coordination of plans is in proposed IRO-017-1, Requirement R2. **Proposed TOP-003-3, Requirement R5:**

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications … **Approved MOD-001-1a, Requirement R1:** **R1.** Each Transmission Operator shall select one of the methodologies1 listed below for calculating Available Transfer Capability (ATC) or Available Flowgate Capability (AFC) for each ATC Path per time period identified in R2 for those Facilities within its Transmission operating area. **Approved MOD-030-2, Requirement R3:** **R3.** The Transmission Operator shall make available to the Transmission Service Provider a Transmission model to determine Available Flowgate Capability (AFC) that … **Approved MOD-001-1a, Requirement R2:** **R2**. Each Transmission Service Provider shall calculate ATC or AFC values as listed below using the methodology or methodologies selected by its Transmission Operator(s). **Proposed IRO-017-1, Requirement R2:** **R2.** Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator's outage coordination process.
R4. Each Balancing Authority and Transmission Operator shall coordinate (where confidentiality agreements allow) its current-day, next-day, and seasonal planning and operations with neighboring Balancing Authorities and Transmission Operators and with its Reliability Coordinator, so that normal Interconnection operation will proceed in an orderly and consistent manner.	Coordination of plans is covered in proposed IRO-017-1, Requirement R2 and proposed IRO-008-2, Requirement R2. **Proposed IRO-017-1, Requirement R2:** **R2.** Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator's outage coordination process. **Proposed iRO-008-2, Requirement R2:** **R2**. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R5. Each Balancing Authority and Transmission Operator shall plan to meet scheduled system configuration, generation dispatch, interchange scheduling and demand patterns.	This requirement has been moved to proposed TOP-002-4, Requirements R2 and R4. **Proposed TOP-002-4, Requirement R2:** **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. **Proposed TOP-002-4, Requirement R4:** **R4.** Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: **4.1** Expected generation resource commitment and dispatch. **4.2** Interchange scheduling **4.3** Demand patterns **4.4** Capacity and energy reserve requirements, including deliverability capability
R6. Each Balancing Authority and Transmission Operator shall plan to meet unscheduled changes in system configuration and generation dispatch (at a minimum N-1 Contingency planning) in accordance with NERC, Regional Reliability Organization, subregional, and local reliability requirements.	The part of the requirement dealing with the Balancing Authority and Transmission Operator is replaced by proposed TOP-002-4, Requirements R2 and R4. The n-1 Contingency planning is 'built in' to the Operational Planning Analysis since SOLs are derived according to the approved FAC standards which include Contingency planning. In addition, the definition of Operational Planning Analysis has been revised to better show the intent of the Contingency aspects of the analysis. The SDT does not believe that there is a need to replace the last part of the sentence 'in accordance with…' with the advent of the ERO and enforceable reliability standards. **Proposed TOP-002-4, Requirement R2:** **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. **Proposed TOP-002-4, Requirement R4:**

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch. 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed definition: Operational Planning Analysis** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
R7. Each Balancing Authority shall plan to meet capacity and energy reserve requirements, including the deliverability/capability for any single Contingency.	This requirement is replaced by proposed TOP-002-4, Requirement R4. **Proposed TOP-002-4, Requirement R4:** **R4.** Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: **4.1** Expected generation resource commitment and dispatch. **4.2** Interchange scheduling **4.3** Demand patterns **4.4** Capacity and energy reserve requirements, including deliverability capability
R8. Each Balancing Authority shall plan to meet voltage and/or reactive limits, including the deliverability/capability for any single contingency.	Voltage and reactive power balance are the responsibility of the Transmission Operator and are replaced by approved VAR-001-4, Requirement R1. Deliverability by the Balancing Authority is covered by proposed TOP-002-4, Requirement R4. **Approved VAR-001-4, Requirement R1:** **R1.** Each Transmission Operator shall specify a system voltage schedule (which is either a range or a

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits. **Proposed TOP-002-4, Requirement R4:** R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: **4.1** Expected generation resource commitment and dispatch. **4.2** Interchange scheduling **4.3** Demand patterns **4.4** Capacity and energy reserve requirements, including deliverability capability
R9. Each Balancing Authority shall plan to meet Interchange Schedules and ramps.	This requirement is replaced by approved INT-006-4, Requirement R5, and proposed TOP-002-4, Requirement R4. **Approved INT-006-4, Requirement R5:** **R5**. For each Arranged Interchange that is transitioned to Confirmed Interchange, the Sink Balancing Authority shall notify the following entities of the on-time Confirmed Interchange such that the notification is delivered in time to be incorporated into scheduling systems prior to ramp start as specified in Attachment 1, Column D: **Proposed TOP-002-4, Requirement R4:** **R4.** Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: **4.1** Expected generation resource commitment and dispatch. **4.2** Interchange scheduling **4.3** Demand patterns **4.4** Capacity and energy reserve requirements, including deliverability capability
R10. Each Balancing Authority and Transmission Operator shall plan to meet all System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs).	Balancing Authority - The Balancing Authority is only responsible to respond to Operating Instructions as per the definition of Balancing Authority in the NERC Glossary and, thus, consistent with the Commission-approved interpretation of Requirement R10, Balancing

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Authorities have been removed from the applicability of this requirement. SOLs and IROLs are limits which the Balancing Authority may not have (and is not required to have) the ability to monitor or control. The Transmission Operator, who is required to monitor SOLs, instructs the Balancing Authority as to what to do in these situations. As stated in the NERC Functional Model V5, "the Balancing Authority's mission is to maintain the balance between loads and resources in real time within its Balancing Authority Area by keeping its actual interchange equal to its scheduled interchange and meeting its frequency bias obligation". The Balancing Authority does not possess the Bulk Power System information necessary to manage Transmission flows. Therefore, the Balancing Authority can only plan to meet SOLs and IROLs by responding to directions (as shown in proposed TOP-001-3, Requirement R3) from the Transmission Operator, including scheduling and operating resources within the limits prescribed by the Transmission Operator. The Balancing Authority must coordinate outage information and exchange data required to allow the Transmission Operator to deal with SOLs. Those items are in proposed IRO-017-1, Requirement R2 and proposed TOP-003-3, Requirement R5. That information is considered by the Transmission Operator when formulating its Operating Plans and since IROLs are a sub-set of SOLs, this is covered in proposed TOP-002-4, requirement R2. **Proposed TOP-001-3, Requirement R3:** **R3.** Each Balancing Authority, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. **Proposed IRO-017-1, Requirement R2:** **R2.** Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator's outage coordination process. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications **Proposed TOP-002-4, Requirement R2:** **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.
R11. The Transmission Operator shall perform seasonal, next-day, and current-day Bulk Electric System studies to determine SOLs. Neighboring Transmission Operators shall utilize identical SOLs for common facilities. The Transmission Operator shall update these Bulk Electric System studies as necessary to reflect current system conditions; and shall make the results of Bulk Electric System studies available to the Transmission Operators, Balancing Authorities (subject confidentiality requirements), and to its Reliability Coordinator.	First sentence replaced by proposed TOP-002-4, Requirement R1, proposed TOP-001-3, Requirement R13. Specific requirements for seasonal studies are not necessary as proposed IRO-017-1 allows for the Reliability Coordinator to determine the timeframe of the studies that it needs. Second sentence – SOLs are set by the Transmission Operator in approved FAC-014-2, Requirement R2 according to the methodology distributed by the Reliability Coordinator in approved FAC-011-2, Requirement R4, Part 4.3. This should assure that SOLs are consistent for common facilities. Third sentence – Replaced by proposed TOP-001-3, Requirement R13 and proposed TOP-001-3, Requirement R8. **Proposed TOP-002-4, Requirement R1:** **R1**. Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed TOP-001-3, Requirement R13:** **R13**. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Approved FAC-014-2, Requirement R2:**

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R2. The Transmission Operator shall establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology. **Approved FAC-011-2, Requirement R4:** **R4.** The Reliability Coordinator shall issue its SOL Methodology and any changes to that methodology, prior to the effectiveness of the Methodology or of a change to the Methodology, to all of the following: 4.3 Each Transmission Operator that operates in the Reliability Coordinator Area. **Proposed TOP-001-3, Requirement R8:** **R8**. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency.
R12. The Transmission Service Provider shall include known SOLs or IROLs within its area and neighboring areas in the determination of transfer capabilities, in accordance with filed tariffs and/or regional Total Transfer Capability and Available Transfer Capability calculation processes.	Replaced by approved MOD-028-2, Requirement R6.1; approved MOD-029-1a, Requirement R3; and approved MOD-030-2, Requirement R2.4. Because IROLs by definition are a subset of SOLs, IROLs are included. **Approved MOD-028-2, Requirement R6.1:** **6.1** Determine the incremental Transfer Capability for each ATC Path by increasing generation and/or decreasing load within the source Balancing Authority area and decreasing generation and/or increasing load within the sink Balancing Authority area until either: • A System Operating Limit is reached on the Transmission Service Provider's system, or • A SOL is reached on any other adjacent system in the Transmission model that is not on the study path and the distribution factor is 5% or greater. **Approved MOD-029-1a, Requirement R3:** **R3.** Each Transmission Operator shall establish the TTC at the lesser of the value calculated in R2 or any System Operating Limit (SOL) for that ATC Path. **Approved MOD-030-2, Requirement R2.4:**

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	2.4 Establish the TFC of each of the defined Flowgates as equal to: - For thermal limits, the System Operating Limit (SOL) of the Flowgate. - For voltage or stability limits, the flow that will respect the SOL of the Flowgate.
R13. At the request of the Balancing Authority or Transmission Operator, a Generator Operator shall perform generating real and reactive capability verification that shall include, among other variables, weather, ambient air and water conditions, and fuel quality and quantity, and provide the results to the Balancing Authority or Transmission Operator operating personnel as requested.	This requirement is replaced by proposed TOP-001-3, Requirement R2 where a Balancing Authority can issue Operating instructions to the Generator Operator which could include verification. The SDT believes that this requirement does not apply to the Transmission Operator since it is dealing exclusively with generation. The data coming back from the verification effort would be included in the Balancing Authority data specification as shown in proposed TOP-003-3, Requirements R2 and R5. **Proposed TOP-001-3, Requirement R2:** **R2.** Each Balancing Authority shall act to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions. **Proposed TOP-003-3, Requirement R2:** **R2.** Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications.
R14. Generator Operators shall, without any intentional time delay, notify their Balancing Authority and Transmission Operator of changes in capabilities and characteristics including but not limited to: **14.1** Changes in real and reactive output capabilities. (Retired August 1, 2007)	This requirement is replaced by proposed TOP-003-3, Requirement R5. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications …

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
14.2 Changes in real output capabilities(Effective August 1, 2007) **14.3** Automatic Voltage Regulator status and mode setting. (Retired August 1, 2007)	
R15. Generation Operators shall, at the request of the Balancing Authority or Transmission Operator, provide a forecast of expected real power output to assist in operations planning (e.g., a seven-day forecast of real output).	This requirement is replaced by proposed TOP-003-3, Requirement R5. **Proposed TOP-003-3, Requirement R5:** **R5**. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications.
R16. Subject to standards of conduct and confidentiality agreements, Transmission Operators shall, without any intentional time delay, notify their Reliability Coordinator and Balancing Authority of changes in capabilities and characteristics including but not limited to: **16.1** - Changes in transmission facility status. **16.2** - Changes in transmission facility rating	This requirement replaced by proposed IRO-010-2, Requirement R3. **Proposed IRO-010-2, Requirement R3:** **R3**. Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications
R17. Balancing Authorities and Transmission Operators shall, without any intentional time delay, communicate the information described in the requirements R1 to R16 above to their Reliability Coordinator.	This requirement replaced by proposed IRO-010-2, Requirement R3. **Proposed IRO-010-2, Requirement R3:** **R3.** Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications using:
R18. Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use uniform line identifiers when referring to transmission facilities of an interconnected network.	This requirement is proposed for retirement as it adds no reliability benefit. Entities have existing processes that handle this issue. There has never been a documented case of the lack of uniform line identifiers contributing to a system reliability issue. This is an administrative item as seen in the measure which simply requires a list of line identifiers. The true reliability issue is not the name of a line but what is happening to it, pointing out the

Standard TOP-002-2.1b — Normal Operations Planning	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	difficulty in assigning compliance responsibility for such a requirement, as well as the near impossibility of coming up with truly unique identifiers on a nation-wide basis. The bottom line is that this situation is handled by the operators as part of their normal responsibilities and no one is aware of a switching error caused by confusion over line identifiers.
R19. Each Balancing Authority and Transmission Operator shall maintain accurate computer models utilized for analyzing and planning system operations.	Accuracy is a relative term that would be difficult to objectively measure and assess compliance with. Proposed TOP-003-3, Requirement R1 stipulates that entities must supply the data needed for reliability. The expectation is that the Transmission Operator would specify the data it requires to perform its functions which would include all of the data it needs to create the model for its analyses and studies. The requirement language allows the entity to specify accuracy of the data provided as part of its data specification. This will, in turn, lead to the creation of an accurate model based on accurate data received. In addition, proposed TOP-003-3, Requirement R5, Part 5.2 allows for the resolution of any data causing conflicts that could affect the models. **Proposed TOP-003-3, Requirement R1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **Proposed TOP-003-3, Requirement R5, Part 5.2:** **5.2** A mutually agreeable process for resolving data conflicts

Standard TOP-003-1 — Planned Outage Coordination	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Generator Operators and Transmission Operators shall provide planned outage information. **1.1** Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements. **1.2** Each Transmission Operator shall provide outage information daily to its Reliability Coordinator, and to affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. The Reliability Coordinator shall establish the outage reporting requirements. **1.3** Such information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.	Parts 1.1, 1.2, and 1.3 are addressed as follows: **1.1** Generator Operators will provide planned outage information to Transmission Operators through proposed TOP-003-3, Requirement R5. Reporting requirements are set in proposed TOP-003-3, Requirement R1. **1.2** Transmission Operators will provide planned outage information to Reliability Coordinators through proposed IRO-010-2, Requirement R3. Reporting requirements are set in proposed IRO-010-2, Requirement R1. **1.3** Reporting requirements are set in proposed TOP-003-3, Requirement R1 and proposed IRO-010-2, Requirement R1. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications … **Proposed TOP-003-3, Requirement R1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification … **Proposed IRO-010-2, Requirement R3:** **R3.** Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications. **Proposed IRO-010-2, Requirement R1:** **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

Standard TOP-003-1 — Planned Outage Coordination	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R2. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators as required.	Generator Operators will provide planned outage information to Transmission Operators and Balancing Authorities through proposed TOP-003-3, Requirement R5. Reporting requirements are set in proposed TOP-003-3, Requirement R1. Transmission Operators and Balancing Authorities coordinate outages through proposed IRO-017-1, Requirement R2. **Proposed TOP-003-3, Requirement R5:** **R5**. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications … **Proposed TOP-003-3, Requirement R1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification … **Proposed IRO-017-1, Requirement R2:** **R2.** Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator's outage coordination process.
R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.	This requirement is replaced by proposed TOP-001-3, Requirement R9. The data specification concept in proposed TOP-003-3 requires entities to provide data as requested. If there are outages of the equipment needed for providing that data, the entity experiencing the outage must notify the entity it is sending data to so that proper arrangements can be made for replacing the data or coming up with a plan to live without it. It is expected that the data specifications would incorporate such concepts. **Proposed TOP-001-3, Requirement R9:** **R9**. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and known impacted interconnected entities of all planned outages, and unplanned outages of 30 minutes or more, for telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities.

Standard TOP-003-1 — Planned Outage Coordination	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R4. Each Reliability Coordinator shall resolve any scheduling of potential reliability conflicts.	This requirement is replaced by proposed IRO-008-2, Requirement R2 and proposed IRO-017-1, Requirement R1, Part 1.4. **Proposed IRO-017-1, Requirement R1, Part 1.4**: **1.4** Define the process to coordinate the resolution of identified outage conflicts with its Transmission Operators and Balancing Authorities, and other Reliability Coordinators **Proposed IRO-008-2, Requirement R2:** **R2.** Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Transmission Operator shall operate within the Interconnection Reliability Operating Limits (IROLs) and System Operating Limits (SOLs).	This requirement has been replaced by proposed TOP-001-3, Requirements R12 and R14. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14**. Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
R2. Each Transmission Operator shall operate so that instability, uncontrolled separation, or cascading outages will not occur as a result of the most severe single contingency.	The SDT has revised the definitions of Operational Planning Analysis and Real-time Assessment to address all Contingencies, not just the single most severe Contingency and operations follow suit as shown in proposed TOP-001-3, Requirement R14 and proposed TOP-002-4, Requirement R2.

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed definition: **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed definition:** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Proposed TOP-002-4, Requirement R2:** **R2**. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.
R3. Each Transmission Operator shall operate to protect against instability, uncontrolled separation, or cascading outages resulting from multiple outages, as specified by its Reliability Coordinator.	This requirement is replaced by proposed TOP-001-3, Requirements R12 and R14. These requirements are not limited by single or multiple Contingencies. Approved FAC-011-2 and FAC-014-2 work collectively to establish how multiple Contingencies are considered in IROLs and SOLs. Approved FAC-014-2, Requirement R6 requires the Planning Coordinator to identify the subset of multiple Contingencies and to provide this list to the Reliability

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Coordinators. Approved FAC-011-2, Requirement R3.3 requires the Reliability Coordinator to include in its SOL methodology a process for determining which of the Stability limits associated with multiple Contingencies are used to establish SOLs. Approved FAC-014-2, Requirement R1 requires the Reliability Coordinator to determine which subset of SOLs qualify as IROLS. Approved FAC-014-2, Requirement R1 also requires the Reliability Coordinator to ensure SOLs, including IROLs, are established for its Reliability Coordinator Area while approved FAC-014-2, Requirement R2 also requires the Transmission Operator to establish SOLs for its area. Thus, IROLs and SOLs that consider multiple outages will be developed appropriately and the Transmission Operator will operate to them. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Approved FAC-011-2, Requirement R1:** **R1**. The Reliability Coordinator shall have a documented methodology for use in developing SOLs (SOL Methodology) within its Reliability Coordinator Area. This SOL Methodology shall: **R1.1**. Be applicable for developing SOLs used in the planning horizon **R1.2.** State that SOLs shall not exceed associated Facility Ratings. **R1.3.** Include a description of how to identify the subset of SOLs that qualify as IROLs. **Approved FAC-011-2, Requirement R3:** **R3.** The Reliability Coordinator's methodology for determining SOLs, shall include, as a minimum, a description of the following, along with any reliability margins applied for each: **R3.3**. A process for determining which of the stability limits associated with the list of multiple contingencies (provided by the Planning Authority in accordance with

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	FAC-014 Requirement 6) are applicable for use in the operating horizon given the actual or expected system conditions. **R3.3.1**. This process shall address the need to modify these limits, to modify the list of limits, and to modify the list of associated multiple contingencies. **Approved FAC-014-2, Requirement R1:** **R1.**The Reliability Coordinator shall ensure that SOLs, including Interconnection Reliability Operating Limits (IROLs), for its Reliability Coordinator Area are established and that the SOLs (including Interconnection Reliability Operating Limits) are consistent with its SOL Methodology. **Approved FAC-014-2, Requirement R2:** **R2.** The Transmission Operator shall establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology. **Approved FAC-014-2, Requirement R6:** **R6.** The Planning Authority shall identify the subset of multiple contingencies (if any), from Reliability Standard TPL-003 which result in stability limits. **R6.1.** The Planning Authority shall provide this list of multiple contingencies and the associated stability limits to the Reliability Coordinators that monitor the facilities associated with these contingencies and limits. **R6.2.** If the Planning Authority does not identify any stability related multiple contingencies, the Planning Authority shall so notify the Reliability Coordinator.
R4. If a Transmission Operator enters an unknown operating state (i.e., any state for which valid operating limits have not been determined), it will be considered to be in an emergency and shall restore operations to respect proven reliable power system limits within 30 minutes.	The SDT believes that given the revised definitions for Operational Planning Analysis and Real-time Assessment, as well as the new requirement for TOPs to update their OPA results through the performance of a Real-time Assessment every 30 minutes, that entities will always be operating to valid operating limits. Therefore, this requirement is replaced by proposed TOP-001-3, Requirements R12, R13, and R14 along with the revised definitions of Operational Planning Analysis and Real-time Assessment. This allows the operator sufficient flexibility within a structured environment to take the necessary actions for the reliability of the Bulk Power System.

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed TOP-001-3, Requirement R12: **R12**. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R13:** **R13**. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Proposed definition:** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition:** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)
R5. Each Transmission Operator shall make every effort to remain connected to the Interconnection. If the Transmission Operator determines that by remaining interconnected, it is in imminent danger of violating an IROL or SOL, the Transmission	Normally, the Transmission Operator does not have the right to unilaterally separate – that can only be done through the authorization of the Reliability Coordinator, unless failure to act immediately would violate safety, equipment, or regulatory or statutory requirements, thus this requirement is proposed for retirement by the SDT. In the Functional Model v5, the

<table>
<tr><th colspan="2">Standard TOP-004-2 — Transmission Operations</th></tr>
<tr><th>Requirement in Approved Standard</th><th>Proposed Language in New Standard or Comment</th></tr>
<tr><td>Operator may take such actions, as it deems necessary, to protect its area.</td><td>Transmission Operator responsibilities and duties are clearly spelled out. Item 14 states that a Transmission Operator sheds load under the auspices of the Reliability Coordinator.

Functional model v5:
14. Coordinates load shedding with, or as directed by, the Reliability Coordinator</td></tr>
<tr><td>R6. Transmission Operators, individually and jointly with other Transmission Operators, shall develop, maintain, and implement formal policies and procedures to provide for transmission reliability. These policies and procedures shall address the execution and coordination of activities that impact inter- and intra-Regional reliability, including:

6.1 Monitoring and controlling voltage levels and real and reactive power flows.

6.2 Switching transmission elements.

6.3 Planned outages of transmission elements.

6.4 Responding to IROL and SOL violations.</td><td>The first sentence has been superseded by the NERC Reliability Standards taken as a whole and is proposed to be retired.

The second sentence was replaced as follows:

R6.1 is duplicative of approved VAR-001-4, Requirement R1 for reactive power. Real power flows are covered in proposed TOP-001-3, Requirements R10, R12 and R14.

R6.2 has been replaced by proposed TOP-001-3, Requirement R8.

R6.3 has been replaced by proposed IRO-017-1, Requirement R2.

R6.4 has been replaced by proposed TOP-001-3, Requirements R12 and R14.

Approved VAR-001-4, Requirement R1:
R1. Each Transmission Operator shall specify a system voltage schedule (which is either a range or a
target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits.

Proposed TOP-001-3, Requirement R8:
R8. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency.

Proposed TOP-001-3, Requirement R10:
R10. Each Transmission Operator shall perform the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area:

10.1 Within its Transmission Operator Area, monitor Facilities and the status of Special Protection Systems, and</td></tr>
</table>

Standard TOP-004-2 — Transmission Operations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	10.2 Outside its Transmission Operator Area, obtain and utilize status, voltages, and flow data for Facilities and the status of Special Protection Systems. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Proposed IRO-017-1, Requirement R2:** **R2.** Each Transmission Operator and Balancing Authority shall perform the functions specified in its Reliability Coordinator's outage coordination process.

Standard TOP-005-2a — Operational Reliability Information	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. As a condition of receiving data from the Interregional Security Network (ISN), each ISN data recipient shall sign the NERC Confidentiality Agreement for "Electric System Reliability Data."	Recognizing security concerns, the SDT has added security protocols to proposed IRO-010-2, Requirement R3, Part 3.3 and to proposed TOP-003-3, Requirement R5, Part 5.3 to address overall security concerns. **Proposed IRO-010-2, Requirement R3, Part 3.3:** **3.3** A mutually agreeable security protocol **Proposed TOP-003-3, Requirement R5, Part 5.3:** **5.3** A mutually agreeable security protocol.
R2. Upon request, each Balancing Authority and Transmission Operator shall provide to other Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability, the operating data that are necessary to allow these Balancing Authorities and Transmission Operators to perform operational reliability assessments and to coordinate reliable operations. Balancing Authorities and Transmission Operators shall provide the types of data as listed in Attachment 1-TOP-005-2a "Electric System Reliability Data," unless otherwise agreed to by the Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability.	This requirement replaced by proposed TOP-003-3, Requirement R1, R2, and R5. **Proposed TOP-003-3, Requirement R1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed TOP-003-3, Requirement R2:** **R2**. Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications.
R3. Each Purchasing-Selling Entity shall provide information as requested by its Host Balancing Authorities and Transmission Operators to enable them to conduct operational reliability assessments and coordinate reliable operations.	Deleted as redundant to NAESB standards – All operating data that a Purchasing-Selling Entity has that a Transmission Operator or Balancing Authority needs is part of eTag and is acquired through that system.

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use. **1.1** - Each Generator Operator shall inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use. **1.2** - Each Transmission Operator shall inform the Reliability Coordinator and other affected Transmission Operators of all transmission resources available for use. **1.3 -** Each Balancing Authority shall inform its Reliability Coordinator of all generation resources available for use.	The main body of the requirement is replaced by proposed TOP-001-3, Requirements R10 and R11. **1.1** This Part is replaced by proposed TOP-003-3, Requirement R5. **1.2** This Part is replaced by proposed IRO-101-2, Requirement R3. **1.3** This Part is replaced by proposed IRO-010-2, Requirement R3. **Proposed TOP-001-3, Requirement R10:** **R10.** Each Transmission Operator shall perform the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: 10.1 Within its Transmission Operator Area, monitor Facilities and the status of Special Protection Systems, and 10.2 Outside its Transmission Operator Area, obtain and utilize status, voltages, and flow data for Facilities and the status of Special Protection Systems. **Proposed TOP-001-3, Requirement R11:** **R11.** Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain Load-interchange balance within its Balancing Authority Area and support Interconnection frequency. **Proposed TOP-003-3, Requirement R5:** **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications. **Proposed IRO-010-2, Requirement R3:** **R3.** Each Reliability Coordinator, Balancing Authority, Planning Coordinator, Transmission Planner, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R2 shall satisfy the obligations of the documented specifications.

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R2. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources.	This requirement is replaced by proposed IRO-002-4, Requirement R3, proposed TOP-001-3, Requirement R10, and proposed TOP-001-3, R11. The requirements mandate that any Facility needed for an entity to perform its reliability-based functions must be monitored. This would include load-tap changers, rotating and static reactive resources, etc. **Proposed IRO-002-4, Requirement R3:** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed TOP-001-3, Requirement R10:** **R10.** Each Transmission Operator shall perform the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: **10.**1 Within its Transmission Operator Area, monitor Facilities and the status of Special Protection Systems, and **10.2** Outside its Transmission Operator Area, obtain and utilize status, voltages, and flow data for Facilities and the status of Special Protection Systems. **Proposed TOP-001-3, Requirement R11:** **R11.** Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.
R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall provide its operating personnel with appropriate technical information concerning protective relays within the Reliability Coordinator Area, the Transmission Operator Area, and the Balancing Authority Area, respectively.	This requirement replaced by proposed IRO-010-2, Requirement R1, Part 1.2; proposed TOP-003-3, Requirement R1, Part 1.2; and proposed TOP-003-3, Requirement R2, Part 2.2.; and the proposed changes to the definitions of Operational Planning Analysis and Real-time Assessment.

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed definition: Operational Planning Analysis - An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition: Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed IRO-010-2, Requirement R1, Part 1.2:** **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: **1.2** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **Proposed TOP-003-3, Requirement R1, Part 1.2:** **R 1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **1.2** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	Proposed TOP-003-3, Requirement R2, Part 2.2: **R2**. Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. The data specification shall include, but not be limited to: **2.2** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.
R4. Each Transmission Operator, and Balancing Authority shall have information, including weather forecasts and past load patterns, available to predict the system's near-term load pattern.	This requirement replaced by proposed TOP-003-3, Requirement R1 and R2 with regard to load patterns. Weather forecasts are a necessary element for load forecasts which are required for Operational Planning Analysis. Therefore, this requirement can be retired. **Proposed TOP-003-3, Requirement R1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed TOP-003-3, Requirement R2:** **R2.** Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. **Proposed definition:** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
R5. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use monitoring equipment to bring to the attention of operating personnel important deviations in operating conditions and to indicate, if appropriate, the need for corrective action.	This requirement replaced by proposed TOP-001-3, Requirements R10 and R11, and proposed IRO-002-4, Requirement R3. **Proposed TOP-001-3, Requirement R10:**

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R10. Each Transmission Operator shall perform the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: 10.1 Within its Transmission Operator Area, monitor Facilities and the status of Special Protection Systems, and 10.2 Outside its Transmission Operator Area, obtain and utilize status, voltages, and flow data for Facilities and the status of Special Protection Systems. **Proposed TOP-001-3, Requirement R11:** **R11.** Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain Load-interchange balance within its Balancing Authority Area and support Interconnection frequency. **Proposed IRO-002-4, Requirement R3:** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
R6. Each Balancing Authority and Transmission Operator shall use sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions under both normal and emergency situations.	The requirement is replaced by proposed TOP-003-3, Requirements R1 and R2 which state that data specifications can include, but are not limited to the 4 criteria listed. This allows for an entity to create specifications that would include items such as range of metering, accuracy, etc. **Proposed TOP-003-3, Requirement R1:** **R1**. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **Proposed TOP-003-3, Requirement R2:**

Standard TOP-006-3 – Monitoring System Conditions	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R2. Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. The data specification shall include, but not be limited to:
R7. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor system frequency.	This requirement is replaced by proposed IRO-002-4, Requirement R3, and proposed TOP-001-3, Requirements R10 and R11. **Proposed IRO-002-4, Requirement R3**: **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed TOP-001-3, Requirement R10:** **R10.** Each Transmission Operator shall perform the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: 10.1 Within its Transmission Operator Area, monitor Facilities and the status of Special Protection Systems, and 10.2 Outside its Transmission Operator Area, obtain and utilize status, voltages, and flow data for Facilities and the status of Special Protection Systems. **Proposed TOP-001-3, Requirement R11:** **R11.** Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.

Standard TOP-007-0 - Reporting System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) Violations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. A Transmission Operator shall inform its Reliability Coordinator when an IROL or SOL has been exceeded and the actions being taken to return the system to within limits.	This requirement is replaced by proposed TOP-001-3, Requirement R15. The Reliability Coordinator has the primary responsibility for IROLs and will be in communication with Transmission Operators to mitigate the situation. This is shown in proposed IRO-008-2, Requirements R5 and R6. **Proposed TOP-001-3, Requirement R15:** **R15.** Each Transmission Operator shall inform its Reliability Coordinator of actions taken to return the System to within limits when a SOL has been exceeded. **Proposed IRO-008-2, Requirement R5:** **R5.** Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area. **Proposed IRO-008-2, Requirement R6:** **R6.** Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R5 has been prevented or mitigated.
R2. Following a Contingency or other event that results in an IROL violation, the Transmission Operator shall return its transmission system to within IROL as soon as possible, but not longer than 30 minutes.	This requirement is replaced by proposed TOP-001-3, Requirement R12 and approved IRO-009-1, Requirement R4. **Approved IRO-009-1, Requirement R4:** **R4.** When actual system conditions show that there is an instance of exceeding an IROL in its Reliability Coordinator Area, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's Tv. **Proposed TOP-001-3, Requirement R12:**

Standard TOP-007-0 - Reporting System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) Violations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
	R12. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v.
R3. A Transmission Operator shall take all appropriate actions up to and including shedding firm load, or directing the shedding of firm load, in order to comply with Requirement R2.	This requirement replaced by approved EOP-003-2, Requirement R1 and approved IRO-009-1, Requirement R4. **Approved IRO-009-1, Requirement R4:** **R4**. When actual system conditions show that there is an instance of exceeding an IROL in its Reliability Coordinator Area, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's Tv. **Approved EOP-003-2, Requirement R1:** **R1**. After taking all other remedial steps, a Transmission Operator or Balancing Authority operating with insufficient generation or transmission capacity shall shed customer load rather than risk an uncontrolled failure of components or cascading outages of the Interconnection.
R4. The Reliability Coordinator shall evaluate actions taken to address an IROL or SOL violation and, if the actions taken are not appropriate or sufficient, direct actions required to return the system to within limits.	This requirement replaced by proposed IRO-008-2, Requirement R6. **Proposed IRO-008-2, Requirement R6:** **R6.** Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R5 has been prevented or mitigated.

Standard TOP-008-1 - Response to Transmission Limit Violations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
R1. The Transmission Operator experiencing or contributing to an IROL or SOL violation shall take immediate steps to relieve the condition, which may include shedding firm load.	This requirement replaced by approved EOP-003-1, Requirement R1 and proposed TOP-001-3, Requirements R12 and R14. **Approved EOP-003-2, Requirement R1:** **R1.** After taking all other remedial steps, a Transmission Operator or Balancing Authority operating with insufficient generation or transmission capacity shall shed customer load rather than risk an uncontrolled failure of components or cascading outages of the Interconnection. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
R2. Each Transmission Operator shall operate to prevent the likelihood that a disturbance, action, or inaction will result in an IROL or SOL violation in its area or another area of the Interconnection. In instances where there is a difference in derived operating limits, the Transmission Operator shall always operate the Bulk Electric System to the most limiting parameter.	First sentence – Replaced by proposed TOP-001-3, Requirements R12 and R14. Second sentence – Replaced by proposed TOP-001-3, Requirement R18. **Proposed TOP-001-3, Requirement R12:** **R12.** Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. **Proposed TOP-001-3, Requirement R14:** **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Proposed TOP-001-3, Requirement R18:** **R18**. Each Transmission Operator shall operate to the most limiting parameter in instances where there is a difference in SOLs.
R3. The Transmission Operator shall disconnect the affected facility if the overload on a transmission facility or abnormal voltage or reactive condition persists and equipment is endangered. In doing so, the Transmission Operator shall	First sentence - Placing this procedure in a requirement when it is only one of the possible options for alleviating the condition is bad practice and should not be mandated in standards. A standard should not be mandating disconnection. This is in conflict with other Reliability Standards where disconnection is dependent on System conditions and coordination with

Standard TOP-008-1 - Response to Transmission Limit Violations	
Requirement in Approved Standard	**Proposed Language in New Standard or Comment**
notify its Reliability Coordinator and all neighboring Transmission Operators impacted by the disconnection prior to switching, if time permits, otherwise, immediately thereafter.	other functional entities. Such actions, taken unilaterally, could make conditions worse. Therefore, the SDT is proposing to retire this requirement. Second sentence – In general, notification is replaced by proposed TOP-001-3, Requirement R8. **Proposed TOP-001-3, Requirement R8:** **R8**. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency.
R4. The Transmission Operator shall have sufficient information and analysis tools to determine the cause(s) of SOL violations. This analysis shall be conducted in all operating timeframes. The Transmission Operator shall use the results of these analyses to immediately mitigate the SOL violation.	The part of the requirement dealing with data is replaced by proposed TOP-003-3, Requirement R1. The part of the requirement dealing with analysis is replaced by proposed TOP-002-4, Requirement R1 and proposed TOP-001-3, Requirement R13. **Proposed TOP-003-3, Requirement R1:** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **Proposed TOP-002-4, Requirement R1:** **R1.** Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **Proposed TOP-001-3, Requirement R13:** **R13**. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

System Operating Limit Definition and Exceedance Clarification

The NERC-defined term System Operating Limit (SOL) is used extensively in the NERC Reliability Standards; however, there is much confusion with – and many widely varied interpretations and applications of – the SOL term. This whitepaper describes the Standard Drafting Team's (SDT) intent with regard to the SOL concept and brings clarity and consistency to the notion of establishing SOLs, exceeding SOLs, and implementing Operating Plans to mitigate SOL exceedances.

System Operating Limit Definition Clarification:
As stated in the NERC Glossary of Terms Used in Reliability Standards, a SOL is defined as the value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. SOLs are based upon certain operating criteria. These include, but are not limited to:

- Facility Ratings (Applicable pre- and post- Contingency equipment or Facility ratings)
- Transient Stability Ratings (Applicable pre- and/or post-Contingency Stability Limits)
- Voltage Stability Ratings (Applicable pre- and/or post- Contingency Voltage Stability)
- System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits)

The concept of SOL determination is not complete without looking at the approved NERC FAC standards FAC-008-3, FAC-011-2, and FAC-014-2:

1. The purpose of approved FAC-008-3, which is applicable to both Generation and Transmission Owners, is to ensure that Facility Ratings used in the reliable planning and operation of the BES are determined based on technically sound principles. A Facility Rating is essential for the determination of SOLs. The standard requires both Generation Owners and Transmission Owners to have a documented Facility Rating that respects the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility. The scope of the Ratings addressed shall include, as a minimum, both Normal and Emergency (short-term) Ratings (approved FAC-008-3, Requirement R3, part 3.4.2). A 24-hour continuous rating is an example of a Normal rating; however, rating practices vary from entity to entity and may include ratings that vary with ambient temperature. Typical Emergency (short-term) Ratings have a finite duration of less than 24 hours (e.g., 4 hours, 2 hours, 1 hour, 30 minutes, or 15 minutes).

2. The purpose of approved FAC-011-2, which is applicable to Reliability Coordinators, is to ensure that SOLs used in the reliable operation of the BES are determined based on an established methodology or methodologies. Approved FAC-011-2, Requirement R2 requires that the Reliability Coordinator's SOL Methodology include a requirement that SOLs provide a certain level of BES performance for the pre- and post-Contingency state. Specifically:

   Pre-Contingency: Acceptable system performance for the pre-Contingency state is characterized by the following:

   a. The BES shall demonstrate transient, dynamic, and voltage Stability.
   b. All Facilities shall be within their applicable Facility Ratings and thermal limits.
   c. All Facilities shall be within their pre-Contingency voltage limits.
   d. All Facilities shall be within their Stability limits.

   Post-Contingency: Acceptable system performance for the post-Contingency state for single Contingencies is characterized by the following (approved Reliability Standard FAC-011-2, Requirement R2, part 2.2):

   a. The BES shall demonstrate transient, dynamic, and voltage Stability.
   b. All Facilities shall be within their applicable Facility Ratings and thermal limits.
   c. All Facilities shall be within their post-Contingency voltage limits.
   d. All Facilities shall be within their Stability limits.
   e. Cascading or uncontrolled separation shall not occur.

3. Approved FAC-011-2 Requirement R3, Part 3.1 also ensures that the Reliability Coordinator's methodology for determining SOLs includes a description of the study model, which at a minimum must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study as well as the level of detail of system models used to determine SOLs which is shown in approved FAC-011-2, Requirement R3, Part 3.4. The requirements within approved FAC-011-2, when combined with the BES Exception Process which is designed to bring impactful facilities into the BES, ensure that all facilities that can adversely impact BES reliability are either designated as part of the BES or otherwise incorporated into planning and operations studies.

3. Approved FAC-014-2, Requirement R2 requires that Transmission Operators establish SOLs for their portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology.

Some have interpreted the language in approved FAC-011-2, Requirement R2 to imply that the objective is to perform prior studies to determine a specific MW flow value (SOL) that ensures operation within the criteria specified in approved FAC-011-2, Requirement R2 sub-requirements, the assumption being that if the system is operated within this pre-determined SOL value, then all of the pre- and post-Contingency requirements described in approved FAC-011-2, Requirement R2 will be met. The SDT believes this approach may not capture the complete intent of the SOL concept within approved FAC-011-2, which is both:

1. Know the Facility Ratings, voltage limits, transient Stability limits, and voltage Stability limits, and
2. Ensure that they are all observed in both the pre- and post-Contingency state by performing a Real-time Assessment.

SOLs are based on Normal and Emergency (short-term) Facility Ratings, voltage limits, transient Stability limits, and voltage Stability limits – any of which can be the most restrictive limit at any point in time pre- or post-Contingency. For example, if an area of the BES is at no risk of encroaching upon Stability or voltage limitations in the pre- or post-Contingency state, and the most restrictive limitations in that area are pre- or post-Contingency exceedance of Facility Ratings, then the thermal Facility Ratings in that area are the most limiting SOLs. Conversely, if an area is not at risk of instability and no Facilities are approaching their thermal Facility Ratings, but the area is prone to pre- or post-Contingency low voltage conditions, then the voltage limits in that area are the most limiting SOLs.

It is important to distinguish operating practices and strategies from the SOL itself. As stated earlier, the SOL is based on the actual set of Facility Ratings, voltage limits, or Stability limits that are to be monitored for the pre- and post-Contingency state. How an entity remains within these SOLs can vary depending on the planning strategies, operating practices, and mechanisms employed by that entity. For example, one Transmission Operator may utilize line outage distribution factors or other similar calculations as a mechanism to ensure SOLs are not exceeded, while another may utilize advanced network applications to achieve the same reliability objective.

In order to ensure an SOL is not exceeded, the following SOL performance must be maintained:

1. **Facility Ratings:**
   In the pre- and post-Contingency state, operate within Facility capability by utilizing Normal and Emergency (short-term) Ratings, as applicable, within their associated time parameters.
2. **Voltage Limits:**
   In the pre-Contingency state, operate within normal voltage limits. In the post-Contingency state, operate within applicable emergency voltage limits.
3. **Transient Stability Limits:**
   Transmission Operators establish SOLs to prevent intra-area instability, inter-area instability, or tripping of Facilities due to out-of-step conditions. Transient Stability limits are typically defined as the maximum power transfer or load level that ensures critical transient reliability criteria are met. Calculated flows must be maintained within appropriate pre- and/or post-Contingency limit.
4. **Voltage Stability Limits:**
   Transmission Operators typically stress Transmission Paths/Interfaces or load areas to the reasonably expected maximum transfer conditions or area load levels to determine whether steady state voltage Stability limits exist. Voltage Stability limits are typically defined as the maximum power transfer or load level that ensures voltage Stability criteria are met. Calculated flows must be maintained within appropriate pre- and/or post-Contingency limits.

System Operating Limit Exceedance Clarification:

The combination of requirements contained within the approved FAC and proposed TOP standards, as well as the use of defined terms contained within those standards such as Operational Planning Analysis, Real-time Assessment, and Operating Plans when executed properly result in maintaining reliable BES performance. Specifically,

1. Approved FAC standards require clear determination of Facility Ratings and describe acceptable system performance criteria for the pre- and post-Contingency state.
2. Proposed TOP-001-3, Requirement R13 requires that a Transmission Operator perform a Real-time Assessment at least once every 30 minutes.
3. Proposed TOP-002-4, Requirement R2 requires that each Transmission Operator have an Operating Plan to address potential SOL exceedances identified as a result of its Operational Planning Analysis.
4. Proposed TOP-001-3, Requirement R14 requires the Transmission Operator to initiate Operating Plan(s) to mitigate SOL exceedances.

<u>Facility Rating Exceedance</u>

Facility Rating exceedance is a function of the available limit set and the magnitude of pre- or post-Contingency flows in relation to those limits as observed in Real-time monitoring or Real-time Assessments. Figure 1 illustrates an SOL Performance Summary for Facility Ratings.

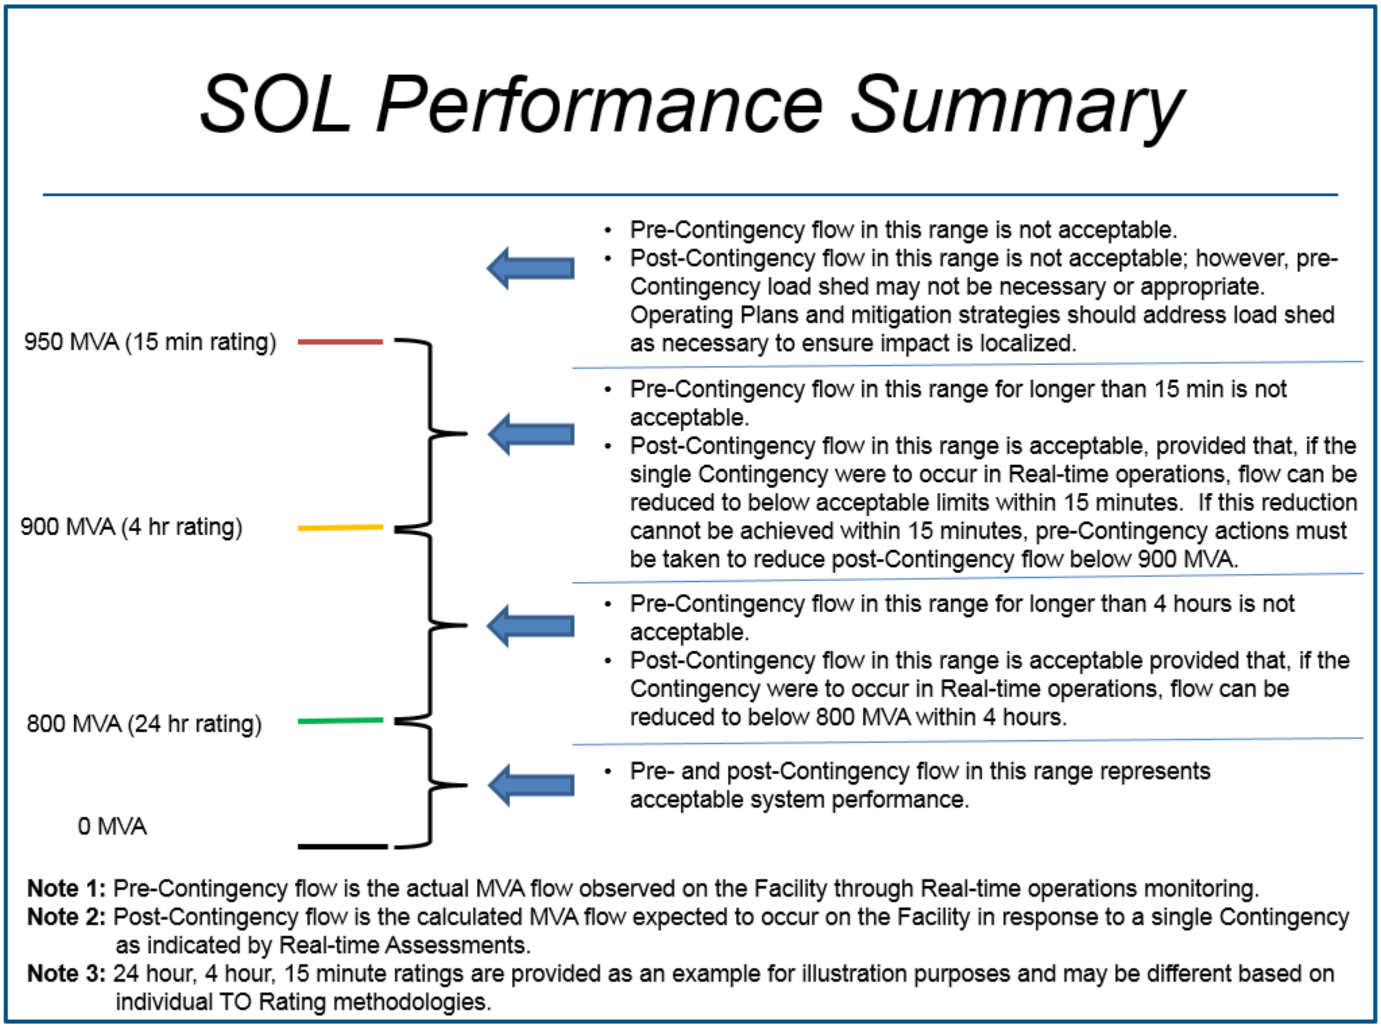

Figure 1. Facility Rating System Operating Limit Performance Summary

In cases where post-Contingency flow exceeds the highest available Facility Rating as shown in Figure 1, Transmission Operators are expected to take pre-Contingency action to relieve the condition (including redispatch, reconfiguration, and making adjustments to the uses of the transmission system); however, the operating condition may not warrant shedding load pre-Contingency to relieve the condition. Pre-Contingency Load shed is generally utilized as a last resort in conditions where the next Contingency could result in Cascading or widespread instability. An entity's Operating Plan is expected to define when it is appropriate to shed Load pre-Contingency versus post-Contingency while ensuring the BES remains N-1 secure.

Steady State Voltage Limit Exceedance

SOL performance for steady state voltage limits is determined through Real-time Assessments. Normal and emergency voltage limits are expected to respect any voltage limitations specified in the Transmission

Owner or the Generation Owner's Facility Ratings Methodology per approved FAC-008-3. Normal voltage limits are typically applicable for the pre-Contingency state while emergency voltage limits are applicable for the post-Contingency state. SOL exceedance with respect to these voltage limits occurs when either actual bus voltage is outside acceptable pre-Contingency (normal) bus voltage limits, or when Real-time Assessments indicate that bus voltages are expected to fall outside acceptable emergency limits in response to a Contingency event. Real-time Assessments should recognize the impact of auto-reactive devices and whether or not those devices are sufficient for maintaining voltages within acceptable limits pre- or post-Contingency.

Stability Limit Exceedance

Transient and voltage Stability limits can be determined through prior studies, or they can be determined in Real-time. Pre-determined Transient and voltage Stability limits must be re-established when changes in the system (both expected future changes and actual Real-time changes) occur that render these pre-determined limits invalid. Associated Operating Plans may include steps that can be taken to maintain acceptable pre- and post-Contingency system performance until additional studies can be performed to establish revised transient or voltage Stability limits.

Transient Stability limits are often expressed as flow limits on a defined interface or cut plane that, if operated within, ensures that the system will remain transiently stable should the identified Contingency(s) occur. Transient instability could take several forms, including undamped oscillations, or angular instability resulting in portions of the system losing synchronism.

Though voltage Stability limits can be determined, expressed, and monitored in several ways, the general principle is universal – voltage Stability limits are intended to ensure that the system does not experience voltage collapse in the pre- or post-Contingency state.

SOL exceedance for Stability limits occurs when the system enters into an operating state where the next Contingency could result in transient or voltage instability. Figure 2 depicts a wide-area voltage Stability based SOL that qualifies as an IROL. In this example, SOL (IROL) exceedance occurs when power transfers over the monitored Facility(s) exceeds the P_{IROL} value. Note - A localized voltage collapse may not qualify as an IROL.

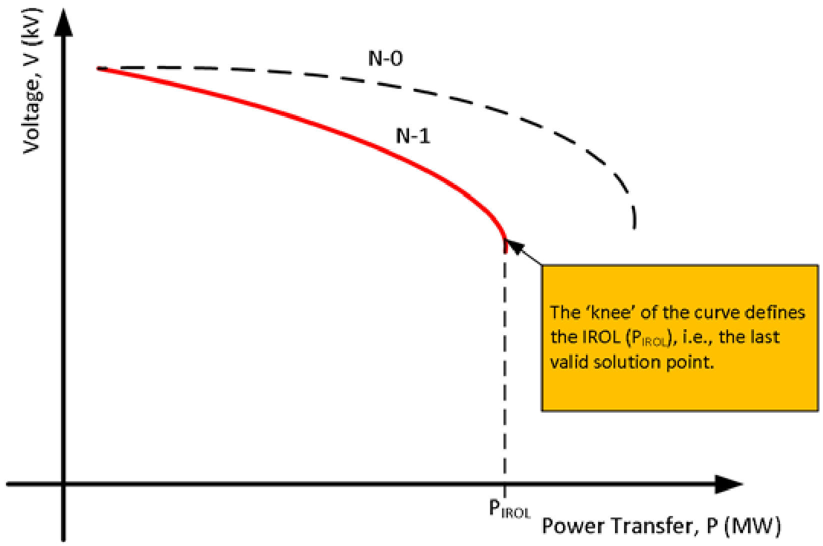

Figure 2. Voltage Stability System Operating Limit Performance Summary

SOL exceedance occurs when acceptable system performance as described in approved FAC-011-2 is not occurring in Real-time operations as determined by Real-time Assessments. In other words, unacceptable system performance as indicated by Real-time Assessments equates to SOL exceedance. An SOL is exceeded when any of the following occur or are observed as part of a Real-time Assessment:

- Actual flow on a Facility is above the Facility Rating for an unacceptable time duration
- Calculated Post-Contingency flow on a Facility is above the highest available Facility Rating
- Actual bus voltage is outside acceptable pre-Contingency (normal) bus voltage limits
- Post-Contingency bus voltage is outside acceptable post-Contingency (emergency) bus voltage limits
- Defined transient or voltage Stability limits are exceeded (techniques for determining and observing Stability limits can vary)

SOL Exceedance and Operating Plans:

When an SOL is being exceeded in Real-time operations, the Transmission Operator is required to implement mitigating strategies consistent with its Operating Plan(s). Operating Plans can include specific Operating Procedures or more general Operating Processes. Operating Plans include both pre- and post-Contingency mitigation plans/strategies. Pre-Contingency mitigation plans/strategies are actions that are implemented before the Contingency occurs to prevent the potential negative impacts on reliability of the

Contingency. Post-Contingency mitigation plans/strategies are actions that are implemented after the Contingency occurs to bring the system back within limits. Operating Plans contain details to include appropriate timelines to escalate the level of mitigating plans/strategies to ensure BES performance is maintained as per approved FAC-011-2, Requirement R2, preventing SOL exceedances from becoming an IROL. Operating Plan(s) must include the appropriate time element to return the system to within acceptable Normal and Emergency (short-term) Ratings and/or operating limits identified above. For example, in Figure 1, operating above the 950 MVA 15 minute limit would be an SOL exceedance for actual flows and may also be an exceedance for projected post-Contingency flows if a communicated post-Contingency load shed plan cannot be implemented in a timely fashion in order to prevent post-Contingency equipment damage and/or non-localized Cascading outages. However, operating between 900 MVA and 950 MVA is not an SOL exceedance unless the associated Operating Plan time parameter is exceeded as explained in Figure 1.

An example Operating Plan is shown in Table 1.

Thermal SOL Limit Exceeded	Pre-Contingency (actual) Loading	Post-Contingency (calculated) Loading
Normal (24 hr)	Reconfiguration actions, Redispatch actions, emergency procedures except Load shed consistent with timelines identified in Operating Plan.	Trend – continue to monitor. Take reconfiguration actions to prevent Contingency from exceeding emergency limit consistent with timelines identified in Operating Plan.
Emergency (4 hr)	All of the above plus Load shed only if necessary and appropriate to control loading below 4 hr Emergency Rating consistent with timelines identified in Operating Plan.	Use available effective actions and emergency procedures except Load shed consistent with timelines identified in Operating Plan.
Emergency (15 min)	All of the above plus Load shed to control loading below 15 min Emergency Rating consistent with timelines identified in Operating Plan.	All of the above however, Load shed only if necessary and appropriate to avoid post-Contingency Cascading consistent with timelines identified in Operating Plan.

Table 1. Operating Plan Example

APPLICABLE DEFINITIONS

Real-time Assessment – An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Operational Planning Analysis – An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Changes made to the definitions of Real-time Assessment and Operational Planning Analysis were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments and Operational Planning Analysis contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

Operating Plan – A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.

Operating Process – A document that identifies general steps for achieving a generic operating goal. An Operating Process includes steps with options that may be selected depending upon Real-time conditions. A guideline for controlling high voltage is an example of an Operating process.

Operating Procedure – A document that identifies specific steps or tasks that should be taken by one or more specific operating positions to achieve specific operating goal(s). The steps in an Operating Procedure should be followed in the order in which they are presented, and should be performed by the position(s) identified. A document that lists the specific steps for a System Operator to take in removing a specific transmission line from service is an example of an Operating Procedure.

Time Horizons
When establishing a time horizon for each requirement, the following criteria should be used:

- **Long-term Planning –** a planning horizon of one year or longer.
- **Operations Planning** – operating and resource plans from day-ahead up to and including seasonal.
- **Same-Day Operations** – routine actions required within the timeframe of a day, but not Real-time.
- **Real-time Operations** – actions required within one hour or less to preserve the reliability of the Bulk Electric System.

Facility Rating – The maximum or minimum voltage, current, frequency, or real or reactive power flow through a facility that does not violate the applicable equipment rating of any equipment comprising the facility.

Normal Rating – The rating as defined by the equipment owner that specifies the level of electrical loading, usually expressed in megawatts (MW) or other appropriate units that a system, facility, or element can support or withstand through the daily demand cycles without loss of equipment life.

Emergency Rating – The rating as defined by the equipment owner that specifics the level of electrical loading or output, usually expressed in megawatts (MW) or Mvar, or other appropriate units, that a system, facility, or element can support, procedure, or withstand for a finite period. The rating assumes acceptable loss of equipment life or other physical or safety limitations for the equipment involved.

System Operating Limit Definition and Exceedance Clarification

The NERC-defined term System Operating Limit (SOL) is used extensively in the NERC Reliability Standards; however, there is much confusion with – and many widely varied interpretations and applications of – the SOL term. This whitepaper describes the Standard Drafting Team's (SDT) intent with regard to the SOL concept and brings clarity and consistency to the notion of establishing SOLs, exceeding SOLs, and implementing Operating Plans to mitigate SOL exceedances.

System Operating Limit Definition Clarification:
As stated in the NERC Glossary of Terms Used in Reliability Standards, a SOL is defined as the value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. SOLs are based upon certain operating criteria. These include, but are not limited to:

- Facility Ratings (Applicable pre- and post- Contingency equipment or Facility ratings)
- Transient Stability Ratings (Applicable pre- and/or post-Contingency Stability Limits)
- Voltage Stability Ratings (Applicable pre- and/or post- Contingency Voltage Stability)
- System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits)

The concept of SOL determination is not complete without looking at the approved NERC FAC standards FAC-008-3, FAC-011-2, and FAC-014-2:

1. The purpose of approved FAC-008-3, which is applicable to both Generation and Transmission Owners, is to ensure that Facility Ratings used in the reliable planning and operation of the BES are determined based on technically sound principles. A Facility Rating is essential for the determination of SOLs. The standard requires both Generation Owners and Transmission Owners to have a documented Facility Rating that respects the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility. The scope of the Ratings addressed shall include, as a minimum, both Normal and Emergency (short-term) Ratings (approved FAC-008-3, Requirement R3, part 3.4.2). A 24-hour continuous rating is an example of a Normal rating; however, rating practices vary from entity to entity and may include ratings that vary with ambient temperature. Typical Emergency (short-term) Ratings have a finite duration of less than 24 hours (e.g., 4 hours, 2 hours, 1 hour, 30 minutes, or 15 minutes).

2. The purpose of approved FAC-011-2, which is applicable to Reliability Coordinators, is to ensure that SOLs used in the reliable operation of the BES are determined based on an established methodology or methodologies. Approved FAC-011-2, Requirement R2 requires that the Reliability Coordinator's SOL Methodology include a requirement that SOLs provide a certain level of BES performance for the pre- and post-Contingency state. Specifically:

   Pre-Contingency: Acceptable system performance for the pre-Contingency state is characterized by the following:

   a. The BES shall demonstrate transient, dynamic, and voltage Stability.
   b. All Facilities shall be within their applicable Facility Ratings and thermal limits.
   c. All Facilities shall be within their pre-Contingency voltage limits.
   d. All Facilities shall be within their Stability limits.

   Post-Contingency: Acceptable system performance for the post-Contingency state for single Contingencies is characterized by the following (approved Reliability Standard FAC-011-2, Requirement R2, part 2.2):

   a. The BES shall demonstrate transient, dynamic, and voltage Stability.
   b. All Facilities shall be within their applicable Facility Ratings and thermal limits.
   c. All Facilities shall be within their post-Contingency voltage limits.
   d. All Facilities shall be within their Stability limits.
   e. Cascading or uncontrolled separation shall not occur.

3. Approved FAC-011-2 Requirement R3, Part 3.1 also ensures that the Reliability Coordinator's methodology for determining SOLs includes a description of the study model, which at a minimum must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study as well as the level of detail of system models used to determine SOLs which is shown in approved FAC-011-2, Requirement R3, Part 3.4. The requirements within approved FAC-011-2, when combined with the BES Exception Process which is designed to bring impactful facilities into the BES, ensure that all facilities that can adversely impact BES reliability are either designated as part of the BES or otherwise incorporated into planning and operations studies.

3. Approved FAC-014-2, Requirement R2 requires that Transmission Operators establish SOLs for their portion of the Reliability Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology.

Some have interpreted the language in approved FAC-011-2, Requirement R2 to imply that the objective is to perform prior studies to determine a specific MW flow value (SOL) that ensures operation within the criteria specified in approved FAC-011-2, Requirement R2 sub-requirements, the assumption being that if the system is operated within this pre-determined SOL value, then all of the pre- and post-Contingency requirements described in approved FAC-011-2, Requirement R2 will be met. The SDT believes this approach may not capture the complete intent of the SOL concept within approved FAC-011-2, which is both:

1. Know the Facility Ratings, voltage limits, transient Stability limits, and voltage Stability limits, and
2. Ensure that they are all observed in both the pre- and post-Contingency state by performing a Real-time Assessment.

SOLs are based on Normal and Emergency (short-term) Facility Ratings, voltage limits, transient Stability limits, and voltage Stability limits – any of which can be the most restrictive limit at any point in time pre- or post-Contingency. For example, if an area of the BES is at no risk of encroaching upon Stability or voltage limitations in the pre- or post-Contingency state, and the most restrictive limitations in that area are pre- or post-Contingency exceedance of Facility Ratings, then the thermal Facility Ratings in that area are the most limiting SOLs. Conversely, if an area is not at risk of instability and no Facilities are approaching their thermal Facility Ratings, but the area is prone to pre- or post-Contingency low voltage conditions, then the voltage limits in that area are the most limiting SOLs.

It is important to distinguish operating practices and strategies from the SOL itself. As stated earlier, the SOL is based on the actual set of Facility Ratings, voltage limits, or Stability limits that are to be monitored for the pre- and post-Contingency state. How an entity remains within these SOLs can vary depending on the planning strategies, operating practices, and mechanisms employed by that entity. For example, one Transmission Operator may utilize line outage distribution factors or other similar calculations as a mechanism to ensure SOLs are not exceeded, while another may utilize advanced network applications to achieve the same reliability objective.

In order to ensure an SOL is not exceeded, the following SOL performance must be maintained:

1. **Facility Ratings:**
   In the pre- and post-Contingency state, operate within Facility capability by utilizing Normal and Emergency (short-term) Ratings, as applicable, within their associated time parameters.

2. **Voltage Limits:**
   In the pre-Contingency state, operate within normal voltage limits. In the post-Contingency state, operate within applicable emergency voltage limits.

3. **Transient Stability Limits:**
   Transmission Operators establish SOLs to prevent intra-area instability, inter-area instability, or tripping of Facilities due to out-of-step conditions. Transient Stability limits are typically defined as the maximum power transfer or load level that ensures critical transient reliability criteria are met. Calculated flows must be maintained within appropriate pre- and/or post-Contingency limit.

4. **Voltage Stability Limits:**
   Transmission Operators typically stress Transmission Paths/Interfaces or load areas to the reasonably expected maximum transfer conditions or area load levels to determine whether steady state voltage Stability limits exist. Voltage Stability limits are typically defined as the maximum power transfer or load level that ensures voltage Stability criteria are met. Calculated flows must be maintained within appropriate pre- and/or post-Contingency limits.

System Operating Limit Exceedance Clarification:

The combination of requirements contained within the approved FAC and proposed TOP standards, as well as the use of defined terms contained within those standards such as Operational Planning Analysis, Real-time Assessment, and Operating Plans when executed properly result in maintaining reliable BES performance. Specifically,

1. Approved FAC standards require clear determination of Facility Ratings and describe acceptable system performance criteria for the pre- and post-Contingency state.
