IRO-004-1 requires that the Reliability Coordinator carry out studies to identify Interconnection Reliability Operating Limits (Requirement R1) and to be aware of system conditions via monitoring tools and information exchange.

IRO-005-1 mandates that each Reliability Coordinator monitor predefined base conditions (Requirement R1), collect additional data when operating limits are or may be exceeded (Requirement R3), and identify actual or potential threats (Requirement R5). The basis for that request is left to each Reliability Coordinator. The Purpose statement of IRO-005-1 focuses on the Reliability Coordinator’s obligation to be aware of conditions that may have a “significant” impact upon its area and to communicate that information to others (Requirements R7 and R9). Please note: it is from this communication that Transmission Operators and Balancing Authorities would either obtain or would know to ask for [SPSRAS](#) information from another Transmission Operator.

The IRO-005-1 (Requirement R12) standard implies that degraded is a condition that will result in a failure to operate as designed. If the loss of a communication channel will result in the failure of a [SPSRAS](#) to operate as designed then the Transmission Operator would be mandated to report that information. On the other hand, if the loss of a communication channel will not result in the failure of the [SPSRAS](#) to operate as designed, then such a condition can be, but is not mandated to be, reported.

### Conclusion

The TOP-005-1 standard does not provide, nor does it require, a definition for the term “degraded.”

The IRO-005-1 (R12) standard implies that degraded is a condition that will result in a failure of a [SPSRAS](#) to operate as designed. If the loss of a communication channel will result in the failure of a [SPSRAS](#) to operate as designed, then the Transmission Operator would be mandated to report that information. On the other hand, if the loss of a communication channel will not result in the failure of the [SPSRAS](#) to operate as designed, then such a condition can be, but is not mandated to be, reported.

To request a formal definition of the term degraded, the Reliability Standards Development Procedure requires the submittal of a Standards Authorization Request.

## A. Introduction

1. **Title:** System Performance Under Normal (No Contingency) Conditions (Category A)
2. **Number:** TPL-001-0.1(X)
3. **Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements with sufficient lead time, and continue to be modified or upgraded as necessary to meet present and future system needs.
4. **Applicability:**
  - 4.1. Planning Authority
  - 4.2. Transmission Planner
5. **Effective Date:** May 13, 2009

## B. Requirements

- R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is planned such that, with all transmission facilities in service and with normal (pre-contingency) operating procedures in effect, the Network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services at all Demand levels over the range of forecast system demands, under the conditions defined in Category A of Table I. To be considered valid, the Planning Authority and Transmission Planner assessments shall:
  - R1.1. Be made annually.
  - R1.2. Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.
  - R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category A of Table 1 (no contingencies). The specific elements selected (from each of the following categories) shall be acceptable to the associated Regional Reliability Organization(s).
    - R1.3.1. Cover critical system conditions and study years as deemed appropriate by the entity performing the study.
    - R1.3.2. Be conducted annually unless changes to system conditions do not warrant such analyses.
    - R1.3.3. Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.
    - R1.3.4. Have established normal (pre-contingency) operating procedures in place.
    - R1.3.5. Have all projected firm transfers modeled.

- R1.3.6.** Be performed for selected demand levels over the range of forecast system demands.
  - R1.3.7.** Demonstrate that system performance meets Table 1 for Category A (no contingencies).
  - R1.3.8.** Include existing and planned facilities.
  - R1.3.9.** Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.
- R1.4.** Address any planned upgrades needed to meet the performance requirements of Category A.
- R2.** When system simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-001-0.1(X)\_R1, the Planning Authority and Transmission Planner shall each:
  - R2.1.** Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon.
    - R2.1.1.** Including a schedule for implementation.
    - R2.1.2.** Including a discussion of expected required in-service dates of facilities.
    - R2.1.3.** Consider lead times necessary to implement plans.
  - R2.2.** Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.
- R3.** The Planning Authority and Transmission Planner shall each document the results of these reliability assessments and corrective plans and shall annually provide these to its respective NERC Regional Reliability Organization(s), as required by the Regional Reliability Organization.

### **C. Measures**

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-001-0.1(X)\_R1 and TPL-001-0.1(X)\_R2.
- M2.** The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its Reliability Assessments and corrective plans per Reliability Standard TPL-001-0.1(X)\_R3.

### **D. Compliance**

#### **1. Compliance Monitoring Process**

##### **1.1. Compliance Monitoring Responsibility**

Compliance Monitor: Regional Reliability Organization.

Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

##### **1.2. Compliance Monitoring Period and Reset Time Frame**

Annually

**1.3. Data Retention**

None specified.

**1.4. Additional Compliance Information**

**2. Levels of Non-Compliance**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** A valid assessment and corrective plan for the longer-term planning horizon is not available.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** A valid assessment and corrective plan for the near-term planning horizon is not available.

**E. Regional Differences**

1. None identified.

| 13. Operation, partial operation, or misoperation of a fully redundant Remedial Action Scheme in response to an event or abnormal system condition for which it was not intended to operate |   |              |                |                         |                |  |  |  |   |  |   |   |  |   |   |  |
| 14. Impact of severe power swings or oscillations from Disturbances in another Regional Reliability Organization.   |   |              |                |                         |                |  |  |  |   |  |   |   |  |   |   |  |

- a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.
- b) Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.
- c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.
- d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.
- e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.
- f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

## A. Introduction

1. **Title:** System Performance Under Normal (No Contingency) Conditions (Category A)
2. **Number:** TPL-001-0.1(X)
3. **Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements with sufficient lead time, and continue to be modified or upgraded as necessary to meet present and future system needs.
4. **Applicability:**
  - 4.1. Planning Authority
  - 4.2. Transmission Planner
5. **Effective Date:** May 13, 2009

## B. Requirements

- R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is planned such that, with all transmission facilities in service and with normal (pre-contingency) operating procedures in effect, the Network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services at all Demand levels over the range of forecast system demands, under the conditions defined in Category A of Table I. To be considered valid, the Planning Authority and Transmission Planner assessments shall:
  - R1.1. Be made annually.
  - R1.2. Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.
  - R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category A of Table 1 (no contingencies). The specific elements selected (from each of the following categories) shall be acceptable to the associated Regional Reliability Organization(s).
    - R1.3.1. Cover critical system conditions and study years as deemed appropriate by the entity performing the study.
    - R1.3.2. Be conducted annually unless changes to system conditions do not warrant such analyses.
    - R1.3.3. Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.
    - R1.3.4. Have established normal (pre-contingency) operating procedures in place.
    - R1.3.5. Have all projected firm transfers modeled.

- R1.3.6.** Be performed for selected demand levels over the range of forecast system demands.
- R1.3.7.** Demonstrate that system performance meets Table 1 for Category A (no contingencies).
- R1.3.8.** Include existing and planned facilities.
- R1.3.9.** Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.
- R1.4.** Address any planned upgrades needed to meet the performance requirements of Category A.
- R2.** When system simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-001-0.1(X)\_R1, the Planning Authority and Transmission Planner shall each:
  - R2.1.** Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon.
    - R2.1.1.** Including a schedule for implementation.
    - R2.1.2.** Including a discussion of expected required in-service dates of facilities.
    - R2.1.3.** Consider lead times necessary to implement plans.
  - R2.2.** Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.
- R3.** The Planning Authority and Transmission Planner shall each document the results of these reliability assessments and corrective plans and shall annually provide these to its respective NERC Regional Reliability Organization(s), as required by the Regional Reliability Organization.

### **C. Measures**

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-001-0.1(X)\_R1 and TPL-001-0.1(X)\_R2.
- M2.** The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its Reliability Assessments and corrective plans per Reliability Standard TPL-001-0.1(X)\_R3.

### **D. Compliance**

#### **1. Compliance Monitoring Process**

##### **1.1. Compliance Monitoring Responsibility**

Compliance Monitor: Regional Reliability Organization.

Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

##### **1.2. Compliance Monitoring Period and Reset Time Frame**

Annually

**1.3. Data Retention**

None specified.

**1.4. Additional Compliance Information**

**2. Levels of Non-Compliance**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** A valid assessment and corrective plan for the longer-term planning horizon is not available.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** A valid assessment and corrective plan for the near-term planning horizon is not available.

**E. Regional Differences**

1. None identified.

|--|---|---|

- a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.
- b) Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.
- c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.
- d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.
- e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.
- f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

## A. Introduction

1. **Title:** Transmission System Planning Performance Requirements
2. **Number:** TPL-001-4(X)
3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**
  - 4.1. **Functional Entity**
    - 4.1.1. Planning Coordinator.
    - 4.1.2. Transmission Planner.
5. **Effective Date:** Requirements R1 and R7 as well as the definitions shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where regulatory approval is not required on the first day of the first calendar quarter 84 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-4(X), Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-4(X):

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

## B. Requirements

- R1.** Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*
- 1.1.** System models shall represent:
- 1.1.1.** Existing Facilities
  - 1.1.2.** Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.
  - 1.1.3.** New planned Facilities and changes to existing Facilities
  - 1.1.4.** Real and reactive Load forecasts
  - 1.1.5.** Known commitments for Firm Transmission Service and Interchange
  - 1.1.6.** Resources (supply or demand side) required for Load
- R2.** Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*
- 2.1.** For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6. Qualifying studies need to include the following conditions:
- 2.1.1.** System peak Load for either Year One or year two, and for year five.
  - 2.1.2.** System Off-Peak Load for one of the five years.
  - 2.1.3.** P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.
  - 2.1.4.** For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response :
    - Real and reactive forecasted Load.
    - Expected transfers.
    - Expected in service dates of new or modified Transmission Facilities.
    - Reactive resource capability.
    - Generation additions, retirements, or other dispatch scenarios.

- Controllable Loads and Demand Side Management.
  - Duration or timing of known Transmission outages.
- 2.1.5.** When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.
- 2.2.** For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:
- 2.2.1.** A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.
- 2.3.** The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.
- 2.4.** For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part 2.6. The following studies are required:
- 2.4.1.** System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.
- 2.4.2.** System Off-Peak Load for one of the five years.
- 2.4.3.** For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:
- Load level, Load forecast, or dynamic Load model assumptions.
  - Expected transfers.
  - Expected in service dates of new or modified Transmission Facilities.
  - Reactive resource capability.
  - Generation additions, retirements, or other dispatch scenarios.

- 2.5.** For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part 2.6 and shall include documentation to support the technical rationale for determining material changes.
- 2.6.** Past studies may be used to support the Planning Assessment if they meet the following requirements:
- 2.6.1.** For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.
- 2.6.2.** For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.
- 2.7.** For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:
- 2.7.1.** List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:
- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
  - Installation, modification, or removal of Protection Systems or Remedial Action Schemes
  - Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
  - Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
  - Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
  - Use of rate applications, DSM, new technologies, or other initiatives.
- 2.7.2.** Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.
- 2.7.3.** If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner

or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

**2.7.4.** Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

**2.8.** For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

**2.8.1.** List System deficiencies and the associated actions needed to achieve required System performance.

**2.8.2.** Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

**R3.** For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

**3.1.** Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.

**3.2.** Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5.

**3.3.** Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:

**3.3.1.** Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

**3.3.1.1.** Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.

**3.3.1.2.** Tripping of Transmission elements where relay loadability limits are exceeded.

**3.3.2.** Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.

**3.4.** Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies

to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

- 3.4.1.** The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
      - 3.5.** Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.
    - R4.** For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
      - 4.1.** Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.
        - 4.1.1.** For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Remedial Action Scheme is not considered pulling out of synchronism.
        - 4.1.2.** For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.
        - 4.1.3.** For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.
      - 4.2.** Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5.
      - 4.3.** Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall :
        - 4.3.1.** Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
          - 4.3.1.1.** Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.
          - 4.3.1.2.** Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

- 4.3.1.3. Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.
    - 4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.
  - 4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
    - 4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
  - 4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.
- R5.** Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- R6.** Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- R7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*
- R8.** Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
  - 8.1.** If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

**Steady State & Stability:**

- a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur.
- b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.
- c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.
- d. Simulate Normal Clearing unless otherwise specified.
- e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

**Steady State Only:**

- f. Applicable Facility Ratings shall not be exceeded.
- g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.
- h. Planning event P0 is applicable to steady state only.
- i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

**Stability Only:**

- j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

| Category   | Initial Condition | Event <sup>1</sup>  | Fault Type <sup>2</sup> | BES Level <sup>3</sup> | Interruption of Firm Transmission Service Allowed <sup>4</sup> | Non-Consequential Load Loss Allowed |
|--|-------------------|---|-------------------------|------------------------|--|-------------------------------------|
| <b>P0</b><br>No Contingency                              | Normal System     | None  | N/A                     | EHV, HV                | No   | No                                  |

**Table 1 – Steady State & Stability Performance Footnotes  
(Planning Events and Extreme Events)**

1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3 $\emptyset$ ) are the fault types that must be evaluated in Stability simulations for the event described. A 3 $\emptyset$  or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.
13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 12 is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
  - a. Date, time, and location for the meeting
  - b. Specific location(s) of the planned Non-Consequential Load Loss under footnote 12
  - c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Non-Consequential Load Loss under footnote 12 (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder's satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 12 utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Non-Consequential Load Loss under footnote 12 which must include the following:

1. Conditions under which Non-Consequential Load Loss under footnote 12 would be necessary:
  - a. System Load level and estimated annual hours of exposure at or above that Load level
  - b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Non-Consequential Load Loss with:
  - a. The estimated number and type of customers affected

- b. An explanation of the effect of the use of Non-Consequential Load Loss under footnote 12 on the health, safety, and welfare of the community
3. Estimated frequency of Non-Consequential Load Loss under footnote 12 based on historical performance
4. Expected duration of Non-Consequential Load Loss under footnote 12 based on historical performance
5. Future plans to alleviate the need for Non-Consequential Load Loss under footnote 12
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 12
7. Alternatives to Non-Consequential Load Loss considered and the rationale for not selecting those alternatives under footnote 12
8. Assessment of potential overlapping uses of footnote 12 including overlaps with adjacent Transmission Planners and Planning Coordinators

### III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required

Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12 if either:

1. The voltage level of the Contingency is greater than 300 kV
  - a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Non-Consequential Load Loss under footnote 12, or
  - b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW

Once assurance has been received that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss.

**C. Measures**

- M1.** Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.
- M2.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.
- M3.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.
- M4.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.
- M5.** Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.
- M6.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.
- M7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.
- M8.** Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1 Compliance Enforcement Authority**

Regional Entity

**1.2 Compliance Monitoring Period and Reset Timeframe**

Not applicable.

### **1.3 Compliance Monitoring and Enforcement Processes:**

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

### **1.4 Data Retention**

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current in-force Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- The documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and transient voltage response since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The documentation specifying the criteria or methodology utilized in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- The current, in force documentation for the agreement(s) on roles and responsibilities, as well as documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the notifications employed in accordance with Requirement R8 and Measure M8.

If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.

### **1.5 Additional Compliance Information**

None

2. Violation Severity Levels

| 1       | Approved by Board of Trustees February 17, 2011 | Revised footnote 'b' pursuant to FERC Order RM06-16-009   | Revised (Project 2010-11)           |
| 2       | August 4, 2011                                  | Revision of TPL-001-1; includes merging and upgrading requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2; and retirement of TPL-005-0 and TPL-006-0.                   | Project 2006-02 – complete revision |
| 2       | August 4, 2011                                  | Adopted by Board of Trustees  |                                     |
| 1       | April 19, 2012                                  | FERC issued Order 762 remanding TPL-001-1, TPL-002-1b, TPL-003-1a, and TPL-004-1. FERC also issued a NOPR proposing to remand TPL-001-2. NERC has been directed to revise footnote 'b' in accordance with the directives of Order Nos. 762 and 693. |                                     |
| 3       | February 7, 2013                                | Adopted by the NERC Board of Trustees. TPL-001-3 was created after the Board of Trustees approved the revised footnote 'b' in TPL-002-2b, which was balloted and appended to: TPL-001-0.1, TPL-002-0b, TPL-003-0a, and TPL-004-0.                   |                                     |
| 4       | February 7, 2013                                | Adopted by the NERC Board of Trustees. TPL-001-4 was adopted by the Board of Trustees as TPL-001-3, but a discrepancy in numbering was identified and corrected prior to filing with the regulatory agencies.                                       |                                     |
| 4       | October 17, 2013                                | FERC Order issued approving TPL-001-4 (Order effective December 23, 2013).  |                                     |
| 4       | May 6, 2014                                     | The NERC Board of Trustees adopted a revision to the VRF of Requirement 1 from Medium to High in TPL-001-4.   |                                     |

**Standard TPL-001-4(X) — Transmission System Planning Performance Requirements**

---

|      |     |                                       |  |
|------|-----|---------------------------------------|--|
| 4(X) | TBD | Adopted by the NERC Board of Trustees | Replaced references to Special Protection System and SPS with Remedial Action Scheme and RAS |
|------|-----|---------------------------------------|--|

## A. Introduction

1. **Title:** Transmission System Planning Performance Requirements
2. **Number:** TPL-001-4(X)
3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**
  - 4.1. **Functional Entity**
    - 4.1.1. Planning Coordinator.
    - 4.1.2. Transmission Planner.
5. **Effective Date:** Requirements R1 and R7 as well as the definitions shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where regulatory approval is not required on the first day of the first calendar quarter 84 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-4(X), Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-4(X):

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

## B. Requirements

- R1.** Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*
- 1.1.** System models shall represent:
- 1.1.1.** Existing Facilities
  - 1.1.2.** Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.
  - 1.1.3.** New planned Facilities and changes to existing Facilities
  - 1.1.4.** Real and reactive Load forecasts
  - 1.1.5.** Known commitments for Firm Transmission Service and Interchange
  - 1.1.6.** Resources (supply or demand side) required for Load
- R2.** Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*
- 2.1.** For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6. Qualifying studies need to include the following conditions:
- 2.1.1.** System peak Load for either Year One or year two, and for year five.
  - 2.1.2.** System Off-Peak Load for one of the five years.
  - 2.1.3.** P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.
  - 2.1.4.** For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response :
    - Real and reactive forecasted Load.
    - Expected transfers.
    - Expected in service dates of new or modified Transmission Facilities.
    - Reactive resource capability.
    - Generation additions, retirements, or other dispatch scenarios.

- Controllable Loads and Demand Side Management.
  - Duration or timing of known Transmission outages.
- 2.1.5.** When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.
- 2.2.** For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:
- 2.2.1.** A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.
- 2.3.** The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.
- 2.4.** For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part 2.6. The following studies are required:
- 2.4.1.** System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.
- 2.4.2.** System Off-Peak Load for one of the five years.
- 2.4.3.** For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:
- Load level, Load forecast, or dynamic Load model assumptions.
  - Expected transfers.
  - Expected in service dates of new or modified Transmission Facilities.
  - Reactive resource capability.
  - Generation additions, retirements, or other dispatch scenarios.

- 2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part 2.6 and shall include documentation to support the technical rationale for determining material changes.
- 2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:
- 2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.
- 2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.
- 2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:
- 2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:
- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
  - Installation, modification, or removal of Protection Systems or ~~Special Protection System~~ Remedial Action Schemes
  - Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
  - Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
  - Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
  - Use of rate applications, DSM, new technologies, or other initiatives.
- 2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.
- 2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner

or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

- 2.7.4.** Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- 2.8.** For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

  - 2.8.1.** List System deficiencies and the associated actions needed to achieve required System performance.
  - 2.8.2.** Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- R3.** For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

  - 3.1.** Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.
  - 3.2.** Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5.
  - 3.3.** Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:

    - 3.3.1.** Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

      - 3.3.1.1.** Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.
      - 3.3.1.2.** Tripping of Transmission elements where relay loadability limits are exceeded.
    - 3.3.2.** Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.
  - 3.4.** Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies

to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

- 3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
- 3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.
- R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
  - 4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.
    - 4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a ~~Special Protection System~~ Remedial Action Scheme is not considered pulling out of synchronism.
    - 4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.
    - 4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.
  - 4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5.
  - 4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall :
    - 4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
      - 4.3.1.1. Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.
      - 4.3.1.2. Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or

assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

- 4.3.1.3.** Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.
    - 4.3.2.** Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.
  - 4.4.** Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
    - 4.4.1.** Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
  - 4.5.** Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.
- R5.** Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]
- R6.** Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]
- R7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R8.** Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]
- 8.1.** If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide

a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

**Steady State & Stability:**

- a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur.
- b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.
- c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.
- d. Simulate Normal Clearing unless otherwise specified.
- e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

**Steady State Only:**

- f. Applicable Facility Ratings shall not be exceeded.
- g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.
- h. Planning event P0 is applicable to steady state only.
- i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

**Stability Only:**

- j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

| Category   | Initial Condition | Event <sup>1</sup>  | Fault Type <sup>2</sup> | BES Level <sup>3</sup> | Interruption of Firm Transmission Service Allowed <sup>4</sup> | Non-Consequential Load Loss Allowed |
|--|-------------------|---|-------------------------|------------------------|--|-------------------------------------|
| <b>P0</b><br>No Contingency                              | Normal System     | None  | N/A                     | EHV, HV                | No   | No                                  |
| <b>P1</b><br>Single Contingency                          | Normal System     | Loss of one of the following:<br>1. Generator<br>2. Transmission Circuit<br>3. Transformer <sup>5</sup><br>4. Shunt Device <sup>6</sup> | 3Ø                      | EHV, HV                | No <sup>9</sup>  | No <sup>12</sup>                    |
|  |                   | 5. Single Pole of a DC line   | SLG                     |                        |  |                                     |
| <b>P2</b><br>Single Contingency                          | Normal System     | 1. Opening of a line section w/o a fault <sup>7</sup>   | N/A                     | EHV, HV                | No <sup>9</sup>  | No <sup>12</sup>                    |
|  |                   | 2. Bus Section Fault  | SLG                     | EHV                    | No <sup>9</sup>  | No                                  |
|  |                   |   |                         | HV                     | Yes  | Yes                                 |
|  |                   | 3. Internal Breaker Fault <sup>8</sup><br>(non-Bus-tie Breaker)   | SLG                     | EHV                    | No <sup>9</sup>  | No                                  |
| HV   | Yes               |   |                         | Yes                    |  |                                     |
| 4. Internal Breaker Fault (Bus-tie Breaker) <sup>8</sup> | SLG               | EHV, HV   | Yes                     | Yes                    |  |                                     |

**Table 1 – Steady State & Stability Performance Footnotes  
(Planning Events and Extreme Events)**

1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3 $\emptyset$ ) are the fault types that must be evaluated in Stability simulations for the event described. A 3 $\emptyset$  or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.
13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 12 is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
  - a. Date, time, and location for the meeting
  - b. Specific location(s) of the planned Non-Consequential Load Loss under footnote 12
  - c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Non-Consequential Load Loss under footnote 12 (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder's satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 12 utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Non-Consequential Load Loss under footnote 12 which must include the following:

1. Conditions under which Non-Consequential Load Loss under footnote 12 would be necessary:
  - a. System Load level and estimated annual hours of exposure at or above that Load level
  - b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Non-Consequential Load Loss with:
  - a. The estimated number and type of customers affected

- b. An explanation of the effect of the use of Non-Consequential Load Loss under footnote 12 on the health, safety, and welfare of the community
3. Estimated frequency of Non-Consequential Load Loss under footnote 12 based on historical performance
4. Expected duration of Non-Consequential Load Loss under footnote 12 based on historical performance
5. Future plans to alleviate the need for Non-Consequential Load Loss under footnote 12
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 12
7. Alternatives to Non-Consequential Load Loss considered and the rationale for not selecting those alternatives under footnote 12
8. Assessment of potential overlapping uses of footnote 12 including overlaps with adjacent Transmission Planners and Planning Coordinators

### III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required

Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12 if either:

1. The voltage level of the Contingency is greater than 300 kV
  - a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Non-Consequential Load Loss under footnote 12, or
  - b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW

Once assurance has been received that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss.

**C. Measures**

- M1.** Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.
- M2.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.
- M3.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.
- M4.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.
- M5.** Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.
- M6.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.
- M7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.
- M8.** Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1 Compliance Enforcement Authority**

Regional Entity

**1.2 Compliance Monitoring Period and Reset Timeframe**

Not applicable.

### **1.3 Compliance Monitoring and Enforcement Processes:**

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

### **1.4 Data Retention**

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current in-force Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- The documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and transient voltage response since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The documentation specifying the criteria or methodology utilized in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- The current, in force documentation for the agreement(s) on roles and responsibilities, as well as documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the notifications employed in accordance with Requirement R8 and Measure M8.

If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.

### **1.5 Additional Compliance Information**

None

2. Violation Severity Levels

| 1       | Approved by Board of Trustees February 17, 2011 | Revised footnote 'b' pursuant to FERC Order RM06-16-009   | Revised (Project 2010-11)           |
| 2       | August 4, 2011                                  | Revision of TPL-001-1; includes merging and upgrading requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2; and retirement of TPL-005-0 and TPL-006-0.                   | Project 2006-02 – complete revision |
| 2       | August 4, 2011                                  | Adopted by Board of Trustees  |                                     |
| 1       | April 19, 2012                                  | FERC issued Order 762 remanding TPL-001-1, TPL-002-1b, TPL-003-1a, and TPL-004-1. FERC also issued a NOPR proposing to remand TPL-001-2. NERC has been directed to revise footnote 'b' in accordance with the directives of Order Nos. 762 and 693. |                                     |
| 3       | February 7, 2013                                | Adopted by the NERC Board of Trustees. TPL-001-3 was created after the Board of Trustees approved the revised footnote 'b' in TPL-002-2b, which was balloted and appended to: TPL-001-0.1, TPL-002-0b, TPL-003-0a, and TPL-004-0.                   |                                     |
| 4       | February 7, 2013                                | Adopted by the NERC Board of Trustees. TPL-001-4 was adopted by the Board of Trustees as TPL-001-3, but a discrepancy in numbering was identified and corrected prior to filing with the regulatory agencies.                                       |                                     |
| 4       | October 17, 2013                                | FERC Order issued approving TPL-001-4 (Order effective December 23, 2013).  |                                     |
| 4       | May 6, 2014                                     | The NERC Board of Trustees adopted a revision to the VRF of Requirement 1 from Medium to High in TPL-001-4.   |                                     |

**Standard TPL-001-4(X) — Transmission System Planning Performance Requirements**

|             |            |  |   |
|-------------|------------|--|---|
|             |            |  |   |
| <u>4(X)</u> | <u>TBD</u> | <u>Adopted by the NERC Board of Trustees</u> | <u>Replaced references to Special Protection System and SPS with Remedial Action Scheme and RAS</u> |

**A. Introduction**

- 1. Title:** System Performance Following Loss of a Single Bulk Electric System Element (Category B)
- 2. Number:** TPL-002-0b(X)
- 3. Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements with sufficient lead time, and continue to be modified or upgraded as necessary to meet present and future system needs.
- 4. Applicability:**
  - 4.1.** Planning Authority
  - 4.2.** Transmission Planner
- 5. Effective Date:** Immediately after approval of applicable regulatory authorities.

**B. Requirements**

- R1.** The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is planned such that the Network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services, at all demand levels over the range of forecast system demands, under the contingency conditions as defined in Category B of Table I. To be valid, the Planning Authority and Transmission Planner assessments shall:
  - R1.1.** Be made annually.
  - R1.2.** Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.
  - R1.3.** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
    - R1.3.1.** Be performed and evaluated only for those Category B contingencies that would produce the more severe System results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
    - R1.3.2.** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
    - R1.3.3.** Be conducted annually unless changes to system conditions do not warrant such analyses.
    - R1.3.4.** Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.
    - R1.3.5.** Have all projected firm transfers modeled.
    - R1.3.6.** Be performed and evaluated for selected demand levels over the range of forecast system Demands.

## **Standard TPL-002-0b(X) — System Performance Following Loss of a Single BES Element**

---

- R1.3.7.** Demonstrate that system performance meets Category B contingencies.
- R1.3.8.** Include existing and planned facilities.
- R1.3.9.** Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.
- R1.3.10.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
- R1.3.11.** Include the effects of existing and planned control devices.
- R1.3.12.** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.
- R1.4.** Address any planned upgrades needed to meet the performance requirements of Category B of Table I.
- R1.5.** Consider all contingencies applicable to Category B.
- R2.** When System simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-002-0b(X)\_R1, the Planning Authority and Transmission Planner shall each:
  - R2.1.** Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon:
    - R2.1.1.** Including a schedule for implementation.
    - R2.1.2.** Including a discussion of expected required in-service dates of facilities.
    - R2.1.3.** Consider lead times necessary to implement plans.
  - R2.2.** Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.
- R3.** The Planning Authority and Transmission Planner shall each document the results of its Reliability Assessments and corrective plans and shall annually provide the results to its respective Regional Reliability Organization(s), as required by the Regional Reliability Organization.

### **C. Measures**

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-0b(X)\_R1 and TPL-002-0b(X)\_R2.
- M2.** The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its reliability assessments and corrective plans per Reliability Standard TPL-002-0b(X)\_R3.

### **D. Compliance**

#### **1. Compliance Monitoring Process**

##### **1.1. Compliance Monitoring Responsibility**

**Compliance Monitor:** Regional Reliability Organizations.

Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

**Standard TPL-002-0b(X) — System Performance Following Loss of a Single BES Element**

**1.2. Compliance Monitoring Period and Reset Timeframe**

Annually.

**1.3. Data Retention**

None specified.

**1.4. Additional Compliance Information**

None.

**2. Levels of Non-Compliance**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** A valid assessment and corrective plan for the longer-term planning horizon is not available.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** A valid assessment and corrective plan for the near-term planning horizon is not available.

**E. Regional Differences**

1. None identified.

**Version History**

Failure of a fully redundant Remedial Action Scheme to operate when required</p> <p>13. Operation, partial operation, or misoperation of a fully redundant Remedial Action Scheme in response to an event or abnormal system condition for which it was not intended to operate</p> <p>14. Impact of severe power swings or oscillations from Disturbances in another Regional Reliability Organization.</p> |   |                |                |                         |                |  |

- a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.
- b) Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.
- c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.
- d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.
- e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.
- f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

## Appendix 1

### Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO

NERC received two requests for interpretation of identical requirements (Requirements R1.3.2 and R1.3.12) in TPL-002-0 and TPL-003-0 from the Midwest ISO and Ameren. These requirements state:

#### **TPL-002-0:**

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

- R1.3** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
- R1.3.2** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
- R1.3.12** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

#### **TPL-003-0:**

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

- R1.3** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
- R1.3.2** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
- R1.3.12** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

### Requirement R1.3.2

#### Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from Ameren on July 25, 2007:

*Ameren specifically requests clarification on the phrase, 'critical system conditions' in R1.3.2. Ameren asks if compliance with R1.3.2 requires multiple contingent generating unit Outages as part of possible generation dispatch scenarios describing critical system conditions for which the system shall be planned and modeled in accordance with the contingency definitions included in Table 1.*

**Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2  
Received from MISO on August 9, 2007:**

*MISO asks if the TPL standards require that any specific dispatch be applied, other than one that is representative of supply of firm demand and transmission service commitments, in the modeling of system contingencies specified in Table 1 in the TPL standards.*

*MISO then asks if a variety of possible dispatch patterns should be included in planning analyses including a probabilistically based dispatch that is representative of generation deficiency scenarios, would it be an appropriate application of the TPL standard to apply the transmission contingency conditions in Category B of Table 1 to these possible dispatch pattern.*

**The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 was developed by the NERC Planning Committee on March 13, 2008:**

The selection of a credible generation dispatch for the modeling of critical system conditions is within the discretion of the Planning Authority. The Planning Authority was renamed “Planning Coordinator” (PC) in the Functional Model dated February 13, 2007. (TPL -002 and -003 use the former “Planning Authority” name, and the Functional Model terminology was a change in name only and did not affect responsibilities.)

- Under the Functional Model, the Planning Coordinator “Provides and informs Resource Planners, Transmission Planners, and adjacent Planning Coordinators of the methodologies and tools for the simulation of the transmission system” while the Transmission Planner “Receives from the Planning Coordinator methodologies and tools for the analysis and development of transmission expansion plans.” A PC’s selection of “critical system conditions” and its associated generation dispatch falls within the purview of “methodology.”

Furthermore, consistent with this interpretation, a Planning Coordinator would formulate critical system conditions that may involve a range of critical generator unit outages as part of the possible generator dispatch scenarios.

Both TPL-002-0 and TPL-003-0 have a similar measure M1:

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-0\_R1 [or TPL-003-0\_R1] and TPL-002-0\_R2 [or TPL-003-0\_R2].”

The Regional Reliability Organization (RRO) is named as the Compliance Monitor in both standards. Pursuant to Federal Energy Regulatory Commission (FERC) Order 693, FERC eliminated the RRO as the appropriate Compliance Monitor for standards and replaced it with the Regional Entity (RE). See paragraph 157 of Order 693. Although the referenced TPL standards still include the reference to the RRO, to be consistent with Order 693, the RRO is replaced by the RE as the Compliance Monitor for this interpretation. As the Compliance Monitor, the RE determines what a “valid assessment” means when evaluating studies based upon specific sub-requirements in R1.3 selected by the Planning Coordinator and the Transmission Planner. If a PC has Transmission Planners in more than one region, the REs must coordinate among themselves on compliance matters.

**Requirement R1.3.12**

**Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12  
Received from Ameren on July 25, 2007:**

*Ameren also asks how the inclusion of planned outages should be interpreted with respect to the contingency definitions specified in Table 1 for Categories B and C. Specifically, Ameren asks if R1.3.12 requires that the system be planned to be operated during those conditions associated with planned outages consistent with the performance requirements described in Table 1 plus any unidentified outage.*

**Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12  
Received from MISO on August 9, 2007:**

*MISO asks if the term “planned outages” means only already known/scheduled planned outages that may continue into the planning horizon, or does it include potential planned outages not yet scheduled that may occur at those demand levels for which planned (including maintenance) outages are performed?*

*If the requirement does include not yet scheduled but potential planned outages that could occur in the planning horizon, is the following a proper interpretation of this provision?*

*The system is adequately planned and in accordance with the standard if, in order for a system operator to potentially schedule such a planned outage on the future planned system, planning studies show that a system adjustment (load shed, re-dispatch of generating units in the interconnection, or system reconfiguration) would be required concurrent with taking such a planned outage in order to prepare for a Category B contingency (single element forced out of service)? In other words, should the system in effect be planned to be operated as for a Category C3 n-2 event, even though the first event is a planned base condition?*

*If the requirement is intended to mean only known and scheduled planned outages that will occur or may continue into the planning horizon, is this interpretation consistent with the original interpretation by NERC of the standard as provided by NERC in response to industry questions in the Phase I development of this standard?*

**The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 was developed by the NERC Planning Committee on March 13, 2008:**

This provision was not previously interpreted by NERC since its approval by FERC and other regulatory authorities. TPL-002-0 and TPL-003-0 explicitly provide that the inclusion of planned (including maintenance) outages of any bulk electric equipment at demand levels for which the planned outages are required. For studies that include planned outages, compliance with the contingency assessment for TPL-002-0 and TPL-003-0 as outlined in Table 1 would include any necessary system adjustments which might be required to accommodate planned outages since a planned outage is not a “contingency” as defined in the *NERC Glossary of Terms Used in Standards*.

## Appendix 2

| Requirement Number and Text of Requirement   |
|--|
| <p><b>R1.3.</b> Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following <b>Category B of Table 1</b> (single contingencies). | Background Information for Interpretation  |
| <p>Requirement R1.3 and sub-requirement R1.3.10 of standard TPL-002-0a contain three key obligations:</p> <ol style="list-style-type: none"> <li>1. That the assessment is supported by “study and/or system simulation testing that addresses each the following categories, showing system performance following Category B of Table 1 (single contingencies).”</li> <li>2. “...these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).”</li> <li>3. “Include the effects of existing and planned protection systems, including any backup or redundant systems.”</li> </ol> <p><i>Category B of Table 1 (single Contingencies) specifies:</i></p> <p>Single Line Ground (SLG) or 3-Phase (3Ø) Fault, with Normal Clearing:</p> <ol style="list-style-type: none"> <li>1. Generator</li> <li>2. Transmission Circuit</li> <li>3. Transformer</li> </ol> <p>Loss of an Element without a Fault.</p> <p>Single Pole Block, Normal Clearing<sup>e</sup>:</p> <ol style="list-style-type: none"> <li>4. Single Pole (dc) Line</li> </ol> <p><i>Note e specifies:</i></p> <p>e) Normal Clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.</p> <p>The NERC Glossary of Terms defines Normal Clearing as “A protection system operates as designed and the fault is cleared in the time normally expected with proper functioning of the installed protection systems.”</p> |
| Conclusion   |
| <p>TPL-002-0a requires that System studies or simulations be made to assess the impact of single Contingency operation with Normal Clearing. TPL-002-0a R1.3.10 does require that all elements expected to be removed from service through normal operations of the Protection Systems be removed in simulations.</p> <p>This standard does not require an assessment of the Transmission System performance due to a Protection System failure or Protection System misoperation. Protection System failure or Protection System misoperation is addressed in TPL-003-0 — System Performance following Loss of Two or</p>   |

More Bulk Electric System Elements (Category C) and TPL-004-0 — System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D).

TPL-002-0a R1.3.10 does not require simulating anything other than Normal Clearing when assessing the impact of a Single Line Ground (SLG) or 3-Phase (3Ø) Fault on the performance of the Transmission System.

**In regards to PacifiCorp’s comments on the material impact associated with this interpretation, the interpretation team has the following comment:**

Requirement R2.1 requires “a written summary of plans to achieve the required system performance,” including a schedule for implementation and an expected in-service date that considers lead times necessary to implement the plan. Failure to provide such summary may lead to noncompliance that could result in penalties and sanctions.

**A. Introduction**

- 1. Title:** System Performance Following Loss of a Single Bulk Electric System Element (Category B)
- 2. Number:** TPL-002-0b(X)
- 3. Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements with sufficient lead time, and continue to be modified or upgraded as necessary to meet present and future system needs.
- 4. Applicability:**
  - 4.1.** Planning Authority
  - 4.2.** Transmission Planner
- 5. Effective Date:** Immediately after approval of applicable regulatory authorities.

**B. Requirements**

- R1.** The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is planned such that the Network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services, at all demand levels over the range of forecast system demands, under the contingency conditions as defined in Category B of Table I. To be valid, the Planning Authority and Transmission Planner assessments shall:
  - R1.1.** Be made annually.
  - R1.2.** Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.
  - R1.3.** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
    - R1.3.1.** Be performed and evaluated only for those Category B contingencies that would produce the more severe System results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
    - R1.3.2.** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
    - R1.3.3.** Be conducted annually unless changes to system conditions do not warrant such analyses.
    - R1.3.4.** Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.
    - R1.3.5.** Have all projected firm transfers modeled.
    - R1.3.6.** Be performed and evaluated for selected demand levels over the range of forecast system Demands.

## **Standard TPL-002-0b(X) — System Performance Following Loss of a Single BES Element**

---

- R1.3.7.** Demonstrate that system performance meets Category B contingencies.
- R1.3.8.** Include existing and planned facilities.
- R1.3.9.** Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.
- R1.3.10.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
- R1.3.11.** Include the effects of existing and planned control devices.
- R1.3.12.** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.
- R1.4.** Address any planned upgrades needed to meet the performance requirements of Category B of Table I.
- R1.5.** Consider all contingencies applicable to Category B.
- R2.** When System simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-002-0b(X)\_R1, the Planning Authority and Transmission Planner shall each:
  - R2.1.** Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon:
    - R2.1.1.** Including a schedule for implementation.
    - R2.1.2.** Including a discussion of expected required in-service dates of facilities.
    - R2.1.3.** Consider lead times necessary to implement plans.
  - R2.2.** Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.
- R3.** The Planning Authority and Transmission Planner shall each document the results of its Reliability Assessments and corrective plans and shall annually provide the results to its respective Regional Reliability Organization(s), as required by the Regional Reliability Organization.

### **C. Measures**

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-0b(X)\_R1 and TPL-002-0b(X)\_R2.
- M2.** The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its reliability assessments and corrective plans per Reliability Standard TPL-002-0b(X)\_R3.

### **D. Compliance**

#### **1. Compliance Monitoring Process**

##### **1.1. Compliance Monitoring Responsibility**

**Compliance Monitor:** Regional Reliability Organizations.

Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

**Standard TPL-002-0b(X) — System Performance Following Loss of a Single BES Element**

**1.2. Compliance Monitoring Period and Reset Timeframe**

Annually.

**1.3. Data Retention**

None specified.

**1.4. Additional Compliance Information**

None.

**2. Levels of Non-Compliance**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** A valid assessment and corrective plan for the longer-term planning horizon is not available.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** A valid assessment and corrective plan for the near-term planning horizon is not available.

**E. Regional Differences**

1. None identified.

**Version History**

| Version      | Date               | Action   | Change Tracking   |

Breaker (failure or internal Fault)</li> <li>6. Loss of towerline with three or more circuits</li> <li>7. All transmission lines on a common right-of way</li> <li>8. Loss of a substation (one voltage level plus transformers)</li> <li>9. Loss of a switching station (one voltage level plus transformers)</li> <li>10. Loss of all generating units at a station</li> <li>11. Loss of a large Load or major Load center</li> <li>12. Failure of a fully redundant <del>Special Protection System (or Remedial Action Scheme)</del> to operate when required</li> <li>13. Operation, partial operation, or misoperation of a fully redundant <del>Special Protection System (or Remedial Action Scheme)</del> in response to an event or abnormal system condition for which it was not intended to operate</li> <li>14. Impact of severe power swings or oscillations from Disturbances in another Regional Reliability Organization.</li> </ol> | <p>Evaluate for risks and consequences.</p> <ul style="list-style-type: none"> <li>▪ May involve substantial loss of customer Demand and generation in a widespread area or areas</li> <li>▪ Portions or all of the interconnected systems may or may not achieve a new, stable operating point.</li> <li>▪ Evaluation of these events may require joint studies with neighboring systems.</li> </ul> |
|---|---|---|

- a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.
- b) Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.
- c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.
- d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.
- e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.
- f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

## Appendix 1

### Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO

NERC received two requests for interpretation of identical requirements (Requirements R1.3.2 and R1.3.12) in TPL-002-0 and TPL-003-0 from the Midwest ISO and Ameren. These requirements state:

#### **TPL-002-0:**

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

- R1.3** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
- R1.3.2** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
- R1.3.12** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

#### **TPL-003-0:**

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

- R1.3** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
- R1.3.2** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
- R1.3.12** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

### Requirement R1.3.2

#### Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from Ameren on July 25, 2007:

*Ameren specifically requests clarification on the phrase, 'critical system conditions' in R1.3.2. Ameren asks if compliance with R1.3.2 requires multiple contingent generating unit Outages as part of possible generation dispatch scenarios describing critical system conditions for which the system shall be planned and modeled in accordance with the contingency definitions included in Table 1.*

**Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2  
Received from MISO on August 9, 2007:**

*MISO asks if the TPL standards require that any specific dispatch be applied, other than one that is representative of supply of firm demand and transmission service commitments, in the modeling of system contingencies specified in Table 1 in the TPL standards.*

*MISO then asks if a variety of possible dispatch patterns should be included in planning analyses including a probabilistically based dispatch that is representative of generation deficiency scenarios, would it be an appropriate application of the TPL standard to apply the transmission contingency conditions in Category B of Table 1 to these possible dispatch pattern.*

**The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 was developed by the NERC Planning Committee on March 13, 2008:**

The selection of a credible generation dispatch for the modeling of critical system conditions is within the discretion of the Planning Authority. The Planning Authority was renamed “Planning Coordinator” (PC) in the Functional Model dated February 13, 2007. (TPL -002 and -003 use the former “Planning Authority” name, and the Functional Model terminology was a change in name only and did not affect responsibilities.)

- Under the Functional Model, the Planning Coordinator “Provides and informs Resource Planners, Transmission Planners, and adjacent Planning Coordinators of the methodologies and tools for the simulation of the transmission system” while the Transmission Planner “Receives from the Planning Coordinator methodologies and tools for the analysis and development of transmission expansion plans.” A PC’s selection of “critical system conditions” and its associated generation dispatch falls within the purview of “methodology.”

Furthermore, consistent with this interpretation, a Planning Coordinator would formulate critical system conditions that may involve a range of critical generator unit outages as part of the possible generator dispatch scenarios.

Both TPL-002-0 and TPL-003-0 have a similar measure M1:

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-0\_R1 [or TPL-003-0\_R1] and TPL-002-0\_R2 [or TPL-003-0\_R2].”

The Regional Reliability Organization (RRO) is named as the Compliance Monitor in both standards. Pursuant to Federal Energy Regulatory Commission (FERC) Order 693, FERC eliminated the RRO as the appropriate Compliance Monitor for standards and replaced it with the Regional Entity (RE). See paragraph 157 of Order 693. Although the referenced TPL standards still include the reference to the RRO, to be consistent with Order 693, the RRO is replaced by the RE as the Compliance Monitor for this interpretation. As the Compliance Monitor, the RE determines what a “valid assessment” means when evaluating studies based upon specific sub-requirements in R1.3 selected by the Planning Coordinator and the Transmission Planner. If a PC has Transmission Planners in more than one region, the REs must coordinate among themselves on compliance matters.

**Requirement R1.3.12**

**Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12  
Received from Ameren on July 25, 2007:**

*Ameren also asks how the inclusion of planned outages should be interpreted with respect to the contingency definitions specified in Table 1 for Categories B and C. Specifically, Ameren asks if R1.3.12 requires that the system be planned to be operated during those conditions associated with planned outages consistent with the performance requirements described in Table 1 plus any unidentified outage.*

**Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12  
Received from MISO on August 9, 2007:**

*MISO asks if the term “planned outages” means only already known/scheduled planned outages that may continue into the planning horizon, or does it include potential planned outages not yet scheduled that may occur at those demand levels for which planned (including maintenance) outages are performed?*

*If the requirement does include not yet scheduled but potential planned outages that could occur in the planning horizon, is the following a proper interpretation of this provision?*

*The system is adequately planned and in accordance with the standard if, in order for a system operator to potentially schedule such a planned outage on the future planned system, planning studies show that a system adjustment (load shed, re-dispatch of generating units in the interconnection, or system reconfiguration) would be required concurrent with taking such a planned outage in order to prepare for a Category B contingency (single element forced out of service)? In other words, should the system in effect be planned to be operated as for a Category C3 n-2 event, even though the first event is a planned base condition?*

*If the requirement is intended to mean only known and scheduled planned outages that will occur or may continue into the planning horizon, is this interpretation consistent with the original interpretation by NERC of the standard as provided by NERC in response to industry questions in the Phase I development of this standard?*

**The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 was developed by the NERC Planning Committee on March 13, 2008:**

This provision was not previously interpreted by NERC since its approval by FERC and other regulatory authorities. TPL-002-0 and TPL-003-0 explicitly provide that the inclusion of planned (including maintenance) outages of any bulk electric equipment at demand levels for which the planned outages are required. For studies that include planned outages, compliance with the contingency assessment for TPL-002-0 and TPL-003-0 as outlined in Table 1 would include any necessary system adjustments which might be required to accommodate planned outages since a planned outage is not a “contingency” as defined in the *NERC Glossary of Terms Used in Standards*.

## Appendix 2

| Requirement Number and Text of Requirement   |
|--|
| <p><b>R1.3.</b> Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following <b>Category B of Table 1</b> (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).</p> <p style="padding-left: 40px;"><b>R1.3.10.</b> Include the effects of existing and planned protection systems, including any backup or redundant systems.</p>  |
| Background Information for Interpretation  |
| <p>Requirement R1.3 and sub-requirement R1.3.10 of standard TPL-002-0a contain three key obligations:</p> <ol style="list-style-type: none"> <li>1. That the assessment is supported by “study and/or system simulation testing that addresses each the following categories, showing system performance following Category B of Table 1 (single contingencies).”</li> <li>2. “...these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).”</li> <li>3. “Include the effects of existing and planned protection systems, including any backup or redundant systems.”</li> </ol> <p><i>Category B of Table 1 (single Contingencies) specifies:</i></p> <p>Single Line Ground (SLG) or 3-Phase (3Ø) Fault, with Normal Clearing:</p> <ol style="list-style-type: none"> <li>1. Generator</li> <li>2. Transmission Circuit</li> <li>3. Transformer</li> </ol> <p>Loss of an Element without a Fault.</p> <p>Single Pole Block, Normal Clearing<sup>e</sup>:</p> <ol style="list-style-type: none"> <li>4. Single Pole (dc) Line</li> </ol> <p><i>Note e specifies:</i></p> <p>e) Normal Clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.</p> <p>The NERC Glossary of Terms defines Normal Clearing as “A protection system operates as designed and the fault is cleared in the time normally expected with proper functioning of the installed protection systems.”</p> |
| Conclusion   |
| <p>TPL-002-0a requires that System studies or simulations be made to assess the impact of single Contingency operation with Normal Clearing. TPL-002-0a R1.3.10 does require that all elements expected to be removed from service through normal operations of the Protection Systems be removed in simulations.</p> <p>This standard does not require an assessment of the Transmission System performance due to a Protection System failure or Protection System misoperation. Protection System failure or Protection System misoperation is addressed in TPL-003-0 — System Performance following Loss of Two or</p>   |

More Bulk Electric System Elements (Category C) and TPL-004-0 — System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D).

TPL-002-0a R1.3.10 does not require simulating anything other than Normal Clearing when assessing the impact of a Single Line Ground (SLG) or 3-Phase (3Ø) Fault on the performance of the Transmission System.

**In regards to PacifiCorp’s comments on the material impact associated with this interpretation, the interpretation team has the following comment:**

Requirement R2.1 requires “a written summary of plans to achieve the required system performance,” including a schedule for implementation and an expected in-service date that considers lead times necessary to implement the plan. Failure to provide such summary may lead to noncompliance that could result in penalties and sanctions.

## Standard TPL-003-0b(X) — System Performance Following Loss of Two or More BES Elements

---

### A. Introduction

1. **Title:** System Performance Following Loss of Two or More Bulk Electric System Elements (Category C)
2. **Number:** TPL-003-0b(X)
3. **Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements, with sufficient lead time and continue to be modified or upgraded as necessary to meet present and future System needs.
4. **Applicability:**
  - 4.1. Planning Authority
  - 4.2. Transmission Planner
5. **Effective Date:** April 23, 2010

### B. Requirements

- R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission systems is planned such that the network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services, at all demand Levels over the range of forecast system demands, under the contingency conditions as defined in Category C of Table I (attached). The controlled interruption of customer Demand, the planned removal of generators, or the Curtailment of firm (non-recallable reserved) power transfers may be necessary to meet this standard. To be valid, the Planning Authority and Transmission Planner assessments shall:
  - R1.1. Be made annually.
  - R1.2. Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.
  - R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
    - R1.3.1. Be performed and evaluated only for those Category C contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
    - R1.3.2. Cover critical system conditions and study years as deemed appropriate by the responsible entity.
    - R1.3.3. Be conducted annually unless changes to system conditions do not warrant such analyses.
    - R1.3.4. Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.

## Standard TPL-003-0b(X) — System Performance Following Loss of Two or More BES Elements

---

- R1.3.5.** Have all projected firm transfers modeled.
  - R1.3.6.** Be performed and evaluated for selected demand levels over the range of forecast system demands.
  - R1.3.7.** Demonstrate that System performance meets Table 1 for Category C contingencies.
  - R1.3.8.** Include existing and planned facilities.
  - R1.3.9.** Include Reactive Power resources to ensure that adequate reactive resources are available to meet System performance.
  - R1.3.10.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
  - R1.3.11.** Include the effects of existing and planned control devices.
  - R1.3.12.** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those Demand levels for which planned (including maintenance) outages are performed.
- R1.4.** Address any planned upgrades needed to meet the performance requirements of Category C.
- R1.5.** Consider all contingencies applicable to Category C.
- R2.** When system simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-003-0b(X)\_R1, the Planning Authority and Transmission Planner shall each:
  - R2.1.** Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon:
    - R2.1.1.** Including a schedule for implementation.
    - R2.1.2.** Including a discussion of expected required in-service dates of facilities.
    - R2.1.3.** Consider lead times necessary to implement plans.
  - R2.2.** Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.
- R3.** The Planning Authority and Transmission Planner shall each document the results of these Reliability Assessments and corrective plans and shall annually provide these to its respective NERC Regional Reliability Organization(s), as required by the Regional Reliability Organization.

### C. Measures

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-003-0b(X)\_R1 and TPL-003-0b(X)\_R2.
- M2.** The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its reliability assessments and corrective plans per Reliability Standard TPL-003-0b(X)\_R3.

### D. Compliance

- 1. Compliance Monitoring Process**

**Standard TPL-003-0b(X) — System Performance Following Loss of Two or More BES Elements**

---

**1.1. Compliance Monitoring Responsibility**

Compliance Monitor: Regional Reliability Organizations.

**1.2. Compliance Monitoring Period and Reset Timeframe**

Annually.

**1.3. Data Retention**

None specified.

**1.4. Additional Compliance Information**

None.

**2. Levels of Non-Compliance**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** A valid assessment and corrective plan for the longer-term planning horizon is not available.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** A valid assessment and corrective plan for the near-term planning horizon is not available.

**E. Regional Differences**

1. None identified.

**Version History**

| Version | Date             | Action   | Change Tracking  |

- a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.
- b) Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.
- c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.
- d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.
- e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.
- f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

## **Appendix 1**

### **Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO**

NERC received two requests for interpretation of identical requirements (Requirements R1.3.2 and R1.3.12) in TPL-002-0 and TPL-003-0 from the Midwest ISO and Ameren. These requirements state:

#### **TPL-002-0:**

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

- R1.3** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
- R1.3.2** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
  - R1.3.12** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

#### **TPL-003-0:**

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

- R1.3** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
- R1.3.2** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
  - R1.3.12** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

### **Requirement R1.3.2**

#### **Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from Ameren on July 25, 2007:**

*Ameren specifically requests clarification on the phrase, 'critical system conditions' in R1.3.2. Ameren asks if compliance with R1.3.2 requires multiple contingent generating unit Outages as part of possible generation dispatch scenarios describing critical system conditions for which the system shall be planned and modeled in accordance with the contingency definitions included in Table 1.*

## Standard TPL-003-0b(X) — System Performance Following Loss of Two or More BES Elements

---

### **Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from MISO on August 9, 2007:**

*MISO asks if the TPL standards require that any specific dispatch be applied, other than one that is representative of supply of firm demand and transmission service commitments, in the modeling of system contingencies specified in Table 1 in the TPL standards.*

*MISO then asks if a variety of possible dispatch patterns should be included in planning analyses including a probabilistically based dispatch that is representative of generation deficiency scenarios, would it be an appropriate application of the TPL standard to apply the transmission contingency conditions in Category B of Table 1 to these possible dispatch pattern.*

### **The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 was developed by the NERC Planning Committee on March 13, 2008:**

The selection of a credible generation dispatch for the modeling of critical system conditions is within the discretion of the Planning Authority. The Planning Authority was renamed “Planning Coordinator” (PC) in the Functional Model dated February 13, 2007. (TPL -002 and -003 use the former “Planning Authority” name, and the Functional Model terminology was a change in name only and did not affect responsibilities.)

- Under the Functional Model, the Planning Coordinator “Provides and informs Resource Planners, Transmission Planners, and adjacent Planning Coordinators of the methodologies and tools for the simulation of the transmission system” while the Transmission Planner “Receives from the Planning Coordinator methodologies and tools for the analysis and development of transmission expansion plans.” A PC’s selection of “critical system conditions” and its associated generation dispatch falls within the purview of “methodology.”

Furthermore, consistent with this interpretation, a Planning Coordinator would formulate critical system conditions that may involve a range of critical generator unit outages as part of the possible generator dispatch scenarios.

Both TPL-002-0 and TPL-003-0 have a similar measure M1:

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-0\_R1 [or TPL-003-0\_R1] and TPL-002-0\_R2 [or TPL-003-0\_R2].”

The Regional Reliability Organization (RRO) is named as the Compliance Monitor in both standards. Pursuant to Federal Energy Regulatory Commission (FERC) Order 693, FERC eliminated the RRO as the appropriate Compliance Monitor for standards and replaced it with the Regional Entity (RE). See paragraph 157 of Order 693. Although the referenced TPL standards still include the reference to the RRO, to be consistent with Order 693, the RRO is replaced by the RE as the Compliance Monitor for this interpretation. As the Compliance Monitor, the RE determines what a “valid assessment” means when evaluating studies based upon specific sub-requirements in R1.3 selected by the Planning Coordinator and the Transmission Planner. If a PC has Transmission Planners in more than one region, the REs must coordinate among themselves on compliance matters.

**Requirement R1.3.12**

**Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from Ameren on July 25, 2007:**

*Ameren also asks how the inclusion of planned outages should be interpreted with respect to the contingency definitions specified in Table 1 for Categories B and C. Specifically, Ameren asks if R1.3.12 requires that the system be planned to be operated during those conditions associated with planned outages consistent with the performance requirements described in Table 1 plus any unidentified outage.*

**Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from MISO on August 9, 2007:**

*MISO asks if the term “planned outages” means only already known/scheduled planned outages that may continue into the planning horizon, or does it include potential planned outages not yet scheduled that may occur at those demand levels for which planned (including maintenance) outages are performed?*

*If the requirement does include not yet scheduled but potential planned outages that could occur in the planning horizon, is the following a proper interpretation of this provision?*

*The system is adequately planned and in accordance with the standard if, in order for a system operator to potentially schedule such a planned outage on the future planned system, planning studies show that a system adjustment (load shed, re-dispatch of generating units in the interconnection, or system reconfiguration) would be required concurrent with taking such a planned outage in order to prepare for a Category B contingency (single element forced out of service)? In other words, should the system in effect be planned to be operated as for a Category C3 n-2 event, even though the first event is a planned base condition?*

*If the requirement is intended to mean only known and scheduled planned outages that will occur or may continue into the planning horizon, is this interpretation consistent with the original interpretation by NERC of the standard as provided by NERC in response to industry questions in the Phase I development of this standard?*

**The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 was developed by the NERC Planning Committee on March 13, 2008:**

This provision was not previously interpreted by NERC since its approval by FERC and other regulatory authorities. TPL-002-0 and TPL-003-0 explicitly provide that the inclusion of planned (including maintenance) outages of any bulk electric equipment at demand levels for which the planned outages are required. For studies that include planned outages, compliance with the contingency assessment for TPL-002-0 and TPL-003-0 as outlined in Table 1 would include any necessary system adjustments which might be required to accommodate planned outages since a planned outage is not a “contingency” as defined in the *NERC Glossary of Terms Used in Standards*.

**Standard TPL-003-0b(X) — System Performance Following Loss of Two or More BES Elements**

**Appendix 2**

Interpretation 2012-INT-02: Response to Request for Interpretation of TPL-003-0a, Requirements R1.3.1, R1.3.10 and R1.5 and TPL-004-0, Requirements R1.3.1, R1.3.7 and R1.4 for the System Protection and Control Subcommittee

**Date submitted:** December 12, 2011

The following interpretations of TPL-003-0a, System Performance Following Loss of Two or More Bulk Electric System Elements (Category C), Requirements R1.3.1, R1.3.10 and R1.5 and TPL-004-0, System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D), Requirements R1.3.1, R1.3.7 and R1.4 were developed by members of the Assess Transmission Future Needs Standard Drafting Team (ATFNSTD), Protection System Misoperations Standard Development Team (PSMSDT), and Protection System Maintenance and Testing Standard Drafting Team (PSMTSDT).

| Standard   | Requirement (and text)   |
|------------|--|
| TPL-003-0a | <b>R1.3.1</b> Be performed and evaluated only for those Category C contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.  |
| TPL-003-0a | <b>R1.3.10.</b> Include the effects of existing and planned protection systems, including any backup or redundant systems.   |
| TPL-003-0a | <b>R1.5.</b> Consider all contingencies applicable to Category C.  |
| TPL-004-0  | <b>R1.3.1.</b> Be performed and evaluated only for those Category D contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information. |
| TPL-004-0  | <b>R1.3.7.</b> Include the effects of existing and planned protection systems, including any backup or redundant systems.  |
| TPL-004-0  | <b>R1.4.</b> Consider all contingencies applicable to Category D.  |

Please explain the clarification needed (as submitted).

This interpretation request has been developed to address Commission concerns related to the term “Single Point of Failure” and how it relates to system performance and contingency planning

## Standard TPL-003-0b(X) — System Performance Following Loss of Two or More BES Elements

---

clarification regarding the following questions about the listed standards, requirements and terms. More specifically, clarification is needed about the comprehensive study of system performance relating to Table 1's, Category C and D contingency of a "protection system failure" and specifically the impact of failed components (i.e., "Single Point of Failure"). It is not entirely clear whether a valid assessment of a protection system failure includes evaluation of shared or non-redundant protection system components. Protection systems that have a shared protection system component are not two independent protection systems, because both protection systems will be mutually impacted for a failure of a single shared component. A protection system component evaluation would include the evaluation of the consequences on system performance for the failure of any protection system component that is integral to the operation of the protection system being evaluated and to the operation of another protection system.

On March 30, 2009, NERC issued an [Industry Advisory — Protection System Single Point of Failure](#)<sup>1</sup> (i.e., NERC Alert) for three significant events. One of which, the Westwing outage (June 14, 2004) was caused by failure of a single auxiliary relay that initiated both breaker tripping and the breaker failure protection. Since breaker tripping and breaker failure protection both shared the same auxiliary relay, there was no independence between breaker tripping and breaker failure protection systems, therefore causing both protection systems to not operate for the single component failure of the auxiliary relay. The failure of this auxiliary relay is known as a "single point of failure." It is not clear whether this situation is comprehensively addressed by the applicable entities when making a valid assessment of system performance for both Category C and D contingencies.

**Question 1:** For the parenthetical "(stuck breaker or protection system failure)" in TPL-003-0a(X) (Category C contingencies 6-9) and TPL-004-0 (Category D contingencies 1-4), does an entity have the option of evaluating the effects<sup>2</sup> of either "stuck breaker" or "protection system failure" contingency<sup>3</sup>, or does an applicable entity have to evaluate the contingency that produces the more severe system results or impacts as identified in R1.3.1 of both standards?

There is a lack of clarity whether R1.3.1<sup>4</sup> requires an entity to assess which contingency causes the most severe system results or impacts (R1.3.1) and this ambiguity could result in a potential reliability gap. Whether the simulation of a stuck breaker or protection system failure will produce the worst result depends on the protection system design. For example when a protection system is fully redundant, a protection system failure will not affect fault clearing; therefore, a stuck breaker would result in more severe system results or impacts. However, when a protection system failure affects fault clearing, the fault clearing time may be longer than the breaker failure protection clearing time for a stuck breaker contingency and may result in tripping of additional system elements, resulting in a more severe system response.

---

<sup>1</sup> NERC Website: (<http://www.nerc.com/fileUploads/File/Events%20Analysis/A-2009-03-30-01.pdf>)

<sup>2</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.3.10. and/or TPL-004-0, Requirement R1.3.7.

<sup>3</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

<sup>4</sup> "Be performed and evaluated only for those Category (TPL-003-0a Category C and TPL-004-0 Category D) contingencies that would produce the more severe system results or impacts."

**Question 2:** For the phrase “Delayed Clearing<sup>5</sup>” used in Category C<sup>6</sup> contingencies 6-9 and Category D<sup>7</sup> contingencies 1-4, to what extent does the description in Table 1, footnote (e)<sup>8</sup> require an entity to model a single point of failure of a protection system component that may prevent correct operation of a protection system, including other protection systems impacted by that failed component based on the as-built design of that protection system?

There is a lack of clarity whether footnote (e) in Table 1 requires the study and/or simulation of a failure of a protection system component (i.e., single point of failure) that may prevent correct operation of the protection system(s) impacted by the component failure. Protection systems that share a protection system component are fully dependent upon the correct operation of that single shared component and do not perform as two independent protection systems. This lack of clarity may result in a potential reliability gap.

Clarity is necessary as to whether (1) a valid assessment should include evaluation of delayed clearing due to failure of the protection system component (i.e., single point of failure), such as the failure of a shared protection system component, that produces the more severe system results or impacts; and (2) the study and/or simulation of the fault clearing sequence and protection system(s) operation should be based on the protection system(s) as-built design.

The lack of clarity is compounded by the similarity between the phrase “Delayed Clearing” used in TPL-003-0a and TPL-004-0, footnote (e), and the NERC glossary term “Delayed Fault Clearing.” While TPL-003-0a and TPL-004-0 do not use the glossary term, the similarity may lead to confusion and inconsistency in how entities apply footnote (e) to “stuck breaker” or “protection system failure” contingency assessments.

## Question 1

For the parenthetical “(stuck breaker or protection system failure)” in TPL-003-0a (Category C contingencies 6-9) and TPL-004-0 (Category D contingencies 1-4), does an entity have the option of evaluating the effects<sup>9</sup> of either “stuck breaker” or “protection system failure” contingency<sup>10</sup>, or does an applicable entity have to evaluate the contingency that produces the more severe system results or impacts as identified in R1.3.1 of both standards?

---

<sup>5</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

<sup>6</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5.

<sup>7</sup> As required by NERC Reliability Standard TPL-004-0, Requirement R1.4.

<sup>8</sup> Footnote (e) Delayed Clearing: “failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay,”

<sup>9</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.3.10. and/or TPL-004-0, Requirement R1.3.7.

<sup>10</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

### Response 1

The interpretation drafting team concludes that the Planning Authority and Transmission Planner must evaluate the situation that produces the more severe system results or impacts (i.e., TPL-003-0a, R1.3.1 and TPL-004-0, R1.3.1) due to a delayed clearing condition regardless of whether the condition resulted from a stuck breaker or protection system failure. The Reliability Standards TPL-003-0a (Table I, Category C contingencies 6-9) and TPL-004-0 (Table I, Category D contingencies 1-4) involve an assessment of the effects of either a stuck breaker or a protection system failure. The single line ground (SLG) (TPL-003-0a, Table I, Category C) Fault and 3-phase (3 $\phi$ ) (TPL-004-0, Table I, Category D) Fault contingencies with delayed clearing are further defined by footnote (e) and the parenthetical phrase “(stuck breaker or protection system failure).” Footnote (e) explains that “Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.” The parenthetical further emphasizes that the failure may be a “stuck breaker or protection system failure” that causes the delayed clearing of the fault. The text in Table 1 in either standard explains that when selecting delayed clearing contingencies to evaluate, both conditions “(stuck breaker or protection system failure)” must be considered.

### Question 2

For the phrase “Delayed Clearing<sup>11</sup>” used in Category C<sup>12</sup> contingencies 6-9 and Category D<sup>13</sup> contingencies 1-4, to what extent does the description in Table 1, footnote (e)<sup>14</sup> require an entity to model a single point of failure of a protection system component that may prevent correct operation of a protection system, including other protection systems impacted by that failed component based on the as-built design of that protection system?

### Response 2

The term “Delayed Clearing” that is described in Table I, footnote (e) refers to fault clearing that results from a failure to achieve the protection system’s normally expected clearing time. For Category C or D contingencies, each Planning Authority and Transmission Planner is permitted engineering judgment in its selection of the protection system component failures for evaluation that would produce the more severe system results or impact (i.e., TPL-003-0a, R1.3.1 and TPL-004-0, R1.3.1). The evaluation would include addressing all protection systems affected by the selected component.

---

<sup>11</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

<sup>12</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5.

<sup>13</sup> As required by NERC Reliability Standard TPL-004-0, Requirement R1.4.

<sup>14</sup> Footnote (e) Delayed Clearing: “failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay,”

## Standard TPL-003-0b(X) — System Performance Following Loss of Two or More BES Elements

---

A protection system component failure that impacts one or more protection systems and increases the total fault clearing time requires the Planning Authority and Transmission Planner to simulate the full impact (clearing time and facilities removed) on the Bulk Electric System performance.

The interpretation drafting team bases this conclusion on the footnote (e) example “...any protection system component such as, relay, circuit breaker, or current transformer...” because the component “circuit breaker” is not addressed in the current or previously defined NERC glossary term. The interpretation drafting team initially believed the lowercase usage of “protection system” inferred the NERC glossary term and the components described therein; however, based on the interpretation drafting team’s further assessment of footnote (e), it concludes that the existing TPL standards (TPL-003-0a and TPL-004-0) do not implicitly use the NERC glossary term. Without an explicit reference to the NERC glossary term, “Protection System,” the two standards do not prescribe the specific protection system components that must be addressed by the Planning Authority and Transmission Planner in performing the studies required in TPL-003-0a and TPL-004-0.

## Standard TPL-003-0b(X) — System Performance Following Loss of Two or More BES Elements

---

### A. Introduction

1. **Title:** System Performance Following Loss of Two or More Bulk Electric System Elements (Category C)
2. **Number:** TPL-003-0b(X)
3. **Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements, with sufficient lead time and continue to be modified or upgraded as necessary to meet present and future System needs.
4. **Applicability:**
  - 4.1. Planning Authority
  - 4.2. Transmission Planner
5. **Effective Date:** April 23, 2010

### B. Requirements

- R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission systems is planned such that the network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services, at all demand Levels over the range of forecast system demands, under the contingency conditions as defined in Category C of Table I (attached). The controlled interruption of customer Demand, the planned removal of generators, or the Curtailment of firm (non-recallable reserved) power transfers may be necessary to meet this standard. To be valid, the Planning Authority and Transmission Planner assessments shall:
  - R1.1. Be made annually.
  - R1.2. Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.
  - R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
    - R1.3.1. Be performed and evaluated only for those Category C contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
    - R1.3.2. Cover critical system conditions and study years as deemed appropriate by the responsible entity.
    - R1.3.3. Be conducted annually unless changes to system conditions do not warrant such analyses.
    - R1.3.4. Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.

## Standard TPL-003-0b(X) — System Performance Following Loss of Two or More BES Elements

---

- R1.3.5.** Have all projected firm transfers modeled.
  - R1.3.6.** Be performed and evaluated for selected demand levels over the range of forecast system demands.
  - R1.3.7.** Demonstrate that System performance meets Table 1 for Category C contingencies.
  - R1.3.8.** Include existing and planned facilities.
  - R1.3.9.** Include Reactive Power resources to ensure that adequate reactive resources are available to meet System performance.
  - R1.3.10.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
  - R1.3.11.** Include the effects of existing and planned control devices.
  - R1.3.12.** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those Demand levels for which planned (including maintenance) outages are performed.
- R1.4.** Address any planned upgrades needed to meet the performance requirements of Category C.
- R1.5.** Consider all contingencies applicable to Category C.
- R2.** When system simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-003-0b(X)\_R1, the Planning Authority and Transmission Planner shall each:
  - R2.1.** Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon:
    - R2.1.1.** Including a schedule for implementation.
    - R2.1.2.** Including a discussion of expected required in-service dates of facilities.
    - R2.1.3.** Consider lead times necessary to implement plans.
  - R2.2.** Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.
- R3.** The Planning Authority and Transmission Planner shall each document the results of these Reliability Assessments and corrective plans and shall annually provide these to its respective NERC Regional Reliability Organization(s), as required by the Regional Reliability Organization.

### C. Measures

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-003-0b(X)\_R1 and TPL-003-0b(X)\_R2.
- M2.** The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its reliability assessments and corrective plans per Reliability Standard TPL-003-0b(X)\_R3.

### D. Compliance

- 1. Compliance Monitoring Process**

**Standard TPL-003-0b(X) — System Performance Following Loss of Two or More BES Elements**

---

**1.1. Compliance Monitoring Responsibility**

Compliance Monitor: Regional Reliability Organizations.

**1.2. Compliance Monitoring Period and Reset Timeframe**

Annually.

**1.3. Data Retention**

None specified.

**1.4. Additional Compliance Information**

None.

**2. Levels of Non-Compliance**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** A valid assessment and corrective plan for the longer-term planning horizon is not available.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** A valid assessment and corrective plan for the near-term planning horizon is not available.

**E. Regional Differences**

1. None identified.

**Version History**

- a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.
- b) Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.
- c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.
- d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.
- e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.
- f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

## Appendix 1

### **Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO**

NERC received two requests for interpretation of identical requirements (Requirements R1.3.2 and R1.3.12) in TPL-002-0 and TPL-003-0 from the Midwest ISO and Ameren. These requirements state:

#### **TPL-002-0:**

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

**R1.3** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

**R1.3.2** Cover critical system conditions and study years as deemed appropriate by the responsible entity.

**R1.3.12** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

#### **TPL-003-0:**

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

**R1.3** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

**R1.3.2** Cover critical system conditions and study years as deemed appropriate by the responsible entity.

**R1.3.12** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

### **Requirement R1.3.2**

#### **Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from Ameren on July 25, 2007:**

*Ameren specifically requests clarification on the phrase, 'critical system conditions' in R1.3.2. Ameren asks if compliance with R1.3.2 requires multiple contingent generating unit Outages as part of possible generation dispatch scenarios describing critical system conditions for which the system shall be planned and modeled in accordance with the contingency definitions included in Table 1.*

## Standard TPL-003-0b(X) — System Performance Following Loss of Two or More BES Elements

---

### **Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from MISO on August 9, 2007:**

*MISO asks if the TPL standards require that any specific dispatch be applied, other than one that is representative of supply of firm demand and transmission service commitments, in the modeling of system contingencies specified in Table 1 in the TPL standards.*

*MISO then asks if a variety of possible dispatch patterns should be included in planning analyses including a probabilistically based dispatch that is representative of generation deficiency scenarios, would it be an appropriate application of the TPL standard to apply the transmission contingency conditions in Category B of Table 1 to these possible dispatch pattern.*

### **The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 was developed by the NERC Planning Committee on March 13, 2008:**

The selection of a credible generation dispatch for the modeling of critical system conditions is within the discretion of the Planning Authority. The Planning Authority was renamed “Planning Coordinator” (PC) in the Functional Model dated February 13, 2007. (TPL -002 and -003 use the former “Planning Authority” name, and the Functional Model terminology was a change in name only and did not affect responsibilities.)

- Under the Functional Model, the Planning Coordinator “Provides and informs Resource Planners, Transmission Planners, and adjacent Planning Coordinators of the methodologies and tools for the simulation of the transmission system” while the Transmission Planner “Receives from the Planning Coordinator methodologies and tools for the analysis and development of transmission expansion plans.” A PC’s selection of “critical system conditions” and its associated generation dispatch falls within the purview of “methodology.”

Furthermore, consistent with this interpretation, a Planning Coordinator would formulate critical system conditions that may involve a range of critical generator unit outages as part of the possible generator dispatch scenarios.

Both TPL-002-0 and TPL-003-0 have a similar measure M1:

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-0\_R1 [or TPL-003-0\_R1] and TPL-002-0\_R2 [or TPL-003-0\_R2].”

The Regional Reliability Organization (RRO) is named as the Compliance Monitor in both standards. Pursuant to Federal Energy Regulatory Commission (FERC) Order 693, FERC eliminated the RRO as the appropriate Compliance Monitor for standards and replaced it with the Regional Entity (RE). See paragraph 157 of Order 693. Although the referenced TPL standards still include the reference to the RRO, to be consistent with Order 693, the RRO is replaced by the RE as the Compliance Monitor for this interpretation. As the Compliance Monitor, the RE determines what a “valid assessment” means when evaluating studies based upon specific sub-requirements in R1.3 selected by the Planning Coordinator and the Transmission Planner. If a PC has Transmission Planners in more than one region, the REs must coordinate among themselves on compliance matters.

**Requirement R1.3.12**

**Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from Ameren on July 25, 2007:**

*Ameren also asks how the inclusion of planned outages should be interpreted with respect to the contingency definitions specified in Table 1 for Categories B and C. Specifically, Ameren asks if R1.3.12 requires that the system be planned to be operated during those conditions associated with planned outages consistent with the performance requirements described in Table 1 plus any unidentified outage.*

**Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from MISO on August 9, 2007:**

*MISO asks if the term “planned outages” means only already known/scheduled planned outages that may continue into the planning horizon, or does it include potential planned outages not yet scheduled that may occur at those demand levels for which planned (including maintenance) outages are performed?*

*If the requirement does include not yet scheduled but potential planned outages that could occur in the planning horizon, is the following a proper interpretation of this provision?*

*The system is adequately planned and in accordance with the standard if, in order for a system operator to potentially schedule such a planned outage on the future planned system, planning studies show that a system adjustment (load shed, re-dispatch of generating units in the interconnection, or system reconfiguration) would be required concurrent with taking such a planned outage in order to prepare for a Category B contingency (single element forced out of service)? In other words, should the system in effect be planned to be operated as for a Category C3 n-2 event, even though the first event is a planned base condition?*

*If the requirement is intended to mean only known and scheduled planned outages that will occur or may continue into the planning horizon, is this interpretation consistent with the original interpretation by NERC of the standard as provided by NERC in response to industry questions in the Phase I development of this standard?*

**The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 was developed by the NERC Planning Committee on March 13, 2008:**

This provision was not previously interpreted by NERC since its approval by FERC and other regulatory authorities. TPL-002-0 and TPL-003-0 explicitly provide that the inclusion of planned (including maintenance) outages of any bulk electric equipment at demand levels for which the planned outages are required. For studies that include planned outages, compliance with the contingency assessment for TPL-002-0 and TPL-003-0 as outlined in Table 1 would include any necessary system adjustments which might be required to accommodate planned outages since a planned outage is not a “contingency” as defined in the *NERC Glossary of Terms Used in Standards*.

**Standard TPL-003-0b(X) — System Performance Following Loss of Two or More BES Elements**

**Appendix 2**

Interpretation 2012-INT-02: Response to Request for Interpretation of TPL-003-0a, Requirements R1.3.1, R1.3.10 and R1.5 and TPL-004-0, Requirements R1.3.1, R1.3.7 and R1.4 for the System Protection and Control Subcommittee

**Date submitted:** December 12, 2011

The following interpretations of TPL-003-0a, System Performance Following Loss of Two or More Bulk Electric System Elements (Category C), Requirements R1.3.1, R1.3.10 and R1.5 and TPL-004-0, System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D), Requirements R1.3.1, R1.3.7 and R1.4 were developed by members of the Assess Transmission Future Needs Standard Drafting Team (ATFNSTD), Protection System Misoperations Standard Development Team (PSMSDT), and Protection System Maintenance and Testing Standard Drafting Team (PSMTSDT).

| Standard   | Requirement (and text)   |
|------------|--|
| TPL-003-0a | <b>R1.3.1</b> Be performed and evaluated only for those Category C contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.  |
| TPL-003-0a | <b>R1.3.10.</b> Include the effects of existing and planned protection systems, including any backup or redundant systems.   |
| TPL-003-0a | <b>R1.5.</b> Consider all contingencies applicable to Category C.  |
| TPL-004-0  | <b>R1.3.1.</b> Be performed and evaluated only for those Category D contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information. |
| TPL-004-0  | <b>R1.3.7.</b> Include the effects of existing and planned protection systems, including any backup or redundant systems.  |
| TPL-004-0  | <b>R1.4.</b> Consider all contingencies applicable to Category D.  |

Please explain the clarification needed (as submitted).

This interpretation request has been developed to address Commission concerns related to the term “Single Point of Failure” and how it relates to system performance and contingency planning

## Standard TPL-003-0b(X) — System Performance Following Loss of Two or More BES Elements

clarification regarding the following questions about the listed standards, requirements and terms. More specifically, clarification is needed about the comprehensive study of system performance relating to Table 1's, Category C and D contingency of a "protection system failure" and specifically the impact of failed components (i.e., "Single Point of Failure"). It is not entirely clear whether a valid assessment of a protection system failure includes evaluation of shared or non-redundant protection system components. Protection systems that have a shared protection system component are not two independent protection systems, because both protection systems will be mutually impacted for a failure of a single shared component. A protection system component evaluation would include the evaluation of the consequences on system performance for the failure of any protection system component that is integral to the operation of the protection system being evaluated and to the operation of another protection system.

On March 30, 2009, NERC issued an [Industry Advisory — Protection System Single Point of Failure](#)<sup>1</sup> (i.e., NERC Alert) for three significant events. One of which, the Westwing outage (June 14, 2004) was caused by failure of a single auxiliary relay that initiated both breaker tripping and the breaker failure protection. Since breaker tripping and breaker failure protection both shared the same auxiliary relay, there was no independence between breaker tripping and breaker failure protection systems, therefore causing both protection systems to not operate for the single component failure of the auxiliary relay. The failure of this auxiliary relay is known as a "single point of failure." It is not clear whether this situation is comprehensively addressed by the applicable entities when making a valid assessment of system performance for both Category C and D contingencies.

**Question 1:** For the parenthetical "(stuck breaker or protection system failure)" in TPL-003-0a(X) (Category C contingencies 6-9) and TPL-004-0 (Category D contingencies 1-4), does an entity have the option of evaluating the effects<sup>2</sup> of either "stuck breaker" or "protection system failure" contingency<sup>3</sup>, or does an applicable entity have to evaluate the contingency that produces the more severe system results or impacts as identified in R1.3.1 of both standards?

There is a lack of clarity whether R1.3.1<sup>4</sup> requires an entity to assess which contingency causes the most severe system results or impacts (R1.3.1) and this ambiguity could result in a potential reliability gap. Whether the simulation of a stuck breaker or protection system failure will produce the worst result depends on the protection system design. For example when a protection system is fully redundant, a protection system failure will not affect fault clearing; therefore, a stuck breaker would result in more severe system results or impacts. However, when a protection system failure affects fault clearing, the fault clearing time may be longer than the breaker failure protection clearing time for a stuck breaker contingency and may result in tripping of additional system elements, resulting in a more severe system response.

<sup>1</sup> NERC Website: (<http://www.nerc.com/fileUploads/File/Events%20Analysis/A-2009-03-30-01.pdf>)

<sup>2</sup> As required by NERC Reliability Standard TPL-003-0a(X), Requirement R1.3.10. and/or TPL-004-0(X), Requirement R1.3.7.

<sup>3</sup> As required by NERC Reliability Standard TPL-003-0a(X), Requirement R1.5. and/or TPL-004-0(X), Requirement R1.4.

<sup>4</sup> "Be performed and evaluated only for those Category (TPL-003-0a(X) Category C and TPL-004-0(X) Category D) contingencies that would produce the more severe system results or impacts."

**Question 2:** For the phrase “Delayed Clearing<sup>5</sup>” used in Category C<sup>6</sup> contingencies 6-9 and Category D<sup>7</sup> contingencies 1-4, to what extent does the description in Table 1, footnote (e)<sup>8</sup> require an entity to model a single point of failure of a protection system component that may prevent correct operation of a protection system, including other protection systems impacted by that failed component based on the as-built design of that protection system?

There is a lack of clarity whether footnote (e) in Table 1 requires the study and/or simulation of a failure of a protection system component (i.e., single point of failure) that may prevent correct operation of the protection system(s) impacted by the component failure. Protection systems that share a protection system component are fully dependent upon the correct operation of that single shared component and do not perform as two independent protection systems. This lack of clarity may result in a potential reliability gap.

Clarity is necessary as to whether (1) a valid assessment should include evaluation of delayed clearing due to failure of the protection system component (i.e., single point of failure), such as the failure of a shared protection system component, that produces the more severe system results or impacts; and (2) the study and/or simulation of the fault clearing sequence and protection system(s) operation should be based on the protection system(s) as-built design.

The lack of clarity is compounded by the similarity between the phrase “Delayed Clearing” used in TPL-003-0a and TPL-004-0, footnote (e), and the NERC glossary term “Delayed Fault Clearing.” While TPL-003-0a and TPL-004-0 do not use the glossary term, the similarity may lead to confusion and inconsistency in how entities apply footnote (e) to “stuck breaker” or “protection system failure” contingency assessments.

## Question 1

For the parenthetical “(stuck breaker or protection system failure)” in TPL-003-0a (Category C contingencies 6-9) and TPL-004-0 (Category D contingencies 1-4), does an entity have the option of evaluating the effects<sup>9</sup> of either “stuck breaker” or “protection system failure” contingency<sup>10</sup>, or does an applicable entity have to evaluate the contingency that produces the more severe system results or impacts as identified in R1.3.1 of both standards?

<sup>5</sup> As required by NERC Reliability Standard TPL-003-0a(X), Requirement R1.5. and/or TPL-004-0(X), Requirement R1.4.

<sup>6</sup> As required by NERC Reliability Standard TPL-003-0a(X), Requirement R1.5.

<sup>7</sup> As required by NERC Reliability Standard TPL-004-0(X), Requirement R1.4.

<sup>8</sup> Footnote (e) Delayed Clearing: “failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay,”

<sup>9</sup> As required by NERC Reliability Standard TPL-003-0a(X), Requirement R1.3.10. and/or TPL-004-0(X), Requirement R1.3.7.

<sup>10</sup> As required by NERC Reliability Standard TPL-003-0a(X), Requirement R1.5. and/or TPL-004-0(X), Requirement R1.4.

### Response 1

The interpretation drafting team concludes that the Planning Authority and Transmission Planner must evaluate the situation that produces the more severe system results or impacts (i.e., TPL-003-0a, R1.3.1 and TPL-004-0, R1.3.1) due to a delayed clearing condition regardless of whether the condition resulted from a stuck breaker or protection system failure. The Reliability Standards TPL-003-0a (Table I, Category C contingencies 6-9) and TPL-004-0 (Table I, Category D contingencies 1-4) involve an assessment of the effects of either a stuck breaker or a protection system failure. The single line ground (SLG) (TPL-003-0a, Table I, Category C) Fault and 3-phase (3 $\phi$ ) (TPL-004-0, Table I, Category D) Fault contingencies with delayed clearing are further defined by footnote (e) and the parenthetical phrase “(stuck breaker or protection system failure).” Footnote (e) explains that “Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.” The parenthetical further emphasizes that the failure may be a “stuck breaker or protection system failure” that causes the delayed clearing of the fault. The text in Table 1 in either standard explains that when selecting delayed clearing contingencies to evaluate, both conditions “(stuck breaker or protection system failure)” must be considered.

### Question 2

For the phrase “Delayed Clearing<sup>11</sup>” used in Category C<sup>12</sup> contingencies 6-9 and Category D<sup>13</sup> contingencies 1-4, to what extent does the description in Table 1, footnote (e)<sup>14</sup> require an entity to model a single point of failure of a protection system component that may prevent correct operation of a protection system, including other protection systems impacted by that failed component based on the as-built design of that protection system?

### Response 2

The term “Delayed Clearing” that is described in Table I, footnote (e) refers to fault clearing that results from a failure to achieve the protection system’s normally expected clearing time. For Category C or D contingencies, each Planning Authority and Transmission Planner is permitted engineering judgment in its selection of the protection system component failures for evaluation that would produce the more severe system results or impact (i.e., TPL-003-0a, R1.3.1 and TPL-004-0, R1.3.1). The evaluation would include addressing all protection systems affected by the selected component.

---

<sup>11</sup> As required by NERC Reliability Standard TPL-003-0a(X), Requirement R1.5. and/or TPL-004-0(X), Requirement R1.4.

<sup>12</sup> As required by NERC Reliability Standard TPL-003-0a(X), Requirement R1.5.

<sup>13</sup> As required by NERC Reliability Standard TPL-004-0(X), Requirement R1.4.

<sup>14</sup> Footnote (e) Delayed Clearing: “failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay,”

## Standard TPL-003-0b(X) — System Performance Following Loss of Two or More BES Elements

---

A protection system component failure that impacts one or more protection systems and increases the total fault clearing time requires the Planning Authority and Transmission Planner to simulate the full impact (clearing time and facilities removed) on the Bulk Electric System performance.

The interpretation drafting team bases this conclusion on the footnote (e) example “...any protection system component such as, relay, circuit breaker, or current transformer...” because the component “circuit breaker” is not addressed in the current or previously defined NERC glossary term. The interpretation drafting team initially believed the lowercase usage of “protection system” inferred the NERC glossary term and the components described therein; however, based on the interpretation drafting team’s further assessment of footnote (e), it concludes that the existing TPL standards (TPL-003-0a and TPL-004-0) do not implicitly use the NERC glossary term. Without an explicit reference to the NERC glossary term, “Protection System,” the two standards do not prescribe the specific protection system components that must be addressed by the Planning Authority and Transmission Planner in performing the studies required in TPL-003-0a and TPL-004-0.

**A. Introduction**

1. **Title:** System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D)
2. **Number:** TPL-004-0a(X)
3. **Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements, with sufficient lead time and continue to be modified or upgraded as necessary to meet present and future System needs.
4. **Applicability:**
  - 4.1. Planning Authority
  - 4.2. Transmission Planner
5. **Effective Date:** April 1, 2005

**B. Requirements**

- R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is evaluated for the risks and consequences of a number of each of the extreme contingencies that are listed under Category D of Table I. To be valid, the Planning Authority's and Transmission Planner's assessment shall:
  - R1.1. Be made annually.
  - R1.2. Be conducted for near-term (years one through five).
  - R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category D contingencies of Table I. The specific elements selected (from within each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
    - R1.3.1. Be performed and evaluated only for those Category D contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
    - R1.3.2. Cover critical system conditions and study years as deemed appropriate by the responsible entity.
    - R1.3.3. Be conducted annually unless changes to system conditions do not warrant such analyses.
    - R1.3.4. Have all projected firm transfers modeled.
    - R1.3.5. Include existing and planned facilities.
    - R1.3.6. Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.
    - R1.3.7. Include the effects of existing and planned protection systems, including any backup or redundant systems.
    - R1.3.8. Include the effects of existing and planned control devices.

**R1.3.9.** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

**R1.4.** Consider all contingencies applicable to Category D.

**R2.** The Planning Authority and Transmission Planner shall each document the results of its reliability assessments and shall annually provide the results to its entities' respective NERC Regional Reliability Organization(s), as required by the Regional Reliability Organization.

**C. Measures**

**M1.** The Planning Authority and Transmission Planner shall have a valid assessment for its system responses as specified in Reliability Standard TPL-004-0a(X)\_R1.

**M2.** The Planning Authority and Transmission Planner shall provide evidence to its Compliance Monitor that it reported documentation of results of its reliability assessments per Reliability Standard TPL-004-0a(X)\_R1.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Compliance Monitor: Regional Reliability Organization.

Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

**1.2. Compliance Monitoring Period and Reset Timeframe**

Annually.

**1.3. Data Retention**

None specified.

**1.4. Additional Compliance Information**

None.

**2. Levels of Non-Compliance**

**2.1. Level 1:** A valid assessment, as defined above, for the near-term planning horizon is not available.

**2.2. Level 2:** Not applicable.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** Not applicable.

**E. Regional Differences**

**1.** None identified.

**Version History**

- a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or System Voltage Limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.
- b) Planned or controlled interruption of electric supply to radial customers or some local network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.
- c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.
- d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.
- e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.
- f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

Appendix 1

Interpretation 2012-INT-02: Response to Request for Interpretation of TPL-003-0a, Requirements R1.3.1, R1.3.10 and R1.5 and TPL-004-0, Requirements R1.3.1, R1.3.7 and R1.4 for the System Protection and Control Subcommittee

**Date submitted:** December 12, 2011

The following interpretations of TPL-003-0a, System Performance Following Loss of Two or More Bulk Electric System Elements (Category C), Requirements R1.3.1, R1.3.10 and R1.5 and TPL-004-0, System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D), Requirements R1.3.1, R1.3.7 and R1.4 were developed by members of the Assess Transmission Future Needs Standard Drafting Team (ATFNSTD), Protection System Misoperations Standard Development Team (PSMSDT), and Protection System Maintenance and Testing Standard Drafting Team (PSMTSDT).

| Standard   | Requirement (and text)   |
|------------|--|
| TPL-003-0a | <b>R1.3.1</b> Be performed and evaluated only for those Category C contingencies that would produce the more severe system results or impacts. | TPL-004-0  | <b>R1.4.</b> Consider all contingencies applicable to Category D.  |

Please explain the clarification needed (as submitted).

This interpretation request has been developed to address Commission concerns related to the term “Single Point of Failure” and how it relates to system performance and contingency planning clarification regarding the following questions about the listed standards, requirements and terms.

More specifically, clarification is needed about the comprehensive study of system performance relating to Table 1's, Category C and D contingency of a "protection system failure" and specifically the impact of failed components (i.e., "Single Point of Failure"). It is not entirely clear whether a valid assessment of a protection system failure includes evaluation of shared or non-redundant protection system components. Protection systems that have a shared protection system component are not two independent protection systems, because both protection systems will be mutually impacted for a failure of a single shared component. A protection system component evaluation would include the evaluation of the consequences on system performance for the failure of any protection system component that is integral to the operation of the protection system being evaluated and to the operation of another protection system.

On March 30, 2009, NERC issued an [Industry Advisory — Protection System Single Point of Failure](#)<sup>1</sup> (i.e., NERC Alert) for three significant events. One of which, the Westwing outage (June 14, 2004) was caused by failure of a single auxiliary relay that initiated both breaker tripping and the breaker failure protection. Since breaker tripping and breaker failure protection both shared the same auxiliary relay, there was no independence between breaker tripping and breaker failure protection systems, therefore causing both protection systems to not operate for the single component failure of the auxiliary relay. The failure of this auxiliary relay is known as a "single point of failure." It is not clear whether this situation is comprehensively addressed by the applicable entities when making a valid assessment of system performance for both Category C and D contingencies.

**Question 1:** For the parenthetical "(stuck breaker or protection system failure)" in TPL-003-0a (Category C contingencies 6-9) and TPL-004-0 (Category D contingencies 1-4), does an entity have the option of evaluating the effects<sup>2</sup> of either "stuck breaker" or "protection system failure" contingency<sup>3</sup>, or does an applicable entity have to evaluate the contingency that produces the more severe system results or impacts as identified in R1.3.1 of both standards?

There is a lack of clarity whether R1.3.1<sup>4</sup> requires an entity to assess which contingency causes the most severe system results or impacts (R1.3.1) and this ambiguity could result in a potential reliability gap. Whether the simulation of a stuck breaker or protection system failure will produce the worst result depends on the protection system design. For example when a protection system is fully redundant, a protection system failure will not affect fault clearing; therefore, a stuck breaker would result in more severe system results or impacts. However, when a protection system failure affects fault clearing, the fault clearing time may be longer than the breaker failure protection clearing time for a stuck breaker contingency and may result in tripping of additional system elements, resulting in a more severe system response.

---

<sup>1</sup> NERC Website: (<http://www.nerc.com/fileUploads/File/Events%20Analysis/A-2009-03-30-01.pdf>)

<sup>2</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.3.10. and/or TPL-004-0, Requirement R1.3.7.

<sup>3</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

<sup>4</sup> "Be performed and evaluated only for those Category (TPL-003-0a Category C and TPL-004-0 Category D) contingencies that would produce the more severe system results or impacts."

**Question 2:** For the phrase “Delayed Clearing<sup>5</sup>” used in Category C<sup>6</sup> contingencies 6-9 and Category D<sup>7</sup> contingencies 1-4, to what extent does the description in Table 1, footnote (e)<sup>8</sup> require an entity to model a single point of failure of a protection system component that may prevent correct operation of a protection system, including other protection systems impacted by that failed component based on the as-built design of that protection system?

There is a lack of clarity whether footnote (e) in Table 1 requires the study and/or simulation of a failure of a protection system component (i.e., single point of failure) that may prevent correct operation of the protection system(s) impacted by the component failure. Protection systems that share a protection system component are fully dependent upon the correct operation of that single shared component and do not perform as two independent protection systems. This lack of clarity may result in a potential reliability gap.

Clarity is necessary as to whether (1) a valid assessment should include evaluation of delayed clearing due to failure of the protection system component (i.e., single point of failure), such as the failure of a shared protection system component, that produces the more severe system results or impacts; and (2) the study and/or simulation of the fault clearing sequence and protection system(s) operation should be based on the protection system(s) as-built design.

The lack of clarity is compounded by the similarity between the phrase “Delayed Clearing” used in TPL-003-0a and TPL-004-0, footnote (e), and the NERC glossary term “Delayed Fault Clearing.” While TPL-003-0a and TPL-004-0 do not use the glossary term, the similarity may lead to confusion and inconsistency in how entities apply footnote (e) to “stuck breaker” or “protection system failure” contingency assessments.

### Question 1

For the parenthetical “(stuck breaker or protection system failure)” in TPL-003-0a (Category C contingencies 6-9) and TPL-004-0 (Category D contingencies 1-4), does an entity have the option of evaluating the effects<sup>9</sup> of either “stuck breaker” or “protection system failure” contingency<sup>10</sup>, or does an applicable entity have to evaluate the contingency that produces the more severe system results or impacts as identified in R1.3.1 of both standards?

### Response 1

<sup>5</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

<sup>6</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5.

<sup>7</sup> As required by NERC Reliability Standard TPL-004-0, Requirement R1.4.

<sup>8</sup> Footnote (e) Delayed Clearing: “failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay,”

<sup>9</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.3.10. and/or TPL-004-0, Requirement R1.3.7.

<sup>10</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

The interpretation drafting team concludes that the Planning Authority and Transmission Planner must evaluate the situation that produces the more severe system results or impacts (i.e., TPL-003-0a, R1.3.1 and TPL-004-0, R1.3.1) due to a delayed clearing condition regardless of whether the condition resulted from a stuck breaker or protection system failure. The Reliability Standards TPL-003-0a (Table I, Category C contingencies 6-9) and TPL-004-0 (Table I, Category D contingencies 1-4) involve an assessment of the effects of either a stuck breaker or a protection system failure. The single line ground (SLG) (TPL-003-0a, Table I, Category C) Fault and 3-phase (3 $\phi$ ) (TPL-004-0, Table I, Category D) Fault contingencies with delayed clearing are further defined by footnote (e) and the parenthetical phrase “(stuck breaker or protection system failure).” Footnote (e) explains that “Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.” The parenthetical further emphasizes that the failure may be a “stuck breaker or protection system failure” that causes the delayed clearing of the fault. The text in Table 1 in either standard explains that when selecting delayed clearing contingencies to evaluate, both conditions “(stuck breaker or protection system failure)” must be considered.

## Question 2

For the phrase “Delayed Clearing<sup>11</sup>” used in Category C<sup>12</sup> contingencies 6-9 and Category D<sup>13</sup> contingencies 1-4, to what extent does the description in Table 1, footnote (e)<sup>14</sup> require an entity to model a single point of failure of a protection system component that may prevent correct operation of a protection system, including other protection systems impacted by that failed component based on the as-built design of that protection system?

## Response 2

The term “Delayed Clearing” that is described in Table I, footnote (e) refers to fault clearing that results from a failure to achieve the protection system’s normally expected clearing time. For Category C or D contingencies, each Planning Authority and Transmission Planner is permitted engineering judgment in its selection of the protection system component failures for evaluation that would produce the more severe system results or impact (i.e., TPL-003-0a, R1.3.1 and TPL-004-0, R1.3.1). The evaluation would include addressing all protection systems affected by the selected component.

A protection system component failure that impacts one or more protection systems and increases the total fault clearing time requires the Planning Authority and Transmission Planner to simulate the full impact (clearing time and facilities removed) on the Bulk Electric System performance.

<sup>11</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

<sup>12</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5.

<sup>13</sup> As required by NERC Reliability Standard TPL-004-0, Requirement R1.4.

<sup>14</sup> Footnote (e) Delayed Clearing: “failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay,”

## **Standard TPL-004-0a(x) — System Performance Following Extreme BES Events**

---

The interpretation drafting team bases this conclusion on the footnote (e) example “...any protection system component such as, relay, circuit breaker, or current transformer...” because the component “circuit breaker” is not addressed in the current or previously defined NERC glossary term. The interpretation drafting team initially believed the lowercase usage of “protection system” inferred the NERC glossary term and the components described therein; however, based on the interpretation drafting team’s further assessment of footnote (e), it concludes that the existing TPL standards (TPL-003-0a and TPL-004-0) do not implicitly use the NERC glossary term. Without an explicit reference to the NERC glossary term, “Protection System,” the two standards do not prescribe the specific protection system components that must be addressed by the Planning Authority and Transmission Planner in performing the studies required in TPL-003-0a and TPL-004-0.

**A. Introduction**

1. **Title:** System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D)
2. **Number:** TPL-004-0a(X)
3. **Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements, with sufficient lead time and continue to be modified or upgraded as necessary to meet present and future System needs.
4. **Applicability:**
  - 4.1. Planning Authority
  - 4.2. Transmission Planner
5. **Effective Date:** April 1, 2005

**B. Requirements**

- R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is evaluated for the risks and consequences of a number of each of the extreme contingencies that are listed under Category D of Table I. To be valid, the Planning Authority's and Transmission Planner's assessment shall:
  - R1.1. Be made annually.
  - R1.2. Be conducted for near-term (years one through five).
  - R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category D contingencies of Table I. The specific elements selected (from within each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
    - R1.3.1. Be performed and evaluated only for those Category D contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
    - R1.3.2. Cover critical system conditions and study years as deemed appropriate by the responsible entity.
    - R1.3.3. Be conducted annually unless changes to system conditions do not warrant such analyses.
    - R1.3.4. Have all projected firm transfers modeled.
    - R1.3.5. Include existing and planned facilities.
    - R1.3.6. Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.
    - R1.3.7. Include the effects of existing and planned protection systems, including any backup or redundant systems.
    - R1.3.8. Include the effects of existing and planned control devices.

**R1.3.9.** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

**R1.4.** Consider all contingencies applicable to Category D.

**R2.** The Planning Authority and Transmission Planner shall each document the results of its reliability assessments and shall annually provide the results to its entities' respective NERC Regional Reliability Organization(s), as required by the Regional Reliability Organization.

**C. Measures**

**M1.** The Planning Authority and Transmission Planner shall have a valid assessment for its system responses as specified in Reliability Standard TPL-004-0a(X)-R1.

**M2.** The Planning Authority and Transmission Planner shall provide evidence to its Compliance Monitor that it reported documentation of results of its reliability assessments per Reliability Standard TPL-004-0a(X)-R1.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Compliance Monitor: Regional Reliability Organization.

Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

**1.2. Compliance Monitoring Period and Reset Timeframe**

Annually.

**1.3. Data Retention**

None specified.

**1.4. Additional Compliance Information**

None.

**2. Levels of Non-Compliance**

**2.1. Level 1:** A valid assessment, as defined above, for the near-term planning horizon is not available.

**2.2. Level 2:** Not applicable.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** Not applicable.

**E. Regional Differences**

**1.** None identified.

**Version History**

|---|---|--|

- a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or System Voltage Limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.
- b) Planned or controlled interruption of electric supply to radial customers or some local network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.
- c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.
- d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.
- e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.
- f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

Appendix 1

Interpretation 2012-INT-02: Response to Request for Interpretation of TPL-003-0a, Requirements R1.3.1, R1.3.10 and R1.5 and TPL-004-0, Requirements R1.3.1, R1.3.7 and R1.4 for the System Protection and Control Subcommittee

**Date submitted:** December 12, 2011

The following interpretations of TPL-003-0a, System Performance Following Loss of Two or More Bulk Electric System Elements (Category C), Requirements R1.3.1, R1.3.10 and R1.5 and TPL-004-0, System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D), Requirements R1.3.1, R1.3.7 and R1.4 were developed by members of the Assess Transmission Future Needs Standard Drafting Team (ATFNSTD), Protection System Misoperations Standard Development Team (PSMSDT), and Protection System Maintenance and Testing Standard Drafting Team (PSMTSDT).

| Standard   | Requirement (and text)   |
|------------|--|
| TPL-003-0a | <b>R1.3.1</b> Be performed and evaluated only for those Category C contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.  |
| TPL-003-0a | <b>R1.3.10.</b> Include the effects of existing and planned protection systems, including any backup or redundant systems.   |
| TPL-003-0a | <b>R1.5.</b> Consider all contingencies applicable to Category C.  |
| TPL-004-0  | <b>R1.3.1.</b> Be performed and evaluated only for those Category D contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information. |
| TPL-004-0  | <b>R1.3.7.</b> Include the effects of existing and planned protection systems, including any backup or redundant systems.  |
| TPL-004-0  | <b>R1.4.</b> Consider all contingencies applicable to Category D.  |

Please explain the clarification needed (as submitted).

This interpretation request has been developed to address Commission concerns related to the term “Single Point of Failure” and how it relates to system performance and contingency planning clarification regarding the following questions about the listed standards, requirements and terms.

More specifically, clarification is needed about the comprehensive study of system performance relating to Table 1's, Category C and D contingency of a "protection system failure" and specifically the impact of failed components (i.e., "Single Point of Failure"). It is not entirely clear whether a valid assessment of a protection system failure includes evaluation of shared or non-redundant protection system components. Protection systems that have a shared protection system component are not two independent protection systems, because both protection systems will be mutually impacted for a failure of a single shared component. A protection system component evaluation would include the evaluation of the consequences on system performance for the failure of any protection system component that is integral to the operation of the protection system being evaluated and to the operation of another protection system.

On March 30, 2009, NERC issued an [Industry Advisory — Protection System Single Point of Failure](#)<sup>1</sup> (i.e., NERC Alert) for three significant events. One of which, the Westwing outage (June 14, 2004) was caused by failure of a single auxiliary relay that initiated both breaker tripping and the breaker failure protection. Since breaker tripping and breaker failure protection both shared the same auxiliary relay, there was no independence between breaker tripping and breaker failure protection systems, therefore causing both protection systems to not operate for the single component failure of the auxiliary relay. The failure of this auxiliary relay is known as a "single point of failure." It is not clear whether this situation is comprehensively addressed by the applicable entities when making a valid assessment of system performance for both Category C and D contingencies.

**Question 1:** For the parenthetical "(stuck breaker or protection system failure)" in TPL-003-0a (Category C contingencies 6-9) and TPL-004-0 (Category D contingencies 1-4), does an entity have the option of evaluating the effects<sup>2</sup> of either "stuck breaker" or "protection system failure" contingency<sup>3</sup>, or does an applicable entity have to evaluate the contingency that produces the more severe system results or impacts as identified in R1.3.1 of both standards?

There is a lack of clarity whether R1.3.1<sup>4</sup> requires an entity to assess which contingency causes the most severe system results or impacts (R1.3.1) and this ambiguity could result in a potential reliability gap. Whether the simulation of a stuck breaker or protection system failure will produce the worst result depends on the protection system design. For example when a protection system is fully redundant, a protection system failure will not affect fault clearing; therefore, a stuck breaker would result in more severe system results or impacts. However, when a protection system failure affects fault clearing, the fault clearing time may be longer than the breaker failure protection clearing time for a stuck breaker contingency and may result in tripping of additional system elements, resulting in a more severe system response.

---

<sup>1</sup> NERC Website: (<http://www.nerc.com/fileUploads/File/Events%20Analysis/A-2009-03-30-01.pdf>)

<sup>2</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.3.10. and/or TPL-004-0, Requirement R1.3.7.

<sup>3</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

<sup>4</sup> "Be performed and evaluated only for those Category (TPL-003-0a Category C and TPL-004-0 Category D) contingencies that would produce the more severe system results or impacts."

**Question 2:** For the phrase “Delayed Clearing<sup>5</sup>” used in Category C<sup>6</sup> contingencies 6-9 and Category D<sup>7</sup> contingencies 1-4, to what extent does the description in Table 1, footnote (e)<sup>8</sup> require an entity to model a single point of failure of a protection system component that may prevent correct operation of a protection system, including other protection systems impacted by that failed component based on the as-built design of that protection system?

There is a lack of clarity whether footnote (e) in Table 1 requires the study and/or simulation of a failure of a protection system component (i.e., single point of failure) that may prevent correct operation of the protection system(s) impacted by the component failure. Protection systems that share a protection system component are fully dependent upon the correct operation of that single shared component and do not perform as two independent protection systems. This lack of clarity may result in a potential reliability gap.

Clarity is necessary as to whether (1) a valid assessment should include evaluation of delayed clearing due to failure of the protection system component (i.e., single point of failure), such as the failure of a shared protection system component, that produces the more severe system results or impacts; and (2) the study and/or simulation of the fault clearing sequence and protection system(s) operation should be based on the protection system(s) as-built design.

The lack of clarity is compounded by the similarity between the phrase “Delayed Clearing” used in TPL-003-0a and TPL-004-0, footnote (e), and the NERC glossary term “Delayed Fault Clearing.” While TPL-003-0a and TPL-004-0 do not use the glossary term, the similarity may lead to confusion and inconsistency in how entities apply footnote (e) to “stuck breaker” or “protection system failure” contingency assessments.

### Question 1

For the parenthetical “(stuck breaker or protection system failure)” in TPL-003-0a (Category C contingencies 6-9) and TPL-004-0 (Category D contingencies 1-4), does an entity have the option of evaluating the effects<sup>9</sup> of either “stuck breaker” or “protection system failure” contingency<sup>10</sup>, or does an applicable entity have to evaluate the contingency that produces the more severe system results or impacts as identified in R1.3.1 of both standards?

### Response 1

<sup>5</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

<sup>6</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5.

<sup>7</sup> As required by NERC Reliability Standard TPL-004-0, Requirement R1.4.

<sup>8</sup> Footnote (e) Delayed Clearing: “failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay,”

<sup>9</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.3.10. and/or TPL-004-0, Requirement R1.3.7.

<sup>10</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

The interpretation drafting team concludes that the Planning Authority and Transmission Planner must evaluate the situation that produces the more severe system results or impacts (i.e., TPL-003-0a, R1.3.1 and TPL-004-0, R1.3.1) due to a delayed clearing condition regardless of whether the condition resulted from a stuck breaker or protection system failure. The Reliability Standards TPL-003-0a (Table I, Category C contingencies 6-9) and TPL-004-0 (Table I, Category D contingencies 1-4) involve an assessment of the effects of either a stuck breaker or a protection system failure. The single line ground (SLG) (TPL-003-0a, Table I, Category C) Fault and 3-phase (3 $\phi$ ) (TPL-004-0, Table I, Category D) Fault contingencies with delayed clearing are further defined by footnote (e) and the parenthetical phrase “(stuck breaker or protection system failure).” Footnote (e) explains that “Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.” The parenthetical further emphasizes that the failure may be a “stuck breaker or protection system failure” that causes the delayed clearing of the fault. The text in Table 1 in either standard explains that when selecting delayed clearing contingencies to evaluate, both conditions “(stuck breaker or protection system failure)” must be considered.

### Question 2

For the phrase “Delayed Clearing<sup>11</sup>” used in Category C<sup>12</sup> contingencies 6-9 and Category D<sup>13</sup> contingencies 1-4, to what extent does the description in Table 1, footnote (e)<sup>14</sup> require an entity to model a single point of failure of a protection system component that may prevent correct operation of a protection system, including other protection systems impacted by that failed component based on the as-built design of that protection system?

### Response 2

The term “Delayed Clearing” that is described in Table I, footnote (e) refers to fault clearing that results from a failure to achieve the protection system’s normally expected clearing time. For Category C or D contingencies, each Planning Authority and Transmission Planner is permitted engineering judgment in its selection of the protection system component failures for evaluation that would produce the more severe system results or impact (i.e., TPL-003-0a, R1.3.1 and TPL-004-0, R1.3.1). The evaluation would include addressing all protection systems affected by the selected component.

A protection system component failure that impacts one or more protection systems and increases the total fault clearing time requires the Planning Authority and Transmission Planner to simulate the full impact (clearing time and facilities removed) on the Bulk Electric System performance.

<sup>11</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

<sup>12</sup> As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5.

<sup>13</sup> As required by NERC Reliability Standard TPL-004-0, Requirement R1.4.

<sup>14</sup> Footnote (e) Delayed Clearing: “failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay,”

## Standard TPL-004-0a(x) — System Performance Following Extreme BES Events

---

The interpretation drafting team bases this conclusion on the footnote (e) example “...any protection system component such as, relay, circuit breaker, or current transformer...” because the component “circuit breaker” is not addressed in the current or previously defined NERC glossary term. The interpretation drafting team initially believed the lowercase usage of “protection system” inferred the NERC glossary term and the components described therein; however, based on the interpretation drafting team’s further assessment of footnote (e), it concludes that the existing TPL standards (TPL-003-0a and TPL-004-0) do not implicitly use the NERC glossary term. Without an explicit reference to the NERC glossary term, “Protection System,” the two standards do not prescribe the specific protection system components that must be addressed by the Planning Authority and Transmission Planner in performing the studies required in TPL-003-0a and TPL-004-0.

# Unofficial Comment Form

## Project 2010-05.2 Special Protection Systems Phase 2 of Protection Systems

Please **DO NOT** use this form for submitting comments. Please use the [electronic form](#) to submit comments on the proposed definition of Remedial Action Scheme (RAS). The electronic comment form must be completed by **8 p.m. Eastern, Friday, July 25, 2014**.

If you have questions, please contact [Al.McMeekin@nerc.net](mailto:Al.McMeekin@nerc.net) or by telephone at (803) 530-1963.

The project page may be accessed by clicking [here](#).

### Background Information

The existing NERC Glossary of Terms definition for “Special Protection System” (“SPS”) or “Remedial Action Scheme” (“RAS”) lacks the specificity necessary to consistently identify what equipment or protection schemes qualify as SPS or RAS across the eight NERC Regions. The existing definition also does not clearly stipulate the characteristics of a SPS or RAS. The actions listed in the definition of “Special Protection System” and “Remedial Action Scheme” are ambiguous and may unintentionally include equipment whose purpose is not expressly related to preserving System reliability in response to predetermined System conditions. Employing a single term; i.e., RAS, and clarifying its definition will lead to more consistent application of the NERC Reliability Standards related to RAS.

The proposed definition of RAS must be broad to include the variety of System conditions monitored and corrective actions taken by RAS. This “broadness”; however, necessitates an exclusion list because without the exclusions, equipment and schemes that should not be considered RAS could be subject to the requirements of the RAS-related Reliability Standards. The exclusion list assures that commonly applied protection and control systems are not unintentionally included as RAS.

**Note:** The term “**Remedial Action Scheme**” (“**RAS**”) is and will be used throughout the documents associated with this Project to reflect the proposed retirement of the term “Special Protection System” (“SPS”).

## Questions

You do not have to answer all questions. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

1. Do you agree that using a single term; i.e., RAS, and clarifying its definition will lead to more consistent application of the related NERC Reliability Standards? If not, please provide specific suggestions and rationale.

Yes

No

Comments:

2. Are there additional corrective actions that should be explicitly included in the proposed definition of RAS? If yes, please provide specific suggestions and rationale.

Yes

No

Comments:

3. Are there additional objectives that should be explicitly included in the proposed definition of RAS? If yes, please provide specific suggestions and rationale.

Yes

No

Comments:

4. Do you agree with the exclusion list in the proposed definition of RAS? If not, please provide specific suggestions and rationale.

Yes

No

Comments:

5. Do you agree with the time frames in the proposed Implementation Plan associated with the proposed definition of RAS? Please provide specific comments in support of your position.

Yes

No

SAR Information

Industry Need (What is the industry problem this request is trying to solve?):

The existing NERC Glossary of Terms definition for a Special Protection System (SPS) or, as used in the Western Interconnection, a Remedial Action Scheme (RAS), lacks the clarity and specificity necessary for consistent identification and classification of protection schemes as SPS or RAS across the eight NERC Regions, leading to inconsistent application of the related NERC Reliability Standards.

In FERC Order No. 693 (dated March 16, 2007), the Commission identified three of the SPS-related Reliability Standards (PRC-012-0, PRC-013-0, and PRC-014-0) as fill-in-the-blank standards because they are applicable to the Regional Reliability Organizations (RROs). Consequently, the Commission did not approve or remand them, rendering them neither mandatory nor enforceable.

This project also addresses, in part, four recommendations related to identification and coordination of SPS from the joint FERC-NERC inquiry of the September 2011 Southwest Blackout Event.

NOTE: Detailed information is included in the NERC Planning Committee report “Special Protection Systems (SPS) and Remedial Action Schemes (RAS): Assessment of Definition, Regional Practices, and Application of Related Standards” Revision 0.1 – April 2013.

Purpose or Goal (How does this request propose to address the problem described above?):

- 1) Establish a definition of an SPS or RAS that provides the specificity needed to consistently identify and classify protection schemes as SPS or RAS across all eight NERC Regions, thereby promoting the consistent application of the NERC Reliability Standards related to SPS.
- 2) Correct the applicability of the NERC Reliability Standards related to SPS/RAS by assigning responsibilities to the specific users, owners, and operators of the Bulk-Power System rather than the RROs.
- 3) Develop continent-wide standards to address all aspects of SPS/RAS, including but not limited to, the:
  - planning, coordination, and design of SPS/RAS,
  - review, assessment, and documentation of SPS/RAS,
  - operational considerations for monitoring, status notification, and response to failures,
  - analysis of SPS/RAS operations, and defining and reporting of SPS/RAS misoperations,
  - testing of SPS/RAS, and maintenance of any non-protection system components used.

| SAR Information  |
|--|
| Identify the Objectives of the proposed standard's requirements (What specific reliability deliverables are required to achieve the goal?):  |
| Successful implementation of a modified definition for an SPS/RAS, with the revised SPS/RAS-related Reliability Standards will improve Bulk-Power System reliability by providing continent-wide consistency in the identification and classification of SPS or RAS, and by promoting the consistent application of the related Reliability Standards.   |
| Brief Description (Provide a paragraph that describes the scope of this standard action.)  |
| <p>The project will develop a revised definition of SPS or RAS, as well as revise the NERC Reliability Standards that address the:</p> <ul style="list-style-type: none"> <li>• review of new or modified SPS/RAS,</li> <li>• annual assessments of SPS/RAS in transmission planning studies,</li> <li>• periodic comprehensive SPS/RAS assessments,</li> <li>• analysis and reporting of SPS/RAS misoperations,</li> <li>• maintenance, testing and operational aspects of SPS/RAS.</li> </ul>  |
| Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)   |
| <p>The SDT will revise the definition of SPS/RAS to provide the clarity and specificity necessary for consistent identification and classification of protection schemes as SPS/RAS across the eight NERC Regions.</p> <p>The SDT will revise or retire the six existing SPS/RAS-related Reliability Standards:</p> <ul style="list-style-type: none"> <li>• PRC-012-0 Special Protection System Review Procedure</li> <li>• PRC-013-0 Special Protection System Database</li> <li>• PRC-014-0 Special Protection System Assessment</li> <li>• PRC-015-0 Special Protection System Data and Documentation</li> <li>• PRC-016-0.1 Special Protection System Misoperations</li> <li>• PRC-017-0 Special Protection System Maintenance and Testing</li> </ul> |

### SAR Information

The SDT will correct the applicability in PRC-012-0, PRC-013-0, and PRC-014-0 by assigning the requirements to the specific users, owners, and operators of the Bulk Power System.

The SDT will combine appropriate requirements from PRC-012-0, PRC-013-0, PRC-014-0, PRC-015-0, PRC-016-0.1, and PRC-017-0 into one or more Reliability Standard(s). The new standard(s) will provide specific requirements for:

- review of new or modified SPS/RAS;
- annual assessments of SPS/RAS in transmission planning studies;
- periodic comprehensive SPS/RAS assessments;
- design of SPS/RAS;
- operations and misoperations;
- maintenance and testing of SPS/RAS; and
- maintenance and testing of non-Protection System components used in SPS/RAS; and
- coordination of SPS/RAS with other SPS/RAS, UFLS, UVLS, and Protection Systems.

Due to the significant difference between Protection Systems and SPS, the subject of SPS misoperation is not addressed in the revision of Reliability Standard PRC-004. This SDT will develop a definition for SPS/RAS misoperation and revise PRC-016-0.1. The new Reliability Standard will provide specific requirements for the analysis of SPS operations and reporting of SPS misoperations.

The SDT will address the complexity of maintaining and testing SPS, as well as the maintenance and testing of non-Protection System components used in SPS in a Reliability Standard. This SDT will coordinate with the PRC-005-4 SDT to prevent any overlaps or gaps in coverage.

The SDT also will consider operational considerations for monitoring, status notification, and response to failures of SPS/RAS; and, if necessary, modify other related standards.

The SDT will retire requirements that are administrative in nature that are not necessary for reliability of the Bulk-Power System, or that are superseded by other requirements; i.e., the new Reliability Standards will qualify as steady-state.

No market interface impacts are anticipated.

Reliability Functions

The Standard will Apply to the Following Functions (Check each one that applies.)

|   |   |
|---|---|
| <input checked="" type="checkbox"/> Reliability Coordinator | Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator’s wide area view.                              |
| <input checked="" type="checkbox"/> Balancing Authority     | Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.                     |
| <input type="checkbox"/> Interchange Authority              | Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas. |
| <input checked="" type="checkbox"/> Planning Coordinator    | Assesses the longer-term reliability of its Planning Coordinator Area.  |
| <input type="checkbox"/> Resource Planner                   | Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.   |
| <input checked="" type="checkbox"/> Transmission Planner    | Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.   |
| <input type="checkbox"/> Transmission Service Provider      | Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).   |
| <input checked="" type="checkbox"/> Transmission Owner      | Owns and maintains transmission facilities.   |
| <input checked="" type="checkbox"/> Transmission Operator   | Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.   |
| <input checked="" type="checkbox"/> Distribution Provider   | Delivers electrical energy to the End-use customer.   |
| <input checked="" type="checkbox"/> Generator Owner         | Owns and maintains generation facilities.   |
| <input checked="" type="checkbox"/> Generator Operator      | Operates generation unit(s) to provide real and reactive power.   |
| <input type="checkbox"/> Purchasing-Selling Entity          | Purchases or sells energy, capacity, and necessary reliability-related services as required.  |
| <input type="checkbox"/> Market Operator                    | Interface point for reliability functions with commercial functions.  |

| Reliability Functions                        |   |
|--|---|
| <input type="checkbox"/> Load-Serving Entity | Secures energy and transmission service (and reliability-related services) to serve the End-use Customer. |

| Reliability and Market Interface Principles  |   |
|--|---|
| Applicable Reliability Principles (Check all that apply).  |   |
| <input checked="" type="checkbox"/>  | 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.               |
| <input type="checkbox"/>   | 2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.                     |
| <input checked="" type="checkbox"/>  | 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably. |
| <input checked="" type="checkbox"/>  | 4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.   |
| <input checked="" type="checkbox"/>  | 5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.  |
| <input type="checkbox"/>   | 6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.                  |
| <input checked="" type="checkbox"/>  | 7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.  |
| <input type="checkbox"/>   | 8. Bulk power systems shall be protected from malicious physical or cyber-attacks.  |
| Does the proposed Standard comply with all of the following Market Interface Principles?   |   |
| 1. A reliability standard shall not give any market participant an unfair competitive advantage.   | Enter (yes/no)<br>Yes   |
| 2. A reliability standard shall neither mandate nor prohibit any specific market structure.  | Yes   |
| 3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.  | Yes   |
| 4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. | Yes   |

## SAR Information

## Industry Need (What is the industry problem this request is trying to solve?):

The existing NERC Glossary of Terms definition for a Special Protection System (SPS) or, as used in the Western Interconnection, a Remedial Action Scheme (RAS), lacks the clarity and specificity necessary for consistent identification and classification of protection schemes as SPS or RAS across the eight NERC Regions, leading to inconsistent application of the related NERC Reliability Standards.

In FERC Order No. 693 (dated March 16, 2007), the Commission identified three of the SPS-related ~~standards~~ Reliability Standards (PRC-012-0, PRC-013-0, and PRC-014-0) as fill-in-the-blank standards because they are applicable to the Regional Reliability Organizations (RROs). Consequently, the Commission did not approve or remand them, rendering them neither mandatory nor enforceable.

This project also addresses, in part, four recommendations related to identification and coordination of SPS from the joint FERC-NERC inquiry of the September 2011 Southwest Blackout Event.

NOTE: Detailed information is included in the NERC Planning Committee report “Special Protection Systems (SPS) and Remedial Action Schemes (RAS): Assessment of Definition, Regional Practices, and Application of Related Standards” Revision 0.1 – April 2013.

## Purpose or Goal (How does this request propose to address the problem described above?):

- 1) Establish a definition of an SPS or RAS that provides the specificity needed to consistently identify and classify protection schemes as SPS or RAS across all eight NERC Regions, thereby promoting the consistent application of the NERC Reliability Standards related to SPS.
- 2) Correct the applicability of the NERC Reliability Standards related to SPS/RAS by assigning responsibilities to the specific users, owners, and operators of the Bulk-Power System rather than the RROs.
- 3) Develop continent-wide standards to address all aspects of SPS/RAS, including but not limited to, the:
  - planning, coordination, and design of SPS/RAS,
  - review, assessment, and documentation of SPS/RAS,
  - operational considerations for monitoring, status notification, and response to failures,
  - analysis of SPS/RAS operations, and defining and reporting of SPS/RAS misoperations,
  - testing of SPS/RAS, and maintenance of any non-protection system components used ~~in SPS~~.

## SAR Information

Identify the Objectives of the proposed standard's requirements (What specific reliability deliverables are required to achieve the goal?):

Successful implementation of a modified ~~SPS~~ definition ~~and~~ for an SPS/RAS, with the revised SPS ~~standards~~ /RAS-related Reliability Standards will improve Bulk-Power System reliability by providing continent-wide consistency in the identification and classification of SPS or RAS, and by promoting the consistent application of ~~NERC~~ the related Reliability Standards ~~related to SPS~~.

Brief Description (Provide a paragraph that describes the scope of this standard action.)

The project will develop a revised definition of SPS or RAS, as well as ~~standards~~ revise the NERC Reliability Standards that address the:

- review of new or modified SPS/RAS,
- annual assessments of SPS/RAS in transmission planning studies,
- periodic comprehensive SPS/RAS assessments,
- analysis and reporting of SPS/RAS misoperations,
- maintenance, testing and operational aspects of SPS/RAS.

Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)

The SDT will revise the definition of SPS/RAS to provide the clarity and specificity necessary for consistent identification and classification of protection schemes as SPS ~~or~~ /RAS across the eight NERC Regions.

The SDT will revise or retire the six existing SPS ~~standards~~ /RAS-related Reliability Standards:

- PRC-012-0 Special Protection System Review Procedure
- PRC-013-0 Special Protection System Database
- PRC-014-0 Special Protection System Assessment
- PRC-015-0 Special Protection System ~~data~~ Data and Documentation
- PRC-016-0.1 Special Protection System Misoperations
- PRC-017-0 Special Protection System Maintenance and Testing

## SAR Information

The SDT will correct the applicability in PRC-012-0, PRC-013-0, and PRC-014-0 by assigning the requirements to the specific users, owners, and operators of the ~~bulk power system~~ Bulk Power System.

The SDT will combine appropriate requirements from PRC-012-0, PRC-013-0, PRC-014-0, PRC-015-0, PRC-016-0.1, and PRC-~~015~~017-0 into one or more Reliability Standard-(s). The new standard(s) will provide specific requirements for:

- review of new or modified SPS/RAS;
- annual assessments of SPS/RAS in transmission planning studies;
- periodic comprehensive SPS/RAS assessments;
- design of SPS;/RAS;
- operations and misoperations;
- maintenance and testing of SPS/RAS; and
- maintenance and testing of non-Protection System components used in SPS/RAS; and
- coordination of SPS/RAS with other SPS/RAS, UFLS, UVLS, and Protection Systems.

Due to the significant difference between Protection Systems and SPS, the subject of SPS misoperation is not addressed in the revision of Reliability Standard PRC-004. This SDT will develop a definition for SPS/RAS misoperation and revise PRC-016-0.1. The new Reliability Standard will provide specific requirements for the analysis of SPS operations and reporting of SPS misoperations.

The SDT will address the complexity of maintaining and testing SPS, as well as the maintenance and testing of non-Protection System components used in SPS in a Reliability Standard. -This SDT will coordinate with the PRC-005-4 SDT to prevent any overlaps or gaps in coverage.

The SDT also will consider operational considerations for monitoring, status notification, and response to failures of SPS/RAS; and, if necessary, modify other related standards.

The SDT will retire requirements that are administrative in nature that are not necessary for reliability of the Bulk-Power System, or that are superseded by other requirements; i.e., the new Reliability Standards will qualify as steady-state.

No market interface impacts are anticipated.

Reliability Functions

The Standard will Apply to the Following Functions (Check each one that applies.)

|   |  |
|---|--|
| <input type="checkbox"/> <del>Regional Reliability Organization</del> | <del>Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.</del> |
| <input checked="" type="checkbox"/> Reliability Coordinator           | Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator’s wide area view.   |
| <input checked="" type="checkbox"/> Balancing Authority               | Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.  |
| <input type="checkbox"/> Interchange Authority                        | Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.                              |
| <input checked="" type="checkbox"/> Planning Coordinator              | Assesses the longer-term reliability of its Planning Coordinator Area.   |
| <input type="checkbox"/> Resource Planner                             | Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.  |
| <input checked="" type="checkbox"/> Transmission Planner              | Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.  |
| <input type="checkbox"/> Transmission Service Provider                | Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).  |
| <input checked="" type="checkbox"/> Transmission Owner                | Owns and maintains transmission facilities.  |
| <input checked="" type="checkbox"/> Transmission Operator             | Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.  |
| <input checked="" type="checkbox"/> Distribution Provider             | Delivers electrical energy to the End-use customer.  |
| <input checked="" type="checkbox"/> Generator Owner                   | Owns and maintains generation facilities.  |
| <input checked="" type="checkbox"/> Generator Operator                | Operates generation unit(s) to provide real and reactive power.  |

| Reliability Functions                              |   |
|--|---|
| <input type="checkbox"/> Purchasing-Selling Entity | Purchases or sells energy, capacity, and necessary reliability-related services as required.              |
| <input type="checkbox"/> Market Operator           | Interface point for reliability functions with commercial functions.                                      |
| <input type="checkbox"/> Load-Serving Entity       | Secures energy and transmission service (and reliability-related services) to serve the End-use Customer. |

| Reliability and Market Interface Principles  |   |
|--|---|
| Applicable Reliability Principles (Check all that apply).  |   |
| <input checked="" type="checkbox"/>  | 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.               |
| <input type="checkbox"/>   | 2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.                     |
| <input checked="" type="checkbox"/>  | 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably. |
| <input checked="" type="checkbox"/>  | 4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.   |
| <input checked="" type="checkbox"/>  | 5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.  |
| <input type="checkbox"/>   | 6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.                  |
| <input checked="" type="checkbox"/>  | 7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.  |
| <input type="checkbox"/>   | 8. Bulk power systems shall be protected from malicious physical or cyber-attacks.  |
| Does the proposed Standard comply with all of the following Market Interface Principles?         |   |
| 1. A reliability standard shall not give any market participant an unfair competitive advantage. | Enter (yes/no)<br>Yes   |
| 2. A reliability standard shall neither mandate nor prohibit any specific market structure.      | Yes   |

| Reliability and Market Interface Principles  |     |
|--|-----|
| 3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.  | Yes |
| 4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. | Yes |

# Uses of “Special Protection System” and “Remedial Action Scheme” in Reliability Standards

This document provides a summary of the occurrences of “Special Protection System” (“SPS”) and “Remedial Action Scheme” (“RAS”) in the existing NERC Reliability Standards to assist entities in assessing the impact of the proposed definition of “Remedial Action Scheme.” The existing Reliability Standards and certain NERC Glossary of Terms use the terms interchangeably.<sup>1</sup> Changes are proposed in this Project for each applicable standard and NERC Glossary term to align the use of the terminology in each instance. Where only the term SPS occurs, it was replaced with RAS. Where both terms, SPS and RAS, occur, the drafting team deleted the references to SPS. Where only the term RAS occurs, no change was made. In all cases, entities should apply the proposed definition of RAS to its own schemes, and determine any impact.

## General Description of Definition Change

The revised definition of RAS will create one definition to replace both existing definitions in the NERC Glossary of Terms, for use throughout the NERC Reliability Standards. The revised definition of RAS addresses ambiguities within the existing definition and provides clarity to promote consistency in the application of the standards by the responsible entities and the auditing of the standards by compliance staff. The revised definition of RAS recasts the existing definition of SPS to:

- more precisely describe the objectives of the schemes;
- more precisely describe exclusions;
- state the relationship between Protection Systems and RAS; and
- clarify that centrally controlled undervoltage-based load shedding is included in the definition.

## Uses of SPS and RAS in Existing Reliability Standards and NERC Glossary of Terms

The table below includes each occurrence of SPS and RAS found in the applicability sections, requirements, tables, and attachments of the existing NERC Reliability Standards (as of May 16, 2014). The table does not reflect any associated occurrences in other sections of the standard such as the measures, compliance information, and Violation Severity Levels. All occurrences have been reflected in the separate document *Revised Reliability Standards for the Revised Definition of “Remedial Action Scheme.”*

<sup>1</sup> NERC, *Reliability Standards for the Bulk Electric Systems of North America* (Updated May 16, 2014).

## Introduction

---

The Project 2010-05.2 – Special Protection Systems Standard Drafting Team (SDT) thanks all commenters who submitted comments on the proposed revision to the NERC Glossary term “Special Protection System” (“SPS”) or “Remedial Action Scheme” (“RAS”) definition from the SAMS-SCPS SPS Technical Reference report. The revised definition was posted for a 30-day informal comment period from March 11, 2014 through April 9, 2014. NERC asked stakeholders to provide feedback on the proposed definition through a special electronic comment form.

The SDT appreciates the stakeholder comments on the revised definition. The SDT reviewed all of the comments and made numerous changes to the definition based on the feedback received. These changes are reflected in the first formal posting of the proposed revised definition for comment and ballot. The SDT developed this background and Frequently Asked Questions (FAQ) document to explain the key concepts incorporated in the revised definition, as well as the team’s approach and intent.

Contact the Standards Developer, Al McMeekin, at 404-446-9675 or at [al.mcmeekin@nerc.net](mailto:al.mcmeekin@nerc.net) with any comments or questions.

# Background – RAS Definition Development

---

## Existing NERC Glossary of Terms Definitions

The existing NERC Glossary of Terms defines **SPS** or **RAS** as: “An automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and Mvar), or system configuration to maintain system stability, acceptable voltage, or power flows. An SPS does not include (a) underfrequency or undervoltage load shedding or (b) fault conditions that must be isolated or (c) out-of-step relaying (not designed as an integral part of an SPS). Also called Remedial Action Scheme.”

The NERC Glossary of Terms defines a **Protection System** as:

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

## Revision of the NERC Glossary of Terms Definition

### Purpose of Revision of the NERC Glossary Terms SPS or RAS

The existing NERC Glossary of Terms definition for an SPS or RAS lacks the clarity and specificity necessary to consistently identify what equipment or schemes qualify as an SPS or RAS across the eight NERC Regions. This confusion leads to inconsistent application of the SPS or RAS-related NERC Reliability Standards.

The existing definition also lacks clarity in the actions stipulated as characteristics of an SPS or RAS. The actions listed in the definition are so broad that the definition may unintentionally include schemes whose purpose is not expressly related to preserving system reliability in response to predetermined system conditions. Inclusion of any scheme taking “corrective action other than isolation of faulted components to maintain system reliability” could be interpreted to mean that devices such as voltage regulators and switching controls for shunt capacitors should be included. This inclusion would then make these devices subject to requirements such as those addressing single-component failure considerations (sometimes referred to as redundancy considerations) in the SPS or RAS-related NERC Reliability Standards.

### Recommendation to Change the Term to RAS Only

Currently, both terms, SPS and RAS, are used in the eight NERC Regions. The SDT contends that a single term promotes consistency. The SDT therefore recommends that the term RAS be retained as the industry-recognized term and that the term SPS be retired. The term RAS is more descriptive of the purpose for which the scheme is installed.

The term RAS also eliminates the confusion associated with the two defined terms, “Special Protection System” and “Protection System.” The inclusion of Protection System in the term Special Protection System implies that SPS are a subset of Protection Systems. RAS are not Protection Systems; however, they may share components with Protection Systems.

### Effects of Using Only the Term RAS in the Existing NERC Reliability Standards

The existing NERC Reliability Standards and NERC Glossary of Terms use the terms, SPS and RAS interchangeably. In most cases, both terms are included in the standards and written as: “SPS or RAS.” The SDT evaluated the existing standards and recommended any necessary revisions to retain the single term, RAS. Many of the same changes would be required regardless of which single term is retained. A summary of the occurrences of the terms is included in the posted document *Uses of “Special Protection System” and “Remedial Action Scheme” in Reliability Standards*.

## Proposed Definition of RAS

**Remedial Action Scheme:** A scheme designed to detect predetermined System conditions and automatically take corrective actions that may include, but are not limited to, curtailing or tripping generation or other sources, curtailing or tripping load, or reconfiguring a System(s). RAS accomplish one or more of the following objectives:

- Meet requirements identified in the NERC Reliability Standards;
- Maintain System stability;
- Maintain acceptable System voltages;
- Maintain acceptable power flows;
- Limit the impact of Cascading; or
- Address other Bulk Electric System (BES) reliability concerns.

These schemes are not Protection Systems; however, they may share components with Protection Systems.

The following do not individually constitute a RAS:

- a. Out-of-step tripping and power swing blocking
- b. Automatic underfrequency load shedding (UFLS) programs
- c. Undervoltage Load Shedding Programs (UVLS Programs)
- d. Autoreclosing schemes
- e. Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss-of-field, transformer top-oil temperature, high voltage, or overload to protect the Element against damage by removing it from service
- f. Controllers that switch or regulate series or shunt reactive devices, flexible alternating current transmission system (FACTS) devices, phase-shifting transformers, variable-frequency transformers, tap-changing transformers, or generation excitation, and that are located at and monitor quantities solely at the same station as the Element being switched or regulated
- g. FACTS controllers that remotely switch static shunt reactive devices located at other stations to regulate the output of a single FACTS device
- h. Schemes or controllers that remotely switch shunt reactors and shunt capacitors for voltage regulation that would otherwise be manually switched
- i. Schemes that automatically de-energize a line for a non-Fault operation when one end of the line is open
- j. Schemes that provide anti-islanding protection (e.g., protect load from effects of being isolated with generation that may not be capable of maintaining acceptable frequency and voltage)
- k. Automatic sequences that proceed when manually initiated solely by an operator

- l. Modulation of HVdc or FACTS via supplementary controls such as angle damping or frequency damping applied to damp local or inter-area oscillations
- m. Sub-synchronous resonance (SSR) protection schemes that directly detect sub-synchronous quantities (e.g., currents or torsional oscillations)

## Exclusion List Explanations

### a. Out-of-step tripping and power swing blocking

The existing NERC Glossary of Terms definition of SPS or RAS excludes out-of-step relaying because it is a protective function. The SDT maintained the exclusion but changed the wording from “out-of-step relaying” to “out-of-step tripping and power swing blocking” to reflect current industry terminology.

### b. Automatic underfrequency load shedding (UFLS) programs

The existing NERC Glossary of Terms definition of SPS or RAS excludes UFLS because it is a protective function that has unique design and implementation considerations that are covered by NERC Reliability Standard PRC-006-1. The SDT maintained the exclusion.

### c. Undervoltage Load Shedding Programs (UVLS Programs)

The existing NERC Glossary of Terms definition of SPS or RAS excludes undervoltage load shedding (UVLS) because it is a protective function. The SDT maintained the exclusion but is using the new term UVLS Program proposed by the SDT for NERC Project 2008-02 – Undervoltage Load Shedding. UVLS Programs are addressed in proposed NERC Reliability Standard PRC-010-1.

### d. Autoreclosing schemes

Autoreclosing schemes, whether single-pole or three-pole, are used to minimize system impacts and restoration efforts by System Operators. Autoreclosing, in itself, is not a RAS; however, if integrated into a larger scheme that performs additional corrective actions to accomplish the objective(s) listed in the RAS definition, then it would be part of a RAS. For example, a scheme that rejects or runs back generation to avoid instability or thermal overloads in addition to initiating autoreclosing would constitute a RAS.

### e. Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss of field, transformer top-oil temperature, high voltage, or overload to protect the Element against damage by removing it from service

The SDT contends that these schemes are applied on an Element to protect it from damage. They are protective functions and are not RAS. The SDT accepts this exclusion consistent with industry practice.

### f. Controllers that switch or regulate series or shunt reactive devices, FACTS devices, phase-shifting transformers, variable-frequency transformers, tap-changing transformers, or generation excitation, and that are located at and monitor quantities solely at the same station as the Element being switched or regulated

The SDT contends these devices are not RAS. The SDT accepts this exclusion consistent with industry practice.

### g. FACTS controllers that remotely switch static shunt reactive devices located at other stations to regulate the output of a single FACTS device

The SDT contends these devices are not RAS. The SDT accepts this exclusion consistent with industry practice.

### h. Schemes or controllers that remotely switch shunt reactors and shunt capacitors for voltage regulation that would otherwise be manually switched

Schemes or controllers that assist a System Operator in coordinating the switching of shunt reactors and shunt capacitors that would otherwise be manually switched are not remedial in the sense of being mitigations in response to predetermined System conditions, but are for general application to all System conditions.

**i. Schemes that automatically de-energize a line for a non-Fault operation when one end of the line is open**

When one end of a line is open, unacceptable voltage levels can occur. Opening the remote terminal(s) to de-energize the transmission line removes this voltage rise. These schemes have not historically been regarded as RAS, and the SDT accepts this exclusion consistent with industry practice.

**j. Schemes that provide anti-islanding protection (e.g., protect load from effects of being isolated with generation that may not be capable of maintaining acceptable frequency and voltage)**

These schemes are designed to protect load in an electrical island that might otherwise operate at an off-nominal frequency or voltage, or facilitate restoration. Actions taken on islanded facilities will not impact the interconnected BES because they are isolated. The SDT accepts this exclusion consistent with industry practice.

**k. Automatic sequences that proceed when manually initiated solely by an operator**

Automated sequences created to simplify the actions of an operator are not RAS because the decision to activate a specific sequence is left to the operator. If the automated sequence fails to execute correctly, the operator has the option to manually set those actions in motion. The SDT accepts this exclusion consistent with industry practice.

**l. Modulation of HVdc or FACTS via supplementary controls such as angle damping or frequency damping applied to damp local or inter-area oscillations**

Modulation of HVdc and FACTS via supplementary controls is occasionally used for damping local or inter-area oscillations. They perform a similar function as a Power System Stabilizer (PSS), which is a component of excitation controls in a generating unit. PSS are not classified as RAS. The SDT accepts this exclusion consistent with industry practice.

**m. Sub-synchronous resonance (SSR) protection schemes that directly detect sub-synchronous quantities; (e.g., currents or torsional oscillations)**

The SDT contends that directly detected SSR conditions and related mitigation are not RAS. The SDT accepts this exclusion consistent with industry practice.

## Explanations Regarding Changes from the Exclusion List Cited in the SAMS-SPCS Report

The SDT revised the straw man definition proposed in the SAMS-SPCS report; however, the proposed definition is consistent with the SAMS-SPCS intent. The drafting team revised the definition in response to stakeholder comments from the informal posting. As a result, it is no longer necessary to explicitly state some of the exclusions.

### 1. Schemes that prevent high line voltage by automatically switching the affected line

This scheme is now addressed by exceptions “e” (protection from high voltage) and “i” (automatic de-energization of a line when one end is open) in the proposed definition.

### 2. Protection schemes that operate local breakers other than those on the faulted circuit to facilitate Fault clearing, such as, but not limited to, opening a circuit breaker to remove infeed so protection at a remote terminal can detect a Fault or to reduce fault duty

The scheme described in this exclusion is a Protection System. The proposed definition excludes Protection Systems from RAS.

### 3. Blanket exclusion for SSR protection schemes

The proposed definition excludes schemes that directly detect sub-synchronous quantities; however, SSR mitigation schemes installed to detect distinct System configurations and loading conditions (that studies have shown may make a generator vulnerable to SSR), and take action to trip the generator or bypass the series capacitor, are classified as RAS.

### 4. A Protection System that includes multiple elements within its zone of protection, or that isolates more than the faulted element because an interrupting device is not provided between the faulted element and one or more other elements

The scheme described in this exclusion is a Protection System. The proposed definition excludes Protection Systems from RAS.

## Frequently Asked Questions

### Why does the proposed definition have an exclusion list?

The definition must be broad enough to include the variety of System conditions monitored and corrective actions taken by RAS. Without the exclusions, equipment and schemes that should not be considered RAS could be subject to the requirements of the RAS-related NERC Reliability Standards. The exclusion list also assures that commonly applied protection and control systems are not unintentionally included as RAS.

### Why did the SDT not propose a screening process to identify RAS?

The SDT contends that a comprehensive definition with specific exclusions is the best way to achieve consistency and immediacy in RAS identification. The SDT asserts that a study-based screening process would be labor-intensive and dependent on assumptions that could vary among the entities performing the studies.

### Why does the proposed definition not include the classification types suggested in the SPCS-SAMS report?

The classification of a RAS is not necessary for defining whether or not a scheme qualifies as a RAS. Informal feedback from many stakeholders indicated uncertainty about the classification types. Therefore, the SDT decided not to include RAS classification types within the definition. The classifications are more appropriately addressed concurrently with revisions to the RAS-related Reliability Standards.

### Why did the SDT not specifically reference the Transmission Planning (TPL) standards in the proposed definition?

The SDT acknowledges that many RAS are installed to address the performance requirements of the TPL standards; however, they are also installed to address other reliability concerns.

**Would automatic actions taken by an Energy Management System (EMS), Supervisory Control and Data Acquisition (SCADA), or Distribution Control System (DCS) be considered a RAS?**

The above-mentioned control systems support and enable grid operations by issuing control commands mostly to geographically distributed power System devices. In this normal application, these systems are not considered to be RAS. However, if these systems are configured to detect predetermined conditions and take corrective actions consistent with the RAS definition, these automatic functions would be considered RAS. The identification of RAS is not dependent upon the specific hardware or platform utilized in the scheme.

**What are the Implementation Plan time frames?**

The Implementation Plan provides RAS owners a minimum of twelve (12) months beyond the date of approval by a governmental authority to evaluate their current schemes for determining whether they are RAS, based on the new definition. The drafting team contends that twelve (12) months is an adequate period of time to review existing schemes to determine whether they are RAS.

The Implementation Plan also provides owners of newly identified RAS twenty-four (24) calendar months beyond the date of approval by a governmental authority to be fully compliant with all standards applicable to the revised definition of Remedial Action Scheme. The drafting team contends that twenty-four (24) calendar months provides the RAS owner sufficient time to become compliant with the revised standards proposed in the Implementation Plan.

**Coordination with Project 2008-02 – Undervoltage Load Shedding**

As part of the current development of PRC-010-1, the Project 2008-02 UVLS SDT is introducing a new NERC Glossary term, UVLS Program, to clearly establish applicability of PRC-010-1:

**Undervoltage Load Shedding Program (UVLS Program):** An automatic load shedding program consisting of distributed relays and controls used to mitigate undervoltage conditions leading to voltage instability, voltage collapse, or Cascading impacting the Bulk Electric System (BES). Centrally controlled undervoltage-based load shedding is not included.

Note that the definition excludes centrally controlled undervoltage-based load shedding. The UVLS SDT maintains that the design and characteristics of centrally controlled undervoltage-based load shedding are commensurate with RAS (wherein load shedding is the remedial action) and, as such, centrally controlled undervoltage-based load shedding should be subject to RAS-related Reliability Standards.

The Project 2010-05.2 SPS SDT agrees with the Project 2008-02 UVLS SDT that the design and characteristics of centrally controlled undervoltage-based load shedding are more appropriately categorized as RAS. The SPS SDT has therefore revised the definition of RAS to clarify that the definition is exclusive of only the newly defined term UVLS Program, and is therefore inclusive of centrally controlled undervoltage-based load shedding. The SDT is coordinating this change with the Project 2008-02 UVLS SDT. Collectively, the two definitions will promote consistency in the identification of centrally controlled undervoltage-based load shedding as a RAS. As a result, all NERC Reliability Standards that include the term RAS will be applicable to centrally controlled undervoltage-based load shedding upon the effective date of the revised definition of RAS.

# Project 2008-02 Undervoltage Load Shedding

Coordination Plan | June 11, 2014

## Background

Project 2008-02 Undervoltage Load Shedding (“UVLS Project”) proposes to consolidate and retire PRC-010-0, PRC-020-1, PRC-021-1, and PRC-022-1 to create PRC-010-1 – Undervoltage Load Shedding. During development, the drafting team identified the following necessary corresponding changes to meet the design of PRC-010-1:

- 1) Retire three requirements in EOP-003-2 – Load Shedding Plans whose required performance is reflected in proposed PRC-010-1.
- 2) Revise the NERC Glossary definition of the term Special Protection System (SPS) to clarify that centrally controlled undervoltage-based load shedding is an SPS because of its design and characteristics.
- 3) Modify PRC-004-3 – Protection System Misoperation Identification and Correction, which excludes UVLS, to include certain types of UVLS programs as part of its applicable facilities.

To make these changes, the UVLS drafting team is coordinating with drafting teams from the three active NERC standard development projects listed below:

- Project 2009-03 – Emergency Operations (“EOP Project”)
- Project 2010-05.2 – Special Protection Systems (Phase 2 of Protection Systems) (“SPS Project”)
- Project 2010-05.1 – Misoperations (Phase 1 of Protection Systems) (“Misoperations Project”)

### **Current Coordination Plan**

NERC has developed a preferred coordination plan for the above-mentioned projects that will properly align the development and implementation of the revised standards and definitions with the retirements of the legacy standards.

- 1) The EOP and UVLS Projects will progress simultaneously and coordinate necessary changes. Comment periods and ballots for each project will run concurrently or overlap.
- 2) The UVLS Project will progress simultaneously with the SPS definition revision by the SPS Project to assure the cohesive transfer of certain aspects of the legacy UVLS standards to the SPS standards. Comment periods and ballots for each project will run concurrently or overlap.
- 3) The UVLS Project will address the conforming changes needed to PRC-004 after PRC-004-3 is complete. How and when this will occur depends on when PRC-004-3 obtains approval from the ballot body and is adopted by the NERC Board of Trustees.

An illustrative diagram of this coordination appears on the next page. This plan is subject to change as necessary.

### **General Considerations**

The revised definition of SPS, the UVLS Project, and the EOP Project should be presented simultaneously to industry, the NERC Board of Trustees, and applicable regulatory authorities. The associated effective dates and retirements for these projects need to align to accommodate the needed transitions of standard coverage.

The implementation plan for the revised SPS definition will provide entities time to address any newly-identified SPS resulting from the application of the revised definition of SPS which will include centrally controlled undervoltage-based load shedding.

## Project 2010-05.2 Phase 2 of Protection Systems Revised Definition of Special Protection System

Ballot Now Open through July 25, 2014

### [Now Available](#)

A ballot for the **Revised Definition of Special Protection System/Remedial Action Scheme** is open through **8 p.m. Eastern on Friday, July 25, 2014.**

Background information for this project can be found on the [project page](#).

### **Instructions for Balloting**

Members of the ballot pools associated with this project may log in and submit their vote for the definition by clicking [here](#).

### **Next Steps**

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the definition. If the comments do not show the need for significant revisions, the definition will proceed to a final ballot.

For information on the **Standards Development Process**, please refer to the [Standard Processes Manual](#).

*For more information or assistance, please contact [Wendy Muller](#),  
Standards Development Administrator, or at 404-446-2560.*

## Project 2010-05.2 Phase 2 of Protection Systems Revised Definition of Special Protection System

### Ballot Results

#### [Now Available](#)

A ballot of **Revised Definition of Special Protection System/Remedial Action Scheme** concluded at **8 p.m. Eastern on Friday, July 25, 2014.**

The definition achieved a quorum but did not receive sufficient affirmative votes for approval. Voting statistics are listed below, and the [Ballot Results](#) page provides a link to the detailed results for the ballot.

| Ballot           |
|------------------|
| Quorum /Approval |
| 78.92% / 58.88%  |

Background information for this project can be found on the [project page](#).

### Next Steps

The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the definition and post it for an additional ballot. If the comments do not show the need for significant revisions, the definition will proceed to a final ballot.

For more information on the **Standards Development Process**, please refer to the [Standard Processes Manual](#).

| It is not clear what the status is of an RAS type system on nonBES facilities. For example a system that if installed at 230 kV would clearly be RAS, but is installed below 100kv. A system that only operates and protects nonBES facilities.  |

| Central Lincoln proposes the following be excluded: "Automatic transfer or system reconfiguration schemes intended to limit the extent and/or duration of outages; and not intended to benefit the BES." These systems operate similar to reclosing, in that they are intended to restore power quickly. Unlike reclosing, they may restore the power via an alternate path. We note the radial systems likely to benefit from auto-reconfiguration of load are unlikely to meet the BES definition, but the proposed definition of RAS has little dependency on the BES definition. The third RAS inclusion (Maintain acceptable System voltages) might be interpreted to include the auto-reconfiguration of load described above. |

| A single term will lead to a more consistent application of reliability standards.  |
| Yes   |
| The objective to "Meet requirements identified in the NERC Reliability Standards" improperly defines a NERC term by utilizing NERC requirements which can change over time. The purpose of this section is to describe the objectives of an RAS. An RAS is accomplished the objectives of adequate reliability. Those Standards and requirements that will apply to RAS will list RAS in their requirements. The final bullet in an RAS objective "Address other Bulk Electric System (BES) reliability concerns" is open ended. The previous bullets of voltage, stability, flows and Cascade are the hallmarks of adequate levels of reliability. To the existing definition of Special Protection System (Remedial Action Scheme), after "Such action may include changes in demand, generation (MW and Mvar)..." add the words HVDC power flows, FACTS device operating points,...  |
| Yes   |
| It is not clear why "unanticipated" was omitted from the first sentence of the definition. While it is true that at least in WECC most of the conditions its RASs detect are predetermined, in other regions that might not be the case and omission of the term creates a loophole that is not there now. A RAS is designed to respond to System Conditions that could happen. The schemes are developed in response to Planning Studies. Protection systems are not installed without considering the conditions that will activate them. First bullet: Have SPS/RAS requirements literally been identified in NERC standards, or is the intent that the SPS/RAS be applied so that the power system meets the performance requirements identified in the NERC reliability standards? Sixth bullet: What is a reliability "concern"? Wouldn't it be more accurate to say address other conditions that could otherwise result in failure to comply with reliability standards?  |
| No  |
| Regarding Item "c" (Undervoltage Load Shedding Programs [UVLS Programs]) of what does not individually constitute a RAS, UVLS Program must become an approved definition. Local undervoltage load shedding schemes that are not installed "to mitigate the risk of Cascading, voltage instability, voltage collapse, or uncontrolled separation resulting from undervoltage conditions" as defined in the draft PRC-010-1 should be excluded, therefore, "c. Undervoltage load Shedding Programs (UVLS Programs)" should be changed to "c. Automatic undervoltage load shedding schemes, including UVLS Programs. However, centrally controlled dispersed undervoltage load shedding schemes are RAS." An objective could be added to address centrally controlled Remedial Action Schemes. After the bulleted section, the sentence "The following do not individually constitute an RAS" could be read as implying that two or three of them taken together might constitute an RAS, which may or may not be the case. Suggest revising to read "The following do not individually, or combined in part or total, constitute a RAS." Please list UFLS and UVLS programs with the same capital letters and use of parentheses. |

| RAS is good – we agree with having one term and do not have a preference on which term is used.   |
| No Comments   |
| No Comments   |
| No  |
| Colorado Springs Utilities does not agree with the exclusion list in the proposed definition. We do not think that it is reasonable or prudent to create a comprehensive list of exclusions. There will always be just one more exception that will force us to continue to modify the list of exclusions. Also, if it is not explicitly defined as an exception then by default it is automatically included whether it could  |

affect reliability or not. The definition should clearly define what a RAS so as to include those schemes identified as essential to reliability. The only implicit exclusion we would recommend would be to exclude protection schemes that meet the definition of a RAS and are explicitly covered under other NERC reliability standards. Utilities would then use the definition to make sure that essential protection systems that meet the definition are included and document any further assumptions or judgement used in delineating between RAS and non-RAS schemes. Trying to micro-manage every possible exclusion or inclusion we think is not realistic and should not be necessary. If we do keep the exclusions list then we would offer the following suggestions on the current list of exclusions, and would anticipate a fairly steady flow of additions/modifications to this list moving forward. 1. Remove "automatic" from UFLS 2. Should we explicitly exclude GMD responses? Refer to EOP-010-1/TPL-007-1.

No

Tacoma Power supports FMPA's comments concerning Question 1.

No

No

No

Tacoma Power supports FMPA's comments concerning Question 4. Furthermore, additional clarification seems necessary for (e): "Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss-of-field, transformer top-oil temperature, high voltage, or overload to protect the Element against damage by removing it from service." Perhaps there could be another category for backing-up operator response and re-dispatch: "Locally sensing devices intended to mitigate thermal damage, within expected system re-dispatch response times, such as 10 minutes or greater. Examples are cooling fans, oil pumps, or thermal protection systems." Does the phrase "power system stabilizers" need to be explicitly added to (f)? In the FAQ document, on page 5 of 8, under "Schemes that automatically de-energize a line for a non-Fault operation when one end of the line is open," include something like the following two examples: (1) Opening the remote terminal(s) to remove an overload on the line in question following operation of the local terminal when there was no fault on the line in question and (2) opening the remote terminal(s) as a precaution against inadvertently closing back into a local island with generation.

No

Tacoma Power supports FMPA's comments concerning Question 5. Furthermore, in the FAQ document, on page 7 of 8, under "What are the Implementation Plan time frames," in the second paragraph, it should be 24 calendar months (or longer if the drafting team extends the timeframe) from the effective date (see page 6 of the Implementation Plan), not 24 calendar months beyond the date of approval by a governmental authority.

Individual

CenterPoint Energy

Yes

No

No

Yes

(a) CenterPoint Energy believes the use of the capitalized term "UVLS Programs" is appropriate based upon the currently posted definition of "UVLS Program" that is proposed in NERC Project

2008-02 Undervoltage Load Shedding PRC-010-1. (b) CenterPoint Energy suggests changing "Autoreclosing schemes" to "Automatic reclosing schemes" (item d) to be consistent with other NERC documents, such as, Reliability Standard PRC-005-3 Protection System and Automatic Reclosing Maintenance. (c) The extensive list of what is not a RAS appears to be well developed with thirteen schemes specifically identified. However, with the opening sentence currently stating "The following do not individually constitute a RAS", it appears to be a finite list that would require a revision of the definition to include other possible control schemes. To not limit the list, CenterPoint Energy recommends the opening sentence be changed to "The following are examples of schemes that do not constitute a RAS". (d) CenterPoint Energy is concerned that the use of the term "individually" in the opening sentence, which currently states "The following do not individually constitute a RAS", reduces the clarity and specificity of the definition. Without clarity, this could result in inconsistent application across regions. As an example, if an entity has both a UVLS Program on their system and FACTS devices at a few locations, are these installations now considered to be collectively a RAS as opposed to individually? Under the existing NERC definition for SPS that states "An SPS does not include (a) underfrequency of Undervoltage load shedding", there would not be any confusion that these installations are not RAS. Of the thirteen items on the exclusions list, there is only one example (item d for autoreclosing) in the project FAQ document that provides insight of the team's intention with the use of "individually". CenterPoint Energy suggests deleting the word "individually" by changing the opening sentence to "The following are examples of schemes that do not constitute a RAS". Alternately, it may be possible to develop additional wording in the definition to codify the intent of the use of the term "individually". In addition, CenterPoint Energy recommends that the project FAQ document include additional examples to help clarify the intent. As an alternative to the FAQ document, NERC could instead develop an Applications Guidelines document, with specific examples, for the definition of RAS.

No

CenterPoint Energy recommends implementing the proposed definition of RAS and retirement of SPS as soon as practicable to incorporate the clarifications and help provide consistent application across all regions more quickly. Instead of 12 months, we suggest the definition become effective the first day of the first quarter after needed approvals. As this change would impact the proposed implementation plan time frame for newly-identified RAS resulting from the revised definition, we suggest changing the proposed twenty-four (24) months to thirty-six (36) months after the Effective Date of the definition.

We recommend the following changes to the exclusions list a) through i), by item: e.) To simply include generator loss of field ignores many other generator protections for abnormal operating conditions. Revise this exclusions list to add the following: "Generator abnormal operating conditions listed in IEEE C37.102." (Or, list each individually, that is, "loss of field, unbalanced currents, loss of synchronism, overexcitation, motoring, over/under-voltage, and abnormal frequencies.") f.) This exclusion needs clarification. Does the clause "controllers that switch or regulate..." apply only to "series or shunt reactive devices", or does it extend to the rest of the items in this list? We suggest that the term "switch or regulate" creates ambiguity. We suggest simply using the term "controls ". Any controls for the various equipment listed should be excluded from being RAS. We also suggest that generator turbine controls be added to this list. j.) We propose that the SDT add a new item after item i), to include "Schemes that automatically shutdown a generator upon load rejection."

| With the statement in the definition of "but are not limited to", and the first of the inclusions of "Meet requirements identified in the NERC Reliability Standards", there is no real limit on the scope of the definition. Also, the last inclusion "Address other BES reliability concerns" looks like a catchall inclusion that could be applied after the fact. This is not so black and white when talking about a definition of a RAS. There needs to be categorization and guidance for the industry to determine their own situations. Not all RAS (in the proposed definition) are equally critical to reliability of the BES.  |

| Joe DePoorter  |
| Yes  |
|  |
| Yes  |
|  |
| Yes  |
| The definition as drafted includes use of Bulk Electric System in some places and not in others. Assuming the RAS that are covered under this standard are only those in the BES, the following changes are suggested to clarify this: A scheme designed to detect predetermined Bulk Electric System (BES) conditions and automatically take corrective actions that may include, but are not limited to, curtailing or tripping BES generation or other BES sources, curtailing or tripping load, or reconfiguring a System(s). RAS accomplish one or more of the following objectives: • Meet requirements identified in the NERC Reliability Standards; • Maintain BES stability; • Maintain acceptable BES voltages; • Maintain acceptable BES power flows; • Limit the impact of BES Cascading; or • Address other BES reliability concerns To eliminate any doubt that the text used in |

NERC Reliability Standards properly applies to only BES Remedial Action Schemes. The NSRF recommends establishing a RAS Definition that applies explicitly to the BES. This objective could be accomplished by defining it as a "BES Remedial Action Scheme" and replacing the references to "System" with "BES". The existing references in the proposed RAS Definition to "System or Systems" apply more broadly to non-BES transmission systems and distribution systems.

No

The NSRF suggests: Item c – Consider rewording to better show the correlation to Item b by including the adjective 'automatic', with text like, "Automatic Undervoltage Load Shedding Programs (UVLS Programs) Item f – consider adding ". . . and controllers that . . ." to the middle of the item for improved readability. Item h – Consider using wording more aligned with Item g, such as ". . . remotely switch static shunt reactive devices for voltage regulation . . .". Otherwise consider wording like, "remotely switch static shunt inductors or static shunt capacitors for voltage regulation . . .".

Since the terms were defined the same and referenced each other, there is no need for the change. However, there is no harm in making the change either.

No

No

No

Exclusion "e." is too broad. There are instances where an overcurrent device that opens a line should be considered a RAS. As currently written, these schemes would fall under exclusion "e." and would no longer be considered RAS. Exclusion "j." should be limited depending on the size of the island, as determined by the Reliability Coordinator. For example, in some areas 800 MW may be small for a single dedicated facility, but in other areas, an 800 MW island could be substantial. Exclusion "m." should be limited to SSR protection schemes that act solely at the same station. It should read: "Sub-synchronous resonance (SSR) protection schemes that directly detect and act solely at the same station depending on sub-synchronous quantities (e.g. currents or torsional oscillations)." Another exclusion ("n.") should be added to exclude schemes that are specifically designed to restore load (often called load throw-over schemes) so that they are not considered RAS. An example of this is a 115-kV line that has load tapped off the middle. After a fault on the line, switches automatically open up at the tapped station and each end of the 115 kV line tries to pick up the load. The unfaulted end of the line will restore the load, and the faulted end will trip out and remain open. However, we do not believe that schemes which are taking actions such as automatic network reconfiguration to reenergize equipment that was tripped as a result of fault clearing which is not restoring load should be excluded.

No

24 months will be needed due to all the changes in documentation that will be required to address the revised definition.

|   |
| Individual  |
| Michelle DAntuono   |
| Ingleside Cogeneration LP   |
| No  |
| Ingleside Cogeneration LP (ICLP) believes that the second draft of the definition of a RAS is too open ended. Two modifications have been made to the base definition of a RAS that infer that almost any Protection System not specifically identified in the list of exclusions is in scope. First, the removal of the qualifier that RAS takes corrective action "other than the isolation of faulted elements" adds almost every relay scheme back into the equation. ICLP sees no good reason for its deletion – if there are such systems that isolate faulted elements and need RAS-like oversight, they should be explicitly listed. Second, the bulleted list under the base definition includes a catchall that stipulates that a RAS may address "other Bulk Electric System (BES) reliability concerns." We have seen ambiguous statements of this type lead to Regional variations, and have watched the original intent vary over time. As such, the item should be removed. In ICLP's view, the project team's decision to eliminate the four categories of RAS by function and extent of impact was also a step backwards. Several Regions have made similar distinctions of this type in order to account for variations in the most appropriate oversight methods – a tactic that has proven to be very effective. Furthermore, our reading of the stakeholder comments indicates that most respondents were comfortable with the concept, but had various concerns that were easily accommodated. As such, ICLP believes that the deferral of those distinctions to the individual NERC standards is too unstructured, and that the four original categories should be retained. |
| No  |
|   |
| Yes   |
| The exclusions proposed by the drafting team are comprehensive and precise – and the bulleted list of "inclusions" under the base definition of RAS must be as well. In the original definition, such descriptors included those RAS whose loss or malfunction would lead to "Non-Consequential Load Loss $\geq$ 300 MW", "Aggregate resource loss (tripping or runback of generation or HVdc) > the largest Real Power resource within the interconnection", "Loss of synchronism between two or more portions of the system each including more than one generating plant", and "Negatively damped oscillations". ICLP is not sure why specifics like this were removed to begin with – and we believe it is the responsibility of the drafting team to provide the rationale, not the industry.  |
| No  |
| If the core definition is not modified as ICLP proposes in response to Question 1, we believe that an exclusion must be made for a protective scheme that takes corrective action "other than the isolation of faulted elements". Without it, a relay owner will have to demonstrate to a CEA that they individually considered almost every relay system before determining that it is not a RAS. If there are such systems that isolate faulted elements and need RAS-like oversight, they can be explicitly listed under the core definition.  |
| Yes   |

No

The objectives do not belong in a definition of RAS. These objectives are a restatement of the NERC defined term "Reliable Operation" which is the objective of all Reliability Standards. . These are too broad and will cast to wide a net. "Meet the requirements identified in the NERC Reliability Standards" could include standards that are not developed yet. A RAS should only be a RAS if it solves a reliability violation for a specific contingency (not a generic "System condition") of the type stated in TPL-001-4 or its successor standard. Additionally, we are not sure if it should be a RAS if it only solves "extreme" events in the TPL standards since the label of RAS takes away incentive to mitigate problems.

No

From item "f", strike the term "and that are located at and monitor quantities solely at the same station as the Element being switched or regulated." Why does it make a difference whether the controller is local or remote? The advent of high-speed phase measurement units (PMUs) and faster computer systems will eventually allow wide area control. This will become essential as the customer's load characteristic evolves (less voltage and frequency dependency means local PSSs will be less effective). We are concerned that the definition in general will hamper innovation. Right now there are schemes that control LTC's and capacitors to minimize losses. Certainly these are not RAS. There are EMS controls such as what PJM uses that dispatch generation precontingency to avoid overloads/voltage problems. These are not RAS either. Eventually computer EMS systems will become fast and robust enough to drop load or reconfigure the system so quickly that wide area blackouts will be virtually eliminated. Recall that only 500 MWs of load drop would have stopped the

|   |
|---|
| 2003 blackout. Therefore wide area systems that generically react to problems (not designed for a single specific contingency (if line A opens, do xyz action)) should not be RAS.  |
| Yes   |
| Group   |
| Seattle City Light  |
| Paul Haase  |
| Yes   |
| No  |
| Seattle appreciates the efforts of the drafting team to be complete, but has concern with a definition that is primarily a negative definition, i.e. a definition of what a RAS is NOT. If such an approach is deemed the most practical, Seattle recommends that a general item be added to the list of what a RAS is not, such as "n. any other scheme that does not automatically act to maintain System performance or BES reliability on a wide area." The point is to have a general item that entities or auditors could point to, in the likely case that additional non-RAS schemes are identified that do not fall within the 13 "these are not a RAS" items identified so far.   |

| Manitoba Hydro  |
| Yes   |
| Manitoba Hydro agrees that using a single term is the preferred approach. However, the proposed definition of "Remedial Action Scheme" is not clear. For example, it is not clear what "curtailing or tripping generation or other sources" means. Does it mean generation (real power) only but not reactive power? What does "other sources" refer to? The single term will take time getting used to in some regions that are used to SPS. However, there has always been confusion between protection systems and special protection system. A remedial action scheme is a better term.   |
| No  |
| No  |
| No  |
| 1. In the exclusion list a), it is not necessary to include power swing blocking 2. In the exclusion list e), it is not clear what "high voltage" here is intended to mean, does it mean overvoltage protection? Consider revise this as: "Schemes applied on an Element that react to non-Fault conditions, such as, but not limited to, generator loss-of-field protection, transformer top-oil temperature monitoring and protection, overvoltage protection, or overload protection to protect the Element itself against damage by removing it from service" 3. In exclusion list f), "switch or regulate" needs clarification, for example, what does "switch or regulate generation excitation" mean? Is converting a unit from a generator to a synchronous condenser considered as switching of generation excitation? Also, "at the same station" needs clarification. For example, if a generator switching station is less than 1 km away from its generating station, can they be considered as the same station? 4. The exclusion list covers transmission elements very well. One special transmission element missing is a braking resistor. Is use of a braking resistor a RAS or a permissible element used to maintain stability? Braking resistors are somewhat uncommon and could fall under the RAS definition. One special generator feature could be included in the exclusion list – fast valving. Fast valving is a common method used in steam turbines to improve stability and avoid generator tripping. |

| Exception "c" of the proposed definition of RAS excludes "UVLS Programs". The background information provided in the FAQ document suggests that the intent of using the term "UVLS Program" in this exclusion was to exclude UVLS schemes that are not centrally controlled. The Project 2008-02 Undervoltage Load Shedding drafting team states in their June 24, 2014 FAQ that UVLS schemes owned by Transmission Owners, Distribution Providers, or Transmission Operators but not required by the planners do not meet the attributes of the proposed defined term "UVLS Program" and are therefore not subject to the requirements of PRC-010-1. This raises uncertainty as to whether such schemes, even if not centrally-controlled, are RAS, UVLS Programs, or neither. Please clarify whether exception "c" of the proposed definition of RAS would include a non-centrally- |

controlled UVLS scheme owned by a Transmission Owner, Distribution Provider, or Transmission Operator but not required by the Planning Coordinator or Transmission Planner, which is therefore not covered by the Project 2008-02 revisions to PRC-010. Exelon contends that such a scheme should not be considered a RAS.

AEP agrees with the concept of using a single term, and believes the project team is off to a good start in its development. AEP offers the following comments for continued improvement... It is unclear from the proposed definition and associated exclusions list whether automatic load rejection (ALR) of a generating unit is considered to be a Remedial Action Scheme. Our negative vote is driven solely on the lack of certainty surrounding this applicability of the definition. The qualifier "BES" should be incorporated into the definition as follows... Maintain \*BES\* System stability; Maintain acceptable \*BES\* System voltages; Maintain acceptable \*BES\* power flows; Limit the impact of \*BES\* Cascading; or

No

Once again, AEP believes the drafting team has done well in developing their exclusions list. As stated previously however, AEP believes it is unclear from the proposed definition and associated exclusions list whether automatic load rejection (ALR) of a generating unit is considered to be a Remedial Action Scheme. AEP believes that ALR is not an RAS and should be explicitly excluded in definition to avoid confusion.

Yes

No

Also, see SPP group comments The FAQ document states: "The classification of a RAS is not necessary for defining whether or not a scheme qualifies as a RAS. Informal feedback from many stakeholders indicated uncertainty about the classification types. Therefore, the SDT decided not to include RAS classification types within the definition. The classifications are more appropriately addressed concurrently with revisions to the RAS-related Reliability Standards." It appears the RAS classification types that are to be included in the RAS reliability standards will be a significant change that needs to be clarified before a full identification of RAS schemes and subsequent design requirements can be accurately completed if they are to be used. If other NERC standards must be updated or rewritten such as PRC or TPL standards in conjunction with this definition to clarify classification changes it is recommended the implementation plan specify that the proposed definition implementation not become effective until or following the most critically related RAS standards that would be updated in order to avoid confusion how the definition relates to existing or as yet un-revised standards. The FAQ document states "The Implementation Plan also provides owners of newly identified RAS twenty-four (24) calendar months beyond the date of approval by a

governmental authority to be fully compliant with all standards applicable to the revised definition of Remedial Action Scheme. The drafting team contends that twenty-four (24) calendar months provides the RAS owner sufficient time to become compliant with the revised standards proposed in the implementation Plan." If it is possible the RAS definition may include new schemes or require complete redundancy modifications near large generating plants that have long outage schedules due to any classification changes it seems the 2 year implementation time frame could be too short. It seems a minimum of 4 to 6 years for an implementation time frame would be more logical for modification changes based on the possible classification types. This would reduce the risk of unplanned or additional generation outages in order to meet this standard.

ReliabilityFirst

Yes

Yes

ReliabilityFirst submits the following comments for consideration: 1. Item k. "Automatic sequences that proceed when manually initiated solely by an operator" a. ReliabilityFirst is aware of a current RAS for a large generation plant in which the RAS can be armed/de-armed by a system operator. In the cases where this RAS is armed, we would consider this to be a RAS, applicable to any associated NERC Reliability Standards. ReliabilityFirst questions whether it is the intent of item "K" to exclude these types of schemes as a RAS. If so, what is the technical justification/basis for such exclusion? b. The term "operator" is undefined and may be left to interpretation. ReliabilityFirst recommends using the NERC Glossary of Terms definition of "System Operator" to further clarify the term "operator".

| An objective of this project is to create a RAS definition and to eliminate the need for an SPS definition. Somewhere, that should be clarified.   |
| No   |
| The Omaha Public Power District (OPPD) believes that the exclusion list needs to be further clarified to state that the EMS/SCADA related schemes are not part of the RAS. Currently, this concern is addressed in the associated FAQ document; however, this document is not going to be part of the RAS Definition going forward. OPPD is concerned that lack of this clarity in the definition may cause inadvertent inclusion of schemes/systems that traditionally are not identified as RAS or SPS.  |

| While we agree with the desire to have a single term, both the proposed name "Remedial Action Scheme" (RAS) as well as the alternative term "Special Protection System" (SPS) seems to have issues. The definition does not say anything about how the action is accomplished. A problem we have is that, of the two names, "Remedial Action Scheme" seems to be worse, because a scheme usually mitigates a condition, but it does not usually remedy it. Strictly speaking, it performs a trade-off by substituting one abnormality, such as an open line or severed interconnection, for another, such as a thermally overloaded line. We are not arguing for one term or the other, but it is critical that the various terms be applied correctly and consistently. Further, the term "Special Protection System" at least implied that it took automatic action, whereas the term "Remedial Action Scheme" does not. A system operator operating a circuit breaker by remote control is a remedial scheme, but we do not think it falls under the scope of what is intended. Although the provision that it be automatic is included within the definition, it might be helpful to include it in the title as is done with underfrequency load shedding. |

| Part c. of Exclusions lists "Undervoltage Load Shedding Programs (UVLS Programs)". The definition of "UVLS Programs" needs to be clarified up front in the same space as the RAS definition. 1. The distinction between "centrally controlled UVLS" being included as part of the RAS definition and "locally controlled UVLS" not included in RAS Definition should be reclarified here. 2. The distinction between UVLS Program schemes and UVLS schemes that are not part of the entity "UVLS Program" also needs to be spelled out. For one intimately familiar with NERC standards, the information is available, but items 1. and 2. should be clear for a reader with somewhat limited knowledge of other standards. For example, engineers need to follow the NERC standards in their work, but may not be intimately familiar with other NERC standards, guidelines and definitions.  |

| Patti Metro  |
| NRECA  |
| Yes  |
| Although NRECA agrees that using the single term RAS can provide clarity in the forty-three (43) standards utilizing the term, the proposed RAS definition creates a conflict with the applicability sections in the PRC-005-2 and PRC-005-3 standards. In these standards, the applicability 4.2.4 states "Protection Systems installed as a Special Protection System ...", but the proposed definition of a RAS explains that a RAS is no longer a "Protection System". With the proposed definition, PRC-005-2 and PRC-005-3 will not be applicable to a RAS. If these standards are meant to be applicable to the a RAS, then the applicability and possibly the associated requirements and tables included in PRC-005-2 and PRC-005-3 will require further revision rather than simply replacing SPS with RAS. NRECA recommends that the drafting team revisit the intent of designating that a RAS is not a "Protection System" which will require a thorough review of the standards to determine if a substitution creates a reliability gap by changing the intent of the modified standards. |
|  |

|   |
|---|
| No  |
| Although NRECA does not believe that Automatic Generation Control (AGC) is a Remedial Action Scheme (RAS), the definition of AGC includes "automatically adjusts generation" which for some NRECA members is implied in the "curtailing generation" language included in the RAS definition. For clarity, consider including AGC in the list of exclusions.   |

|--|
| Group  |
| Tennessee Valley Authority   |
| Brandy Spraker   |
| No   |
| We agree that using a single term should help bring the industry toward a common understanding/usage of the term. However, we believe the revised draft definition fails to add the desired clarity. We suggest the following modification: "A control scheme designed and installed to detect pre-analyzed System conditions and automatically perform corrective actions that may include, but are not limited to, curtailing or tripping generation or other sources, curtailing or tripping load, or reconfiguring a System(s). RAS accomplish one or more of the following objectives: <ul style="list-style-type: none"> <li>• Meet requirements identified in the NERC Reliability Standards;</li> <li>• Maintain System stability, as related to the NERC Reliability Standards;</li> <li>• Maintain acceptable System voltages, as related to the NERC Reliability Standards;</li> <li>• Maintain acceptable power flows, as related to the NERC Reliability Standards; or</li> <li>• Limit the impact of Cascading, as related to the NERC Reliability Standards.; or</li> </ul> DELETED: Address other Bulk Electric System (BES) reliability concerns. |
| No   |
|  |
| Yes  |
| The bulleted list of objectives fails to enhance clarity, and could in fact increase the uncertainty around RAS. Bullets 2-6 can be interpreted to cover objectives beyond NERC Reliability Standards, when taken in context with the first bullet. The scope of the definition should be limited to applications that are relevant to the NERC Reliability Standards in which the term is used. See proposed modifications under question 1 response.   |
| Yes  |
| We think it's appropriate to address exclusions, however when the exclusion list is this long (and perhaps growing) it highlights the challenge in developing a good base definition for what constitutes a RAS NERC-wide. An alternative would be to "catalog" the RAS exclusions in a separate NERC reference document that could be revised without revising the base RAS definition.   |
| Three years seems like a reasonable implementation period (a 1 year period for the definition to go into effect and a 2 year period for any existing scheme pulled into the definition to be brought into compliance). However, with 38 additional standards to be revised, this could entail more work than anticipated to ensure full compliance with each one under the new definition.   |
| Individual   |
| Richard Pienkos  |
| Consumers Energy Company   |
| No   |
| In general, we are encouraged with the redefinition of this scheme especially with the added clarity and emphasis on identifying that they are not Protection schemes but may share components. However, it is a little unclear if the intent of this definition was to define a term specifically for schemes applicable only to the BES or is the intent to have a broader definition and then restrict its applicability when used in each standard. To illustrate this point, in the first paragraph, the term "System" is used which in itself does not refer only to the BES. Yet in the list the objectives the RAS is to accomplish, the first item (Meet requirements identified in the NERC Standards) and the last item (address other BES reliability concerns) specifically refer to the applicability on the BES.  |
| Yes  |
| If the intent was indeed to have this definition apply only to the BES, then we suggest the additional clarifications since many companies may have similar schemes on non-applicable systems: A scheme designed to detect predetermined System conditions on the BES and automatically take corrective actions that may include, but are not limited to, curtailing or tripping generation or other sources, curtailing or tripping load, or reconfiguring a System(s). RAS accomplish one or more of the following objectives: <ul style="list-style-type: none"> <li>• Meet requirements identified in the NERC Reliability Standards;</li> <li>• Maintain BES System stability;</li> <li>• Maintain acceptable BES System voltages;</li> <li>• Maintain acceptable BES power flows;</li> <li>• Limit the impact of Cascading on the BES; or</li> <li>• Address other Bulk Electric System (BES) reliability concerns.</li> </ul>   |

|  |
|--|
| Yes  |
| If the intent was indeed to have a broader definition and then restrict its applicability when used in each standard, then we suggest the following clarifications: A scheme designed to detect predetermined System conditions and automatically take corrective actions that may include, but are not limited to, curtailing or tripping generation or other sources, curtailing or tripping load, or reconfiguring a System(s). RAS accomplish one or more of the following objectives: • Meet requirements identified in the NERC Reliability Standards; • Maintain System stability; • Maintain acceptable System voltages; • Maintain acceptable power flows; • Limit the impact of Cascading; or • Address other Bulk Electric System (BES) reliability concerns. Then each standard using this term would state something like "...an RAS used to address BES reliability..." to help define applicability in each standard.   |
| No   |
| We recommend that the first more restrictive definition that applies only to the BES be adopted. If this were done, then we would vote affirmative for this definition.  |

| Shannon V. Mickens  |
| Yes   |
| The single term 'RAS' reduces the confusion and ambiguities that the current interchangeable terms 'SPS/RAS' have created for the industry.   |

|  |
|--|
| Yes  |
| We have a concern in reference to the term 'curtailed' being used in the revised definition. Our thought process associates 'curtailed' with the tagging process. The group suggests the term 'reduce' for it seems more fitting with the terms 'tripping of generation or load'.  |
| No   |
| We would suggest the removal of the first bullet 'Meet requirements identified in the NERC Reliability Standards' from the definition because the RAS shouldn't be implemented in reference to a particular Standard but for the operational needs of the system. Also, we recommend the removal of the last bullet 'Address other Bulk Electric System (BES) reliability concerns' to avoid the lack of clarity that was an issue with the original 'SPS/RAS' definition including it leaves the definition too open to interpretation.   |
| No   |
| The distinction between distributed and central controlled UVLS systems is not clear in the definition. The clarification is contained in the supporting documentation for the definition but requires extensive efforts to dig it out. We suggest the drafting team revise exclusion C in the proposed definition to provide more clarity.  |
| No   |
| We suggest extending the time frame from twenty-four (24) months to thirty-six (36) months. There are many elements that have to be considered when establishing a new RAS. For example, identifying new facilities/equipment, budgeting, outage coordination and receiving necessary approvals will require large amounts of time. We would like to commend the SPS SDT on the quality of the documents in this posting. We did not find a single typo/grammatical error that are so typically present in these postings. Well done and thank you.  |

| (1) We agree with the need to modify the existing definition of SPS and RAS and that use of a single term will result in more consistent application of the standards. Furthermore, we are supportive of moving away from the SPS term to the RAS term to avoid confusion with Protection Systems and to more accurately reflect the intended purpose. The current definition lacks specificity, which leads to inconsistent application among the various NERC regions. We also note that the proposed changes have improved the RAS definition by removing some ambiguity. However, we believe there continues to remain to significant items of ambiguity that need to be addressed. Those are discussed below. (2) Use of the term "meet requirements identified in the NERC Reliability Standards" is ambiguous which will lead to inconsistent enforcement. Would this clause apply to any standard or is it intended primarily to apply to TPL standards? Does this require the owner of the RAS to document for which standards the RAS is installed? For a newly installed RAS, this might be easy but there could be disagreement over the purpose of the installation of existing RAS especially those that have been installed for a decade or more. We recommend removing the phrase from the definition. If the phrase persists, please identify specific standards and requirements in the technical guideline section for clarity. (3) Use of the term "address other Bulk Electric System (BES) reliability concern" is vague and ambiguous which will only lead to inconsistent enforcement. What other reliability concerns could there be besides system stability, system voltages, power flows, and Cascading that would not be excluded. Protecting equipment from damage would be one reliability concern that does not specifically fit into one of the categories but any schemes associated with protecting equipment from damage would be excluded by exclusion e. or excluded because they are Protection Systems. We simply cannot come up with any additional examples that warrant inclusion of such an ambiguity. We suggest the drafting team remove this phrase to remove the ambiguity. If there are other reliability concerns for which a RAS may be installed that do not fit into one of the five other buckets, then additional specific buckets should be added to avoid ambiguity. (4) "Relay" or "control" should be inserted just before scheme in the definition to provide additional clarity over what type of scheme is involved. (5) PRC-005-2 and PRC-005-3 will require further revision to the applicability section 4.2.4 other than simply replacing SPS with RAS to avoid ambiguity. The proposed definition of RAS specifically states that "these schemes are not Protection Systems." However, applicability section 4.2.4 states that it is applicable to "Protection Systems installed as a |

|  |
|--|
| Remedial Action Scheme (RAS)" which directly conflicts with the definition. One could argue that PRC-005-2 and PRC-005-3 are then never applicable to a RAS once the new definition is approved since it is very specific that they are not Protection Systems.  |
| No   |
| We cannot identify any.  |
| No   |
| (1) We do not believe any additional objectives are necessary and believe that two objectives should be removed as discussed below. (2) Use of the term "meet requirements identified in the NERC Reliability Standards" is ambiguous which will lead to inconsistent enforcement. Would this clause apply to any standard or is it intended primarily to apply to TPL standards? Does this require the owner of the RAS to document for which standards the RAS is installed? For a newly installed RAS, this might be easy but there could be disagreement over the purpose of the installation of existing RAS especially those that have been installed for a decade or more. We recommend removing the phrase from the definition. If the phrase persists, please identify specific standards and requirements in the technical guideline section for clarity. (3) Use of the term "address other Bulk Electric System (BES) reliability concern" is vague and ambiguous which will only lead to inconsistent enforcement. What other reliability concerns could there be besides system stability, system voltages, power flows, and Cascading that would not be excluded. Protecting equipment from damage would be one reliability concern that does not specifically fit into one of the categories but any schemes associated with protecting equipment from damage would be excluded by exclusion e. or excluded because they are Protection Systems. We simply cannot come up with any additional examples that warrant inclusion of such an ambiguity. We suggest the drafting team remove this phrase to remove the ambiguity. If there are other reliability concerns for which a RAS may be installed that do not fit into one of the five other buckets, then additional specific buckets should be added to avoid ambiguity. (4) Because schemes could be interpreted to include AGC and excitation systems, the objectives could also inadvertently result in AGC or excitation systems being classified as RAS. AGC ultimately is required to meet several requirements in the BAL standards and excitation systems are used to control a generator's reactive power output to maintain an acceptable voltage schedule. Thus, both AGC and excitation systems support at least one of the objectives of the RAS definition. These objectives should ultimately be evaluated more closely. At the very least, AGC and excitation systems should be included in the exclusions list. |
| Yes  |
| We agree that the exclusion list is very detailed and helpful.   |
| Yes  |
| We agree with the time frame of 12 months after regulatory approval for the effective date of the standard. We also agree with the time frame for application of standards to newly identified RAS which is 24 months after the revised definition for newly identified RAS.   |

| Gul Khan   |
| Oncor Electric Delivery LLC  |
| No   |
| Oncor disagrees with using RAS as a replacement for SPS. A SPS is used within ERCOT as an automatic system designed to detect abnormal or pre-determined ERCOT System conditions and take pre-planned corrective action. This term applies to and is referenced in numerous guides, procedures and protocols. Additionally the RAP (Remedial action plan) term is used in ERCOT and includes "controllable load shedding by dispatcher or ERCOT action." ERCOT's RAP's are predefined but not automatic and are used frequently within the system to maintain reliability under various operating conditions. Updating the various processes and procedures and training all the ERCOT TOPs on the new term will be a challenge and could cause significant confusion. The term SPS should not be based upon normal operational schemes like a RAS. These are "special" systems designed to maintain reliability until solutions can be added to remove or "exit" their changes. We also anticipate other reliability coordinators having to go through a similar effort in regards to the SPS terminology change.   |
| No   |

The SPS definition should be implemented as soon as possible the way it was originally developed by the NERC System Analysis and Modeling Subcommittee (SAMS) and approved by NERC OC PC. SAMS took several years developing the definition and getting approvals.

No

Yes

Yes

The RAP and SPS definition are already being used within ERCOT and apply to and are referenced in numerous guides, procedures and protocols. Many of ERCOT's RAP's are not automatic and are used frequently within the system to maintain reliability under various operating conditions. Updating SPS to the new term RAS through ERCOT's process of revising their documents will not only be a significant challenge but could also cause confusion with the RAP term.

PacifiCorp

Sandra Shaffer

Yes

No

Yes

To clarify the intent of the proposed definition of Remedial Action Scheme, PacifiCorp recommends inserting Bulk Electric System into the first sentence as follows: "A scheme designed to detect predetermined Bulk Electric System conditions and automatically take corrective actions that may include, but are not limited to, curtailing or tripping generation or other sources, curtailing or tripping load, or reconfiguring a System(s)."

No

The proposed RAS definition will result in a significant expansion of the number of schemes that meet the criteria for classification as a RAS. In many instances, this expansion will not result in an improvement in Bulk Electric System reliability, and will unnecessarily complicate analysis of transmission system reliability. PacifiCorp recommends that the drafting team consider expansion of the exclusion list to include transfer- or cross-trip schemes that are located within a single substation. This exclusion would encompass schemes that operate from relays contained within substation apparatus to trip additional system elements other than those that are directly monitored by the relays with no additional logic or communications. As these schemes may be modeled with simple contingency definitions, PacifiCorp does not believe that their inclusion in the definition of RAS will provide any additional benefit for system reliability purposes. As stated in previous comments submitted to the drafting team by PacifiCorp on April 9, 2014, many common protection schemes that utilize breaker status contacts or lockout contacts to transfer trip multiple elements within a substation will meet the new SPS definition, despite limited potential impacts to the Bulk Electric System. For example, consider a scheme that utilizes a status contact on a line breaker to transfer-trip a shunt capacitor within the substation in conjunction with line tripping. In this example, the scheme is contained within the substation, and does not utilize any arming logic. The intent of the example scheme is to provide fast shunt device tripping and to provide additional redundancy for the shunt device voltage control. Under the draft definition, this scheme would meet the RAS criteria, as the shunt capacitor control is not based on locally-sensed voltage and system elements are tripped for a reason other than facilitation of fault clearing. Tripping of the capacitor could easily be modeled with a single line of code in a contingency definition, with the same results for system analysis and reliability purposes as inclusion in RAS databases. As such, this scheme and similar schemes that cross-trip various system elements within a single substation should have a specific exclusion in the proposed RAS definition. In addition, PacifiCorp recommends one specific change to the list of RAS exclusions. Exclusion "e" should include an Element in series as follows: "Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss-of-field, transformer top-oil temperature, high voltage, or overload to protect the Element or

|   |
|---|
| series Element against damage by removing it from service." It may be simpler and less costly to remove an Element in series with the overloaded Element rather than the overloaded Element itself.   |
| Yes   |
| Individual  |
| Sergio Banuelos   |
| Tri-State Generation and Transmission Association, Inc.   |
| Yes   |
| Although Tri-State agrees that using the single term RAS can provide clarity in the forty-three (43) standards utilizing the term, the proposed RAS definition creates a conflict with the applicability sections in the PRC-005-2 and PRC-005-3 standards. In these standards, the applicability 4.2.4 states "Protection Systems installed as a Special Protection System ...", but the proposed definition of a RAS explains that a RAS is no longer a "Protection System". With the proposed definition, PRC-005-2 and PRC-005-3 will not be applicable to a RAS. If these standards are meant to be applicable to the a RAS, then the applicability and possibly the associated requirements and tables included in PRC-005-2 and PRC-005-3 will require further revision rather than simply replacing SPS with RAS. Tri-State recommends that the drafting team revisit the intent of designating that a RAS is not a "Protection System" which will require a thorough review of the standards to determine if a substitution creates a reliability gap by changing the intent of the modified standards |
| No  |
| No  |
| No  |
| Although Tri-State does not believe that Automatic Generation Control (AGC) is a Remedial Action Scheme (RAS), the definition of AGC includes "automatically adjusts generation" which for some may be implied in the "curtailing generation" language included in the RAS definition. For clarity, consider including AGC in the list of exclusions  |

# Consideration of Comments

## Project 2010-05.2 – Special Protection Systems (Phase 2 of Protection Systems)

The Special Protection Systems Drafting Team thanks all commenters who submitted comments on the proposed definition of Remedial Action Scheme (RAS). These standards were posted for a 45-day public comment period from June 11, 2014 through July 25, 2014. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 53 sets of comments, including comments from approximately 159 different people from approximately 110 companies representing all 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's [project page](#).

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Director of Standards, Valerie Agnew, at 404-446-2566 or at [valerie.agnew@nerc.net](mailto:valerie.agnew@nerc.net). In addition, there is a NERC Reliability Standards Appeals Process.<sup>1</sup>

### Summary of Changes

#### Definition:

Changed the phrase “curtailing or tripping generation or other sources” to “adjusting or tripping generation (MW and Mvar)”

Changed the phrase “curtailing or tripping load” to “tripping load”

Changed the introductory sentence to the objectives from: “RAS accomplish one or more of the following objectives” to “RAS accomplish objectives such as” because the objective list is no longer all inclusive

Inserted “Bulk Electric System” (BES) as a qualifier in the pertinent objectives

Removed the last objective: “Address other Bulk Electric System (BES) reliability concerns” because it was deemed overly broad.

---

<sup>1</sup> The appeals process is in the Standard Processes Manual:  
[http://www.nerc.com/comm/SC/Documents/Appendix\\_3A\\_StandardsProcessesManual.pdf](http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf)

Revised the fifth objective to read: “Limit the impact of Cascading or extreme event”

Removed the sentence: “These schemes are not Protection Systems; however, they may share components with Protection Systems.”

Added a new exclusion “a” that reads: “Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating the faulted Elements”

Combined exclusions “b” and “c” to read: “Schemes for automatic underfrequency load shedding (UFLS) and automatic undervoltage load shedding (UVLS) comprised of only distributed relays”

Changed exclusion “d” from “Autoreclosing schemes” to “Automatic Reclosing schemes” to be in alignment with Reliability Standard PRC-05-3

In exclusion “e”, changed the term “high voltage” to “overvoltage”

In exclusion “f”, removed the term “generation excitation”

In exclusion “k”, replaced “operator” with the defined term “System Operator”

Added a new exclusion “n” that reads: “Generator controls such as, but not limited to, automatic generation control (AGC), generation excitation [e.g. automatic voltage regulation (AVR) and power system stabilizers (PSS)], fast valving, and speed governing”

### **Implementation Plan:**

Updated to add a specific Effective Date for PRC-024-1

Removed standards that are currently in implementation phase (these standards will be modified at a later date)

Removed retirement of “Special Protection System” (SPS) (the SPS definition will be needed until all references to SPS can be replaced with “Remedial Action Scheme” (RAS))

### **Background and FAQ:**

The Background and FAQ document was updated to reflect the changes and additions made to the proposed definition.

**Unresolved Minority Views:**

A few commenters questioned the general formatting of the definition and the need for an exclusion list.

The drafting team explained the definition must be broad enough to include the variety of System conditions monitored and corrective actions taken by RAS. Because of the diversity of RAS in both action and objective, the practical approach to the definition is to begin with a wide scope and then list specific exclusions. Without the exclusions, equipment and schemes that should not be considered RAS could be subject to the requirements of the RAS-related NERC Reliability Standards. The exclusion list also assures that commonly applied protection and control systems are not unintentionally included as RAS. Note, if a scheme or protective system is not explicitly defined as an exclusion, it is not by default a RAS - the definition of RAS must be met in its entirety.

**1. Do you agree that using a single term; i.e., RAS, and clarifying its definition will lead to more consistent application of the related NERC Reliability Standards? If not, please provide specific suggestions and rationale .....16**

**2. Are there additional corrective actions that should be explicitly included in the proposed definition of RAS? If yes, please provide specific suggestions and rationale. ....31**

**3. Are there additional objectives that should be explicitly included in the proposed definition of RAS? If yes, please provide specific suggestions and rationale. ....39**

**4. Do you agree with the exclusion list in the proposed definition of RAS? If not, please provide specific suggestions and rationale.....50**

**5. Do you agree with the time frames in the proposed Implementation Plan associated with the proposed definition of RAS? Please provide specific comments in support of your position. ....72**

**The Industry Segments are:**

- 1 — Transmission Owners
- 2 — RTOs, ISOs
- 3 — Load-serving Entities
- 4 — Transmission-dependent Utilities
- 5 — Electric Generators
- 6 — Electricity Brokers, Aggregators, and Marketers
- 7 — Large Electricity End Users
- 8 — Small Electricity End Users
- 9 — Federal, State, Provincial Regulatory or other Government Entities
- 10 — Regional Reliability Organizations, Regional Entities

|              |       | <p>4. Do you agree with the exclusion list in the proposed definition of RAS? If not, please provide specific suggestions and rationale. NoComments: LCRA TSC recommends an additional example be included under the heading "The following do not individually constitute a RAS:" stated, "Protection systems installed to clear faults." It appears that items F and G of the proposed definition are in conflict. Item G creates an exclusion that is taken away in item F for FACTS devices but leaves in place the limitation for switched shunts. LCRA TSC recommends revising items f. and g. as follows: f. Controllers that switch or regulate series or shunt reactive devices, flexible alternating current transmission system (FACTS) devices, phase-shifting transformers, variable-frequency transformers, tap-changing transformers, or generation excitation, and that are located at and monitor quantities solely at the same station as the Element being switched or regulated g. FACTS controllers that remotely switch static shunt reactive devices located at other stations to regulate the output of a single FACTS device</p> <p>5. Do you agree with the time frames in the proposed Implementation Plan associated with the proposed definition of RAS? Please provide specific comments in support of your position. Yes</p> |

**1. Do you agree that using a single term; i.e., RAS, and clarifying its definition will lead to more consistent application of the related NERC Reliability Standards? If not, please provide specific suggestions and rationale**

**Summary Consideration:**

By a four to one margin, commenters agreed with the drafting team that adopting and using the single term RAS across all of the eight NERC Regions, and clarifying its definition, will promote consistency in the application of the related NERC Reliability Standards.

Several commenters suggested the drafting team delete the statement “These schemes are not Protection Systems; however, they may share components with Protection Systems.” from the definition because it created some confusion with regards to the use of the term Protection Systems in other Reliability Standards. In response, the drafting team removed the statement from the definition.

There were numerous comments unrelated to this question that were addressed but not included in this summary.

| Organization               | Yes or No | Question 1 Comment  |
|----------------------------|-----------|---|
| Tennessee Valley Authority | No        | We agree that using a single term should help bring the industry toward a common understanding/usage of the term. However, we believe the revised draft definition fails to add the desired clarity. We suggest the following modification:” A control scheme designed and installed to detect pre-analyzed System conditions and automatically perform corrective actions that may include, but are not limited to, curtailing or tripping generation or other sources, curtailing or tripping load, or reconfiguring a System(s). RAS accomplish one or more of the following objectives: o Meet requirements identified in the NERC Reliability Standards; o Maintain System stability, as related to the NERC Reliability Standards; o Maintain acceptable System voltages, as related to the NERC Reliability Standards; o Maintain acceptable power flows, as related to the NERC Reliability Standards; or o Limit the impact of Cascading, as related to the NERC Reliability Standards.; or o DELETE: Address other Bulk Electric System (BES) reliability concerns. |

| <p><b>Response:</b> Thank you for your comment. The drafting team agrees and revised the objectives by deleting the last bullet that read: "Address other Bulk Electric System (BES) reliability concerns" negating the all-inclusive nature of the objectives.</p> |           |  |
| <p>Florida Municipal Power Agency</p>   | <p>No</p> | <p>FMPA is casting a Negative ballot for the RAS definition.</p> <ol style="list-style-type: none"> <li>1) FMPA is concerned with the following statement in the Remedial Action Schemes (RAS) definition: "These schemes are not Protection Systems; however, they may share components with Protection Systems." This sentence is confusing. RAS is a scheme and stating that it may share components with Protection Systems and at the same time terminating the use of the SPS reference is confusing. FMPA supports the intent of creating a RAS definition and believes the referenced statement should be deleted.</li> <li>2) Further, an additional example should be included under the heading, "The following do not individually constitute a RAS:" The addition may be worded something like, "Protection systems installed to clear faults are not RAS."</li> <li>3) FMPA suggests that a thorough look at all the uses of Protection System in the standards to determine if it was intended to include SPS/RAS as part of the requirement. (One example is PRC-005; the proposed definition specifically states that SPS/RAS is not a Protection System. Applicability of PRC-005-2 at 4.2.4 states: "Protection Systems installed as a Special Protection System ..." Since RAS/SPS is proposed to no longer be Protection Systems, this is a null set, removing RAS/SPS from PRC-005 creating an illogical statement of applicability. Note: some other instances where Protection System is used, that may be intended to include RAS, are: EOP-010, NUC-001, PER-005, PRC001, TPL-00x-0, the Glossary definition for Planning Authority, the definition for Protection System Maintenance Program.)</li> </ol> |

| Organization  | Yes or No | Question 1 Comment   |
|---|-----------|--|
| <p>1. To remove any confusion regarding the statement you identified, the drafting team deleted it from the definition.</p> <p>2. The drafting team agrees and added a new exclusion (a) which reads: Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating the faulted Elements. The drafting team also added clarifying language in the FAQ.</p> <p>3. The removal of the aforementioned statement “These schemes are not Protection Systems; however, they may share components with Protection Systems.” should eliminate the need to review other Reliability Standards regarding the use of the term “Protection System(s).”</p> |           |  |
| Tacoma Public Utilities   | No        | Tacoma Power supports FMPA’s comments concerning Question 1.   |
| <p><b>Response:</b> Thank you for your comment. See the drafting team’s response to FMPA’s comments.</p>  |           |  |
| ISO New England   | No        | Since the terms were defined the same and referenced each other, there is no need for the change. However, there is no harm in making the change either.   |
| <p><b>Response:</b> Thank you for your comment.</p>   |           |  |
| Ingleside Cogeneration LP   | No        | <p>Ingleside Cogeneration LP (ICLP) believes that the second draft of the definition of a RAS is too open ended.</p> <p>1) Two modifications have been made to the base definition of a RAS that infer that almost any Protection System not specifically identified in the list of exclusions is in scope. First, the removal of the qualifier that RAS takes corrective action “other than the isolation of faulted elements” adds almost every relay scheme back into the equation. ICLP sees no good reason for its deletion - if there are such systems that isolate faulted elements and need RAS-like oversight, they should be explicitly listed.</p> <p>2) Second, the bulleted list under the base definition includes a catchall that stipulates that a RAS may address “other Bulk Electric System (BES) reliability concerns.” We have seen ambiguous statements of this type</p> |

| Organization  | Yes or No | Question 1 Comment   |
|---|-----------|--|
|   |           | <p>lead to Regional variations, and have watched the original intent vary over time. As such, the item should be removed.</p> <p>3) In ICLP’s view, the project team’s decision to eliminate the four categories of RAS by function and extent of impact was also a step backwards. Several Regions have made similar distinctions of this type in order to account for variations in the most appropriate oversight methods - a tactic that has proven to be very effective. Furthermore, our reading of the stakeholder comments indicates that most respondents were comfortable with the concept, but had various concerns that were easily accommodated. As such, ICLP believes that the deferral of those distinctions to the individual NERC standards is too unstructured, and that the four original categories should be retained.</p> |
| <p><b>Response:</b> Thank you for your comments.</p> <ol style="list-style-type: none"> <li>1. The drafting team agrees and added a new exclusion (a) which reads: Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating the faulted Elements. The drafting team also added clarifying language in the FAQ.</li> <li>2. The drafting team agrees and revised the objectives by deleting the last bullet that read: “Address other Bulk Electric System (BES) reliability concerns” negating the all-inclusive nature of the objectives.</li> <li>3. The classification of a RAS is not necessary for defining whether or not a scheme qualifies as a RAS. Informal feedback from many stakeholders indicated uncertainty about the classification types. Therefore, the SDT decided not to include RAS classification types within the definition. The classifications are more appropriately addressed concurrently with revisions to the RAS-related Reliability Standards.</li> </ol> |           |  |
| Ameren  | No        | <p>The last bullet point in the definition of a Remedial Action Scheme “Address other Bulk Electric System (BES) reliability concerns.” appears too broad, and we request the drafting team removed this from the definition.</p>  |
| <p><b>Response:</b> Thank you for your comment. The drafting team agrees and revised the objectives by deleting the last bullet that read: “Address other Bulk Electric System (BES) reliability concerns” negating the all-inclusive nature of the objectives.</p>   |           |  |

| Organization   | Yes or No | Question 1 Comment  |
|--|-----------|---|
| Consumers Energy Company   | No        | <p>In general, we are encouraged with the redefinition of this scheme especially with the added clarity and emphasis on identifying that they are not Protection schemes but may share components. However, it is a little unclear if the intent of this definition was to define a term specifically for schemes applicable only to the BES or is the intent to have a broader definition and then restrict its applicability when used in each standard. To illustrate this point, in the first paragraph, the term “System” is used which in itself does not refer only to the BES. Yet in the list the objectives the RAS is to accomplish, the first item (Meet requirements identified in the NERC Standards) and the last item (address other BES reliability concerns) specifically refer to the applicability on the BES.</p>  |
| <p><b>Response:</b> Thank you for your comment. The drafting team revised the objectives by deleting the last bullet that read: “Address other Bulk Electric System (BES) reliability concerns” negating the all-inclusive nature of the objectives.</p> |           |   |
| Austin Energy  | No        | <p>AE is casting a Negative ballot for the RAS definition.</p> <ol style="list-style-type: none"> <li>1) AE is concerned with the following statement in the Remedial Action Schemes (RAS) definition: “These schemes are not Protection Systems; however, they may share components with Protection Systems.” This sentence is confusing. RAS is a scheme and stating that it may share components with Protection Systems and at the same time terminating the use of the SPS reference is confusing. AE supports the intent of creating a RAS definition and believes the referenced statement should be deleted.</li> <li>2) Further, an additional example should be included under the heading, “The following do not individually constitute a RAS:” The addition may be worded something like, “Protection systems installed to clear faults are not RAS.”</li> </ol> |

| Organization   | Yes or No | Question 1 Comment  |
|--|-----------|---|
|  |           | <p>3) AE suggests that a thorough look at all the uses of Protection System in the standards to determine if it was intended to include SPS/RAS as part of the requirement.</p>   |
| <p><b>Response:</b> Thank you for your comments.</p> <ol style="list-style-type: none"> <li>To remove any confusion regarding the statement you identified, the drafting team deleted it from the definition.</li> <li>The drafting team agrees and added a new exclusion (a) which reads: Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating the faulted Elements.</li> <li>The removal of the aforementioned statement “These schemes are not Protection Systems; however, they may share components with Protection Systems.” should eliminate the need to review other Reliability Standards regarding the use of the term “Protection System(s).</li> </ol> |           |   |
| Oncor Electric Delivery LLC  | No        | <ol style="list-style-type: none"> <li>Oncor disagrees with using RAS as a replacement for SPS. A SPS is used within ERCOT as an automatic system designed to detect abnormal or pre-determined ERCOT System conditions and take pre-planned corrective action. This term applies to and is referenced in numerous guides, procedures and protocols.</li> <li>Additionally the RAP (Remedial action plan) term is used in ERCOT and includes “controllable load shedding by dispatcher or ERCOT action.” ERCOTs RAP’s are predefined but not automatic and are used frequently within the system to maintain reliability under various operating conditions. Updating the various processes and procedures and training all the ERCOT TOPs on the new term will be a challenge and could cause significant confusion.</li> <li>The term SPS should not be based upon normal operational schemes like a RAS. These are “special” systems designed to maintain reliability until solutions can be added to remove or “exit” their changes. We also anticipate other reliability coordinators having to go through a similar effort in regards to the SPS terminology change.</li> </ol> |

| Organization   | Yes or No | Question 1 Comment   |
|--|-----------|--|
| <p><b>Response:</b> Thank you for your comments.</p> <ol style="list-style-type: none"> <li>The drafting team appreciates the fact that the selected term will cause some necessary documentation changes for entities but asserts that the use of the single term RAS will provide consistency and avoid the confusion associated with the SPS term.</li> <li>The drafting team acknowledges that entities will need time to adapt to the RAS term.</li> <li>The terms RAS and SPS are currently synonymous and interchangeable terms in the Glossary of Terms Used in NERC Reliability Standards.</li> </ol> |           |  |
| Northeast Power Coordinating Council   | Yes       | A single term will lead to a more consistent application of reliability standards.   |
| <p><b>Response:</b> Thank you for your comment and support.</p>  |           |  |
| Colorado Springs Utilities   | Yes       | RAS is good - we agree with having one term and do not have a preference on which term is used.  |
| <p><b>Response:</b> Thank you for your comment and support.</p>  |           |  |

| National Grid  | Yes       | <p>While we agree with the desire to have a single term, both the proposed name "Remedial Action Scheme" (RAS) as well as the alternative term "Special Protection System" (SPS) seems to have issues.</p> <ol style="list-style-type: none"> <li>The definition does not say anything about how the action is accomplished. A problem we have is that, of the two names, "Remedial</li> </ol> |

| Organization  | Yes or No | Question 1 Comment  |
|---|-----------|---|
|   |           | <p>Action Scheme" seems to be worse, because a scheme usually mitigates a condition, but it does not usually remedy it. Strictly speaking, it performs a trade-off by substituting one abnormality, such as an open line or severed interconnection, for another, such as a thermally overloaded line.</p> <p>2. We are not arguing for one term or the other, but it is critical that the various terms be applied correctly and consistently. Further, the term "Special Protection System" at least implied that it took automatic action, whereas the term "Remedial Action Scheme" does not. A system operator operating a circuit breaker by remote control is a remedial scheme, but we do not think it falls under the scope of what is intended. Although the provision that it be automatic is included within the definition, it might be helpful to include it in the title as is done with underfrequency load shedding.</p> |
| <p><b>Response:</b> Thank you for your comments.</p> <p>1. Currently, both terms, SPS and RAS, are used in the eight NERC Regions. The drafting team asserts that the use of the single term RAS will provide consistency and avoid the confusion associated with the SPS term. The drafting team therefore recommends that the term RAS be retained as the industry-recognized term and that the term SPS be retired as soon as possible.</p> <p>2. The term "Remedial Action Scheme" (RAS) is a long-standing alternative term for "Special Protection System" (SPS) in the Glossary of Terms Used in NERC Reliability Standards, as such NERC already recognizes RAS as an "automatic" scheme.</p> |           |   |

| SPP Standards Review Group  | Yes       | The single term 'RAS' reduces the confusion and ambiguities that the current interchangeable terms 'SPS/RAS' have created for the industry.   |
| <b>Response:</b> Thank you for your comment and support.  |           |   |
| ACES Standards Collaborators  | Yes       | <p>We agree with the need to modify the existing definition of SPS and RAS and that use of a single term will result in more consistent application of the standards. Furthermore, we are supportive of moving away from the SPS term to the RAS term to avoid confusion with Protection Systems and to more accurately reflect the intended purpose. The current definition lacks specificity, which leads to inconsistent application among the various NERC regions. We also note that the proposed changes have improved the RAS definition by removing some ambiguity. However, we believe there continues to remain to significant items of ambiguity that need to be addressed. Those are discussed below.</p> <ol style="list-style-type: none"> <li>1. Use of the term “meet requirements identified in the NERC Reliability Standards” is ambiguous which will lead to inconsistent enforcement. Would this clause apply to any standard or is it intended primarily to apply to TPL standards? Does this require the owner of the RAS to document for which standards the RAS is installed? For a newly</li> </ol> |

| Organization | Yes or No | Question 1 Comment   |
|--------------|-----------|--|
|              |           | <p>installed RAS, this might be easy but there could be disagreement over the purpose of the installation of existing RAS especially those that have been installed for a decade or more. We recommend removing the phrase from the definition. If the phrase persists, please identify specific standards and requirements in the technical guideline section for clarity.</p> <ol style="list-style-type: none"> <li>2. Use of the term “address other Bulk Electric System (BES) reliability concern” is vague and ambiguous which will only lead to inconsistent enforcement. What other reliability concerns could there be besides system stability, system voltages, power flows, and Cascading that would not be excluded. Protecting equipment from damage would be one reliability concern that does not specifically fit into one of the categories but any schemes associated with protecting equipment from damage would be excluded by exclusion e. or excluded because they are Protection Systems. We simply cannot come up with any additional examples that warrant inclusion of such an ambiguity. We suggest the drafting team remove this phrase to remove the ambiguity. If there are other reliability concerns for which a RAS may be installed that do not fit into one of the five other buckets, then additional specific buckets should be added to avoid ambiguity.</li> <li>3. “Relay” or “control” should be inserted just before scheme in the definition to provide additional clarity over what type of scheme is involved.</li> <li>4. PRC-005-2 and PRC-005-3 will require further revision to the applicability section 4.2.4 other than simply replacing SPS with RAS to avoid ambiguity. The proposed definition of RAS specifically states that “these schemes are not Protection Systems.” However, applicability section 4.2.4 states that it is applicable to “Protection Systems installed as a Remedial Action Scheme (RAS)” which directly conflicts with the definition. One could argue that PRC-005-2 and PRC-005-3 are then</li> </ol> |

**2. Are there additional corrective actions that should be explicitly included in the proposed definition of RAS? If yes, please provide specific suggestions and rationale.**

**Summary Consideration:**

Approximately 80% of commenters agreed with the corrective actions included in the proposed definition of RAS.

A few commenters requested the clarity around the phrase “curtailing or tripping generation or other sources.” The drafting team changed “curtailing” to “adjusting” because “curtailing” is associated with electronic tagging; and replaced “other sources” with “(MW and Mvar)” to clarify that generation includes both real and reactive power.

There were numerous comments unrelated to this question that were addressed but not included in this summary.

| Oncor Electric Delivery LLC  | No        | The SPS definition should be implemented as soon as possible the way it was originally developed by the NERC System Analysis and Modeling Subcommittee (SAMS) and approved by NERC OC PC. SAMS took several years developing the definition and getting approvals.   |
| <p><b>Response:</b> Thank you for your comment. The drafting team recognizes the efforts of SAMS/SPCS in development of the proposed definition. Several drafting team members participated directly in that process and the drafting team used that report as a starting point in its efforts, but neither NERC nor the drafting team expected this starting point to also be the end point. While the approval of the NERC Operating and Planning Committees is important, it does not rise to the level of stakeholder vetting through the standards development process.</p> |           |  |
| Tri-State Generation and Transmission Association, Inc.  | No        |  |
| Northeast Power Coordinating Council   | Yes       | <ol style="list-style-type: none"> <li>1. The objective to “Meet requirements identified in the NERC Reliability Standards” improperly defines a NERC term by utilizing NERC requirements which can change over time. The purpose of this section is to describe the objectives of an RAS. An RAS is accomplishes the objectives of adequate reliability. Those Standards and requirements that will apply to RAS will list RAS in their requirements.</li> <li>2. The final bullet in an RAS objective “Address other Bulk Electric System (BES) reliability concerns” is open ended. The previous bullets of voltage, stability, flows and Cascade are the hallmarks of adequate levels of reliability.</li> </ol> |

| Organization   | Yes or No | Question 2 Comment   |
|--|-----------|--|
|  |           | <p>3. To the existing definition of Special Protection System (Remedial Action Scheme), after “Such action may include changes in demand, generation (MW and Mvar)...” add the words HVDC power flows, FACTS device operating points,...</p> |
| <p><b>Response:</b> Thank you for your comment.</p> <p>1. The SDT agrees that requirements in NERC reliability Standards can change over time. The statement in the definition does not refer to a specific standard or requirements, nor does it impose requirements by itself. The drafting team considers that meeting requirements in the NERC Reliability Standards is one objective for installing a RAS.</p> <p>2. The drafting team agrees that the item “Address other Bulk Electric System (BES) reliability concerns” is open ended and removed the bullet.</p> <p>3. The drafting team agrees that the proposed additions to the list of RAS actions are legitimate, but declines to make the change because the list provides examples only and is not all-inclusive.</p> |           |  |
| MRO NERC Standards Review Forum  | Yes       |  |
| IRC Standards Review Committee   | Yes       | Reverse Power Sensing Relays should be added to the list of RAS.   |
| <p><b>Response:</b> Thank you for your comment. The drafting team considers reverse power sensing relays to be a protective function. As such, they do not individually constitute a RAS under exclusion “e” which reads: “Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss-of-field, transformer top-oil temperature, overvoltage, or overload to protect the Element against damage by removing it from service.”</p> <p>However, the drafting team asserts that reverse power sensing relays could, as other protective functions, be part of a larger scheme that meets the definition of RAS.</p>  |           |  |
| SPP Standards Review Group   | Yes       | We have a concern in reference to the term ‘curtailed’ being used in the revised definition. Our thought process associates ‘curtailed’ with the tagging process. The  |

| Organization   | Yes or No | Question 2 Comment   |
|--|-----------|--|
|  |           | group suggests the term ‘reduce’ for it seems more fitting with the terms ‘tripping of generation or load’.  |
| <p><b>Response:</b> Thank you for your comment. The drafting team revised the first sentence of the definition to read: “A scheme designed to detect predetermined System conditions and automatically take corrective actions that may include, but are not limited to, adjusting or tripping generation (MW and Mvar), tripping load, or reconfiguring a System(s).”</p>   |           |  |
| City of Vineland   | Yes       | <ol style="list-style-type: none"> <li>1. With the statement in the definition of "but are not limited to", and the first of the inclusions of "Meet requirements identified in the NERC Reliability Standards", there is no real limit on the scope of the definition. Also, the last inclusion "Address other BES reliability concerns" looks like a catchall inclusion that could be applied after the fact. This is not so black and white when talking about a definition of a RAS.</li> <li>2. There needs to be categorization and guidance for the industry to determine their own situations. Not all RAS (in the proposed definition) are equally critical to reliability of the BES.</li> </ol> |
| <p><b>Response:</b> Thank you for your comment.</p> <ol style="list-style-type: none"> <li>1. Because of the diversity of RAS in both action and objective, the practical approach to a definition is to begin with a wide and general scope and then list specific exclusions. However, the drafting team did limit the scope of the objectives by removing the last bullet as you suggested. The revised objectives provide examples and are no longer all-inclusive.</li> <li>2. The classification of a RAS is not necessary for defining whether or not a scheme qualifies as a RAS. Informal feedback from many stakeholders indicated uncertainty about the classification types. Therefore, the drafting team decided not to include RAS classification types within the definition. The classifications are more appropriately addressed concurrently with revisions to the RAS-related Reliability Standards.</li> </ol> |           |  |
| ReliabilityFirst   | Yes       | <p>ReliabilityFirst submits the following comments for consideration: 1. Item k. “Automatic sequences that proceed when manually initiated solely by an operator”</p> <ol style="list-style-type: none"> <li>a. ReliabilityFirst is aware of a current RAS for a large generation plant in which the RAS can be armed/de-armed by a system operator. In the cases where this RAS is armed, we would consider this to be a RAS, applicable to any associated NERC</li> </ol>  |

| Organization  | Yes or No | Question 2 Comment   |
|---|-----------|--|
|   |           | <p>Reliability Standards. ReliabilityFirst questions whether it is the intent of item “K” to exclude these types of schemes as a RAS. If so, what is the technical justification/basis for such exclusion?</p> <p>b. The term “operator” is undefined and may be left to interpretation. ReliabilityFirst recommends using the NERC Glossary of Terms definition of “System Operator” to further clarify the term “operator”.</p>  |
| <p><b>Response:</b> Thank you for your comment.</p> <p>a) Exclusion k is not referring to whether schemes are armed by a System Operator or not. A RAS can be armed and waiting on predetermined system conditions to take action. Arming only introduces a layer of supervision and does not determine whether or not a scheme is a RAS. Exclusion k refers to schemes that will take automatic actions upon being initiated manually by a System Operator.</p> <p>b) The drafting team agrees and revised the definition to use the term “System Operator.”</p> |           |  |
| NV Energy   | Yes       | <p>The list of corrective actions taken by a RAS is comprehensive; however, we feel it would be a valuable improvement to clarify that each of the second through fifth bulleted items is applicable only to the BES. For instance, the second bullet would read “Maintain Bulk Electric System stability”; third bullet would read “Maintain acceptable BES voltages”; fourth bullet “Maintain acceptable BES power flows”; and fifth bullet “Limit the impact of Cascading throughout the BES”.</p>  |
| <p><b>Response:</b> Thank you for your comment. The drafting team agrees and inserted “BES” as a qualifier in the pertinent objectives.</p>   |           |  |
| Consumers Energy Company  | Yes       | <p>If the intent was indeed to have this definition apply only to the BES, then we suggest the additional clarifications since many companies may have similar schemes on non-applicable systems: A scheme designed to detect predetermined System conditions on the BES and automatically take corrective actions that may include, but are not limited to, curtailing or tripping generation or other sources, curtailing or tripping load, or reconfiguring a System(s). RAS accomplish one or more of the following objectives:</p> <ul style="list-style-type: none"> <li>o Meet requirements identified in the NERC Reliability Standards;</li> <li>o Maintain BES System stability;</li> <li>o Maintain acceptable BES System voltages;</li> <li>o</li> </ul> |

| Organization  | Yes or No | Question 2 Comment  |

**3. Are there additional objectives that should be explicitly included in the proposed definition of RAS? If yes, please provide specific suggestions and rationale.**

**Summary Consideration:**

A majority of commenters agreed there was no need for additional objectives.

Numerous commenters expressed concerns with the first and last stated objectives: respectively, they are “Meet requirements identified in the NERC Reliability Standards” and “Address other Bulk Electric System (BES) reliability concerns”. Commenters questioned whether RAS applications should be limited to meeting requirements of specific NERC Reliability Standards. The drafting team responded that RAS applications should not be limited to meeting requirements and that RAS could be implemented to limit the impact of an extreme event or Cascading. Commenters stated that the last objective was all encompassing making the other objectives irrelevant. In response, the drafting team deleted the objective; thereby, negating the all-inclusive nature of the objective list.

To clarify the intent of the proposed definition of Remedial Action Scheme, numerous commenters also requested that the list of objectives should specifically pertain to the Bulk Electric System (BES). The drafting team agreed and inserted the qualifier “BES” where appropriate.

There were numerous comments unrelated to this question that were addressed but not included in this summary.

| Organization                        | Yes or No | Question 3 Comment  |
|-------------------------------------|-----------|---|
| <p>ACES Standards Collaborators</p> | <p>No</p> | <p>We do not believe any additional objectives are necessary and believe that two objectives should be removed as discussed below.</p> <ol style="list-style-type: none"> <li>1. Use of the term “meet requirements identified in the NERC Reliability Standards” is ambiguous which will lead to inconsistent enforcement. Would this clause apply to any standard or is it intended primarily to apply to TPL standards? Does this require the owner of the RAS to document for which standards the RAS is installed? For a newly installed RAS, this might be easy but there could be disagreement over the purpose of the installation of existing RAS especially those that have been installed for a decade or more. We recommend removing the phrase from the definition. If the phrase persists, please identify specific standards and requirements in the technical guideline section for clarity.</li> <li>2. Use of the term “address other Bulk Electric System (BES) reliability concern” is vague and ambiguous which will only lead to inconsistent enforcement. What other reliability concerns could there be besides system stability, system voltages, power flows, and Cascading that would not be excluded. Protecting equipment from damage would be one reliability concern that does not specifically fit into one of the categories but any schemes associated with protecting equipment from damage would be excluded by exclusion e. or excluded because they are Protection Systems. We simply cannot come up with any additional examples that warrant inclusion of such an ambiguity. We suggest the drafting team remove this phrase to remove the ambiguity. If there are other reliability concerns for which a RAS may be installed that do not fit into one of the five other buckets, then additional specific buckets should be added to avoid ambiguity.</li> <li>3. Because schemes could be interpreted to include AGC and excitation systems, the objectives could also inadvertently result in AGC or excitation systems being classified as RAS. AGC ultimately is required to meet several requirements in the BAL standards and excitation systems are used to control a generator’s reactive power output to maintain an acceptable voltage schedule. Thus, both AGC and excitation systems support at least one of the objectives of the RAS definition.</li> </ol> |

| Organization  | Yes or No | Question 3 Comment   |
|---|-----------|--|
|   |           | These objectives should ultimately be evaluated more closely. At the very least, AGC and excitation systems should be included in the exclusions list. |
| <p><b>Response:</b> Thank you for your comments.</p> <ol style="list-style-type: none"> <li>1. The drafting team contends that the requested level of specificity regarding the NERC Reliability Standards is not appropriate to include in the RAS definition. It is important that the scope of the definition include schemes whose failure to operate or whose misoperation may pose a reliability risk. Listing specific standards in the definition may unintentionally limit the scope of the definition. The definition by itself imposes no requirements on RAS owners.</li> <li>2. The drafting team agrees and revised the objectives by deleting the last bullet that read: “Address other Bulk Electric System (BES) reliability concerns” negating the all-inclusive nature of the objectives.</li> <li>3. The drafting team agrees that generator controls were not clearly addressed by the exclusion list: therefore, the drafting team added a new exclusion (n) which reads: “Generator controls such as, but not limited to, automatic generation control (AGC), generation excitation [e.g. automatic voltage regulation (AVR) and power system stabilizers (PSS)], fast valving, and speed governing.”</li> </ol> |           |  |

While it is true that at least in WECC most of the conditions its RASs detect are predetermined, in other regions that might not be the case and omission of the term creates a loophole that is not there now. A RAS is designed to respond to System Conditions that could happen. The schemes are developed in response to Planning Studies. Protection systems are not installed without considering the conditions that will activate them.</li> <li>2. First bullet: Have SPS/RAS requirements literally been identified in NERC standards, or is the intent that the SPS/RAS be applied so that the power system meets the performance requirements identified in the NERC reliability standards?</li> <li>3. Sixth bullet: What is a reliability "concern"? Wouldn't it be more accurate to say address other conditions that could otherwise result in failure to comply with reliability standards?</li> </ol> |
| <p><b>Response:</b> Thank you for your comments.</p> <ol style="list-style-type: none"> <li>1. The drafting team contends that the system conditions being detected by the RAS must be predetermined in order to define operation of the RAS. Events which could lead to such conditions, however, may be "unanticipated" events specific or contingencies. The proposed definition encompasses both event and condition scenarios.</li> </ol> |           |   |

| Organization  | Yes or No | Question 3 Comment   |
|---|-----------|--|
|   |           | <p>2. No, SPS/RAS have not been literally identified in NERC standards. NERC Reliability Standards specify reliability objectives (outcomes) and do not specify the “how” or the methods used to achieve the objectives. Installing a RAS is one possible method to address the reliability objective of a standard.</p> <p>3. The drafting team removed the last objective that read: “Address other Bulk Electric System (BES) reliability concerns” as many commenters stated it was all-encompassing.</p>  |
| MRO NERC Standards Review Forum   | Yes       | <p>The definition as drafted includes use of Bulk Electric System in some places and not in others. Assuming the RAS that are covered under this standard are only those in the BES, the following changes are suggested to clarify this: A scheme designed to detect predetermined Bulk Electric System (BES) conditions and automatically take corrective actions that may include, but are not limited to, curtailing or tripping BES generation or other BES sources, curtailing or tripping load, or reconfiguring a System(s). RAS accomplish one or more of the following objectives:</p> <ul style="list-style-type: none"> <li>o Meet requirements identified in the NERC Reliability Standards;</li> <li>o Maintain BES stability;</li> <li>o Maintain acceptable BES voltages;</li> <li>o Maintain acceptable BES power flows;</li> <li>o Limit the impact of BES Cascading; or</li> <li>o Address other BES reliability concerns</li> </ul> <p>To eliminate any doubt that the text used in NERC Reliability Standards properly applies to only BES Remedial Action Schemes. The NSRF recommends establishing a RAS Definition that applies explicitly to the BES. This objective could be accomplished by defining it as a “BES Remedial Action Scheme” and replacing the references to “System” with “BES”. The existing references in the proposed RAS Definition to “System or Systems” apply more broadly to non-BES transmission systems and distribution systems.</p> |
| <p><b>Response:</b> Thank you for your comment. The drafting team agrees and inserted “BES” as a qualifier in the pertinent objectives. However, the detection of predetermined conditions should not be limited to the BES; therefore, that change was not made.</p> |           |  |
| National Grid   | Yes       | <p>RE: "RAS accomplish one or more of the following objectives: Maintain System Stability" Can a RAS/SPS maintain system stability or does it prevent (or at least lessen the odds of) system instability?</p>   |

| Organization   | Yes or No | Question 3 Comment  |
|--|-----------|---|
| <p><b>Response:</b> Thank you for your comments. The drafting team inserted “BES” as a qualifier in the pertinent objectives. The drafting team contends that maintaining Bulk Electric System (BES) stability is synonymous with preventing System instability.</p>   |           |   |
| Tennessee Valley Authority   | Yes       | <p>The bulleted list of objectives fails to enhance clarity, and could in fact increase the uncertainty around RAS. Bullets 2-6 can be interpreted to cover objectives beyond NERC Reliability Standards, when taken in context with the first bullet. The scope of the definition should be limited to applications that are relevant to the NERC Reliability Standards in which the term is used. See proposed modifications under question 1 response.</p> |
| <p><b>Response:</b> Thank you for your comments.</p> <p>Because of the diversity of RAS in both action and objective, the practical approach to the RAS definition is to begin with a wide scope and then list specific exclusions. However, the drafting team did limit the scope of the objectives by removing the last bullet that read: “Address other Bulk Electric System (BES) reliability concerns.” The revised objectives provide examples and are no longer all-inclusive. The objectives serve as examples of why RAS may be installed. The exclusions identify equipment and schemes that should not be considered RAS. RAS may be used to solve either event-based "contingencies" or condition-based "System conditions" (e.g. overloads, etc.). The SDT maintains that satisfying requirements of a reliability standard is a legitimate RAS objective. The drafting team does not agree that RAS should be limited to applications that are relevant to the NERC Reliability Standards in which the term is used. RAS may also be implemented for applications beyond requirements of the NERC Reliability Standards, such as to limit the impact of an extreme event or Cascading.</p> |           |   |
| PacifiCorp   | Yes       | <p>To clarify the intent of the proposed definition of Remedial Action Scheme, PacifiCorp recommends inserting Bulk Electric System into the first sentence as follows: “A scheme designed to detect predetermined Bulk Electric System conditions and automatically take corrective actions that may include, but are not limited to, curtailing or tripping generation or other sources, curtailing or tripping load, or reconfiguring a System(s).”</p>    |
| <p><b>Response:</b> Thank you for your comment. The drafting team agrees and inserted “BES” as a qualifier in the pertinent objectives. However, the detection of predetermined conditions should not be limited to the BES; therefore, that change was not made.</p>  |           |   |

| Organization   | Yes or No | Question 3 Comment  |
|--|-----------|---|
| City of Vineland   | Yes       | Categorization of RAS for criticality.  |
| <p><b>Response:</b> Thank you for your comments. The classification of a RAS is not necessary for defining whether or not a scheme qualifies as a RAS. Informal feedback from many stakeholders indicated uncertainty about the classification types. Therefore, the drafting team decided not to include RAS classification types within the definition. The classifications are more appropriately addressed concurrently with revisions to the RAS-related Reliability Standards.</p>   |           |   |
| Ingleside Cogeneration LP  | Yes       | <p>The exclusions proposed by the drafting team are comprehensive and precise - and the bulleted list of “inclusions” under the base definition of RAS must be as well. In the original definition, such descriptors included those RAS whose loss or malfunction would lead to “Non-Consequential Load Loss ≥ 300 MW”, “Aggregate resource loss (tripping or runback of generation or HVdc) &gt; the largest Real Power resource within the interconnection”, “Loss of synchronism between two or more portions of the system each including more than one generating plant”, and “Negatively damped oscillations”. ICLP is not sure why specifics like this were removed to begin with - and we believe it is the responsibility of the drafting team to provide the rationale, not the industry.</p> |
| <p><b>Response:</b> Thank you for your comments. The SAMS-SPCS whitepaper does include specifics on suggested classifications. However, the classification of a RAS is not necessary for defining whether or not a scheme qualifies as a RAS. Informal feedback from many stakeholders indicated uncertainty about the classification types. Therefore, the SDT decided not to include RAS classification types within the definition. The classifications are more appropriately addressed concurrently with revisions to the RAS-related Reliability Standards. Please see the FAQ document.</p> |           |   |
| American Transmission Company, LLC   | Yes       | <p>To eliminate any doubt that the text used in NERC Reliability Standards properly applies to only BES Remedial Action Schemes, ATC recommends establishing a RAS Definition that applies explicitly to the BES. This could be accomplished by defining it as a “BES Remedial Action Scheme” and replacing the references to “System” with “BES.” The existing references in the proposed RAS Definition to “System” or “Systems” apply more broadly to non-BES transmission systems and distribution systems.</p>   |

| Organization  | Yes or No | Question 3 Comment  |

| <p><b>Response:</b> Thank you for your comment. The drafting team agrees and inserted “BES” as a qualifier in the pertinent objectives. However, the detection of predetermined conditions should not be limited to the BES; therefore, that change was not made.</p> |           |   |
| Omaha Public Power District   | Yes       | An objective of this project is to create a RAS definition and to eliminate the need for an SPS definition. Somewhere, that should be clarified.  |
| <p><b>Response:</b> Thank you for your comment. Please see the FAQ document.</p>  |           |   |
| Consumers Energy Company  | Yes       | <p>If the intent was indeed to have a broader definition and then restrict its applicability when used in each standard, then we suggest the following clarifications: A scheme designed to detect predetermined System conditions and automatically take corrective actions that may include, but are not limited to, curtailing or tripping generation or other sources, curtailing or tripping load, or reconfiguring a System(s). RAS accomplish one or more of the following objectives:</p> <ul style="list-style-type: none"> <li>o Meet requirements identified in the NERC Reliability Standards;</li> <li>o Maintain System stability;</li> <li>o Maintain acceptable System voltages;</li> <li>o Maintain acceptable power flows;</li> <li>o Limit the impact of Cascading; or</li> <li>o Address other Bulk Electric System (BES) reliability concerns.</li> </ul> <p>Then each standard using this term would state something like “...an RAS used to address BES reliability...” to help define applicability in each standard.</p> |
| <p><b>Response:</b> Thank you for your comment. The drafting team agrees and inserted “BES” as a qualifier in the pertinent objectives.</p>   |           |   |
| Colorado Springs Utilities  |           | No Comments   |

#### 4. Do you agree with the exclusion list in the proposed definition of RAS? If not, please provide specific suggestions and rationale.

##### Summary Consideration:

Approximately 40% of commenters agreed with the proposed exclusion list. There were three primary themes in the comments submitted by stakeholders that disagreed.

##### 1. Include an exclusion for Protection Systems that clear Faults

In response, the drafting team added a new exclusion (a) which reads: “Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating the faulted Elements.

##### 2. Include an exclusion for AGC and other generator excitation systems

In response, the drafting team added a new exclusion (n) which reads: “Generator controls such as, but not limited to, automatic generation control (AGC), generation excitation [e.g. automatic voltage regulation (AVR) and power system stabilizers (PSS)], fast valving, and speed governing”.

##### 3. Requested clarity of the UVLS exclusion

In response, the drafting team combined the posted exclusions (b) UFLS and (c) UVLS into a single exclusion (b) for this posting that reads: “Schemes for automatic under-frequency load shedding (UFLS) and automatic under-voltage load shedding (UVLS) comprised of only distributed relays.” The drafting team tailored this exclusion to match the language of the recently-approved “UVLS Program.”

A few commenters requested an exclusion for switching performed in the same station (including transfer- or cross-trip schemes) that trip Elements other than the impacted Element.

The drafting team thought this concept was too broad and contends that schemes that reconfigure the System should be RAS. No change made.

Other commenters requested additional examples be included several of the exclusions.

The drafting team declined to make the suggested changes noting that they were not attempting to provide an all-inclusive list of examples.

A few commenters questioned the general formatting of the definition and the need for an exclusion list.

The drafting team explained the definition must be broad enough to include the variety of System conditions monitored and corrective actions taken by RAS. Because of the diversity of RAS in both action and objective, the practical approach to the definition is to begin with a wide scope and then list specific exclusions. Without the exclusions, equipment and schemes that should not be considered RAS

could be subject to the requirements of the RAS-related NERC Reliability Standards. The exclusion list also assures that commonly applied protection and control systems are not unintentionally included as RAS. Note, if a scheme or protective system is not explicitly defined as an exclusion, it is not by default a RAS - the definition of RAS must be met in its entirety.

There were numerous comments unrelated to this question that were addressed but not included in this summary.

| <p>2. The drafting team contends that two or more exclusions taken together may or may not constitute a RAS. Individually, an exclusion is not a RAS; however, any of the exclusion(s) could be an integral part of a larger scheme that meets the RAS definition.</p> <p>3. The drafting team followed the NERC style guide for capitalization.</p>   |           |  |
| <p>Colorado Springs Utilities</p>  | <p>No</p> | <p>1. Colorado Springs Utilities does not agree with the exclusion list in the proposed definition. We do not think that it is reasonable or prudent to create a comprehensive list of exclusions. There will always be just one more exception that will force us to continue to modify the list of exclusions. Also, if it is not explicitly defined as an exception then by default it is automatically included whether it could affect reliability or not. The definition should clearly define what a RAS so as to include those schemes identified as essential to reliability. The only implicit exclusion we would recommend would be to exclude protection schemes that meet the definition of a RAS and are explicitly covered under other NERC reliability standards. Utilities would then use the definition to make sure that essential protection systems that meet the definition are included and document any further assumptions or judgement used in delineating between RAS and non-RAS schemes. Trying to micro-manage every possible exclusion or inclusion we think is not realistic and should not be necessary. If we do keep the exclusions list then we would offer the following suggestions on the current list of exclusions, and would anticipate a fairly steady flow of additions/modifications to this list moving forward.</p> <p>2. Remove “automatic” from UFLS.</p> <p>3. Should we explicitly exclude GMD responses? Refer to EOP-010-1/TPL-007-1.</p> |
| <p><b>Response:</b> Thank you for your comment.</p> <p>1. The definition must be broad enough to include the variety of System conditions monitored and corrective actions taken by RAS. Because of the diversity of RAS in both action and objective, the practical approach to the definition is to begin with a wide scope and then list specific exclusions. Without the exclusions, equipment and schemes that should not be considered RAS could be subject to the requirements of the RAS-related NERC Reliability Standards. The exclusion list also assures that commonly applied protection and control systems are not unintentionally included as RAS. Note, if a scheme or protective system is not explicitly defined as an exclusion, it is not by default a RAS - the definition of RAS must be met in its entirety.</p> |           |  |

| Organization  | Yes or No | Question 4 Comment   |
|---|-----------|--|
| <p>2. The drafting team disagrees and declined to make the suggested change.</p> <p>3. The drafting team contends that most GMD responses are equipment-based protection and would be covered by exclusion (e).</p>   |           |  |
| <p>MRO NERC Standards Review Forum</p>  | <p>No</p> | <p>1. The NSRF suggests: Item c - Consider rewording to better show the correlation to Item b by including the adjective 'automatic', with text like, "Automatic Undervoltage Load Shedding Programs (UVLS Programs)</p> <p>2. Item f - consider adding ". . . and controllers that . . ." to the middle of the item for improved readability.</p> <p>3. Item h - Consider using wording more aligned with Item g, such as ". . . remotely switch static shunt reactive devices for voltage regulation . . .". Otherwise consider wording like, "remotely switch static shunt inductors or static shunt capacitors for voltage regulation . . .".</p>  |
| <p><b>Response:</b> Thank you for your comment.</p> <p>1. The drafting team combined the posted exclusions (b) and (c) into a single exclusion (b) for this posting that reads: "Schemes for automatic under-frequency load shedding (UFLS) and automatic under-voltage load shedding (UVLS) comprised of only distributed relays." The drafting team tailored this exclusion to match the language of the recently-approved "UVLS Program" definition.</p> <p>2. The drafting team disagrees and declined to make the suggested change.</p> <p>3. The drafting team disagrees and declined to make the suggested change.</p> |           |  |
| <p>Dominion</p>   | <p>No</p> | <p>From item "f", strike the term "and that are located at and monitor quantities solely at the same station as the Element being switched or regulated." Why does it make a difference whether the controller is local or remote? The advent of high-speed phase measurement units (PMUs) and faster computer systems will eventually allow wide area control. This will become essential as the customer's load characteristic evolves (less voltage and frequency dependency means local PSSs will be less effective). We are concerned that the definition in general will hamper innovation. Right now there are schemes that control LTC's and capacitors to minimize losses. Certainly these are not RAS. There are EMS controls such as what PJM uses that dispatch generation precontingency to avoid</p> |

| Organization  | Yes or No | Question 4 Comment   |
|---|-----------|--|
|   |           | <p>overloads/voltage problems. These are not RAS either. Eventually computer EMS systems will become fast and robust enough to drop load or reconfigure the system so quickly that wide area blackouts will be virtually eliminated. Recall that only 500 MWs of load drop would have stopped the 2003 blackout. Therefore wide area systems that generically react to problems (not designed for a single specific contingency (if line A opens, do xyz action)) should not be RAS.</p>   |
| <p><b>Response:</b> Thank you for your comment. The difference between local and remote control is the associated increase of reliability risk. Schemes that act remotely are more likely to have a broad impact on the System and merit the more rigorous oversight required for RAS. For your examples: the drafting team agrees that schemes that control LTC's and capacitors to minimize losses are typically not RAS; EMS controls for generation dispatch are typically not RAS; however, "wide area systems that generically react to problems" by dropping load or reconfiguring the System are typically RAS.</p> |           |  |
| Seattle City Light  | No        | <p>Seattle appreciates the efforts of the drafting team to be complete, but has concern with a definition that is primarily a negative definition, i.e. a definition of what a RAS is NOT. If such an approach is deemed the most practical, Seattle recommends that a general item be added to the list of what a RAS is not, such as "n. any other scheme that does not automatically act to maintain System performance or BES reliability on a wide area." The point is to have a general item that entities or auditors could point to, in the likely case that additional non-RAS schemes are identified that do not fall within the 13 "these are not a RAS" items identified so far.</p> |
| <p><b>Response:</b> Thank you for your comment. Because of the diversity of RAS in both action and objective, the practical approach to a definition is to begin with a wide scope and then list specific exclusions. The exclusions identify equipment and schemes that should not be considered RAS. RAS may be used to solve either event-based "contingencies" or condition-based "System conditions" (e.g. overloads, etc.). The drafting team declines to make the suggested change because the proposed exclusion is too broad.</p>  |           |  |
| Operational Compliance  | No        | <p>Part c. of Exclusions lists "Undervoltage Load Shedding Programs (UVLS Programs)". The definition of "UVLS Programs" needs to be clarified up front in the same space as the RAS definition. 1. The distinction between "centrally controlled UVLS" being included as part of the RAS definition and "locally controlled UVLS" not included in</p>  |

| Organization  | Yes or No | Question 4 Comment  |
|---|-----------|---|
|   |           | <p>RAS Definition should be reclarified here. 2. The distinction between UVLS Program schemes and UVLS schemes that are not part of the entity “UVLS Program” also needs to be spelled out. For one intimately familiar with NERC standards, the information is available, but items 1. and 2. should be clear for a reader with somewhat limited knowledge of other standards. For example, engineers need to follow the NERC standards in their work, but may not be intimately familiar with other NERC standards, guidelines and definitions.</p> |
| <p><b>Response:</b> Thank you for your comment. The drafting team combined the posted exclusions (b) and (c) into a single exclusion (b) for this posting that reads: “Schemes for automatic under-frequency load shedding (UFLS) and automatic under-voltage load shedding (UVLS) comprised of only distributed relays.” The drafting team tailored this exclusion to match the language of the recently-approved “UVLS Program” definition.</p> |           |   |
| <p>Florida Municipal Power Agency</p>   | <p>No</p> | <p>The RAS definition is too broad as drafted and should specifically exclude control systems such as AGC, AVR, governor controls, etc. Suggested language is provided under number 1.</p>  |
| <p><b>Response:</b> Thank you for your comment. The drafting team acknowledges this needed addition and added a new exclusion (n) which reads: “Generator controls such as, but not limited to, automatic generation control (AGC), generation excitation [e.g. automatic voltage regulation (AVR) and power system stabilizers (PSS)], fast valving, and speed governing.”</p>   |           |   |
| <p>Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing</p>  | <p>No</p> | <p>Additional words should be added to Exclusion e as follows: "Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss-of-field, transformer top-oil temperature, high voltage, or overload to protect the Element against damage by 1) removing it from service or 2) performing switching in the same substation as the Element to relieve the condition.</p>  |

| Organization  | Yes or No | Question 4 Comment   |
|---|-----------|--|
| <p><b>Response:</b> Thank you for your comment. The drafting team contends that “performing switching in the same substation as the Element to relieve the condition” is too broad of an exclusion. Schemes that reconfigure the System should be RAS.</p>  |           |  |
| SPP Standards Review Group  | No        | <p>The distinction between distributed and central controlled UVLS systems is not clear in the definition. The clarification is contained in the supporting documentation for the definition but requires extensive efforts to dig it out. We suggest the drafting team revise exclusion C in the proposed definition to provide more clarity.</p>   |
| <p><b>Response:</b> Thank you for your comment. The drafting team combined the posted exclusions (b) and (c) into a single exclusion (b) for this posting that reads: “Schemes for automatic under-frequency load shedding (UFLS) and automatic under-voltage load shedding (UVLS) comprised of only distributed relays.” The drafting team tailored this exclusion to match the language of the recently-approved “UVLS Program” definition.</p> |           |  |
| PacifiCorp  | No        | <p>The proposed RAS definition will result in a significant expansion of the number of schemes that meet the criteria for classification as a RAS. In many instances, this expansion will not result in an improvement in Bulk Electric System reliability, and will unnecessarily complicate analysis of transmission system reliability.</p> <p>PacifiCorp recommends that the drafting team consider expansion of the exclusion list to include transfer- or cross-trip schemes that are located within a single substation. This exclusion would encompass schemes that operate from relays contained within substation apparatus to trip additional system elements other than those that are directly monitored by the relays with no additional logic or communications. As these schemes may be modeled with simple contingency definitions, PacifiCorp does not believe that their inclusion in the definition of RAS will provide any additional benefit for system reliability purposes. As stated in previous comments submitted to the drafting team by PacifiCorp on April 9, 2014, many common protection schemes that utilize breaker status contacts or lockout contacts to transfer trip multiple elements within a substation will meet the new SPS definition, despite limited potential impacts to the Bulk Electric System. For example, consider a scheme that utilizes a status contact on a line breaker to transfer-trip a</p> |

| Organization  | Yes or No | Question 4 Comment  |
|---|-----------|---|
|   |           | <p>shunt capacitor within the substation in conjunction with line tripping. In this example, the scheme is contained within the substation, and does not utilize any arming logic. The intent of the example scheme is to provide fast shunt device tripping and to provide additional redundancy for the shunt device voltage control. Under the draft definition, this scheme would meet the RAS criteria, as the shunt capacitor control is not based on locally-sensed voltage and system elements are tripped for a reason other than facilitation of fault clearing. Tripping of the capacitor could easily be modeled with a single line of code in a contingency definition, with the same results for system analysis and reliability purposes as inclusion in RAS databases. As such, this scheme and similar schemes that cross-trip various system elements within a single substation should have a specific exclusion in the proposed RAS definition. In addition, PacifiCorp recommends one specific change to the list of RAS exclusions. Exclusion “e” should include an Element in series as follows: “Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss-of-field, transformer top-oil temperature, high voltage, or overload to protect the Element or series Element against damage by removing it from service.” It may be simpler and less costly to remove an Element in series with the overloaded Element rather than the overloaded Element itself.</p> |
| <p><b>Response:</b> Thank you for your comment. The drafting team contends that performing switching in the same substation (including transfer- or cross-trip schemes) that trip Elements other than the impacted Element is too broad of an exclusion. Schemes that reconfigure the System should be RAS.</p> |           |   |
| Orlando Utilities Commission  | No        | <p>It is not clear what the status is of an RAS type system on nonBES facilities. For example a system that if installed at 230 kV would clearly be RAS, but is installed below 100kv. A system that only operates and protects nonBES facilities.</p>  |
| <p><b>Response:</b> Thank you for your comment. To clarify, the drafting team inserted “BES” as a qualifier in the pertinent objectives.</p>  |           |   |
| Central Lincoln   | No        | <p>Central Lincoln proposes the following be excluded: “Automatic transfer or system reconfiguration schemes intended to limit the extent and/or duration of outages; and not intended to benefit the BES.” These systems operate similar to reclosing, in that</p>   |

| Organization   | Yes or No | Question 4 Comment  |
|--|-----------|---|
|  |           | <p>they are intended to restore power quickly. Unlike reclosing, they may restore the power via an alternate path. We note the radial systems likely to benefit from auto-reconfiguration of load are unlikely to meet the BES definition, but the proposed definition of RAS has little dependency on the BES definition. The third RAS inclusion (Maintain acceptable System voltages) might be interpreted to include the auto-reconfiguration of load described above.</p>  |
| <p><b>Response:</b> Thank you for your comment. The drafting team contends that auto-sectionalizing for restoration following a Fault would typically fall under exclusion (d) “Automatic Reclosing schemes;” however, system reconfiguration schemes that transfer the load to another source typically would be a RAS.</p> |           |   |
| Tacoma Public Utilities  | No        | <ol style="list-style-type: none"> <li>1. Tacoma Power supports FMPA’s comments concerning Question 4.</li> <li>2. Furthermore, additional clarification seems necessary for (e): “Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss-of-field, transformer top-oil temperature, high voltage, or overload to protect the Element against damage by removing it from service.” Perhaps there could be another category for backing-up operator response and re-dispatch: “Locally sensing devices intended to mitigate thermal damage, within expected system re-dispatch response times, such as 10 minutes or greater. Examples are cooling fans, oil pumps, or thermal protection systems.”</li> <li>3. Does the phrase “power system stabilizers” need to be explicitly added to (f)?</li> <li>4. In the FAQ document, on page 5 of 8, under “Schemes that automatically de-energize a line for a non-Fault operation when one end of the line is open,” include something like the following two examples: (1) Opening the remote terminal(s) to remove an overload on the line in question following operation of the local terminal when there was no fault on the line in question and (2) opening the remote terminal(s) as a precaution against inadvertently closing back into a local island with generation.</li> </ol> |
| <p><b>Response:</b> Thank you for your comment.</p>  |           |   |

|---|-----------|---|
| <p>3. The drafting team asserts that, regardless of the scheme used to originally remove the generator from service (RAS or not), once the generator is disconnected from the System, the reasons for any subsequent automatic shutdown actions would not be a RAS and not subject to RAS oversight.</p>  |           |   |
| City of Vineland  | No        | Problems with determining a UVLS Program and RAS.   |
| <p><b>Response:</b> Thank you for your comment. The drafting team combined the posted exclusions (b) and (c) into a single exclusion (b) for this posting that reads: “Schemes for automatic under-frequency load shedding (UFLS) and automatic under-voltage load shedding (UVLS) comprised of only distributed relays.” The drafting team tailored this exclusion to match the language of the recently-approved “UVLS Program” definition.</p> |           |   |
| Hydro One   | No        | Local undervoltage load shedding schemes should be excluded, therefore, in the exclusion list, “c. Undervoltage load Shedding Programs (UVLS Programs)” should be changed to “c. Automatic undervoltage load shedding schemes, including UVLS Programs. However, centrally-controlled dispersed undervoltage load shedding schemes are RAS.”  |
| <p><b>Response:</b> Thank you for your comment. The drafting team combined the posted exclusions (b) and (c) into a single exclusion (b) for this posting that reads: “Schemes for automatic under-frequency load shedding (UFLS) and automatic under-voltage load shedding (UVLS) comprised of only distributed relays.” The drafting team tailored this exclusion to match the language of the recently-approved “UVLS Program” definition.</p> |           |   |
| ISO New England   | No        | <ol style="list-style-type: none"> <li>1. Exclusion “e.” is too broad. There are instances where an overcurrent device that opens a line should be considered a RAS. As currently written, these schemes would fall under exclusion “e.” and would no longer be considered RAS.</li> <li>2. Exclusion “j.” should be limited depending on the size of the island, as determined by the Reliability Coordinator. For example, in some areas 800 MW may be small for a single dedicated facility, but in other areas, an 800 MW island could be substantial.</li> <li>3. Exclusion “m.” should be limited to SSR protection schemes that act solely at the same station. It should read: “Sub-synchronous resonance (SSR) protection schemes that directly detect and act solely at the same station depending on sub-synchronous quantities (e.g. currents or torsional oscillations).”</li> </ol> |

| Organization  | Yes or No | Question 4 Comment   |
|---|-----------|--|
|   |           | <p>4. Another exclusion (“n.”) should be added to exclude schemes that are specifically designed to restore load (often called load throw-over schemes) so that they are not considered RAS. An example of this is a 115-kV line that has load tapped off the middle. After a fault on the line, switches automatically open up at the tapped station and each end of the 115 kV line tries to pick up the load. The unfaulted end of the line will restore the load, and the faulted end will trip out and remain open. However, we do not believe that schemes which are taking actions such as automatic network reconfiguration to reenergize equipment that was tripped as a result of fault clearing which is not restoring load should be excluded.</p> |
| <p><b>Response:</b> Thank you for your comment.</p> <ol style="list-style-type: none"> <li>The list of exclusions in the RAS definition is prefaced by the statement: “The following do not individually constitute a RAS.” The drafting team contends that an overcurrent device applied to a single Element would usually not be a RAS.</li> <li>The drafting team contends the MW size of the island is inconsequential with regards to the definition of a RAS.</li> <li>Exclusion (m) is consistent with present industry practices and the drafting team declined to make the suggested change. The proposed definition excludes schemes that directly detect sub-synchronous quantities; however, SSR mitigation schemes installed to detect distinct System configurations and loading conditions (that studies have shown may make a generator vulnerable to SSR), and take action to trip the generator or bypass the series capacitor, are classified as RAS.</li> <li>The drafting team contends that auto-sectionalizing for restoration following a Fault would typically fall under exclusion (d) “Automatic Reclosing schemes;” however, system reconfiguration which transfers the load to another source typically would be a RAS.</li> </ol> |           |  |
| Ingleside Cogeneration LP   | No        | <p>If the core definition is not modified as ICLP proposes in response to Question 1, we believe that an exclusion must be made for a protective scheme that takes corrective action “other than the isolation of faulted elements”. Without it, a relay owner will have to demonstrate to a CEA that they individually considered almost every relay system before determining that it is not a RAS. If there are such systems that isolate faulted elements and need RAS-like oversight, they can be explicitly listed under the core definition.</p>  |

| Organization  | Yes or No | Question 4 Comment  |
|---|-----------|---|
| <p><b>Response:</b> Thank you for your comment. The drafting team agrees and added a new exclusion (a) which reads: Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating the faulted Elements. The drafting team also added clarifying language in the FAQ.</p> |           |   |
| <p>Manitoba Hydro</p>   | <p>No</p> | <ol style="list-style-type: none"> <li>1. In the exclusion list a), it is not necessary to include power swing blocking.</li> <li>2. In the exclusion list e), it is not clear what “high voltage” here is intended to mean, does it mean overvoltage protection? Consider revise this as: “Schemes applied on an Element that react to non-Fault conditions, such as, but not limited to, generator loss-of-field protection, transformer top-oil temperature monitoring and protection, overvoltage protection, or overload protection to protect the Element itself against damage by removing it from service”</li> <li>3. In exclusion list f), “switch or regulate” needs clarification, for example, what does “switch or regulate generation excitation” mean? Is converting a unit from a generator to a synchronous condenser considered as switching of generation excitation?</li> <li>4. Also, “at the same station” needs clarification. For example, if a generator switching station is less than 1 km away from its generating station, can they be considered as the same station?</li> <li>5. The exclusion list covers transmission elements very well. One special transmission element missing is a braking resistor. Is use of a braking resistor a RAS or a permissible element used to maintain stability? Braking resistors are somewhat uncommon and could fall under the RAS definition.</li> <li>6. One special generator feature could be included in the exclusion list - fast valving. Fast valving is a common method used in steam turbines to improve stability and avoid generator tripping.</li> </ol> |
| <p><b>Response:</b> Thank you for your comment.</p>   |           |   |

| Organization  | Yes or No | Question 4 Comment  |
|---|-----------|---|
|   |           | <ol style="list-style-type: none"> <li>1. The existing NERC Glossary of Terms definition of SPS or RAS excludes out-of-step relaying because it is a protective function. The SDT maintained the exclusion but changed the wording from “out-of-step relaying” to “out-of-step tripping and power swing blocking” to reflect current industry terminology.</li> <li>2. The drafting team made the suggested change to “overvoltage.”</li> <li>3. The drafting team removed generator excitation from exclusion (f) and created a new exclusion (n) which reads: “Generator controls such as, but not limited to, automatic generation control (AGC), generation excitation [e.g. automatic voltage regulation (AVR) and power system stabilizers (PSS)], fast valving, and speed governing.”</li> <li>4. The drafting team contends that if the generating station and the switching station share infrastructure such as the same ground grid, then they could be considered to be the same station.</li> <li>5. The drafting team contends that a braking resistor would typically be a component of a RAS.</li> <li>6. Fast valving is included in the new exclusion (n).</li> </ol> |
| MidAmerican Energy Company  | No        | Exception "e" could be read to only include schemes that take the action of removing an element from service. If an action does something other than removing an element from service but its objective is to protect the element it should be included in this exception. Suggest removing the words "by removing it from service" be deleted from this exception.   |
| <p><b>Response:</b> Thank you for your comment. The SDT contends that switching in the same substation other than the impacted Element is too broad of an exclusion. Schemes that reconfigure the System should be RAS.</p> |           |   |
| Exelon Companies  | No        | Exception “c” of the proposed definition of RAS excludes “UVLS Programs”. The background information provided in the FAQ document suggests that the intent of using the term “UVLS Program” in this exclusion was to exclude UVLS schemes that are not centrally controlled. The Project 2008-02 Undervoltage Load Shedding drafting team states in their June 24, 2014 FAQ that UVLS schemes owned by Transmission Owners, Distribution Providers, or Transmission Operators but not required by the planners do not meet the attributes of the proposed defined term “UVLS Program” and are therefore not subject to the requirements of PRCâ€™010â€™1. This raises uncertainty as to whether such schemes, even if not centrally-controlled, are RAS, UVLS Programs, or neither. Please clarify whether  |

| Organization  | Yes or No | Question 4 Comment   |
|---|-----------|--|
|   |           | <p>exception “c” of the proposed definition of RAS would include a non-centrally-controlled UVLS scheme owned by a Transmission Owner, Distribution Provider, or Transmission Operator but not required by the Planning Coordinator or Transmission Planner, which is therefore not covered by the Project 2008-02 revisions to PRC-010. Exelon contends that such a scheme should not be considered a RAS.</p>  |
| <p><b>Response:</b> Thank you for your comment. The drafting team combined the posted exclusions (b) and (c) into a single exclusion (b) for this posting that reads: “Schemes for automatic under-frequency load shedding (UFLS) and automatic under-voltage load shedding (UVLS) comprised of only distributed relays.” The drafting team tailored this exclusion to match the language of the recently-approved “UVLS Program” definition.</p>   |           |  |
| <p>American Electric Power</p>  | <p>No</p> | <p>Once again, AEP believes the drafting team has done well in developing their exclusions list. As stated previously however, AEP believes it is unclear from the proposed definition and associated exclusions list whether automatic load rejection (ALR) of a generating unit is considered to be a Remedial Action Scheme. AEP believes that ALR is not an RAS and should be explicitly excluded in definition to avoid confusion.</p>  |
| <p><b>Response:</b> Thank you for your comment. An automatic load rejection scheme (ALR) may or may not be a RAS depending upon the application details.</p>  |           |  |
| <p>Omaha Public Power District</p>  | <p>No</p> | <p>The Omaha Public Power District (OPPD) believes that the exclusion list needs to be further clarified to state that the EMS/SCADA related schemes are not part of the RAS. Currently, this concern is addressed in the associated FAQ document; however, this document is not going to be part of the RAS Definition going forward. OPPD is concerned that lack of this clarity in the definition may cause inadvertent inclusion of schemes/systems that traditionally are not identified as RAS or SPS.</p> |
| <p><b>Response:</b> Thank you for your comment. The drafting team acknowledge that the EMS/SCADA can be a component of a RAS as described in the FAQ which reads: “The above-mentioned control systems support and enable grid operations by issuing control commands mostly to geographically distributed power System devices. In this normal application, e.g. automatic generation control (AGC), these systems are not considered to be RAS. However, if these systems are configured to detect predetermined conditions</p> |           |  |

| Organization  | Yes or No | Question 4 Comment   |
|---|-----------|--|
| <p>and take corrective actions consistent with the RAS definition, these automatic functions (not the entire EMS) would be considered to be part of a RAS. The identification of RAS is not dependent upon the specific hardware or platform utilized in the scheme. For example, an automatic UVLS scheme centrally controlled through an EMS would be a RAS.” The FAQ will remain as part of the documentation associated with the development of the RAS definition.</p>   |           |  |
| NRECA   | No        | <p>Although NRECA does not believe that Automatic Generation Control (AGC) is a Remedial Action Scheme (RAS), the definition of AGC includes “automatically adjusts generation” which for some NRECA members is implied in the “curtailing generation” language included in the RAS definition. For clarity, consider including AGC in the list of exclusions.</p>   |
| <p><b>Response:</b> Thank you for your comment. The drafting team acknowledges this needed addition and has added a new exclusion (n) which reads: “Generator controls such as, but not limited to, automatic generation control (AGC), generation excitation [e.g. automatic voltage regulation (AVR) and power system stabilizers (PSS)], fast valving, and speed governing.”</p>   |           |  |
| LCRA Transmission Services Corporation  | No        | <ol style="list-style-type: none"> <li>1. LCRA TSC recommends an additional example be included under the heading “The following do not individually constitute a RAS:” stated, “Protection systems installed to clear faults.”</li> <li>2. It appears that items F and G of the proposed definition are in conflict. Item G creates an exclusion that is taken away in item F for FACTS devices but leaves in place the limitation for switched shunts. LCRA TSC recommends revising items f. and g. as follows: f. Controllers that switch or regulate series or shunt reactive devices, flexible alternating current transmission system (FACTS) devices, phase-shifting transformers, variable-frequency transformers, tap-changing transformers, or generation excitation.</li> </ol> |
| <p><b>Response:</b> Thank you for your comment.</p> <ol style="list-style-type: none"> <li>1. The drafting team agrees and added a new exclusion (a) which reads: Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating the faulted Elements. The drafting team also added clarifying language in the FAQ.</li> <li>2. Exclusions (f) and (g) are complementary in that (f) provides a broad exception for local controls at the same station while (g) provides a specific exclusion for FACTS control of shunt devices at one or more other stations.</li> </ol> |           |  |

| Organization  | Yes or No | Question 4 Comment   |
|---|-----------|--|
| Consumers Energy Company  | No        | We recommend that the first more restrictive definition that applies only to the BES be adopted. If this were done, then we would vote affirmative for this definition.  |
| <p><b>Response:</b> Thank you for your comment. The drafting team agrees and inserted “BES” as a qualifier in the pertinent objectives. The drafting team further revised the objectives by deleting the last bullet that read: “Address other Bulk Electric System (BES) reliability concerns” negating the all-inclusive nature of the objectives.</p>                            |           |  |
| Austin Energy   | No        | The RAS definition is too broad as drafted and should specifically exclude control systems such as AGC, AVR, governor controls, etc. Suggested language is provided under number 1.  |
| <p><b>Response:</b> Thank you for your comment. The drafting team acknowledges this needed addition and has added a new exclusion (n) which reads: “Generator controls such as, but not limited to, automatic generation control (AGC), generation excitation [e.g. automatic voltage regulation (AVR) and power system stabilizers (PSS)], fast valving, and speed governing.”</p> |           |  |
| Tri-State Generation and Transmission Association, Inc.   | No        | Although Tri-State does not believe that Automatic Generation Control (AGC) is a Remedial Action Scheme (RAS), the definition of AGC includes “automatically adjusts generation” which for some may be implied in the “curtailing generation” language included in the RAS definition. For clarity, consider including AGC in the list of exclusions |
| <p><b>Response:</b> Thank you for your comment. The drafting team acknowledges this needed addition and has added a new exclusion (n) which reads: “Generator controls such as, but not limited to, automatic generation control (AGC), generation excitation [e.g. automatic voltage regulation (AVR) and power system stabilizers (PSS)], fast valving, and speed governing.”</p> |           |  |
| FirstEnergy Corp.   | Yes       | Exclusion "e", Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss-of-field, transformer top-oil temperature, high voltage, or overload to protect the Element against damage by removing it from service. Please provide clarification on this exclusion.   |
| <p><b>Response:</b> Thank you for your comment. The drafting team contends these schemes are protective functions applied on an Element to protect it from damage, and as such, are not RAS.</p>  |           |  |

| Organization  | Yes or No | Question 4 Comment  |
|---|-----------|---|
| Tennessee Valley Authority  | Yes       | We think it’s appropriate to address exclusions, however when the exclusion list is this long (and perhaps growing) it highlights the challenge in developing a good base definition for what constitutes a RAS NERC-wide. An alternative would be to “catalog” the RAS exclusions in a separate NERC reference document that could be revised without revising the base RAS definition.  |
| <p><b>Response:</b> Thank you for your comment. The drafting team declines to make the suggested change because having separate documents is more cumbersome.</p>   |           |   |
| Duke Energy   | Yes       | Duke Energy does agree with the exclusion list, however, we request clarification on exclusion “a. Out of step tripping and power swing blocking.” Does the exclusion apply when transfer trips and supervisory signals are used as an integral part of the Out of step tripping (OST) and power swing blocking (PSB) functions? It is possible to have an OST or a PSB and transfer a trip to many locations as part of that signal. It is also possible to have supervisory signals such as Voltage to enable the OST and PSB functions. A combination of signals and the transfer of signals are present, and we ask the standard drafting team if the intent was to exclude all of the possible functionalities/associated signals capable from an OST and PSB. |
| <p><b>Response:</b> Thank you for your comment. The drafting team contends that OST and PSB functions within a substation are typically not a RAS. The drafting team contends that two or more exclusions taken together may or may not constitute a RAS. Individually, an exclusion is not a RAS; however, any of the exclusion(s) could be an integral part of a larger scheme that meets the RAS definition.</p> |           |   |
| SERC Protection and Controls Subcommittee   | Yes       |   |
| IRC Standards Review Committee  | Yes       | 1. Exclusion “m.” should be limited to SSR protection schemes that act solely at the same station. It should read: “Sub-synchronous resonance (SSR) protection schemes that directly detect and act solely at the same station depending on sub-synchronous quantities (e.g. currents or torsional oscillations).”  |

| Organization   | Yes or No | Question 4 Comment   |
|--|-----------|--|
|  |           | <p>2. Another exclusion (“n.”) should be added to exclude schemes that are specifically designed to restore load (often called load throw-over schemes) so that they are not considered RAS. An example of this is a 115-kV line that has load tapped off the middle. After a fault on the line, switches automatically open up at the tapped station and each end of the 115 kV line tries to pick up the load. The unfaulted end of the line will restore the load, and the faulted end will trip out and remain open. However, we do not believe that schemes which are taking actions such as automatic network reconfiguration to reenergize equipment that was tripped as a result of fault clearing which is not restoring load should be excluded.</p> |
| <p><b>Response:</b> Thank you for your comment.</p> <p>1. Exclusion (m) is consistent with present industry practices and the drafting team declines to make the suggested change. The proposed definition excludes schemes that directly detect sub-synchronous quantities; however, SSR mitigation schemes installed to detect distinct System configurations and loading conditions (that studies have shown may make a generator vulnerable to SSR), and take action to trip the generator or bypass the series capacitor, are classified as RAS.</p> <p>2. The drafting team contends that auto-sectionalizing for restoration following a Fault would typically fall under exclusion (d) “Automatic Reclosing schemes;” however, system reconfiguration schemes that transfer the load to another source typically would be a RAS.</p> |           |  |
| Bonneville Power Administration  | Yes       |  |
| ACES Standards Collaborators   | Yes       | We agree that the exclusion list is very detailed and helpful.   |
| <p><b>Response:</b> Thank you for your comment.</p>  |           |  |
| CenterPoint Energy   | Yes       | <p>1. (a) CenterPoint Energy believes the use of the capitalized term “UVLS Programs” is appropriate based upon the currently posted definition of “UVLS Program” that is proposed in NERC Project 2008-02 Undervoltage Load Shedding PRC-010-1.</p>   |

| Organization | Yes or No | Question 4 Comment  |
|--------------|-----------|---|
|              |           | <p>2. (b) CenterPoint Energy suggests changing “Autoreclosing schemes” to “Automatic reclosing schemes” (item d) to be consistent with other NERC documents, such as, Reliability Standard PRC-005-3 Protection System and Automatic Reclosing Maintenance.</p> <p>3. (c) The extensive list of what is not a RAS appears to be well developed with thirteen schemes specifically identified. However, with the opening sentence currently stating “The following do not individually constitute a RAS”, it appears to be a finite list that would require a revision of the definition to include other possible control schemes. To not limit the list, CenterPoint Energy recommends the opening sentence be changed to “The following are examples of schemes that do not constitute a RAS”. (d) CenterPoint Energy is concerned that the use of the term “individually” in the opening sentence, which currently states “The following do not individually constitute a RAS”, reduces the clarity and specificity of the definition. Without clarity, this could result in inconsistent application across regions. As an example, if an entity has both a UVLS Program on their system and FACTS devices at a few locations, are these installations now considered to be collectively a RAS as opposed to individually? Under the existing NERC definition for SPS that states “An SPS does not include (a) underfrequency of Undervoltage load shedding”, there would not be any confusion that these installations are not RAS. Of the thirteen items on the exclusions list, there is only one example (item d for autoreclosing) in the project FAQ document that provides insight of the team’s intention with the use of “individually”. CenterPoint Energy suggests deleting the word “individually” by changing the opening sentence to “The following are examples of schemes that do not constitute a RAS”. Alternately, it may be possible to develop additional wording in the definition to codify the intent of the use of the term “individually”. In addition, CenterPoint Energy recommends that the project FAQ document include additional examples to help clarify the intent.</p> |

| Organization  | Yes or No | Question 4 Comment  |
|---|-----------|---|
|   |           | <p>4. As an alternative to the FAQ document, NERC could instead develop an Applications Guidelines document, with specific examples, for the definition of RAS.</p>   |
| <p><b>Response:</b> Thank you for your comment.</p> <ol style="list-style-type: none"> <li>The drafting team combined the posted exclusions (b) and (c) into a single exclusion (b) for this posting that reads: “Schemes for automatic under-frequency load shedding (UFLS) and automatic under-voltage load shedding (UVLS) comprised of only distributed relays.” The drafting team tailored this exclusion to match the language of the recently-approved “UVLS Program” definition.</li> <li>The drafting team agrees and made the suggested change.</li> <li>The drafting team disagrees and declined to make the suggested change. In the cited example, if the few FACTS devices and a UVLS program are controlled independently from each other, they would not be collectively regarded as a RAS.</li> <li>The FAQ will remain as part of the documentation associated with the development of the RAS definition.</li> </ol> |           |   |
| Pepco Holdings Inc  | Yes       |   |
| American Transmission Company, LLC  | Yes       |   |
| Xcel Energy   | Yes       | <p>We also feel that sudden pressure relays (SPRs) should also be explicitly stated in item "e".</p>  |
| <p><b>Response:</b> Thank you for your comment. The drafting team agrees that SPRs are a legitimate example but declines to make the addition because the list is not intended to be all-inclusive.</p>   |           |   |
| Idaho Power   | Yes       | <p>We would like to see Protection System operations and fault clearing included as an exception. We feel this will better separate RAS actions from Protection System operations, e.g. fault clearing or generator loss of field tripping.</p> |
| <p><b>Response:</b> Thank you for your comment. The drafting team agrees and added a new exclusion (a) which reads: Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating the faulted Elements.</p>  |           |   |

**5. Do you agree with the time frames in the proposed Implementation Plan associated with the proposed definition of RAS? Please provide specific comments in support of your position.**

**Summary Consideration:**

Approximately 75% of commenters agreed with the time frames in the proposed Implementation Plan associated with the definition of RAS. The commenters that replied “no” to the question had a variety of thoughts and alternative approaches but overall did not offer any compelling argument to change the stated time frames. The drafting team reiterated that the Implementation Plan provides thirty-six (36) months from the time the definition is approved by an applicable governmental authority. The time is noted in the twelve (12) months leading up to the Effective Date of the standard plus the twenty four (24) months noted following the Effective Date. This only applies to existing schemes that must transition to RAS due to the revised definition. Future RAS are not subject to this Implementation Plan. When the drafting team revises the RAS-related standards, those standards will include their own implementation periods.

| Organization   | Yes or No | Question 5 Comment   |
|--|-----------|--|
| Florida Municipal Power Agency   | No        | A thorough review of all the standards and their use of Protection Systems should be factored into the implementation plan.  |
| <p><b>Response:</b> Thank you for your comment. The drafting team agrees that a thorough review of all standards is prudent and asserts that the time period provided in the Implementation Plan is sufficient to evaluate existing compliance programs regarding the definition change.</p> |           |  |
| SPP Standards Review Group   | No        | <ol style="list-style-type: none"> <li>1) We suggest extending the time frame from twenty-four (24) months to thirty-six (36) months. There are many elements that have to be considered when establishing a new RAS. For example, identifying new facilities/equipment, budgeting, outage coordination and receiving necessary approvals will require large amounts of time.</li> <li>2) We would like to commend the SPS SDT on the quality of the documents in this posting. We did not find a single typo/grammatical error that are so typically present in these postings. Well done and thank you.</li> </ol> |
| <p><b>Response:</b> Thank you for your comment.</p>  |           |  |

| Organization  | Yes or No | Question 5 Comment  |
|---|-----------|---|
| <p>1. As a point of clarification, the Implementation Plan already provides thirty-six (36) months from the time the definition is approved by an applicable governmental authority. The time is noted in the twelve (12) months leading up to the Effective Date of the standard plus the twenty four (24) months noted following the Effective Date. This only applies to existing schemes that must transition to RAS due to the revised definition. When the drafting team revises the RAS-related standards, those standards will include their own implementation periods.</p> <p>2. Thank you for your compliment.</p> |           |   |
| Tacoma Public Utilities   | No        | <p>Tacoma Power supports FMPA’s comments concerning Question 5. Furthermore, in the FAQ document, on page 7 of 8, under “What are the Implementation Plan time frames,” in the second paragraph, it should be 24 calendar months (or longer if the drafting team extends the timefram) from the effective date (see page 6 of the Implementation Plan), not 24 calendar months beyond the date of approval by a governmental authority.</p>   |
| <p><b>Response:</b> Thank you for your comments. Please refer to our responses to FMPA above. The language in the FAQ document has been clarified.</p>  |           |   |
| CenterPoint Energy  | No        | <p>CenterPoint Energy recommends implementing the proposed definition of RAS and retirement of SPS as soon as practicable to incorporate the clarifications and help provide consistent application across all regions more quickly. Instead of 12 months, we suggest the definition become effective the first day of the first quarter after needed approvals. As this change would impact the proposed implementation plan time frame for newly-identified RAS resulting from the revised definition, we suggest changing the proposed twenty-four (24) months to thirty-six (36) months after the Effective Date of the definition.</p> |
| <p><b>Response:</b> Thank you for your comments. The drafting team does not see any benefit in making the definition effective immediately. Either way, entities will have at least thirty-six (36) months to identify RAS and become compliant with the existing RAS-related standards. This applies only to existing schemes that must transition to RAS due to the revised definition. Future RAS are not subject to this Implementation Plan. The new RAS-related standards will have separate effective dates and implementation plans of their own.</p>   |           |   |
| City of Vineland  | No        |   |

| Organization  | Yes or No | Question 5 Comment   |
|---|-----------|--|
| ISO New England   | No        | 24 months will be needed due to all the changes in documentation that will be required to address the revised definition.  |
| <p><b>Response:</b> Thank you for your comment. The revisions to the RAS definition should not require substantial changes for existing RAS-related documentation. For newly identified RAS, the time necessary for revisions is provided for in the Implementation Plan.</p> |           |  |
| Manitoba Hydro  | No        | The effective date for the revised Reliability Standards should be specific for each revised standard, and it should be specified in each revised standard.  |
| <p><b>Response:</b> Thank you for your comment. The drafting team revised the Effective Dates of each standard such that it is standard specific. The timing of the Effective Dates for the standards will coincide with the Effective Date of the RAS definition.</p>        |           |  |
| Nebraska Public Power District  | No        | <p>Also, see SPP group comments. The FAQ document states: “The classification of a RAS is not necessary for defining whether or not a scheme qualifies as a RAS. Informal feedback from many stakeholders indicated uncertainty about the classification types. Therefore, the SDT decided not to include RAS classification types within the definition. The classifications are more appropriately addressed concurrently with revisions to the RAS related Reliability Standards. It appears the RAS classification types that are to be included in the RAS reliability standards will be a significant change that needs to be clarified before a full identification of RAS schemes and subsequent design requirements can be accurately completed if they are to be used. If other NERC standards must be updated or rewritten such as PRC or TPL standards in conjunction with this definition to clarify classification changes it is recommended the implementation plan specify that the proposed definition implementation not become effective until or following the most critically related RAS standards that would be updated in order to avoid confusion how the definition relates to existing or as yet un-revised standards. The FAQ document states “The Implementation Plan also provides owners of newly identified RAS twenty-four (24) calendar months beyond the date of approval by a governmental authority to be fully compliant with all standards applicable to the revised definition of Remedial Action Scheme. The drafting team contends that twenty-four (24) calendar months provides the RAS owner sufficient time to become compliant with the revised standards proposed in</p> |

| Organization  | Yes or No | Question 5 Comment   |
|---|-----------|--|
|   |           | <p>the implementation Plan. If it is possible the RAS definition may include new schemes or require complete redundancy modifications near large generating plants that have long outage schedules due to any classification changes it seems the 2 year implementation time frame could be too short. It seems a minimum of 4 to 6 years for an implementation time frame would be more logical for modification changes based on the possible classification types. This would reduce the risk of unplanned or additional generation outages in order to meet this standard.</p>   |
| <p><b>Response:</b> Thank you for your comments. The drafting team does not see any benefit in making the definition effective immediately. Either way, entities will have at least thirty-six (36) months to identify RAS and become compliant with the existing RAS-related standards. This applies only to existing schemes that must transition to RAS due to the revised definition. Future RAS are not subject to this Implementation Plan. The new RAS-related standards will have separate effective dates and implementation plans of their own.</p> |           |  |
| Ameren  | No        | <ol style="list-style-type: none"> <li>1. Direct substitution of RAS for SPS works in almost all cases, except for PRC-005-2, and - 3 section 4 Applicability 4.2.4 where it contradicts part of your proposed RAS definition “These schemes are not Protection Systems; however, they may share components with Protection Systems.” We request the drafting team reword PRC-005-2 and -3 section 4.2.4 by adding ‘Components’ and ‘part of’ to yield the following: “Protection System Components installed as part of a Remedial Action Scheme (RAS) for BES reliability.”</li> <li>2. We request the drafting team to drop the word ‘other’ that’s in front of ‘protection systems’ in PRC-012, PRC-013, PRC-014, PRC-015, and PRC-016 because it can be read to imply that a RAS is a protection system, which contradicts with part of your proposed RAS definition “These schemes are not Protection Systems; however, they may share components with Protection Systems.”</li> </ol> |
| <p><b>Response:</b> Thank you for your comments.</p> <ol style="list-style-type: none"> <li>1. Please see the drafting team’s response to FMPA for Question 1.</li> </ol>   |           |  |

| Organization  | Yes or No | Question 5 Comment   |
|---|-----------|--|
| <p>2. The drafting team is currently developing only the RAS definition. The RAS-related standards development will begin in 2015 subsequent to the approval of the new definition. Any changes to other standards needed related to the new definition of RAS will occur at that time. The current standard changes proposed are only intended to accomplish the replacement of the term SPS with RAS.</p> |           |  |
| Austin Energy   | No        | A thorough review of all the standards and their use of Protection Systems should be factored into the implementation plan.  |

| Independent Electricity System Operator   | Yes       |   |
| Oncor Electric Delivery LLC   | Yes       | The RAP and SPS definition are already being used within ERCOT and apply to and are referenced in numerous guides, procedures and protocols. Many of ERCOTs RAP's are not automatic and are used frequently within the system to maintain reliability under various operating conditions. Updating SPS to the new term RAS through ERCOT's process of revising their documents will not only be a significant challenge but could also cause confusion with the RAP term. |
| <p><b>Response:</b> Thank you for your comments. The drafting team appreciates the fact that the selected term will cause some necessary documentation changes for many entities. The drafting team asserts that the use of the single term RAS will ensure consistency and avoid the confusion associated with the SPS term. The drafting team acknowledges that entities will need time to adapt to the RAS term.</p> |           |   |
| Tri-State Generation and Transmission Association, Inc.   | Yes       |   |
| Colorado Springs Utilities  |           | No Comments   |
| Tennessee Valley Authority  |           | Three years seems like a reasonable implementation period (a 1 year period for the definition to go into effect and a 2 year period for any existing scheme pulled into the definition to be brought into compliance). However, with 38 additional standards to be revised, this could entail more work than anticipated to ensure full compliance with each one under the new definition.  |
| <p><b>Response:</b> Thank you for your comments. The drafting team appreciates the fact that the selected term will cause some necessary documentation changes for many entities. The drafting team asserts that the use of the single term RAS will benefit the industry. The revised Reliability Standards will reflect the use of the single term RAS.</p>   |           |   |

**END OF REPORT**

## Proposed Definition of “Remedial Action Scheme”

### *Remedial Action Scheme (RAS)*

A scheme designed to detect predetermined System conditions and automatically take corrective actions that may include, but are not limited to, adjusting or tripping generation (MW and Mvar), tripping load, or reconfiguring a System(s). RAS accomplish objectives such as:

- Meet requirements identified in the NERC Reliability Standards;
- Maintain Bulk Electric System (BES) stability;
- Maintain acceptable BES voltages;
- Maintain acceptable BES power flows;
- Limit the impact of Cascading or extreme events.

The following do not individually constitute a RAS:

- a. Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating the faulted Elements
- b. Schemes for automatic underfrequency load shedding (UFLS) and automatic undervoltage load shedding (UVLS) comprised of only distributed relays
- c. Out-of-step tripping and power swing blocking
- d. Automatic Reclosing schemes
- e. Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss-of-field, transformer top-oil temperature, overvoltage, or overload to protect the Element against damage by removing it from service
- f. Controllers that switch or regulate one or more of the following: series or shunt reactive devices, flexible alternating current transmission system (FACTS) devices, phase-shifting transformers, variable-frequency transformers, or tap-changing transformers; and, that are located at and monitor quantities solely at the same station as the Element being switched or regulated
- g. FACTS controllers that remotely switch static shunt reactive devices located at other stations to regulate the output of a single FACTS device
- h. Schemes or controllers that remotely switch shunt reactors and shunt capacitors for voltage regulation that would otherwise be manually switched
- i. Schemes that automatically de-energize a line for a non-Fault operation when one end of the line is open
- j. Schemes that provide anti-islanding protection (e.g., protect load from effects of being isolated with generation that may not be capable of maintaining acceptable frequency and voltage)

- k. Automatic sequences that proceed when manually initiated solely by a System Operator
- l. Modulation of HVdc or FACTS via supplementary controls, such as angle damping or frequency damping applied to damp local or inter-area oscillations
- m. Sub-synchronous resonance (SSR) protection schemes that directly detect sub-synchronous quantities (e.g., currents or torsional oscillations)
- n. Generator controls such as, but not limited to, automatic generation control (AGC), generation excitation [e.g. automatic voltage regulation (AVR) and power system stabilizers (PSS)], fast valving, and speed governing

## Existing Definitions – Glossary of Terms Used in NERC Reliability Standards

### *Special Protection System (Remedial Action Scheme)*

An automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and Mvar), or system configuration to maintain system stability, acceptable voltage, or power flows. An SPS does not include (a) underfrequency or undervoltage load shedding or (b) fault conditions that must be isolated or (c) out-of-step relaying (not designed as an integral part of an SPS). Also called Remedial Action Scheme.

### *Remedial Action Scheme*

See “Special Protection System”

## Proposed Definition of “Remedial Action Scheme”

### *Remedial Action Scheme (RAS)*

A scheme designed to detect predetermined System conditions and automatically take corrective actions that may include, but are not limited to, ~~curtailing adjusting~~ or tripping generation ~~or other sources,~~ ~~curtailing or (MW and Mvar),~~ tripping load, or reconfiguring a System(s). RAS accomplish ~~one or more of the following~~ objectives such as:

- Meet requirements identified in the NERC Reliability Standards;
- Maintain Bulk Electric System (BES) stability;
- Maintain acceptable System BES voltages;
- Maintain acceptable BES power flows;
- Limit the impact of Cascading; or
- ~~Address other Bulk Electric System (BES) reliability concerns.~~

~~These schemes are not Protection Systems; however, they may share components with Protection Systems extreme events.~~

The following do not individually constitute a RAS:

- ~~a.~~ Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating the faulted Elements
- ~~b.~~ Schemes for automatic underfrequency load shedding (UFLS) and automatic undervoltage load shedding (UVLS) comprised of only distributed relays
- ~~a-c.~~ Out-of-step tripping and power swing blocking
- ~~a.~~ Automatic ~~underfrequency load shedding (UFLS) programs~~
- ~~b.~~ ~~Undervoltage Load Shedding Programs (UVLS Programs)~~
- ~~b-d.~~ Autoreclosing/Reclosing schemes
- ~~e-e.~~ Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss-of-field, transformer top-oil temperature, high voltage overvoltage, or overload to protect the Element against damage by removing it from service
- ~~d-f.~~ Controllers that switch or regulate one or more of the following: series or shunt reactive devices, flexible alternating current transmission system (FACTS) devices, phase-shifting transformers, variable-frequency transformers, or tap-changing transformers, ~~or generation excitation,~~; and, that are located at and monitor quantities solely at the same station as the Element being switched or regulated

- ~~e.g.~~ FACTS controllers that remotely switch static shunt reactive devices located at other stations to regulate the output of a single FACTS device
- ~~f.h.~~ Schemes or controllers that remotely switch shunt reactors and shunt capacitors for voltage regulation that would otherwise be manually switched
- ~~g.i.~~ Schemes that automatically de-energize a line for a non-Fault operation when one end of the line is open
- ~~h.j.~~ Schemes that provide anti-islanding protection (e.g., protect load from effects of being isolated with generation that may not be capable of maintaining acceptable frequency and voltage)
- ~~i.k.~~ Automatic sequences that proceed when manually initiated solely by ~~an operator~~ a System Operator
- ~~j.l.~~ Modulation of HVdc or FACTS via supplementary controls, such as angle damping or frequency damping applied to damp local or inter-area oscillations
- ~~k.m.~~ \_\_\_\_\_ Sub-synchronous resonance (SSR) protection schemes that directly detect sub-synchronous quantities (e.g., currents or torsional oscillations)
- n. Generator controls such as, but not limited to, automatic generation control (AGC), generation excitation [e.g. automatic voltage regulation (AVR) and power system stabilizers (PSS)], fast valving, and speed governing

## **Existing ~~NERC Definitions~~ – Glossary of Terms ~~Definitions~~ Used in NERC Reliability Standards**

### *Special Protection System (Remedial Action Scheme)*

An automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and Mvar), or system configuration to maintain system stability, acceptable voltage, or power flows. An SPS does not include (a) underfrequency or undervoltage load shedding or (b) fault conditions that must be isolated or (c) out-of-step relaying (not designed as an integral part of an SPS). Also called Remedial Action Scheme.

### *Remedial Action Scheme*

See “Special Protection System”

# Implementation Plan for the Revised Definition of “Remedial Action Scheme”

## Project 2010-05.2 – Special Protection Systems

### Background

The existing Glossary of Terms Used in NERC Reliability Standards definition for “Special Protection System” (“SPS”) or “Remedial Action Scheme” (“RAS”) lacks the specificity necessary to consistently identify what equipment or protection schemes qualify as SPS/RAS across the eight NERC Regions. The existing definition also does not clearly stipulate the characteristics of a SPS/RAS. The actions listed in the definition of SPS, which are incorporated by cross reference (NERC Glossary of Terms) into the definition of RAS, are ambiguous and may unintentionally include equipment whose purpose is not expressly related to preserving System reliability in response to predetermined System conditions. Employing a single term, i.e., RAS, and clarifying its definition will lead to more consistent application of the NERC Reliability Standards related to RAS.

The proposed definition of RAS must be broad to include the variety of System conditions monitored and corrective actions taken by RAS. This “broadness,” however, necessitates an exclusion list because without the exclusions, equipment and schemes that should not be considered RAS could be subject to the requirements of the RAS-related Reliability Standards. The exclusion list assures that commonly applied protection and control systems are not unintentionally included as RAS.

The Project 2010-05.2 SPS SDT is coordinating the development of the RAS definition with the development of PRC-010-1 by the SDT for Project 2008-02 – Undervoltage Load Shedding. The UVLS SDT is introducing a new NERC Glossary term, UVLS Program, to clearly establish applicability of PRC-010-1. The proposed term UVLS Program is defined as: “An automatic load shedding program consisting of distributed relays and controls used to mitigate undervoltage conditions leading to voltage instability, voltage collapse, or Cascading impacting the Bulk Electric System (BES). Centrally controlled undervoltage-based load shedding is not included.”

Note that the proposed definition excludes centrally controlled undervoltage-based load shedding. The UVLS SDT maintains that the design and characteristics of centrally controlled undervoltage-based load shedding are commensurate with RAS (wherein load shedding is the remedial action) and, as such, should be subject to RAS-related Reliability Standards. The Project 2010-05.2 SPS SDT agrees with this assessment and revised the definition of RAS to clarify that it is exclusive of distributed UVLS relays including the newly defined term UVLS Program. Therefore, the definition is inclusive of centrally controlled undervoltage-based load shedding. Collectively, the two definitions will promote consistency in the identification of centrally controlled undervoltage-based load shedding as RAS. The coordination of these revisions is required to maintain coverage of those systems and prevent a reliability gap. As a result of these revisions, all NERC Reliability Standards that include the term RAS will be applicable to

centrally controlled undervoltage-based load shedding upon the effective dates of the revised definitions of RAS and UVLS Program.

**Requested Approvals**

Definition of “**Remedial Action Scheme**” and the standards listed below

The following standards are proposed for approval to align the use of the single defined term RAS. This list is intended to reflect Reliability Standards currently in effect at the time of Project development. In certain cases, a standard listed below for approval may already be retired pursuant to an implementation plan of a successor version by the time the definition of “Remedial Action Scheme” becomes effective in a particular jurisdiction. In these cases, the standard below will not become effective.

The standard numbers below currently include an (X) to indicate the version numbering will be updated. Some standards are open in current projects and others are pending with governmental authorities. As a result, NERC will assign the appropriate version number prior to BOT adoption.

TPL-004-0a

### General Considerations

The entity shall modify its processes as necessary to account for the revised definition. The revised definition of RAS clarifies that it is inclusive of centrally controlled undervoltage-based load shedding. Entities may have additional changes to the classification of certain schemes to align them with the revised definition.

This Implementation Plan provides additional time for entities with newly identified RAS to become compliant with the Reliability Standards during the transition to the revised definition.

All aspects of the Implementation Plans for PRC-005-2 and PRC-005-3 will remain applicable to PRC-005-2(X) and PRC-005-3(X). These implementation plans are incorporated here by reference.

### Prerequisite Approvals

NERC Reliability Standard PRC-010-1 – Undervoltage Load Shedding  
Definition of “Undervoltage Load Shedding Program (UVLS Program)” in Project 2008-02 Undervoltage Load Shedding

### Revisions to the NERC Glossary of Terms

The drafting team proposes the following revised definition:

#### Remedial Action Scheme (RAS)

A scheme designed to detect predetermined System conditions and automatically take corrective actions that may include, but are not limited to, adjusting or tripping generation (MW and Mvar), tripping load, or reconfiguring a System(s). RAS accomplish objectives such as:

- Meet requirements identified in the NERC Reliability Standards;
- Maintain Bulk Electric System (BES) stability;
- Maintain acceptable BES voltages;
- Maintain acceptable BES power flows;
- Limit the impact of Cascading or extreme events.

The following do not individually constitute a RAS:

- a. Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating the faulted Elements
- b. Schemes for automatic underfrequency load shedding (UFLS) and automatic undervoltage load shedding (UVLS) comprised of only distributed relays
- c. Out-of-step tripping and power swing blocking
- d. Automatic Reclosing schemes

- e. Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss-of-field, transformer top-oil temperature, overvoltage, or overload to protect the Element against damage by removing it from service
- f. Controllers that switch or regulate one or more of the following: series or shunt reactive devices, flexible alternating current transmission system (FACTS) devices, phase-shifting transformers, variable-frequency transformers, or tap-changing transformers; and, that are located at and monitor quantities solely at the same station as the Element being switched or regulated
- g. FACTS controllers that remotely switch static shunt reactive devices located at other stations to regulate the output of a single FACTS device
- h. Schemes or controllers that remotely switch shunt reactors and shunt capacitors for voltage regulation that would otherwise be manually switched
- i. Schemes that automatically de-energize a line for a non-Fault operation when one end of the line is open
- j. Schemes that provide anti-islanding protection (e.g., protect load from effects of being isolated with generation that may not be capable of maintaining acceptable frequency and voltage)
- k. Automatic sequences that proceed when manually initiated solely by a System Operator
- l. Modulation of HVdc or FACTS via supplementary controls, such as angle damping or frequency damping applied to damp local or inter-area oscillations
- m. Sub-synchronous resonance (SSR) protection schemes that directly detect sub-synchronous quantities (e.g., currents or torsional oscillations)
- n. Generator controls such as, but not limited to, automatic generation control (AGC), generation excitation [e.g. automatic voltage regulation (AVR) and power system stabilizers (PSS)], fast valving, and speed governing

### **Conforming Changes to Other Standards**

The existing Reliability Standards proposed for retirement contain references to SPS or RAS or both. The revised Reliability Standards will reflect the use of the single term RAS. The revised Reliability Standards noted above for approval are included in a separate document *Revised Reliability Standards for the Revised Definition of "Remedial Action Scheme."*

### **Effective Date for Revised Reliability Standards and Definition**

Except as noted below, the revised Reliability Standards and the revised definition of "Remedial Action Scheme" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standards and definition are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard and the definition shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standards and definition are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

PRC-024-1(X) shall become effective on the later of the Effective Date of PRC-024-1 or the first day of the first calendar quarter that is twelve (12) months after the date the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, PRC-024-1(X) shall become effective on the later of the Effective Date of PRC-024-1 or on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

### **Implementation Plan for Newly Identified Remedial Action Schemes (RAS)**

Entities with newly identified “Remedial Action Scheme” (RAS) resulting from the application of the revised definition must be fully compliant with all Reliability Standards applicable RAS twenty-four (24) months from the Effective Date of the revised definition of RAS. This additional time applies only to existing schemes that must transition to RAS due to the revised definition. The additional time does not apply to future RAS that may be created following implementation of the revised definition.

### **Retirement of Existing Standards and Definitions**

The requested Reliability Standards for retirement shall be retired at midnight of the day immediately prior to the Effective Date of its successor standard in the particular jurisdiction in which the revised definition is becoming effective. The current definition of “Remedial Action Scheme” shall be retired at midnight of the day immediately prior to the Effective Date of the revised definition of “Remedial Action Scheme”.

# Implementation Plan for the Revised Definition of “Remedial Action Scheme”

## Project 2010-05.2 – Special Protection Systems

### Background

The existing [NERC Glossary of Terms Used in NERC Reliability Standards](#) definition for “Special Protection System” (“SPS”) or “Remedial Action Scheme” (“RAS”) lacks the specificity necessary to consistently identify what equipment or protection schemes qualify as SPS ~~or~~ /RAS across the eight NERC Regions. The existing definition also does not clearly stipulate the characteristics of a SPS ~~or~~ /RAS. The actions listed in the definition of SPS, which are incorporated by cross reference (NERC Glossary of Terms) into the definition of RAS, are ambiguous and may unintentionally include equipment whose purpose is not expressly related to preserving System reliability in response to predetermined System conditions. Employing a single term, i.e., RAS, and clarifying its definition will lead to more consistent application of the NERC Reliability Standards related to RAS.

The proposed definition of RAS must be broad to include the variety of System conditions monitored and corrective actions taken by RAS. This “broadness,” however, necessitates an exclusion list because without the exclusions, equipment and schemes that should not be considered RAS could be subject to the requirements of the RAS-related Reliability Standards. The exclusion list assures that commonly applied protection and control systems are not unintentionally included as RAS.

The Project 2010-05.2 SPS SDT is coordinating the development of the RAS definition with the development of PRC-010-1 by the SDT for Project 2008-02 – Undervoltage Load Shedding. The UVLS SDT is introducing a new NERC Glossary term, UVLS Program, to clearly establish applicability of PRC-010-1. The proposed term UVLS Program is defined as: “An automatic load shedding program consisting of distributed relays and controls used to mitigate undervoltage conditions leading to voltage instability, voltage collapse, or Cascading impacting the Bulk Electric System (BES). Centrally controlled undervoltage-based load shedding is not included.”

Note that the proposed definition excludes centrally controlled undervoltage-based load shedding. The UVLS SDT maintains that the design and characteristics of centrally controlled undervoltage-based load shedding are commensurate with RAS (wherein load shedding is the remedial action) and, as such, should be subject to RAS-related Reliability Standards. The Project 2010-05.2 SPS SDT agrees with this assessment and revised the definition of RAS to clarify that it is [exclusive of distributed UVLS relays including the newly defined term UVLS Program. Therefore, the definition is](#) inclusive of centrally controlled undervoltage-based load shedding. Collectively, the two definitions will promote consistency in the identification of centrally controlled undervoltage-based load shedding as RAS. The coordination of these revisions is required to maintain coverage of those systems and prevent a reliability gap. As a result of these revisions, all NERC Reliability Standards that include the term RAS will be applicable to

centrally controlled undervoltage-based load shedding upon the effective dates of the revised definitions of RAS and UVLS Program.

**Requested Approvals**

Definition of “**Remedial Action Scheme**” and the standards listed below

The following standards are proposed for approval to align the use of the single defined term RAS. This list is intended to reflect Reliability Standards currently in effect at the time of Project development. In certain cases, a standard listed below for approval may already be retired pursuant to an implementation plan of a successor version by the time the definition of “Remedial Action Scheme” becomes effective in a particular jurisdiction. In these cases, the standard below will not become effective.

The standard numbers below currently include an (X) to indicate the version numbering will be updated. Some standards are open in current projects and others are pending with governmental authorities. As a result, NERC will assign the appropriate version number prior to BOT adoption.

**General Considerations**

The entity shall modify its processes as necessary to account for the revised definition. The revised definition of RAS clarifies that it is inclusive of centrally controlled undervoltage-based load shedding. Entities may have additional changes to the classification of certain schemes to align them with the revised definition.

This Implementation Plan provides additional time for entities with newly-identified RAS to become compliant with the Reliability Standards during the transition to the revised definition.

All aspects of the Implementation Plans for PRC-005-2 and PRC-005-3 will remain applicable to PRC-005-2(X) and PRC-005-3(X). These implementation plans are incorporated here by reference.

**Prerequisite Approvals**

NERC Reliability Standard PRC-010-1 – Undervoltage Load Shedding  
 Definition of “Undervoltage Load Shedding Program (UVLS Program)” in Project 2008-02 Undervoltage Load Shedding

**Revisions to the NERC Glossary of Terms**

The drafting team proposes the following revised definition:

**Remedial Action Scheme (RAS)**

A scheme designed to detect predetermined System conditions and automatically take corrective actions that may include, but are not limited to, ~~curtailing adjusting~~ or tripping generation ~~or other sources,~~ ~~curtailing or (MW and Mvar),~~ tripping load, or reconfiguring a System(s). RAS accomplish ~~one or more of the following~~ objectives such as:

- Meet requirements identified in the NERC Reliability Standards;
- Maintain Bulk Electric System (BES) stability;
- Maintain acceptable ~~System~~BES voltages;

- Maintain acceptable BES power flows;
- Limit the impact of Cascading; or extreme events.
- ~~Address other Bulk Electric System (BES) reliability concerns.~~

~~These schemes are not Protection Systems; however, they may share components with Protection Systems.~~

The following do not individually constitute a RAS:

- a. Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating the faulted Elements
- b. Schemes for automatic underfrequency load shedding (UFLS) and automatic undervoltage load shedding (UVLS) comprised of only distributed relays
- ~~a-c.~~ Out-of-step tripping and power swing blocking
- ~~a.~~ Automatic underfrequency load shedding (UFLS) programs
- ~~b.~~ Undervoltage Load Shedding Programs (UVLS Programs)
- ~~b-d.~~ Autoreclosing/Reclosing schemes
- ~~e-e.~~ Schemes applied on an Element for non-Fault conditions, such as, but not limited to, generator loss-of-field, transformer top-oil temperature, high-voltage overvoltage, or overload to protect the Element against damage by removing it from service
- ~~d-f.~~ Controllers that switch or regulate one or more of the following: series or shunt reactive devices, flexible alternating current transmission system (FACTS) devices, phase-shifting transformers, variable-frequency transformers, or tap-changing transformers, ~~or generation excitation;~~ and, that are located at and monitor quantities solely at the same station as the Element being switched or regulated
- ~~e-g.~~ FACTS controllers that remotely switch static shunt reactive devices located at other stations to regulate the output of a single FACTS device
- ~~f-h.~~ Schemes or controllers that remotely switch shunt reactors and shunt capacitors for voltage regulation that would otherwise be manually switched
- ~~g-i.~~ Schemes that automatically de-energize a line for a non-Fault operation when one end of the line is open
- ~~h-j.~~ Schemes that provide anti-islanding protection (e.g., protect load from effects of being isolated with generation that may not be capable of maintaining acceptable frequency and voltage)
- ~~i-k.~~ Automatic sequences that proceed when manually initiated solely by ~~an operator~~ System Operator
- ~~j-l.~~ Modulation of HVdc or FACTS via supplementary controls, such as angle damping or frequency damping applied to damp local or inter-area oscillations

- ~~k.m.~~ Sub-synchronous resonance (SSR) protection schemes that directly detect sub-synchronous quantities (e.g., currents or torsional oscillations)
- n. Generator controls such as, but not limited to, automatic generation control (AGC), generation excitation [e.g. automatic voltage regulation (AVR) and power system stabilizers (PSS)], fast valving, and speed governing

### Conforming Changes to Other Standards

The existing Reliability Standards proposed for retirement contain references to SPS or RAS or both. The revised Reliability Standards will reflect the use of the single term RAS. The revised Reliability Standards noted above for approval are included in a separate document *Revised Reliability Standards for the Revised Definition of "Remedial Action Scheme."*

### Effective Date for Revised Reliability Standards and Definition

~~The~~ Except as noted below, the revised Reliability Standards and the revised definition of "Remedial Action Scheme" shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standards and definition are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard and the definition shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standards and definition are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

PRC-024-1(X) shall become effective on the later of the Effective Date of PRC-024-1 or the first day of the first calendar quarter that is twelve (12) months after the date the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, PRC-024-1(X) shall become effective on the later of the Effective Date of PRC-024-1 or on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

### Implementation Plan for Newly- Identified Remedial Action Schemes (RAS)

Entities with newly-identified "Remedial Action Scheme" (RAS) resulting from the application of the revised definition must be fully compliant with all Reliability Standards applicable ~~to the revised definition of "Remedial Action Scheme" RAS~~ twenty-four (24) months from the Effective Date of the revised definition of "Remedial Action Scheme." RAS. This additional time applies only to existing schemes that must transition to RAS due to the revised definition. The additional time does not apply to future RAS that may be created following implementation of the revised definition.

### Retirement of Existing Standards and Definitions

The requested Reliability Standards for retirement, ~~the current definition of "Special Protection System," and the~~ shall be retired at midnight of the day immediately prior to the Effective Date of its successor

standard in the particular jurisdiction in which the revised definition is becoming effective. The current definition of “Remedial Action Scheme” shall be retired at midnight of the day immediately prior to the Effective Date of the revised definition of “Remedial Action Scheme”. ~~in the particular jurisdiction in which the revised definition is becoming effective.~~

**A. Introduction**

1. **Title:** Cyber Security — Critical Cyber Asset Identification
2. **Number:** CIP-002-3(X)
3. **Purpose:** NERC Standards CIP-002-3(X) through CIP-009-3(X) provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System.

These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

Standard CIP-002-3(X) requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of a risk-based assessment.

**4. Applicability:**

**4.1.** Within the text of Standard CIP-002-3(X), “Responsible Entity” shall mean:

- 4.1.1 Reliability Coordinator.
- 4.1.2 Balancing Authority.
- 4.1.3 Interchange Authority.
- 4.1.4 Transmission Service Provider.
- 4.1.5 Transmission Owner.
- 4.1.6 Transmission Operator.
- 4.1.7 Generator Owner.
- 4.1.8 Generator Operator.
- 4.1.9 Load Serving Entity.
- 4.1.10 NERC.
- 4.1.11 Regional Entity.

**4.2.** The following are exempt from Standard CIP-002-3(X):

- 4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.
- 4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on

the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**B. Requirements**

- R1.** Critical Asset Identification Method — The Responsible Entity shall identify and document a risk-based assessment methodology to use to identify its Critical Assets.
  - R1.1.** The Responsible Entity shall maintain documentation describing its risk-based assessment methodology that includes procedures and evaluation criteria.
  - R1.2.** The risk-based assessment shall consider the following assets:
    - R1.2.1.** Control centers and backup control centers performing the functions of the entities listed in the Applicability section of this standard.
    - R1.2.2.** Transmission substations that support the reliable operation of the Bulk Electric System.
    - R1.2.3.** Generation resources that support the reliable operation of the Bulk Electric System.
    - R1.2.4.** Systems and facilities critical to system restoration, including blackstart generators and substations in the electrical path of transmission lines used for initial system restoration.
    - R1.2.5.** Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.
    - R1.2.6.** Remedial Action Schemes that support the reliable operation of the Bulk Electric System.
    - R1.2.7.** Any additional assets that support the reliable operation of the Bulk Electric System that the Responsible Entity deems appropriate to include in its assessment.
- R2.** Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the risk-based assessment methodology required in R1. The Responsible Entity shall review this list at least annually, and update it as necessary.
- R3.** Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R2, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. Examples at control centers and backup control centers include systems and facilities at master and remote sites that provide monitoring and control, automatic generation control, real-time power system modeling, and real-time inter-utility data exchange. The Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-3(X), Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:
  - R3.1.** The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,
  - R3.2.** The Cyber Asset uses a routable protocol within a control center; or,
  - R3.3.** The Cyber Asset is dial-up accessible.
- R4.** Annual Approval — The senior manager or delegate(s) shall approve annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1, R2, and R3 the Responsible Entity may determine that it has no Critical

Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

**C. Measures**

- M1.** The Responsible Entity shall make available its current risk-based assessment methodology documentation as specified in Requirement R1.
- M2.** The Responsible Entity shall make available its list of Critical Assets as specified in Requirement R2.
- M3.** The Responsible Entity shall make available its list of Critical Cyber Assets as specified in Requirement R3.
- M4.** The Responsible Entity shall make available its approval records of annual approvals as specified in Requirement R4.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Enforcement Authority**

- 1.1.1** Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.
- 1.1.2** ERO for Regional Entity.
- 1.1.3** Third-party monitor without vested interest in the outcome for NERC.

**1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

**1.3. Compliance Monitoring and Enforcement Processes**

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.4. Data Retention**

- 1.4.1** The Responsible Entity shall keep documentation required by Standard CIP-002-3(X) from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.
- 1.4.2** The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

**1.5. Additional Compliance Information**

- 1.5.1** None.

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

| Version | Date              | Action  | Change Tracking  |

## Standard CIP-002-3(X) — Cyber Security — Critical Cyber Asset Identification

### A. Introduction

1. **Title:** Cyber Security — Critical Cyber Asset Identification
2. **Number:** CIP-002-3(X)
3. **Purpose:** NERC Standards CIP-002-3(X) through CIP-009-3(X) provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System.

These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

Standard CIP-002-3(X) requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of a risk-based assessment.

#### 4. Applicability:

4.1. Within the text of Standard CIP-002-3(X), “Responsible Entity” shall mean:

- 4.1.1 Reliability Coordinator.
- 4.1.2 Balancing Authority.
- 4.1.3 Interchange Authority.
- 4.1.4 Transmission Service Provider.
- 4.1.5 Transmission Owner.
- 4.1.6 Transmission Operator.
- 4.1.7 Generator Owner.
- 4.1.8 Generator Operator.
- 4.1.9 Load Serving Entity.
- 4.1.10 NERC.
- 4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-002-3(X):

- 4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.
- 4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on

**Deleted:** The first day of the third calendar quarter after applicable regulatory approvals<sup>¶</sup>  
<#>have been received (or the Reliability Standard otherwise becomes effective the first day of the<sup>¶</sup>  
<#>third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is<sup>¶</sup> not required)

**Deleted: Approved by Board of Trustees: December 16, 2009**

## Standard CIP-002-3(X) — Cyber Security — Critical Cyber Asset Identification

the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

### B. Requirements

- R1.** Critical Asset Identification Method — The Responsible Entity shall identify and document a risk-based assessment methodology to use to identify its Critical Assets.
- R1.1.** The Responsible Entity shall maintain documentation describing its risk-based assessment methodology that includes procedures and evaluation criteria.
- R1.2.** The risk-based assessment shall consider the following assets:
- R1.2.1.** Control centers and backup control centers performing the functions of the entities listed in the Applicability section of this standard.
- R1.2.2.** Transmission substations that support the reliable operation of the Bulk Electric System.
- R1.2.3.** Generation resources that support the reliable operation of the Bulk Electric System.
- R1.2.4.** Systems and facilities critical to system restoration, including blackstart generators and substations in the electrical path of transmission lines used for initial system restoration.
- R1.2.5.** Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.
- R1.2.6.** Remedial Action Schemes that support the reliable operation of the Bulk Electric System.
- R1.2.7.** Any additional assets that support the reliable operation of the Bulk Electric System that the Responsible Entity deems appropriate to include in its assessment.
- R2.** Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the risk-based assessment methodology required in R1. The Responsible Entity shall review this list at least annually, and update it as necessary.
- R3.** Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R2, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. Examples at control centers and backup control centers include systems and facilities at master and remote sites that provide monitoring and control, automatic generation control, real-time power system modeling, and real-time inter-utility data exchange. The Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-3(X), Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:
- R3.1.** The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,
- R3.2.** The Cyber Asset uses a routable protocol within a control center; or,
- R3.3.** The Cyber Asset is dial-up accessible.
- R4.** Annual Approval — The senior manager or delegate(s) shall approve annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1, R2, and R3 the Responsible Entity may determine that it has no Critical

**A. Introduction**

1. **Title:** Cyber Security — Critical Cyber Asset Identification
2. **Number:** CIP-002-3b(X)
3. **Purpose:** NERC Standards CIP-002-3b(X) through CIP-009-3 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System.

These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

Standard CIP-002-3b(X) requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of a risk-based assessment.

**4. Applicability:**

**4.1.** Within the text of Standard CIP-002-3b(X), “Responsible Entity” shall mean:

- 4.1.1 Reliability Coordinator.
- 4.1.2 Balancing Authority.
- 4.1.3 Interchange Authority.
- 4.1.4 Transmission Service Provider.
- 4.1.5 Transmission Owner.
- 4.1.6 Transmission Operator.
- 4.1.7 Generator Owner.
- 4.1.8 Generator Operator.
- 4.1.9 Load Serving Entity.
- 4.1.10 NERC.
- 4.1.11 Regional Entity.

**4.2.** The following are exempt from Standard CIP-002-3b(X):

- 4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.
- 4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval

by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

## **B. Requirements**

- R1. Critical Asset Identification Method** — The Responsible Entity shall identify and document a risk-based assessment methodology to use to identify its Critical Assets.
- R1.1.** The Responsible Entity shall maintain documentation describing its risk-based assessment methodology that includes procedures and evaluation criteria.
- R1.2.** The risk-based assessment shall consider the following assets:
- R1.2.1.** Control centers and backup control centers performing the functions of the entities listed in the Applicability section of this standard.
  - R1.2.2.** Transmission substations that support the reliable operation of the Bulk Electric System.
  - R1.2.3.** Generation resources that support the reliable operation of the Bulk Electric System.
  - R1.2.4.** Systems and facilities critical to system restoration, including blackstart generators and substations in the electrical path of transmission lines used for initial system restoration.
  - R1.2.5.** Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.
  - R1.2.6.** Remedial Action Schemes that support the reliable operation of the Bulk Electric System.
  - R1.2.7.** Any additional assets that support the reliable operation of the Bulk Electric System that the Responsible Entity deems appropriate to include in its assessment.
- R2. Critical Asset Identification** — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the risk-based assessment methodology required in R1. The Responsible Entity shall review this list at least annually, and update it as necessary.
- R3. Critical Cyber Asset Identification** — Using the list of Critical Assets developed pursuant to Requirement R2, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. Examples at control centers and backup control centers include systems and facilities at master and remote sites that provide monitoring and control, automatic generation control, real-time power system modeling, and real-time inter-utility data exchange. The Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-3b(X), Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

- R3.1.** The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,
- R3.2.** The Cyber Asset uses a routable protocol within a control center; or,
- R3.3.** The Cyber Asset is dial-up accessible.
- R4.** Annual Approval — The senior manager or delegate(s) shall approve annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1, R2, and R3 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

**C. Measures**

- M1.** The Responsible Entity shall make available its current risk-based assessment methodology documentation as specified in Requirement R1.
- M2.** The Responsible Entity shall make available its list of Critical Assets as specified in Requirement R2.
- M3.** The Responsible Entity shall make available its list of Critical Cyber Assets as specified in Requirement R3.
- M4.** The Responsible Entity shall make available its approval records of annual approvals as specified in Requirement R4.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Enforcement Authority**

- 1.1.1** Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.
- 1.1.2** ERO for Regional Entity.
- 1.1.3** Third-party monitor without vested interest in the outcome for NERC.

**1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

**1.3. Compliance Monitoring and Enforcement Processes**

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.4. Data Retention**

**1.4.1** The Responsible Entity shall keep documentation required by Standard CIP-002-3b(X) from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

**1.4.2** The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

**1.5. Additional Compliance Information**

**1.5.1** None.

Appendix 1

**Project 2012-INT-05: Response to Request for an Interpretation of NERC Standard CIP-002-3 for the OGE Energy Corporation**

Date submitted: 2/24/11

The following interpretation of NERC Standard CIP-002-3 Cyber Security — Critical Cyber Asset Identification, Requirement R1.2.5, was developed by a project team from the CIP Interpretation Drafting Team.

**Requirement Number and Text of Requirement**

R1. Critical Asset Identification Method — The Responsible Entity shall identify and document a risk-based assessment methodology to use to identify its Critical Assets.

R1.2. The risk-based assessment shall consider the following assets:

R1.2.5. Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.

**Identify specifically what requirement needs clarification (as submitted):**

Requirement Number and Text of Requirement:

CIP-002-3 R1.2.5 - Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.

Clarification needed: Based on the text above, an auditor could apply this standard to the Smart Grid Advanced Meter Infrastructure (AMI) remote connect/disconnect functionality. While the AMI system is not designed to perform automatic load shedding of 300 MW it could be repurposed to shed an aggregate load of 300 MW or more. However, it is important to note that the AMI remote disconnect function is not used for under-voltage load shedding or under-frequency load shedding as a part of the region's load shedding program.

The primary purpose of the AMI remote connect/disconnect function is to connect and disconnect individual retail electric customers from a central location rather than at the meter itself to enable substantial efficiency gains.

OGE would like NERC to clarify that a company's SmartGrid AMI functionality, which may be able to disconnect 300+ MW of load, is not considered a system or facility critical to automatic load shedding

under a common control system capable of shedding 300 mw and therefore it should not be included in the Company's risk based methodology. OGE believes this clarification is appropriate because CIP-002-3 R1.2.5 was written to address under-voltage and under-frequency load shedding systems; SmartGrid AMI disconnect functionality pertains to neither.

### **Question Summary**

OGE Energy Corporation seeks clarification on the meaning of CIP-002-3, Requirement R1.2.5 as it relates to “SmartGrid Advanced Meter Infrastructure (AMI) remote connect/disconnect functionality.”

In its response, the Interpretation Drafting Team will answer whether a company’s SmartGrid AMI functionality, which may be able to disconnect more than 300 MW of load, is considered a system or facility critical to automatic load shedding under a common control system capable of shedding 300 MW or more under CIP-002-3, Requirement 1.2.5.

### **Response**

In evaluating OGE’s request, the Interpretation Drafting Team (IDT) clarifies the meaning of CIP-002-3, Requirement R1.2.5 as it relates and applies to new technologies such as AMI. CIP-002-3, Requirement R1.2.5, along with the context of the standard as a whole, informed development of this interpretation.

CIP-002-3, Requirement R1.2 specifies that the Responsible Entity’s risk-based assessment methodology (“RBAM”) “shall consider” the assets described in Requirement R1.2.5.

During the identification and documentation of the RBAM, a Responsible Entity shall consider “Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more” as specified in Requirement R1.2.5. Requirement R2 then requires the entity to apply this RBAM annually to identify Critical Assets. If a system or facility does not meet the specifications of Requirement R1.2.5, the RBAM is not required to consider that asset.

The Critical Asset identification method under CIP-002-3, Requirement R1 is based on a facts and circumstance-driven analysis and is not dependent exclusively on specific technology or specific types of systems or facilities. For instance, systems or facilities such as AMI may have the potential or capability to be set up to automatically shed load, but having that potential or capability does not necessarily mean that the system or facility performs the function as described in Requirement R1.2.5. Therefore, an AMI system specifically built and configured to perform the Remote Disconnect function that does not automatically shed load without human operator initiation would not meet the criteria found in CIP-002-3, Requirement R1.2.5.

## Standard CIP-002-3b(X) — Cyber Security — Critical Cyber Asset Identification

---

### A. Introduction

1. **Title:** Cyber Security — Critical Cyber Asset Identification
2. **Number:** CIP-002-3b(X)
3. **Purpose:** NERC Standards CIP-002-3b(X) through CIP-009-3 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System.

These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

Standard CIP-002-3b(X) requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of a risk-based assessment.

#### 4. **Applicability:**

4.1. Within the text of Standard CIP-002-3b(X), “Responsible Entity” shall mean:

- 4.1.1 Reliability Coordinator.
- 4.1.2 Balancing Authority.
- 4.1.3 Interchange Authority.
- 4.1.4 Transmission Service Provider.
- 4.1.5 Transmission Owner.
- 4.1.6 Transmission Operator.
- 4.1.7 Generator Owner.
- 4.1.8 Generator Operator.
- 4.1.9 Load Serving Entity.
- 4.1.10 NERC.
- 4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-002-3b(X):

- 4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.
- 4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval

## Standard CIP-002-3b(X) — Cyber Security — Critical Cyber Asset Identification

by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

### B. Requirements

- R1.** Critical Asset Identification Method — The Responsible Entity shall identify and document a risk-based assessment methodology to use to identify its Critical Assets.
- R1.1.** The Responsible Entity shall maintain documentation describing its risk-based assessment methodology that includes procedures and evaluation criteria.
- R1.2.** The risk-based assessment shall consider the following assets:
- R1.2.1.** Control centers and backup control centers performing the functions of the entities listed in the Applicability section of this standard.
- R1.2.2.** Transmission substations that support the reliable operation of the Bulk Electric System.
- R1.2.3.** Generation resources that support the reliable operation of the Bulk Electric System.
- R1.2.4.** Systems and facilities critical to system restoration, including blackstart generators and substations in the electrical path of transmission lines used for initial system restoration.
- R1.2.5.** Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.
- R1.2.6.** Remedial Action Schemes that support the reliable operation of the Bulk Electric System.
- R1.2.7.** Any additional assets that support the reliable operation of the Bulk Electric System that the Responsible Entity deems appropriate to include in its assessment.
- R2.** Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the risk-based assessment methodology required in R1. The Responsible Entity shall review this list at least annually, and update it as necessary.
- R3.** Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R2, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. Examples at control centers and backup control centers include systems and facilities at master and remote sites that provide monitoring and control, automatic generation control, real-time power system modeling, and real-time inter-utility data exchange. The Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-3b(X), Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

**Deleted:** The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)

**Deleted:** Special Protection System

- R3.1.** The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,
- R3.2.** The Cyber Asset uses a routable protocol within a control center; or,
- R3.3.** The Cyber Asset is dial-up accessible.
- R4.** Annual Approval — The senior manager or delegate(s) shall approve annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1, R2, and R3 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

**C. Measures**

- M1.** The Responsible Entity shall make available its current risk-based assessment methodology documentation as specified in Requirement R1.
- M2.** The Responsible Entity shall make available its list of Critical Assets as specified in Requirement R2.
- M3.** The Responsible Entity shall make available its list of Critical Cyber Assets as specified in Requirement R3.
- M4.** The Responsible Entity shall make available its approval records of annual approvals as specified in Requirement R4.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Enforcement Authority**

- 1.1.1** Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.
- 1.1.2** ERO for Regional Entity.
- 1.1.3** Third-party monitor without vested interest in the outcome for NERC.

**1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

**1.3. Compliance Monitoring and Enforcement Processes**

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**Standard CIP-002-3b(X) — Cyber Security — Critical Cyber Asset Identification**

---

**1.4. Data Retention**

**1.4.1** The Responsible Entity shall keep documentation required by Standard CIP-002-3b(X) from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

**1.4.2** The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

**1.5. Additional Compliance Information**

**1.5.1** None.

2. Violation Severity Levels

| Requirement | VRF    | Lower VSL | Moderate VSL  | High VSL  | Severe VSL   |
|-------------|--------|-----------|---|---|--|
| R1.         | MEDIUM | N/A       | N/A   | N/A   | The responsible entity has not documented a risk-based assessment methodology to use to identify its Critical Assets as specified in R1.                 |
| R1.1.       | LOWER  | N/A       | The Responsible Entity maintained documentation describing its risk-based assessment methodology which includes evaluation criteria, but does not include procedures. | The Responsible Entity maintained documentation describing its risk-based assessment methodology that includes procedures but does not include evaluation criteria. | The Responsible Entity did not maintain documentation describing its risk-based assessment methodology that includes procedures and evaluation criteria. |
| R1.2.       | MEDIUM | N/A       | N/A   | N/A   | The Responsible Entity did not consider all of the asset types listed in R1.2.1 through R1.2.7 in its risk-based assessment.                             |
| R1.2.1.     | LOWER  | N/A       | N/A   | N/A   | N/A  |
| R1.2.2.     | LOWER  | N/A       | N/A   | N/A   | N/A  |
| R1.2.3.     | LOWER  | N/A       | N/A   | N/A   | N/A  |
| R1.2.4.     | LOWER  | N/A       | N/A   | N/A   | N/A  |
| R1.2.5.     | LOWER  | N/A       | N/A   | N/A   | N/A  |

**Standard CIP-002-3b(X) — Cyber Security — Critical Cyber Asset Identification**

| Requirement | VRF   | Lower VSL | Moderate VSL  | High VSL   | Severe VSL   |
|-------------|-------|-----------|---|--|--|
| R1.2.6.     | LOWER | N/A       | N/A   | N/A  | N/A  |
| R1.2.7.     | LOWER | N/A       | N/A   | N/A  | N/A  |
| R2.         | HIGH  | N/A       | N/A   | The Responsible Entity has developed a list of Critical Assets but the list has not been reviewed and updated annually as required.  | The Responsible Entity did not develop a list of its identified Critical Assets even if such list is null.   |
| R3.         | HIGH  | N/A       | N/A   | The Responsible Entity has developed a list of associated Critical Cyber Assets essential to the operation of the Critical Asset list as per requirement R2 but the list has not been reviewed and updated annually as required. | The Responsible Entity did not develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset list as per requirement R2 even if such list is null. |
| R3.1.       | LOWER | N/A       | N/A   | N/A  | A Cyber Asset essential to the operation of the Critical Asset was identified that met the criteria in this requirement but was not included in the Critical Cyber Asset List.           |
| R3.2.       | LOWER | N/A       | N/A   | N/A  | A Cyber Asset essential to the operation of the Critical Asset was identified that met the criteria in this requirement but was not included in the Critical Cyber Asset List.           |
| R3.3.       | LOWER | N/A       | N/A   | N/A  | A Cyber Asset essential to the operation of the Critical Asset was identified that met the criteria in this requirement but was not included in the Critical Cyber Asset List.           |
| R4.         | LOWER | N/A       | The Responsible Entity does not have a signed and dated | The Responsible Entity does not have a signed and dated record of the senior manager or delegate(s)'s annual   | The Responsible Entity does not have a signed and dated record of the senior manager or delegate(s) annual approval of   |

**Standard CIP-002-3b(X) — Cyber Security — Critical Cyber Asset Identification**

| Requirement | VRF | Lower VSL | Moderate VSL   | High VSL   | Severe VSL  |

Appendix 1

| Project 2012-INT-05: Response to Request for an Interpretation of NERC Standard CIP-002-3 for the OGE Energy Corporation   |  |
|--|--|
| Date submitted: 2/24/11  |  |
| The following interpretation of NERC Standard CIP-002-3 Cyber Security — Critical Cyber Asset Identification, Requirement R1.2.5, was developed by a project team from the CIP Interpretation Drafting Team.   |  |
| Requirement Number and Text of Requirement   |  |
| R1.Critical Asset Identification Method — The Responsible Entity shall identify and document a risk-based assessment methodology to use to identify its Critical Assets.<br><br>R1.2. The risk-based assessment shall consider the following assets:<br><br>R1.2.5. Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.   |  |
| Identify specifically what requirement needs clarification (as submitted):   |  |
| Requirement Number and Text of Requirement:<br>CIP-002-3 R1.2.5 - Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.<br><br>Clarification needed: Based on the text above, an auditor could apply this standard to the Smart Grid Advanced Meter Infrastructure (AMI) remote connect/disconnect functionality. While the AMI system is not designed to perform automatic load shedding of 300 MW it could be repurposed to shed an aggregate load of 300 MW or more. However, it is important to note that the AMI remote disconnect function is not used for under-voltage load shedding or under-frequency load shedding as a part of the region's load shedding program.<br><br>The primary purpose of the AMI remote connect/disconnect function is to connect and disconnect individual retail electric customers from a central location rather than at the meter itself to enable substantial efficiency gains.<br><br>OGE would like NERC to clarify that a company's SmartGrid AMI functionality, which may be able to disconnect 300+ MW of load, is not considered a system or facility critical to automatic load shedding |  |

**Standard CIP-002-3b(X) — Cyber Security — Critical Cyber Asset Identification**

under a common control system capable of shedding 300 mw and therefore it should not be included in the Company's risk based methodology. OGE believes this clarification is appropriate because CIP-002-3 R1.2.5 was written to address under-voltage and under-frequency load shedding systems; SmartGrid AMI disconnect functionality pertains to neither.

**Question Summary**

OGE Energy Corporation seeks clarification on the meaning of CIP-002-3, Requirement R1.2.5 as it relates to “SmartGrid Advanced Meter Infrastructure (AMI) remote connect/disconnect functionality.”

In its response, the Interpretation Drafting Team will answer whether a company’s SmartGrid AMI functionality, which may be able to disconnect more than 300 MW of load, is considered a system or facility critical to automatic load shedding under a common control system capable of shedding 300 MW or more under CIP-002-3, Requirement 1.2.5.

**Response**

In evaluating OGE’s request, the Interpretation Drafting Team (IDT) clarifies the meaning of CIP-002-3, Requirement R1.2.5 as it relates and applies to new technologies such as AMI. CIP-002-3, Requirement R1.2.5, along with the context of the standard as a whole, informed development of this interpretation.

CIP-002-3, Requirement R1.2 specifies that the Responsible Entity’s risk-based assessment methodology (“RBAM”) “shall consider” the assets described in Requirement R1.2.5.

During the identification and documentation of the RBAM, a Responsible Entity shall consider “Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more” as specified in Requirement R1.2.5. Requirement R2 then requires the entity to apply this RBAM annually to identify Critical Assets. If a system or facility does not meet the specifications of Requirement R1.2.5, the RBAM is not required to consider that asset.

The Critical Asset identification method under CIP-002-3, Requirement R1 is based on a facts and circumstance-driven analysis and is not dependent exclusively on specific technology or specific types of systems or facilities. For instance, systems or facilities such as AMI may have the potential or capability to be set up to automatically shed load, but having that potential or capability does not necessarily mean that the system or facility performs the function as described in Requirement R1.2.5. Therefore, an AMI system specifically built and configured to perform the Remote Disconnect function that does not automatically shed load without human operator initiation would not meet the criteria found in CIP-002-3, Requirement R1.2.5.

### A. Introduction

1. **Title:** Event Reporting
2. **Number:** EOP-004-2(X)
3. **Purpose:** To improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities.
4. **Applicability:**
  - 4.1. **Functional Entities:** For the purpose of the Requirements and the EOP-004 Attachment 1 contained herein, the following functional entities will be collectively referred to as “Responsible Entity.”
    - 4.1.1. Reliability Coordinator
    - 4.1.2. Balancing Authority
    - 4.1.3. Transmission Owner
    - 4.1.4. Transmission Operator
    - 4.1.5. Generator Owner
    - 4.1.6. Generator Operator
    - 4.1.7. Distribution Provider
5. **Effective Dates:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
6. **Background:**

NERC established a SAR Team in 2009 to investigate and propose revisions to the CIP-001 and EOP-004 Reliability Standards. The team was asked to consider the following:

  1. CIP-001 could be merged with EOP-004 to eliminate redundancies.
  2. Acts of sabotage have to be reported to the DOE as part of EOP-004.
  3. Specific references to the DOE form need to be eliminated.
  4. EOP-004 had some ‘fill-in-the-blank’ components to eliminate.

The development included other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient Bulk Electric System reliability standards.

The SAR for Project 2009-01, Disturbance and Sabotage Reporting was moved forward for standard drafting by the NERC Standards Committee in August of 2009. The Disturbance and Sabotage Reporting Standard Drafting Team (DSR SDT) was formed in late 2009.

The DSR SDT developed a concept paper to solicit stakeholder input regarding the proposed reporting concepts that the DSR SDT had developed. The posting of the concept paper sought comments from stakeholders on the “road map” that will be used by the DSR SDT in updating or revising CIP-001 and EOP-004. The concept paper provided stakeholders the background information and thought process of the DSR SDT. The DSR SDT has reviewed the existing standards, the SAR, issues from the NERC issues database and FERC Order 693 Directives in order to determine a prudent course of action with respect to revision of these standards.

### B. Requirements and Measures

- R1.** Each Responsible Entity shall have an event reporting Operating Plan in accordance with EOP-004-2(X) Attachment 1 that includes the protocol(s) for reporting to the Electric Reliability Organization and other organizations (e.g., the Regional Entity, company personnel, the Responsible Entity’s Reliability Coordinator, law enforcement, or governmental authority). *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*
  
- M1.** Each Responsible Entity will have a dated event reporting Operating Plan that includes, but is not limited to the protocol(s) and each organization identified to receive an event report for event types specified in EOP-004-2(X) Attachment 1 and in accordance with the entity responsible for reporting.
  
- R2.** Each Responsible Entity shall report events per their Operating Plan within 24 hours of recognition of meeting an event type threshold for reporting or by the end of the next business day if the event occurs on a weekend (which is recognized to be 4 PM local time on Friday to 8 AM Monday local time). *[Violation Risk Factor: Medium] [Time Horizon: Operations Assessment]*
  
- M2.** Each Responsible Entity will have as evidence of reporting an event, copy of the completed EOP-004-2(X) Attachment 2 form or a DOE-OE-417 form; and evidence of submittal (e.g., operator log or other operating documentation, voice recording, electronic mail message, or confirmation of facsimile) demonstrating the event report was submitted within 24 hours of recognition of meeting the threshold for reporting or by the

end of the next business day if the event occurs on a weekend (which is recognized to be 4 PM local time on Friday to 8 AM Monday local time). (R2)

- R3.** Each Responsible Entity shall validate all contact information contained in the Operating Plan pursuant to Requirement R1 each calendar year. [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]
- M3.** Each Responsible Entity will have dated records to show that it validated all contact information contained in the Operating Plan each calendar year. Such evidence may include, but are not limited to, dated voice recordings and operating logs or other communication documentation. (R3)

## **C. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1 Compliance Enforcement Authority**

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

#### **1.2 Evidence Retention**

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

- Each Responsible Entity shall retain the current Operating Plan plus each version issued since the last audit for Requirements R1, and Measure M1.
- Each Responsible Entity shall retain evidence of compliance since the last audit for Requirements R2, R3 and Measure M2, M3.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the duration specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.3 Compliance Monitoring and Enforcement Processes:**

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

**1.4 Additional Compliance Information**

Guideline and Technical Basis (attached)

**EOP-004 - Attachment 1: Reportable Events**

NOTE: Under certain adverse conditions (e.g. severe weather, multiple events) it may not be possible to report the damage caused by an event and issue a written Event Report within the timing in the standard. In such cases, the affected Responsible Entity shall notify parties per Requirement R2 and provide as much information as is available at the time of the notification. Submit reports to the ERO via one of the following: e-mail: [systemawareness@nerc.net](mailto:systemawareness@nerc.net), Facsimile 404-446-9770 or Voice: 404-446-9780.

**Submit EOP-004 Attachment 2 (or DOE-OE-417) pursuant to Requirements R1 and R2.**

| Event Type                          | Entity with Reporting Responsibility | Threshold for Reporting   |
|-------------------------------------|--------------------------------------|---|
| Damage or destruction of a Facility | RC, BA, TOP                          | Damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area or Transmission Operator Area that results in actions to avoid a BES Emergency.   |
| Damage or destruction of a Facility | BA, TO, TOP, GO, GOP, DP             | Damage or destruction of its Facility that results from actual or suspected intentional human action.   |
| Physical threats to a Facility      | BA, TO, TOP, GO, GOP, DP             | Physical threat to its Facility excluding weather or natural disaster related threats, which has the potential to degrade the normal operation of the Facility.<br>OR<br>Suspicious device or activity at a Facility.<br>Do not report theft unless it degrades normal operation of a Facility. |

**EOP-004-2(X) — Event Reporting**

## Guideline and Technical Basis

### Distribution Provider Applicability Discussion

The DSR SDT has included Distribution Providers (DP) as an applicable entity under this standard. The team realizes that not all DPs will own BES Facilities and will not meet the “Threshold for Reporting” for any event listed in Attachment 1. These DPs will not have any reports to submit under Requirement R2. However, these DPs will be responsible for meeting Requirements R1 and R3. The DSR SDT does not intend for these entities to have a detailed Operating Plan to address events that are not applicable to them. In this instance, the DSR SDT intends for the DP to have a very simple Operating Plan that includes a statement that there are no applicable events in Attachment 1 (to meet R1) and that the DP will review the list of events in Attachment 1 each year (to meet R3). The team does not think this will be a burden on any entity as the development and annual validation of the Operating Plan should not take more than 30 minutes on an annual basis. If a DP discovers applicable events during the annual review, it is expected that the DP will develop a more detailed Operating Plan to comply with the requirements of the standard.

### Multiple Reports for a Single Organization

For entities that have multiple registrations, the DSR SDT intends that these entities will only have to submit one report for any individual event. For example, if an entity is registered as a Reliability Coordinator, Balancing Authority and Transmission Operator, the entity would only submit one report for a particular event rather than submitting three reports as each individual registered entity.

### Summary of Key Concepts

The DSR SDT identified the following principles to assist them in developing the standard:

- Develop a single form to report disturbances and events that threaten the reliability of the Bulk Electric System
- Investigate other opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements
- Establish clear criteria for reporting
- Establish consistent reporting timelines
- Provide clarity around who will receive the information and how it will be used

During the development of concepts, the DSR SDT considered the FERC directive to “further define sabotage”. There was concern among stakeholders that a definition may be ambiguous and subject to interpretation. Consequently, the DSR SDT decided to eliminate the term sabotage from the standard. The team felt that it was almost impossible to determine if an act or event was sabotage or vandalism without the intervention of law enforcement. The DSR SDT felt that attempting to define sabotage would result in further ambiguity with respect to

## **EOP-004-2(X) — Event Reporting**

---

reporting events. The term “sabotage” is no longer included in the standard. The events listed in EOP-004 Attachment 1 were developed to provide guidance for reporting both actual events as well as events which may have an impact on the Bulk Electric System. The DSR SDT believes that this is an equally effective and efficient means of addressing the FERC Directive.

The types of events that are required to be reported are contained within EOP-004 Attachment 1. The DSR SDT has coordinated with the NERC Events Analysis Working Group to develop the list of events that are to be reported under this standard. EOP-004 Attachment 1 pertains to those actions or events that have impacted the Bulk Electric System. These events were previously reported under EOP-004-1, CIP-001-1 or the Department of Energy form OE-417. EOP-004 Attachment 1 covers similar items that may have had an impact on the Bulk Electric System or has the potential to have an impact and should be reported.

The DSR SDT wishes to make clear that the proposed Standard does not include any real-time operating notifications for the events listed in EOP-004 Attachment 1. Real-time communication is achieved is covered in other standards. The proposed standard deals exclusively with after-the-fact reporting.

### **Data Gathering**

The requirements of EOP-004-1 require that entities “promptly analyze Bulk Electric System disturbances on its system or facilities” (Requirement R2). The requirements of EOP-004-2(X) specify that certain types of events are to be reported but do not include provisions to analyze events. Events reported under EOP-004-2(X) may trigger further scrutiny by the ERO Events Analysis Program. If warranted, the Events Analysis Program personnel may request that more data for certain events be provided by the reporting entity or other entities that may have experienced the event. Entities are encouraged to become familiar with the Events Analysis Program and the NERC Rules of Procedure to learn more about with the expectations of the program.

### **Law Enforcement Reporting**

The reliability objective of EOP-004-2(X) is to improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities. Certain outages, such as those due to vandalism and terrorism, may not be reasonably preventable. These are the types of events that should be reported to law enforcement. Entities rely upon law enforcement agencies to respond to and investigate those events which have the potential to impact a wider area of the BES. The inclusion of reporting to law enforcement enables and supports reliability principles such as protection of Bulk Electric System from malicious physical attack. The importance of BES awareness of the threat around them is essential to the effective operation and planning to mitigate the potential risk to the BES.

### **Stakeholders in the Reporting Process**

- Industry

- NERC (ERO), Regional Entity
- FERC
- DOE
- NRC
- DHS – Federal
- Homeland Security- State
- State Regulators
- Local Law Enforcement
- State or Provincial Law Enforcement
- FBI
- Royal Canadian Mounted Police (RCMP)

The above stakeholders have an interest in the timely notification, communication and response to an incident at a Facility. The stakeholders have various levels of accountability and have a vested interest in the protection and response to ensure the reliability of the BES.

### **Present expectations of the industry under CIP-001-1a:**

It has been the understanding by industry participants that an occurrence of sabotage has to be reported to the FBI. The FBI has the jurisdictional requirements to investigate acts of sabotage and terrorism. The CIP-001-1-1a standard requires a liaison relationship on behalf of the industry and the FBI or RCMP. These requirements, under the standard, of the industry have not been clear and have lead to misunderstandings and confusion in the industry as to how to demonstrate that the liaison is in place and effective. As an example of proof of compliance with Requirement R4, Responsible Entities have asked FBI Office personnel to provide, on FBI letterhead, confirmation of the existence of a working relationship to report acts of sabotage, the number of years the liaison relationship has been in existence, and the validity of the telephone numbers for the FBI.

### **Coordination of Local and State Law Enforcement Agencies with the FBI**

The Joint Terrorism Task Force (JTTF) came into being with the first task force being established in 1980. JTTFs are small cells of highly trained, locally based, committed investigators, analysts, linguists, SWAT experts, and other specialists from dozens of U.S. law enforcement and intelligence agencies. The JTTF is a multi-agency effort led by the Justice Department and FBI designed to combine the resources of federal, state, and local law enforcement. Coordination and communications largely through the interagency National Joint Terrorism Task Force, working out of FBI Headquarters, which makes sure that information and intelligence flows freely among the local JTTFs. This information flow can be most beneficial to the industry in analytical intelligence, incident response and investigation. Historically, the most immediate response to an industry incident has been local and state law enforcement agencies to suspected vandalism and criminal damages at industry facilities. Relying upon the JTTF

coordination between local, state and FBI law enforcement would be beneficial to effective communications and the appropriate level of investigative response.

### **Coordination of Local and Provincial Law Enforcement Agencies with the RCMP**

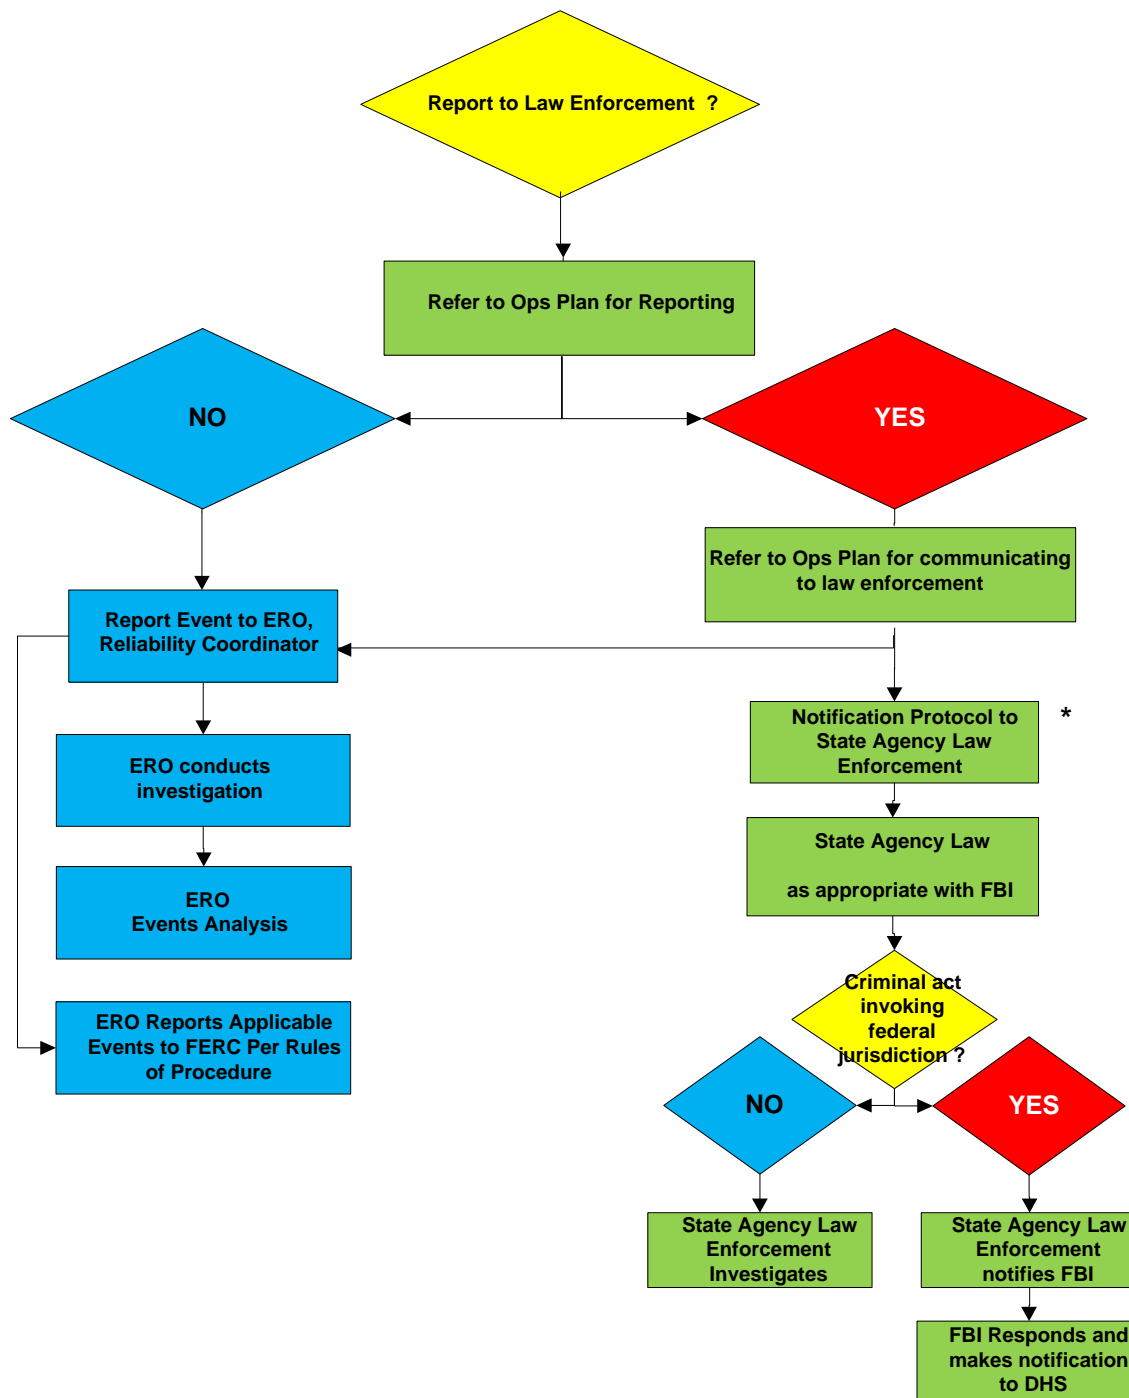

A similar law enforcement coordination hierarchy exists in Canada. Local and Provincial law enforcement coordinate to investigate suspected acts of vandalism and sabotage. The Provincial law enforcement agency has a reporting relationship with the Royal Canadian Mounted Police (RCMP).

### **A Reporting Process Solution – EOP-004**

A proposal discussed with the FBI, FERC Staff, NERC Standards Project Coordinator and the SDT Chair is reflected in the flowchart below (Reporting Hierarchy for Reportable Events). Essentially, reporting an event to law enforcement agencies will only require the industry to notify the state or provincial or local level law enforcement agency. The state or provincial or local level law enforcement agency will coordinate with law enforcement with jurisdiction to investigate. If the state or provincial or local level law enforcement agency decides federal agency law enforcement or the RCMP should respond and investigate, the state or provincial or local level law enforcement agency will notify and coordinate with the FBI or the RCMP.

Example of Reporting Process including Law Enforcement

Entity Experiencing An Event in Attachment 1

\* Canadian entities will follow law enforcement protocols applicable in their jurisdictions

### Disturbance and Sabotage Reporting Standard Drafting Team (Project 2009-01) - Reporting Concepts

#### Introduction

The SAR for Project 2009-01, Disturbance and Sabotage Reporting was moved forward for standard drafting by the NERC Standards Committee in August of 2009. The Disturbance and Sabotage Reporting Standard Drafting Team (DSR SDT) was formed in late 2009 and has developed updated standards based on the SAR.

The standards listed under the SAR are:

- CIP-001 — Sabotage Reporting
- EOP-004 — Disturbance Reporting

The changes do not include any real-time operating notifications for the types of events covered by CIP-001 and EOP-004. The real-time reporting requirements are achieved through the RCIS and are covered in other standards (e.g. EOP-002-Capacity and Energy Emergencies). These standards deal exclusively with after-the-fact reporting.

The DSR SDT has consolidated disturbance and sabotage event reporting under a single standard. These two components and other key concepts are discussed in the following sections.

#### Summary of Concepts and Assumptions:

##### *The Standard:*

- Requires reporting of “events” that impact or may impact the reliability of the Bulk Electric System
- Provides clear criteria for reporting
- Includes consistent reporting timelines
- Identifies appropriate applicability, including a reporting hierarchy in the case of disturbance reporting
- Provides clarity around of who will receive the information

##### **Discussion of Disturbance Reporting**

Disturbance reporting requirements existed in the previous version of EOP-004. The current approved definition of Disturbance from the NERC Glossary of Terms is:

1. An unplanned event that produces an abnormal system condition.
2. Any perturbation to the electric system.

3. The unexpected change in ACE that is caused by the sudden failure of generation or interruption of load.

Disturbance reporting requirements and criteria were in the previous EOP-004 standard and its attachments. The DSR SDT discussed the reliability needs for disturbance reporting and developed the list of events that are to be reported under this standard (EOP-004 Attachment 1).

### **Discussion of Event Reporting**

There are situations worthy of reporting because they have the potential to impact reliability.

Event reporting facilitates industry awareness, which allows potentially impacted parties to prepare for and possibly mitigate any associated reliability risk. It also provides the raw material, in the case of certain potential reliability threats, to see emerging patterns.

Examples of such events include:

- Bolts removed from transmission line structures
- Train derailment adjacent to a Facility that either could have damaged a Facility directly or could indirectly damage a Facility (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a control center)
- Destruction of Bulk Electric System equipment

### ***What about sabotage?***

One thing became clear in the DSR SDT's discussion concerning sabotage: everyone has a different definition. The current standard CIP-001 elicited the following response from FERC in FERC Order 693, paragraph 471 which states in part: *“. . . the Commission directs the ERO to develop the following modifications to the Reliability Standard through the Reliability Standards development process: (1) further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event.”*

Often, the underlying reason for an event is unknown or cannot be confirmed. The DSR SDT believes that by reporting material risks to the Bulk Electric System using the event categorization in this standard, it will be easier to get the relevant information for mitigation, awareness, and tracking, while removing the distracting element of motivation.

Certain types of events should be reported to NERC, the Department of Homeland Security (DHS), the Federal Bureau of Investigation (FBI), and/or Provincial or local law enforcement. Other types of events may have different reporting requirements. For example, an event that is related to copper theft may only need to be reported to the local law enforcement authorities.

### ***Potential Uses of Reportable Information***

Event analysis, correlation of data, and trend identification are a few potential uses for the information reported under this standard. The standard requires Functional entities to report the incidents and provide known information at the time of the report. Further data gathering necessary for event analysis is provided for under the Events Analysis Program and the NERC Rules of Procedure. Other entities (e.g. – NERC, Law Enforcement, etc) will be responsible for performing the analyses. The [NERC Rules of Procedure \(section 800\)](#) provide an overview of the responsibilities of the ERO in regards to analysis and dissemination of information for reliability. Jurisdictional agencies (which may include DHS, FBI, NERC, RE, FERC, Provincial Regulators, and DOE) have other duties and responsibilities.

### **Collection of Reportable Information or “One stop shopping”**

The DSR SDT recognizes that some regions require reporting of additional information beyond what is in EOP-004. The DSR SDT has updated the listing of reportable events in EOP-004 Attachment 1 based on discussions with jurisdictional agencies, NERC, Regional Entities and stakeholder input. There is a possibility that regional differences still exist.

The reporting required by this standard is intended to meet the uses and purposes of NERC. The DSR SDT recognizes that other requirements for reporting exist (e.g., DOE-417 reporting), which may duplicate or overlap the information required by NERC. To the extent that other reporting is required, the DSR SDT envisions that duplicate entry of information should not be necessary, and the submission of the alternate report will be acceptable to NERC so long as all information required by NERC is submitted. For example, if the NERC Report duplicates information from the DOE form, the DOE report may be sent to the NERC in lieu of entering that information on the NERC report.

### **Rationale:**

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

### **Rationale for R1:**

The requirement to have an Operating Plan for reporting specific types of events provides the entity with a method to have its operating personnel recognize events that affect reliability and to be able to report them to appropriate parties; e.g., Regional Entities, applicable Reliability Coordinators, and law enforcement and other jurisdictional agencies when so recognized. In addition, these event reports are an input to the NERC Events Analysis Program. These other parties use this information to promote reliability, develop a culture of reliability excellence, provide industry collaboration and promote a learning organization.

Every Registered Entity that owns or operates elements or devices on the grid has a formal or informal process, procedure, or steps it takes to gather information regarding what happened when events occur. This requirement has the Responsible Entity establish documentation on

how that procedure, process, or plan is organized. This documentation may be a single document or a combination of various documents that achieve the reliability objective. The communication protocol(s) could include a process flowchart, identification of internal and external personnel or entities to be notified, or a list of personnel by name and their associated contact information. An existing procedure that meets the requirements of CIP-001-2a may be included in this Operating Plan along with other processes, procedures or plans to meet this requirement.

### **Rationale for R2:**

Each Responsible Entity must report and communicate events according to its Operating Plan based on the information in EOP-004-2(X) Attachment 1. By implementing the event reporting Operating Plan the Responsible Entity will assure situational awareness to the Electric Reliability Organization so that they may develop trends and prepare for a possible next event and mitigate the current event. This will assure that the BES remains secure and stable by mitigation actions that the Responsible Entity has within its function. By communicating events per the Operating Plan, the Responsible Entity will assure that people/agencies are aware of the current situation and they may prepare to mitigate current and further events.

### **Rationale for R3:**

Requirement 3 calls for the Responsible Entity to validate the contact information contained in the Operating Plan each calendar year. This requirement helps ensure that the event reporting Operating Plan is up to date and entities will be able to effectively report events to assure situational awareness to the Electric Reliability Organization. If an entity experiences an actual event, communication evidence from the event may be used to show compliance with the validation requirement for the specific contacts used for the event.

### **Rationale for EOP-004 Attachment 1:**

The DSR SDT used the defined term “Facility” to add clarity for several events listed in Attachment 1. A Facility is defined as:

“A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)”

The DSR SDT does not intend the use of the term Facility to mean a substation or any other facility (not a defined term) that one might consider in everyday discussions regarding the grid. This is intended to mean ONLY a Facility as defined above.

## Version History

| Version | Date             | Action   | Change Tracking  |
|---------|------------------|--|--|
| 2       |                  | Merged CIP-001-2a Sabotage Reporting and EOP-004-1 Disturbance Reporting into EOP-004-2 Event Reporting; Retire CIP-001-2a Sabotage Reporting and Retired EOP-004-1 Disturbance Reporting. | Revision to entire standard (Project 2009-01)  |
| 2       | November 7, 2012 | Adopted by the NERC Board of Trustees  |  |
| 2       | June 20, 2013    | FERC approved  |  |
| 2(X)    | TBD              | Adopted by the NERC Board of Trustees  | Replaced references to Special Protection System and SPS with Remedial Action Scheme and RAS |

## EOP-004-2(X) — Event Reporting

---

### A. Introduction

1. **Title:** Event Reporting
2. **Number:** EOP-004-2(X)
3. **Purpose:** To improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities.
4. **Applicability:**
  - 4.1. **Functional Entities:** For the purpose of the Requirements and the EOP-004 Attachment 1 contained herein, the following functional entities will be collectively referred to as “Responsible Entity.”
    - 4.1.1. Reliability Coordinator
    - 4.1.2. Balancing Authority
    - 4.1.3. Transmission Owner
    - 4.1.4. Transmission Operator
    - 4.1.5. Generator Owner
    - 4.1.6. Generator Operator
    - 4.1.7. Distribution Provider
5. **Effective Dates:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
6. **Background:**

NERC established a SAR Team in 2009 to investigate and propose revisions to the CIP-001 and EOP-004 Reliability Standards. The team was asked to consider the following:

  1. CIP-001 could be merged with EOP-004 to eliminate redundancies.
  2. Acts of sabotage have to be reported to the DOE as part of EOP-004.
  3. Specific references to the DOE form need to be eliminated.
  4. EOP-004 had some ‘fill-in-the-blank’ components to eliminate.

**Deleted:** The first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.¶

## EOP-004-2(X) — Event Reporting

---

The development included other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient Bulk Electric System reliability standards.

The SAR for Project 2009-01, Disturbance and Sabotage Reporting was moved forward for standard drafting by the NERC Standards Committee in August of 2009. The Disturbance and Sabotage Reporting Standard Drafting Team (DSR SDT) was formed in late 2009.

The DSR SDT developed a concept paper to solicit stakeholder input regarding the proposed reporting concepts that the DSR SDT had developed. The posting of the concept paper sought comments from stakeholders on the “road map” that will be used by the DSR SDT in updating or revising CIP-001 and EOP-004. The concept paper provided stakeholders the background information and thought process of the DSR SDT. The DSR SDT has reviewed the existing standards, the SAR, issues from the NERC issues database and FERC Order 693 Directives in order to determine a prudent course of action with respect to revision of these standards.

### B. Requirements and Measures

- R1.** Each Responsible Entity shall have an event reporting Operating Plan in accordance with EOP-004-2(X) Attachment 1 that includes the protocol(s) for reporting to the Electric Reliability Organization and other organizations (e.g., the Regional Entity, company personnel, the Responsible Entity’s Reliability Coordinator, law enforcement, or governmental authority). *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*
- M1.** Each Responsible Entity will have a dated event reporting Operating Plan that includes, but is not limited to the protocol(s) and each organization identified to receive an event report for event types specified in EOP-004-2(X) Attachment 1 and in accordance with the entity responsible for reporting.
- R2.** Each Responsible Entity shall report events per their Operating Plan within 24 hours of recognition of meeting an event type threshold for reporting or by the end of the next business day if the event occurs on a weekend (which is recognized to be 4 PM local time on Friday to 8 AM Monday local time). *[Violation Risk Factor: Medium] [Time Horizon: Operations Assessment]*
- M2.** Each Responsible Entity will have as evidence of reporting an event, copy of the completed EOP-004-2(X) Attachment 2 form or a DOE-OE-417 form; and evidence of submittal (e.g., operator log or other operating documentation, voice recording, electronic mail message, or confirmation of facsimile) demonstrating the event report was submitted within 24 hours of recognition of meeting the threshold for reporting or by the

## EOP-004-2(X) — Event Reporting

---

end of the next business day if the event occurs on a weekend (which is recognized to be 4 PM local time on Friday to 8 AM Monday local time). (R2)

- R3.** Each Responsible Entity shall validate all contact information contained in the Operating Plan pursuant to Requirement R1 each calendar year. *[Violation Risk Factor: Medium]*  
*[Time Horizon: Operations Planning]*
- M3.** Each Responsible Entity will have dated records to show that it validated all contact information contained in the Operating Plan each calendar year. Such evidence may include, but are not limited to, dated voice recordings and operating logs or other communication documentation. (R3)

### C. Compliance

#### 1. Compliance Monitoring Process

##### 1.1 Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

##### 1.2 Evidence Retention

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

- Each Responsible Entity shall retain the current Operating Plan plus each version issued since the last audit for Requirements R1, and Measure M1.
- Each Responsible Entity shall retain evidence of compliance since the last audit for Requirements R2, R3 and Measure M2, M3.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the duration specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**EOP-004 - Attachment 1: Reportable Events**

NOTE: Under certain adverse conditions (e.g. severe weather, multiple events) it may not be possible to report the damage caused by an event and issue a written Event Report within the timing in the standard. In such cases, the affected Responsible Entity shall notify parties per Requirement R2 and provide as much information as is available at the time of the notification. Submit reports to the ERO via one of the following: e-mail: [systemawareness@nerc.net](mailto:systemawareness@nerc.net), Facsimile 404-446-9770 or Voice: 404-446-9780.

## Guideline and Technical Basis

### Distribution Provider Applicability Discussion

The DSR SDT has included Distribution Providers (DP) as an applicable entity under this standard. The team realizes that not all DPs will own BES Facilities and will not meet the “Threshold for Reporting” for any event listed in Attachment 1. These DPs will not have any reports to submit under Requirement R2. However, these DPs will be responsible for meeting Requirements R1 and R3. The DSR SDT does not intend for these entities to have a detailed Operating Plan to address events that are not applicable to them. In this instance, the DSR SDT intends for the DP to have a very simple Operating Plan that includes a statement that there are no applicable events in Attachment 1 (to meet R1) and that the DP will review the list of events in Attachment 1 each year (to meet R3). The team does not think this will be a burden on any entity as the development and annual validation of the Operating Plan should not take more than 30 minutes on an annual basis. If a DP discovers applicable events during the annual review, it is expected that the DP will develop a more detailed Operating Plan to comply with the requirements of the standard.

### Multiple Reports for a Single Organization

For entities that have multiple registrations, the DSR SDT intends that these entities will only have to submit one report for any individual event. For example, if an entity is registered as a Reliability Coordinator, Balancing Authority and Transmission Operator, the entity would only submit one report for a particular event rather submitting three reports as each individual registered entity.

### Summary of Key Concepts

The DSR SDT identified the following principles to assist them in developing the standard:

- Develop a single form to report disturbances and events that threaten the reliability of the Bulk Electric System
- Investigate other opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements
- Establish clear criteria for reporting
- Establish consistent reporting timelines
- Provide clarity around who will receive the information and how it will be used

During the development of concepts, the DSR SDT considered the FERC directive to “further define sabotage”. There was concern among stakeholders that a definition may be ambiguous and subject to interpretation. Consequently, the DSR SDT decided to eliminate the term sabotage from the standard. The team felt that it was almost impossible to determine if an act or event was sabotage or vandalism without the intervention of law enforcement. The DSR SDT felt that attempting to define sabotage would result in further ambiguity with respect to

## **EOP-004-2(X) — Event Reporting**

---

reporting events. The term “sabotage” is no longer included in the standard. The events listed in EOP-004 Attachment 1 were developed to provide guidance for reporting both actual events as well as events which may have an impact on the Bulk Electric System. The DSR SDT believes that this is an equally effective and efficient means of addressing the FERC Directive.

The types of events that are required to be reported are contained within EOP-004 Attachment 1. The DSR SDT has coordinated with the NERC Events Analysis Working Group to develop the list of events that are to be reported under this standard. EOP-004 Attachment 1 pertains to those actions or events that have impacted the Bulk Electric System. These events were previously reported under EOP-004-1, CIP-001-1 or the Department of Energy form OE-417. EOP-004 Attachment 1 covers similar items that may have had an impact on the Bulk Electric System or has the potential to have an impact and should be reported.

The DSR SDT wishes to make clear that the proposed Standard does not include any real-time operating notifications for the events listed in EOP-004 Attachment 1. Real-time communication is achieved is covered in other standards. The proposed standard deals exclusively with after-the-fact reporting.

### **Data Gathering**

The requirements of EOP-004-1 require that entities “promptly analyze Bulk Electric System disturbances on its system or facilities” (Requirement R2). The requirements of EOP-004-2(X) specify that certain types of events are to be reported but do not include provisions to analyze events. Events reported under EOP-004-2(X) may trigger further scrutiny by the ERO Events Analysis Program. If warranted, the Events Analysis Program personnel may request that more data for certain events be provided by the reporting entity or other entities that may have experienced the event. Entities are encouraged to become familiar with the Events Analysis Program and the NERC Rules of Procedure to learn more about with the expectations of the program.

### **Law Enforcement Reporting**

The reliability objective of EOP-004-2(X) is to improve the reliability of the Bulk Electric System by requiring the reporting of events by Responsible Entities. Certain outages, such as those due to vandalism and terrorism, may not be reasonably preventable. These are the types of events that should be reported to law enforcement. Entities rely upon law enforcement agencies to respond to and investigate those events which have the potential to impact a wider area of the BES. The inclusion of reporting to law enforcement enables and supports reliability principles such as protection of Bulk Electric System from malicious physical attack. The importance of BES awareness of the threat around them is essential to the effective operation and planning to mitigate the potential risk to the BES.

### **Stakeholders in the Reporting Process**

- Industry

## EOP-004-2(X) — Event Reporting

---

- NERC (ERO), Regional Entity
- FERC
- DOE
- NRC
- DHS – Federal
- Homeland Security- State
- State Regulators
- Local Law Enforcement
- State or Provincial Law Enforcement
- FBI
- Royal Canadian Mounted Police (RCMP)

The above stakeholders have an interest in the timely notification, communication and response to an incident at a Facility. The stakeholders have various levels of accountability and have a vested interest in the protection and response to ensure the reliability of the BES.

### **Present expectations of the industry under CIP-001-1a:**

It has been the understanding by industry participants that an occurrence of sabotage has to be reported to the FBI. The FBI has the jurisdictional requirements to investigate acts of sabotage and terrorism. The CIP-001-1-1a standard requires a liaison relationship on behalf of the industry and the FBI or RCMP. These requirements, under the standard, of the industry have not been clear and have lead to misunderstandings and confusion in the industry as to how to demonstrate that the liaison is in place and effective. As an example of proof of compliance with Requirement R4, Responsible Entities have asked FBI Office personnel to provide, on FBI letterhead, confirmation of the existence of a working relationship to report acts of sabotage, the number of years the liaison relationship has been in existence, and the validity of the telephone numbers for the FBI.

### **Coordination of Local and State Law Enforcement Agencies with the FBI**

The Joint Terrorism Task Force (JTTF) came into being with the first task force being established in 1980. JTTFs are small cells of highly trained, locally based, committed investigators, analysts, linguists, SWAT experts, and other specialists from dozens of U.S. law enforcement and intelligence agencies. The JTTF is a multi-agency effort led by the Justice Department and FBI designed to combine the resources of federal, state, and local law enforcement. Coordination and communications largely through the interagency National Joint Terrorism Task Force, working out of FBI Headquarters, which makes sure that information and intelligence flows freely among the local JTTFs. This information flow can be most beneficial to the industry in analytical intelligence, incident response and investigation. Historically, the most immediate response to an industry incident has been local and state law enforcement agencies to suspected vandalism and criminal damages at industry facilities. Relying upon the JTTF

## **EOP-004-2(X) — Event Reporting**

---

coordination between local, state and FBI law enforcement would be beneficial to effective communications and the appropriate level of investigative response.

### **Coordination of Local and Provincial Law Enforcement Agencies with the RCMP**

A similar law enforcement coordination hierarchy exists in Canada. Local and Provincial law enforcement coordinate to investigate suspected acts of vandalism and sabotage. The Provincial law enforcement agency has a reporting relationship with the Royal Canadian Mounted Police (RCMP).

### **A Reporting Process Solution – EOP-004**

A proposal discussed with the FBI, FERC Staff, NERC Standards Project Coordinator and the SDT Chair is reflected in the flowchart below (Reporting Hierarchy for Reportable Events). Essentially, reporting an event to law enforcement agencies will only require the industry to notify the state or provincial or local level law enforcement agency. The state or provincial or local level law enforcement agency will coordinate with law enforcement with jurisdiction to investigate. If the state or provincial or local level law enforcement agency decides federal agency law enforcement or the RCMP should respond and investigate, the state or provincial or local level law enforcement agency will notify and coordinate with the FBI or the RCMP.

Example of Reporting Process including Law Enforcement Enforcement

Entity Experiencing An Event in Attachment 1

\* Canadian entities will follow law enforcement protocols applicable in their jurisdictions

## Disturbance and Sabotage Reporting Standard Drafting Team (Project 2009-01) - Reporting Concepts

### Introduction

The SAR for Project 2009-01, Disturbance and Sabotage Reporting was moved forward for standard drafting by the NERC Standards Committee in August of 2009. The Disturbance and Sabotage Reporting Standard Drafting Team (DSR SDT) was formed in late 2009 and has developed updated standards based on the SAR.

The standards listed under the SAR are:

- CIP-001 — Sabotage Reporting
- EOP-004 — Disturbance Reporting

The changes do not include any real-time operating notifications for the types of events covered by CIP-001 and EOP-004. The real-time reporting requirements are achieved through the RCIS and are covered in other standards (e.g. EOP-002-Capacity and Energy Emergencies). These standards deal exclusively with after-the-fact reporting.

The DSR SDT has consolidated disturbance and sabotage event reporting under a single standard. These two components and other key concepts are discussed in the following sections.

### Summary of Concepts and Assumptions:

#### *The Standard:*

- Requires reporting of “events” that impact or may impact the reliability of the Bulk Electric System
- Provides clear criteria for reporting
- Includes consistent reporting timelines
- Identifies appropriate applicability, including a reporting hierarchy in the case of disturbance reporting
- Provides clarity around of who will receive the information

#### **Discussion of Disturbance Reporting**

Disturbance reporting requirements existed in the previous version of EOP-004. The current approved definition of Disturbance from the NERC Glossary of Terms is:

1. An unplanned event that produces an abnormal system condition.
2. Any perturbation to the electric system.

## EOP-004-2(X) — Event Reporting

---

3. The unexpected change in ACE that is caused by the sudden failure of generation or interruption of load.

Disturbance reporting requirements and criteria were in the previous EOP-004 standard and its attachments. The DSR SDT discussed the reliability needs for disturbance reporting and developed the list of events that are to be reported under this standard (EOP-004 Attachment 1).

### Discussion of Event Reporting

There are situations worthy of reporting because they have the potential to impact reliability.

Event reporting facilitates industry awareness, which allows potentially impacted parties to prepare for and possibly mitigate any associated reliability risk. It also provides the raw material, in the case of certain potential reliability threats, to see emerging patterns.

Examples of such events include:

- Bolts removed from transmission line structures
- Train derailment adjacent to a Facility that either could have damaged a Facility directly or could indirectly damage a Facility (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a control center)
- Destruction of Bulk Electric System equipment

### What about sabotage?

One thing became clear in the DSR SDT's discussion concerning sabotage: everyone has a different definition. The current standard CIP-001 elicited the following response from FERC in FERC Order 693, paragraph 471 which states in part: *" . . . the Commission directs the ERO to develop the following modifications to the Reliability Standard through the Reliability Standards development process: (1) further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event."*

Often, the underlying reason for an event is unknown or cannot be confirmed. The DSR SDT believes that by reporting material risks to the Bulk Electric System using the event categorization in this standard, it will be easier to get the relevant information for mitigation, awareness, and tracking, while removing the distracting element of motivation.

Certain types of events should be reported to NERC, the Department of Homeland Security (DHS), the Federal Bureau of Investigation (FBI), and/or Provincial or local law enforcement. Other types of events may have different reporting requirements. For example, an event that is related to copper theft may only need to be reported to the local law enforcement authorities.

## EOP-004-2(X) — Event Reporting

---

### ***Potential Uses of Reportable Information***

Event analysis, correlation of data, and trend identification are a few potential uses for the information reported under this standard. The standard requires Functional entities to report the incidents and provide known information at the time of the report. Further data gathering necessary for event analysis is provided for under the Events Analysis Program and the NERC Rules of Procedure. Other entities (e.g. – NERC, Law Enforcement, etc) will be responsible for performing the analyses. The [NERC Rules of Procedure \(section 800\)](#) provide an overview of the responsibilities of the ERO in regards to analysis and dissemination of information for reliability. Jurisdictional agencies (which may include DHS, FBI, NERC, RE, FERC, Provincial Regulators, and DOE) have other duties and responsibilities.

### **Collection of Reportable Information or “One stop shopping”**

The DSR SDT recognizes that some regions require reporting of additional information beyond what is in EOP-004. The DSR SDT has updated the listing of reportable events in EOP-004 Attachment 1 based on discussions with jurisdictional agencies, NERC, Regional Entities and stakeholder input. There is a possibility that regional differences still exist.

The reporting required by this standard is intended to meet the uses and purposes of NERC. The DSR SDT recognizes that other requirements for reporting exist (e.g., DOE-417 reporting), which may duplicate or overlap the information required by NERC. To the extent that other reporting is required, the DSR SDT envisions that duplicate entry of information should not be necessary, and the submission of the alternate report will be acceptable to NERC so long as all information required by NERC is submitted. For example, if the NERC Report duplicates information from the DOE form, the DOE report may be sent to the NERC in lieu of entering that information on the NERC report.

### **Rationale:**

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

#### **Rationale for R1:**

The requirement to have an Operating Plan for reporting specific types of events provides the entity with a method to have its operating personnel recognize events that affect reliability and to be able to report them to appropriate parties; e.g., Regional Entities, applicable Reliability Coordinators, and law enforcement and other jurisdictional agencies when so recognized. In addition, these event reports are an input to the NERC Events Analysis Program. These other parties use this information to promote reliability, develop a culture of reliability excellence, provide industry collaboration and promote a learning organization.

Every Registered Entity that owns or operates elements or devices on the grid has a formal or informal process, procedure, or steps it takes to gather information regarding what happened when events occur. This requirement has the Responsible Entity establish documentation on

## EOP-004-2(X) — Event Reporting

---

how that procedure, process, or plan is organized. This documentation may be a single document or a combination of various documents that achieve the reliability objective. The communication protocol(s) could include a process flowchart, identification of internal and external personnel or entities to be notified, or a list of personnel by name and their associated contact information. An existing procedure that meets the requirements of CIP-001-2a may be included in this Operating Plan along with other processes, procedures or plans to meet this requirement.

### **Rationale for R2:**

Each Responsible Entity must report and communicate events according to its Operating Plan based on the information in EOP-004-2(X) Attachment 1. By implementing the event reporting Operating Plan the Responsible Entity will assure situational awareness to the Electric Reliability Organization so that they may develop trends and prepare for a possible next event and mitigate the current event. This will assure that the BES remains secure and stable by mitigation actions that the Responsible Entity has within its function. By communicating events per the Operating Plan, the Responsible Entity will assure that people/agencies are aware of the current situation and they may prepare to mitigate current and further events.

### **Rationale for R3:**

Requirement 3 calls for the Responsible Entity to validate the contact information contained in the Operating Plan each calendar year. This requirement helps ensure that the event reporting Operating Plan is up to date and entities will be able to effectively report events to assure situational awareness to the Electric Reliability Organization. If an entity experiences an actual event, communication evidence from the event may be used to show compliance with the validation requirement for the specific contacts used for the event.

### **Rationale for EOP-004 Attachment 1:**

The DSR SDT used the defined term “Facility” to add clarity for several events listed in Attachment 1. A Facility is defined as:

“A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)”

The DSR SDT does not intend the use of the term Facility to mean a substation or any other facility (not a defined term) that one might consider in everyday discussions regarding the grid. This is intended to mean ONLY a Facility as defined above.

## EOP-004-2(X) — Event Reporting

---

### Version History

| Version     | Date             | Action   | Change Tracking   |
|-------------|------------------|--|---|
| 2           |                  | Merged CIP-001-2a Sabotage Reporting and EOP-004-1 Disturbance Reporting into EOP-004-2 Event Reporting; Retire CIP-001-2a Sabotage Reporting and Retired EOP-004-1 Disturbance Reporting. | Revision to entire standard (Project 2009-01)   |
| 2           | November 7, 2012 | Adopted by the NERC Board of Trustees  |   |
| 2           | June 20, 2013    | FERC approved  |   |
| <u>2(X)</u> | <u>TBD</u>       | <u>Adopted by the NERC Board of Trustees</u>   | <u>Replaced references to Special Protection System and SPS with Remedial Action Scheme and RAS</u> |

**A. Introduction**

- 1. Title:** System Operating Limits Methodology for the Planning Horizon
- 2. Number:** FAC-010-2.1(X)
- 3. Purpose:** To ensure that System Operating Limits (SOLs) used in the reliable planning of the Bulk Electric System (BES) are determined based on an established methodology or methodologies.
- 4. Applicability**
  - 4.1. Planning Authority**
- 5. Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**B. Requirements**

- R1.** The Planning Authority shall have a documented SOL Methodology for use in developing SOLs within its Planning Authority Area. This SOL Methodology shall:
  - R1.1.** Be applicable for developing SOLs used in the planning horizon.
  - R1.2.** State that SOLs shall not exceed associated Facility Ratings.
  - R1.3.** Include a description of how to identify the subset of SOLs that qualify as IROLs.
- R2.** The Planning Authority's SOL Methodology shall include a requirement that SOLs provide BES performance consistent with the following:
  - R2.1.** In the pre-contingency state and with all Facilities in service, the BES shall demonstrate transient, dynamic and voltage stability; all Facilities shall be within their Facility Ratings and within their thermal, voltage and stability limits. In the determination of SOLs, the BES condition used shall reflect expected system conditions and shall reflect changes to system topology such as Facility outages.
  - R2.2.** Following the single Contingencies<sup>1</sup> identified in Requirement 2.2.1 through Requirement 2.2.3, the system shall demonstrate transient, dynamic and voltage stability; all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur.
    - R2.2.1.** Single line to ground or three-phase Fault (whichever is more severe), with Normal Clearing, on any Faulted generator, line, transformer, or shunt device.
    - R2.2.2.** Loss of any generator, line, transformer, or shunt device without a Fault.
    - R2.2.3.** Single pole block, with Normal Clearing, in a monopolar or bipolar high voltage direct current system.

---

<sup>1</sup> The Contingencies identified in R2.2.1 through R2.2.3 are the minimum contingencies that must be studied but are not necessarily the only Contingencies that should be studied.

## Standard FAC-010-2.1(X) — System Operating Limits Methodology for the Planning Horizon

---

- R2.3.** Starting with all Facilities in service, the system's response to a single Contingency, may include any of the following:
  - R2.3.1.** Planned or controlled interruption of electric supply to radial customers or some local network customers connected to or supplied by the Faulted Facility or by the affected area.
  - R2.3.2.** System reconfiguration through manual or automatic control or protection actions.
- R2.4.** To prepare for the next Contingency, system adjustments may be made, including changes to generation, uses of the transmission system, and the transmission system topology.
- R2.5.** Starting with all Facilities in service and following any of the multiple Contingencies identified in Reliability Standard TPL-003 the system shall demonstrate transient, dynamic and voltage stability; all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur.
- R2.6.** In determining the system's response to any of the multiple Contingencies, identified in Reliability Standard TPL-003, in addition to the actions identified in R2.3.1 and R2.3.2, the following shall be acceptable:
  - R2.6.1.** Planned or controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers.
- R3.** The Planning Authority's methodology for determining SOLs, shall include, as a minimum, a description of the following, along with any reliability margins applied for each:
  - R3.1.** Study model (must include at least the entire Planning Authority Area as well as the critical modeling details from other Planning Authority Areas that would impact the Facility or Facilities under study).
  - R3.2.** Selection of applicable Contingencies.
  - R3.3.** Level of detail of system models used to determine SOLs.
  - R3.4.** Allowed uses of Remedial Action Schemes.
  - R3.5.** Anticipated transmission system configuration, generation dispatch and Load level.
  - R3.6.** Criteria for determining when violating a SOL qualifies as an Interconnection Reliability Operating Limit (IROL) and criteria for developing any associated IROL  $T_v$ .
- R4.** The Planning Authority shall issue its SOL Methodology, and any change to that methodology, to all of the following prior to the effectiveness of the change:
  - R4.1.** Each adjacent Planning Authority and each Planning Authority that indicated it has a reliability-related need for the methodology.
  - R4.2.** Each Reliability Coordinator and Transmission Operator that operates any portion of the Planning Authority's Planning Authority Area.
  - R4.3.** Each Transmission Planner that works in the Planning Authority's Planning Authority Area.
- R5.** If a recipient of the SOL Methodology provides documented technical comments on the methodology, the Planning Authority shall provide a documented response to that recipient

## Standard FAC-010-2.1(X) — System Operating Limits Methodology for the Planning Horizon

---

within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the SOL Methodology and, if no change will be made to that SOL Methodology, the reason why. (Retirement approved by FERC effective January 21, 2014.)

### C. Measures

- M1.** The Planning Authority's SOL Methodology shall address all of the items listed in Requirement 1 through Requirement 3.
- M2.** The Planning Authority shall have evidence it issued its SOL Methodology and any changes to that methodology, including the date they were issued, in accordance with Requirement 4.

If the recipient of the SOL Methodology provides documented comments on its technical review of that SOL methodology, the Planning Authority that distributed that SOL Methodology shall have evidence that it provided a written response to that commenter within 45 calendar days of receipt of those comments in accordance with Requirement 5. (Retirement approved by FERC effective January 21, 2014.)

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organization

##### 1.2. Compliance Monitoring Period and Reset Time Frame

Each Planning Authority shall self-certify its compliance to the Compliance Monitor at least once every three years. New Planning Authorities shall demonstrate compliance through an on-site audit conducted by the Compliance Monitor within the first year that it commences operation. The Compliance Monitor shall also conduct an on-site audit once every nine years and an investigation upon complaint to assess performance.

The Performance-Reset Period shall be twelve months from the last non-compliance.

##### 1.3. Data Retention

The Planning Authority shall keep all superseded portions to its SOL Methodology for 12 months beyond the date of the change in that methodology ~~and shall keep all documented comments on its SOL Methodology and associated responses for three years.~~ In addition, entities found non-compliant shall keep information related to the non-compliance until found compliant. (Deleted text retired-Retirement approved by FERC effective January 21, 2014.)

The Compliance Monitor shall keep the last audit and all subsequent compliance records.

##### 1.4. Additional Compliance Information

The Planning Authority shall make the following available for inspection during an on-site audit by the Compliance Monitor or within 15 business days of a request as part of an investigation upon complaint:

###### 1.4.1 SOL Methodology.

Documented comments provided by a recipient of the SOL Methodology on its technical review of a SOL Methodology, and the associated responses. (Retirement approved by FERC effective January 21, 2014.)

###### 1.4.2 Superseded portions of its SOL Methodology that had been made within the past 12 months.

## Standard FAC-010-2.1(X) — System Operating Limits Methodology for the Planning Horizon

---

- 1.4.3 Evidence that the SOL Methodology and any changes to the methodology that occurred within the past 12 months were issued to all required entities.
- 2. **Levels of Non-Compliance for Western Interconnection: (To be replaced with VSLs once developed and approved by WECC)**
  - 2.1. **Level 1:** There shall be a level one non-compliance if either of the following conditions exists:
    - 2.1.1 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded.
    - 2.1.2 No evidence of responses to a recipient's comments on the SOL Methodology. **(Retirement approved by FERC effective January 21, 2014.)**
  - 2.2. **Level 2:** The SOL Methodology did not include a requirement to address all of the elements in R2.1 through R2.3 and E1.
  - 2.3. **Level 3:** There shall be a level three non-compliance if any of the following conditions exists:
    - 2.3.1 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not include evaluation of system response to one of the three types of single Contingencies identified in R2.2.
    - 2.3.2 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not include evaluation of system response to two of the seven types of multiple Contingencies identified in E1.1.
    - 2.3.3 The System Operating Limits Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not address two of the six required topics in R3.
  - 2.4. **Level 4:** The SOL Methodology was not issued to all required entities in accordance with R4

**Standard FAC-010-2.1(X) — System Operating Limits Methodology for the Planning Horizon**

**3. Violation Severity Levels:**

| Requirement | Lower  | Moderate   | High   | Severe  |
|-------------|--|--|--|---|
| R1          | Not applicable.  | The Planning Authority has a documented SOL Methodology for use in developing SOLs within its Planning Authority Area, but it does not address R1.2  | The Planning Authority has a documented SOL Methodology for use in developing SOLs within its Planning Authority Area, but it does not address R1.3.   | The Planning Authority has a documented SOL Methodology for use in developing SOLs within its Planning Authority Area, but it does not address R1.1.<br>OR<br>The Planning Authority has no documented SOL Methodology for use in developing SOLs within its Planning Authority Area.                             |

## **E. Regional Differences**

- 1.** The following Interconnection-wide Regional Difference shall be applicable in the Western Interconnection:
  - 1.1.** As governed by the requirements of R2.5 and R2.6, starting with all Facilities in service, shall require the evaluation of the following multiple Facility Contingencies when establishing SOLs:
    - 1.1.1** Simultaneous permanent phase to ground Faults on different phases of each of two adjacent transmission circuits on a multiple circuit tower, with Normal Clearing. If multiple circuit towers are used only for station entrance and exit purposes, and if they do not exceed five towers at each station, then this condition is an acceptable risk and therefore can be excluded.
    - 1.1.2** A permanent phase to ground Fault on any generator, transmission circuit, transformer, or bus section with Delayed Fault Clearing except for bus sectionalizing breakers or bus-tie breakers addressed in E1.1.7
    - 1.1.3** Simultaneous permanent loss of both poles of a direct current bipolar Facility without an alternating current Fault.
    - 1.1.4** The failure of a circuit breaker associated with a Remedial Action Scheme to operate when required following: the loss of any element without a Fault; or a permanent phase to ground Fault, with Normal Clearing, on any transmission circuit, transformer or bus section.
    - 1.1.5** A non-three phase Fault with Normal Clearing on common mode Contingency of two adjacent circuits on separate towers unless the event frequency is determined to be less than one in thirty years.
    - 1.1.6** A common mode outage of two generating units connected to the same switchyard, not otherwise addressed by FAC-010.
    - 1.1.7** The loss of multiple bus sections as a result of failure or delayed clearing of a bus tie or bus sectionalizing breaker to clear a permanent Phase to Ground Fault.
  - 1.2.** SOLs shall be established such that for multiple Facility Contingencies in E1.1.1 through E1.1.5 operation within the SOL shall provide system performance consistent with the following:
    - 1.2.1** All Facilities are operating within their applicable Post-Contingency thermal, frequency and voltage limits.
    - 1.2.2** Cascading does not occur.
    - 1.2.3** Uncontrolled separation of the system does not occur.
    - 1.2.4** The system demonstrates transient, dynamic and voltage stability.
    - 1.2.5** Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted firm (non-recallable reserved) electric power transfers may be necessary to maintain the overall security of the interconnected transmission systems.
    - 1.2.6** Interruption of firm transfer, Load or system reconfiguration is permitted through manual or automatic control or protection actions.

## Standard FAC-010-2.1(X) — System Operating Limits Methodology for the Planning Horizon

- 1.2.7** To prepare for the next Contingency, system adjustments are permitted, including changes to generation, Load and the transmission system topology when determining limits.
- 1.3.** SOLs shall be established such that for multiple Facility Contingencies in E1.1.6 through E1.1.7 operation within the SOL shall provide system performance consistent with the following with respect to impacts on other systems:
- 1.3.1** Cascading does not occur.
- 1.4.** The Western Interconnection may make changes (performance category adjustments) to the Contingencies required to be studied and/or the required responses to Contingencies for specific facilities based on actual system performance and robust design. Such changes will apply in determining SOLs.

### Version History

## Standard FAC-010-2.1(X) — System Operating Limits Methodology for the Planning Horizon

---

### A. Introduction

1. **Title:** System Operating Limits Methodology for the Planning Horizon
2. **Number:** FAC-010-2.1(X)
3. **Purpose:** To ensure that System Operating Limits (SOLs) used in the reliable planning of the Bulk Electric System (BES) are determined based on an established methodology or methodologies.
4. **Applicability**
  - 4.1. Planning Authority
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Deleted: April 19, 2010

### B. Requirements

- R1. The Planning Authority shall have a documented SOL Methodology for use in developing SOLs within its Planning Authority Area. This SOL Methodology shall:
  - R1.1. Be applicable for developing SOLs used in the planning horizon.
  - R1.2. State that SOLs shall not exceed associated Facility Ratings.
  - R1.3. Include a description of how to identify the subset of SOLs that qualify as IROLs.
- R2. The Planning Authority's SOL Methodology shall include a requirement that SOLs provide BES performance consistent with the following:
  - R2.1. In the pre-contingency state and with all Facilities in service, the BES shall demonstrate transient, dynamic and voltage stability; all Facilities shall be within their Facility Ratings and within their thermal, voltage and stability limits. In the determination of SOLs, the BES condition used shall reflect expected system conditions and shall reflect changes to system topology such as Facility outages.
  - R2.2. Following the single Contingencies<sup>1</sup> identified in Requirement 2.2.1 through Requirement 2.2.3, the system shall demonstrate transient, dynamic and voltage stability; all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur.
    - R2.2.1. Single line to ground or three-phase Fault (whichever is more severe), with Normal Clearing, on any Faulted generator, line, transformer, or shunt device.
    - R2.2.2. Loss of any generator, line, transformer, or shunt device without a Fault.
    - R2.2.3. Single pole block, with Normal Clearing, in a monopolar or bipolar high voltage direct current system.

---

<sup>1</sup> The Contingencies identified in R2.2.1 through R2.2.3 are the minimum contingencies that must be studied but are not necessarily the only Contingencies that should be studied.

**Standard FAC-010-2.1(X) — System Operating Limits Methodology for the Planning Horizon**

- R2.3.** Starting with all Facilities in service, the system’s response to a single Contingency, may include any of the following:
  - R2.3.1.** Planned or controlled interruption of electric supply to radial customers or some local network customers connected to or supplied by the Faulted Facility or by the affected area.
  - R2.3.2.** System reconfiguration through manual or automatic control or protection actions.
- R2.4.** To prepare for the next Contingency, system adjustments may be made, including changes to generation, uses of the transmission system, and the transmission system topology.
- R2.5.** Starting with all Facilities in service and following any of the multiple Contingencies identified in Reliability Standard TPL-003 the system shall demonstrate transient, dynamic and voltage stability; all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur.
- R2.6.** In determining the system’s response to any of the multiple Contingencies, identified in Reliability Standard TPL-003, in addition to the actions identified in R2.3.1 and R2.3.2, the following shall be acceptable:
  - R2.6.1.** Planned or controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers.
- R3.** The Planning Authority’s methodology for determining SOLs, shall include, as a minimum, a description of the following, along with any reliability margins applied for each:
  - R3.1.** Study model (must include at least the entire Planning Authority Area as well as the critical modeling details from other Planning Authority Areas that would impact the Facility or Facilities under study).
  - R3.2.** Selection of applicable Contingencies.
  - R3.3.** Level of detail of system models used to determine SOLs.
  - R3.4.** Allowed uses of Remedial Action Schemes.
  - R3.5.** Anticipated transmission system configuration, generation dispatch and Load level.
  - R3.6.** Criteria for determining when violating a SOL qualifies as an Interconnection Reliability Operating Limit (IROL) and criteria for developing any associated IROL  $T_v$ .
- R4.** The Planning Authority shall issue its SOL Methodology, and any change to that methodology, to all of the following prior to the effectiveness of the change:
  - R4.1.** Each adjacent Planning Authority and each Planning Authority that indicated it has a reliability-related need for the methodology.
  - R4.2.** Each Reliability Coordinator and Transmission Operator that operates any portion of the Planning Authority’s Planning Authority Area.
  - R4.3.** Each Transmission Planner that works in the Planning Authority’s Planning Authority Area.
- R5.** If a recipient of the SOL Methodology provides documented technical comments on the methodology, the Planning Authority shall provide a documented response to that recipient

Deleted: Special Protection Systems or

Deleted: Plans

## Standard FAC-010-2.1(X) — System Operating Limits Methodology for the Planning Horizon

---

within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the SOL Methodology and, if no change will be made to that SOL Methodology, the reason why. (Retirement approved by FERC effective January 21, 2014.)

### C. Measures

- M1.** The Planning Authority's SOL Methodology shall address all of the items listed in Requirement 1 through Requirement 3.
- M2.** The Planning Authority shall have evidence it issued its SOL Methodology and any changes to that methodology, including the date they were issued, in accordance with Requirement 4.

If the recipient of the SOL Methodology provides documented comments on its technical review of that SOL methodology, the Planning Authority that distributed that SOL Methodology shall have evidence that it provided a written response to that commenter within 45 calendar days of receipt of those comments in accordance with Requirement 5. (Retirement approved by FERC effective January 21, 2014.)

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organization

##### 1.2. Compliance Monitoring Period and Reset Time Frame

Each Planning Authority shall self-certify its compliance to the Compliance Monitor at least once every three years. New Planning Authorities shall demonstrate compliance through an on-site audit conducted by the Compliance Monitor within the first year that it commences operation. The Compliance Monitor shall also conduct an on-site audit once every nine years and an investigation upon complaint to assess performance.

The Performance-Reset Period shall be twelve months from the last non-compliance.

##### 1.3. Data Retention

The Planning Authority shall keep all superseded portions to its SOL Methodology for 12 months beyond the date of the change in that methodology ~~and shall keep all documented comments on its SOL Methodology and associated responses for three years.~~ In addition, entities found non-compliant shall keep information related to the non-compliance until found compliant. (Deleted text retired-Retirement approved by FERC effective January 21, 2014.)

The Compliance Monitor shall keep the last audit and all subsequent compliance records.

##### 1.4. Additional Compliance Information

The Planning Authority shall make the following available for inspection during an on-site audit by the Compliance Monitor or within 15 business days of a request as part of an investigation upon complaint:

###### 1.4.1 SOL Methodology.

Documented comments provided by a recipient of the SOL Methodology on its technical review of a SOL Methodology, and the associated responses.  
(Retirement approved by FERC effective January 21, 2014.)

###### 1.4.2 Superseded portions of its SOL Methodology that had been made within the past 12 months.

**Standard FAC-010-2.1(X) — System Operating Limits Methodology for the Planning Horizon**

---

- 1.4.3 Evidence that the SOL Methodology and any changes to the methodology that occurred within the past 12 months were issued to all required entities.
- 2. **Levels of Non-Compliance for Western Interconnection: (To be replaced with VSLs once developed and approved by WECC)**
  - 2.1. **Level 1:** There shall be a level one non-compliance if either of the following conditions exists:
    - 2.1.1 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded.
    - 2.1.2 No evidence of responses to a recipient's comments on the SOL Methodology. (Retirement approved by FERC effective January 21, 2014.)
  - 2.2. **Level 2:** The SOL Methodology did not include a requirement to address all of the elements in R2.1 through R2.3 and E1.
  - 2.3. **Level 3:** There shall be a level three non-compliance if any of the following conditions exists:
    - 2.3.1 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not include evaluation of system response to one of the three types of single Contingencies identified in R2.2.
    - 2.3.2 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not include evaluation of system response to two of the seven types of multiple Contingencies identified in E1.1.
    - 2.3.3 The System Operating Limits Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not address two of the six required topics in R3.
  - 2.4. **Level 4:** The SOL Methodology was not issued to all required entities in accordance with R4

**Standard FAC-010-2.1(X) — System Operating Limits Methodology for the Planning Horizon**

**3. Violation Severity Levels:**

**Standard FAC-010-2.1(X) — System Operating Limits Methodology for the Planning Horizon**

---

**E. Regional Differences**

1. The following Interconnection-wide Regional Difference shall be applicable in the Western Interconnection:
  - 1.1. As governed by the requirements of R2.5 and R2.6, starting with all Facilities in service, shall require the evaluation of the following multiple Facility Contingencies when establishing SOLs:
    - 1.1.1 Simultaneous permanent phase to ground Faults on different phases of each of two adjacent transmission circuits on a multiple circuit tower, with Normal Clearing. If multiple circuit towers are used only for station entrance and exit purposes, and if they do not exceed five towers at each station, then this condition is an acceptable risk and therefore can be excluded.
    - 1.1.2 A permanent phase to ground Fault on any generator, transmission circuit, transformer, or bus section with Delayed Fault Clearing except for bus sectionalizing breakers or bus-tie breakers addressed in E1.1.7
    - 1.1.3 Simultaneous permanent loss of both poles of a direct current bipolar Facility without an alternating current Fault.
    - 1.1.4 The failure of a circuit breaker associated with a [Remedial Action Scheme](#) to operate when required following: the loss of any element without a Fault; or a permanent phase to ground Fault, with Normal Clearing, on any transmission circuit, transformer or bus section.
    - 1.1.5 A non-three phase Fault with Normal Clearing on common mode Contingency of two adjacent circuits on separate towers unless the event frequency is determined to be less than one in thirty years.
    - 1.1.6 A common mode outage of two generating units connected to the same switchyard, not otherwise addressed by FAC-010.
    - 1.1.7 The loss of multiple bus sections as a result of failure or delayed clearing of a bus tie or bus sectionalizing breaker to clear a permanent Phase to Ground Fault.
  - 1.2. SOLs shall be established such that for multiple Facility Contingencies in E1.1.1 through E1.1.5 operation within the SOL shall provide system performance consistent with the following:
    - 1.2.1 All Facilities are operating within their applicable Post-Contingency thermal, frequency and voltage limits.
    - 1.2.2 Cascading does not occur.
    - 1.2.3 Uncontrolled separation of the system does not occur.
    - 1.2.4 The system demonstrates transient, dynamic and voltage stability.
    - 1.2.5 Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted firm (non-recallable reserved) electric power transfers may be necessary to maintain the overall security of the interconnected transmission systems.
    - 1.2.6 Interruption of firm transfer, Load or system reconfiguration is permitted through manual or automatic control or protection actions.

Deleted: Special Protection System

**Standard FAC-010-2.1(X) — System Operating Limits Methodology for the Planning Horizon**

**1.2.7** To prepare for the next Contingency, system adjustments are permitted, including changes to generation, Load and the transmission system topology when determining limits.

**1.3.** SOLs shall be established such that for multiple Facility Contingencies in E1.1.6 through E1.1.7 operation within the SOL shall provide system performance consistent with the following with respect to impacts on other systems:

**1.3.1** Cascading does not occur.

**1.4.** The Western Interconnection may make changes (performance category adjustments) to the Contingencies required to be studied and/or the required responses to Contingencies for specific facilities based on actual system performance and robust design. Such changes will apply in determining SOLs.

## A. Introduction

1. **Title:** System Operating Limits Methodology for the Operations Horizon
2. **Number:** FAC-011-2(X)
3. **Purpose:** To ensure that System Operating Limits (SOLs) used in the reliable operation of the Bulk Electric System (BES) are determined based on an established methodology or methodologies.
4. **Applicability**
  - 4.1. Reliability Coordinator
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

## B. Requirements

- R1. The Reliability Coordinator shall have a documented methodology for use in developing SOLs (SOL Methodology) within its Reliability Coordinator Area. This SOL Methodology shall:
  - R1.1. Be applicable for developing SOLs used in the operations horizon.
  - R1.2. State that SOLs shall not exceed associated Facility Ratings.
  - R1.3. Include a description of how to identify the subset of SOLs that qualify as IROLs.
- R2. The Reliability Coordinator's SOL Methodology shall include a requirement that SOLs provide BES performance consistent with the following:
  - R2.1. In the pre-contingency state, the BES shall demonstrate transient, dynamic and voltage stability; all Facilities shall be within their Facility Ratings and within their thermal, voltage and stability limits. In the determination of SOLs, the BES condition used shall reflect current or expected system conditions and shall reflect changes to system topology such as Facility outages.
  - R2.2. Following the single Contingencies<sup>1</sup> identified in Requirement 2.2.1 through Requirement 2.2.3, the system shall demonstrate transient, dynamic and voltage stability; all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur.
    - R2.2.1. Single line to ground or 3-phase Fault (whichever is more severe), with Normal Clearing, on any Faulted generator, line, transformer, or shunt device.
    - R2.2.2. Loss of any generator, line, transformer, or shunt device without a Fault.

---

<sup>1</sup> The Contingencies identified in FAC-011 R2.2.1 through R2.2.3 are the minimum contingencies that must be studied but are not necessarily the only Contingencies that should be studied.

- R2.2.3.** Single pole block, with Normal Clearing, in a monopolar or bipolar high voltage direct current system.
- R2.3.** In determining the system's response to a single Contingency, the following shall be acceptable:
  - R2.3.1.** Planned or controlled interruption of electric supply to radial customers or some local network customers connected to or supplied by the Faulted Facility or by the affected area.
  - R2.3.2.** Interruption of other network customers, (a) only if the system has already been adjusted, or is being adjusted, following at least one prior outage, or (b) if the real-time operating conditions are more adverse than anticipated in the corresponding studies
  - R2.3.3.** System reconfiguration through manual or automatic control or protection actions.
- R2.4.** To prepare for the next Contingency, system adjustments may be made, including changes to generation, uses of the transmission system, and the transmission system topology.
- R3.** The Reliability Coordinator's methodology for determining SOLs, shall include, as a minimum, a description of the following, along with any reliability margins applied for each:
  - R3.1.** Study model (must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study.)
  - R3.2.** Selection of applicable Contingencies
  - R3.3.** A process for determining which of the stability limits associated with the list of multiple contingencies (provided by the Planning Authority in accordance with FAC-014 Requirement 6) are applicable for use in the operating horizon given the actual or expected system conditions.
    - R3.3.1.** This process shall address the need to modify these limits, to modify the list of limits, and to modify the list of associated multiple contingencies.
  - R3.4.** Level of detail of system models used to determine SOLs.
  - R3.5.** Allowed uses of Remedial Action Schemes.
  - R3.6.** Anticipated transmission system configuration, generation dispatch and Load level
  - R3.7.** Criteria for determining when violating a SOL qualifies as an Interconnection Reliability Operating Limit (IROL) and criteria for developing any associated IROL  $T_v$ .
- R4.** The Reliability Coordinator shall issue its SOL Methodology and any changes to that methodology, prior to the effectiveness of the Methodology or of a change to the Methodology, to all of the following:
  - R4.1.** Each adjacent Reliability Coordinator and each Reliability Coordinator that indicated it has a reliability-related need for the methodology.
  - R4.2.** Each Planning Authority and Transmission Planner that models any portion of the Reliability Coordinator's Reliability Coordinator Area.
  - R4.3.** Each Transmission Operator that operates in the Reliability Coordinator Area.

- R5.** If a recipient of the SOL Methodology provides documented technical comments on the methodology, the Reliability Coordinator shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the SOL Methodology and, if no change will be made to that SOL Methodology, the reason why. (Retirement approved by FERC effective January 21, 2014.)

### **C. Measures**

- M1.** The Reliability Coordinator's SOL Methodology shall address all of the items listed in Requirement 1 through Requirement 3.
- M2.** The Reliability Coordinator shall have evidence it issued its SOL Methodology, and any changes to that methodology, including the date they were issued, in accordance with Requirement 4.
- M3.** If the recipient of the SOL Methodology provides documented comments on its technical review of that SOL methodology, the Reliability Coordinator that distributed that SOL Methodology shall have evidence that it provided a written response to that commenter within 45 calendar days of receipt of those comments in accordance with Requirement 5. (Retirement approved by FERC effective January 21, 2014.)

### **D. Compliance**

#### **1. Compliance Monitoring Process**

##### **1.1. Compliance Monitoring Responsibility**

Regional Reliability Organization

##### **1.2. Compliance Monitoring Period and Reset Time Frame**

Each Reliability Coordinator shall self-certify its compliance to the Compliance Monitor at least once every three years. New Reliability Authorities shall demonstrate compliance through an on-site audit conducted by the Compliance Monitor within the first year that it commences operation. The Compliance Monitor shall also conduct an on-site audit once every nine years and an investigation upon complaint to assess performance.

The Performance-Reset Period shall be twelve months from the last non-compliance.

##### **1.3. Data Retention**

The Reliability Coordinator shall keep all superseded portions to its SOL Methodology for 12 months beyond the date of the change in that methodology ~~and shall keep all documented comments on its SOL Methodology and associated responses for three years.~~ In addition, entities found non-compliant shall keep information related to the non-compliance until found compliant. (Deleted text retired-Retirement approved by FERC effective January 21, 2014.)

The Compliance Monitor shall keep the last audit and all subsequent compliance records.

##### **1.4. Additional Compliance Information**

The Reliability Coordinator shall make the following available for inspection during an on-site audit by the Compliance Monitor or within 15 business days of a request as part of an investigation upon complaint:

**1.4.1** SOL Methodology.

**1.4.2** Documented comments provided by a recipient of the SOL Methodology on its technical review of a SOL Methodology, and the associated responses.  
(Retirement approved by FERC effective January 21, 2014.)

**1.4.3** Superseded portions of its SOL Methodology that had been made within the past 12 months.

**1.4.4** Evidence that the SOL Methodology and any changes to the methodology that occurred within the past 12 months were issued to all required entities.

**2. Levels of Non-Compliance for Western Interconnection: (To be replaced with VSLs once developed and approved by WECC)**

**2.1. Level 1:** There shall be a level one non-compliance if either of the following conditions exists:

**2.1.1** The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded.

**2.1.2** No evidence of responses to a recipient's comments on the SOL Methodology  
(Retirement approved by FERC effective January 21, 2014.)

**2.2. Level 2:** The SOL Methodology did not include a requirement to address all of the elements in R3.1, R3.2, R3.4 through R3.7 and E1.

**2.3. Level 3:** There shall be a level three non-compliance if any of the following conditions exists:

**2.3.1** The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not include evaluation of system response to one of the three types of single Contingencies identified in R2.2.

**2.3.2** The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not include evaluation of system response to two of the seven types of multiple Contingencies identified in E1.1.

**2.3.3** The System Operating Limits Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not address two of the six required topics in R3.1, R3.2, R3.4 through R3.7.

**2.4. Level 4:** The SOL Methodology was not issued to all required entities in accordance with R4.

3. Violation Severity Levels:

| Requirement | Lower  | Moderate  | High  | Severe  |
|-------------|--|---|---|---|
| R1          | Not applicable.  | The Reliability Coordinator has a documented SOL Methodology for use in developing SOLs within its Reliability Coordinator Area, but it does not address R1.2                     | The Reliability Coordinator has a documented SOL Methodology for use in developing SOLs within its Reliability Coordinator Area, but it does not address R1.3.  | The Reliability Coordinator has a documented SOL Methodology for use in developing SOLs within its Reliability Coordinator Area, but it does not address R1.1.<br>OR<br>The Reliability Coordinator has no documented SOL Methodology for use in developing SOLs within its Reliability Coordinator Area. |
| R2          | The Reliability Coordinator's SOL Methodology requires that SOLs are set to meet BES performance following single contingencies, but does not require that SOLs are set to meet BES performance in the pre-contingency state. (R2.1) | Not applicable.   | The Reliability Coordinator's SOL Methodology requires that SOLs are set to meet BES performance in the pre-contingency state, but does not require that SOLs are set to meet BES performance following single contingencies. (R2.2 – R2.4) | The Reliability Coordinator's SOL Methodology does not require that SOLs are set to meet BES performance in the pre-contingency state and does not require that SOLs are set to meet BES performance following single contingencies. (R2.1 through R2.4)  |
| R3          | The Reliability Coordinator's SOL Methodology includes a description for all but one of the following: R3.1 through R3.7.  | The Reliability Coordinator's SOL Methodology includes a description for all but two of the following: R3.1 through R3.7.   | The Reliability Coordinator's SOL Methodology includes a description for all but three of the following: R3.1 through R3.7.   | The Reliability Coordinator's SOL Methodology is missing a description of four or more of the following: R3.1 through R3.7.   |
| R3.6        | N/A  | N/A   | N/A   | N/A   |
| R4          | The Reliability Coordinator failed to issue its SOL Methodology and/or one or more changes to that methodology to one of the required entities specified in R4.1, R4.2, and R4.3.  | The Reliability Coordinator failed to issue its SOL Methodology and/or one or more changes to that methodology to two of the required entities specified in R4.1, R4.2, and R4.3. | The Reliability Coordinator failed to issue its SOL Methodology and/or one or more changes to that methodology to three of the required entities specified in R4.1, R4.2, and R4.3.   | The Reliability Coordinator failed to issue its SOL Methodology and/or one or more changes to that methodology to four or more of the required entities specified in R4.1, R4.2, and R4.3   |

## **Regional Differences**

- 1.** The following Interconnection-wide Regional Difference shall be applicable in the Western Interconnection:
  - 1.1.** As governed by the requirements of R3.3, starting with all Facilities in service, shall require the evaluation of the following multiple Facility Contingencies when establishing SOLs:
    - 1.1.1** Simultaneous permanent phase to ground Faults on different phases of each of two adjacent transmission circuits on a multiple circuit tower, with Normal Clearing. If multiple circuit towers are used only for station entrance and exit purposes, and if they do not exceed five towers at each station, then this condition is an acceptable risk and therefore can be excluded.
    - 1.1.2** A permanent phase to ground Fault on any generator, transmission circuit, transformer, or bus section with Delayed Fault Clearing except for bus sectionalizing breakers or bus-tie breakers addressed in E1.1.7
    - 1.1.3** Simultaneous permanent loss of both poles of a direct current bipolar Facility without an alternating current Fault.
    - 1.1.4** The failure of a circuit breaker associated with a Remedial Action Scheme to operate when required following: the loss of any element without a Fault; or a permanent phase to ground Fault, with Normal Clearing, on any transmission circuit, transformer or bus section.
    - 1.1.5** A non-three phase Fault with Normal Clearing on common mode Contingency of two adjacent circuits on separate towers unless the event frequency is determined to be less than one in thirty years.
    - 1.1.6** A common mode outage of two generating units connected to the same switchyard, not otherwise addressed by FAC-011.
    - 1.1.7** The loss of multiple bus sections as a result of failure or delayed clearing of a bus tie or bus sectionalizing breaker to clear a permanent Phase to Ground Fault.
  - 1.2.** SOLs shall be established such that for multiple Facility Contingencies in E1.1.1 through E1.1.5 operation within the SOL shall provide system performance consistent with the following:
    - 1.2.1** All Facilities are operating within their applicable Post-Contingency thermal, frequency and voltage limits.
    - 1.2.2** Cascading does not occur.
    - 1.2.3** Uncontrolled separation of the system does not occur.
    - 1.2.4** The system demonstrates transient, dynamic and voltage stability.
    - 1.2.5** Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted firm (non-recallable reserved) electric power transfers may be necessary to maintain the overall security of the interconnected transmission systems.
    - 1.2.6** Interruption of firm transfer, Load or system reconfiguration is permitted through manual or automatic control or protection actions.

**Standard FAC-011-2(X) — System Operating Limits Methodology for the Operations Horizon**

- 1.2.7 To prepare for the next Contingency, system adjustments are permitted, including changes to generation, Load and the transmission system topology when determining limits.
- 1.3. SOLs shall be established such that for multiple Facility Contingencies in E1.1.6 through E1.1.7 operation within the SOL shall provide system performance consistent with the following with respect to impacts on other systems:
  - 1.3.1 Cascading does not occur.
- 1.4. The Western Interconnection may make changes (performance category adjustments) to the Contingencies required to be studied and/or the required responses to Contingencies for specific facilities based on actual system performance and robust design. Such changes will apply in determining SOLs.

## Standard FAC-011-2(X) — System Operating Limits Methodology for the Operations Horizon

### A. Introduction

1. **Title:** System Operating Limits Methodology for the Operations Horizon
2. **Number:** FAC-011-2(X)
3. **Purpose:** To ensure that System Operating Limits (SOLs) used in the reliable operation of the Bulk Electric System (BES) are determined based on an established methodology or methodologies.
4. **Applicability**
  - 4.1. Reliability Coordinator
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Deleted: April 29, 2009

### B. Requirements

- R1. The Reliability Coordinator shall have a documented methodology for use in developing SOLs (SOL Methodology) within its Reliability Coordinator Area. This SOL Methodology shall:
  - R1.1. Be applicable for developing SOLs used in the operations horizon.
  - R1.2. State that SOLs shall not exceed associated Facility Ratings.
  - R1.3. Include a description of how to identify the subset of SOLs that qualify as IROLs.
- R2. The Reliability Coordinator's SOL Methodology shall include a requirement that SOLs provide BES performance consistent with the following:
  - R2.1. In the pre-contingency state, the BES shall demonstrate transient, dynamic and voltage stability; all Facilities shall be within their Facility Ratings and within their thermal, voltage and stability limits. In the determination of SOLs, the BES condition used shall reflect current or expected system conditions and shall reflect changes to system topology such as Facility outages.
  - R2.2. Following the single Contingencies<sup>1</sup> identified in Requirement 2.2.1 through Requirement 2.2.3, the system shall demonstrate transient, dynamic and voltage stability; all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur.
    - R2.2.1. Single line to ground or 3-phase Fault (whichever is more severe), with Normal Clearing, on any Faulted generator, line, transformer, or shunt device.
    - R2.2.2. Loss of any generator, line, transformer, or shunt device without a Fault.

---

<sup>1</sup> The Contingencies identified in FAC-011 R2.2.1 through R2.2.3 are the minimum contingencies that must be studied but are not necessarily the only Contingencies that should be studied.

**Standard FAC-011-2(X) — System Operating Limits Methodology for the Operations Horizon**

- R5.** If a recipient of the SOL Methodology provides documented technical comments on the methodology, the Reliability Coordinator shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the SOL Methodology and, if no change will be made to that SOL Methodology, the reason why. (Retirement approved by FERC effective January 21, 2014.)

**C. Measures**

- M1.** The Reliability Coordinator’s SOL Methodology shall address all of the items listed in Requirement 1 through Requirement 3.
- M2.** The Reliability Coordinator shall have evidence it issued its SOL Methodology, and any changes to that methodology, including the date they were issued, in accordance with Requirement 4.
- M3.** If the recipient of the SOL Methodology provides documented comments on its technical review of that SOL methodology, the Reliability Coordinator that distributed that SOL Methodology shall have evidence that it provided a written response to that commenter within 45 calendar days of receipt of those comments in accordance with Requirement 5. (Retirement approved by FERC effective January 21, 2014.)

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Regional Reliability Organization

**1.2. Compliance Monitoring Period and Reset Time Frame**

Each Reliability Coordinator shall self-certify its compliance to the Compliance Monitor at least once every three years. New Reliability Authorities shall demonstrate compliance through an on-site audit conducted by the Compliance Monitor within the first year that it commences operation. The Compliance Monitor shall also conduct an on-site audit once every nine years and an investigation upon complaint to assess performance.

The Performance-Reset Period shall be twelve months from the last non-compliance.

**1.3. Data Retention**

The Reliability Coordinator shall keep all superseded portions to its SOL Methodology for 12 months beyond the date of the change in that methodology ~~and shall keep all documented comments on its SOL Methodology and associated responses for three years.~~ In addition, entities found non-compliant shall keep information related to the non-compliance until found compliant. (Deleted text retired-Retirement approved by FERC effective January 21, 2014.)

The Compliance Monitor shall keep the last audit and all subsequent compliance records.

**1.4. Additional Compliance Information**

**Standard FAC-011-2(X) — System Operating Limits Methodology for the Operations Horizon**

The Reliability Coordinator shall make the following available for inspection during an on-site audit by the Compliance Monitor or within 15 business days of a request as part of an investigation upon complaint:

- 1.4.1 SOL Methodology.
  - 1.4.2 Documented comments provided by a recipient of the SOL Methodology on its technical review of a SOL Methodology, and the associated responses.  
(Retirement approved by FERC effective January 21, 2014.)
  - 1.4.3 Superseded portions of its SOL Methodology that had been made within the past 12 months.
  - 1.4.4 Evidence that the SOL Methodology and any changes to the methodology that occurred within the past 12 months were issued to all required entities.
2. **Levels of Non-Compliance for Western Interconnection: (To be replaced with VSLs once developed and approved by WECC)**
- 2.1. **Level 1:** There shall be a level one non-compliance if either of the following conditions exists:
    - 2.1.1 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded.
    - 2.1.2 No evidence of responses to a recipient's comments on the SOL Methodology  
(Retirement approved by FERC effective January 21, 2014.)
  - 2.2. **Level 2:** The SOL Methodology did not include a requirement to address all of the elements in R3.1, R3.2, R3.4 through R3.7 and E1.
  - 2.3. **Level 3:** There shall be a level three non-compliance if any of the following conditions exists:
    - 2.3.1 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not include evaluation of system response to one of the three types of single Contingencies identified in R2.2.
    - 2.3.2 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not include evaluation of system response to two of the seven types of multiple Contingencies identified in E1.1.
    - 2.3.3 The System Operating Limits Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not address two of the six required topics in R3.1, R3.2, R3.4 through R3.7.
  - 2.4. **Level 4:** The SOL Methodology was not issued to all required entities in accordance with R4.

**Standard FAC-011-2(X) — System Operating Limits Methodology for the Operations Horizon**

**3. Violation Severity Levels:**

| Requirement | Lower  | Moderate  | High  | Severe  |

### Regional Differences

1. The following Interconnection-wide Regional Difference shall be applicable in the Western Interconnection:
  - 1.1. As governed by the requirements of R3.3, starting with all Facilities in service, shall require the evaluation of the following multiple Facility Contingencies when establishing SOLs:
    - 1.1.1 Simultaneous permanent phase to ground Faults on different phases of each of two adjacent transmission circuits on a multiple circuit tower, with Normal Clearing. If multiple circuit towers are used only for station entrance and exit purposes, and if they do not exceed five towers at each station, then this condition is an acceptable risk and therefore can be excluded.
    - 1.1.2 A permanent phase to ground Fault on any generator, transmission circuit, transformer, or bus section with Delayed Fault Clearing except for bus sectionalizing breakers or bus-tie breakers addressed in E1.1.7
    - 1.1.3 Simultaneous permanent loss of both poles of a direct current bipolar Facility without an alternating current Fault.
    - 1.1.4 The failure of a circuit breaker associated with a [Remedial Action Scheme](#) to operate when required following: the loss of any element without a Fault; or a permanent phase to ground Fault, with Normal Clearing, on any transmission circuit, transformer or bus section.
    - 1.1.5 A non-three phase Fault with Normal Clearing on common mode Contingency of two adjacent circuits on separate towers unless the event frequency is determined to be less than one in thirty years.
    - 1.1.6 A common mode outage of two generating units connected to the same switchyard, not otherwise addressed by FAC-011.
    - 1.1.7 The loss of multiple bus sections as a result of failure or delayed clearing of a bus tie or bus sectionalizing breaker to clear a permanent Phase to Ground Fault.
  - 1.2. SOLs shall be established such that for multiple Facility Contingencies in E1.1.1 through E1.1.5 operation within the SOL shall provide system performance consistent with the following:
    - 1.2.1 All Facilities are operating within their applicable Post-Contingency thermal, frequency and voltage limits.
    - 1.2.2 Cascading does not occur.
    - 1.2.3 Uncontrolled separation of the system does not occur.
    - 1.2.4 The system demonstrates transient, dynamic and voltage stability.
    - 1.2.5 Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted firm (non-recallable reserved) electric power transfers may be necessary to maintain the overall security of the interconnected transmission systems.
    - 1.2.6 Interruption of firm transfer, Load or system reconfiguration is permitted through manual or automatic control or protection actions.

Deleted: Special Protection System

**Standard FAC-011-2(X) — System Operating Limits Methodology for the Operations Horizon**

**1.2.7** To prepare for the next Contingency, system adjustments are permitted, including changes to generation, Load and the transmission system topology when determining limits.

**1.3.** SOLs shall be established such that for multiple Facility Contingencies in E1.1.6 through E1.1.7 operation within the SOL shall provide system performance consistent with the following with respect to impacts on other systems:

**1.3.1** Cascading does not occur.

**1.4.** The Western Interconnection may make changes (performance category adjustments) to the Contingencies required to be studied and/or the required responses to Contingencies for specific facilities based on actual system performance and robust design. Such changes will apply in determining SOLs.

## A. Introduction

1. **Title:** Reliability Coordination — Current Day Operations
2. **Number:** IRO-005-3.1a(X)
3. **Purpose:** The Reliability Coordinator must be continuously aware of conditions within its Reliability Coordinator Area and include this information in its reliability assessments. The Reliability Coordinator must monitor Bulk Electric System parameters that may have significant impacts upon the Reliability Coordinator Area and neighboring Reliability Coordinator Areas.
4. **Applicability**
  - 4.1. Reliability Coordinators.
  - 4.2. Balancing Authorities.
  - 4.3. Transmission Operators.
  - 4.4. Transmission Service Providers.
  - 4.5. Generator Operators.
  - 4.6. Load-Serving Entities.
  - 4.7. Purchasing-Selling Entities.
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

## B. Requirements

- R1. Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following:
  - R1.1. Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Remedial Action Schemes) and system loading.
  - R1.2. Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.
  - R1.3. Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.
  - R1.4. System real and reactive reserves (actual versus required).
  - R1.5. Capacity and energy adequacy conditions.
  - R1.6. Current ACE for all its Balancing Authorities.

- R1.7.** Current local or Transmission Loading Relief procedures in effect.
- R1.8.** Planned generation dispatches.
- R1.9.** Planned transmission or generation outages.
- R1.10.** Contingency events.
- R2.** Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard and Disturbance Control Standard requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.
- R3.** Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.
- R4.** The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.
- R5.** Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.
- R6.** The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.
- R7.** As necessary, the Reliability Coordinator shall assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities.
- R8.** The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.
- R9.** Whenever a Remedial Action Scheme that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Remedial Action Scheme on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Remedial Action Scheme including any degradation or potential failure to operate as expected.
- R10.** In instances where there is a difference in derived limits, the Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.
- R11.** The Transmission Service Provider shall respect SOLs and IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.

- R12.** Each Reliability Coordinator who foresees a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area shall issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. The Reliability Coordinator shall notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem has been mitigated.

**C. Measures**

- M1.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, a prepared report specifically detailing compliance to each of the bullets in Requirement 1, EMS availability, SCADA data collection system communications performance or equivalent evidence that will be used to confirm that it monitors the Reliability Coordinator Area parameters specified in Requirements 1.1 through 1.9.
- M2.** If one of its Balancing Authorities has insufficient operating reserves, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to computer printouts, operating logs, voice recordings or transcripts of voice recordings, or equivalent evidence that will be used to determine if the Reliability Coordinator directed and, if needed, assisted the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. (Requirement 2 and Requirement 7)
- M3.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to determine if it informed Transmission Operators and Balancing Authorities of Geo-Magnetic Disturbance (GMD) forecast information and provided assistance as needed in the development of any required response plans. (Requirement 3)
- M4.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it disseminated information within its Reliability Coordinator Area in accordance with Requirement 4.
- M5.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, computer printouts, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it monitored system frequency and Balancing Authority performance and directed any necessary rebalancing, as specified in Requirement 5 Part 1.
- M6.** The Transmission Operators and Balancing Authorities shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it utilized all resources, including firm load shedding, as directed by its Reliability Coordinator, to relieve an emergent condition. (Requirement 5 Part 2)
- M7.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, voice recordings or transcripts of voice recordings, electronic communications, operator logs or equivalent evidence that will be used to determine if it coordinated with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or DCS violations including the coordination of pending generation and transmission maintenance

outages with Transmission Operators, Balancing Authorities and Generator Operators.  
(Requirement 6 Part 1)

- M8.** If a large Area Control Error has occurred, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it identified sources of the Area Control Errors, and initiated corrective actions with the appropriate Balancing Authority if the problem was within the Reliability Coordinator's Area (Requirement 8 Part 1)
- M9.** If a Remedial Action Scheme is armed and that system could have had an inter-area impact, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, agreements with their Transmission Operators, procedural documents, operator logs, computer analysis, training modules, training records or equivalent evidence that will be used to confirm that it was aware of the impact of that Remedial Action Scheme on inter-area flows. (Requirement 9)
- M10.** If there is an instance where there is a disagreement on a derived limit, the Transmission Operator, Balancing Authority, Generator Operator, Load-serving Entity, Purchasing-selling Entity and Transmission Service Provider involved in the disagreement shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings, electronic communications or equivalent evidence that will be used to determine if it operated to the most limiting parameter. (Requirement 10)
- M11.** The Transmission Service Providers shall have and provide upon request evidence that could include, but is not limited to, procedural documents, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it respected the SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.(Requirement 11)
- M12.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it issued alerts when it foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area, to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area as specified in Requirement 12 Part 1.
- M13.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that upon receiving information such as an SOL or IROL violation, loss of reactive reserves, etc. it disseminated the information to its impacted Transmission Operators and Balancing Authorities as specified in Requirement 12 Part 2.
- M14.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it notified all impacted Transmission Operators, Balancing Authorities and Reliability Coordinators when a transmission problem has been mitigated. (Requirement 12 Part 3)

## **D. Compliance**

### **1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Regional Reliability Organizations shall be responsible for compliance monitoring.

**1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

**1.3. Data Retention**

For Measures 1 and 9, each Reliability Coordinator shall have its current in-force documents as evidence.

For Measures 2–8 and Measures 12 through 13, the Reliability Coordinator shall keep 90 days of historical data (evidence).

For Measure 6, the Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence).

For Measure 10, the Transmission Operator, Balancing Authority, and Transmission Service Provider shall keep 90 days of historical data (evidence).

For Measure 11, the Transmission Service Provider shall keep 90 days of historical data (evidence).

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

**1.4. Additional Compliance Information**

None.

**Standard IRO-005-3.1a(X) — Reliability Coordination — Current Day Operations**

**2. Violation Severity Levels:**

| Requirement | Lower   | Moderate  | High  | Severe  |
|-------------|---|---|---|---|
| R1          | The Reliability Coordinator failed to monitor one (1) of the elements listed in IRO-005-3.1a(X) R1.1 through R1.10.   | The Reliability Coordinator failed to monitor two (2) of the elements listed in IRO-005-3.1a(X) R1.1 through R1.10. | The Reliability Coordinator failed to monitor three (3) of the elements listed in IRO-005-3.1a(X) R1.1 through R1.10. | The Reliability Coordinator failed to monitor more than three (3) of the elements listed in IRO-005-3.1a(X) R1.1 through R1.10. |
| R1.1        | The Reliability Coordinator failed to monitor the current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Remedial Action Schemes) and system loading.  | N/A   | N/A   | N/A   |
| R1.2        | The Reliability Coordinator failed to monitor current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan’s viability and scope. | N/A   | N/A   | N/A   |

**Standard IRO-005-3.1a(X) — Reliability Coordination — Current Day Operations**

| Requirement | Lower  | Moderate | High | Severe |
|-------------|--|----------|------|--------|
| R1.3        | The Reliability Coordinator failed to monitor current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan’s viability and scope. | N/A      | N/A  | N/A    |
| R1.4        | The Reliability Coordinator failed to monitor system real and reactive reserves (actual versus required).  | N/A      | N/A  | N/A    |
| R1.5        | The Reliability Coordinator failed to monitor capacity and energy adequacy conditions.   | N/A      | N/A  | N/A    |
| R1.6        | The Reliability Coordinator failed to monitor current ACE for all its Balancing Authorities.   | N/A      | N/A  | N/A    |
| R1.7        | The Reliability Coordinator failed to monitor current local or Transmission Loading Relief procedures in effect.   | N/A      | N/A  | N/A    |
| R1.8        | The Reliability Coordinator failed to monitor planned generation dispatches.   | N/A      | N/A  | N/A    |
| R1.9        | The Reliability Coordinator failed to monitor planned transmission or generation outages.  | N/A      | N/A  | N/A    |

**Standard IRO-005-3.1a(X) — Reliability Coordination — Current Day Operations**

| Requirement | Lower   | Moderate   | High  | Severe  |
|-------------|---|--|---|---|
| R1.10       | The Reliability Coordinator failed to monitor contingency events. | N/A  | N/A   | N/A   |
| R2          | N/A   | The Reliability Coordinator failed to direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. | The Reliability Coordinator failed to issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.  | The Reliability Coordinator failed to monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves was provided and available as required to meet the Control Performance Standard and Disturbance Control Standard requirements. |
| R3          | N/A   | N/A  | The Reliability Coordinator ensured its Transmission Operators and Balancing Authorities were aware of Geo-Magnetic Disturbance (GMD) forecast information, but failed to assist, when needed, in the development of any required response plans. | The Reliability Coordinator failed to ensure its Transmission Operators and Balancing Authorities were aware of Geo-Magnetic Disturbance (GMD) forecast information.  |
| R4          | N/A   | N/A  | N/A   | The Reliability Coordinator failed to disseminate information within its Reliability Coordinator Area, when required.   |

## Appendix 1

| Requirement Number and Text of Requirement   |
|--|
| <p><b>TOP-005-1 Requirement R3</b></p> <p>Upon request, each Balancing Authority and Transmission Operator shall provide to other Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability, the operating data that are necessary to allow these Balancing Authorities and Transmission Operators to perform operational reliability assessments and to coordinate reliable operations. Balancing Authorities and Transmission Operators shall provide the types of data as listed in Attachment 1-TOP-005-0(X) “Electric System Reliability Data,” unless otherwise agreed to by the Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability.</p> <p style="text-align: center;"><i>The above-referenced Attachment 1 — TOP-005-0 specifies the following data as item 2.6: New or <u>degraded</u> Remedial Action Schemes. [Underline added for emphasis.]</i></p> <p><b>IRO-005-1 Requirement R12<sup>1</sup></b></p> <p><b>R12.</b> Whenever a Remedial Action Scheme that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Remedial Action Scheme on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Remedial Action Scheme including any <u>degradation</u> or potential failure to operate as expected. [Underline added for emphasis.]</p> <p><b>PRC-012-0(X) Requirements R1 and R1.3</b></p> <p><b>R1.</b> Each Regional Reliability Organization with a Transmission Owner, Generator Owner, or Distribution Providers that uses or is planning to use a RAS shall have a documented Regional Reliability Organization RAS review procedure to ensure that RAS comply with Regional criteria and NERC Reliability Standards. The Regional RAS review procedure shall include:</p> <p style="padding-left: 40px;"><b>R1.3.</b> Requirements to demonstrate that the RAS shall be designed so that a single RAS component failure, when the RAS was intended to operate, does not prevent the interconnected transmission system from meeting the performance requirements defined in Reliability Standards TPL-001-0, TPL-002-0, and TPL-003-0.</p> |
| Background Information for Interpretation  |
| <p>The TOP-005-1 standard focuses on two key obligations. The first key obligation (Requirement R1) is a “responsibility mandate.” Requirement R1 establishes who is responsible for the obligation to provide operating data “required” by a Reliability Coordinator within the framework of the Reliability Coordinator requirements defined in the IRO standards. The second key obligation (Requirement R3) is a “performance mandate.” Requirement R3 defines the obligation to provide data “requested” by other reliability entities that is needed “to perform assessments and to coordinate operations.”</p> <p>The Attachment to TOP-005-1 is provided as a guideline of what “can be shared.” The Attachment is not an obligation of “what must be shared.” Enforceable NERC Requirements must be explicitly contained within a given Standard’s approved requirements. In this case, the standard only requires data “upon request.” If a Reliability Coordinator or other reliability entity were to request data such as</p>   |

<sup>1</sup> In the current version of the Standard (IRO-005-3a)(X), this requirement is R9.

listed in the Attachment, then the entity being asked would be mandated by Requirements R1 and R3 to provide that data (including item 2.6, whether it is or is not in some undefined “degraded” state).

IRO-002-1 requires the Reliability Coordinator to have processes in place to support its reliability obligations (Requirement R2). Requirement R4 mandates that the Reliability Coordinator have communications processes in place to meet its reliability obligations, and Requirement R5 et al mandate the Reliability Coordinator to have the tools to carry out these reliability obligations.

IRO-003-2 (Requirements R1 and R2) requires the Reliability Coordinator to monitor the state of its system.

IRO-004-1 requires that the Reliability Coordinator carry out studies to identify Interconnection Reliability Operating Limits (Requirement R1) and to be aware of system conditions via monitoring tools and information exchange.

IRO-005-1 mandates that each Reliability Coordinator monitor predefined base conditions (Requirement R1), collect additional data when operating limits are or may be exceeded (Requirement R3), and identify actual or potential threats (Requirement R5). The basis for that request is left to each Reliability Coordinator. The Purpose statement of IRO-005-1 focuses on the Reliability Coordinator’s obligation to be aware of conditions that may have a “significant” impact upon its area and to communicate that information to others (Requirements R7 and R9). Please note: it is from this communication that Transmission Operators and Balancing Authorities would either obtain or would know to ask for RAS information from another Transmission Operator.

The IRO-005-1 (Requirement R12) standard implies that degraded is a condition that will result in a failure to operate as designed. If the loss of a communication channel will result in the failure of a RAS to operate as designed then the Transmission Operator would be mandated to report that information. On the other hand, if the loss of a communication channel will not result in the failure of the RAS to operate as designed, then such a condition can be, but is not mandated to be, reported.

### **Conclusion**

The TOP-005-1 standard does not provide, nor does it require, a definition for the term “degraded.”

The IRO-005-1 (R12) standard implies that degraded is a condition that will result in a failure of a RAS to operate as designed. If the loss of a communication channel will result in the failure of a RAS to operate as designed, then the Transmission Operator would be mandated to report that information. On the other hand, if the loss of a communication channel will not result in the failure of the RAS to operate as designed, then such a condition can be, but is not mandated to be, reported.

To request a formal definition of the term degraded, the Reliability Standards Development Procedure requires the submittal of a Standards Authorization Request.

## Standard IRO-005-3.1a(X) — Reliability Coordination — Current Day Operations

### A. Introduction

1. **Title:** Reliability Coordination — Current Day Operations
2. **Number:** IRO-005-3.1a(X)
3. **Purpose:** The Reliability Coordinator must be continuously aware of conditions within its Reliability Coordinator Area and include this information in its reliability assessments. The Reliability Coordinator must monitor Bulk Electric System parameters that may have significant impacts upon the Reliability Coordinator Area and neighboring Reliability Coordinator Areas.
4. **Applicability**
  - 4.1. Reliability Coordinators.
  - 4.2. Balancing Authorities.
  - 4.3. Transmission Operators.
  - 4.4. Transmission Service Providers.
  - 4.5. Generator Operators.
  - 4.6. Load-Serving Entities.
  - 4.7. Purchasing-Selling Entities.
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

### B. Requirements

- R1. Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following:
  - R1.1. Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Remedial Action Schemes) and system loading.
  - R1.2. Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.
  - R1.3. Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.
  - R1.4. System real and reactive reserves (actual versus required).
  - R1.5. Capacity and energy adequacy conditions.
  - R1.6. Current ACE for all its Balancing Authorities.

**Deleted:** In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.¶  
In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.¶

**Deleted:** Special Protection System

**Standard IRO-005-3.1a(X) — Reliability Coordination — Current Day Operations**

- R1.7.** Current local or Transmission Loading Relief procedures in effect.
- R1.8.** Planned generation dispatches.
- R1.9.** Planned transmission or generation outages.
- R1.10.** Contingency events.
- R2.** Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard and Disturbance Control Standard requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.
- R3.** Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.
- R4.** The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.
- R5.** Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.
- R6.** The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.
- R7.** As necessary, the Reliability Coordinator shall assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities.
- R8.** The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.
- R9.** Whenever a Remedial Action Scheme that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Remedial Action Scheme on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Remedial Action Scheme including any degradation or potential failure to operate as expected.
- R10.** In instances where there is a difference in derived limits, the Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.
- R11.** The Transmission Service Provider shall respect SOLs and IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.

Deleted: Special Protection System

## Standard IRO-005-3.1a(X) — Reliability Coordination — Current Day Operations

---

**R12.** Each Reliability Coordinator who foresees a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area shall issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. The Reliability Coordinator shall notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem has been mitigated.

### C. Measures

- M1.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, a prepared report specifically detailing compliance to each of the bullets in Requirement 1, EMS availability, SCADA data collection system communications performance or equivalent evidence that will be used to confirm that it monitors the Reliability Coordinator Area parameters specified in Requirements 1.1 through 1.9.
- M2.** If one of its Balancing Authorities has insufficient operating reserves, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to computer printouts, operating logs, voice recordings or transcripts of voice recordings, or equivalent evidence that will be used to determine if the Reliability Coordinator directed and, if needed, assisted the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. (Requirement 2 and Requirement 7)
- M3.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to determine if it informed Transmission Operators and Balancing Authorities of Geo-Magnetic Disturbance (GMD) forecast information and provided assistance as needed in the development of any required response plans. (Requirement 3)
- M4.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it disseminated information within its Reliability Coordinator Area in accordance with Requirement 4.
- M5.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, computer printouts, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it monitored system frequency and Balancing Authority performance and directed any necessary rebalancing, as specified in Requirement 5 Part 1.
- M6.** The Transmission Operators and Balancing Authorities shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it utilized all resources, including firm load shedding, as directed by its Reliability Coordinator, to relieve an emergent condition. (Requirement 5 Part 2)
- M7.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, voice recordings or transcripts of voice recordings, electronic communications, operator logs or equivalent evidence that will be used to determine if it coordinated with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or DCS violations including the coordination of pending generation and transmission maintenance

## Standard IRO-005-3.1a(X) — Reliability Coordination — Current Day Operations

outages with Transmission Operators, Balancing Authorities and Generator Operators. (Requirement 6 Part 1)

- M8.** If a large Area Control Error has occurred, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it identified sources of the Area Control Errors, and initiated corrective actions with the appropriate Balancing Authority if the problem was within the Reliability Coordinator's Area (Requirement 8 Part 1)
- M9.** If a Remedial Action Scheme is armed and that system could have had an inter-area impact, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, agreements with their Transmission Operators, procedural documents, operator logs, computer analysis, training modules, training records or equivalent evidence that will be used to confirm that it was aware of the impact of that Remedial Action Scheme on inter-area flows. (Requirement 9)
- M10.** If there is an instance where there is a disagreement on a derived limit, the Transmission Operator, Balancing Authority, Generator Operator, Load-serving Entity, Purchasing-selling Entity and Transmission Service Provider involved in the disagreement shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings, electronic communications or equivalent evidence that will be used to determine if it operated to the most limiting parameter. (Requirement 10)
- M11.** The Transmission Service Providers shall have and provide upon request evidence that could include, but is not limited to, procedural documents, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it respected the SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes. (Requirement 11)
- M12.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it issued alerts when it foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area, to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area as specified in Requirement 12 Part 1.
- M13.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that upon receiving information such as an SOL or IROL violation, loss of reactive reserves, etc. it disseminated the information to its impacted Transmission Operators and Balancing Authorities as specified in Requirement 12 Part 2.
- M14.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it notified all impacted Transmission Operators, Balancing Authorities and Reliability Coordinators when a transmission problem has been mitigated. (Requirement 12 Part 3)

Deleted: Special Protection System

### D. Compliance

#### 1. Compliance Monitoring Process

**1.1. Compliance Monitoring Responsibility**

Regional Reliability Organizations shall be responsible for compliance monitoring.

**1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

**1.3. Data Retention**

For Measures 1 and 9, each Reliability Coordinator shall have its current in-force documents as evidence.

For Measures 2–8 and Measures 12 through 13, the Reliability Coordinator shall keep 90 days of historical data (evidence).

For Measure 6, the Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence).

For Measure 10, the Transmission Operator, Balancing Authority, and Transmission Service Provider shall keep 90 days of historical data (evidence).

For Measure 11, the Transmission Service Provider shall keep 90 days of historical data (evidence).

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

**1.4. Additional Compliance Information**

None.

**Standard IRO-005-3.1a(X) — Reliability Coordination — Current Day Operations**

**2. Violation Severity Levels:**

| Requirement | Lower   | Moderate  | High  | Severe  |
|-------------|---|---|---|---|
| R1          | The Reliability Coordinator failed to monitor one (1) of the elements listed in IRO-005-3.1a(X) R1.1 through R1.10.   | The Reliability Coordinator failed to monitor two (2) of the elements listed in IRO-005-3.1a(X) R1.1 through R1.10. | The Reliability Coordinator failed to monitor three (3) of the elements listed in IRO-005-3.1a(X) R1.1 through R1.10. | The Reliability Coordinator failed to monitor more than three (3) of the elements listed in IRO-005-3.1a(X) R1.1 through R1.10. |
| R1.1        | The Reliability Coordinator failed to monitor the current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Remedial Action Schemes) and system loading.  | N/A   | N/A   | N/A   |
| R1.2        | The Reliability Coordinator failed to monitor current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope. | N/A   | N/A   | N/A   |

The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the <u>Remedial Action Scheme</u> including any <u>degradation</u> or potential failure to operate as expected. [Underline added for emphasis.]</p>   |
| <p><b>PRC-012-0(X) Requirements R1 and R1.3</b></p> <p><b>R1.</b> Each Regional Reliability Organization with a Transmission Owner, Generator Owner, or Distribution Providers that uses or is planning to use a <u>RAS</u> shall have a documented Regional Reliability Organization <u>RAS</u> review procedure to ensure that <u>RAS</u> comply with Regional criteria and NERC Reliability Standards. The Regional <u>RAS</u> review procedure shall include:</p> <p><b>R1.3.</b> Requirements to demonstrate that the <u>RAS</u> shall be designed so that a single <u>RAS</u> component failure, when the <u>RAS</u> was intended to operate, does not prevent the interconnected transmission system from meeting the performance requirements defined in Reliability Standards TPL-001-0, TPL-002-0, and TPL-003-0.</p>  |
| <p><b>Background Information for Interpretation</b></p> <p>The TOP-005-1 standard focuses on two key obligations. The first key obligation (Requirement R1) is a “responsibility mandate.” Requirement R1 establishes who is responsible for the obligation to provide operating data “required” by a Reliability Coordinator within the framework of the Reliability Coordinator requirements defined in the IRO standards. The second key obligation (Requirement R3) is a “performance mandate.” Requirement R3 defines the obligation to provide data “requested” by other reliability entities that is needed “to perform assessments and to coordinate operations.”</p> <p>The Attachment to TOP-005-1 is provided as a guideline of what “can be shared.” The Attachment is not an obligation of “what must be shared.” Enforceable NERC Requirements must be explicitly contained within a given Standard’s approved requirements. In this case, the standard only requires data “upon request.” If a Reliability Coordinator or other reliability entity were to request data such as</p> |

<sup>1</sup> In the current version of the Standard (IRO-005-3a)(X), this requirement is R9.

**Standard IRO-005-3.1a(X) — Reliability Coordination — Current Day Operations**

listed in the Attachment, then the entity being asked would be mandated by Requirements R1 and R3 to provide that data (including item 2.6, whether it is or is not in some undefined “degraded” state).

IRO-002-1 requires the Reliability Coordinator to have processes in place to support its reliability obligations (Requirement R2). Requirement R4 mandates that the Reliability Coordinator have communications processes in place to meet its reliability obligations, and Requirement R5 et al mandate the Reliability Coordinator to have the tools to carry out these reliability obligations.

IRO-003-2 (Requirements R1 and R2) requires the Reliability Coordinator to monitor the state of its system.

IRO-004-1 requires that the Reliability Coordinator carry out studies to identify Interconnection Reliability Operating Limits (Requirement R1) and to be aware of system conditions via monitoring tools and information exchange.

IRO-005-1 mandates that each Reliability Coordinator monitor predefined base conditions (Requirement R1), collect additional data when operating limits are or may be exceeded (Requirement R3), and identify actual or potential threats (Requirement R5). The basis for that request is left to each Reliability Coordinator. The Purpose statement of IRO-005-1 focuses on the Reliability Coordinator’s obligation to be aware of conditions that may have a “significant” impact upon its area and to communicate that information to others (Requirements R7 and R9). Please note: it is from this communication that Transmission Operators and Balancing Authorities would either obtain or would know to ask for RAS information from another Transmission Operator.

The IRO-005-1 (Requirement R12) standard implies that degraded is a condition that will result in a failure to operate as designed. If the loss of a communication channel will result in the failure of a RAS to operate as designed then the Transmission Operator would be mandated to report that information. On the other hand, if the loss of a communication channel will not result in the failure of the RAS to operate as designed, then such a condition can be, but is not mandated to be, reported.

**Conclusion**

The TOP-005-1 standard does not provide, nor does it require, a definition for the term “degraded.”

The IRO-005-1 (R12) standard implies that degraded is a condition that will result in a failure of a RAS to operate as designed. If the loss of a communication channel will result in the failure of a RAS to operate as designed, then the Transmission Operator would be mandated to report that information. On the other hand, if the loss of a communication channel will not result in the failure of the RAS to operate as designed, then such a condition can be, but is not mandated to be, reported.

To request a formal definition of the term degraded, the Reliability Standards Development Procedure requires the submittal of a Standards Authorization Request.

## A. Introduction

1. **Title:** Rated System Path Methodology
2. **Number:** MOD-029-1a(X)
3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Rated System Path Methodology to support analysis and system operations.
4. **Applicability:**
  - 4.1. Each Transmission Operator that uses the Rated System Path Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.
  - 4.2. Each Transmission Service Provider that uses the Rated System Path Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths.
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

## B. Requirements

- R1. When calculating TTCs for ATC Paths, the Transmission Operator shall use a Transmission model which satisfies the following requirements: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]
  - R1.1. The model utilizes data and assumptions consistent with the time period being studied and that meets the following criteria:
    - R1.1.1. Includes at least:
      - R1.1.1.1. The Transmission Operator area. Equivalent representation of radial lines and facilities 161kV or below is allowed.
      - R1.1.1.2. All Transmission Operator areas contiguous with its own Transmission Operator area. (Equivalent representation is allowed.)
      - R1.1.1.3. Any other Transmission Operator area linked to the Transmission Operator's area by joint operating agreement. (Equivalent representation is allowed.)

- R1.1.2.** Models all system Elements as in-service for the assumed initial conditions.
  - R1.1.3.** Models all generation (may be either a single generator or multiple generators) that is greater than 20 MVA at the point of interconnection in the studied area.
  - R1.1.4.** Models phase shifters in non-regulating mode, unless otherwise specified in the Available Transfer Capability Implementation Document (ATCID).
  - R1.1.5.** Uses Load forecast by Balancing Authority.
  - R1.1.6.** Uses Transmission Facility additions and retirements.
  - R1.1.7.** Uses Generation Facility additions and retirements.
  - R1.1.8.** Uses Remedial Action Scheme (RAS) models where currently existing or projected for implementation within the studied time horizon.
  - R1.1.9.** Models series compensation for each line at the expected operating level unless specified otherwise in the ATCID.
  - R1.1.10.** Includes any other modeling requirements or criteria specified in the ATCID.
- R1.2.** Uses Facility Ratings as provided by the Transmission Owner and Generator Owner
- R2.** The Transmission Operator shall use the following process to determine TTC: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]
  - R2.1.** Except where otherwise specified within MOD-029-1(X), adjust base case generation and Load levels within the updated power flow model to determine the TTC (maximum flow or reliability limit) that can be simulated on the ATC Path while at the same time satisfying all planning criteria contingencies as follows:
    - R2.1.1.** When modeling normal conditions, all Transmission Elements will be modeled at or below 100% of their continuous rating.
    - R2.1.2.** When modeling contingencies the system shall demonstrate transient, dynamic and voltage stability, with no Transmission Element modeled above its Emergency Rating.
    - R2.1.3.** Uncontrolled separation shall not occur.
  - R2.2.** Where it is impossible to actually simulate a reliability-limited flow in a direction counter to prevailing flows (on an alternating current Transmission line), set the TTC for the non-prevailing direction equal to the TTC in the prevailing direction. If the TTC in the prevailing flow direction is dependent on a Remedial Action Scheme (RAS), set the TTC for the non-prevailing flow direction equal to the greater of the maximum flow that can be simulated in the non-prevailing flow direction or the maximum TTC that can be achieved in the prevailing flow direction without use of a RAS.

- R2.3.** For an ATC Path whose capacity is limited by contract, set TTC on the ATC Path at the lesser of the maximum allowable contract capacity or the reliability limit as determined by R2.1.
- R2.4.** For an ATC Path whose TTC varies due to simultaneous interaction with one or more other paths, develop a nomogram describing the interaction of the paths and the resulting TTC under specified conditions.
- R2.5.** The Transmission Operator shall identify when the TTC for the ATC Path being studied has an adverse impact on the TTC value of any existing path. Do this by modeling the flow on the path being studied at its proposed new TTC level simultaneous with the flow on the existing path at its TTC level while at the same time honoring the reliability criteria outlined in R2.1. The Transmission Operator shall include the resolution of this adverse impact in its study report for the ATC Path.
- R2.6.** Where multiple ownership of Transmission rights exists on an ATC Path, allocate TTC of that ATC Path in accordance with the contractual agreement made by the multiple owners of that ATC Path.
- R2.7.** For ATC Paths whose path rating, adjusted for seasonal variance, was established, known and used in operation since January 1, 1994, and no action has been taken to have the path rated using a different method, set the TTC at that previously established amount.
- R2.8.** Create a study report that describes the steps above that were undertaken (R2.1 – R2.7), including the contingencies and assumptions used, when determining the TTC and the results of the study. Where three phase fault damping is used to determine stability limits, that report shall also identify the percent used and include justification for use unless specified otherwise in the ATCID.
- R3.** Each Transmission Operator shall establish the TTC at the lesser of the value calculated in R2 or any System Operating Limit (SOL) for that ATC Path. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]
- R4.** Within seven calendar days of the finalization of the study report, the Transmission Operator shall make available to the Transmission Service Provider of the ATC Path, the most current value for TTC and the TTC study report documenting the assumptions used and steps taken in determining the current value for TTC for that ATC Path. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]
- R5.** When calculating ETC for firm Existing Transmission Commitments (ETC<sub>F</sub>) for a specified period for an ATC Path, the Transmission Service Provider shall use the algorithm below: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ETC_F = NL_F + NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

**Where:**

NL<sub>F</sub> is the firm capacity set aside to serve peak Native Load forecast commitments for the time period being calculated, to include losses, and Native

Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**NITS<sub>F</sub>** is the firm capacity reserved for Network Integration Transmission Service serving Load, to include losses, and Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**GF<sub>F</sub>** is the firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "safe harbor tariff."

**PTP<sub>F</sub>** is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

**ROR<sub>F</sub>** is the firm capacity reserved for Roll-over rights for contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

**OS<sub>F</sub>** is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service as specified in the ATCID.

- R6.** When calculating ETC for non-firm Existing Transmission Commitments (ETC<sub>NF</sub>) for all time horizons for an ATC Path the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

**Where:**

**NITS<sub>NF</sub>** is the non-firm capacity set aside for Network Integration Transmission Service serving Load (i.e., secondary service), to include losses, and load growth not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**GF<sub>NF</sub>** is the non-firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "safe harbor tariff."

**PTP<sub>NF</sub>** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**OS<sub>NF</sub>** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm transmission service as specified in the ATCID.

- R7.** When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC_F = TTC - ETC_F - CBM - TRM + Postbacks_F + counterflows_F$$

**Where**

**ATC<sub>F</sub>** is the firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**ETC<sub>F</sub>** is the sum of existing firm commitments for the ATC Path during that period.

**CBM** is the Capacity Benefit Margin for the ATC Path during that period.

**TRM** is the Transmission Reliability Margin for the ATC Path during that period.

**Postbacks<sub>F</sub>** are changes to firm Available Transfer Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**counterflows<sub>F</sub>** are adjustments to firm Available Transfer Capability as determined by the Transmission Service Provider and specified in their ATCID.

- R8.** When calculating non-firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC_{NF} = TTC - ETC_F - ETC_{NF} - CBM_S - TRM_U + Postbacks_{NF} + counterflows_{NF}$$

**Where:**

**ATC<sub>NF</sub>** is the non-firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**ETC<sub>F</sub>** is the sum of existing firm commitments for the ATC Path during that period.

**ETC<sub>NF</sub>** is the sum of existing non-firm commitments for the ATC Path during that period.

**CBM<sub>S</sub>** is the Capacity Benefit Margin for the ATC Path that has been scheduled during that period.

**TRM<sub>U</sub>** is the Transmission Reliability Margin for the ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period.

**Postbacks<sub>NF</sub>** are changes to non-firm Available Transfer Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**counterflows<sub>NF</sub>** are adjustments to non-firm Available Transfer Capability as determined by the Transmission Service Provider and specified in its ATCID.

### C. Measures

- M1.** Each Transmission Operator that uses the Rated System Path Methodology shall produce any Transmission model it used to calculate TTC for purposes of calculating ATC for each ATC Path, as required in R1, for the time horizon(s) to be examined. (R1)
- M1.1.** Production shall be in the same form and format used by the Transmission Operator to calculate the TTC, as required in R1. (R1)
- M1.2.** The Transmission model produced must include the areas listed in R1.1.1 (or an equivalent representation, as described in the requirement) (R1.1)
- M1.3.** The Transmission model produced must show the use of the modeling parameters stated in R1.1.2 through R1.1.10; except that, no evidence shall be required to prove: 1) utilization of a Remedial Action Scheme where none was included in the model or 2) that no additions or retirements to the generation or Transmission system occurred. (R1.1.2 through R1.1.10)
- M1.4.** The Transmission Operator must provide evidence that the models used to determine TTC included Facility Ratings as provided by the Transmission Owner and Generator Owner. (R1.2)
- M2.** Each Transmission Operator that uses the Rated System Path Methodology shall produce the ATCID it uses to show where it has described and used additional modeling criteria in its ACTID that are not otherwise included in MOD-29 (R1.1.4, R.1.1.9, and R1.1.10).
- M3.** Each Transmission Operator that uses the Rated System Path Methodology with paths with ratings established prior to January 1, 1994 shall provide evidence the path and its rating were established prior to January 1, 1994. (R2.7)
- M4.** Each Transmission Operator that uses the Rated System Path Methodology shall produce as evidence the study reports, as required in R.2.8, for each path for which it determined TTC for the period examined. (R2)
- M5.** Each Transmission Operator shall provide evidence that it used the lesser of the calculated TTC or the SOL as the TTC, by producing: 1) all values calculated pursuant to R2 for each ATC Path, 2) Any corresponding SOLs for those ATC Paths, and 3) the TTC set by the Transmission Operator and given to the Transmission Service Provider for use in R7 and R8 for each ATC Path. (R3)
- M6.** Each Transmission Operator shall provide evidence (such as logs or data) that it provided the TTC and its study report to the Transmission Service Provider within seven calendar days of the finalization of the study report. (R4)
- M7.** The Transmission Service Provider shall demonstrate compliance with R5 by recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R5 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in MOD-029-1(X) and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the

originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R5 to calculate its firm ETC. (R5)

- M8.** The Transmission Service Provider shall demonstrate compliance with R5 by recalculating non-firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R6 and with data used to calculate this specified value for the designated time period. The data used must meet the requirements specified in the MOD-029 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R6 to calculate its non-firm ETC. (R6)
- M9.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm ATCs, as required in R7. Such documentation must show that only the variables allowed in R7 were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc...). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R7)
- M10.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm ATCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate non-firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc...). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

Regional Entity.

#### **1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

#### **1.3. Data Retention**

- The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:
- The Transmission Operator shall have its latest models used to determine TTC for R1. (M1)

- The Transmission Operator shall have the current, in force ATCID(s) provided by its Transmission Service Provider(s) and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1. (M2)
- The Transmission Operator shall retain evidence of any path and its rating that was established prior to January 1, 1994. (M3)
- The Transmission Operator shall retain the latest version and prior version of the TTC study reports to show compliance with R2. (M4)
- The Transmission Operator shall retain evidence for the most recent three calendar years plus the current year to show compliance with R3 and R4. (M5 and M6)
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in R5 and R6 for the most recent 14 days; evidence to show compliance in calculating daily values required in R5 and R6 for the most recent 30 days; and evidence to show compliance in calculating daily values required in R5 and R6 for the most recent sixty days. (M7 and M8)
- The Transmission Service Provider shall retain evidence for the most recent three calendar years plus the current year to show compliance with R7 and R8. (M9 and M10)
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

2. Violation Severity Levels

## Appendix 1

| Requirement Number and Text of Requirement  |
|---|
| <p><b>MOD-001-01 Requirement R2:</b></p> <p><b>R2.</b> Each Transmission Service Provider shall calculate ATC or AFC values as listed below using the methodology or methodologies selected by its Transmission Operator(s):</p> <ul style="list-style-type: none"> <li><b>R2.1.</b> Hourly values for at least the next 48 hours.</li> <li><b>R2.2.</b> Daily values for at least the next 31 calendar days.</li> <li><b>R2.3.</b> Monthly values for at least the next 12 months (months 2-13).</li> </ul> <p><b>MOD-001-01 Requirement R8:</b></p> <p><b>R8.</b> Each Transmission Service Provider that calculates ATC shall recalculate ATC at a minimum on the following frequency, unless none of the calculated values identified in the ATC equation have changed:</p> <ul style="list-style-type: none"> <li><b>R8.1.</b> Hourly values, once per hour. Transmission Service Providers are allowed up to 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the ATC equation.</li> <li><b>R8.2.</b> Daily values, once per day.</li> <li><b>R8.3.</b> Monthly values, once per week.</li> </ul> |
| Question #1   |
| <p>Is the “advisory ATC” used under the NYISO tariff subject to the ATC calculation and recalculation requirements in MOD-001-1 Requirements R2 and R8? If not, is it necessary to document the frequency of “advisory” calculations in the responsible entity’s Available Transfer Capability Implementation Document?</p>   |
| Response to Question #1   |
| <p>Requirements R2 and R8 of MOD-001-1 are both related to Requirement R1, which defines that ATC methodologies are to be applied to specific “ATC Paths.” The NERC definition of ATC Path is “Any combination of Point of Receipt and Point of Delivery for which ATC is calculated; and any Posted Path.” Based on a review of the language included in this request, the NYISO Open Access Transmission Tariff, and other information posted on the NYISO Web site, it appears that the NYISO does indeed have multiple ATC Paths, which are subject to the calculation and recalculation requirements in Requirements R2 and R8. It appears from reviewing this information that ATC is defined in the NYISO tariff in the same manner in which NERC defines it, making it difficult to conclude that NYISO’s “advisory ATC” is not the same as ATC. In addition, it appears that pre-scheduling is permitted on certain external paths, making the calculation of ATC prior to day ahead necessary on those paths.</p>   |

The second part of NYISO’s question is only applicable if the first part was answered in the negative and therefore will not be addressed.

**Requirement Number and Text of Requirement**

**MOD-029-01(X) Requirements R5 and R6:**

**R5.** When calculating ETC for firm Existing Transmission Commitments (ETC<sub>F</sub>) for a specified period for an ATC Path, the Transmission Service Provider shall use the algorithm below:

$$ETC_F = NL_F + NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

Where:

NL<sub>F</sub> is the firm capacity set aside to serve peak Native Load forecast commitments for the time period being calculated, to include losses, and Native Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

NITS<sub>F</sub> is the firm capacity reserved for Network Integration Transmission Service serving Load, to include losses, and Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

GF<sub>F</sub> is the firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider’s Open Access Transmission Tariff or “safe harbor tariff.”

PTP<sub>F</sub> is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

ROR<sub>F</sub> is the firm capacity reserved for Roll-over rights for contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer’s Transmission Service contract expires or is eligible for renewal.

OS<sub>F</sub> is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service as specified in the ATCID.

**R6.** When calculating ETC for non-firm Existing Transmission Commitments (ETC<sub>NF</sub>) for all time horizons for an ATC Path the Transmission Service Provider shall use the following algorithm:

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

Where:

NITS<sub>NF</sub> is the non-firm capacity set aside for Network Integration Transmission Service serving Load (i.e., secondary service), to include losses, and load growth not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$GF_{NF}$  is the non-firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "safe harbor tariff."

$PTP_{NF}$  is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

$OS_{NF}$  is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm transmission service as specified in the ATCID.

**Question #2**

Could  $OS_F$  in MOD-029-1(X) Requirement R5 and  $OS_{NF}$  in MOD-029-1(X) Requirement R6 be calculated using Transmission Flow Utilization in the determination of ATC?

**Response to Question #2**

This request for interpretation and the NYISO Open Access Transmission Tariff describe the NYISO's concept of "Transmission Flow Utilization;" however, it is unclear whether or not Native Load, Point-to-Point Transmission Service, Network Integration Transmission Service, or any of the other components explicitly defined in Requirements R5 and R6 are incorporated into "Transmission Flow Utilization." Provided that "Transmission Flow Utilization" does not include Native Load, Point-to-Point Transmission Service, Network Integration Transmission Service, or any of the other components explicitly defined in Requirements R5 and R6, it is appropriate to be included within the "Other Services" term. However, if "Transmission Flow Utilization" does incorporate those components, then simply including "Transmission Flow Utilization" in "Other Service" would be inappropriate.

## Standard MOD-029-1a(X)— Rated System Path Methodology

### A. Introduction

1. **Title:** Rated System Path Methodology
2. **Number:** MOD-029-1a(X)
3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Rated System Path Methodology to support analysis and system operations.
4. **Applicability:**
  - 4.1. Each Transmission Operator that uses the Rated System Path Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.
  - 4.2. Each Transmission Service Provider that uses the Rated System Path Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths.
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**Deleted: Proposed**

**Deleted:** Immediately after approval of applicable regulatory authorities.

### B. Requirements

- R1. When calculating TTCs for ATC Paths, the Transmission Operator shall use a Transmission model which satisfies the following requirements: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]
  - R1.1. The model utilizes data and assumptions consistent with the time period being studied and that meets the following criteria:
    - R1.1.1. Includes at least:
      - R1.1.1.1. The Transmission Operator area. Equivalent representation of radial lines and facilities 161kV or below is allowed.
      - R1.1.1.2. All Transmission Operator areas contiguous with its own Transmission Operator area. (Equivalent representation is allowed.)
      - R1.1.1.3. Any other Transmission Operator area linked to the Transmission Operator's area by joint operating agreement. (Equivalent representation is allowed.)

**Standard MOD-029-1a(X)— Rated System Path Methodology**

- R1.1.2.** Models all system Elements as in-service for the assumed initial conditions.
  - R1.1.3.** Models all generation (may be either a single generator or multiple generators) that is greater than 20 MVA at the point of interconnection in the studied area.
  - R1.1.4.** Models phase shifters in non-regulating mode, unless otherwise specified in the Available Transfer Capability Implementation Document (ATCID).
  - R1.1.5.** Uses Load forecast by Balancing Authority.
  - R1.1.6.** Uses Transmission Facility additions and retirements.
  - R1.1.7.** Uses Generation Facility additions and retirements.
  - R1.1.8.** Uses **Remedial Action Scheme (RAS)** models where currently existing or projected for implementation within the studied time horizon.
  - R1.1.9.** Models series compensation for each line at the expected operating level unless specified otherwise in the ATCID.
  - R1.1.10.** Includes any other modeling requirements or criteria specified in the ATCID.
  - R1.2.** Uses Facility Ratings as provided by the Transmission Owner and Generator Owner
- R2.** The Transmission Operator shall use the following process to determine TTC:  
[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]
- R2.1.** Except where otherwise specified within MOD-029-1(X), adjust base case generation and Load levels within the updated power flow model to determine the TTC (maximum flow or reliability limit) that can be simulated on the ATC Path while at the same time satisfying all planning criteria contingencies as follows:
    - R2.1.1.** When modeling normal conditions, all Transmission Elements will be modeled at or below 100% of their continuous rating.
    - R2.1.2.** When modeling contingencies the system shall demonstrate transient, dynamic and voltage stability, with no Transmission Element modeled above its Emergency Rating.
    - R2.1.3.** Uncontrolled separation shall not occur.
  - R2.2.** Where it is impossible to actually simulate a reliability-limited flow in a direction counter to prevailing flows (on an alternating current Transmission line), set the TTC for the non-prevailing direction equal to the TTC in the prevailing direction. If the TTC in the prevailing flow direction is dependent on a **Remedial Action Scheme (RAS)**, set the TTC for the non-prevailing flow direction equal to the greater of the maximum flow that can be simulated in the non-prevailing flow direction or the maximum TTC that can be achieved in the prevailing flow direction without use of a **RAS**.

Deleted: Special Protection System (SPS)

Deleted: Special Protection System (SPS)

Deleted: SPS

**Standard MOD-029-1a(X)— Rated System Path Methodology**

---

- R2.3.** For an ATC Path whose capacity is limited by contract, set TTC on the ATC Path at the lesser of the maximum allowable contract capacity or the reliability limit as determined by R2.1.
- R2.4.** For an ATC Path whose TTC varies due to simultaneous interaction with one or more other paths, develop a nomogram describing the interaction of the paths and the resulting TTC under specified conditions.
- R2.5.** The Transmission Operator shall identify when the TTC for the ATC Path being studied has an adverse impact on the TTC value of any existing path. Do this by modeling the flow on the path being studied at its proposed new TTC level simultaneous with the flow on the existing path at its TTC level while at the same time honoring the reliability criteria outlined in R2.1. The Transmission Operator shall include the resolution of this adverse impact in its study report for the ATC Path.
- R2.6.** Where multiple ownership of Transmission rights exists on an ATC Path, allocate TTC of that ATC Path in accordance with the contractual agreement made by the multiple owners of that ATC Path.
- R2.7.** For ATC Paths whose path rating, adjusted for seasonal variance, was established, known and used in operation since January 1, 1994, and no action has been taken to have the path rated using a different method, set the TTC at that previously established amount.
- R2.8.** Create a study report that describes the steps above that were undertaken (R2.1 – R2.7), including the contingencies and assumptions used, when determining the TTC and the results of the study. Where three phase fault damping is used to determine stability limits, that report shall also identify the percent used and include justification for use unless specified otherwise in the ATCID.
- R3.** Each Transmission Operator shall establish the TTC at the lesser of the value calculated in R2 or any System Operating Limit (SOL) for that ATC Path. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]
- R4.** Within seven calendar days of the finalization of the study report, the Transmission Operator shall make available to the Transmission Service Provider of the ATC Path, the most current value for TTC and the TTC study report documenting the assumptions used and steps taken in determining the current value for TTC for that ATC Path. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]
- R5.** When calculating ETC for firm Existing Transmission Commitments (ETC<sub>F</sub>) for a specified period for an ATC Path, the Transmission Service Provider shall use the algorithm below: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ETC_F = NL_F + NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

**Where:**

NL<sub>F</sub> is the firm capacity set aside to serve peak Native Load forecast commitments for the time period being calculated, to include losses, and Native

Standard MOD-029-1a(X)— Rated System Path Methodology

Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**NITS<sub>F</sub>** is the firm capacity reserved for Network Integration Transmission Service serving Load, to include losses, and Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**GF<sub>F</sub>** is the firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider’s Open Access Transmission Tariff or “safe harbor tariff.”

**PTP<sub>F</sub>** is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

**ROR<sub>F</sub>** is the firm capacity reserved for Roll-over rights for contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer’s Transmission Service contract expires or is eligible for renewal.

**OS<sub>F</sub>** is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service as specified in the ATCID.

- R6.** When calculating ETC for non-firm Existing Transmission Commitments (ETC<sub>NF</sub>) for all time horizons for an ATC Path the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

**Where:**

**NITS<sub>NF</sub>** is the non-firm capacity set aside for Network Integration Transmission Service serving Load (i.e., secondary service), to include losses, and load growth not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**GF<sub>NF</sub>** is the non-firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider’s Open Access Transmission Tariff or “safe harbor tariff.”

**PTP<sub>NF</sub>** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**OS<sub>NF</sub>** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm transmission service as specified in the ATCID.

- R7.** When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC_F = TTC - ETC_F - CBM - TRM + Postbacks_F + counterflows_F$$

**Where**

**ATC<sub>F</sub>** is the firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**ETC<sub>F</sub>** is the sum of existing firm commitments for the ATC Path during that period.

**CBM** is the Capacity Benefit Margin for the ATC Path during that period.

**TRM** is the Transmission Reliability Margin for the ATC Path during that period.

**Postbacks<sub>F</sub>** are changes to firm Available Transfer Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**counterflows<sub>F</sub>** are adjustments to firm Available Transfer Capability as determined by the Transmission Service Provider and specified in their ATCID.

- R8.** When calculating non-firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC_{NF} = TTC - ETC_F - ETC_{NF} - CBM_S - TRM_U + Postbacks_{NF} + counterflows_{NF}$$

**Where:**

**ATC<sub>NF</sub>** is the non-firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**ETC<sub>F</sub>** is the sum of existing firm commitments for the ATC Path during that period.

**ETC<sub>NF</sub>** is the sum of existing non-firm commitments for the ATC Path during that period.

**CBM<sub>S</sub>** is the Capacity Benefit Margin for the ATC Path that has been scheduled during that period.

**TRM<sub>U</sub>** is the Transmission Reliability Margin for the ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period.

**Postbacks<sub>NF</sub>** are changes to non-firm Available Transfer Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**counterflows<sub>NF</sub>** are adjustments to non-firm Available Transfer Capability as determined by the Transmission Service Provider and specified in its ATCID.

## Standard MOD-029-1a(X)— Rated System Path Methodology

### C. Measures

- M1.** Each Transmission Operator that uses the Rated System Path Methodology shall produce any Transmission model it used to calculate TTC for purposes of calculating ATC for each ATC Path, as required in R1, for the time horizon(s) to be examined. (R1)
- M1.1.** Production shall be in the same form and format used by the Transmission Operator to calculate the TTC, as required in R1. (R1)
- M1.2.** The Transmission model produced must include the areas listed in R1.1.1 (or an equivalent representation, as described in the requirement) (R1.1)
- M1.3.** The Transmission model produced must show the use of the modeling parameters stated in R1.1.2 through R1.1.10; except that, no evidence shall be required to prove: 1) utilization of a Remedial Action Scheme where none was included in the model or 2) that no additions or retirements to the generation or Transmission system occurred. (R1.1.2 through R1.1.10)
- M1.4.** The Transmission Operator must provide evidence that the models used to determine TTC included Facility Ratings as provided by the Transmission Owner and Generator Owner. (R1.2)
- M2.** Each Transmission Operator that uses the Rated System Path Methodology shall produce the ATCID it uses to show where it has described and used additional modeling criteria in its ACTID that are not otherwise included in MOD-29 (R1.1.4, R1.1.9, and R1.1.10).
- M3.** Each Transmission Operator that uses the Rated System Path Methodology with paths with ratings established prior to January 1, 1994 shall provide evidence the path and its rating were established prior to January 1, 1994. (R2.7)
- M4.** Each Transmission Operator that uses the Rated System Path Methodology shall produce as evidence the study reports, as required in R.2.8, for each path for which it determined TTC for the period examined. (R2)
- M5.** Each Transmission Operator shall provide evidence that it used the lesser of the calculated TTC or the SOL as the TTC, by producing: 1) all values calculated pursuant to R2 for each ATC Path, 2) Any corresponding SOLs for those ATC Paths, and 3) the TTC set by the Transmission Operator and given to the Transmission Service Provider for use in R7 and R8 for each ATC Path. (R3)
- M6.** Each Transmission Operator shall provide evidence (such as logs or data) that it provided the TTC and its study report to the Transmission Service Provider within seven calendar days of the finalization of the study report. (R4)
- M7.** The Transmission Service Provider shall demonstrate compliance with R5 by recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R5 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in MOD-029-1(X) and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the

Deleted: Special Protection System

## Standard MOD-029-1a(X)— Rated System Path Methodology

---

originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R5 to calculate its firm ETC. (R5)

- M8.** The Transmission Service Provider shall demonstrate compliance with R5 by recalculating non-firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R6 and with data used to calculate this specified value for the designated time period. The data used must meet the requirements specified in the MOD-029 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R6 to calculate its non-firm ETC. (R6)
- M9.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm ATCs, as required in R7. Such documentation must show that only the variables allowed in R7 were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc...). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R7)
- M10.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm ATCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate non-firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc...). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Enforcement Authority

Regional Entity.

##### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

##### 1.3. Data Retention

- The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:
- The Transmission Operator shall have its latest models used to determine TTC for R1. (M1)

## Standard MOD-029-1a(X)— Rated System Path Methodology

---

- The Transmission Operator shall have the current, in force ATCID(s) provided by its Transmission Service Provider(s) and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1. (M2)
- The Transmission Operator shall retain evidence of any path and its rating that was established prior to January 1, 1994. (M3)
- The Transmission Operator shall retain the latest version and prior version of the TTC study reports to show compliance with R2. (M4)
- The Transmission Operator shall retain evidence for the most recent three calendar years plus the current year to show compliance with R3 and R4. (M5 and M6)
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in R5 and R6 for the most recent 14 days; evidence to show compliance in calculating daily values required in R5 and R6 for the most recent 30 days; and evidence to show compliance in calculating daily values required in R5 and R6 for the most recent sixty days. (M7 and M8)
- The Transmission Service Provider shall retain evidence for the most recent three calendar years plus the current year to show compliance with R7 and R8. (M9 and M10)
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

### **1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

### **1.5. Additional Compliance Information**

None.

Appendix 1

| Requirement Number and Text of Requirement  |
|---|
| <p><b>MOD-001-01 Requirement R2:</b></p> <p><b>R2.</b> Each Transmission Service Provider shall calculate ATC or AFC values as listed below using the methodology or methodologies selected by its Transmission Operator(s):</p> <ul style="list-style-type: none"><li><b>R2.1.</b> Hourly values for at least the next 48 hours.</li><li><b>R2.2.</b> Daily values for at least the next 31 calendar days.</li><li><b>R2.3.</b> Monthly values for at least the next 12 months (months 2-13).</li></ul>  |
| <p><b>MOD-001-01 Requirement R8:</b></p> <p><b>R8.</b> Each Transmission Service Provider that calculates ATC shall recalculate ATC at a minimum on the following frequency, unless none of the calculated values identified in the ATC equation have changed:</p> <ul style="list-style-type: none"><li><b>R8.1.</b> Hourly values, once per hour. Transmission Service Providers are allowed up to 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the ATC equation.</li><li><b>R8.2.</b> Daily values, once per day.</li><li><b>R8.3.</b> Monthly values, once per week.</li></ul>  |
| Question #1   |
| <p>Is the “advisory ATC” used under the NYISO tariff subject to the ATC calculation and recalculation requirements in MOD-001-1 Requirements R2 and R8? If not, is it necessary to document the frequency of “advisory” calculations in the responsible entity’s Available Transfer Capability Implementation Document?</p>   |
| Response to Question #1   |
| <p>Requirements R2 and R8 of MOD-001-1 are both related to Requirement R1, which defines that ATC methodologies are to be applied to specific “ATC Paths.” The NERC definition of ATC Path is “Any combination of Point of Receipt and Point of Delivery for which ATC is calculated; and any Posted Path.” Based on a review of the language included in this request, the NYISO Open Access Transmission Tariff, and other information posted on the NYISO Web site, it appears that the NYISO does indeed have multiple ATC Paths, which are subject to the calculation and recalculation requirements in Requirements R2 and R8. It appears from reviewing this information that ATC is defined in the NYISO tariff in the same manner in which NERC defines it, making it difficult to conclude that NYISO’s “advisory ATC” is not the same as ATC. In addition, it appears that pre-scheduling is permitted on certain external paths, making the calculation of ATC prior to day ahead necessary on those paths.</p> |

**Standard MOD-029-1a(X) — Rated System Path Methodology**

The second part of NYISO's question is only applicable if the first part was answered in the negative and therefore will not be addressed.

**Requirement Number and Text of Requirement**

**MOD-029-01(X) Requirements R5 and R6:**

**R5.** When calculating ETC for firm Existing Transmission Commitments ( $ETC_F$ ) for a specified period for an ATC Path, the Transmission Service Provider shall use the algorithm below:

$$ETC_F = NL_F + NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

Where:

$NL_F$  is the firm capacity set aside to serve peak Native Load forecast commitments for the time period being calculated, to include losses, and Native Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$NITS_F$  is the firm capacity reserved for Network Integration Transmission Service serving Load, to include losses, and Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$GF_F$  is the firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "safe harbor tariff."

$PTP_F$  is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

$ROR_F$  is the firm capacity reserved for Roll-over rights for contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

$OS_F$  is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service as specified in the ATCID.

**R6.** When calculating ETC for non-firm Existing Transmission Commitments ( $ETC_{NF}$ ) for all time horizons for an ATC Path the Transmission Service Provider shall use the following algorithm:

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

Where:

$NITS_{NF}$  is the non-firm capacity set aside for Network Integration Transmission Service serving Load (i.e., secondary service), to include losses, and load growth not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**Standard MOD-029-1a(X) — Rated System Path Methodology**

GF<sub>NF</sub> is the non-firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "safe harbor tariff."

PTP<sub>NF</sub> is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

OS<sub>NF</sub> is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm transmission service as specified in the ATCID.

**Question #2**

Could OS<sub>F</sub> in MOD-029-1(X) Requirement R5 and OS<sub>NF</sub> in MOD-029-1(X) Requirement R6 be calculated using Transmission Flow Utilization in the determination of ATC?

**Response to Question #2**

This request for interpretation and the NYISO Open Access Transmission Tariff describe the NYISO's concept of "Transmission Flow Utilization;" however, it is unclear whether or not Native Load, Point-to-Point Transmission Service, Network Integration Transmission Service, or any of the other components explicitly defined in Requirements R5 and R6 are incorporated into "Transmission Flow Utilization." Provided that "Transmission Flow Utilization" does not include Native Load, Point-to-Point Transmission Service, Network Integration Transmission Service, or any of the other components explicitly defined in Requirements R5 and R6, it is appropriate to be included within the "Other Services" term. However, if "Transmission Flow Utilization" does incorporate those components, then simply including "Transmission Flow Utilization" in "Other Service" would be inappropriate.

## A. Introduction

1. **Title:** **Flowgate Methodology**
2. **Number:** **MOD-030-02(X)**
3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Flowgate Methodology to support analysis and system operations.
4. **Applicability:**
  - 4.1.1 Each Transmission Operator that uses the Flowgate Methodology to support the calculation of Available Flowgate Capabilities (AFCs) on Flowgates.
  - 4.1.2 Each Transmission Service Provider that uses the Flowgate Methodology to calculate AFCs on Flowgates.
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

## B. Requirements

- R1. The Transmission Service Provider shall include in its “Available Transfer Capability Implementation Document” (ATCID): [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]
  - R1.1. The criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates that are to be considered in Available Flowgate Capability (AFC) calculations.
  - R1.2. The following information on how source and sink for transmission service is accounted for in AFC calculations including:
    - R1.2.1. Define if the source used for AFC calculations is obtained from the source field or the Point of Receipt (POR) field of the transmission reservation.
    - R1.2.2. Define if the sink used for AFC calculations is obtained from the sink field or the Point of Delivery (POD) field of the transmission reservation.
    - R1.2.3. The source/sink or POR/POD identification and mapping to the model.
    - R1.2.4. If the Transmission Service Provider’s AFC calculation process involves a grouping of generators, the ATCID must identify how these generators participate in the group.
- R2. The Transmission Operator shall perform the following: [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]
  - R2.1. Include Flowgates used in the AFC process based, at a minimum, on the following criteria:
    - R2.1.1. Results of a first Contingency transfer analysis for ATC Paths internal to a Transmission Operator’s system up to the path capability such that at a

minimum the first three limiting Elements and their worst associated Contingency combinations with an OTDF of at least 5% and within the Transmission Operator's system are included as Flowgates.

**R2.1.1.1.** Use first Contingency criteria consistent with those first Contingency criteria used in planning of operations for the applicable time periods, including use of Remedial Action Schemes.

**R2.1.1.2.** Only the most limiting element in a series configuration needs to be included as a Flowgate.

**R2.1.1.3.** If any limiting element is kept within its limit for its associated worst Contingency by operating within the limits of another Flowgate, then no new Flowgate needs to be established for such limiting elements or Contingencies.

**R2.1.2.** Results of a first Contingency transfer analysis from all adjacent Balancing Authority source and sink (as defined in the ATCID) combinations up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an Outage Transfer Distribution Factor (OTDF) of at least 5% and within the Transmission Operator's system are included as Flowgates unless the interface between such adjacent Balancing Authorities is accounted for using another ATC methodology.

**R2.1.2.1.** Use first Contingency criteria consistent with those first Contingency criteria used in planning of operations for the applicable time periods, including use of Remedial Action Schemes.

**R2.1.2.2.** Only the most limiting element in a series configuration needs to be included as a Flowgate.

**R2.1.2.3.** If any limiting element is kept within its limit for its associated worst Contingency by operating within the limits of another Flowgate, then no new Flowgate needs to be established for such limiting elements or Contingencies.

**R2.1.3.** Any limiting Element/Contingency combination at least within its Reliability Coordinator's Area that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months, unless the limiting Element/Contingency combination is accounted for using another ATC methodology or was created to address temporary operating conditions.

**R2.1.4.** Any limiting Element/Contingency combination within the Transmission model that has been requested to be included by any other Transmission Service Provider using the Flowgate Methodology or Area Interchange Methodology, where:

**R2.1.4.1.** The coordination of the limiting Element/Contingency combination is not already addressed through a different methodology, and

- Any generator within the Transmission Service Provider's area has at least a 5% Power Transfer Distribution Factor

(PTDF) or Outage Transfer Distribution Factor (OTDF) impact on the Flowgate when delivered to the aggregate load of its own area, or

- A transfer from any Balancing Area within the Transmission Service Provider's area to a Balancing Area adjacent has at least a 5% PTDF or OTDF impact on the Flowgate.
- The Transmission Operator may utilize distribution factors less than 5% if desired.

**R2.1.4.2.** The limiting Element/Contingency combination is included in the requesting Transmission Service Provider's methodology.

- R2.2.** At a minimum, establish a list of Flowgates by creating, modifying, or deleting Flowgate definitions at least once per calendar year.
- R2.3.** At a minimum, establish a list of Flowgates by creating, modifying, or deleting Flowgates that have been requested as part of R2.1.4 within thirty calendar days from the request.
- R2.4.** Establish the TFC of each of the defined Flowgates as equal to:
- For thermal limits, the System Operating Limit (SOL) of the Flowgate.
  - For voltage or stability limits, the flow that will respect the SOL of the Flowgate.
- R2.5.** At a minimum, establish the TFC once per calendar year.
- R2.5.1.** If notified of a change in the Rating by the Transmission Owner that would affect the TFC of a flowgate used in the AFC process, the TFC should be updated within seven calendar days of the notification.
- R2.6.** Provide the Transmission Service Provider with the TFCs within seven calendar days of their establishment.
- R3.** The Transmission Operator shall make available to the Transmission Service Provider a Transmission model to determine Available Flowgate Capability (AFC) that meets the following criteria: [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]
- R3.1.** Contains generation Facility Ratings, such as generation maximum and minimum output levels, specified by the Generator Owners of the Facilities within the model.
- R3.2.** Updated at least once per day for AFC calculations for intra-day, next day, and days two through 30.
- R3.3.** Updated at least once per month for AFC calculations for months two through 13.
- R3.4.** Contains modeling data and system topology for the Facilities within its Reliability Coordinator's Area. Equivalent representation of radial lines and Facilities 161kV or below is allowed.
- R3.5.** Contains modeling data and system topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination Areas.
- R4.** When calculating AFCs, the Transmission Service Provider shall represent the impact of Transmission Service as follows: [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider’s Transmission model, use the discretely modeled point as the source.
  - If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an “equivalence” or “aggregate” representation in the Transmission Service Provider’s Transmission model, use the modeled equivalence or aggregate as the source.
  - If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an “equivalence” representation in the Transmission Service Provider’s Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
  - If the source, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
  - If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider’s Transmission model, use the discretely modeled point as the sink.
  - If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an “equivalence” or “aggregate” representation in the Transmission Service Provider’s Transmission model, use the modeled equivalence or aggregate as the sink.
  - If the sink, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an “equivalence” representation in the Transmission Service Provider’s Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.
  - If the sink, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.
- R5.** When calculating AFCs, the Transmission Service Provider shall: [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]
- R5.1.** Use the models provided by the Transmission Operator.
  - R5.2.** Include in the transmission model expected generation and Transmission outages, additions, and retirements within the scope of the model as specified in the ATCID and in effect during the applicable period of the AFC calculation for the Transmission Service Provider’s area, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed.
  - R5.3.** For external Flowgates, identified in R2.1.4, use the AFC provided by the Transmission Service Provider that calculates AFC for that Flowgate.
- R6.** When calculating the impact of ETC for firm commitments (ETC<sub>Fi</sub>) for all time periods for a Flowgate, the Transmission Service Provider shall sum the following: [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]

- R6.1.** The impact of firm Network Integration Transmission Service, including the impacts of generation to load, in the model referenced in R5.2 for the Transmission Service Provider's area, based on:
  - R6.1.1.** Load forecast for the time period being calculated, including Native Load and Network Service load
  - R6.1.2.** Unit commitment and Dispatch Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.
- R6.2.** The impact of any firm Network Integration Transmission Service, including the impacts of generation to load in the model referenced in R5.2 and has a distribution factor equal to or greater than the percentage<sup>1</sup> used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed based on:
  - R6.2.1.** Load forecast for the time period being calculated, including Native Load and Network Service load
  - R6.2.2.** Unit commitment and Dispatch Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.
- R6.3.** The impact of all confirmed firm Point-to-Point Transmission Service expected to be scheduled, including roll-over rights for Firm Transmission Service contracts, for the Transmission Service Provider's area.
- R6.4.** The impact of any confirmed firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, including roll-over rights for Firm Transmission Service contracts having a distribution factor equal to or greater than the percentage<sup>2</sup> used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.
- R6.5.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider's area.
- R6.6.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage<sup>3</sup> used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission

---

<sup>1</sup> A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

<sup>2</sup> A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

<sup>3</sup> A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

- R6.7.** The impact of other firm services determined by the Transmission Service Provider.
- R7.** When calculating the impact of ETC for non-firm commitments (ETC<sub>NFi</sub>) for all time periods for a Flowgate the Transmission Service Provider shall sum: [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]
- R7.1.** The impact of all confirmed non-firm Point-to-Point Transmission Service expected to be scheduled for the Transmission Service Provider's area.
- R7.2.** The impact of any confirmed non-firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, that have a distribution factor equal to or greater than the percentage<sup>4</sup> used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.
- R7.3.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider's area.
- R7.4.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage<sup>5</sup> used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.
- R7.5.** The impact of non-firm Network Integration Transmission Service serving Load within the Transmission Service Provider's area (i.e., secondary service), to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.
- R7.6.** The impact of any non-firm Network Integration Transmission Service (secondary service) with a distribution factor equal to or greater than the percentage<sup>6</sup> used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.
- R7.7.** The impact of other non-firm services determined by the Transmission Service Provider.

---

<sup>4</sup> A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

<sup>5</sup> A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

<sup>6</sup> A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

- R8.** When calculating firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]

$$AFC_F = TFC - ETC_{Fi} - CBM_i - TRM_i + Postbacks_{SFi} + counterflows_{Fi}$$

**Where:**

**AFC<sub>F</sub>** is the firm Available Flowgate Capability for the Flowgate for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**ETC<sub>Fi</sub>** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**CBM<sub>i</sub>** is the impact of the Capacity Benefit Margin on the Flowgate during that period.

**TRM<sub>i</sub>** is the impact of the Transmission Reliability Margin on the Flowgate during that period.

**Postbacks<sub>Fi</sub>** are changes to firm AFC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**counterflows<sub>Fi</sub>** are adjustments to firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

- R9.** When calculating non-firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]

$$AFC_{NF} = TFC - ETC_{Fi} - ETC_{NFi} - CBM_{Si} - TRM_{Ui} + Postbacks_{SNFi} + counterflows$$

**Where:**

**AFC<sub>NF</sub>** is the non-firm Available Flowgate Capability for the Flowgate for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**ETC<sub>Fi</sub>** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**ETC<sub>NFi</sub>** is the sum of the impacts of existing non-firm Transmission commitments for the Flowgate during that period.

**CBM<sub>Si</sub>** is the impact of any schedules during that period using Capacity Benefit Margin.

**TRM<sub>Ui</sub>** is the impact on the Flowgate of the Transmission Reliability Margin that has not been released (unreleased) for sale as non-firm capacity by the Transmission Service Provider during that period.

**Postbacks<sub>NF</sub>** are changes to non-firm Available Flowgate Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**counterflows<sub>NF</sub>** are adjustments to non-firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

- R10.** Each Transmission Service Provider shall recalculate AFC, utilizing the updated models described in R3.2, R3.3, and R5, at a minimum on the following frequency, unless none of the calculated values identified in the AFC equation have changed: [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]

- R10.1.** For hourly AFC, once per hour. Transmission Service Providers are allowed up to 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the AFC equation.
- R10.2.** For daily AFC, once per day.
- R10.3.** For monthly AFC, once per week.
- R11.** When converting Flowgate AFCs to ATCs for ATC Paths, the Transmission Service Provider shall convert those values based on the following algorithm: [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]

$$ATC = \min(P)$$

$$P = \{PATC_1, PATC_2, \dots, PATC_n\}$$

$$PATC_n = \frac{AFC_n}{DF_{np}}$$

**Where:**

**ATC** is the Available Transfer Capability.

**P** is the set of partial Available Transfer Capabilities for all “impacted” Flowgates honored by the Transmission Service Provider; a Flowgate is considered “impacted” by a path if the Distribution Factor for that path is greater than the percentage<sup>7</sup> used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider on an OTDF Flowgate or PTDF Flowgate.

**PATC<sub>n</sub>** is the partial Available Transfer Capability for a path relative to a Flowgate *n*.

**AFC<sub>n</sub>** is the Available Flowgate Capability of a Flowgate *n*.

**DF<sub>np</sub>** is the distribution factor for Flowgate *n* relative to path *p*.

**C. Measures**

- M1.** Each Transmission Service Provider shall provide its ATCID and other evidence (such as written documentation) to show that its ATCID contains the criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates and information on how sources and sinks are accounted for in AFC calculations. (R1)
- M2.** The Transmission Operator shall provide evidence (such as studies and working papers) that all Flowgates that meet the criteria described in R2.1 are considered in its AFC calculations. (R2.1)
- M3.** The Transmission Operator shall provide evidence (such as logs) that it updated its list of Flowgates at least once per calendar year. (R2.2)
- M4.** The Transmission Operator shall provide evidence (such as logs and dated requests) that it updated the list of Flowgates within thirty calendar days from a request. (R2.3)
- M5.** The Transmission Operator shall provide evidence (such as data or models) that it determined the TFC for each Flowgate as defined in R2.4. (R2.4)

---

<sup>7</sup> A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

- M6.** The Transmission Operator shall provide evidence (such as logs) that it established the TFCs for each Flowgate in accordance with the timing defined in R2.5. (R2.5)
- M7.** The Transmission Operator shall provide evidence (such as logs and electronic communication) that it provided the Transmission Service Provider with updated TFCs within seven calendar days of their determination. (R2.6)
- M8.** The Transmission Operator shall provide evidence (such as written documentation, logs, models, and data) that the Transmission model used to determine AFCs contains the information specified in R3. (R3)
- M9.** The Transmission Service Provider shall provide evidence (such as written documentation and data) that the modeling of point-to-point reservations was based on the rules described in R4. (R4)
- M10.** The Transmission Service Provider shall provide evidence including the models received from Transmission Operators and other evidence (such as documentation and data) to show that it used the Transmission Operator's models in calculating AFC. (R5.1)
- M11.** The Transmission Service Provider shall provide evidence (such as written documentation, electronic communications, and data) that all expected generation and Transmission outages, additions, and retirements were included in the AFC calculation as specified in the ATCID. (R5.2)
- M12.** The Transmission Service Provider shall provide evidence (such as logs, electronic communications, and data) that AFCs provided by third parties on external Flowgates were used instead of those calculated by the Transmission Operator. (R5.3)
- M13.** The Transmission Service Provider shall demonstrate compliance with R6 by recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R6 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in this standard and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements defined in R6 to calculate its firm ETC. (R6)
- M14.** The Transmission Service Provider shall demonstrate compliance with R7 by recalculating non-firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R7 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in the standard and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements in R7 to calculate its non-firm ETC. (R7)
- M15.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm AFCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc...). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

- M16.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm AFCs, as required in R9. Such documentation must show that only the variables allowed in R9 were used to calculate non-firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc...). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R9)
- M17.** The Transmission Service Provider shall provide evidence (such as documentation, dated logs, and data) that it calculated AFC on the frequency defined in R10. (R10)
- M18.** The Transmission Service Provider shall provide evidence (such as documentation and data) when converting Flowgate AFCs to ATCs for ATC Paths, it follows the procedure described in R11. (R11)

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

Regional Entity.

#### **1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

#### **1.3. Data Retention**

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to determine flowgates and TFC and evidence of the previous version to show compliance with R2 and R3.
- The Transmission Operator shall retain evidence to show compliance with R2.1, R2.3 for the most recent 12 months.
- The Transmission Operator shall retain evidence to show compliance with R2.2, R2.4 and R2.5 for the most recent three calendar years plus current year.
- The Transmission Service Provider shall retain evidence to show compliance with R4 for 12 months or until the model used to calculate AFC is updated, whichever is longer.
- The Transmission Service Provider shall retain evidence to show compliance with R5, R8, R9, R10, and R11 for the most recent calendar year plus current year.
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in R6 and R7 for the most recent 14 days; evidence to show compliance in calculating daily values required in R6 and R7 for the most recent 30 days; and evidence to show compliance in calculating monthly values required in R6 and R7 for the most recent sixty days.

- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

2. Violation Severity Levels

| R # | Lower VSL   | Moderate VSL   | High VSL   | Severe VSL   |
|-----|---|--|--|--|

## Standard MOD-030-02(X) — Flowgate Methodology

### A. Introduction

1. **Title:** Flowgate Methodology
2. **Number:** MOD-030-02(X)
3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Flowgate Methodology to support analysis and system operations.
4. **Applicability:**
  - 4.1.1 Each Transmission Operator that uses the Flowgate Methodology to support the calculation of Available Flowgate Capabilities (AFCs) on Flowgates.
  - 4.1.2 Each Transmission Service Provider that uses the Flowgate Methodology to calculate AFCs on Flowgates.
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Deleted: Proposed

Deleted: The date upon which MOD-030-01 is currently scheduled to become effective.

### B. Requirements

- R1. The Transmission Service Provider shall include in its “Available Transfer Capability Implementation Document” (ATCID): [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]
  - R1.1. The criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates that are to be considered in Available Flowgate Capability (AFC) calculations.
  - R1.2. The following information on how source and sink for transmission service is accounted for in AFC calculations including:
    - R1.2.1. Define if the source used for AFC calculations is obtained from the source field or the Point of Receipt (POR) field of the transmission reservation.
    - R1.2.2. Define if the sink used for AFC calculations is obtained from the sink field or the Point of Delivery (POD) field of the transmission reservation.
    - R1.2.3. The source/sink or POR/POD identification and mapping to the model.
    - R1.2.4. If the Transmission Service Provider’s AFC calculation process involves a grouping of generators, the ATCID must identify how these generators participate in the group.
- R2. The Transmission Operator shall perform the following: [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]
  - R2.1. Include Flowgates used in the AFC process based, at a minimum, on the following criteria:
    - R2.1.1. Results of a first Contingency transfer analysis for ATC Paths internal to a Transmission Operator’s system up to the path capability such that at a

**Standard MOD-030-02(X) — Flowgate Methodology**

minimum the first three limiting Elements and their worst associated Contingency combinations with an OTDF of at least 5% and within the Transmission Operator's system are included as Flowgates.

**R2.1.1.1.** Use first Contingency criteria consistent with those first Contingency criteria used in planning of operations for the applicable time periods, including use of Remedial Action Schemes.

Deleted: Special Protection System

**R2.1.1.2.** Only the most limiting element in a series configuration needs to be included as a Flowgate.

**R2.1.1.3.** If any limiting element is kept within its limit for its associated worst Contingency by operating within the limits of another Flowgate, then no new Flowgate needs to be established for such limiting elements or Contingencies.

**R2.1.2.** Results of a first Contingency transfer analysis from all adjacent Balancing Authority source and sink (as defined in the ATCID) combinations up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an Outage Transfer Distribution Factor (OTDF) of at least 5% and within the Transmission Operator's system are included as Flowgates unless the interface between such adjacent Balancing Authorities is accounted for using another ATC methodology.

**R2.1.2.1.** Use first Contingency criteria consistent with those first Contingency criteria used in planning of operations for the applicable time periods, including use of Remedial Action Schemes.

Deleted: Special Protection System

**R2.1.2.2.** Only the most limiting element in a series configuration needs to be included as a Flowgate.

**R2.1.2.3.** If any limiting element is kept within its limit for its associated worst Contingency by operating within the limits of another Flowgate, then no new Flowgate needs to be established for such limiting elements or Contingencies.

**R2.1.3.** Any limiting Element/Contingency combination at least within its Reliability Coordinator's Area that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months, unless the limiting Element/Contingency combination is accounted for using another ATC methodology or was created to address temporary operating conditions.

**R2.1.4.** Any limiting Element/Contingency combination within the Transmission model that has been requested to be included by any other Transmission Service Provider using the Flowgate Methodology or Area Interchange Methodology, where:

**R2.1.4.1.** The coordination of the limiting Element/Contingency combination is not already addressed through a different methodology, and

- Any generator within the Transmission Service Provider's area has at least a 5% Power Transfer Distribution Factor

Deleted: Adopted by NERC Board of Trustees: February 10, 2009

## Standard MOD-030-02(X) — Flowgate Methodology

(PTDF) or Outage Transfer Distribution Factor (OTDF) impact on the Flowgate when delivered to the aggregate load of its own area, or

- A transfer from any Balancing Area within the Transmission Service Provider's area to a Balancing Area adjacent has at least a 5% PTDF or OTDF impact on the Flowgate.
- The Transmission Operator may utilize distribution factors less than 5% if desired.

**R2.1.4.2.** The limiting Element/Contingency combination is included in the requesting Transmission Service Provider's methodology.

**R2.2.** At a minimum, establish a list of Flowgates by creating, modifying, or deleting Flowgate definitions at least once per calendar year.

**R2.3.** At a minimum, establish a list of Flowgates by creating, modifying, or deleting Flowgates that have been requested as part of R2.1.4 within thirty calendar days from the request.

**R2.4.** Establish the TFC of each of the defined Flowgates as equal to:

- For thermal limits, the System Operating Limit (SOL) of the Flowgate.
- For voltage or stability limits, the flow that will respect the SOL of the Flowgate.

**R2.5.** At a minimum, establish the TFC once per calendar year.

**R2.5.1.** If notified of a change in the Rating by the Transmission Owner that would affect the TFC of a flowgate used in the AFC process, the TFC should be updated within seven calendar days of the notification.

**R2.6.** Provide the Transmission Service Provider with the TFCs within seven calendar days of their establishment.

**R3.** The Transmission Operator shall make available to the Transmission Service Provider a Transmission model to determine Available Flowgate Capability (AFC) that meets the following criteria: [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]

**R3.1.** Contains generation Facility Ratings, such as generation maximum and minimum output levels, specified by the Generator Owners of the Facilities within the model.

**R3.2.** Updated at least once per day for AFC calculations for intra-day, next day, and days two through 30.

**R3.3.** Updated at least once per month for AFC calculations for months two through 13.

**R3.4.** Contains modeling data and system topology for the Facilities within its Reliability Coordinator's Area. Equivalent representation of radial lines and Facilities 161kV or below is allowed.

**R3.5.** Contains modeling data and system topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination Areas.

**R4.** When calculating AFCs, the Transmission Service Provider shall represent the impact of Transmission Service as follows: [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]

Deleted: Adopted by NERC Board of Trustees: February 10, 2009

## Standard MOD-030-02(X) — Flowgate Methodology

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.
  - If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate" representation in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the source.
  - If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence" representation in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
  - If the source, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
  - If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the sink.
  - If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate" representation in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the sink.
  - If the sink, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence" representation in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.
  - If the sink, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.
- R5.** When calculating AFCs, the Transmission Service Provider shall: [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]
- R5.1.** Use the models provided by the Transmission Operator.
  - R5.2.** Include in the transmission model expected generation and Transmission outages, additions, and retirements within the scope of the model as specified in the ATCID and in effect during the applicable period of the AFC calculation for the Transmission Service Provider's area, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed.
  - R5.3.** For external Flowgates, identified in R2.1.4, use the AFC provided by the Transmission Service Provider that calculates AFC for that Flowgate.
- R6.** When calculating the impact of ETC for firm commitments ( $ETC_{Fi}$ ) for all time periods for a Flowgate, the Transmission Service Provider shall sum the following: [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]

Deleted: Adopted by NERC Board of Trustees: February 10, 2009

**Standard MOD-030-02(X) — Flowgate Methodology**

---

- R6.1.** The impact of firm Network Integration Transmission Service, including the impacts of generation to load, in the model referenced in R5.2 for the Transmission Service Provider's area, based on:
  - R6.1.1.** Load forecast for the time period being calculated, including Native Load and Network Service load
  - R6.1.2.** Unit commitment and Dispatch Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.
- R6.2.** The impact of any firm Network Integration Transmission Service, including the impacts of generation to load in the model referenced in R5.2 and has a distribution factor equal to or greater than the percentage<sup>1</sup> used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed based on:
  - R6.2.1.** Load forecast for the time period being calculated, including Native Load and Network Service load
  - R6.2.2.** Unit commitment and Dispatch Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.
- R6.3.** The impact of all confirmed firm Point-to-Point Transmission Service expected to be scheduled, including roll-over rights for Firm Transmission Service contracts, for the Transmission Service Provider's area.
- R6.4.** The impact of any confirmed firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, including roll-over rights for Firm Transmission Service contracts having a distribution factor equal to or greater than the percentage<sup>2</sup> used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.
- R6.5.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider's area.
- R6.6.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage<sup>3</sup> used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission

**Standard MOD-030-02(X) — Flowgate Methodology**

- R8.** When calculating firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]

$$AFC_F = TFC - ETC_{Fi} - CBM_i - TRM_i + Postbacks_{Fi} + counterflows_{Fi}$$

**Where:**

- AFC<sub>F</sub>** is the firm Available Flowgate Capability for the Flowgate for that period.
- TFC** is the Total Flowgate Capability of the Flowgate.
- ETC<sub>Fi</sub>** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.
- CBM<sub>i</sub>** is the impact of the Capacity Benefit Margin on the Flowgate during that period.
- TRM<sub>i</sub>** is the impact of the Transmission Reliability Margin on the Flowgate during that period.
- Postbacks<sub>Fi</sub>** are changes to firm AFC due to a change in the use of Transmission Service for that period, as defined in Business Practices.
- counterflows<sub>Fi</sub>** are adjustments to firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

- R9.** When calculating non-firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]

$$AFC_{NF} = TFC - ETC_{Fi} - ETC_{NFi} - CBM_{Si} - TRM_{Ui} + Postbacks_{NFi} + counterflows$$

**Where:**

- AFC<sub>NF</sub>** is the non-firm Available Flowgate Capability for the Flowgate for that period.
- TFC** is the Total Flowgate Capability of the Flowgate.
- ETC<sub>Fi</sub>** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.
- ETC<sub>NFi</sub>** is the sum of the impacts of existing non-firm Transmission commitments for the Flowgate during that period.
- CBM<sub>Si</sub>** is the impact of any schedules during that period using Capacity Benefit Margin.
- TRM<sub>Ui</sub>** is the impact on the Flowgate of the Transmission Reliability Margin that has not been released (unreleased) for sale as non-firm capacity by the Transmission Service Provider during that period.
- Postbacks<sub>NF</sub>** are changes to non-firm Available Flowgate Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.
- counterflows<sub>NF</sub>** are adjustments to non-firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

- R10.** Each Transmission Service Provider shall recalculate AFC, utilizing the updated models described in R3.2, R3.3, and R5, at a minimum on the following frequency, unless none of the calculated values identified in the AFC equation have changed: [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]

Deleted: Adopted by NERC Board of Trustees: February 10, 2009

## Standard MOD-030-02(X) — Flowgate Methodology

- R10.1.** For hourly AFC, once per hour. Transmission Service Providers are allowed up to 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the AFC equation.
- R10.2.** For daily AFC, once per day.
- R10.3.** For monthly AFC, once per week.
- R11.** When converting Flowgate AFCs to ATCs for ATC Paths, the Transmission Service Provider shall convert those values based on the following algorithm: [*Violation Risk Factor: To Be Determined*] [*Time Horizon: Operations Planning*]

$$\begin{aligned} \text{ATC} &= \min(P) \\ P &= \{\text{PATC}_1, \text{PATC}_2, \dots, \text{PATC}_n\} \\ \text{PATC}_n &= \frac{\text{AFC}_n}{\text{DF}_{np}} \end{aligned}$$

**Where:**

**ATC** is the Available Transfer Capability.

**P** is the set of partial Available Transfer Capabilities for all “impacted” Flowgates honored by the Transmission Service Provider; a Flowgate is considered “impacted” by a path if the Distribution Factor for that path is greater than the percentage<sup>7</sup> used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider on an OTDF Flowgate or PTDF Flowgate.

**PATC<sub>n</sub>** is the partial Available Transfer Capability for a path relative to a Flowgate *n*.

**AFC<sub>n</sub>** is the Available Flowgate Capability of a Flowgate *n*.

**DF<sub>np</sub>** is the distribution factor for Flowgate *n* relative to path *p*.

### C. Measures

- M1.** Each Transmission Service Provider shall provide its ATCID and other evidence (such as written documentation) to show that its ATCID contains the criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates and information on how sources and sinks are accounted for in AFC calculations. (R1)
- M2.** The Transmission Operator shall provide evidence (such as studies and working papers) that all Flowgates that meet the criteria described in R2.1 are considered in its AFC calculations. (R2.1)
- M3.** The Transmission Operator shall provide evidence (such as logs) that it updated its list of Flowgates at least once per calendar year. (R2.2)
- M4.** The Transmission Operator shall provide evidence (such as logs and dated requests) that it updated the list of Flowgates within thirty calendar days from a request. (R2.3)
- M5.** The Transmission Operator shall provide evidence (such as data or models) that it determined the TFC for each Flowgate as defined in R2.4. (R2.4)

---

<sup>7</sup> A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

Deleted: Adopted by NERC Board of Trustees: February 10, 2009

## Standard MOD-030-02(X) — Flowgate Methodology

---

- M6.** The Transmission Operator shall provide evidence (such as logs) that it established the TFCs for each Flowgate in accordance with the timing defined in R2.5. (R2.5)
- M7.** The Transmission Operator shall provide evidence (such as logs and electronic communication) that it provided the Transmission Service Provider with updated TFCs within seven calendar days of their determination. (R2.6)
- M8.** The Transmission Operator shall provide evidence (such as written documentation, logs, models, and data) that the Transmission model used to determine AFCs contains the information specified in R3. (R3)
- M9.** The Transmission Service Provider shall provide evidence (such as written documentation and data) that the modeling of point-to-point reservations was based on the rules described in R4. (R4)
- M10.** The Transmission Service Provider shall provide evidence including the models received from Transmission Operators and other evidence (such as documentation and data) to show that it used the Transmission Operator's models in calculating AFC. (R5.1)
- M11.** The Transmission Service Provider shall provide evidence (such as written documentation, electronic communications, and data) that all expected generation and Transmission outages, additions, and retirements were included in the AFC calculation as specified in the ATCID. (R5.2)
- M12.** The Transmission Service Provider shall provide evidence (such as logs, electronic communications, and data) that AFCs provided by third parties on external Flowgates were used instead of those calculated by the Transmission Operator. (R5.3)
- M13.** The Transmission Service Provider shall demonstrate compliance with R6 by recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R6 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in this standard and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements defined in R6 to calculate its firm ETC. (R6)
- M14.** The Transmission Service Provider shall demonstrate compliance with R7 by recalculating non-firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R7 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in the standard and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements in R7 to calculate its non-firm ETC. (R7)
- M15.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm AFCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc...). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

Deleted: Adopted by NERC Board of Trustees: February 10, 2009

## Standard MOD-030-02(X) — Flowgate Methodology

---

- M16.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm AFCs, as required in R9. Such documentation must show that only the variables allowed in R9 were used to calculate non-firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc...). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R9)
- M17.** The Transmission Service Provider shall provide evidence (such as documentation, dated logs, and data) that it calculated AFC on the frequency defined in R10. (R10)
- M18.** The Transmission Service Provider shall provide evidence (such as documentation and data) when converting Flowgate AFCs to ATCs for ATC Paths, it follows the procedure described in R11. (R11)

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Enforcement Authority

Regional Entity.

##### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

##### 1.3. Data Retention

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to determine flowgates and TFC and evidence of the previous version to show compliance with R2 and R3.
- The Transmission Operator shall retain evidence to show compliance with R2.1, R2.3 for the most recent 12 months.
- The Transmission Operator shall retain evidence to show compliance with R2.2, R2.4 and R2.5 for the most recent three calendar years plus current year.
- The Transmission Service Provider shall retain evidence to show compliance with R4 for 12 months or until the model used to calculate AFC is updated, whichever is longer.
- The Transmission Service Provider shall retain evidence to show compliance with R5, R8, R9, R10, and R11 for the most recent calendar year plus current year.
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in R6 and R7 for the most recent 14 days; evidence to show compliance in calculating daily values required in R6 and R7 for the most recent 30 days; and evidence to show compliance in calculating monthly values required in R6 and R7 for the most recent sixty days.

Deleted: Adopted by NERC Board of Trustees: February 10, 2009

**Standard MOD-030-02(X) — Flowgate Methodology**

---

- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

**A. Introduction**

- 1. Title:** Nuclear Plant Interface Coordination
- 2. Number:** NUC-001-2.1(X)
- 3. Purpose:** This standard requires coordination between Nuclear Plant Generator Operators and Transmission Entities for the purpose of ensuring nuclear plant safe operation and shutdown.
- 4. Applicability:**
  - 4.1.** Nuclear Plant Generator Operator.
  - 4.2.** Transmission Entities shall mean all entities that are responsible for providing services related to Nuclear Plant Interface Requirements (NPIRs). Such entities may include one or more of the following:
    - 4.2.1** Transmission Operators.
    - 4.2.2** Transmission Owners.
    - 4.2.3** Transmission Planners.
    - 4.2.4** Transmission Service Providers.
    - 4.2.5** Balancing Authorities.
    - 4.2.6** Reliability Coordinators.
    - 4.2.7** Planning Coordinators.
    - 4.2.8** Distribution Providers.
    - 4.2.9** Load-serving Entities.
    - 4.2.10** Generator Owners.
    - 4.2.11** Generator Operators.
- 5. Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**B. Requirements**

- R1.** The Nuclear Plant Generator Operator shall provide the proposed NPIRs in writing to the applicable Transmission Entities and shall verify receipt [*Risk Factor: Lower*]
- R2.** The Nuclear Plant Generator Operator and the applicable Transmission Entities shall have in effect one or more Agreements<sup>1</sup> that include mutually agreed to NPIRs and document how the

---

1. Agreements may include mutually agreed upon procedures or protocols in effect between entities or between departments of a vertically integrated system.

Nuclear Plant Generator Operator and the applicable Transmission Entities shall address and implement these NPIRs. [*Risk Factor: Medium*]

- R3.** Per the Agreements developed in accordance with this standard, the applicable Transmission Entities shall incorporate the NPIRs into their planning analyses of the electric system and shall communicate the results of these analyses to the Nuclear Plant Generator Operator. [*Risk Factor: Medium*]
- R4.** Per the Agreements developed in accordance with this standard, the applicable Transmission Entities shall: [*Risk Factor: High*]
  - R4.1.** Incorporate the NPIRs into their operating analyses of the electric system.
  - R4.2.** Operate the electric system to meet the NPIRs.
  - R4.3.** Inform the Nuclear Plant Generator Operator when the ability to assess the operation of the electric system affecting NPIRs is lost.
- R5.** The Nuclear Plant Generator Operator shall operate per the Agreements developed in accordance with this standard. [*Risk Factor: High*]
- R6.** Per the Agreements developed in accordance with this standard, the applicable Transmission Entities and the Nuclear Plant Generator Operator shall coordinate outages and maintenance activities which affect the NPIRs. [*Risk Factor: Medium*]
- R7.** Per the Agreements developed in accordance with this standard, the Nuclear Plant Generator Operator shall inform the applicable Transmission Entities of actual or proposed changes to nuclear plant design, configuration, operations, limits, Protection Systems, or capabilities that may impact the ability of the electric system to meet the NPIRs. [*Risk Factor: High*]
- R8.** Per the Agreements developed in accordance with this standard, the applicable Transmission Entities shall inform the Nuclear Plant Generator Operator of actual or proposed changes to electric system design, configuration, operations, limits, Protection Systems, or capabilities that may impact the ability of the electric system to meet the NPIRs. [*Risk Factor: High*]
- R9.** The Nuclear Plant Generator Operator and the applicable Transmission Entities shall include, as a minimum, the following elements within the agreement(s) identified in R2: [*Risk Factor: Medium*]
  - R9.1.** Administrative elements: (Retirement approved by FERC effective January 21, 2014.)
    - R9.1.1.** Definitions of key terms used in the agreement. (Retirement approved by FERC effective January 21, 2014.)
    - R9.1.2.** Names of the responsible entities, organizational relationships, and responsibilities related to the NPIRs. (Retirement approved by FERC effective January 21, 2014.)
    - R9.1.3.** A requirement to review the agreement(s) at least every three years. (Retirement approved by FERC effective January 21, 2014.)
    - R9.1.4.** A dispute resolution mechanism. (Retirement approved by FERC effective January 21, 2014.)
  - R9.2.** Technical requirements and analysis:
    - R9.2.1.** Identification of parameters, limits, configurations, and operating scenarios included in the NPIRs and, as applicable, procedures for providing any specific data not provided within the agreement.

- R9.2.2.** Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs.
- R9.2.3.** Types of planning and operational analyses performed specifically to support the NPIRs, including the frequency of studies and types of Contingencies and scenarios required.
- R9.3.** Operations and maintenance coordination:
  - R9.3.1.** Designation of ownership of electrical facilities at the interface between the electric system and the nuclear plant and responsibilities for operational control coordination and maintenance of these facilities.
  - R9.3.2.** Identification of any maintenance requirements for equipment not owned or controlled by the Nuclear Plant Generator Operator that are necessary to meet the NPIRs.
  - R9.3.3.** Coordination of testing, calibration and maintenance of on-site and off-site power supply systems and related components.
  - R9.3.4.** Provisions to address mitigating actions needed to avoid violating NPIRs and to address periods when responsible Transmission Entity loses the ability to assess the capability of the electric system to meet the NPIRs. These provisions shall include responsibility to notify the Nuclear Plant Generator Operator within a specified time frame.
  - R9.3.5.** Provision for considering, within the restoration process, the requirements and urgency of a nuclear plant that has lost all off-site and on-site AC power.
  - R9.3.6.** Coordination of physical and cyber security protection of the Bulk Electric System at the nuclear plant interface to ensure each asset is covered under at least one entity's plan.
  - R9.3.7.** Coordination of the NPIRs with transmission system Remedial Action Schemes and underfrequency and undervoltage load shedding programs.
- R9.4.** Communications and training:
  - R9.4.1.** Provisions for communications between the Nuclear Plant Generator Operator and Transmission Entities, including communications protocols, notification time requirements, and definitions of terms.
  - R9.4.2.** Provisions for coordination during an off-normal or emergency event affecting the NPIRs, including the need to provide timely information explaining the event, an estimate of when the system will be returned to a normal state, and the actual time the system is returned to normal.
  - R9.4.3.** Provisions for coordinating investigations of causes of unplanned events affecting the NPIRs and developing solutions to minimize future risk of such events.
  - R9.4.4.** Provisions for supplying information necessary to report to government agencies, as related to NPIRs.
  - R9.4.5.** Provisions for personnel training, as related to NPIRs.

**C. Measures**

- M1.** The Nuclear Plant Generator Operator shall, upon request of the Compliance Enforcement Authority, provide a copy of the transmittal and receipt of transmittal of the proposed NPIRs to the responsible Transmission Entities. (Requirement 1)
- M2.** The Nuclear Plant Generator Operator and each Transmission Entity shall each have a copy of the Agreement(s) addressing the elements in Requirement 9 available for inspection upon request of the Compliance Enforcement Authority. (Requirement 2 and 9)
- M3.** Each Transmission Entity responsible for planning analyses in accordance with the Agreement shall, upon request of the Compliance Enforcement Authority, provide a copy of the planning analyses results transmitted to the Nuclear Plant Generator Operator, showing incorporation of the NPIRs. The Compliance Enforcement Authority shall refer to the Agreements developed in accordance with this standard for specific requirements. (Requirement 3)
- M4.** Each Transmission Entity responsible for operating the electric system in accordance with the Agreement shall demonstrate or provide evidence of the following, upon request of the Compliance Enforcement Authority:
  - M4.1** The NPIRs have been incorporated into the current operating analysis of the electric system. (Requirement 4.1)
  - M4.2** The electric system was operated to meet the NPIRs. (Requirement 4.2)
  - M4.3** The Transmission Entity informed the Nuclear Plant Generator Operator when it became aware it lost the capability to assess the operation of the electric system affecting the NPIRs. (Requirement 4.3)
- M5.** The Nuclear Plant Generator Operator shall, upon request of the Compliance Enforcement Authority, demonstrate or provide evidence that the Nuclear Power Plant is being operated consistent with the Agreements developed in accordance with this standard. (Requirement 5)
- M6.** The Transmission Entities and Nuclear Plant Generator Operator shall, upon request of the Compliance Enforcement Authority, provide evidence of the coordination between the Transmission Entities and the Nuclear Plant Generator Operator regarding outages and maintenance activities which affect the NPIRs. (Requirement 6)
- M7.** The Nuclear Plant Generator Operator shall provide evidence that it informed the applicable Transmission Entities of changes to nuclear plant design, configuration, operations, limits, Protection Systems, or capabilities that would impact the ability of the Transmission Entities to meet the NPIRs. (Requirement 7)
- M8.** The Transmission Entities shall each provide evidence that it informed the Nuclear Plant Generator Operator of changes to electric system design, configuration, operations, limits, Protection Systems, or capabilities that would impact the ability of the Nuclear Plant Generator Operator to meet the NPIRs. (Requirement 8)

#### **D. Compliance**

- 1. Compliance Monitoring Process**
  - 1.1. Compliance Enforcement Authority**

Regional Entity.
  - 1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.
  - 1.3. Compliance Monitoring and Enforcement Processes:**

Compliance Audits  
Self-Certifications  
Spot Checking  
Compliance Violation Investigations  
Self-Reporting  
Complaints

#### **1.4. Data Retention**

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- For Measure 1, the Nuclear Plant Generator Operator shall keep its latest transmittals and receipts.
- For Measure 2, the Nuclear Plant Generator Operator and each Transmission Entity shall have its current, in-force agreement.
- For Measure 3, the Transmission Entity shall have the latest planning analysis results.
- For Measures 4.3, 6 and 8, the Transmission Entity shall keep evidence for two years plus current.
- For Measures 5, 6 and 7, the Nuclear Plant Generator Operator shall keep evidence for two years plus current.

If a Responsible Entity is found non-compliant it shall keep information related to the noncompliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### **1.5. Additional Compliance Information**

None.

### **2. Violation Severity Levels**

- 2.1. Lower:** Agreement(s) exist per this standard and NPIRs were identified and implemented, but documentation described in M1-M8 was not provided.
- 2.2. Moderate:** Agreement(s) exist per R2 and NPIRs were identified and implemented, but one or more elements of the Agreement in R9 were not met.
- 2.3. High:** One or more requirements of R3 through R8 were not met.
- 2.4. Severe:** No proposed NPIRs were submitted per R1, no Agreement exists per this standard, or the Agreements were not implemented.

### **E. Regional Differences**

The design basis for Canadian (CANDU) NPPs does not result in the same licensing requirements as U.S. NPPs. NRC design criteria specifies that in addition to emergency on-site electrical power, electrical power from the electric network also be provided to permit safe shutdown. This requirement is specified in such NRC Regulations as 10 CFR 50 Appendix A — General Design Criterion 17 and 10 CFR 50.63 Loss of all alternating current power. There are no equivalent Canadian Regulatory

## Standard NUC-001-2.1(X) — Nuclear Plant Interface Coordination

requirements for Station Blackout (SBO) or coping times as they do not form part of the licensing basis for CANDU NPPs.

Therefore the definition of NPLR for Canadian CANDU units will be as follows:

**Nuclear Plant Licensing Requirements (NPLR)** are requirements included in the design basis of the nuclear plant and are statutorily mandated for the operation of the plant; when used in this standard, NPLR shall mean nuclear power plant licensing requirements for avoiding preventable challenges to nuclear safety as a result of an electric system disturbance, transient, or condition.

## Standard NUC-001-2.1(X) — Nuclear Plant Interface Coordination

---

### A. Introduction

1. **Title:** Nuclear Plant Interface Coordination
2. **Number:** NUC-001-2.1(X)
3. **Purpose:** This standard requires coordination between Nuclear Plant Generator Operators and Transmission Entities for the purpose of ensuring nuclear plant safe operation and shutdown.
4. **Applicability:**
  - 4.1. Nuclear Plant Generator Operator.
  - 4.2. Transmission Entities shall mean all entities that are responsible for providing services related to Nuclear Plant Interface Requirements (NPIRs). Such entities may include one or more of the following:
    - 4.2.1 Transmission Operators.
    - 4.2.2 Transmission Owners.
    - 4.2.3 Transmission Planners.
    - 4.2.4 Transmission Service Providers.
    - 4.2.5 Balancing Authorities.
    - 4.2.6 Reliability Coordinators.
    - 4.2.7 Planning Coordinators.
    - 4.2.8 Distribution Providers.
    - 4.2.9 Load-serving Entities.
    - 4.2.10 Generator Owners.
    - 4.2.11 Generator Operators.
5. **Effective Date:** [This standard shall become effective on the first day of the first calendar quarter that is twelve \(12\) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve \(12\) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.](#)

Deleted: . April 1, 2010

### B. Requirements

- R1. The Nuclear Plant Generator Operator shall provide the proposed NPIRs in writing to the applicable Transmission Entities and shall verify receipt [*Risk Factor: Lower*]
- R2. The Nuclear Plant Generator Operator and the applicable Transmission Entities shall have in effect one or more Agreements<sup>1</sup> that include mutually agreed to NPIRs and document how the

---

1. Agreements may include mutually agreed upon procedures or protocols in effect between entities or between departments of a vertically integrated system.

## Standard NUC-001-2.1(X) — Nuclear Plant Interface Coordination

---

Nuclear Plant Generator Operator and the applicable Transmission Entities shall address and implement these NPIRs. [*Risk Factor: Medium*]

- R3.** Per the Agreements developed in accordance with this standard, the applicable Transmission Entities shall incorporate the NPIRs into their planning analyses of the electric system and shall communicate the results of these analyses to the Nuclear Plant Generator Operator. [*Risk Factor: Medium*]
- R4.** Per the Agreements developed in accordance with this standard, the applicable Transmission Entities shall: [*Risk Factor: High*]
  - R4.1.** Incorporate the NPIRs into their operating analyses of the electric system.
  - R4.2.** Operate the electric system to meet the NPIRs.
  - R4.3.** Inform the Nuclear Plant Generator Operator when the ability to assess the operation of the electric system affecting NPIRs is lost.
- R5.** The Nuclear Plant Generator Operator shall operate per the Agreements developed in accordance with this standard. [*Risk Factor: High*]
- R6.** Per the Agreements developed in accordance with this standard, the applicable Transmission Entities and the Nuclear Plant Generator Operator shall coordinate outages and maintenance activities which affect the NPIRs. [*Risk Factor: Medium*]
- R7.** Per the Agreements developed in accordance with this standard, the Nuclear Plant Generator Operator shall inform the applicable Transmission Entities of actual or proposed changes to nuclear plant design, configuration, operations, limits, Protection Systems, or capabilities that may impact the ability of the electric system to meet the NPIRs. [*Risk Factor: High*]
- R8.** Per the Agreements developed in accordance with this standard, the applicable Transmission Entities shall inform the Nuclear Plant Generator Operator of actual or proposed changes to electric system design, configuration, operations, limits, Protection Systems, or capabilities that may impact the ability of the electric system to meet the NPIRs. [*Risk Factor: High*]
- R9.** The Nuclear Plant Generator Operator and the applicable Transmission Entities shall include, as a minimum, the following elements within the agreement(s) identified in R2: [*Risk Factor: Medium*]
  - R9.1.** Administrative elements: (Retirement approved by FERC effective January 21, 2014.)
    - R9.1.1.** Definitions of key terms used in the agreement. (Retirement approved by FERC effective January 21, 2014.)
    - R9.1.2.** Names of the responsible entities, organizational relationships, and responsibilities related to the NPIRs. (Retirement approved by FERC effective January 21, 2014.)
    - R9.1.3.** A requirement to review the agreement(s) at least every three years. (Retirement approved by FERC effective January 21, 2014.)
    - R9.1.4.** A dispute resolution mechanism. (Retirement approved by FERC effective January 21, 2014.)
  - R9.2.** Technical requirements and analysis:
    - R9.2.1.** Identification of parameters, limits, configurations, and operating scenarios included in the NPIRs and, as applicable, procedures for providing any specific data not provided within the agreement.

## Standard NUC-001-2.1(X) — Nuclear Plant Interface Coordination

- R9.2.2.** Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs.
- R9.2.3.** Types of planning and operational analyses performed specifically to support the NPIRs, including the frequency of studies and types of Contingencies and scenarios required.
- R9.3.** Operations and maintenance coordination:
  - R9.3.1.** Designation of ownership of electrical facilities at the interface between the electric system and the nuclear plant and responsibilities for operational control coordination and maintenance of these facilities.
  - R9.3.2.** Identification of any maintenance requirements for equipment not owned or controlled by the Nuclear Plant Generator Operator that are necessary to meet the NPIRs.
  - R9.3.3.** Coordination of testing, calibration and maintenance of on-site and off-site power supply systems and related components.
  - R9.3.4.** Provisions to address mitigating actions needed to avoid violating NPIRs and to address periods when responsible Transmission Entity loses the ability to assess the capability of the electric system to meet the NPIRs. These provisions shall include responsibility to notify the Nuclear Plant Generator Operator within a specified time frame.
  - R9.3.5.** Provision for considering, within the restoration process, the requirements and urgency of a nuclear plant that has lost all off-site and on-site AC power.
  - R9.3.6.** Coordination of physical and cyber security protection of the Bulk Electric System at the nuclear plant interface to ensure each asset is covered under at least one entity's plan.
  - R9.3.7.** Coordination of the NPIRs with transmission system [Remedial Action Schemes](#) and underfrequency and undervoltage load shedding programs.
- R9.4.** Communications and training:
  - R9.4.1.** Provisions for communications between the Nuclear Plant Generator Operator and Transmission Entities, including communications protocols, notification time requirements, and definitions of terms.
  - R9.4.2.** Provisions for coordination during an off-normal or emergency event affecting the NPIRs, including the need to provide timely information explaining the event, an estimate of when the system will be returned to a normal state, and the actual time the system is returned to normal.
  - R9.4.3.** Provisions for coordinating investigations of causes of unplanned events affecting the NPIRs and developing solutions to minimize future risk of such events.
  - R9.4.4.** Provisions for supplying information necessary to report to government agencies, as related to NPIRs.
  - R9.4.5.** Provisions for personnel training, as related to NPIRs.

Deleted: Special Protection System

### C. Measures

## Standard NUC-001-2.1(X) — Nuclear Plant Interface Coordination

---

- M1.** The Nuclear Plant Generator Operator shall, upon request of the Compliance Enforcement Authority, provide a copy of the transmittal and receipt of transmittal of the proposed NPIRs to the responsible Transmission Entities. (Requirement 1)
- M2.** The Nuclear Plant Generator Operator and each Transmission Entity shall each have a copy of the Agreement(s) addressing the elements in Requirement 9 available for inspection upon request of the Compliance Enforcement Authority. (Requirement 2 and 9)
- M3.** Each Transmission Entity responsible for planning analyses in accordance with the Agreement shall, upon request of the Compliance Enforcement Authority, provide a copy of the planning analyses results transmitted to the Nuclear Plant Generator Operator, showing incorporation of the NPIRs. The Compliance Enforcement Authority shall refer to the Agreements developed in accordance with this standard for specific requirements. (Requirement 3)
- M4.** Each Transmission Entity responsible for operating the electric system in accordance with the Agreement shall demonstrate or provide evidence of the following, upon request of the Compliance Enforcement Authority:
  - M4.1** The NPIRs have been incorporated into the current operating analysis of the electric system. (Requirement 4.1)
  - M4.2** The electric system was operated to meet the NPIRs. (Requirement 4.2)
  - M4.3** The Transmission Entity informed the Nuclear Plant Generator Operator when it became aware it lost the capability to assess the operation of the electric system affecting the NPIRs. (Requirement 4.3)
- M5.** The Nuclear Plant Generator Operator shall, upon request of the Compliance Enforcement Authority, demonstrate or provide evidence that the Nuclear Power Plant is being operated consistent with the Agreements developed in accordance with this standard. (Requirement 5)
- M6.** The Transmission Entities and Nuclear Plant Generator Operator shall, upon request of the Compliance Enforcement Authority, provide evidence of the coordination between the Transmission Entities and the Nuclear Plant Generator Operator regarding outages and maintenance activities which affect the NPIRs. (Requirement 6)
- M7.** The Nuclear Plant Generator Operator shall provide evidence that it informed the applicable Transmission Entities of changes to nuclear plant design, configuration, operations, limits, Protection Systems, or capabilities that would impact the ability of the Transmission Entities to meet the NPIRs. (Requirement 7)
- M8.** The Transmission Entities shall each provide evidence that it informed the Nuclear Plant Generator Operator of changes to electric system design, configuration, operations, limits, Protection Systems, or capabilities that would impact the ability of the Nuclear Plant Generator Operator to meet the NPIRs. (Requirement 8)

### D. Compliance

- 1. Compliance Monitoring Process**
  - 1.1. Compliance Enforcement Authority**

Regional Entity.
  - 1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.
  - 1.3. Compliance Monitoring and Enforcement Processes:**

## Standard NUC-001-2.1(X) — Nuclear Plant Interface Coordination

---

Compliance Audits  
Self-Certifications  
Spot Checking  
Compliance Violation Investigations  
Self-Reporting  
Complaints

### 1.4. Data Retention

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- For Measure 1, the Nuclear Plant Generator Operator shall keep its latest transmittals and receipts.
- For Measure 2, the Nuclear Plant Generator Operator and each Transmission Entity shall have its current, in-force agreement.
- For Measure 3, the Transmission Entity shall have the latest planning analysis results.
- For Measures 4.3, 6 and 8, the Transmission Entity shall keep evidence for two years plus current.
- For Measures 5, 6 and 7, the Nuclear Plant Generator Operator shall keep evidence for two years plus current.

If a Responsible Entity is found non-compliant it shall keep information related to the noncompliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

### 1.5. Additional Compliance Information

None.

## 2. Violation Severity Levels

- 2.1. Lower:** Agreement(s) exist per this standard and NPIRs were identified and implemented, but documentation described in M1-M8 was not provided.
- 2.2. Moderate:** Agreement(s) exist per R2 and NPIRs were identified and implemented, but one or more elements of the Agreement in R9 were not met.
- 2.3. High:** One or more requirements of R3 through R8 were not met.
- 2.4. Severe:** No proposed NPIRs were submitted per R1, no Agreement exists per this standard, or the Agreements were not implemented.

## E. Regional Differences

The design basis for Canadian (CANDU) NPPs does not result in the same licensing requirements as U.S. NPPs. NRC design criteria specifies that in addition to emergency on-site electrical power, electrical power from the electric network also be provided to permit safe shutdown. This requirement is specified in such NRC Regulations as 10 CFR 50 Appendix A — General Design Criterion 17 and 10 CFR 50.63 Loss of all alternating current power. There are no equivalent Canadian Regulatory

**Standard NUC-001-2.1(X) — Nuclear Plant Interface Coordination**

requirements for Station Blackout (SBO) or coping times as they do not form part of the licensing basis for CANDU NPPs.

Therefore the definition of NPLR for Canadian CANDU units will be as follows:

**Nuclear Plant Licensing Requirements (NPLR)** are requirements included in the design basis of the nuclear plant and are statutorily mandated for the operation of the plant; when used in this standard, NPLR shall mean nuclear power plant licensing requirements for avoiding preventable challenges to nuclear safety as a result of an electric system disturbance, transient, or condition.

## A. Introduction

1. **Title:** System Protection Coordination
2. **Number:** PRC-001-1.1(X)
3. **Purpose:**  
To ensure system protection is coordinated among operating entities.
4. **Applicability**
  - 4.1. Balancing Authorities
  - 4.2. Transmission Operators
  - 4.3. Generator Operators
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

## B. Requirements

- R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of Protection System schemes applied in its area.
- R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:
  - R2.1. If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible.
  - R2.2. If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.
- R3. A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows.
  - R3.1. Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority.
  - R3.2. Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.

- R4.** Each Transmission Operator shall coordinate Protection Systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.
- R5.** A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the Protection Systems of others:
  - R5.1.** Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could require changes in the Transmission Operator's Protection Systems.
  - R5.2.** Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' Protection Systems.
- R6.** Each Transmission Operator and Balancing Authority shall monitor the status of each Remedial Action Scheme in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.

### **C. Measures**

- M1.** Each Generator Operator and Transmission Operator shall have and provide upon request evidence that could include but is not limited to, revised fault analysis study, letters of agreement on settings, notifications of changes, or other equivalent evidence that will be used to confirm that there was coordination of new protective systems or changes as noted in Requirements 3, 3.1, and 3.2.
- M2.** Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, documentation, electronic logs, computer printouts, or computer demonstration or other equivalent evidence that will be used to confirm that it monitors the Remedial Action Schemes in its area. (Requirement 6 Part 1)
- M3.** Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, operator logs, phone records, electronic-notifications or other equivalent evidence that will be used to confirm that it notified affected Transmission Operator and Balancing Authorities of changes in status of one of its Remedial Action Schemes. (Requirement 6 Part 2)

### **D. Compliance**

#### **1. Compliance Monitoring Process**

##### **1.1. Compliance Monitoring Responsibility**

Regional Reliability Organizations shall be responsible for compliance monitoring.

##### **1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

### **1.3. Data Retention**

Each Generator Operator and Transmission Operator shall have current, in-force documents available as evidence of compliance for Measure 1.

Each Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence) for Measures 2 and 3.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

### **1.4. Additional Compliance Information**

None.

## **2. Levels of Non-Compliance for Generator Operators:**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** Not applicable.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** Failed to provide evidence of coordination when installing new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority as specified in R3.1.

## **3. Levels of Non-Compliance for Transmission Operators:**

**3.1. Level 1:** Not applicable.

**3.2. Level 2:** Not applicable.

3.3. **Level 3:** Not applicable.

3.4. **Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

3.4.1 Failed to provide evidence of coordination when installing new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities as specified in R3.2.

3.4.2 Did not monitor the status of each Remedial Action Scheme, or did not notify affected Transmission Operators, Balancing Authorities of changes in special protection status as specified in R6.

4. **Levels of Non-Compliance for Balancing Authorities:**

4.1. **Level 1:** Not applicable.

4.2. **Level 2:** Not applicable.

4.3. **Level 3:** Not applicable.

4.4. **Level 4:** Did not monitor the status of each Remedial Action Scheme, or did not notify affected Transmission Operators, Balancing Authorities of changes in special protection status as specified in R6.

**E. Regional Differences**

None identified.

**Version History**

| Version | Date              | Action  | Change Tracking                           |

Deleted: January 1, 2007 .

## B. Requirements

- R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of Protection System schemes applied in its area.
- R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:
  - R2.1. If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible.
  - R2.2. If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.
- R3. A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows.
  - R3.1. Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority.
  - R3.2. Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.

- R4. Each Transmission Operator shall coordinate Protection Systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.
- R5. A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the Protection Systems of others:
  - R5.1. Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could require changes in the Transmission Operator's Protection Systems.
  - R5.2. Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' Protection Systems.
- R6. Each Transmission Operator and Balancing Authority shall monitor the status of each Remedial Action Scheme in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.

Deleted: Special Protection System

**C. Measures**

- M1. Each Generator Operator and Transmission Operator shall have and provide upon request evidence that could include but is not limited to, revised fault analysis study, letters of agreement on settings, notifications of changes, or other equivalent evidence that will be used to confirm that there was coordination of new protective systems or changes as noted in Requirements 3, 3.1, and 3.2.
- M2. Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, documentation, electronic logs, computer printouts, or computer demonstration or other equivalent evidence that will be used to confirm that it monitors the Remedial Action Schemes in its area. (Requirement 6 Part 1)
- M3. Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, operator logs, phone records, electronic-notifications or other equivalent evidence that will be used to confirm that it notified affected Transmission Operator and Balancing Authorities of changes in status of one of its Remedial Action Schemes. (Requirement 6 Part 2)

Deleted: Special Protection System

Deleted: Special Protection System

**D. Compliance**

- 1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

Regional Reliability Organizations shall be responsible for compliance monitoring.
  - 1.2. **Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

**1.3. Data Retention**

Each Generator Operator and Transmission Operator shall have current, in-force documents available as evidence of compliance for Measure 1.

Each Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence) for Measures 2 and 3.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

**1.4. Additional Compliance Information**

None.

**2. Levels of Non-Compliance for Generator Operators:**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** Not applicable.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** Failed to provide evidence of coordination when installing new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority as specified in R3.1.

**3. Levels of Non-Compliance for Transmission Operators:**

**3.1. Level 1:** Not applicable.

**3.2. Level 2:** Not applicable.

**Standard PRC-001-1.1(X) — System Protection Coordination**

3.3. **Level 3:** Not applicable.

3.4. **Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

3.4.1 Failed to provide evidence of coordination when installing new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities as specified in R3.2.

3.4.2 Did not monitor the status of each Remedial Action Scheme, or did not notify affected Transmission Operators, Balancing Authorities of changes in special protection status as specified in R6.

Deleted: Special Protection System

**4. Levels of Non-Compliance for Balancing Authorities:**

4.1. **Level 1:** Not applicable.

4.2. **Level 2:** Not applicable.

4.3. **Level 3:** Not applicable.

4.4. **Level 4:** Did not monitor the status of each Remedial Action Scheme, or did not notify affected Transmission Operators, Balancing Authorities of changes in special protection status as specified in R6.

Deleted: Special Protection System

**E. Regional Differences**

None identified.

---

|  |  |  |   |
|--|--|--|---|
|  |  |  | <u>System and SPS with Remedial Action Scheme and RAS</u> |
|--|--|--|---|

**A. Introduction**

- 1. Title:** Protection System and Remedial Action Scheme Misoperation
- 2. Number:** PRC-004-WECC-1(X)
- 3. Purpose:** Regional Reliability Standard to ensure all transmission and generation Protection System and Remedial Action Scheme (RAS) Misoperations on Transmission Paths and RAS defined in section 4 are analyzed and/or mitigated.

**4. Applicability**

- 4.1.** Transmission Owners of selected WECC major transmission path facilities and RAS listed in tables titled “Major WECC Transfer Paths in the Bulk Electric System” provided at <http://www.wecc.biz/Standards/Approved%20Standards/Supporting%20Tables/Table%20Major%20Paths%204-28-08.pdf> and “Major WECC Remedial Action Schemes (RAS)” provided at <http://www.wecc.biz/Standards/Approved%20Standards/Supporting%20Tables/Table%20Major%20RAS%204-28-08.pdf>.
- 4.2.** Generator Owners that own RAS listed in the Table titled “Major WECC Remedial Action Schemes (RAS)” provided at <http://www.wecc.biz/Standards/Approved%20Standards/Supporting%20Tables/Table%20Major%20RAS%204-28-08.pdf>.
- 4.3.** Transmission Operators that operate major transmission path facilities and RAS listed in Tables titled “Major WECC Transfer Paths in the Bulk Electric System” provided at <http://www.wecc.biz/Standards/Approved%20Standards/Supporting%20Tables/Table%20Major%20Paths%204-28-08.pdf> and “Major WECC Remedial Action Schemes (RAS)” provided at <http://www.wecc.biz/Standards/Approved%20Standards/Supporting%20Tables/Table%20Major%20RAS%204-28-08.pdf>.
- 5. Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**B. Requirements**

The requirements below only apply to the major transmission paths facilities and RAS listed in the tables titled “Major WECC Transfer Paths in the Bulk Electric System” and “Major WECC Remedial Action Schemes (RAS).”

- R.1.** System Operators and System Protection personnel of the Transmission Owners and Generator Owners shall analyze all Protection System and RAS operations. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment]*
  - R1.1.** System Operators shall review all tripping of transmission elements and RAS operations to identify apparent Misoperations within 24 hours.
  - R1.2.** System Protection personnel shall analyze all operations of Protection Systems and RAS within 20 business days for correctness to characterize whether a Misoperation has occurred that may not have been identified by System Operators.

- R.2.** Transmission Owners and Generator Owners shall perform the following actions for each Misoperation of the Protection System or RAS. It is not intended that Requirements R2.1 through R2.4 apply to Protection System and/or RAS actions that appear to be entirely reasonable and correct at the time of occurrence and associated system performance is fully compliant with NERC Reliability Standards. If the Transmission Owner or Generator Owner later finds the Protection System or RAS operation to be incorrect through System Protection personnel analysis, the requirements of R2.1 through R2.4 become applicable at the time the Transmission Owner or Generator Owner identifies the Misoperation:
- R2.1.** If the Protection System or RAS has a Security-Based Misoperation and two or more Functionally Equivalent Protection Systems (FEPS) or Functionally Equivalent RAS (FERAS) remain in service to ensure Bulk Electric System (BES) reliability, the Transmission Owners or Generator Owners shall remove from service the Protection System or RAS that misoperated within 22 hours following identification of the Misoperation. Repair or replacement of the failed Protection System or RAS is at the Transmission Owners' and Generator Owners' discretion. *[Violation Risk Factor: High] [Time Horizon: Same-day Operations]*
- R2.2.** If the Protection System or RAS has a Security-Based Misoperation and only one FEPS or FERAS remains in service to ensure BES reliability, the Transmission Owner or Generator Owner shall perform the following. *[Violation Risk Factor: High] [Time Horizon: Same-day Operations]*
- R2.2.1.** Following identification of the Protection System or RAS Misoperation, Transmission Owners and Generator Owners shall remove from service within 22 hours for repair or modification the Protection System or RAS that misoperated.
- R2.2.2.** The Transmission Owner or Generator Owner shall repair or replace any Protection System or RAS that misoperated with a FEPS or FERAS within 20 business days of the date of removal. The Transmission Owner or Generator Owner shall remove the Element from service or disable the RAS if repair or replacement is not completed within 20 business days.
- R2.3.** If the Protection System or RAS has a Security-Based or Dependability-Based Misoperation and a FEPS and FERAS is not in service to ensure BES reliability, Transmission Owners or Generator Owners shall repair and place back in service within 22 hours the Protection System or RAS that misoperated. If this cannot be done, then Transmission Owners and Generator Owners shall perform the following. *[Violation Risk Factor: High] [Time Horizon: Same-day Operations]*
- R2.3.1.** When a FEPS is not available, the Transmission Owners shall remove the associated Element from service.
- R2.3.2.** When FERAS is not available, then
- 2.3.2.1.** The Generator Owners shall adjust generation to a reliable operating level, or
- 2.3.2.2.** Transmission Operators shall adjust the SOL and operate the facilities within established limits.
- R2.4.** If the Protection System or RAS has a Dependability-Based Misoperation but has one or more FEPS or FERAS that operated correctly, the associated Element or transmission path may remain in service without removing from service the Protection System or RAS that failed, provided one of the following is performed.
- R2.4.1.** Transmission Owners or Generator Owners shall repair or replace any

Protection System or RAS that misoperated with FEPS and FERAS within 20 business days of the date of the Misoperation identification, or

- R2.4.2.** Transmission Owners or Generator Owners shall remove from service the associated Element or RAS. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Assessment*]
- R.3.** Transmission Owners and Generation Owners shall submit Misoperation incident reports to WECC within 10 business days for the following. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Assessment*]
  - R3.1.** Identification of a Misoperation of a Protection System and/or RAS,
  - R3.2.** Completion of repairs or the replacement of Protection System and/or RAS that misoperated.

### **C. Measures**

**Each measure below applies directly to the requirement by number.**

- M1.** Transmission Owners and Generation Owners shall have evidence that they reported and analyzed all Protection System and RAS operations.
  - M1.1** Transmission Owners and Generation Owners shall have evidence that System Operating personnel reviewed all operations of Protection System and RAS within 24 hours.
  - M1.2** Transmission Owners and Generation Owners shall have evidence that System Protection personnel analyzed all operations of Protection System and RAS for correctness within 20 business days.
- M2.** Transmission Owners and Generation Owners shall have evidence for the following.
  - M2.1** Transmission Owners and Generation Owners shall have evidence that they removed the Protection System or RAS that misoperated from service within 22 hours following identification of the Protection System or RAS Misoperation.
  - M2.2** Transmission Owners and Generation Owners shall have evidence that they removed from service and repaired the Protection System or RAS that misoperated per measurements M2.2.1 through M2.2.2.
    - M2.2.1** Transmission Owners and Generation Owners shall have evidence that they removed the Protection System or RAS that misoperated from service within 22 hours following identification of the Protection System or RAS Misoperation.
    - M2.2.2** Transmission Owners and Generation Owners shall have evidence that they repaired or replaced the Protection System or RAS that misoperated within 20 business days or either removed the Element from service or disabled the RAS.
  - M2.3** The Transmission Owners and Generation Owners shall have evidence that they repaired the Protection System or RAS that misoperated within 22 hours following identification of the Protection System or RAS Misoperation.
    - M2.3.1** The Transmission Owner shall have evidence that it removed the associated Element from service.
    - M2.3.2** The Generator Owners and Transmission Operators shall have documentation describing all actions taken that adjusted generation or SOLs and operated facilities within established limits.

**M2.4** Transmission Owners and Generation Owners shall have evidence that they repaired or replaced the Protection System or RAS that misoperated including documentation that describes the actions taken.

**M2.4.1** Transmission Owners and Generation Owners shall have evidence that they repaired or replaced the Protection System or RAS that misoperated within 20 business days of the misoperation identification.

**M2.4.2** Transmission Owners and Generation Owners shall have evidence that they removed the associated Element or RAS from service.

**M3.** Transmission Owners and Generation Owners shall have evidence that they reported the following within 10 business days.

**M3.1** Identification of all Protection System and RAS Misoperations and corrective actions taken or planned.

**M3.2** Completion of repair or replacement of Protection System and/or RAS that misoperated.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1 Compliance Monitoring Responsibility**

Compliance Enforcement Authority

**1.2 Compliance Monitoring Period**

Compliance Enforcement Authority may use one or more of the following methods to assess compliance:

- Misoperation Reports
- Reports submitted quarterly
- Spot check audits conducted anytime with 30 days notice given to prepare
- Periodic audit as scheduled by the Compliance Enforcement Authority
- Investigations
- Other methods as provided for in the Compliance Monitoring Enforcement Program

**1.2.1** The Performance-reset Period is one calendar month.

**1.3 Data Retention**

Reliability Coordinators, Transmission Owners, and Generation Owners shall keep evidence for Measures M1 and M2 for five calendar years plus year to date.

**1.4. Additional Compliance Information**

None.

**2. Violation Severity Levels**

**R1**

**WECC Standard PRC-004-WECC-1(X) — Protection System and Remedial Action Scheme Misoperation**

**A. Introduction**

- 1. Title:** Protection System and Remedial Action Scheme Misoperation
- 2. Number:** PRC-004-WECC-1(X)
- 3. Purpose:** Regional Reliability Standard to ensure all transmission and generation Protection System and Remedial Action Scheme (RAS) Misoperations on Transmission Paths and RAS defined in section 4 are analyzed and/or mitigated.

**4. Applicability**

- 4.1.** Transmission Owners of selected WECC major transmission path facilities and RAS listed in tables titled “Major WECC Transfer Paths in the Bulk Electric System” provided at <http://www.wecc.biz/Standards/Approved%20Standards/Supporting%20Tables/Table%20Major%20Paths%204-28-08.pdf> and “Major WECC Remedial Action Schemes (RAS)” provided at <http://www.wecc.biz/Standards/Approved%20Standards/Supporting%20Tables/Table%20Major%20RAS%204-28-08.pdf>.
- 4.2.** Generator Owners that own RAS listed in the Table titled “Major WECC Remedial Action Schemes (RAS)” provided at <http://www.wecc.biz/Standards/Approved%20Standards/Supporting%20Tables/Table%20Major%20RAS%204-28-08.pdf>.
- 4.3.** Transmission Operators that operate major transmission path facilities and RAS listed in Tables titled “Major WECC Transfer Paths in the Bulk Electric System” provided at <http://www.wecc.biz/Standards/Approved%20Standards/Supporting%20Tables/Table%20Major%20Paths%204-28-08.pdf> and “Major WECC Remedial Action Schemes (RAS)” provided at <http://www.wecc.biz/Standards/Approved%20Standards/Supporting%20Tables/Table%20Major%20RAS%204-28-08.pdf>.

**5. Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**Deleted:** On the first day of the second quarter following applicable regulatory approval.

**B. Requirements**

The requirements below only apply to the major transmission paths facilities and RAS listed in the tables titled “Major WECC Transfer Paths in the Bulk Electric System” and “Major WECC Remedial Action Schemes (RAS).”

- R.1.** System Operators and System Protection personnel of the Transmission Owners and Generator Owners shall analyze all Protection System and RAS operations. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment]*
  - R1.1.** System Operators shall review all tripping of transmission elements and RAS operations to identify apparent Misoperations within 24 hours.
  - R1.2.** System Protection personnel shall analyze all operations of Protection Systems and RAS within 20 business days for correctness to characterize whether a Misoperation has occurred that may not have been identified by System Operators.

**Deleted: Adopted by Board of Trustees: October 29, 2008**

**WECC Standard PRC-004-WECC-1(X) — Protection System and Remedial Action Scheme Misoperation**

---

**R.2.** Transmission Owners and Generator Owners shall perform the following actions for each Misoperation of the Protection System or RAS. It is not intended that Requirements R2.1 through R2.4 apply to Protection System and/or RAS actions that appear to be entirely reasonable and correct at the time of occurrence and associated system performance is fully compliant with NERC Reliability Standards. If the Transmission Owner or Generator Owner later finds the Protection System or RAS operation to be incorrect through System Protection personnel analysis, the requirements of R2.1 through R2.4 become applicable at the time the Transmission Owner or Generator Owner identifies the Misoperation:

**R2.1.** If the Protection System or RAS has a Security-Based Misoperation and two or more Functionally Equivalent Protection Systems (FEPS) or Functionally Equivalent RAS (FERAS) remain in service to ensure Bulk Electric System (BES) reliability, the Transmission Owners or Generator Owners shall remove from service the Protection System or RAS that misoperated within 22 hours following identification of the Misoperation. Repair or replacement of the failed Protection System or RAS is at the Transmission Owners' and Generator Owners' discretion. *[Violation Risk Factor: High] [Time Horizon: Same-day Operations]*

**R2.2.** If the Protection System or RAS has a Security-Based Misoperation and only one FEPS or FERAS remains in service to ensure BES reliability, the Transmission Owner or Generator Owner shall perform the following. *[Violation Risk Factor: High] [Time Horizon: Same-day Operations]*

**R2.2.1.** Following identification of the Protection System or RAS Misoperation, Transmission Owners and Generator Owners shall remove from service within 22 hours for repair or modification the Protection System or RAS that misoperated.

**R2.2.2.** The Transmission Owner or Generator Owner shall repair or replace any Protection System or RAS that misoperated with a FEPS or FERAS within 20 business days of the date of removal. The Transmission Owner or Generator Owner shall remove the Element from service or disable the RAS if repair or replacement is not completed within 20 business days.

**R2.3.** If the Protection System or RAS has a Security-Based or Dependability-Based Misoperation and a FEPS and FERAS is not in service to ensure BES reliability, Transmission Owners or Generator Owners shall repair and place back in service within 22 hours the Protection System or RAS that misoperated. If this cannot be done, then Transmission Owners and Generator Owners shall perform the following. *[Violation Risk Factor: High] [Time Horizon: Same-day Operations]*

**R2.3.1.** When a FEPS is not available, the Transmission Owners shall remove the associated Element from service.

**R2.3.2.** When FERAS is not available, then

**2.3.2.1.** The Generator Owners shall adjust generation to a reliable operating level, or

**2.3.2.2.** Transmission Operators shall adjust the SOL and operate the facilities within established limits.

**R2.4.** If the Protection System or RAS has a Dependability-Based Misoperation but has one or more FEPS or FERAS that operated correctly, the associated Element or transmission path may remain in service without removing from service the Protection System or RAS that failed, provided one of the following is performed.

**R2.4.1.** Transmission Owners or Generator Owners shall repair or replace any

Deleted: Adopted by Board of Trustees: October 29, 2008

**WECC Standard PRC-004-WECC-1(X) — Protection System and Remedial Action Scheme Misoperation**

Protection System or RAS that misoperated with FEPS and FERAS within 20 business days of the date of the Misoperation identification, or

**R2.4.2.** Transmission Owners or Generator Owners shall remove from service the associated Element or RAS. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment]*

**R.3.** Transmission Owners and Generation Owners shall submit Misoperation incident reports to WECC within 10 business days for the following. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment]*

**R3.1.** Identification of a Misoperation of a Protection System and/or RAS,

**R3.2.** Completion of repairs or the replacement of Protection System and/or RAS that misoperated.

**C. Measures**

**Each measure below applies directly to the requirement by number.**

**M1.** Transmission Owners and Generation Owners shall have evidence that they reported and analyzed all Protection System and RAS operations.

**M1.1** Transmission Owners and Generation Owners shall have evidence that System Operating personnel reviewed all operations of Protection System and RAS within 24 hours.

**M1.2** Transmission Owners and Generation Owners shall have evidence that System Protection personnel analyzed all operations of Protection System and RAS for correctness within 20 business days.

**M2.** Transmission Owners and Generation Owners shall have evidence for the following.

**M2.1** Transmission Owners and Generation Owners shall have evidence that they removed the Protection System or RAS that misoperated from service within 22 hours following identification of the Protection System or RAS Misoperation.

**M2.2** Transmission Owners and Generation Owners shall have evidence that they removed from service and repaired the Protection System or RAS that misoperated per measurements M2.2.1 through M2.2.2.

**M2.2.1** Transmission Owners and Generation Owners shall have evidence that they removed the Protection System or RAS that misoperated from service within 22 hours following identification of the Protection System or RAS Misoperation.

**M2.2.2** Transmission Owners and Generation Owners shall have evidence that they repaired or replaced the Protection System or RAS that misoperated within 20 business days or either removed the Element from service or disabled the RAS.

**M2.3** The Transmission Owners and Generation Owners shall have evidence that they repaired the Protection System or RAS that misoperated within 22 hours following identification of the Protection System or RAS Misoperation.

**M2.3.1** The Transmission Owner shall have evidence that it removed the associated Element from service.

**M2.3.2** The Generator Owners and Transmission Operators shall have documentation describing all actions taken that adjusted generation or SOLs and operated facilities within established limits.

Deleted: Adopted by Board of Trustees: October 29, 2008

**WECC Standard PRC-004-WECC-1(X) — Protection System and Remedial Action Scheme Misoperation**

- M2.4** Transmission Owners and Generation Owners shall have evidence that they repaired or replaced the Protection System or RAS that misoperated including documentation that describes the actions taken.
  - M2.4.1** Transmission Owners and Generation Owners shall have evidence that they repaired or replaced the Protection System or RAS that misoperated within 20 business days of the misoperation identification.
  - M2.4.2** Transmission Owners and Generation Owners shall have evidence that they removed the associated Element or RAS from service.
- M3.** Transmission Owners and Generation Owners shall have evidence that they reported the following within 10 business days.
  - M3.1** Identification of all Protection System and RAS Misoperations and corrective actions taken or planned.
  - M3.2** Completion of repair or replacement of Protection System and/or RAS that misoperated.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1 Compliance Monitoring Responsibility**

Compliance Enforcement Authority

**1.2 Compliance Monitoring Period**

Compliance Enforcement Authority may use one or more of the following methods to assess compliance:

- Misoperation Reports
- Reports submitted quarterly
- Spot check audits conducted anytime with 30 days notice given to prepare
- Periodic audit as scheduled by the Compliance Enforcement Authority
- Investigations
- Other methods as provided for in the Compliance Monitoring Enforcement Program

**1.2.1** The Performance-reset Period is one calendar month.

**1.3 Data Retention**

Reliability Coordinators, Transmission Owners, and Generation Owners shall keep evidence for Measures M1 and M2 for five calendar years plus year to date.

**1.4. Additional Compliance Information**

None.

**2. Violation Severity Levels**

|-------------|----------------|---|---|
| 1           | April 21, 2011 | FERC Order issued approving PRC-004-WECC-1 (approval effective June 27, 2011) |   |
| <u>1(X)</u> | <u>TBD</u>     | <u>Adopted by the NERC Board of Trustees</u>                                  | <u>Replaced references to Special Protection System and SPS with Remedial Action Scheme and RAS</u> |

Deleted: Adopted by Board of Trustees: October 29, 2008

## A. Introduction

1. **Title:** Protection System Maintenance
2. **Number:** PRC-005-2(X)
3. **Purpose:** To document and implement programs for the maintenance of all Protection Systems affecting the reliability of the Bulk Electric System (BES) so that these Protection Systems are kept in working order.
4. **Applicability:**
  - 4.1. **Functional Entities:**
    - 4.1.1 Transmission Owner
    - 4.1.2 Generator Owner
    - 4.1.3 Distribution Provider
  - 4.2. **Facilities:**
    - 4.2.1 Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.)
    - 4.2.2 Protection Systems used for underfrequency load-shedding systems installed per ERO underfrequency load-shedding requirements.
    - 4.2.3 Protection Systems used for undervoltage load-shedding systems installed to prevent system voltage collapse or voltage instability for BES reliability.
    - 4.2.4 Protection Systems installed as a Remedial Action Scheme (RAS) for BES reliability.
    - 4.2.5 Protection Systems for generator Facilities that are part of the BES, including:
      - 4.2.5.1 Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays.
      - 4.2.5.2 Protection Systems for generator step-up transformers for generators that are part of the BES.
      - 4.2.5.3 Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind-farms to the BES).
      - 4.2.5.4 Protection Systems for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays.
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction. (See the Implementation Plan for additional detail)

## B. Requirements

- R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a Protection System Maintenance Program (PSMP) for its Protection Systems identified in Section 4.2. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

**Component Type** - Any one of the five specific elements of the Protection System definition.

The PSMP shall:

- 1.1.** Identify which maintenance method (time-based, performance-based per PRC-005 Attachment A, or a combination) is used to address each Protection System Component Type. All batteries associated with the station dc supply Component Type of a Protection System shall be included in a time-based program as described in Table 1-4 and Table 3.
- 1.2.** Include the applicable monitored Component attributes applied to each Protection System Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, and Table 3 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System Components.

**Component** – A component is any individual discrete piece of equipment included in a Protection System, including but not limited to a protective relay or current sensing device. The designation of what constitutes a control circuit component is very dependent upon how an entity performs and tracks the testing of the control circuitry. Some entities test their control circuits on a breaker basis whereas others test their circuitry on a local zone of protection basis. Thus, entities are allowed the latitude to designate their own definitions of control circuit components. Another example of where the entity has some discretion on determining what constitutes a single component is the voltage and current sensing devices, where the entity may choose either to designate a full three-phase set of such devices or a single device as a single component.

- R2.** Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals in its PSMP shall follow the procedure established in PRC-005 Attachment A to establish and maintain its performance-based intervals. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

- R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall maintain its Protection System Components that are included within the time-based maintenance program in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

**Unresolved Maintenance Issue** - A deficiency identified during a maintenance activity that causes the component to not meet the intended performance, cannot be corrected during the maintenance interval, and requires follow-up corrective action.

- R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance program(s) in accordance with Requirement R2 shall implement and follow its PSMP for its Protection System Components that are included within the performance-based program(s). *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

- R5.** Each Transmission Owner, Generator Owner, and Distribution Provider shall demonstrate efforts to correct identified Unresolved Maintenance Issues. *[Violation Risk Factor: Medium]*  
*[Time Horizon: Operations Planning]*

## **C. Measures**

- M1.** Each Transmission Owner, Generator Owner and Distribution Provider shall have a documented Protection System Maintenance Program in accordance with Requirement R1.
- For each Protection System Component Type, the documentation shall include the type of maintenance method applied (time-based, performance-based, or a combination of these maintenance methods), and shall include all batteries associated with the station dc supply Component Types in a time-based program as described in Table 1-4 and Table 3. (Part 1.1)
- For Component Types that use monitoring to extend the maintenance intervals, the responsible entity(s) shall have evidence for each protection Component Type (such as manufacturer's specifications or engineering drawings) of the appropriate monitored Component attributes as specified in Tables 1-1 through 1-5, Table 2, and Table 3. (Part 1.2)
- M2.** Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals shall have evidence that its current performance-based maintenance program(s) is in accordance with Requirement R2, which may include but is not limited to Component lists, dated maintenance records, and dated analysis records and results.
- M3.** Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall have evidence that it has maintained its Protection System Components included within its time-based program in accordance with Requirement R3. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.
- M4.** Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance intervals in accordance with Requirement R2 shall have evidence that it has implemented the Protection System Maintenance Program for the Protection System Components included in its performance-based program in accordance with Requirement R4. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.
- M5.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence that it has undertaken efforts to correct identified Unresolved Maintenance Issues in accordance with Requirement R5. The evidence may include but is not limited to work orders, replacement Component orders, invoices, project schedules with completed milestones, return material authorizations (RMAs) or purchase orders.

## **D. Compliance**

- 1. Compliance Monitoring Process**
- 1.1. Compliance Enforcement Authority**  
Regional Entity
- 1.2. Compliance Monitoring and Enforcement Processes:**  
Compliance Audit  
Self-Certification  
Spot Checking  
Compliance Investigation  
Self-Reporting  
Complaint

### **1.3. Evidence Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

For Requirement R1, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep its current dated Protection System Maintenance Program, as well as any superseded versions since the preceding compliance audit, including the documentation that specifies the type of maintenance program applied for each Protection System Component Type.

For Requirement R2, Requirement R3, Requirement R4, and Requirement R5, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep documentation of the two most recent performances of each distinct maintenance activity for the Protection System Component, or all performances of each distinct maintenance activity for the Protection System Component since the previous scheduled audit date, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

### **1.4. Additional Compliance Information**

None.

2. Violation Severity Levels

| Requirement Number | Lower VSL   | Moderate VSL  | High VSL   | Severe VSL   |
|--------------------|---|---|--|--|
| R1                 | <p>The responsible entity’s PSMP failed to specify whether one Component Type is being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1)</p> <p style="text-align: center;">OR</p> <p>The responsible entity’s PSMP failed to include applicable station batteries in a time-based program. (Part 1.1)</p> | <p>The responsible entity’s PSMP failed to specify whether two Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1)</p> | <p>The responsible entity’s PSMP failed to include the applicable monitoring attributes applied to each Protection System Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, and Table 3 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System Components. (Part 1.2).</p> | <p>The responsible entity failed to establish a PSMP.</p> <p style="text-align: center;">OR</p> <p>The responsible entity failed to specify whether three or more Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1).</p>  |
| R2                 | <p>The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within three years.</p>   | <p style="text-align: center;">NA</p>   | <p>The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within four years.</p>   | <p>The responsible entity uses performance-based maintenance intervals in its PSMP but:</p> <ol style="list-style-type: none"> <li>1) Failed to establish the technical justification described within Requirement R2 for the initial use of the performance-based PSMP</li> </ol> <p style="text-align: center;">OR</p> <ol style="list-style-type: none"> <li>2) Failed to reduce Countable Events to no more than 4% within five years</li> </ol> <p style="text-align: center;">OR</p> <ol style="list-style-type: none"> <li>3) Maintained a Segment with less than 60 Components</li> </ol> <p style="text-align: center;">OR</p> <ol style="list-style-type: none"> <li>4) Failed to: <ul style="list-style-type: none"> <li>• Annually update the list of Components,</li> </ul> </li> </ol> <p style="text-align: center;">OR</p> |

**Standard PRC-005-2(X) — Protection System Maintenance**

| Requirement Number | Lower VSL  | Moderate VSL   | High VSL  | Severe VSL  |
|--------------------|--|--|---|---|
|                    |  |  |   | <ul style="list-style-type: none"> <li>• Annually perform maintenance on the greater of 5% of the segment population or 3 Components,</li> <li style="text-align: center;">OR</li> <li>• Annually analyze the program activities and results for each Segment.</li> </ul>   |
| R3                 | For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain 5% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3. | For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3. | For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3. | For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 15% of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3. |
| R4                 | For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain 5% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.  | For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.  | For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.  | For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 15% of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.  |
| R5                 | The responsible entity failed to undertake efforts to correct 5 or   | The responsible entity failed to undertake efforts to correct greater than 5, but less than or equal to 10   | The responsible entity failed to undertake efforts to correct greater than 10, but less than or equal to 15   | The responsible entity failed to undertake efforts to correct greater   |

|------|-------------------|--|--|
| 1.1b | May 9, 2012       | PRC-005-1.1b was adopted by the Board of Trustees as part of Project 2010-07 (GOTO).   |  |
| 2    | November 7, 2012  | Adopted by Board of Trustees   | Complete revision, absorbing maintenance requirements from PRC-005-1b, PRC-008-0, PRC-011-0, PRC-017-0 |
| 2    | October 17, 2013  | Errata Change: The Standards Committee approved an errata change to the implementation plan for PRC-005-2 to add the phrase “or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities;” to the second sentence under the “Retirement of Existing Standards” section.  |  |
| 2    | December 19, 2013 | FERC Order issued approving PRC-005-2. (The enforcement date for PRC-005-2 will be April 1, 2015, which is the first date entities must be compliant with part of the standard. The implementation plan for PRC-005-2 includes specific compliance dates and timeframes for each of the Requirements. The regulatory approval date in the U.S. is February 24, 2014. |  |
| 2(X) | TBD               | Adopted by the NERC Board of Trustees  | Replaced references to Special Protection System and SPS with Remedial Action Scheme and RAS           |

| Table 1-1<br>Component Type - Protective Relay<br>Excluding distributed UFLS and distributed UVLS (see Table 3)  |   |   |
|--|---|---|
| Component Attributes   | Maximum Maintenance Interval <sup>1</sup> | Maintenance Activities  |
| Any unmonitored protective relay not having all the monitoring attributes of a category below.   | 6 calendar years                          | For all unmonitored relays: <ul style="list-style-type: none"> <li>• Verify that settings are as specified</li> </ul> For non-microprocessor relays: <ul style="list-style-type: none"> <li>• Test and, if necessary calibrate</li> </ul> For microprocessor relays: <ul style="list-style-type: none"> <li>• Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System.</li> <li>• Verify acceptable measurement of power system input values.</li> </ul> |
| Monitored microprocessor protective relay with the following: <ul style="list-style-type: none"> <li>• Internal self-diagnosis and alarming (see Table 2).</li> <li>• Voltage and/or current waveform sampling three or more times per power cycle, and conversion of samples to numeric values for measurement calculations by microprocessor electronics.</li> <li>• Alarming for power supply failure (see Table 2).</li> </ul> | 12 calendar years                         | Verify: <ul style="list-style-type: none"> <li>• Settings are as specified.</li> <li>• Operation of the relay inputs and outputs that are essential to proper functioning of the Protection System.</li> <li>• Acceptable measurement of power system input values.</li> </ul>  |

<sup>1</sup> For the tables in this standard, a calendar year starts on the first day of a new year (January 1) after a maintenance activity has been completed. For the tables in this standard, a calendar month starts on the first day of the first month after a maintenance activity has been completed.

| Table 1-1<br>Component Type - Protective Relay<br>Excluding distributed UFLS and distributed UVLS (see Table 3)  |   |   |
|--|---|---|
| Component Attributes   | Maximum Maintenance Interval <sup>1</sup> | Maintenance Activities  |
| Monitored microprocessor protective relay with preceding row attributes and the following: <ul style="list-style-type: none"> <li>• Ac measurements are continuously verified by comparison to an independent ac measurement source, with alarming for excessive error (See Table 2).</li> <li>• Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2).</li> <li>• Alarming for change of settings (See Table 2).</li> </ul> | 12 calendar years                         | Verify only the unmonitored relay inputs and outputs that are essential to proper functioning of the Protection System. |

| Table 1-2<br>Component Type - Communications Systems<br>Excluding distributed UFLS and distributed UVLS (see Table 3)   |                              |  |
|---|------------------------------|--|
| Component Attributes  | Maximum Maintenance Interval | Maintenance Activities   |
| Any unmonitored communications system necessary for correct operation of protective functions, and not having all the monitoring attributes of a category below.  | 4 calendar months            | Verify that the communications system is functional.   |
|   | 6 calendar years             | Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate).<br>Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System. |
| Any communications system with continuous monitoring or periodic automated testing for the presence of the channel function, and alarming for loss of function (See Table 2).   | 12 calendar years            | Verify that the communications system meets performance criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate).<br>Verify operation of communications system inputs and outputs that are essential to proper functioning of the Protection System. |
| Any communications system with all of the following: <ul style="list-style-type: none"> <li>• Continuous monitoring or periodic automated testing for the performance of the channel using criteria pertinent to the communications technology applied (e.g. signal level, reflected power, or data error rate, and alarming for excessive performance degradation). (See Table 2)</li> <li>• Some or all binary or status inputs and control outputs are monitored by a process that continuously demonstrates ability to perform as designed, with alarming for failure (See Table 2).</li> </ul> | 12 calendar years            | Verify only the unmonitored communications system inputs and outputs that are essential to proper functioning of the Protection System   |

| Table 1-3<br>Component Type - Voltage and Current Sensing Devices Providing Inputs to Protective Relays<br>Excluding distributed UFLS and distributed UVLS (see Table 3)   |                                   |  |
|--|-----------------------------------|--|
| Component Attributes   | Maximum Maintenance Interval      | Maintenance Activities   |
| Any voltage and current sensing devices not having monitoring attributes of the category below.  | 12 calendar years                 | Verify that current and voltage signal values are provided to the protective relays. |
| Voltage and Current Sensing devices connected to microprocessor relays with AC measurements are continuously verified by comparison of sensing input value, as measured by the microprocessor relay, to an independent ac measurement source, with alarming for unacceptable error or failure (see Table 2). | No periodic maintenance specified | None.  |

**Table 1-4(a)**  
**Component Type – Protection System Station dc Supply Using Vented Lead-Acid (VLA) Batteries**  
**Excluding distributed UFLS and distributed UVLS (see Table 3)**

Protection System Station dc supply used only for non-BES interrupting devices for RAS, non-distributed UFLS systems, or non-distributed UVLS systems is excluded (see Table 1-4(e)).

| Table 1-4(f)<br>Exclusions for Protection System Station dc Supply Monitoring Devices and Systems  |                                   |  |
|--|-----------------------------------|--|
| Component Attributes   | Maximum Maintenance Interval      | Maintenance Activities   |
| Any station dc supply with high and low voltage monitoring and alarming of the battery charger voltage to detect charger overvoltage and charger failure (See Table 2).  | No periodic maintenance specified | No periodic verification of station dc supply voltage is required.   |
| Any battery based station dc supply with electrolyte level monitoring and alarming in every cell (See Table 2).  |                                   | No periodic inspection of the electrolyte level for each cell is required.   |
| Any station dc supply with unintentional dc ground monitoring and alarming (See Table 2).  |                                   | No periodic inspection of unintentional dc grounds is required.  |
| Any station dc supply with charger float voltage monitoring and alarming to ensure correct float voltage is being applied on the station dc supply (See Table 2).  |                                   | No periodic verification of float voltage of battery charger is required.  |
| Any battery based station dc supply with monitoring and alarming of battery string continuity (See Table 2).   |                                   | No periodic verification of the battery continuity is required.  |
| Any battery based station dc supply with monitoring and alarming of the intercell and/or terminal connection detail resistance of the entire battery (See Table 2).  |                                   | No periodic verification of the intercell and terminal connection resistance is required.  |
| Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with internal ohmic value or float current monitoring and alarming, and evaluating present values relative to baseline internal ohmic values for every cell/unit (See Table 2). |                                   | No periodic evaluation relative to baseline of battery cell/unit measurements indicative of battery performance is required to verify the station battery can perform as manufactured. |
| Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with monitoring and alarming of each cell/unit internal ohmic value (See Table 2).  |                                   | No periodic inspection of the condition of all individual units by measuring battery cell/unit internal ohmic values of a station VRLA or Vented Lead-Acid (VLA) battery is required.  |

| <b>Table 1-5</b><br><b>Component Type - Control Circuitry Associated With Protective Functions</b><br><b>Excluding distributed UFLS and distributed UVLS (see Table 3)</b><br><b>Note: Table requirements apply to all Control Circuitry Components of Protection Systems, and RASs except as noted.</b> |                                   |   |
|--|-----------------------------------|---|
| Component Attributes   | Maximum Maintenance Interval      | Maintenance Activities  |
| Trip coils or actuators of circuit breakers, interrupting devices, or mitigating devices (regardless of any monitoring of the control circuitry).  | 6 calendar years                  | Verify that each trip coil is able to operate the circuit breaker, interrupting device, or mitigating device.   |
| Electromechanical lockout devices which are directly in a trip path from the protective relay to the interrupting device trip coil (regardless of any monitoring of the control circuitry).  | 6 calendar years                  | Verify electrical operation of electromechanical lockout devices.   |
| Unmonitored control circuitry associated with RAS.   | 12 calendar years                 | Verify all paths of the control circuits essential for proper operation of the RAS.   |
| Unmonitored control circuitry associated with protective functions inclusive of all auxiliary relays.  | 12 calendar years                 | Verify all paths of the trip circuits inclusive of all auxiliary relays through the trip coil(s) of the circuit breakers or other interrupting devices. |
| Control circuitry associated with protective functions and/or RAS whose integrity is monitored and alarmed (See Table 2).  | No periodic maintenance specified | None.   |

| <b>Table 2 – Alarming Paths and Monitoring</b><br>In Tables 1-1 through 1-5 and Table 3, alarm attributes used to justify extended maximum maintenance intervals and/or reduced maintenance activities are subject to the following maintenance requirements   |                                   |  |
|--|-----------------------------------|--|
| Component Attributes   | Maximum Maintenance Interval      | Maintenance Activities   |
| Any alarm path through which alarms in Tables 1-1 through 1-5 and Table 3 are conveyed from the alarm origin to the location where corrective action can be initiated, and not having all the attributes of the “Alarm Path with monitoring” category below.<br><br>Alarms are reported within 24 hours of detection to a location where corrective action can be initiated. | 12 Calendar Years                 | Verify that the alarm path conveys alarm signals to a location where corrective action can be initiated. |
| Alarm Path with monitoring:<br><br>The location where corrective action is taken receives an alarm within 24 hours for failure of any portion of the alarming path from the alarm origin to the location where corrective action can be initiated.   | No periodic maintenance specified | None.  |

| Protection System dc supply for tripping non-BES interrupting devices used only for a UFLS or UVLS system.   | 12 calendar years                   | Verify Protection System dc supply voltage.  |
| Control circuitry between the UFLS or UVLS relays and electromechanical lockout and/or tripping auxiliary devices (excludes non-BES interrupting device trip coils).   | 12 calendar years                   | Verify the path from the relay to the lockout and/or tripping auxiliary relay (including essential supervisory logic). |
| Electromechanical lockout and/or tripping auxiliary devices associated only with UFLS or UVLS systems (excludes non-BES interrupting device trip coils).   | 12 calendar years                   | Verify electrical operation of electromechanical lockout and/or tripping auxiliary devices.                            |
| Control circuitry between the electromechanical lockout and/or tripping auxiliary devices and the non-BES interrupting devices in UFLS or UVLS systems, or between UFLS or UVLS relays (with no interposing electromechanical lockout or auxiliary device) and the non-BES interrupting devices (excludes non-BES interrupting device trip coils). | No periodic maintenance specified   | None.  |
| Trip coils of non-BES interrupting devices in UFLS or UVLS systems.  | No periodic maintenance specified   | None.  |

PRC-005 — Attachment A

Criteria for a Performance-Based Protection System Maintenance Program

**Purpose:** To establish a technical basis for initial and continued use of a performance-based Protection System Maintenance Program (PSMP).

**To establish the technical justification for the initial use of a performance-based PSMP:**

1. Develop a list with a description of Components included in each designated Segment of the Protection System Component population, with a minimum **Segment** population of 60 Components.
2. Maintain the Components in each Segment according to the time-based maximum allowable intervals established in Tables 1-1 through 1-5 and Table 3 until results of maintenance activities for the Segment are available for a minimum of 30 individual Components of the Segment.
3. Document the maintenance program activities and results for each Segment, including maintenance dates and Countable Events for each included Component.
4. Analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment and develop maintenance intervals.
5. Determine the maximum allowable maintenance interval for each Segment such that the Segment experiences **Countable Events** on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.

**Segment** – *Protection Systems or components of a consistent design standard, or a particular model or type from a single manufacturer that typically share other common elements. Consistent performance is expected across the entire population of a Segment. A Segment must contain at least sixty (60) individual components.*

**Countable Event** – *A failure of a component requiring repair or replacement, any condition discovered during the maintenance activities in Tables 1-1 through 1-5 and Table 3 which requires corrective action, or a Misoperation attributed to hardware failure or calibration failure. Misoperations due to product design errors, software errors, relay settings different from specified settings, Protection System component configuration errors, or Protection System application errors are not included in Countable Events.*

**To maintain the technical justification for the ongoing use of a performance-based PSMP:**

1. At least annually, update the list of Protection System Components and Segments and/or description if any changes occur within the Segment.
2. Perform maintenance on the greater of 5% of the Components (addressed in the performance based PSMP) in each Segment or 3 individual Components within the Segment in each year.
3. For the prior year, analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment.

## Standard PRC-005-2(X) – Protection System Maintenance

---

4. Using the prior year's data, determine the maximum allowable maintenance interval for each Segment such that the Segment experiences Countable Events on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.
5. If the Components in a Protection System Segment maintained through a performance-based PSMP experience 4% or more Countable Events, develop, document, and implement an action plan to reduce the Countable Events to less than 4% of the Segment population within 3 years.

## Standard PRC-005-2(X) — Protection System Maintenance

---

### A. Introduction

1. **Title:** Protection System Maintenance
2. **Number:** PRC-005-2(X)
3. **Purpose:** To document and implement programs for the maintenance of all Protection Systems affecting the reliability of the Bulk Electric System (BES) so that these Protection Systems are kept in working order.
4. **Applicability:**
  - 4.1. **Functional Entities:**
    - 4.1.1 Transmission Owner
    - 4.1.2 Generator Owner
    - 4.1.3 Distribution Provider
  - 4.2. **Facilities:**
    - 4.2.1 Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.)
    - 4.2.2 Protection Systems used for underfrequency load-shedding systems installed per ERO underfrequency load-shedding requirements.
    - 4.2.3 Protection Systems used for undervoltage load-shedding systems installed to prevent system voltage collapse or voltage instability for BES reliability.
    - 4.2.4 Protection Systems installed as a Remedial Action Scheme (RAS) for BES reliability.
    - 4.2.5 Protection Systems for generator Facilities that are part of the BES, including:
      - 4.2.5.1 Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays.
      - 4.2.5.2 Protection Systems for generator step-up transformers for generators that are part of the BES.
      - 4.2.5.3 Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind-farms to the BES).
      - 4.2.5.4 Protection Systems for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays.
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction. (See the [Implementation Plan for additional detail](#))

Deleted: Special Protection System (SPS)

Deleted: See Implementation Plan

## Standard PRC-005-2(X) — Protection System Maintenance

### B. Requirements

- R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a Protection System Maintenance Program (PSMP) for its Protection Systems identified in Section 4.2. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

**Component Type** - Any one of the five specific elements of the Protection System definition.

The PSMP shall:

- 1.1.** Identify which maintenance method (time-based, performance-based per PRC-005 Attachment A, or a combination) is used to address each Protection System Component Type. All batteries associated with the station dc supply Component Type of a Protection System shall be included in a time-based program as described in Table 1-4 and Table 3.
  - 1.2.** Include the applicable monitored Component attributes applied to each Protection System Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, and Table 3 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System Components.
- R2.** Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals in its PSMP shall follow the procedure established in PRC-005 Attachment A to establish and maintain its performance-based intervals. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*
- R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall maintain its Protection System Components that are included within the time-based maintenance program in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*
- R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance program(s) in accordance with Requirement R2 shall implement and follow its PSMP for its Protection System Components that are included within the performance-based program(s). *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

**Component** – A component is any individual discrete piece of equipment included in a Protection System, including but not limited to a protective relay or current sensing device. The designation of what constitutes a control circuit component is very dependent upon how an entity performs and tracks the testing of the control circuitry. Some entities test their control circuits on a breaker basis whereas others test their circuitry on a local zone of protection basis. Thus, entities are allowed the latitude to designate their own definitions of control circuit components. Another example of where the entity has some discretion on determining what constitutes a single component is the voltage and current sensing devices, where the entity may choose either to designate a full three-phase set of such devices or a single device as a single component.

**Unresolved Maintenance Issue** - A deficiency identified during a maintenance activity that causes the component to not meet the intended performance, cannot be corrected during the maintenance interval, and requires follow-up corrective action.

**Standard PRC-005-2(X) — Protection System Maintenance**

---

- R5.** Each Transmission Owner, Generator Owner, and Distribution Provider shall demonstrate efforts to correct identified Unresolved Maintenance Issues. [*Violation Risk Factor: Medium*]  
[*Time Horizon: Operations Planning*]

## Standard PRC-005-2(X) — Protection System Maintenance

---

### C. Measures

- M1.** Each Transmission Owner, Generator Owner and Distribution Provider shall have a documented Protection System Maintenance Program in accordance with Requirement R1.
- For each Protection System Component Type, the documentation shall include the type of maintenance method applied (time-based, performance-based, or a combination of these maintenance methods), and shall include all batteries associated with the station dc supply Component Types in a time-based program as described in Table 1-4 and Table 3. (Part 1.1)
- For Component Types that use monitoring to extend the maintenance intervals, the responsible entity(s) shall have evidence for each protection Component Type (such as manufacturer’s specifications or engineering drawings) of the appropriate monitored Component attributes as specified in Tables 1-1 through 1-5, Table 2, and Table 3. (Part 1.2)
- M2.** Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals shall have evidence that its current performance-based maintenance program(s) is in accordance with Requirement R2, which may include but is not limited to Component lists, dated maintenance records, and dated analysis records and results.
- M3.** Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall have evidence that it has maintained its Protection System Components included within its time-based program in accordance with Requirement R3. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.
- M4.** Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance intervals in accordance with Requirement R2 shall have evidence that it has implemented the Protection System Maintenance Program for the Protection System Components included in its performance-based program in accordance with Requirement R4. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.
- M5.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence that it has undertaken efforts to correct identified Unresolved Maintenance Issues in accordance with Requirement R5. The evidence may include but is not limited to work orders, replacement Component orders, invoices, project schedules with completed milestones, return material authorizations (RMAs) or purchase orders.

### D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Enforcement Authority**
    - Regional Entity
  - 1.2. **Compliance Monitoring and Enforcement Processes:**
    - Compliance Audit
    - Self-Certification
    - Spot Checking
    - Compliance Investigation
    - Self-Reporting
    - Complaint

## Standard PRC-005-2(X) — Protection System Maintenance

---

### 1.3. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

For Requirement R1, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep its current dated Protection System Maintenance Program, as well as any superseded versions since the preceding compliance audit, including the documentation that specifies the type of maintenance program applied for each Protection System Component Type.

For Requirement R2, Requirement R3, Requirement R4, and Requirement R5, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep documentation of the two most recent performances of each distinct maintenance activity for the Protection System Component, or all performances of each distinct maintenance activity for the Protection System Component since the previous scheduled audit date, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

### 1.4. Additional Compliance Information

None.

**Standard PRC-005-2(X) — Protection System Maintenance**

**2. Violation Severity Levels**

| Requirement Number | Lower VSL   | Moderate VSL  | High VSL   | Severe VSL   |
|--------------------|---|---|--|--|
| R1                 | <p>The responsible entity’s PSMP failed to specify whether one Component Type is being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1)</p> <p style="text-align: center;">OR</p> <p>The responsible entity’s PSMP failed to include applicable station batteries in a time-based program. (Part 1.1)</p> | <p>The responsible entity’s PSMP failed to specify whether two Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1)</p> | <p>The responsible entity’s PSMP failed to include the applicable monitoring attributes applied to each Protection System Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, and Table 3 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System Components. (Part 1.2).</p> | <p>The responsible entity failed to establish a PSMP.</p> <p style="text-align: center;">OR</p> <p>The responsible entity failed to specify whether three or more Component Types are being addressed by time-based or performance-based maintenance, or a combination of both. (Part 1.1).</p>  |
| R2                 | <p>The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within three years.</p>   | <p style="text-align: center;">NA</p>   | <p>The responsible entity uses performance-based maintenance intervals in its PSMP but failed to reduce Countable Events to no more than 4% within four years.</p>   | <p>The responsible entity uses performance-based maintenance intervals in its PSMP but:</p> <ol style="list-style-type: none"> <li>1) Failed to establish the technical justification described within Requirement R2 for the initial use of the performance-based PSMP</li> </ol> <p style="text-align: center;">OR</p> <ol style="list-style-type: none"> <li>2) Failed to reduce Countable Events to no more than 4% within five years</li> </ol> <p style="text-align: center;">OR</p> <ol style="list-style-type: none"> <li>3) Maintained a Segment with less than 60 Components</li> </ol> <p style="text-align: center;">OR</p> <ol style="list-style-type: none"> <li>4) Failed to:             <ul style="list-style-type: none"> <li>• Annually update the list of Components,</li> </ul> </li> </ol> <p style="text-align: center;">OR</p> |

**Standard PRC-005-2(X) — Protection System Maintenance**

| Requirement Number | Lower VSL  | Moderate VSL   | High VSL  | Severe VSL  |
|--------------------|--|--|---|---|
|                    |  |  |   | <ul style="list-style-type: none"> <li>Annually perform maintenance on the greater of 5% of the segment population or 3 Components,</li> </ul> <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> <li>Annually analyze the program activities and results for each Segment.</li> </ul>  |
| R3                 | For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain 5% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3. | For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3. | For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3. | For Protection System Components included within a time-based maintenance program, the responsible entity failed to maintain more than 15% of the total Components included within a specific Protection System Component Type, in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, and Table 3. |
| R4                 | For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain 5% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.  | For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 5% but 10% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.  | For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 10% but 15% or less of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.  | For Protection System Components included within a performance-based maintenance program, the responsible entity failed to maintain more than 15% of the annual scheduled maintenance for a specific Protection System Component Type in accordance with their performance-based PSMP.  |
| R5                 | The responsible entity failed to undertake efforts to correct 5 or   | The responsible entity failed to undertake efforts to correct greater than 5, but less than or equal to 10   | The responsible entity failed to undertake efforts to correct greater than 10, but less than or equal to 15   | The responsible entity failed to undertake efforts to correct greater   |

|--|-----------------------------------|--|
| Component Attributes   | Maximum Maintenance Interval      | Maintenance Activities   |
| Any station dc supply with high and low voltage monitoring and alarming of the battery charger voltage to detect charger overvoltage and charger failure (See Table 2).  | No periodic maintenance specified | No periodic verification of station dc supply voltage is required.   |
| Any battery based station dc supply with electrolyte level monitoring and alarming in every cell (See Table 2).  |                                   | No periodic inspection of the electrolyte level for each cell is required.   |
| Any station dc supply with unintentional dc ground monitoring and alarming (See Table 2).  |                                   | No periodic inspection of unintentional dc grounds is required.  |
| Any station dc supply with charger float voltage monitoring and alarming to ensure correct float voltage is being applied on the station dc supply (See Table 2).  |                                   | No periodic verification of float voltage of battery charger is required.  |
| Any battery based station dc supply with monitoring and alarming of battery string continuity (See Table 2).   |                                   | No periodic verification of the battery continuity is required.  |
| Any battery based station dc supply with monitoring and alarming of the intercell and/or terminal connection detail resistance of the entire battery (See Table 2).  |                                   | No periodic verification of the intercell and terminal connection resistance is required.  |
| Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with internal ohmic value or float current monitoring and alarming, and evaluating present values relative to baseline internal ohmic values for every cell/unit (See Table 2). |                                   | No periodic evaluation relative to baseline of battery cell/unit measurements indicative of battery performance is required to verify the station battery can perform as manufactured. |
| Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with monitoring and alarming of each cell/unit internal ohmic value (See Table 2).  |                                   | No periodic inspection of the condition of all individual units by measuring battery cell/unit internal ohmic values of a station VRLA or Vented Lead-Acid (VLA) battery is required.  |

**Standard PRC-005-2(X) – Protection System Maintenance**

| <b>Table 1-5</b><br><b>Component Type - Control Circuitry Associated With Protective Functions</b><br><b>Excluding distributed UFLS and distributed UVLS (see Table 3)</b><br><b>Note: Table requirements apply to all Control Circuitry Components of Protection Systems, and RASs except as noted.</b> |                                   |   |

PRC-005 — Attachment A

Criteria for a Performance-Based Protection System Maintenance Program

**Purpose:** To establish a technical basis for initial and continued use of a performance-based Protection System Maintenance Program (PSMP).

**To establish the technical justification for the initial use of a performance-based PSMP:**

1. Develop a list with a description of Components included in each designated Segment of the Protection System Component population, with a minimum **Segment** population of 60 Components.
2. Maintain the Components in each Segment according to the time-based maximum allowable intervals established in Tables 1-1 through 1-5 and Table 3 until results of maintenance activities for the Segment are available for a minimum of 30 individual Components of the Segment.
3. Document the maintenance program activities and results for each Segment, including maintenance dates and Countable Events for each included Component.
4. Analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment and develop maintenance intervals.
5. Determine the maximum allowable maintenance interval for each Segment such that the Segment experiences **Countable Events** on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.

**Segment** – Protection Systems or components of a consistent design standard, or a particular model or type from a single manufacturer that typically share other common elements. Consistent performance is expected across the entire population of a Segment. A Segment must contain at least sixty (60) individual components.

**Countable Event** – A failure of a component requiring repair or replacement, any condition discovered during the maintenance activities in Tables 1-1 through 1-5 and Table 3 which requires corrective action, or a Misoperation attributed to hardware failure or calibration failure. Misoperations due to product design errors, software errors, relay settings different from specified settings, Protection System component configuration errors, or Protection System application errors are not included in Countable Events.

**To maintain the technical justification for the ongoing use of a performance-based PSMP:**

1. At least annually, update the list of Protection System Components and Segments and/or description if any changes occur within the Segment.
2. Perform maintenance on the greater of 5% of the Components (addressed in the performance based PSMP) in each Segment or 3 individual Components within the Segment in each year.
3. For the prior year, analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment.

**Standard PRC-005-2(X) – Protection System Maintenance**

---

4. Using the prior year's data, determine the maximum allowable maintenance interval for each Segment such that the Segment experiences Countable Events on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.
5. If the Components in a Protection System Segment maintained through a performance-based PSMP experience 4% or more Countable Events, develop, document, and implement an action plan to reduce the Countable Events to less than 4% of the Segment population within 3 years.

**A. Introduction**

- 1. Title:**       **Protection System and Automatic Reclosing Maintenance**
- 2. Number:**     PRC-005-3(X)
- 3. Purpose:**    To document and implement programs for the maintenance of all Protection Systems and Automatic Reclosing affecting the reliability of the Bulk Electric System (BES) so that they are kept in working order.
- 4. Applicability:**
  - 4.1. Functional Entities:**
    - 4.1.1**   Transmission Owner
    - 4.1.2**   Generator Owner
    - 4.1.3**   Distribution Provider
  - 4.2. Facilities:**
    - 4.2.1**   Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.)
    - 4.2.2**   Protection Systems used for underfrequency load-shedding systems installed per ERO underfrequency load-shedding requirements.
    - 4.2.3**   Protection Systems used for undervoltage load-shedding systems installed to prevent system voltage collapse or voltage instability for BES reliability.
    - 4.2.4**   Protection Systems installed as a Remedial Action Schemes (RAS) for BES reliability.
    - 4.2.5**   Protection Systems for generator Facilities that are part of the BES, including:
      - 4.2.5.1** Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays.
      - 4.2.5.2** Protection Systems for generator step-up transformers for generators that are part of the BES.
      - 4.2.5.3** Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind-farms to the BES).
      - 4.2.5.4** Protection Systems for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays.
    - 4.2.6**   Automatic Reclosing<sup>1</sup>, including:
      - 4.2.6.1** Automatic Reclosing applied on the terminals of Elements connected to the BES bus located at generating plant substations where the total installed

---

<sup>1</sup> Automatic Reclosing addressed in Section 4.2.6.1 and 4.2.6.2 may be excluded if the equipment owner can demonstrate that a close-in three-phase fault present for twice the normal clearing time (capturing a minimum trip-close-trip time delay) does not result in a total loss of gross generation in the Interconnection exceeding the gross capacity of the largest BES generating unit within the Balancing Authority Area where the Automatic Reclosing is applied.

gross generating plant capacity is greater than the gross capacity of the largest BES generating unit within the Balancing Authority Area.

**4.2.6.2** Automatic Reclosing applied on the terminals of all BES Elements at substations one bus away from generating plants specified in Section 4.2.6.1 when the substation is less than 10 circuit-miles from the generating plant substation.

**4.2.6.3** Automatic Reclosing applied as an integral part of a RAS specified in Section 4.2.4.

**5. Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction. (See the Implementation Plan for additional detail)

**6. Definitions Used in this Standard:** The following terms are defined for use only within PRC-005-3, and should remain with the standard upon approval rather than being moved to the Glossary of Terms.

**Automatic Reclosing** – Includes the following Components:

- Reclosing relay
- Control circuitry associated with the reclosing relay.

**Unresolved Maintenance Issue** – A deficiency identified during a maintenance activity that causes the component to not meet the intended performance, cannot be corrected during the maintenance interval, and requires follow-up corrective action.

**Segment** – Components of a consistent design standard, or a particular model or type from a single manufacturer that typically share other common elements. Consistent performance is expected across the entire population of a Segment. A Segment must contain at least sixty (60) individual Components.

**Component Type** – Either any one of the five specific elements of the Protection System definition or any one of the two specific elements of the Automatic Reclosing definition.

**Component** – A Component is any individual discrete piece of equipment included in a Protection System or in Automatic Reclosing, including but not limited to a protective relay, reclosing relay, or current sensing device. The designation of what constitutes a control circuit Component is dependent upon how an entity performs and tracks the testing of the control circuitry. Some entities test their control circuits on a breaker basis whereas others test their circuitry on a local zone of protection basis. Thus, entities are allowed the latitude to designate their own definitions of control circuit Components. Another example of where the entity has some discretion on determining what constitutes a single Component is the voltage and current sensing devices, where the entity may choose either to designate a full three-phase set of such devices or a single device as a single Component.

**Countable Event** – A failure of a Component requiring repair or replacement, any condition discovered during the maintenance activities in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 which requires corrective action or a Protection System Misoperation attributed to hardware failure or calibration failure. Misoperations due to product design errors, software errors, relay settings different from specified settings, Protection System Component or Automatic Reclosing configuration or application errors are not included in Countable Events.

## **B. Requirements**

- R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a Protection System Maintenance Program (PSMP) for its Protection Systems and Automatic Reclosing identified in Facilities Section 4.2. [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

The PSMP shall:

- 1.1.** Identify which maintenance method (time-based, performance-based per PRC-005 Attachment A, or a combination) is used to address each Protection System and Automatic Reclosing Component Type. All batteries associated with the station dc supply Component Type of a Protection System shall be included in a time-based program as described in Table 1-4 and Table 3.
  - 1.2.** Include the applicable monitored Component attributes applied to each Protection System and Automatic Reclosing Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System and Automatic Reclosing Components.
- R2.** Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals in its PSMP shall follow the procedure established in PRC-005 Attachment A to establish and maintain its performance-based intervals. [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]
- R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall maintain its Protection System and Automatic Reclosing Components that are included within the time-based maintenance program in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2. [*Violation Risk Factor: High*] [*Time Horizon: Operations Planning*]
- R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance program(s) in accordance with Requirement R2 shall implement and follow its PSMP for its Protection System and Automatic Reclosing Components that are included within the performance-based program(s). [*Violation Risk Factor: High*] [*Time Horizon: Operations Planning*]
- R5.** Each Transmission Owner, Generator Owner, and Distribution Provider shall demonstrate efforts to correct identified Unresolved Maintenance Issues. [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

## **C. Measures**

- M1.** Each Transmission Owner, Generator Owner and Distribution Provider shall have a documented Protection System Maintenance Program in accordance with Requirement R1.

## Standard PRC-005-3(X) — Protection System and Automatic Reclosing Maintenance

---

For each Protection System and Automatic Reclosing Component Type, the documentation shall include the type of maintenance method applied (time-based, performance-based, or a combination of these maintenance methods), and shall include all batteries associated with the station dc supply Component Types in a time-based program as described in Table 1-4 and Table 3. (Part 1.1)

For Component Types that use monitoring to extend the maintenance intervals, the responsible entity(s) shall have evidence for each Protection System and Automatic Reclosing Component Type (such as manufacturer's specifications or engineering drawings) of the appropriate monitored Component attributes as specified in Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2. (Part 1.2)

- M2.** Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals shall have evidence that its current performance-based maintenance program(s) is in accordance with Requirement R2, which may include but is not limited to Component lists, dated maintenance records, and dated analysis records and results.
- M3.** Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall have evidence that it has maintained its Protection System and Automatic Reclosing Components included within its time-based program in accordance with Requirement R3. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.
- M4.** Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance intervals in accordance with Requirement R2 shall have evidence that it has implemented the Protection System Maintenance Program for the Protection System and Automatic Reclosing Components included in its performance-based program in accordance with Requirement R4. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.
- M5.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence that it has undertaken efforts to correct identified Unresolved Maintenance Issues in accordance with Requirement R5. The evidence may include but is not limited to work orders, replacement Component orders, invoices, project schedules with completed milestones, return material authorizations (RMAs) or purchase orders.

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

##### 1.2. Compliance Monitoring and Enforcement Processes:

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Investigation
- Self-Reporting

Complaint

**1.3. Evidence Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

For Requirement R1, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep its current dated Protection System Maintenance Program, as well as any superseded versions since the preceding compliance audit, including the documentation that specifies the type of maintenance program applied for each Protection System Component Type.

For Requirement R2, Requirement R3, Requirement R4, and Requirement R5, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep documentation of the two most recent performances of each distinct maintenance activity for the Protection System or Automatic Reclosing Component, or all performances of each distinct maintenance activity for the Protection System or Automatic Reclosing Component since the previous scheduled audit date, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Additional Compliance Information**

None.

**Standard PRC-005-3(X) — Protection System and Automatic Reclosing Maintenance**

**2. Violation Severity Levels**

| Requirement Number | Lower VSL   | Moderate VSL  | High VSL  | Severe VSL   |
|--------------------|---|---|---|--|
| R1                 | <p>The responsible entity’s PSMP failed to specify whether one Component Type is being addressed by time-based or performance-based maintenance, or a combination of both. |--|--|-----------------------------------|
| Component Attributes   | Maximum Maintenance Interval                       | Maintenance Activities            |
| Any Protection System dc supply used for tripping only non-BES interrupting devices as part of a RAS, non-distributed UFLS, or non-distributed UVLS system and not having monitoring attributes of Table 1-4(f). | When control circuits are verified (See Table 1-5) | Verify Station dc supply voltage. |

| Table 1-4(f)<br>Exclusions for Protection System Station dc Supply Monitoring Devices and Systems  |                                   |  |
|--|-----------------------------------|--|
| Component Attributes   | Maximum Maintenance Interval      | Maintenance Activities   |
| Any station dc supply with high and low voltage monitoring and alarming of the battery charger voltage to detect charger overvoltage and charger failure (See Table 2).  | No periodic maintenance specified | No periodic verification of station dc supply voltage is required.   |
| Any battery based station dc supply with electrolyte level monitoring and alarming in every cell (See Table 2).  |                                   | No periodic inspection of the electrolyte level for each cell is required.   |
| Any station dc supply with unintentional dc ground monitoring and alarming (See Table 2).  |                                   | No periodic inspection of unintentional dc grounds is required.  |
| Any station dc supply with charger float voltage monitoring and alarming to ensure correct float voltage is being applied on the station dc supply (See Table 2).  |                                   | No periodic verification of float voltage of battery charger is required.  |
| Any battery based station dc supply with monitoring and alarming of battery string continuity (See Table 2).   |                                   | No periodic verification of the battery continuity is required.  |
| Any battery based station dc supply with monitoring and alarming of the intercell and/or terminal connection detail resistance of the entire battery (See Table 2).  |                                   | No periodic verification of the intercell and terminal connection resistance is required.  |
| Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with internal ohmic value or float current monitoring and alarming, and evaluating present values relative to baseline internal ohmic values for every cell/unit (See Table 2). |                                   | No periodic evaluation relative to baseline of battery cell/unit measurements indicative of battery performance is required to verify the station battery can perform as manufactured. |
| Any Valve Regulated Lead-Acid (VRLA) or Vented Lead-Acid (VLA) station battery with monitoring and alarming of each cell/unit internal ohmic value (See Table 2).  |                                   | No periodic inspection of the condition of all individual units by measuring battery cell/unit internal ohmic values of a station VRLA or Vented Lead-Acid (VLA) battery is required.  |

| <b>Table 1-5<br/>                     Component Type - Control Circuitry Associated With Protective Functions<br/>                     Excluding distributed UFLS and distributed UVLS (see Table 3)</b> |                                     |   |
|--|-------------------------------------|---|
| <b>Note: Table requirements apply to all Control Circuitry Components of Protection Systems, and RAS except as noted.</b>  |                                     |   |
| <b>Component Attributes</b>  | <b>Maximum Maintenance Interval</b> | <b>Maintenance Activities</b>   |
| Trip coils or actuators of circuit breakers, interrupting devices, or mitigating devices (regardless of any monitoring of the control circuitry).  | 6 Calendar Years                    | Verify that each trip coil is able to operate the circuit breaker, interrupting device, or mitigating device.   |
| Electromechanical lockout devices which are directly in a trip path from the protective relay to the interrupting device trip coil (regardless of any monitoring of the control circuitry).              | 6 Calendar Years                    | Verify electrical operation of electromechanical lockout devices.   |
| Unmonitored control circuitry associated with RAS.<br>(See Table 4-2(b) for RAS which include Automatic Reclosing.)  | 12 Calendar Years                   | Verify all paths of the control circuits essential for proper operation of the RAS.   |
| Unmonitored control circuitry associated with protective functions inclusive of all auxiliary relays.  | 12 Calendar Years                   | Verify all paths of the trip circuits inclusive of all auxiliary relays through the trip coil(s) of the circuit breakers or other interrupting devices. |
| Control circuitry associated with protective functions and/or RAS whose integrity is monitored and alarmed (See Table 2).  | No periodic maintenance specified   | None.   |

| <b>Table 2 – Alarming Paths and Monitoring</b><br>In Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2, alarm attributes used to justify extended maximum maintenance intervals and/or reduced maintenance activities are subject to the following maintenance requirements   |                                   |  |
|---|-----------------------------------|--|
| Component Attributes  | Maximum Maintenance Interval      | Maintenance Activities   |
| Any alarm path through which alarms in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 are conveyed from the alarm origin to the location where corrective action can be initiated, and not having all the attributes of the “Alarm Path with monitoring” category below.<br><br>Alarms are reported within 24 hours of detection to a location where corrective action can be initiated. | 12 Calendar Years                 | Verify that the alarm path conveys alarm signals to a location where corrective action can be initiated. |
| Alarm Path with monitoring:<br><br>The location where corrective action is taken receives an alarm within 24 hours for failure of any portion of the alarming path from the alarm origin to the location where corrective action can be initiated.  | No periodic maintenance specified | None.  |

| Table 3<br>Maintenance Activities and Intervals for distributed UFLS and distributed UVLS Systems   |                              |  |
|---|------------------------------|--|
| Component Attributes  | Maximum Maintenance Interval | Maintenance Activities   |
| Any unmonitored protective relay not having all the monitoring attributes of a category below.  | 6 Calendar Years             | <p>Verify that settings are as specified.</p> <p>For non-microprocessor relays:</p> <ul style="list-style-type: none"> <li>• Test and, if necessary calibrate.</li> </ul> <p>For microprocessor relays:</p> <ul style="list-style-type: none"> <li>• Verify operation of the relay inputs and outputs that are essential to proper functioning of the Protection System.</li> <li>• Verify acceptable measurement of power system input values.</li> </ul> |

| Unmonitored close control circuitry associated with Automatic Reclosing used as an integral part of a RAS.   | 12 Calendar Years                   | Verify all paths of the control circuits associated with Automatic Reclosing that are essential for proper operation of the RAS. |
| Control circuitry associated with Automatic Reclosing that is an integral part of a RAS whose integrity is monitored and alarmed. (See Table 2)  | No periodic maintenance specified   | None.  |

**PRC-005 — Attachment A**

**Criteria for a Performance-Based Protection System Maintenance Program**

**Purpose:** To establish a technical basis for initial and continued use of a performance-based Protection System Maintenance Program (PSMP).

**To establish the technical justification for the initial use of a performance-based PSMP:**

1. Develop a list with a description of Components included in each designated Segment, with a minimum **Segment** population of 60 Components.
2. Maintain the Components in each Segment according to the time-based maximum allowable intervals established in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 until results of maintenance activities for the Segment are available for a minimum of 30 individual Components of the Segment.
3. Document the maintenance program activities and results for each Segment, including maintenance dates and Countable Events for each included Component.
4. Analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment and develop maintenance intervals.
5. Determine the maximum allowable maintenance interval for each Segment such that the Segment experiences **Countable Events** on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.

**To maintain the technical justification for the ongoing use of a performance-based PSMP:**

1. At least annually, update the list of Components and Segments and/or description if any changes occur within the Segment.
2. Perform maintenance on the greater of 5% of the Components (addressed in the performance based PSMP) in each Segment or 3 individual Components within the Segment in each year.
3. For the prior year, analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment.
4. Using the prior year's data, determine the maximum allowable maintenance interval for each Segment such that the Segment experiences Countable Events on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.
5. If the Components in a Segment maintained through a performance-based PSMP experience 4% or more Countable Events, develop, document, and implement an action plan to reduce the Countable Events to less than 4% of the Segment population within 3 years.

## Standard PRC-005-3(X) — Protection System and Automatic Reclosing Maintenance

### A. Introduction

1. **Title:** Protection System and Automatic Reclosing Maintenance
2. **Number:** PRC-005-3(X)
3. **Purpose:** To document and implement programs for the maintenance of all Protection Systems and Automatic Reclosing affecting the reliability of the Bulk Electric System (BES) so that they are kept in working order.
4. **Applicability:**
  - 4.1. **Functional Entities:**
    - 4.1.1 Transmission Owner
    - 4.1.2 Generator Owner
    - 4.1.3 Distribution Provider
  - 4.2. **Facilities:**
    - 4.2.1 Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.)
    - 4.2.2 Protection Systems used for underfrequency load-shedding systems installed per ERO underfrequency load-shedding requirements.
    - 4.2.3 Protection Systems used for undervoltage load-shedding systems installed to prevent system voltage collapse or voltage instability for BES reliability.
    - 4.2.4 Protection Systems installed as a [Remedial Action Schemes \(RAS\)](#) for BES reliability.
    - 4.2.5 Protection Systems for generator Facilities that are part of the BES, including:
      - 4.2.5.1 Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays.
      - 4.2.5.2 Protection Systems for generator step-up transformers for generators that are part of the BES.
      - 4.2.5.3 Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind-farms to the BES).
      - 4.2.5.4 Protection Systems for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays.
    - 4.2.6 Automatic Reclosing<sup>1</sup>, including:
      - 4.2.6.1 Automatic Reclosing applied on the terminals of Elements connected to the BES bus located at generating plant substations where the total installed

Deleted: Special Protection System (SPS)

<sup>1</sup> Automatic Reclosing addressed in Section 4.2.6.1 and 4.2.6.2 may be excluded if the equipment owner can demonstrate that a close-in three-phase fault present for twice the normal clearing time (capturing a minimum trip-close-trip time delay) does not result in a total loss of gross generation in the Interconnection exceeding the gross capacity of the largest BES generating unit within the Balancing Authority Area where the Automatic Reclosing is applied.

**Standard PRC-005-3(X) — Protection System and Automatic Reclosing Maintenance**

gross generating plant capacity is greater than the gross capacity of the largest BES generating unit within the Balancing Authority Area.

**4.2.6.2** Automatic Reclosing applied on the terminals of all BES Elements at substations one bus away from generating plants specified in Section 4.2.6.1 when the substation is less than 10 circuit-miles from the generating plant substation.

**4.2.6.3** Automatic Reclosing applied as an integral part of a RAS specified in Section 4.2.4.

Deleted: n SPS

**5. Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction. (See the Implementation Plan for additional detail)

Deleted: See Implementation Plan

**6. Definitions Used in this Standard:** The following terms are defined for use only within PRC-005-3, and should remain with the standard upon approval rather than being moved to the Glossary of Terms.

**Automatic Reclosing** – Includes the following Components:

- Reclosing relay
- Control circuitry associated with the reclosing relay.

**Unresolved Maintenance Issue** – A deficiency identified during a maintenance activity that causes the component to not meet the intended performance, cannot be corrected during the maintenance interval, and requires follow-up corrective action.

**Segment** – Components of a consistent design standard, or a particular model or type from a single manufacturer that typically share other common elements. Consistent performance is expected across the entire population of a Segment. A Segment must contain at least sixty (60) individual Components.

**Component Type** – Either any one of the five specific elements of the Protection System definition or any one of the two specific elements of the Automatic Reclosing definition.

**Component** – A Component is any individual discrete piece of equipment included in a Protection System or in Automatic Reclosing, including but not limited to a protective relay, reclosing relay, or current sensing device. The designation of what constitutes a control circuit Component is dependent upon how an entity performs and tracks the testing of the control circuitry. Some entities test their control circuits on a breaker basis whereas others test their circuitry on a local zone of protection basis. Thus, entities are allowed the latitude to designate their own definitions of control circuit Components. Another example of where the entity has some discretion on determining what constitutes a single Component is the voltage and current sensing devices, where the entity may choose either to designate a full three-phase set of such devices or a single device as a single Component.

## Standard PRC-005-3(X) — Protection System and Automatic Reclosing Maintenance

**Countable Event** – A failure of a Component requiring repair or replacement, any condition discovered during the maintenance activities in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 which requires corrective action or a Protection System Misoperation attributed to hardware failure or calibration failure. Misoperations due to product design errors, software errors, relay settings different from specified settings, Protection System Component or Automatic Reclosing configuration or application errors are not included in Countable Events.

### B. Requirements

- R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a Protection System Maintenance Program (PSMP) for its Protection Systems and Automatic Reclosing identified in Facilities Section 4.2. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

The PSMP shall:

- 1.1.** Identify which maintenance method (time-based, performance-based per PRC-005 Attachment A, or a combination) is used to address each Protection System and Automatic Reclosing Component Type. All batteries associated with the station dc supply Component Type of a Protection System shall be included in a time-based program as described in Table 1-4 and Table 3.
  - 1.2.** Include the applicable monitored Component attributes applied to each Protection System and Automatic Reclosing Component Type consistent with the maintenance intervals specified in Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2 where monitoring is used to extend the maintenance intervals beyond those specified for unmonitored Protection System and Automatic Reclosing Components.
- R2.** Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals in its PSMP shall follow the procedure established in PRC-005 Attachment A to establish and maintain its performance-based intervals. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*
- R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall maintain its Protection System and Automatic Reclosing Components that are included within the time-based maintenance program in accordance with the minimum maintenance activities and maximum maintenance intervals prescribed within Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*
- R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance program(s) in accordance with Requirement R2 shall implement and follow its PSMP for its Protection System and Automatic Reclosing Components that are included within the performance-based program(s). *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*
- R5.** Each Transmission Owner, Generator Owner, and Distribution Provider shall demonstrate efforts to correct identified Unresolved Maintenance Issues. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

### C. Measures

- M1.** Each Transmission Owner, Generator Owner and Distribution Provider shall have a documented Protection System Maintenance Program in accordance with Requirement R1.

## Standard PRC-005-3(X) — Protection System and Automatic Reclosing Maintenance

For each Protection System and Automatic Reclosing Component Type, the documentation shall include the type of maintenance method applied (time-based, performance-based, or a combination of these maintenance methods), and shall include all batteries associated with the station dc supply Component Types in a time-based program as described in Table 1-4 and Table 3. (Part 1.1)

For Component Types that use monitoring to extend the maintenance intervals, the responsible entity(s) shall have evidence for each Protection System and Automatic Reclosing Component Type (such as manufacturer's specifications or engineering drawings) of the appropriate monitored Component attributes as specified in Tables 1-1 through 1-5, Table 2, Table 3, and Table 4-1 through 4-2. (Part 1.2)

- M2.** Each Transmission Owner, Generator Owner, and Distribution Provider that uses performance-based maintenance intervals shall have evidence that its current performance-based maintenance program(s) is in accordance with Requirement R2, which may include but is not limited to Component lists, dated maintenance records, and dated analysis records and results.
- M3.** Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes time-based maintenance program(s) shall have evidence that it has maintained its Protection System and Automatic Reclosing Components included within its time-based program in accordance with Requirement R3. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.
- M4.** Each Transmission Owner, Generator Owner, and Distribution Provider that utilizes performance-based maintenance intervals in accordance with Requirement R2 shall have evidence that it has implemented the Protection System Maintenance Program for the Protection System and Automatic Reclosing Components included in its performance-based program in accordance with Requirement R4. The evidence may include but is not limited to dated maintenance records, dated maintenance summaries, dated check-off lists, dated inspection records, or dated work orders.
- M5.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence that it has undertaken efforts to correct identified Unresolved Maintenance Issues in accordance with Requirement R5. The evidence may include but is not limited to work orders, replacement Component orders, invoices, project schedules with completed milestones, return material authorizations (RMAs) or purchase orders.

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

##### 1.2. Compliance Monitoring and Enforcement Processes:

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Investigation
- Self-Reporting

**Standard PRC-005-3(X) — Protection System and Automatic Reclosing Maintenance**

---

Complaint

**1.3. Evidence Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

For Requirement R1, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep its current dated Protection System Maintenance Program, as well as any superseded versions since the preceding compliance audit, including the documentation that specifies the type of maintenance program applied for each Protection System Component Type.

For Requirement R2, Requirement R3, Requirement R4, and Requirement R5, the Transmission Owner, Generator Owner, and Distribution Provider shall each keep documentation of the two most recent performances of each distinct maintenance activity for the Protection System or Automatic Reclosing Component, or all performances of each distinct maintenance activity for the Protection System or Automatic Reclosing Component since the previous scheduled audit date, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Additional Compliance Information**

None.

**Standard PRC-005-3(X) — Protection System and Automatic Reclosing Maintenance**

**2. Violation Severity Levels**

| Requirement Number | Lower VSL   | Moderate VSL  | High VSL  | Severe VSL   |
|--------------------|---|---|---|--|
| R1                 | <p>The responsible entity's PSMP failed to specify whether one Component Type is being addressed by time-based or performance-based maintenance, or a combination of both. **PRC-005 — Attachment A**

**Criteria for a Performance-Based Protection System Maintenance Program**

**Purpose:** To establish a technical basis for initial and continued use of a performance-based Protection System Maintenance Program (PSMP).

**To establish the technical justification for the initial use of a performance-based PSMP:**

1. Develop a list with a description of Components included in each designated Segment, with a minimum **Segment** population of 60 Components.
2. Maintain the Components in each Segment according to the time-based maximum allowable intervals established in Tables 1-1 through 1-5, Table 3, and Tables 4-1 through 4-2 until results of maintenance activities for the Segment are available for a minimum of 30 individual Components of the Segment.
3. Document the maintenance program activities and results for each Segment, including maintenance dates and Countable Events for each included Component.
4. Analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment and develop maintenance intervals.
5. Determine the maximum allowable maintenance interval for each Segment such that the Segment experiences **Countable Events** on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.

**To maintain the technical justification for the ongoing use of a performance-based PSMP:**

1. At least annually, update the list of Components and Segments and/or description if any changes occur within the Segment.
2. Perform maintenance on the greater of 5% of the Components (addressed in the performance based PSMP) in each Segment or 3 individual Components within the Segment in each year.
3. For the prior year, analyze the maintenance program activities and results for each Segment to determine the overall performance of the Segment.
4. Using the prior year's data, determine the maximum allowable maintenance interval for each Segment such that the Segment experiences Countable Events on no more than 4% of the Components within the Segment, for the greater of either the last 30 Components maintained or all Components maintained in the previous year.
5. If the Components in a Segment maintained through a performance-based PSMP experience 4% or more Countable Events, develop, document, and implement an action plan to reduce the Countable Events to less than 4% of the Segment population within 3 years.

1. **Title:** Automatic Underfrequency Load Shedding
2. **Number:** PRC-006-1(X)
3. **Purpose:** To establish design and documentation requirements for automatic underfrequency load shedding (UFLS) programs to arrest declining frequency, assist recovery of frequency following underfrequency events and provide last resort system preservation measures.
4. **Applicability:**
  - 4.1. Planning Coordinators
  - 4.2. UFLS entities shall mean all entities that are responsible for the ownership, operation, or control of UFLS equipment as required by the UFLS program established by the Planning Coordinators. Such entities may include one or more of the following:
    - 4.2.1 Transmission Owners
    - 4.2.2 Distribution Providers
  - 4.3. Transmission Owners that own Elements identified in the UFLS program established by the Planning Coordinators.
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

## B. Requirements

- R1. Each Planning Coordinator shall develop and document criteria, including consideration of historical events and system studies, to select portions of the Bulk Electric System (BES), including interconnected portions of the BES in adjacent Planning Coordinator areas and Regional Entity areas that may form islands. [*VRF: Medium*][*Time Horizon: Long-term Planning*]
- R2. Each Planning Coordinator shall identify one or more islands to serve as a basis for designing its UFLS program including: [*VRF: Medium*][*Time Horizon: Long-term Planning*]
  - 2.1. Those islands selected by applying the criteria in Requirement R1, and

- 2.2. Any portions of the BES designed to detach from the Interconnection (planned islands) as a result of the operation of a relay scheme or Remedial Action Scheme, and
  - 2.3. A single island that includes all portions of the BES in either the Regional Entity area or the Interconnection in which the Planning Coordinator's area resides. If a Planning Coordinator's area resides in multiple Regional Entity areas, each of those Regional Entity areas shall be identified as an island. Planning Coordinators may adjust island boundaries to differ from Regional Entity area boundaries by mutual consent where necessary for the sole purpose of producing contiguous regional islands more suitable for simulation.
- R3.** Each Planning Coordinator shall develop a UFLS program, including notification of and a schedule for implementation by UFLS entities within its area, that meets the following performance characteristics in simulations of underfrequency conditions resulting from an imbalance scenario, where an imbalance = [(load — actual generation output) / (load)], of up to 25 percent within the identified island(s). [*VRF: High*][*Time Horizon: Long-term Planning*]
- 3.1. Frequency shall remain above the Underfrequency Performance Characteristic curve in PRC-006-1(X) - Attachment 1, either for 60 seconds or until a steady-state condition between 59.3 Hz and 60.7 Hz is reached, and
  - 3.2. Frequency shall remain below the Overfrequency Performance Characteristic curve in PRC-006-1(X) - Attachment 1, either for 60 seconds or until a steady-state condition between 59.3 Hz and 60.7 Hz is reached, and
  - 3.3. Volts per Hz (V/Hz) shall not exceed 1.18 per unit for longer than two seconds cumulatively per simulated event, and shall not exceed 1.10 per unit for longer than 45 seconds cumulatively per simulated event at each generator bus and generator step-up transformer high-side bus associated with each of the following:
    - 3.3.1. Individual generating units greater than 20 MVA (gross nameplate rating) directly connected to the BES
    - 3.3.2. Generating plants/facilities greater than 75 MVA (gross aggregate nameplate rating) directly connected to the BES
    - 3.3.3. Facilities consisting of one or more units connected to the BES at a common bus with total generation above 75 MVA gross nameplate rating.
- R4.** Each Planning Coordinator shall conduct and document a UFLS design assessment at least once every five years that determines through dynamic simulation whether the UFLS program design meets the performance characteristics in Requirement R3 for each island identified in Requirement R2. The simulation shall model each of the following: [*VRF: High*][*Time Horizon: Long-term Planning*]
- 4.1. Underfrequency trip settings of individual generating units greater than 20 MVA (gross nameplate rating) directly connected to the BES that trip above the

- Generator Underfrequency Trip Modeling curve in PRC-006-1(X) - Attachment 1.
- 4.2. Underfrequency trip settings of generating plants/facilities greater than 75 MVA (gross aggregate nameplate rating) directly connected to the BES that trip above the Generator Underfrequency Trip Modeling curve in PRC-006-1(X) - Attachment 1.
  - 4.3. Underfrequency trip settings of any facility consisting of one or more units connected to the BES at a common bus with total generation above 75 MVA (gross nameplate rating) that trip above the Generator Underfrequency Trip Modeling curve in PRC-006-1(X) - Attachment 1.
  - 4.4. Overfrequency trip settings of individual generating units greater than 20 MVA (gross nameplate rating) directly connected to the BES that trip below the Generator Overfrequency Trip Modeling curve in PRC-006-1(X) — Attachment 1.
  - 4.5. Overfrequency trip settings of generating plants/facilities greater than 75 MVA (gross aggregate nameplate rating) directly connected to the BES that trip below the Generator Overfrequency Trip Modeling curve in PRC-006-1(X) — Attachment 1.
  - 4.6. Overfrequency trip settings of any facility consisting of one or more units connected to the BES at a common bus with total generation above 75 MVA (gross nameplate rating) that trip below the Generator Overfrequency Trip Modeling curve in PRC-006-1(X) — Attachment 1.
  - 4.7. Any automatic Load restoration that impacts frequency stabilization and operates within the duration of the simulations run for the assessment.
- R5. Each Planning Coordinator, whose area or portions of whose area is part of an island identified by it or another Planning Coordinator which includes multiple Planning Coordinator areas or portions of those areas, shall coordinate its UFLS program design with all other Planning Coordinators whose areas or portions of whose areas are also part of the same identified island through one of the following: *[VRF: High][Time Horizon: Long-term Planning]*
- Develop a common UFLS program design and schedule for implementation per Requirement R3 among the Planning Coordinators whose areas or portions of whose areas are part of the same identified island, or
  - Conduct a joint UFLS design assessment per Requirement R4 among the Planning Coordinators whose areas or portions of whose areas are part of the same identified island, or
  - Conduct an independent UFLS design assessment per Requirement R4 for the identified island, and in the event the UFLS design assessment fails to meet Requirement R3, identify modifications to the UFLS program(s) to meet

Requirement R3 and report these modifications as recommendations to the other Planning Coordinators whose areas or portions of whose areas are also part of the same identified island and the ERO.

- R6.** Each Planning Coordinator shall maintain a UFLS database containing data necessary to model its UFLS program for use in event analyses and assessments of the UFLS program at least once each calendar year, with no more than 15 months between maintenance activities. *[VRF: Lower][Time Horizon: Long-term Planning]*
- R7.** Each Planning Coordinator shall provide its UFLS database containing data necessary to model its UFLS program to other Planning Coordinators within its Interconnection within 30 calendar days of a request. *[VRF: Lower][Time Horizon: Long-term Planning]*
- R8.** Each UFLS entity shall provide data to its Planning Coordinator(s) according to the format and schedule specified by the Planning Coordinator(s) to support maintenance of each Planning Coordinator's UFLS database. *[VRF: Lower][Time Horizon: Long-term Planning]*
- R9.** Each UFLS entity shall provide automatic tripping of Load in accordance with the UFLS program design and schedule for application determined by its Planning Coordinator(s) in each Planning Coordinator area in which it owns assets. *[VRF: High][Time Horizon: Long-term Planning]*
- R10.** Each Transmission Owner shall provide automatic switching of its existing capacitor banks, Transmission Lines, and reactors to control over-voltage as a result of underfrequency load shedding if required by the UFLS program and schedule for application determined by the Planning Coordinator(s) in each Planning Coordinator area in which the Transmission Owner owns transmission. *[VRF: High][Time Horizon: Long-term Planning]*
- R11.** Each Planning Coordinator, in whose area a BES islanding event results in system frequency excursions below the initializing set points of the UFLS program, shall conduct and document an assessment of the event within one year of event actuation to evaluate: *[VRF: Medium][Time Horizon: Operations Assessment]*
  - 11.1.** The performance of the UFLS equipment,
  - 11.2.** The effectiveness of the UFLS program.
- R12.** Each Planning Coordinator, in whose islanding event assessment (per R11) UFLS program deficiencies are identified, shall conduct and document a UFLS design assessment to consider the identified deficiencies within two years of event actuation. *[VRF: Medium][Time Horizon: Operations Assessment]*
- R13.** Each Planning Coordinator, in whose area a BES islanding event occurred that also included the area(s) or portions of area(s) of other Planning Coordinator(s) in the same islanding event and that resulted in system frequency excursions below the initializing set points of the UFLS program, shall coordinate its event assessment (in accordance

with Requirement R11) with all other Planning Coordinators whose areas or portions of whose areas were also included in the same islanding event through one of the following: *[VRF: Medium][Time Horizon: Operations Assessment]*

- Conduct a joint event assessment per Requirement R11 among the Planning Coordinators whose areas or portions of whose areas were included in the same islanding event, or
- Conduct an independent event assessment per Requirement R11 that reaches conclusions and recommendations consistent with those of the event assessments of the other Planning Coordinators whose areas or portions of whose areas were included in the same islanding event, or
- Conduct an independent event assessment per Requirement R11 and where the assessment fails to reach conclusions and recommendations consistent with those of the event assessments of the other Planning Coordinators whose areas or portions of whose areas were included in the same islanding event, identify differences in the assessments that likely resulted in the differences in the conclusions and recommendations and report these differences to the other Planning Coordinators whose areas or portions of whose areas were included in the same islanding event and the ERO.

**R14.** Each Planning Coordinator shall respond to written comments submitted by UFLS entities and Transmission Owners within its Planning Coordinator area following a comment period and before finalizing its UFLS program, indicating in the written response to comments whether changes will be made or reasons why changes will not be made to the following *[VRF: Lower][Time Horizon: Long-term Planning]*:

**14.1.** UFLS program, including a schedule for implementation

**14.2.** UFLS design assessment

**14.3.** Format and schedule of UFLS data submittal

### **C. Measures**

**M1.** Each Planning Coordinator shall have evidence such as reports, or other documentation of its criteria to select portions of the Bulk Electric System that may form islands including how system studies and historical events were considered to develop the criteria per Requirement R1.

**M2.** Each Planning Coordinator shall have evidence such as reports, memorandums, e-mails, or other documentation supporting its identification of an island(s) as a basis for designing a UFLS program that meet the criteria in Requirement R2, Parts 2.1 through 2.3.

**M3.** Each Planning Coordinator shall have evidence such as reports, memorandums, e-mails, program plans, or other documentation of its UFLS program, including the notification of the UFLS entities of implementation schedule, that meet the criteria in Requirement R3, Parts 3.1 through 3.3.

- M4.** Each Planning Coordinator shall have dated evidence such as reports, dynamic simulation models and results, or other dated documentation of its UFLS design assessment that demonstrates it meets Requirement R4, Parts 4.1 through 4.7.
- M5.** Each Planning Coordinator, whose area or portions of whose area is part of an island identified by it or another Planning Coordinator which includes multiple Planning Coordinator areas or portions of those areas, shall have dated evidence such as joint UFLS program design documents, reports describing a joint UFLS design assessment, letters that include recommendations, or other dated documentation demonstrating that it coordinated its UFLS program design with all other Planning Coordinators whose areas or portions of whose areas are also part of the same identified island per Requirement R5.
- M6.** Each Planning Coordinator shall have dated evidence such as a UFLS database, data requests, data input forms, or other dated documentation to show that it maintained a UFLS database for use in event analyses and assessments of the UFLS program per Requirement R6 at least once each calendar year, with no more than 15 months between maintenance activities.
- M7.** Each Planning Coordinator shall have dated evidence such as letters, memorandums, e-mails or other dated documentation that it provided their UFLS database to other Planning Coordinators within their Interconnection within 30 calendar days of a request per Requirement R7.
- M8.** Each UFLS Entity shall have dated evidence such as responses to data requests, spreadsheets, letters or other dated documentation that it provided data to its Planning Coordinator according to the format and schedule specified by the Planning Coordinator to support maintenance of the UFLS database per Requirement R8.
- M9.** Each UFLS Entity shall have dated evidence such as spreadsheets summarizing feeder load armed with UFLS relays, spreadsheets with UFLS relay settings, or other dated documentation that it provided automatic tripping of load in accordance with the UFLS program design and schedule for application per Requirement R9.
- M10.** Each Transmission Owner shall have dated evidence such as relay settings, tripping logic or other dated documentation that it provided automatic switching of its existing capacitor banks, Transmission Lines, and reactors in order to control over-voltage as a result of underfrequency load shedding if required by the UFLS program and schedule for application per Requirement R10.
- M11.** Each Planning Coordinator shall have dated evidence such as reports, data gathered from an historical event, or other dated documentation to show that it conducted an event assessment of the performance of the UFLS equipment and the effectiveness of the UFLS program per Requirement R11.
- M12.** Each Planning Coordinator shall have dated evidence such as reports, data gathered from an historical event, or other dated documentation to show that it conducted a

UFLS design assessment per Requirements R12 and R4 if UFLS program deficiencies are identified in R11.

- M13.** Each Planning Coordinator, in whose area a BES islanding event occurred that also included the area(s) or portions of area(s) of other Planning Coordinator(s) in the same islanding event and that resulted in system frequency excursions below the initializing set points of the UFLS program, shall have dated evidence such as a joint assessment report, independent assessment reports and letters describing likely reasons for differences in conclusions and recommendations, or other dated documentation demonstrating it coordinated its event assessment (per Requirement R11) with all other Planning Coordinator(s) whose areas or portions of whose areas were also included in the same islanding event per Requirement R13.
- M14.** Each Planning Coordinator shall have dated evidence of responses, such as e-mails and letters, to written comments submitted by UFLS entities and Transmission Owners within its Planning Coordinator area following a comment period and before finalizing its UFLS program per Requirement R14.

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

Regional Entity

#### **1.2. Data Retention**

Each Planning Coordinator and UFLS entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Each Planning Coordinator shall retain the current evidence of Requirements R1, R2, R3, R4, R5, R12, and R14, Measures M1, M2, M3, M4, M5, M12, and M14 as well as any evidence necessary to show compliance since the last compliance audit.
- Each Planning Coordinator shall retain the current evidence of UFLS database update in accordance with Requirement R6, Measure M6, and evidence of the prior year's UFLS database update.
- Each Planning Coordinator shall retain evidence of any UFLS database transmittal to another Planning Coordinator since the last compliance audit in accordance with Requirement R7, Measure M7.
- Each UFLS entity shall retain evidence of UFLS data transmittal to the Planning Coordinator(s) since the last compliance audit in accordance with Requirement R8, Measure M8.

- Each UFLS entity shall retain the current evidence of adherence with the UFLS program in accordance with Requirement R9, Measure M9, and evidence of adherence since the last compliance audit.
- Transmission Owner shall retain the current evidence of adherence with the UFLS program in accordance with Requirement R10, Measure M10, and evidence of adherence since the last compliance audit.
- Each Planning Coordinator shall retain evidence of Requirements R11, and R13, and Measures M11, and M13 for 6 calendar years.

If a Planning Coordinator or UFLS entity is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the retention period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

### **1.3. Compliance Monitoring and Assessment Processes**

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Violation Investigation
- Self-Reporting
- Complaint

### **1.4. Additional Compliance Information**

Not applicable.

|            |           |              |          | excursions below the initializing set points of the UFLS program, failed to coordinate its UFLS event assessment with all other Planning Coordinators whose areas or portions of whose areas were also included in the same islanding event in one of the manners described in Requirement R13   |
| <b>R14</b> | N/A       | N/A          | N/A      | The Planning Coordinator failed to respond to written comments submitted by UFLS entities and Transmission Owners within its Planning Coordinator area following a comment period and before finalizing its UFLS program, indicating in the written response to comments whether changes were made or reasons why changes were not made to the items in Parts 14.1 through 14.3. |

## E. Regional Variances

### E.A. Regional Variance for the Quebec Interconnection

The following Interconnection-wide variance shall be applicable in the Quebec Interconnection and replaces, in their entirety, Requirements R3 and R4 and the violation severity levels associated with Requirements R3 and R4.

**E.A.3.** Each Planning Coordinator shall develop a UFLS program, including a schedule for implementation by UFLS entities within its area, that meets the following performance characteristics in simulations of underfrequency conditions resulting from an imbalance scenario, where an imbalance = [(load — actual generation output) / (load)], of up to 25 percent within the identified island(s).  
*[VRF: High][Time Horizon: Long-term Planning]*

**E.A.3.1.** Frequency shall remain above the Underfrequency Performance Characteristic curve in PRC-006-1(X) - Attachment 1A, either for 30 seconds or until a steady-state condition between 59.3 Hz and 60.7 Hz is reached, and

**E.A.3.2.** Frequency shall remain below the Overfrequency Performance Characteristic curve in PRC-006-1(X) - Attachment 1A, either for 30 seconds or until a steady-state condition between 59.3 Hz and 60.7 Hz is reached, and

**E.A.3.3.** Volts per Hz (V/Hz) shall not exceed 1.18 per unit for longer than two seconds cumulatively per simulated event, and shall not exceed 1.10 per unit for longer than 45 seconds cumulatively per simulated event at each generator bus and generator step-up transformer high-side bus associated with each of the following:

**EA.3.3.1.** Individual generating unit greater than 50 MVA (gross nameplate rating) directly connected to the BES

**EA.3.3.2.** Generating plants/facilities greater than 50 MVA (gross aggregate nameplate rating) directly connected to the BES

**EA.3.3.3.** Facilities consisting of one or more units connected to the BES at a common bus with total generation above 50 MVA gross nameplate rating.

**E.A.4.** Each Planning Coordinator shall conduct and document a UFLS design assessment at least once every five years that determines through dynamic simulation whether the UFLS program design meets the performance characteristics in Requirement E.A.3 for each island identified in Requirement R2. The simulation shall model each of the following; *[VRF: High][Time Horizon: Long-term Planning]*

**E.A.4.1** Underfrequency trip settings of individual generating units that are part of plants/facilities with a capacity of 50 MVA or more individually or cumulatively (gross nameplate rating), directly

connected to the BES that trip above the Generator Underfrequency Trip Modeling curve in PRC-006-1(X) - Attachment 1A, and

**E.A.4.2** Overfrequency trip settings of individual generating units that are part of plants/facilities with a capacity of 50 MVA or more individually or cumulatively (gross nameplate rating), directly connected to the BES that trip below the Generator Overfrequency Trip Modeling curve in PRC-006-1(X) - Attachment 2A, and

**E.A.4.3** Any automatic Load restoration that impacts frequency stabilization and operates within the duration of the simulations run for the assessment.

**M.E.A.3.** Each Planning Coordinator shall have evidence such as reports, memorandums, e-mails, program plans, or other documentation of its UFLS program, including the notification of the UFLS entities of implementation schedule, that meet the criteria in Requirement E.A.3 Parts E.A.3.1 through EA3.3.

**M.E.A.4.** Each Planning Coordinator shall have dated evidence such as reports, dynamic simulation models and results, or other dated documentation of its UFLS design assessment that demonstrates it meets Requirement E.A.4 Parts E.A.4.1 through E.A.4.3.

| E #        | Lower VSL | Moderate VSL  | High VSL   | Severe VSL  |
|------------|-----------|---|--|---|
| <b>EA3</b> | N/A       | The Planning Coordinator developed a UFLS program, including a schedule for implementation by UFLS entities within its area, but failed to meet one (1) of the performance characteristic in Parts E.A.3.1, E.A.3.2, or E.A.3.3 in simulations of underfrequency conditions   | The Planning Coordinator developed a UFLS program including a schedule for implementation by UFLS entities within its area, but failed to meet two (2) of the performance characteristic in Parts E.A.3.1, E.A.3.2, or E.A.3.3 in simulations of underfrequency conditions   | The Planning Coordinator developed a UFLS program including a schedule for implementation by UFLS entities within its area, but failed to meet all the performance characteristic in Parts E.A.3.1, E.A.3.2, and E.A.3.3 in simulations of underfrequency conditions<br><br>OR<br><br>The Planning Coordinator failed to develop a UFLS program.  |
| <b>EA4</b> | N/A       | The Planning Coordinator conducted and documented a UFLS assessment at least once every five years that determines through dynamic simulation whether the UFLS program design meets the performance characteristics in Requirement E.A.3 but simulation failed to include one (1) of the items as specified in Parts E.A.4.1, E.A.4.2 or E.A.4.3. | The Planning Coordinator conducted and documented a UFLS assessment at least once every five years that determines through dynamic simulation whether the UFLS program design meets the performance characteristics in Requirement E3 but simulation failed to include two (2) of the items as specified in Parts E.A.4.1, E.A.4.2 or E.A.4.3. | The Planning Coordinator conducted and documented a UFLS assessment at least once every five years that determines through dynamic simulation whether the UFLS program design meets the performance characteristics in Requirement E3 but simulation failed to include all of the items as specified in Parts E.A.4.1, E.A.4.2 and E.A.4.3.<br><br>OR<br><br>The Planning Coordinator failed to conduct and document a UFLS assessment at least once every five years that determines through dynamic simulation whether the UFLS program design meets the performance characteristics in Requirement E.A.3 |

## **E.B. Regional Variance for the Western Electricity Coordinating Council**

The following Interconnection-wide variance shall be applicable in the Western Electricity Coordinating Council (WECC) and replaces, in their entirety, Requirements R1, R2, R3, R4, R5, R11, R12, and R13.

- E.B.1.** Each Planning Coordinator shall participate in a joint regional review with the other Planning Coordinators in the WECC Regional Entity area that develops and documents criteria, including consideration of historical events and system studies, to select portions of the Bulk Electric System (BES) that may form islands. *[VRF: Medium][Time Horizon: Long-term Planning]*
- E.B.2.** Each Planning Coordinator shall identify one or more islands from the regional review (per E.B.1) to serve as a basis for designing a region-wide coordinated UFLS program including: *[VRF: Medium][Time Horizon: Long-term Planning]*
- E.B.2.1.** Those islands selected by applying the criteria in Requirement E.B.1, and
- E.B.2.2.** Any portions of the BES designed to detach from the Interconnection (planned islands) as a result of the operation of a relay scheme or Remedial Action Scheme.
- EB.3.** Each Planning Coordinator shall adopt a UFLS program, coordinated across the WECC Regional Entity area, including notification of and a schedule for implementation by UFLS entities within its area, that meets the following performance characteristics in simulations of underfrequency conditions resulting from an imbalance scenario, where an imbalance =  $[(\text{load} - \text{actual generation output}) / (\text{load})]$ , of up to 25 percent within the identified island(s). *[VRF: High][Time Horizon: Long-term Planning]*
- E.B.3.1.** Frequency shall remain above the Underfrequency Performance Characteristic curve in PRC-006-1(X) - Attachment 1, either for 60 seconds or until a steady-state condition between 59.3 Hz and 60.7 Hz is reached, and
- E.B.3.2.** Frequency shall remain below the Overfrequency Performance Characteristic curve in PRC-006-1(X) - Attachment 1, either for 60 seconds or until a steady-state condition between 59.3 Hz and 60.7 Hz is reached, and
- E.B.3.3.** Volts per Hz (V/Hz) shall not exceed 1.18 per unit for longer than two seconds cumulatively per simulated event, and shall not exceed 1.10 per unit for longer than 45 seconds cumulatively per simulated event at each generator bus and generator step-up transformer high-side bus associated with each of the following:
- E.B.3.3.1.** Individual generating units greater than 20 MVA (gross nameplate rating) directly connected to the BES
- E.B.3.3.2.** Generating plants/facilities greater than 75 MVA (gross aggregate nameplate rating) directly connected to the BES

- E.B.3.3.3.** Facilities consisting of one or more units connected to the BES at a common bus with total generation above 75 MVA gross nameplate rating.
- E.B.4.** Each Planning Coordinator shall participate in and document a coordinated UFLS design assessment with the other Planning Coordinators in the WECC Regional Entity area at least once every five years that determines through dynamic simulation whether the UFLS program design meets the performance characteristics in Requirement E.B.3 for each island identified in Requirement E.B.2. The simulation shall model each of the following: *[VRF: High][Time Horizon: Long-term Planning]*
- E.B.4.1.** Underfrequency trip settings of individual generating units greater than 20 MVA (gross nameplate rating) directly connected to the BES that trip above the Generator Underfrequency Trip Modeling curve in PRC-006-1(X) - Attachment 1.
- E.B.4.2.** Underfrequency trip settings of generating plants/facilities greater than 75 MVA (gross aggregate nameplate rating) directly connected to the BES that trip above the Generator Underfrequency Trip Modeling curve in PRC-006-1(X) - Attachment 1.
- E.B.4.3.** Underfrequency trip settings of any facility consisting of one or more units connected to the BES at a common bus with total generation above 75 MVA (gross nameplate rating) that trip above the Generator Underfrequency Trip Modeling curve in PRC-006-1(X) - Attachment 1.
- E.B.4.4.** Overfrequency trip settings of individual generating units greater than 20 MVA (gross nameplate rating) directly connected to the BES that trip below the Generator Overfrequency Trip Modeling curve in PRC-006-1(X) — Attachment 1.
- E.B.4.5.** Overfrequency trip settings of generating plants/facilities greater than 75 MVA (gross aggregate nameplate rating) directly connected to the BES that trip below the Generator Overfrequency Trip Modeling curve in PRC-006-1(X) — Attachment 1.
- E.B.4.6.** Overfrequency trip settings of any facility consisting of one or more units connected to the BES at a common bus with total generation above 75 MVA (gross nameplate rating) that trip below the Generator Overfrequency Trip Modeling curve in PRC-006-1(X) — Attachment 1.
- E.B.4.7.** Any automatic Load restoration that impacts frequency stabilization and operates within the duration of the simulations run for the assessment.
- E.B.11.** Each Planning Coordinator, in whose area a BES islanding event results in system frequency excursions below the initializing set points of the UFLS program, shall participate in and document a coordinated event assessment with all affected Planning Coordinators to conduct and document an assessment of the

event within one year of event actuation to evaluate: *[VRF: Medium][Time Horizon: Operations Assessment]*

**E.B.11.1.** The performance of the UFLS equipment,

**E.B.11.2** The effectiveness of the UFLS program

**E.B.12.** Each Planning Coordinator, in whose islanding event assessment (per E.B.11) UFLS program deficiencies are identified, shall participate in and document a coordinated UFLS design assessment of the UFLS program with the other Planning Coordinators in the WECC Regional Entity area to consider the identified deficiencies within two years of event actuation. *[VRF: Medium][Time Horizon: Operations Assessment]*

- M.E.B.1.** Each Planning Coordinator shall have evidence such as reports, or other documentation of its criteria, developed as part of the joint regional review with other Planning Coordinators in the WECC Regional Entity area to select portions of the Bulk Electric System that may form islands including how system studies and historical events were considered to develop the criteria per Requirement E.B.1.
- M.E.B.2.** Each Planning Coordinator shall have evidence such as reports, memorandums, e-mails, or other documentation supporting its identification of an island(s), from the regional review (per E.B.1), as a basis for designing a region-wide coordinated UFLS program that meet the criteria in Requirement E.B.2 Parts E.B.2.1 and E.B.2.2.
- M.E.B.3.** Each Planning Coordinator shall have evidence such as reports, memorandums, e-mails, program plans, or other documentation of its adoption of a UFLS program, coordinated across the WECC Regional Entity area, including the notification of the UFLS entities of implementation schedule, that meet the criteria in Requirement E.B.3 Parts E.B.3.1 through E.B.3.3.
- M.E.B.4.** Each Planning Coordinator shall have dated evidence such as reports, dynamic simulation models and results, or other dated documentation of its participation in a coordinated UFLS design assessment with the other Planning Coordinators in the WECC Regional Entity area that demonstrates it meets Requirement E.B.4 Parts E.B.4.1 through E.B.4.7.
- M.E.B.11.** Each Planning Coordinator shall have dated evidence such as reports, data gathered from an historical event, or other dated documentation to show that it participated in a coordinated event assessment of the performance of the UFLS equipment and the effectiveness of the UFLS program per Requirement E.B.11.
- M.E.B.12.** Each Planning Coordinator shall have dated evidence such as reports, data gathered from an historical event, or other dated documentation to show that it participated in a UFLS design assessment per Requirements E.B.12 and E.B.4 if UFLS program deficiencies are identified in E.B.11.

## A. Introduction

1. **Title:** Automatic Underfrequency Load Shedding
2. **Number:** PRC-006-1(X)
3. **Purpose:** To establish design and documentation requirements for automatic underfrequency load shedding (UFLS) programs to arrest declining frequency, assist recovery of frequency following underfrequency events and provide last resort system preservation measures.
4. **Applicability:**
  - 4.1. Planning Coordinators
  - 4.2. UFLS entities shall mean all entities that are responsible for the ownership, operation, or control of UFLS equipment as required by the UFLS program established by the Planning Coordinators. Such entities may include one or more of the following:
    - 4.2.1 Transmission Owners
    - 4.2.2 Distribution Providers
  - 4.3. Transmission Owners that own Elements identified in the UFLS program established by the Planning Coordinators.

5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Deleted: (Proposed)

## B. Requirements

- R1. Each Planning Coordinator shall develop and document criteria, including consideration of historical events and system studies, to select portions of the Bulk Electric System (BES), including interconnected portions of the BES in adjacent Planning Coordinator areas and Regional Entity areas that may form islands. [VRF: Medium][Time Horizon: Long-term Planning]
- R2. Each Planning Coordinator shall identify one or more islands to serve as a basis for designing its UFLS program including: [VRF: Medium][Time Horizon: Long-term Planning]
  - 2.1. Those islands selected by applying the criteria in Requirement R1, and

Deleted: <#>The standard, with the exception of Requirement R4, Parts 4.1 through 4.6, is effective the first day of the first calendar quarter one year after applicable regulatory approvals. ¶  
Parts 4.1 through 4.6 of Requirement R4 shall become effective and enforceable one year following the receipt of generation data as required in PRC-024-1(X), but no sooner than one year following the first day of the first calendar quarter after applicable regulatory approvals of PRC-006-1(X).¶

- 2.2. Any portions of the BES designed to detach from the Interconnection (planned islands) as a result of the operation of a relay scheme or Remedial Action Scheme, and
  - 2.3. A single island that includes all portions of the BES in either the Regional Entity area or the Interconnection in which the Planning Coordinator's area resides. If a Planning Coordinator's area resides in multiple Regional Entity areas, each of those Regional Entity areas shall be identified as an island. Planning Coordinators may adjust island boundaries to differ from Regional Entity area boundaries by mutual consent where necessary for the sole purpose of producing contiguous regional islands more suitable for simulation.
- R3.** Each Planning Coordinator shall develop a UFLS program, including notification of and a schedule for implementation by UFLS entities within its area, that meets the following performance characteristics in simulations of underfrequency conditions resulting from an imbalance scenario, where an imbalance = [(load — actual generation output) / (load)], of up to 25 percent within the identified island(s). [*VRF: High*][*Time Horizon: Long-term Planning*]
- 3.1. Frequency shall remain above the Underfrequency Performance Characteristic curve in PRC-006-1(X) - Attachment 1, either for 60 seconds or until a steady-state condition between 59.3 Hz and 60.7 Hz is reached, and
  - 3.2. Frequency shall remain below the Overfrequency Performance Characteristic curve in PRC-006-1(X) - Attachment 1, either for 60 seconds or until a steady-state condition between 59.3 Hz and 60.7 Hz is reached, and
  - 3.3. Volts per Hz (V/Hz) shall not exceed 1.18 per unit for longer than two seconds cumulatively per simulated event, and shall not exceed 1.10 per unit for longer than 45 seconds cumulatively per simulated event at each generator bus and generator step-up transformer high-side bus associated with each of the following:
    - 3.3.1. Individual generating units greater than 20 MVA (gross nameplate rating) directly connected to the BES
    - 3.3.2. Generating plants/facilities greater than 75 MVA (gross aggregate nameplate rating) directly connected to the BES
    - 3.3.3. Facilities consisting of one or more units connected to the BES at a common bus with total generation above 75 MVA gross nameplate rating.
- R4.** Each Planning Coordinator shall conduct and document a UFLS design assessment at least once every five years that determines through dynamic simulation whether the UFLS program design meets the performance characteristics in Requirement R3 for each island identified in Requirement R2. The simulation shall model each of the following: [*VRF: High*][*Time Horizon: Long-term Planning*]
- 4.1. Underfrequency trip settings of individual generating units greater than 20 MVA (gross nameplate rating) directly connected to the BES that trip above the

Deleted: Special Protection System

- Generator Underfrequency Trip Modeling curve in PRC-006-1(X) - Attachment 1.
- 4.2. Underfrequency trip settings of generating plants/facilities greater than 75 MVA (gross aggregate nameplate rating) directly connected to the BES that trip above the Generator Underfrequency Trip Modeling curve in PRC-006-1(X) - Attachment 1.
  - 4.3. Underfrequency trip settings of any facility consisting of one or more units connected to the BES at a common bus with total generation above 75 MVA (gross nameplate rating) that trip above the Generator Underfrequency Trip Modeling curve in PRC-006-1(X) - Attachment 1.
  - 4.4. Overfrequency trip settings of individual generating units greater than 20 MVA (gross nameplate rating) directly connected to the BES that trip below the Generator Overfrequency Trip Modeling curve in PRC-006-1(X) — Attachment 1.
  - 4.5. Overfrequency trip settings of generating plants/facilities greater than 75 MVA (gross aggregate nameplate rating) directly connected to the BES that trip below the Generator Overfrequency Trip Modeling curve in PRC-006-1(X) — Attachment 1.
  - 4.6. Overfrequency trip settings of any facility consisting of one or more units connected to the BES at a common bus with total generation above 75 MVA (gross nameplate rating) that trip below the Generator Overfrequency Trip Modeling curve in PRC-006-1(X) — Attachment 1.
  - 4.7. Any automatic Load restoration that impacts frequency stabilization and operates within the duration of the simulations run for the assessment.
- R5. Each Planning Coordinator, whose area or portions of whose area is part of an island identified by it or another Planning Coordinator which includes multiple Planning Coordinator areas or portions of those areas, shall coordinate its UFLS program design with all other Planning Coordinators whose areas or portions of whose areas are also part of the same identified island through one of the following: *[VRF: High][Time Horizon: Long-term Planning]*
- Develop a common UFLS program design and schedule for implementation per Requirement R3 among the Planning Coordinators whose areas or portions of whose areas are part of the same identified island, or
  - Conduct a joint UFLS design assessment per Requirement R4 among the Planning Coordinators whose areas or portions of whose areas are part of the same identified island, or
  - Conduct an independent UFLS design assessment per Requirement R4 for the identified island, and in the event the UFLS design assessment fails to meet Requirement R3, identify modifications to the UFLS program(s) to meet

Requirement R3 and report these modifications as recommendations to the other Planning Coordinators whose areas or portions of whose areas are also part of the same identified island and the ERO.

- R6.** Each Planning Coordinator shall maintain a UFLS database containing data necessary to model its UFLS program for use in event analyses and assessments of the UFLS program at least once each calendar year, with no more than 15 months between maintenance activities. *[VRF: Lower][Time Horizon: Long-term Planning]*
- R7.** Each Planning Coordinator shall provide its UFLS database containing data necessary to model its UFLS program to other Planning Coordinators within its Interconnection within 30 calendar days of a request. *[VRF: Lower][Time Horizon: Long-term Planning]*
- R8.** Each UFLS entity shall provide data to its Planning Coordinator(s) according to the format and schedule specified by the Planning Coordinator(s) to support maintenance of each Planning Coordinator's UFLS database. *[VRF: Lower][Time Horizon: Long-term Planning]*
- R9.** Each UFLS entity shall provide automatic tripping of Load in accordance with the UFLS program design and schedule for application determined by its Planning Coordinator(s) in each Planning Coordinator area in which it owns assets. *[VRF: High][Time Horizon: Long-term Planning]*
- R10.** Each Transmission Owner shall provide automatic switching of its existing capacitor banks, Transmission Lines, and reactors to control over-voltage as a result of underfrequency load shedding if required by the UFLS program and schedule for application determined by the Planning Coordinator(s) in each Planning Coordinator area in which the Transmission Owner owns transmission. *[VRF: High][Time Horizon: Long-term Planning]*
- R11.** Each Planning Coordinator, in whose area a BES islanding event results in system frequency excursions below the initializing set points of the UFLS program, shall conduct and document an assessment of the event within one year of event actuation to evaluate: *[VRF: Medium][Time Horizon: Operations Assessment]*
  - 11.1.** The performance of the UFLS equipment,
  - 11.2.** The effectiveness of the UFLS program.
- R12.** Each Planning Coordinator, in whose islanding event assessment (per R11) UFLS program deficiencies are identified, shall conduct and document a UFLS design assessment to consider the identified deficiencies within two years of event actuation. *[VRF: Medium][Time Horizon: Operations Assessment]*
- R13.** Each Planning Coordinator, in whose area a BES islanding event occurred that also included the area(s) or portions of area(s) of other Planning Coordinator(s) in the same islanding event and that resulted in system frequency excursions below the initializing set points of the UFLS program, shall coordinate its event assessment (in accordance

with Requirement R11) with all other Planning Coordinators whose areas or portions of whose areas were also included in the same islanding event through one of the following: *[VRF: Medium][Time Horizon: Operations Assessment]*

- Conduct a joint event assessment per Requirement R11 among the Planning Coordinators whose areas or portions of whose areas were included in the same islanding event, or
- Conduct an independent event assessment per Requirement R11 that reaches conclusions and recommendations consistent with those of the event assessments of the other Planning Coordinators whose areas or portions of whose areas were included in the same islanding event, or
- Conduct an independent event assessment per Requirement R11 and where the assessment fails to reach conclusions and recommendations consistent with those of the event assessments of the other Planning Coordinators whose areas or portions of whose areas were included in the same islanding event, identify differences in the assessments that likely resulted in the differences in the conclusions and recommendations and report these differences to the other Planning Coordinators whose areas or portions of whose areas were included in the same islanding event and the ERO.

**R14.** Each Planning Coordinator shall respond to written comments submitted by UFLS entities and Transmission Owners within its Planning Coordinator area following a comment period and before finalizing its UFLS program, indicating in the written response to comments whether changes will be made or reasons why changes will not be made to the following *[VRF: Lower][Time Horizon: Long-term Planning]*:

**14.1.** UFLS program, including a schedule for implementation

**14.2.** UFLS design assessment

**14.3.** Format and schedule of UFLS data submittal

### **C. Measures**

- M1.** Each Planning Coordinator shall have evidence such as reports, or other documentation of its criteria to select portions of the Bulk Electric System that may form islands including how system studies and historical events were considered to develop the criteria per Requirement R1.
- M2.** Each Planning Coordinator shall have evidence such as reports, memorandums, e-mails, or other documentation supporting its identification of an island(s) as a basis for designing a UFLS program that meet the criteria in Requirement R2, Parts 2.1 through 2.3.
- M3.** Each Planning Coordinator shall have evidence such as reports, memorandums, e-mails, program plans, or other documentation of its UFLS program, including the notification of the UFLS entities of implementation schedule, that meet the criteria in Requirement R3, Parts 3.1 through 3.3.

- M4.** Each Planning Coordinator shall have dated evidence such as reports, dynamic simulation models and results, or other dated documentation of its UFLS design assessment that demonstrates it meets Requirement R4, Parts 4.1 through 4.7.
- M5.** Each Planning Coordinator, whose area or portions of whose area is part of an island identified by it or another Planning Coordinator which includes multiple Planning Coordinator areas or portions of those areas, shall have dated evidence such as joint UFLS program design documents, reports describing a joint UFLS design assessment, letters that include recommendations, or other dated documentation demonstrating that it coordinated its UFLS program design with all other Planning Coordinators whose areas or portions of whose areas are also part of the same identified island per Requirement R5.
- M6.** Each Planning Coordinator shall have dated evidence such as a UFLS database, data requests, data input forms, or other dated documentation to show that it maintained a UFLS database for use in event analyses and assessments of the UFLS program per Requirement R6 at least once each calendar year, with no more than 15 months between maintenance activities.
- M7.** Each Planning Coordinator shall have dated evidence such as letters, memorandums, e-mails or other dated documentation that it provided their UFLS database to other Planning Coordinators within their Interconnection within 30 calendar days of a request per Requirement R7.
- M8.** Each UFLS Entity shall have dated evidence such as responses to data requests, spreadsheets, letters or other dated documentation that it provided data to its Planning Coordinator according to the format and schedule specified by the Planning Coordinator to support maintenance of the UFLS database per Requirement R8.
- M9.** Each UFLS Entity shall have dated evidence such as spreadsheets summarizing feeder load armed with UFLS relays, spreadsheets with UFLS relay settings, or other dated documentation that it provided automatic tripping of load in accordance with the UFLS program design and schedule for application per Requirement R9.
- M10.** Each Transmission Owner shall have dated evidence such as relay settings, tripping logic or other dated documentation that it provided automatic switching of its existing capacitor banks, Transmission Lines, and reactors in order to control over-voltage as a result of underfrequency load shedding if required by the UFLS program and schedule for application per Requirement R10.
- M11.** Each Planning Coordinator shall have dated evidence such as reports, data gathered from an historical event, or other dated documentation to show that it conducted an event assessment of the performance of the UFLS equipment and the effectiveness of the UFLS program per Requirement R11.
- M12.** Each Planning Coordinator shall have dated evidence such as reports, data gathered from an historical event, or other dated documentation to show that it conducted a

UFLS design assessment per Requirements R12 and R4 if UFLS program deficiencies are identified in R11.

- M13.** Each Planning Coordinator, in whose area a BES islanding event occurred that also included the area(s) or portions of area(s) of other Planning Coordinator(s) in the same islanding event and that resulted in system frequency excursions below the initializing set points of the UFLS program, shall have dated evidence such as a joint assessment report, independent assessment reports and letters describing likely reasons for differences in conclusions and recommendations, or other dated documentation demonstrating it coordinated its event assessment (per Requirement R11) with all other Planning Coordinator(s) whose areas or portions of whose areas were also included in the same islanding event per Requirement R13.
- M14.** Each Planning Coordinator shall have dated evidence of responses, such as e-mails and letters, to written comments submitted by UFLS entities and Transmission Owners within its Planning Coordinator area following a comment period and before finalizing its UFLS program per Requirement R14.

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

Regional Entity

#### **1.2. Data Retention**

Each Planning Coordinator and UFLS entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Each Planning Coordinator shall retain the current evidence of Requirements R1, R2, R3, R4, R5, R12, and R14, Measures M1, M2, M3, M4, M5, M12, and M14 as well as any evidence necessary to show compliance since the last compliance audit.
- Each Planning Coordinator shall retain the current evidence of UFLS database update in accordance with Requirement R6, Measure M6, and evidence of the prior year's UFLS database update.
- Each Planning Coordinator shall retain evidence of any UFLS database transmittal to another Planning Coordinator since the last compliance audit in accordance with Requirement R7, Measure M7.
- Each UFLS entity shall retain evidence of UFLS data transmittal to the Planning Coordinator(s) since the last compliance audit in accordance with Requirement R8, Measure M8.

- Each UFLS entity shall retain the current evidence of adherence with the UFLS program in accordance with Requirement R9, Measure M9, and evidence of adherence since the last compliance audit.
- Transmission Owner shall retain the current evidence of adherence with the UFLS program in accordance with Requirement R10, Measure M10, and evidence of adherence since the last compliance audit.
- Each Planning Coordinator shall retain evidence of Requirements R11, and R13, and Measures M11, and M13 for 6 calendar years.

If a Planning Coordinator or UFLS entity is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the retention period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

### **1.3. Compliance Monitoring and Assessment Processes**

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Violation Investigation
- Self-Reporting
- Complaint

### **1.4. Additional Compliance Information**

Not applicable.

## E. Regional Variances

### E.A. Regional Variance for the Quebec Interconnection

The following Interconnection-wide variance shall be applicable in the Quebec Interconnection and replaces, in their entirety, Requirements R3 and R4 and the violation severity levels associated with Requirements R3 and R4.

- E.A.3.** Each Planning Coordinator shall develop a UFLS program, including a schedule for implementation by UFLS entities within its area, that meets the following performance characteristics in simulations of underfrequency conditions resulting from an imbalance scenario, where an imbalance = [(load — actual generation output) / (load)], of up to 25 percent within the identified island(s).  
*[VRF: High][Time Horizon: Long-term Planning]*
- E.A.3.1.** Frequency shall remain above the Underfrequency Performance Characteristic curve in PRC-006-1(X) - Attachment 1A, either for 30 seconds or until a steady-state condition between 59.3 Hz and 60.7 Hz is reached, and
- E.A.3.2.** Frequency shall remain below the Overfrequency Performance Characteristic curve in PRC-006-1(X) - Attachment 1A, either for 30 seconds or until a steady-state condition between 59.3 Hz and 60.7 Hz is reached, and
- E.A.3.3.** Volts per Hz (V/Hz) shall not exceed 1.18 per unit for longer than two seconds cumulatively per simulated event, and shall not exceed 1.10 per unit for longer than 45 seconds cumulatively per simulated event at each generator bus and generator step-up transformer high-side bus associated with each of the following:
- EA.3.3.1.** Individual generating unit greater than 50 MVA (gross nameplate rating) directly connected to the BES
  - EA.3.3.2.** Generating plants/facilities greater than 50 MVA (gross aggregate nameplate rating) directly connected to the BES
  - EA.3.3.3.** Facilities consisting of one or more units connected to the BES at a common bus with total generation above 50 MVA gross nameplate rating.
- E.A.4.** Each Planning Coordinator shall conduct and document a UFLS design assessment at least once every five years that determines through dynamic simulation whether the UFLS program design meets the performance characteristics in Requirement E.A.3 for each island identified in Requirement R2. The simulation shall model each of the following; *[VRF: High][Time Horizon: Long-term Planning]*
- E.A.4.1** Underfrequency trip settings of individual generating units that are part of plants/facilities with a capacity of 50 MVA or more individually or cumulatively (gross nameplate rating), directly

connected to the BES that trip above the Generator Underfrequency Trip Modeling curve in PRC-006-1(X) - Attachment 1A, and

- E.A.4.2** Overfrequency trip settings of individual generating units that are part of plants/facilities with a capacity of 50 MVA or more individually or cumulatively (gross nameplate rating), directly connected to the BES that trip below the Generator Overfrequency Trip Modeling curve in PRC-006-1(X) - Attachment 2A, and
  - E.A.4.3** Any automatic Load restoration that impacts frequency stabilization and operates within the duration of the simulations run for the assessment.
- M.E.A.3.** Each Planning Coordinator shall have evidence such as reports, memorandums, e-mails, program plans, or other documentation of its UFLS program, including the notification of the UFLS entities of implementation schedule, that meet the criteria in Requirement E.A.3 Parts E.A.3.1 through EA3.3.
- M.E.A.4.** Each Planning Coordinator shall have dated evidence such as reports, dynamic simulation models and results, or other dated documentation of its UFLS design assessment that demonstrates it meets Requirement E.A.4 Parts E.A.4.1 through E.A.4.3.

| E # | Lower VSL | Moderate VSL   | High VSL  | Severe VSL   |
|-----|-----------|--|---|--|
| EA3 | N/A       | <p>The Planning Coordinator developed a UFLS program, including a schedule for implementation by UFLS entities within its area, but failed to meet one (1) of the performance characteristic in Parts E.A.3.1, E.A.3.2, or E.A.3.3 in simulations of underfrequency conditions</p>   | <p>The Planning Coordinator developed a UFLS program including a schedule for implementation by UFLS entities within its area, but failed to meet two (2) of the performance characteristic in Parts E.A.3.1, E.A.3.2, or E.A.3.3 in simulations of underfrequency conditions</p>   | <p>The Planning Coordinator developed a UFLS program including a schedule for implementation by UFLS entities within its area, but failed to meet all the performance characteristic in Parts E.A.3.1, E.A.3.2, and E.A.3.3 in simulations of underfrequency conditions</p> <p>OR</p> <p>The Planning Coordinator failed to develop a UFLS program.</p>  |
| EA4 | N/A       | <p>The Planning Coordinator conducted and documented a UFLS assessment at least once every five years that determines through dynamic simulation whether the UFLS program design meets the performance characteristics in Requirement E.A.3 but simulation failed to include one (1) of the items as specified in Parts E.A.4.1, E.A.4.2 or E.A.4.3.</p> | <p>The Planning Coordinator conducted and documented a UFLS assessment at least once every five years that determines through dynamic simulation whether the UFLS program design meets the performance characteristics in Requirement E3 but simulation failed to include two (2) of the items as specified in Parts E.A.4.1, E.A.4.2 or E.A.4.3.</p> | <p>The Planning Coordinator conducted and documented a UFLS assessment at least once every five years that determines through dynamic simulation whether the UFLS program design meets the performance characteristics in Requirement E3 but simulation failed to include all of the items as specified in Parts E.A.4.1, E.A.4.2 and E.A.4.3.</p> <p>OR</p> <p>The Planning Coordinator failed to conduct and document a UFLS assessment at least once every five years that determines through dynamic simulation whether the UFLS program design meets the performance characteristics in Requirement E.A.3</p> |

**E.B. Regional Variance for the Western Electricity Coordinating Council**

The following Interconnection-wide variance shall be applicable in the Western Electricity Coordinating Council (WECC) and replaces, in their entirety, Requirements R1, R2, R3, R4, R5, R11, R12, and R13.

**E.B.1.** Each Planning Coordinator shall participate in a joint regional review with the other Planning Coordinators in the WECC Regional Entity area that develops and documents criteria, including consideration of historical events and system studies, to select portions of the Bulk Electric System (BES) that may form islands. *[VRF: Medium][Time Horizon: Long-term Planning]*

**E.B.2.** Each Planning Coordinator shall identify one or more islands from the regional review (per E.B.1) to serve as a basis for designing a region-wide coordinated UFLS program including: *[VRF: Medium][Time Horizon: Long-term Planning]*

**E.B.2.1.** Those islands selected by applying the criteria in Requirement E.B.1, and

**E.B.2.2.** Any portions of the BES designed to detach from the Interconnection (planned islands) as a result of the operation of a relay scheme or Remedial Action Scheme.

Deleted: Special Protection System

**EB.3.** Each Planning Coordinator shall adopt a UFLS program, coordinated across the WECC Regional Entity area, including notification of and a schedule for implementation by UFLS entities within its area, that meets the following performance characteristics in simulations of underfrequency conditions resulting from an imbalance scenario, where an imbalance = [(load — actual generation output) / (load)], of up to 25 percent within the identified island(s). *[VRF: High][Time Horizon: Long-term Planning]*

**E.B.3.1.** Frequency shall remain above the Underfrequency Performance Characteristic curve in PRC-006-1(X) - Attachment 1, either for 60 seconds or until a steady-state condition between 59.3 Hz and 60.7 Hz is reached, and

**E.B.3.2.** Frequency shall remain below the Overfrequency Performance Characteristic curve in PRC-006-1(X) - Attachment 1, either for 60 seconds or until a steady-state condition between 59.3 Hz and 60.7 Hz is reached, and

**E.B.3.3.** Volts per Hz (V/Hz) shall not exceed 1.18 per unit for longer than two seconds cumulatively per simulated event, and shall not exceed 1.10 per unit for longer than 45 seconds cumulatively per simulated event at each generator bus and generator step-up transformer high-side bus associated with each of the following:

**E.B.3.3.1.** Individual generating units greater than 20 MVA (gross nameplate rating) directly connected to the BES

**E.B.3.3.2.** Generating plants/facilities greater than 75 MVA (gross aggregate nameplate rating) directly connected to the BES

- E.B.3.3.3.** Facilities consisting of one or more units connected to the BES at a common bus with total generation above 75 MVA gross nameplate rating.
- E.B.4.** Each Planning Coordinator shall participate in and document a coordinated UFLS design assessment with the other Planning Coordinators in the WECC Regional Entity area at least once every five years that determines through dynamic simulation whether the UFLS program design meets the performance characteristics in Requirement E.B.3 for each island identified in Requirement E.B.2. The simulation shall model each of the following: [*VRF: High*][*Time Horizon: Long-term Planning*]
- E.B.4.1.** Underfrequency trip settings of individual generating units greater than 20 MVA (gross nameplate rating) directly connected to the BES that trip above the Generator Underfrequency Trip Modeling curve in PRC-006-1(X) - Attachment 1.
- E.B.4.2.** Underfrequency trip settings of generating plants/facilities greater than 75 MVA (gross aggregate nameplate rating) directly connected to the BES that trip above the Generator Underfrequency Trip Modeling curve in PRC-006-1(X) - Attachment 1.
- E.B.4.3.** Underfrequency trip settings of any facility consisting of one or more units connected to the BES at a common bus with total generation above 75 MVA (gross nameplate rating) that trip above the Generator Underfrequency Trip Modeling curve in PRC-006-1(X) - Attachment 1.
- E.B.4.4.** Overfrequency trip settings of individual generating units greater than 20 MVA (gross nameplate rating) directly connected to the BES that trip below the Generator Overfrequency Trip Modeling curve in PRC-006-1(X) — Attachment 1.
- E.B.4.5.** Overfrequency trip settings of generating plants/facilities greater than 75 MVA (gross aggregate nameplate rating) directly connected to the BES that trip below the Generator Overfrequency Trip Modeling curve in PRC-006-1(X) — Attachment 1.
- E.B.4.6.** Overfrequency trip settings of any facility consisting of one or more units connected to the BES at a common bus with total generation above 75 MVA (gross nameplate rating) that trip below the Generator Overfrequency Trip Modeling curve in PRC-006-1(X) — Attachment 1.
- E.B.4.7.** Any automatic Load restoration that impacts frequency stabilization and operates within the duration of the simulations run for the assessment.
- E.B.11.** Each Planning Coordinator, in whose area a BES islanding event results in system frequency excursions below the initializing set points of the UFLS program, shall participate in and document a coordinated event assessment with all affected Planning Coordinators to conduct and document an assessment of the

event within one year of event actuation to evaluate: *[VRF: Medium][Time Horizon: Operations Assessment]*

**E.B.11.1.** The performance of the UFLS equipment,

**E.B.11.2** The effectiveness of the UFLS program

**E.B.12.** Each Planning Coordinator, in whose islanding event assessment (per E.B.11) UFLS program deficiencies are identified, shall participate in and document a coordinated UFLS design assessment of the UFLS program with the other Planning Coordinators in the WECC Regional Entity area to consider the identified deficiencies within two years of event actuation. *[VRF: Medium][Time Horizon: Operations Assessment]*

- M.E.B.1.** Each Planning Coordinator shall have evidence such as reports, or other documentation of its criteria, developed as part of the joint regional review with other Planning Coordinators in the WECC Regional Entity area to select portions of the Bulk Electric System that may form islands including how system studies and historical events were considered to develop the criteria per Requirement E.B.1.
- M.E.B.2.** Each Planning Coordinator shall have evidence such as reports, memorandums, e-mails, or other documentation supporting its identification of an island(s), from the regional review (per E.B.1), as a basis for designing a region-wide coordinated UFLS program that meet the criteria in Requirement E.B.2 Parts E.B.2.1 and E.B.2.2.
- M.E.B.3.** Each Planning Coordinator shall have evidence such as reports, memorandums, e-mails, program plans, or other documentation of its adoption of a UFLS program, coordinated across the WECC Regional Entity area, including the notification of the UFLS entities of implementation schedule, that meet the criteria in Requirement E.B.3 Parts E.B.3.1 through E.B.3.3.
- M.E.B.4.** Each Planning Coordinator shall have dated evidence such as reports, dynamic simulation models and results, or other dated documentation of its participation in a coordinated UFLS design assessment with the other Planning Coordinators in the WECC Regional Entity area that demonstrates it meets Requirement E.B.4 Parts E.B.4.1 through E.B.4.7.
- M.E.B.11.** Each Planning Coordinator shall have dated evidence such as reports, data gathered from an historical event, or other dated documentation to show that it participated in a coordinated event assessment of the performance of the UFLS equipment and the effectiveness of the UFLS program per Requirement E.B.11.
- M.E.B.12.** Each Planning Coordinator shall have dated evidence such as reports, data gathered from an historical event, or other dated documentation to show that it participated in a UFLS design assessment per Requirements E.B.12 and E.B.4 if UFLS program deficiencies are identified in E.B.11.

**A. Introduction**

1. **Title:** Remedial Action Scheme Review Procedure
2. **Number:** PRC-012-0(X)
3. **Purpose:** To ensure that all Remedial Action Schemes (RAS) are properly designed, meet performance requirements, and are coordinated with other protection systems. To ensure that maintenance and testing programs are developed and misoperations are analyzed and corrected.
4. **Applicability:**
  - 4.1. Regional Reliability Organization
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**B. Requirements**

- R1. Each Regional Reliability Organization with a Transmission Owner, Generator Owner, or Distribution Providers that uses or is planning to use a RAS shall have a documented Regional Reliability Organization RAS review procedure to ensure that RAS comply with Regional criteria and NERC Reliability Standards. The Regional RAS review procedure shall include:
  - R1.1. Description of the process for submitting a proposed RAS for Regional Reliability Organization review.
  - R1.2. Requirements to provide data that describes design, operation, and modeling of a RAS.
  - R1.3. Requirements to demonstrate that the RAS shall be designed so that a single RAS component failure, when the RAS was intended to operate, does not prevent the interconnected transmission system from meeting the performance requirements defined in Reliability Standards TPL-001-0, TPL-002-0, and TPL-003-0.
  - R1.4. Requirements to demonstrate that the inadvertent operation of a RAS shall meet the same performance requirement (TPL-001-0, TPL-002-0, and TPL-003-0) as that required of the contingency for which it was designed, and not exceed TPL-003-0.
  - R1.5. Requirements to demonstrate the proposed RAS will coordinate with other protection and control systems and applicable Regional Reliability Organization Emergency procedures.
  - R1.6. Regional Reliability Organization definition of misoperation.
  - R1.7. Requirements for analysis and documentation of corrective action plans for all RAS misoperations.
  - R1.8. Identification of the Regional Reliability Organization group responsible for the Regional Reliability Organization's review procedure and the process for Regional Reliability Organization approval of the procedure.
  - R1.9. Determination, as appropriate, of maintenance and testing requirements.

- R2.** The Regional Reliability Organization shall provide affected Regional Reliability Organizations and NERC with documentation of its RAS review procedure on request (within 30 calendar days).

**C. Measures**

- M1.** The Regional Reliability Organization with a Transmission Owner, Generator Owner, or Distribution Provider using or planning to use a RAS shall have a documented Regional review procedure as defined in Reliability Standard PRC-012-0(X)\_R1.
- M2.** The Regional Reliability Organization shall have evidence it provided affected Regional Reliability Organizations and NERC with documentation of its RAS review procedure on request (within 30 calendar days).

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Compliance Monitor: NERC.

**1.2. Compliance Monitoring Period and Reset Timeframe**

On request (within 30 calendar days.)

**1.3. Data Retention**

None specified.

**1.4. Additional Compliance Information**

None.

**2. Levels of Non-Compliance**

- 2.1. Level 1:** Documentation of the Regional Reliability Organization’s procedure is missing one of the items listed in Reliability Standard PRC-012-0(X)\_R1.
- 2.2. Level 2:** Documentation of the Regional Reliability Organization’s procedure is missing two of the items listed in Reliability Standard PRC-012-0(X)\_R1.
- 2.3. Level 3:** Documentation of the Regional Reliability Organization’s procedure is missing three of the items listed in Reliability Standard PRC-012-0(X)\_R1.
- 2.4. Level 4:** Documentation of the Regional Reliability Organization’s procedure was not provided or is missing four or more of the items listed in Reliability Standard PRC-012-0(X)\_R1.

**E. Regional Differences**

- 1.** None identified.

Standard PRC-012-0(X) — Remedial Action Scheme Review Procedure

A. Introduction

- 1. Title: Remedial Action Scheme Review Procedure
- 2. Number: PRC-012-0(X)
- 3. Purpose: To ensure that all Remedial Action Schemes (RAS) are properly designed, meet performance requirements, and are coordinated with other protection systems. To ensure that maintenance and testing programs are developed and misoperations are analyzed and corrected.
- 4. Applicability:
  - 4.1. Regional Reliability Organization
- 5. Effective Date: This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Deleted: Special Protection Systems (SPS)

Deleted: April 1, 2005

B. Requirements

- R1. Each Regional Reliability Organization with a Transmission Owner, Generator Owner, or Distribution Providers that uses or is planning to use a RAS shall have a documented Regional Reliability Organization RAS review procedure to ensure that RAS comply with Regional criteria and NERC Reliability Standards. The Regional RAS review procedure shall include:
  - R1.1. Description of the process for submitting a proposed RAS for Regional Reliability Organization review.
  - R1.2. Requirements to provide data that describes design, operation, and modeling of a RAS.
  - R1.3. Requirements to demonstrate that the RAS shall be designed so that a single RAS component failure, when the RAS was intended to operate, does not prevent the interconnected transmission system from meeting the performance requirements defined in Reliability Standards TPL-001-0, TPL-002-0, and TPL-003-0.
  - R1.4. Requirements to demonstrate that the inadvertent operation of a RAS shall meet the same performance requirement (TPL-001-0, TPL-002-0, and TPL-003-0) as that required of the contingency for which it was designed, and not exceed TPL-003-0.
  - R1.5. Requirements to demonstrate the proposed RAS will coordinate with other protection and control systems and applicable Regional Reliability Organization Emergency procedures.
  - R1.6. Regional Reliability Organization definition of misoperation.
  - R1.7. Requirements for analysis and documentation of corrective action plans for all RAS misoperations.
  - R1.8. Identification of the Regional Reliability Organization group responsible for the Regional Reliability Organization's review procedure and the process for Regional Reliability Organization approval of the procedure.
  - R1.9. Determination, as appropriate, of maintenance and testing requirements.

Effective Date: April 1, 2005

## A. Introduction

1. **Title:** Remedial Action Scheme Database.
2. **Number:** PRC-013-0(X)
3. **Purpose:** To ensure that all Remedial Action Schemes (RAS) are properly designed, meet performance requirements, and are coordinated with other protection systems.
4. **Applicability:**
  - 4.1. Regional Reliability Organization
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

## B. Requirements

- R1. The Regional Reliability Organization that has a Transmission Owner, Generator Owner, or Distribution Provider with a RAS installed shall maintain a RAS database. The database shall include the following types of information:
  - R1.1. Design Objectives — Contingencies and system conditions for which the RAS was designed,
  - R1.2. Operation — The actions taken by the RAS in response to Disturbance conditions, and
  - R1.3. Modeling — Information on detection logic or relay settings that control operation of the RAS.
- R2. The Regional Reliability Organization shall provide to affected Regional Reliability Organization(s) and NERC documentation of its database or the information therein on request (within 30 calendar days).

## C. Measures

- M1. The Regional Reliability Organization that has a Transmission Owner, Generator Owner, or Distribution Providers with a RAS installed, shall have a RAS database as defined in PRC-013-0(X)\_R1 of this Reliability Standard.
- M2. The Regional Reliability Organization shall have evidence it provided documentation of its database or the information therein, to affected Regional Reliability Organization(s) and NERC on request (within 30 calendar days).

## D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

Compliance Monitor: NERC.
  - 1.2. **Compliance Monitoring Period and Reset Timeframe**

On request (within 30 calendar days.)

**1.3. Data Retention**

None specified.

**1.4. Additional Compliance Information**

None.

**2. Levels of Non-Compliance**

**2.1. Level 1:** The Regional Reliability Organization’s database is missing one of the items listed in Reliability Standard PRC-013-0(X)\_R1.

**2.2. Level 2:** The Regional Reliability Organization’s database is missing two of the items listed in Reliability Standard PRC-013-0(X)\_R1.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** The Regional Reliability Organization’s database was not provided or is missing all of the elements listed in Reliability Standard PRC-013-0(X)\_R1.

**E. Regional Differences**

1. None identified.

**A. Introduction**

- 1. Title:** Remedial Action Scheme Data and Documentation
- 2. Number:** PRC-015-0(X)
- 3. Purpose:** To ensure that all Remedial Action Schemes (RAS) are properly designed, meet performance requirements, and are coordinated with other protection systems. To ensure that maintenance and testing programs are developed and misoperations are analyzed and corrected.
- 4. Applicability:**
  - 4.1.** Transmission Owner that owns a RAS
  - 4.2.** Generator Owner that owns a RAS
  - 4.3.** Distribution Provider that owns a RAS
- 5. Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**B. Requirements**

- R1.** The Transmission Owner, Generator Owner, and Distribution Provider that owns a RAS shall maintain a list of and provide data for existing and proposed RAS as specified in Reliability Standard PRC-013-0(X)\_R1.
- R2.** The Transmission Owner, Generator Owner, and Distribution Provider that owns a RAS shall have evidence it reviewed new or functionally modified RAS in accordance with the Regional Reliability Organization's procedures as defined in Reliability Standard PRC-012-0(X)\_R1 prior to being placed in service.
- R3.** The Transmission Owner, Generator Owner, and Distribution Provider that owns a RAS shall provide documentation of RAS data and the results of Studies that show compliance of new or functionally modified RAS with NERC Reliability Standards and Regional Reliability Organization criteria to affected Regional Reliability Organizations and NERC on request (within 30 calendar days).

**C. Measures**

- M1.** The Transmission Owner, Generator Owner, and Distribution Provider that owns a RAS shall have evidence it maintains a list of and provides data for existing and proposed RAS as defined in Reliability Standard PRC-013-0(X)\_R1.
- M2.** The Transmission Owner, Generator Owner, and Distribution Provider that owns a RAS shall have evidence it reviewed new or functionally modified RAS in accordance with the Regional Reliability Organization's procedures as defined in Reliability Standard PRC-012-0(X)\_R1 prior to being placed in service.
- M3.** The Transmission Owner, Generator Owner, and Distribution Provider that owns a RAS shall have evidence it provided documentation of RAS data and the results of studies that show compliance of new or functionally modified RAS with NERC standards and Regional

Reliability Organization criteria to affected Regional Reliability Organizations and NERC on request (within 30 calendar days).

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Compliance Monitor: Regional Reliability Organization.

**1.2. Compliance Monitoring Period and Reset Timeframe**

On request (within 30 calendar days).

**1.3. Data Retention**

None specified.

**1.4. Additional Compliance Information**

None.

**2. Levels of Non-Compliance**

**2.1. Level 1:** RAS owners provided RAS data, but was incomplete according to the Regional Reliability Organization RAS database requirements.

**2.2. Level 2:** RAS owners provided results of studies that show compliance of new or functionally modified RAS with the NERC Planning Standards and Regional Reliability Organization criteria, but were incomplete according to the Regional Reliability Organization procedures for Reliability Standard PRC-012-0(X)\_R1.

**2.3. Level 3:** Not applicable.

**2.4. Deleted: Adopted by NERC Board of Trustees: February 8, 2005

Deleted: Effective Date: April 1, 2005

### A. Introduction

1. **Title: Remedial Action Scheme Misoperations**
2. **Number:** PRC-016-0.1(X)
3. **Purpose:** To ensure that all Remedial Action Schemes (RAS) are properly designed, meet performance requirements, and are coordinated with other protection systems. To ensure that maintenance and testing programs are developed and misoperations are analyzed and corrected.
4. **Applicability:**
  - 4.1. Transmission Owner that owns a RAS.
  - 4.2. Generator Owner that owns a RAS.
  - 4.3. Distribution Provider that owns a RAS.
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

### B. Requirements

- R1. The Transmission Owner, Generator Owner, and Distribution Provider that owns a RAS shall analyze its RAS operations and maintain a record of all misoperations in accordance with the Regional RAS review procedure specified in Reliability Standard PRC-012-0(X)\_R1.
- R2. The Transmission Owner, Generator Owner, and Distribution Provider that owns a RAS shall take corrective actions to avoid future misoperations.
- R3. The Transmission Owner, Generator Owner, and Distribution Provider that owns a RAS shall provide documentation of the misoperation analyses and the corrective action plans to its Regional Reliability Organization and NERC on request (within 90 calendar days).

### C. Measures

- M1. The Transmission Owner, Generator Owner, and Distribution Provider that owns a RAS shall have evidence it analyzed RAS operations and maintained a record of all misoperations in accordance with the Regional RAS review procedure specified in Reliability Standard PRC-012-0(X)\_R1.
- M2. The Transmission Owner, Generator Owner, and Distribution Provider that owns a RAS shall have evidence it took corrective actions to avoid future misoperations.

- M3.** The Transmission Owner, Generator Owner, and Distribution Provider that owns a RAS shall have evidence it provided documentation of the misoperation analyses and the corrective action plans to the affected Regional Reliability Organization and NERC on request (within 90 calendar days).

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Compliance Monitor: Regional Reliability Organization.

**1.2. Compliance Monitoring Period and Reset Time Frame**

On request [within 90 calendar days of the incident or on request (within 30 calendar days) if requested more than 90 calendar days after the incident.]

**1.3. Data Retention**

None specified.

**1.4. Additional Compliance Information**

None.

**2. Levels of Non-Compliance**

**2.1. Level 1:** Documentation of RAS misoperations is complete but documentation of corrective actions taken for all identified RAS misoperations is incomplete.

**2.2. Level 2:** Documentation of corrective actions taken for RAS misoperations is complete but documentation of RAS misoperations is incomplete.

**2.3. Level 3:** Documentation of RAS misoperations and corrective actions is incomplete.

**2.4. Level 4:** No documentation of RAS misoperations or corrective actions.

**E. Regional Differences**

None identified.

Deleted: Adopted by NERC Board of Trustees: February 8, 2005

Deleted: ¶  
Effective Date: April 1, 2005

## A. Introduction

1. **Title:** Under-Voltage Load Shedding Program Database
2. **Number:** PRC-020-1(X)
3. **Purpose:** Ensure that a regional database is maintained for Under-Voltage Load Shedding (UVLS) programs implemented by entities within the Region to mitigate the risk of voltage collapse or voltage instability in the Bulk Electric System (BES). Ensure the UVLS database is available for Regional studies and for dynamic studies and simulations of the BES.
4. **Applicability**
  - 4.1. Regional Reliability Organization with entities that own or operate a UVLS program.
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

## B. Requirements

- R1. The Regional Reliability Organization shall establish, maintain and annually update a database for UVLS programs implemented by entities within the region to mitigate the risk of voltage collapse or voltage instability in the BES. This database shall include the following items:
  - R1.1. Owner and operator of the UVLS program.
  - R1.2. Size and location of customer load, or percent of connected load, to be interrupted.
  - R1.3. Corresponding voltage set points and overall scheme clearing times.
  - R1.4. Time delay from initiation to trip signal.
  - R1.5. Breaker operating times.
  - R1.6. Any other schemes that are part of or impact the UVLS programs such as related generation protection, islanding schemes, automatic load restoration schemes, UFLS and Remedial Action Schemes.
- R2. The Regional Reliability Organization shall provide the information in its UVLS database to the Planning Authority, the Transmission Planner, or other Regional Reliability Organizations and to NERC within 30 calendar days of a request.

## C. Measures

- M1. The Regional Reliability Organization shall have evidence that it established and annually updated its UVLS database to include all elements in Requirement 1.1 through 1.6.
- M2. The Regional Reliability Organization shall have evidence that it provided the information in its UVLS database to the requesting entities and to NERC in accordance with Requirement 2.

## D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

## Standard PRC-020-1(X) — Under-Voltage Load Shedding Program Database

NERC

### 1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

### 1.3. Data Retention

The Regional Reliability Organization shall retain the current and prior annual updated database. The Compliance Monitor shall retain all audit data for three years.

### 1.4. Additional Compliance Information

The Regional Reliability Organization shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

## 2. Levels of Non-Compliance

**2.1. Level 1:** Did not update its UVLS database annually.

**2.2. Level 2:** UVLS program database information provided, but did not include all of the items identified in R1.1 through R1.6.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** Did not provide information from its UVLS program database.

## E. Regional Differences

## Standard PRC-020-1(X) — Under-Voltage Load Shedding Program Database

### A. Introduction

1. **Title:** Under-Voltage Load Shedding Program Database
2. **Number:** PRC-020-1(X)
3. **Purpose:** Ensure that a regional database is maintained for Under-Voltage Load Shedding (UVLS) programs implemented by entities within the Region to mitigate the risk of voltage collapse or voltage instability in the Bulk Electric System (BES). Ensure the UVLS database is available for Regional studies and for dynamic studies and simulations of the BES.
4. **Applicability**
  - 4.1. Regional Reliability Organization with entities that own or operate a UVLS program.
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Deleted: May 1, 2006

### B. Requirements

- R1. The Regional Reliability Organization shall establish, maintain and annually update a database for UVLS programs implemented by entities within the region to mitigate the risk of voltage collapse or voltage instability in the BES. This database shall include the following items:
  - R1.1. Owner and operator of the UVLS program.
  - R1.2. Size and location of customer load, or percent of connected load, to be interrupted.
  - R1.3. Corresponding voltage set points and overall scheme clearing times.
  - R1.4. Time delay from initiation to trip signal.
  - R1.5. Breaker operating times.
  - R1.6. Any other schemes that are part of or impact the UVLS programs such as related generation protection, islanding schemes, automatic load restoration schemes, UFLS and Remedial Action Schemes.
- R2. The Regional Reliability Organization shall provide the information in its UVLS database to the Planning Authority, the Transmission Planner, or other Regional Reliability Organizations and to NERC within 30 calendar days of a request.

Deleted: Special Protection System

### C. Measures

- M1. The Regional Reliability Organization shall have evidence that it established and annually updated its UVLS database to include all elements in Requirement 1.1 through 1.6.
- M2. The Regional Reliability Organization shall have evidence that it provided the information in its UVLS database to the requesting entities and to NERC in accordance with Requirement 2.

### D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

Deleted: Adopted by Board of Trustees: February 7, 2006

Deleted: -

Deleted: Effective Date: May 1, 2006

**Standard PRC-020-1(X) — Under-Voltage Load Shedding Program Database**

NERC

**1.2. Compliance Monitoring Period and Reset Time Frame**

One calendar year.

**1.3. Data Retention**

The Regional Reliability Organization shall retain the current and prior annual updated database. The Compliance Monitor shall retain all audit data for three years.

**1.4. Additional Compliance Information**

The Regional Reliability Organization shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

**2. Levels of Non-Compliance**

**2.1. Level 1:** Did not update its UVLS database annually.

**2.2. Level 2:** UVLS program database information provided, but did not include all of the items identified in R1.1 through R1.6.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** Did not provide information from its UVLS program database.

**E. Regional Differences**

None identified.

### A. Introduction

1. **Title:** Under-Voltage Load Shedding Program Data
2. **Number:** PRC-021-1(X)
3. **Purpose:** Ensure data is provided to support the Regional database maintained for Under-Voltage Load Shedding (UVLS) programs that were implemented to mitigate the risk of voltage collapse or voltage instability in the Bulk Electric System (BES).
4. **Applicability**
  - 4.1. Transmission Owner that owns a UVLS program.
  - 4.2. Distribution Provider that owns a UVLS program.
5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

### B. Requirements

- R1. Each Transmission Owner and Distribution Provider that owns a UVLS program to mitigate the risk of voltage collapse or voltage instability in the BES shall annually update its UVLS data to support the Regional UVLS program database. The following data shall be provided to the Regional Reliability Organization for each installed UVLS system:
  - R1.1. Size and location of customer load, or percent of connected load, to be interrupted.
  - R1.2. Corresponding voltage set points and overall scheme clearing times.
  - R1.3. Time delay from initiation to trip signal.
  - R1.4. Breaker operating times.
  - R1.5. Any other schemes that are part of or impact the UVLS programs such as related generation protection, islanding schemes, automatic load restoration schemes, UFLS and Remedial Action Schemes.
- R2. Each Transmission Owner and Distribution Provider that owns a UVLS program shall provide its UVLS program data to the Regional Reliability Organization within 30 calendar days of a request.

### C. Measures

- M1. Each Transmission Owner and Distribution Provider that owns a UVLS program shall have documentation that its UVLS data was updated annually and includes all items specified in Requirement 1.1 through 1.5.
- M2. Each Transmission Owner and Distribution Provider that owns a UVLS program shall have evidence it provided the Regional Reliability Organization with its UVLS program data within 30 calendar days of a request.

### D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

## Standard PRC-021-1(X) — Under-Voltage Load Shedding Program Data

Regional Reliability Organization.

### 1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

### 1.3. Data Retention

Each Transmission Owner and Distribution Provider that owns a UVLS program shall retain a copy of the data submitted over the past two years.

The Compliance Monitor shall retain all audit data for three years.

### 1.4. Additional Compliance Information

Transmission Owner and Distribution Provider shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

## 2. Levels of Non-Compliance

**2.1. Level 1:** Did not update its UVLS data annually.

**2.2. Level 2:** UVLS data was provided, but did not address one of the items identified in R1.1 through R1.5.

**2.3. Level 3:** UVLS data was provided, but did not address two or more of the items identified in R1.1 through R1.5.

**2.4. Level 4:** Did not provide any UVLS data.

## E. Regional Differences

None identified.

**A. Introduction**

**1. Title: Transmission Relay Loadability**

**2. Number:** PRC-023-2(X)

**3. Purpose:** Protective relay settings shall not limit transmission loadability; not interfere with system operators' ability to take remedial action to protect system reliability and; be set to reliably detect all fault conditions and protect the electrical network from these faults.

**4. Applicability**

**4.1. Functional Entity**

**4.1.1** Transmission Owners with load-responsive phase protection systems as described in PRC-023-2(X) - Attachment A, applied to circuits defined in 4.2.1 (*Circuits Subject to Requirements R1 – R5*).

**4.1.2** Generator Owners with load-responsive phase protection systems as described in PRC-023-2(X) - Attachment A, applied to circuits defined in 4.2.1 (*Circuits Subject to Requirements R1 – R5*).

**4.1.3** Distribution Providers with load-responsive phase protection systems as described in PRC-023-2(X) - Attachment A, applied to circuits defined in 4.2.1 (*Circuits Subject to Requirements R1 – R5*), provided those circuits have bi-directional flow capabilities.

**4.1.4** Planning Coordinators

**4.2. Circuits**

**4.2.1 Circuits Subject to Requirements R1 – R5**

**4.2.1.1** Transmission lines operated at 200 kV and above.

**4.2.1.2** Transmission lines operated at 100 kV to 200 kV selected by the Planning Coordinator in accordance with R6.

**4.2.1.3** Transmission lines operated below 100 kV that are part of the BES and selected by the Planning Coordinator in accordance with R6.

**4.2.1.4** Transformers with low voltage terminals connected at 200 kV and above.

**4.2.1.5** Transformers with low voltage terminals connected at 100 kV to 200 kV selected by the Planning Coordinator in accordance with R6.

**4.2.1.6** Transformers with low voltage terminals connected below 100 kV that are part of the BES and selected by the Planning Coordinator in accordance with R6.

**4.2.2 Circuits Subject to Requirement R6**

**4.2.2.1** Transmission lines operated at 100 kV to 200 kV and transformers with low voltage terminals connected at 100 kV to 200 kV

**4.2.2.2** Transmission lines operated below 100 kV and transformers with low voltage terminals connected below 100 kV that are part of the BES

**5. Effective Dates:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the

## **Standard PRC-023-2(X) — Transmission Relay Loadability**

---

standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**B. Requirements**

**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall use any one of the following criteria (Requirement R1, criteria 1 through 13) for any specific circuit terminal to prevent its phase protective relay settings from limiting transmission system loadability while maintaining reliable protection of the BES for all fault conditions. Each Transmission Owner, Generator Owner, and Distribution Provider shall evaluate relay loadability at 0.85 per unit voltage and a power factor angle of 30 degrees. [*Violation Risk Factor: High*] [*Time Horizon: Long Term Planning*].

**Criteria:**

1. Set transmission line relays so they do not operate at or below 150% of the highest seasonal Facility Rating of a circuit, for the available defined loading duration nearest 4 hours (expressed in amperes).
2. Set transmission line relays so they do not operate at or below 115% of the highest seasonal 15-minute Facility Rating<sup>1</sup> of a circuit (expressed in amperes).
3. Set transmission line relays so they do not operate at or below 115% of the maximum theoretical power transfer capability (using a 90-degree angle between the sending-end and receiving-end voltages and either reactance or complex impedance) of the circuit (expressed in amperes) using one of the following to perform the power transfer calculation:
  - An infinite source (zero source impedance) with a 1.00 per unit bus voltage at each end of the line.
  - An impedance at each end of the line, which reflects the actual system source impedance with a 1.05 per unit voltage behind each source impedance.
4. Set transmission line relays on series compensated transmission lines so they do not operate at or below the maximum power transfer capability of the line, determined as the greater of:
  - 115% of the highest emergency rating of the series capacitor.
  - 115% of the maximum power transfer capability of the circuit (expressed in amperes), calculated in accordance with Requirement R1, criterion 3, using the full line inductive reactance.
5. Set transmission line relays on weak source systems so they do not operate at or below 170% of the maximum end-of-line three-phase fault magnitude (expressed in amperes).
6. Set transmission line relays applied on transmission lines connected to generation stations remote to load so they do not operate at or below 230% of the aggregated generation nameplate capability.
7. Set transmission line relays applied at the load center terminal, remote from generation stations, so they do not operate at or below 115% of the maximum current flow from the load to the generation source under any system configuration.

---

<sup>1</sup> When a 15-minute rating has been calculated and published for use in real-time operations, the 15-minute rating can be used to establish the loadability requirement for the protective relays.

8. Set transmission line relays applied on the bulk system-end of transmission lines that serve load remote to the system so they do not operate at or below 115% of the maximum current flow from the system to the load under any system configuration.
9. Set transmission line relays applied on the load-end of transmission lines that serve load remote to the bulk system so they do not operate at or below 115% of the maximum current flow from the load to the system under any system configuration.
10. Set transformer fault protection relays and transmission line relays on transmission lines terminated only with a transformer so that the relays do not operate at or below the greater of:
  - 150% of the applicable maximum transformer nameplate rating (expressed in amperes), including the forced cooled ratings corresponding to all installed supplemental cooling equipment.
  - 115% of the highest operator established emergency transformer rating
- 10.1 Set load responsive transformer fault protection relays, if used, such that the protection settings do not expose the transformer to a fault level and duration that exceeds the transformer's mechanical withstand capability<sup>2</sup>.
11. For transformer overload protection relays that do not comply with the loadability component of Requirement R1, criterion 10 set the relays according to one of the following:
  - Set the relays to allow the transformer to be operated at an overload level of at least 150% of the maximum applicable nameplate rating, or 115% of the highest operator established emergency transformer rating, whichever is greater, for at least 15 minutes to provide time for the operator to take controlled action to relieve the overload.
  - Install supervision for the relays using either a top oil or simulated winding hot spot temperature element set no less than 100° C for the top oil temperature or no less than 140° C for the winding hot spot temperature<sup>3</sup>.
12. When the desired transmission line capability is limited by the requirement to adequately protect the transmission line, set the transmission line distance relays to a maximum of 125% of the apparent impedance (at the impedance angle of the transmission line) subject to the following constraints:
  - a. Set the maximum torque angle (MTA) to 90 degrees or the highest supported by the manufacturer.
  - b. Evaluate the relay loadability in amperes at the relay trip point at 0.85 per unit voltage and a power factor angle of 30 degrees.

---

<sup>2</sup> As illustrated by the “dotted line” in IEEE C57.109-1993 - *IEEE Guide for Liquid-Immersed Transformer Through-Fault-Current Duration*, Clause 4.4, Figure 4

<sup>3</sup> IEEE standard C57.91, Tables 7 and 8, specify that transformers are to be designed to withstand a winding hot spot temperature of 180 degrees C, and Annex A cautions that bubble formation may occur above 140 degrees C.

## Standard PRC-023-2(X) — Transmission Relay Loadability

---

- c. Include a relay setting component of 87% of the current calculated in Requirement R1, criterion 12 in the Facility Rating determination for the circuit.
- 13.** Where other situations present practical limitations on circuit capability, set the phase protection relays so they do not operate at or below 115% of such limitations.
- R2.** Each Transmission Owner, Generator Owner, and Distribution Provider shall set its out-of-step blocking elements to allow tripping of phase protective relays for faults that occur during the loading conditions used to verify transmission line relay loadability per Requirement R1. *[Violation Risk Factor: High] [Time Horizon: Long Term Planning]*
- R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that uses a circuit capability with the practical limitations described in Requirement R1, criterion 6, 7, 8, 9, 12, or 13 shall use the calculated circuit capability as the Facility Rating of the circuit and shall obtain the agreement of the Planning Coordinator, Transmission Operator, and Reliability Coordinator with the calculated circuit capability. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning]*
- R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that chooses to use Requirement R1 criterion 2 as the basis for verifying transmission line relay loadability shall provide its Planning Coordinator, Transmission Operator, and Reliability Coordinator with an updated list of circuits associated with those transmission line relays at least once each calendar year, with no more than 15 months between reports. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]*
- R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that sets transmission line relays according to Requirement R1 criterion 12 shall provide an updated list of the circuits associated with those relays to its Regional Entity at least once each calendar year, with no more than 15 months between reports, to allow the ERO to compile a list of all circuits that have protective relay settings that limit circuit capability. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]*
- R6.** Each Planning Coordinator shall conduct an assessment at least once each calendar year, with no more than 15 months between assessments, by applying the criteria in Attachment B to determine the circuits in its Planning Coordinator area for which Transmission Owners, Generator Owners, and Distribution Providers must comply with Requirements R1 through R5. The Planning Coordinator shall: *[Violation Risk Factor: High] [Time Horizon: Long Term Planning]*
- 6.1** Maintain a list of circuits subject to PRC-023-2(X) per application of Attachment B, including identification of the first calendar year in which any criterion in Attachment B applies.
- 6.2** Provide the list of circuits to all Regional Entities, Reliability Coordinators, Transmission Owners, Generator Owners, and Distribution Providers within its Planning Coordinator area within 30 calendar days of the establishment of the initial list and within 30 calendar days of any changes to that list.

### C. Measures

- M1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence such as spreadsheets or summaries of calculations to show that each of its transmission relays is set according to one of the criteria in Requirement R1, criterion 1 through 13 and shall have evidence such as coordination curves or summaries of calculations that show that relays set per criterion 10 do not expose the transformer to fault levels and durations beyond those indicated in the standard. (R1)

- M2.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence such as spreadsheets or summaries of calculations to show that each of its out-of-step blocking elements is set to allow tripping of phase protective relays for faults that occur during the loading conditions used to verify transmission line relay loadability per Requirement R1. (R2)
- M3.** Each Transmission Owner, Generator Owner, and Distribution Provider with transmission relays set according to Requirement R1, criterion 6, 7, 8, 9, 12, or 13 shall have evidence such as Facility Rating spreadsheets or Facility Rating database to show that it used the calculated circuit capability as the Facility Rating of the circuit and evidence such as dated correspondence that the resulting Facility Rating was agreed to by its associated Planning Coordinator, Transmission Operator, and Reliability Coordinator. (R3)
- M4.** Each Transmission Owner, Generator Owner, or Distribution Provider that sets transmission line relays according to Requirement R1, criterion 2 shall have evidence such as dated correspondence to show that it provided its Planning Coordinator, Transmission Operator, and Reliability Coordinator with an updated list of circuits associated with those transmission line relays within the required timeframe. The updated list may either be a full list, a list of incremental changes to the previous list, or a statement that there are no changes to the previous list. (R4)
- M5.** Each Transmission Owner, Generator Owner, or Distribution Provider that sets transmission line relays according to Requirement R1, criterion 12 shall have evidence such as dated correspondence that it provided an updated list of the circuits associated with those relays to its Regional Entity within the required timeframe. The updated list may either be a full list, a list of incremental changes to the previous list, or a statement that there are no changes to the previous list. (R5)
- M6.** Each Planning Coordinator shall have evidence such as power flow results, calculation summaries, or study reports that it used the criteria established within Attachment B to determine the circuits in its Planning Coordinator area for which applicable entities must comply with the standard as described in Requirement R6. The Planning Coordinator shall have a dated list of such circuits and shall have evidence such as dated correspondence that it provided the list to the Regional Entities, Reliability Coordinators, Transmission Owners, Generator Owners, and Distribution Providers within its Planning Coordinator area within the required timeframe.

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Monitoring Responsibility**

- For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.
- For functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

#### **1.2. Data Retention**

The Transmission Owner, Generator Owner, Distribution Provider and Planning Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Transmission Owner, Generator Owner, and Distribution Provider shall each retain documentation to demonstrate compliance with Requirements R1 through R5 for three calendar years.

The Planning Coordinator shall retain documentation of the most recent review process required in R6. The Planning Coordinator shall retain the most recent list of circuits in its Planning Coordinator area for which applicable entities must comply with the standard, as determined per R6.

If a Transmission Owner, Generator Owner, Distribution Provider or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time specified above, whichever is longer.

The Compliance Monitor shall keep the last audit record and all requested and submitted subsequent audit records.

**1.3. Compliance Monitoring and Assessment Processes**

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Violation Investigation
- Self-Reporting
- Complaint

**1.4. Additional Compliance Information**

None.

2. Violation Severity Levels:

| Requirement | Lower | Moderate | High | Severe   |
|-------------|-------|----------|------|--|
| <b>R1</b>   | N/A   | N/A      | N/A  | <p>The responsible entity did not use any one of the following criteria (Requirement R1 criterion 1 through 13) for any specific circuit terminal to prevent its phase protective relay settings from limiting transmission system loadability while maintaining reliable protection of the Bulk Electric System for all fault conditions.</p> <p>OR</p> <p>The responsible entity did not evaluate relay loadability at 0.85 per unit voltage and a power factor angle of 30 degrees.</p> |

**PRC-023 — Attachment A**

1. This standard includes any protective functions which could trip with or without time delay, on load current, including but not limited to:
  - 1.1. Phase distance.
  - 1.2. Out-of-step tripping.
  - 1.3. Switch-on-to-fault.
  - 1.4. Overcurrent relays.
  - 1.5. Communications aided protection schemes including but not limited to:
    - 1.5.1 Permissive overreach transfer trip (POTT).
    - 1.5.2 Permissive under-reach transfer trip (PUTT).
    - 1.5.3 Directional comparison blocking (DCB).
    - 1.5.4 Directional comparison unblocking (DCUB).
  - 1.6. Phase overcurrent supervisory elements (i.e., phase fault detectors) associated with current-based, communication-assisted schemes (i.e., pilot wire, phase comparison, and line current differential) where the scheme is capable of tripping for loss of communications.
2. The following protection systems are excluded from requirements of this standard:
  - 2.1. Relay elements that are only enabled when other relays or associated systems fail. For example:
    - Overcurrent elements that are only enabled during loss of potential conditions.
    - Elements that are only enabled during a loss of communications except as noted in section 1.6
  - 2.2. Protection systems intended for the detection of ground fault conditions.
  - 2.3. Protection systems intended for protection during stable power swings.
  - 2.4. Generator protection relays that are susceptible to load.
  - 2.5. Relay elements used only for Remedial Action Schemes applied and approved in accordance with NERC Reliability Standards PRC-012 through PRC-017 or their successors.
  - 2.6. Protection systems that are designed only to respond in time periods which allow 15 minutes or greater to respond to overload conditions.
  - 2.7. Thermal emulation relays which are used in conjunction with dynamic Facility Ratings.
  - 2.8. Relay elements associated with dc lines.
  - 2.9. Relay elements associated with dc converter transformers.

**PRC-023 — Attachment B**

**Circuits to Evaluate**

- Transmission lines operated at 100 kV to 200 kV and transformers with low voltage terminals connected at 100 kV to 200 kV.
- Transmission lines operated below 100 kV and transformers with low voltage terminals connected below 100 kV that are part of the BES.

**Criteria**

If any of the following criteria apply to a circuit, the applicable entity must comply with the standard for that circuit.

- B1.** The circuit is a monitored Facility of a permanent flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection as defined by the Regional Entity, or a comparable monitored Facility in the Québec Interconnection, that has been included to address reliability concerns for loading of that circuit, as confirmed by the applicable Planning Coordinator.
- B2.** The circuit is a monitored Facility of an IROL, where the IROL was determined in the planning horizon pursuant to FAC-010.
- B3.** The circuit forms a path (as agreed to by the Generator Operator and the transmission entity) to supply off-site power to a nuclear plant as established in the Nuclear Plant Interface Requirements (NPIRs) pursuant to NUC-001.
- B4.** The circuit is identified through the following sequence of power flow analyses<sup>4</sup> performed by the Planning Coordinator for the one-to-five-year planning horizon:
- a. Simulate double contingency combinations selected by engineering judgment, without manual system adjustments in between the two contingencies (reflects a situation where a System Operator may not have time between the two contingencies to make appropriate system adjustments).
  - b. For circuits operated between 100 kV and 200 kV evaluate the post-contingency loading, in consultation with the Facility owner, against a threshold based on the Facility Rating assigned for that circuit and used in the power flow case by the Planning Coordinator.
  - c. When more than one Facility Rating for that circuit is available in the power flow case, the threshold for selection will be based on the Facility Rating for the loading duration nearest four hours.
  - d. The threshold for selection of the circuit will vary based on the loading duration assumed in the development of the Facility Rating.

---

<sup>4</sup> Past analyses may be used to support the assessment if no material changes to the system have occurred since the last assessment

## Standard PRC-023-2(X) — Transmission Relay Loadability

---

- i. If the Facility Rating is based on a loading duration of up to and including four hours, the circuit must comply with the standard if the loading exceeds 115% of the Facility Rating.
  - ii. If the Facility Rating is based on a loading duration greater than four and up to and including eight hours, the circuit must comply with the standard if the loading exceeds 120% of the Facility Rating.
  - iii. If the Facility Rating is based on a loading duration of greater than eight hours, the circuit must comply with the standard if the loading exceeds 130% of the Facility Rating.
- e. Radially operated circuits serving only load are excluded.
- B5.** The circuit is selected by the Planning Coordinator based on technical studies or assessments, other than those specified in criteria B1 through B4, in consultation with the Facility owner.
- B6.** The circuit is mutually agreed upon for inclusion by the Planning Coordinator and the Facility owner.

## Standard PRC-023-2(X) — Transmission Relay Loadability

---

### A. Introduction

1. **Title:** Transmission Relay Loadability
2. **Number:** PRC-023-2(X)
3. **Purpose:** Protective relay settings shall not limit transmission loadability; not interfere with system operators' ability to take remedial action to protect system reliability and; be set to reliably detect all fault conditions and protect the electrical network from these faults.
4. **Applicability**
  - 4.1. **Functional Entity**
    - 4.1.1 Transmission Owners with load-responsive phase protection systems as described in PRC-023-2(X) - Attachment A, applied to circuits defined in 4.2.1 (*Circuits Subject to Requirements R1 – R5*).
    - 4.1.2 Generator Owners with load-responsive phase protection systems as described in PRC-023-2(X) - Attachment A, applied to circuits defined in 4.2.1 (*Circuits Subject to Requirements R1 – R5*).
    - 4.1.3 Distribution Providers with load-responsive phase protection systems as described in PRC-023-2(X) - Attachment A, applied to circuits defined in 4.2.1 (*Circuits Subject to Requirements R1 – R5*), provided those circuits have bi-directional flow capabilities.
    - 4.1.4 Planning Coordinators
  - 4.2. **Circuits**
    - 4.2.1 **Circuits Subject to Requirements R1 – R5**
      - 4.2.1.1 Transmission lines operated at 200 kV and above.
      - 4.2.1.2 Transmission lines operated at 100 kV to 200 kV selected by the Planning Coordinator in accordance with R6.
      - 4.2.1.3 Transmission lines operated below 100 kV that are part of the BES and selected by the Planning Coordinator in accordance with R6.
      - 4.2.1.4 Transformers with low voltage terminals connected at 200 kV and above.
      - 4.2.1.5 Transformers with low voltage terminals connected at 100 kV to 200 kV selected by the Planning Coordinator in accordance with R6.
      - 4.2.1.6 Transformers with low voltage terminals connected below 100 kV that are part of the BES and selected by the Planning Coordinator in accordance with R6.
    - 4.2.2 **Circuits Subject to Requirement R6**
      - 4.2.2.1 Transmission lines operated at 100 kV to 200 kV and transformers with low voltage terminals connected at 100 kV to 200 kV
      - 4.2.2.2 Transmission lines operated below 100 kV and transformers with low voltage terminals connected below 100 kV that are part of the BES
5. **Effective Dates:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the

**Standard PRC-023-2(X) — Transmission Relay Loadability**

---

standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**Commented [KS1]:** Deleted: Effective Date table.

**Deleted:** The effective dates of the requirements in the PRC-023-2(X) standard corresponding to the applicable Functional Entities and circuits are summarized in the following table:¶

## Standard PRC-023-2(X) — Transmission Relay Loadability

---

### B. Requirements

**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall use any one of the following criteria (Requirement R1, criteria 1 through 13) for any specific circuit terminal to prevent its phase protective relay settings from limiting transmission system loadability while maintaining reliable protection of the BES for all fault conditions. Each Transmission Owner, Generator Owner, and Distribution Provider shall evaluate relay loadability at 0.85 per unit voltage and a power factor angle of 30 degrees. *[Violation Risk Factor: High] [Time Horizon: Long Term Planning]*.

#### Criteria:

1. Set transmission line relays so they do not operate at or below 150% of the highest seasonal Facility Rating of a circuit, for the available defined loading duration nearest 4 hours (expressed in amperes).
2. Set transmission line relays so they do not operate at or below 115% of the highest seasonal 15-minute Facility Rating<sup>1</sup> of a circuit (expressed in amperes).
3. Set transmission line relays so they do not operate at or below 115% of the maximum theoretical power transfer capability (using a 90-degree angle between the sending-end and receiving-end voltages and either reactance or complex impedance) of the circuit (expressed in amperes) using one of the following to perform the power transfer calculation:
  - An infinite source (zero source impedance) with a 1.00 per unit bus voltage at each end of the line.
  - An impedance at each end of the line, which reflects the actual system source impedance with a 1.05 per unit voltage behind each source impedance.
4. Set transmission line relays on series compensated transmission lines so they do not operate at or below the maximum power transfer capability of the line, determined as the greater of:
  - 115% of the highest emergency rating of the series capacitor.
  - 115% of the maximum power transfer capability of the circuit (expressed in amperes), calculated in accordance with Requirement R1, criterion 3, using the full line inductive reactance.
5. Set transmission line relays on weak source systems so they do not operate at or below 170% of the maximum end-of-line three-phase fault magnitude (expressed in amperes).
6. Set transmission line relays applied on transmission lines connected to generation stations remote to load so they do not operate at or below 230% of the aggregated generation nameplate capability.
7. Set transmission line relays applied at the load center terminal, remote from generation stations, so they do not operate at or below 115% of the maximum current flow from the load to the generation source under any system configuration.

---

<sup>1</sup> When a 15-minute rating has been calculated and published for use in real-time operations, the 15-minute rating can be used to establish the loadability requirement for the protective relays.

## Standard PRC-023-2(X) — Transmission Relay Loadability

---

8. Set transmission line relays applied on the bulk system-end of transmission lines that serve load remote to the system so they do not operate at or below 115% of the maximum current flow from the system to the load under any system configuration.
9. Set transmission line relays applied on the load-end of transmission lines that serve load remote to the bulk system so they do not operate at or below 115% of the maximum current flow from the load to the system under any system configuration.
10. Set transformer fault protection relays and transmission line relays on transmission lines terminated only with a transformer so that the relays do not operate at or below the greater of:
  - 150% of the applicable maximum transformer nameplate rating (expressed in amperes), including the forced cooled ratings corresponding to all installed supplemental cooling equipment.
  - 115% of the highest operator established emergency transformer rating
- 10.1 Set load responsive transformer fault protection relays, if used, such that the protection settings do not expose the transformer to a fault level and duration that exceeds the transformer's mechanical withstand capability<sup>2</sup>.
11. For transformer overload protection relays that do not comply with the loadability component of Requirement R1, criterion 10 set the relays according to one of the following:
  - Set the relays to allow the transformer to be operated at an overload level of at least 150% of the maximum applicable nameplate rating, or 115% of the highest operator established emergency transformer rating, whichever is greater, for at least 15 minutes to provide time for the operator to take controlled action to relieve the overload.
  - Install supervision for the relays using either a top oil or simulated winding hot spot temperature element set no less than 100° C for the top oil temperature or no less than 140° C for the winding hot spot temperature<sup>3</sup>.
12. When the desired transmission line capability is limited by the requirement to adequately protect the transmission line, set the transmission line distance relays to a maximum of 125% of the apparent impedance (at the impedance angle of the transmission line) subject to the following constraints:
  - a. Set the maximum torque angle (MTA) to 90 degrees or the highest supported by the manufacturer.
  - b. Evaluate the relay loadability in amperes at the relay trip point at 0.85 per unit voltage and a power factor angle of 30 degrees.

---

<sup>2</sup> As illustrated by the "dotted line" in IEEE C57.109-1993 - *IEEE Guide for Liquid-Immersed Transformer Through-Fault-Current Duration*, Clause 4.4, Figure 4

<sup>3</sup> IEEE standard C57.91, Tables 7 and 8, specify that transformers are to be designed to withstand a winding hot spot temperature of 180 degrees C, and Annex A cautions that bubble formation may occur above 140 degrees C.

## Standard PRC-023-2(X) — Transmission Relay Loadability

---

- c. Include a relay setting component of 87% of the current calculated in Requirement R1, criterion 12 in the Facility Rating determination for the circuit.
- 13.** Where other situations present practical limitations on circuit capability, set the phase protection relays so they do not operate at or below 115% of such limitations.
- R2.** Each Transmission Owner, Generator Owner, and Distribution Provider shall set its out-of-step blocking elements to allow tripping of phase protective relays for faults that occur during the loading conditions used to verify transmission line relay loadability per Requirement R1. *[Violation Risk Factor: High] [Time Horizon: Long Term Planning]*
- R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that uses a circuit capability with the practical limitations described in Requirement R1, criterion 6, 7, 8, 9, 12, or 13 shall use the calculated circuit capability as the Facility Rating of the circuit and shall obtain the agreement of the Planning Coordinator, Transmission Operator, and Reliability Coordinator with the calculated circuit capability. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning]*
- R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that chooses to use Requirement R1 criterion 2 as the basis for verifying transmission line relay loadability shall provide its Planning Coordinator, Transmission Operator, and Reliability Coordinator with an updated list of circuits associated with those transmission line relays at least once each calendar year, with no more than 15 months between reports. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]*
- R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that sets transmission line relays according to Requirement R1 criterion 12 shall provide an updated list of the circuits associated with those relays to its Regional Entity at least once each calendar year, with no more than 15 months between reports, to allow the ERO to compile a list of all circuits that have protective relay settings that limit circuit capability. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]*
- R6.** Each Planning Coordinator shall conduct an assessment at least once each calendar year, with no more than 15 months between assessments, by applying the criteria in Attachment B to determine the circuits in its Planning Coordinator area for which Transmission Owners, Generator Owners, and Distribution Providers must comply with Requirements R1 through R5. The Planning Coordinator shall: *[Violation Risk Factor: High] [Time Horizon: Long Term Planning]*
- 6.1** Maintain a list of circuits subject to PRC-023-2(X) per application of Attachment B, including identification of the first calendar year in which any criterion in Attachment B applies.
  - 6.2** Provide the list of circuits to all Regional Entities, Reliability Coordinators, Transmission Owners, Generator Owners, and Distribution Providers within its Planning Coordinator area within 30 calendar days of the establishment of the initial list and within 30 calendar days of any changes to that list.

### C. Measures

- M1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence such as spreadsheets or summaries of calculations to show that each of its transmission relays is set according to one of the criteria in Requirement R1, criterion 1 through 13 and shall have evidence such as coordination curves or summaries of calculations that show that relays set per criterion 10 do not expose the transformer to fault levels and durations beyond those indicated in the standard. (R1)

## Standard PRC-023-2(X) — Transmission Relay Loadability

---

- M2.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence such as spreadsheets or summaries of calculations to show that each of its out-of-step blocking elements is set to allow tripping of phase protective relays for faults that occur during the loading conditions used to verify transmission line relay loadability per Requirement R1. (R2)
- M3.** Each Transmission Owner, Generator Owner, and Distribution Provider with transmission relays set according to Requirement R1, criterion 6, 7, 8, 9, 12, or 13 shall have evidence such as Facility Rating spreadsheets or Facility Rating database to show that it used the calculated circuit capability as the Facility Rating of the circuit and evidence such as dated correspondence that the resulting Facility Rating was agreed to by its associated Planning Coordinator, Transmission Operator, and Reliability Coordinator. (R3)
- M4.** Each Transmission Owner, Generator Owner, or Distribution Provider that sets transmission line relays according to Requirement R1, criterion 2 shall have evidence such as dated correspondence to show that it provided its Planning Coordinator, Transmission Operator, and Reliability Coordinator with an updated list of circuits associated with those transmission line relays within the required timeframe. The updated list may either be a full list, a list of incremental changes to the previous list, or a statement that there are no changes to the previous list. (R4)
- M5.** Each Transmission Owner, Generator Owner, or Distribution Provider that sets transmission line relays according to Requirement R1, criterion 12 shall have evidence such as dated correspondence that it provided an updated list of the circuits associated with those relays to its Regional Entity within the required timeframe. The updated list may either be a full list, a list of incremental changes to the previous list, or a statement that there are no changes to the previous list. (R5)
- M6.** Each Planning Coordinator shall have evidence such as power flow results, calculation summaries, or study reports that it used the criteria established within Attachment B to determine the circuits in its Planning Coordinator area for which applicable entities must comply with the standard as described in Requirement R6. The Planning Coordinator shall have a dated list of such circuits and shall have evidence such as dated correspondence that it provided the list to the Regional Entities, Reliability Coordinators, Transmission Owners, Generator Owners, and Distribution Providers within its Planning Coordinator area within the required timeframe.

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Monitoring Responsibility

- For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.
- For functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

##### 1.2. Data Retention

The Transmission Owner, Generator Owner, Distribution Provider and Planning Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

## **Standard PRC-023-2(X) — Transmission Relay Loadability**

---

The Transmission Owner, Generator Owner, and Distribution Provider shall each retain documentation to demonstrate compliance with Requirements R1 through R5 for three calendar years.

The Planning Coordinator shall retain documentation of the most recent review process required in R6. The Planning Coordinator shall retain the most recent list of circuits in its Planning Coordinator area for which applicable entities must comply with the standard, as determined per R6.

If a Transmission Owner, Generator Owner, Distribution Provider or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time specified above, whichever is longer.

The Compliance Monitor shall keep the last audit record and all requested and submitted subsequent audit records.

### **1.3. Compliance Monitoring and Assessment Processes**

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Violation Investigation
- Self-Reporting
- Complaint

### **1.4. Additional Compliance Information**

None.

**Standard PRC-023-2(X) — Transmission Relay Loadability**

**2. Violation Severity Levels:**

| Requirement | Lower | Moderate | High | Severe   |
|-------------|-------|----------|------|--|
| <b>R1</b>   | N/A   | N/A      | N/A  | <p>The responsible entity did not use any one of the following criteria (Requirement R1 criterion 1 through 13) for any specific circuit terminal to prevent its phase protective relay settings from limiting transmission system loadability while maintaining reliable protection of the Bulk Electric System for all fault conditions.</p> <p>OR</p> <p>The responsible entity did not evaluate relay loadability at 0.85 per unit voltage and a power factor angle of 30 degrees.</p> |
| <b>R2</b>   | N/A   | N/A      | N/A  | <p>The responsible entity failed to ensure that its out-of-step blocking elements allowed tripping of phase protective relays for faults that occur during the loading conditions used to verify transmission line relay loadability per Requirement R1.</p>   |
| <b>R3</b>   | N/A   | N/A      | N/A  | <p>The responsible entity that uses a circuit capability with the practical limitations described in Requirement R1 criterion 6, 7, 8, 9, 12, or 13 did not use the calculated circuit capability as the Facility Rating of the circuit.</p> <p>OR</p>   |

**Standard PRC-023-2(X) — Transmission Relay Loadability**

| Requirement | Lower | Moderate   | High   | Severe   |
|-------------|-------|--|--|--|
|             |       |  |  | The responsible entity did not obtain the agreement of the Planning Coordinator, Transmission Operator, and Reliability Coordinator with the calculated circuit capability.  |
| <b>R4</b>   | N/A   | N/A  | N/A  | The responsible entity did not provide its Planning Coordinator, Transmission Operator, and Reliability Coordinator with an updated list of circuits that have transmission line relays set according to the criteria established in Requirement R1 criterion 2 at least once each calendar year, with no more than 15 months between reports. |
| <b>R5</b>   | N/A   | N/A  | N/A  | The responsible entity did not provide its Regional Entity, with an updated list of circuits that have transmission line relays set according to the criteria established in Requirement R1 criterion 12 at least once each calendar year, with no more than 15 months between reports.  |
| <b>R6</b>   | N/A   | The Planning Coordinator used the criteria established within Attachment B to determine the circuits in its Planning Coordinator area for which applicable entities must comply with the standard and met parts 6.1 and 6.2, but more than 15 months and less than 24 months lapsed between assessments. | The Planning Coordinator used the criteria established within Attachment B to determine the circuits in its Planning Coordinator area for which applicable entities must comply with the standard and met parts 6.1 and 6.2, but 24 months or more lapsed between assessments. | The Planning Coordinator failed to use the criteria established within Attachment B to determine the circuits in its Planning Coordinator area for which applicable entities must comply with the standard.<br><br>OR<br>The Planning Coordinator used the criteria established within   |

## Standard PRC-023-2(X) — Transmission Relay Loadability

---

### PRC-023 — Attachment A

1. This standard includes any protective functions which could trip with or without time delay, on load current, including but not limited to:
  - 1.1. Phase distance.
  - 1.2. Out-of-step tripping.
  - 1.3. Switch-on-to-fault.
  - 1.4. Overcurrent relays.
  - 1.5. Communications aided protection schemes including but not limited to:
    - 1.5.1 Permissive overreach transfer trip (POTT).
    - 1.5.2 Permissive under-reach transfer trip (PUTT).
    - 1.5.3 Directional comparison blocking (DCB).
    - 1.5.4 Directional comparison unblocking (DCUB).
  - 1.6. Phase overcurrent supervisory elements (i.e., phase fault detectors) associated with current-based, communication-assisted schemes (i.e., pilot wire, phase comparison, and line current differential) where the scheme is capable of tripping for loss of communications.
2. The following protection systems are excluded from requirements of this standard:
  - 2.1. Relay elements that are only enabled when other relays or associated systems fail. For example:
    - Overcurrent elements that are only enabled during loss of potential conditions.
    - Elements that are only enabled during a loss of communications except as noted in section 1.6
  - 2.2. Protection systems intended for the detection of ground fault conditions.
  - 2.3. Protection systems intended for protection during stable power swings.
  - 2.4. Generator protection relays that are susceptible to load.
  - 2.5. Relay elements used only for Remedial Action Schemes applied and approved in accordance with NERC Reliability Standards PRC-012 through PRC-017 or their successors.
  - 2.6. Protection systems that are designed only to respond in time periods which allow 15 minutes or greater to respond to overload conditions.
  - 2.7. Thermal emulation relays which are used in conjunction with dynamic Facility Ratings.
  - 2.8. Relay elements associated with dc lines.
  - 2.9. Relay elements associated with dc converter transformers.

Deleted: Special Protection System

**PRC-023 — Attachment B**

**Circuits to Evaluate**

- Transmission lines operated at 100 kV to 200 kV and transformers with low voltage terminals connected at 100 kV to 200 kV.
- Transmission lines operated below 100 kV and transformers with low voltage terminals connected below 100 kV that are part of the BES.

**Criteria**

If any of the following criteria apply to a circuit, the applicable entity must comply with the standard for that circuit.

- B1.** The circuit is a monitored Facility of a permanent flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection as defined by the Regional Entity, or a comparable monitored Facility in the Québec Interconnection, that has been included to address reliability concerns for loading of that circuit, as confirmed by the applicable Planning Coordinator.
- B2.** The circuit is a monitored Facility of an IROL, where the IROL was determined in the planning horizon pursuant to FAC-010.
- B3.** The circuit forms a path (as agreed to by the Generator Operator and the transmission entity) to supply off-site power to a nuclear plant as established in the Nuclear Plant Interface Requirements (NPIRs) pursuant to NUC-001.
- B4.** The circuit is identified through the following sequence of power flow analyses<sup>4</sup> performed by the Planning Coordinator for the one-to-five-year planning horizon:
  - a. Simulate double contingency combinations selected by engineering judgment, without manual system adjustments in between the two contingencies (reflects a situation where a System Operator may not have time between the two contingencies to make appropriate system adjustments).
  - b. For circuits operated between 100 kV and 200 kV evaluate the post-contingency loading, in consultation with the Facility owner, against a threshold based on the Facility Rating assigned for that circuit and used in the power flow case by the Planning Coordinator.
  - c. When more than one Facility Rating for that circuit is available in the power flow case, the threshold for selection will be based on the Facility Rating for the loading duration nearest four hours.
  - d. The threshold for selection of the circuit will vary based on the loading duration assumed in the development of the Facility Rating.

---

<sup>4</sup> Past analyses may be used to support the assessment if no material changes to the system have occurred since the last assessment

**Standard PRC-023-2(X) — Transmission Relay Loadability**

---

- i. If the Facility Rating is based on a loading duration of up to and including four hours, the circuit must comply with the standard if the loading exceeds 115% of the Facility Rating.
  - ii. If the Facility Rating is based on a loading duration greater than four and up to and including eight hours, the circuit must comply with the standard if the loading exceeds 120% of the Facility Rating.
  - iii. If the Facility Rating is based on a loading duration of greater than eight hours, the circuit must comply with the standard if the loading exceeds 130% of the Facility Rating.
- e. Radially operated circuits serving only load are excluded.
- B5.** The circuit is selected by the Planning Coordinator based on technical studies or assessments, other than those specified in criteria B1 through B4, in consultation with the Facility owner.
- B6.** The circuit is mutually agreed upon for inclusion by the Planning Coordinator and the Facility owner.

## **A. Introduction**

- 1. Title:**           **Transmission Relay Loadability**
- 2. Number:**       PRC-023-3(X)
- 3. Purpose:** Protective relay settings shall not limit transmission loadability; not interfere with system operators' ability to take remedial action to protect system reliability and; be set to reliably detect all fault conditions and protect the electrical network from these faults.
- 4. Applicability:**
  - 4.1. Functional Entity:**
    - 4.1.1** Transmission Owner with load-responsive phase protection systems as described in PRC-023-3(X) - Attachment A, applied at the terminals of the circuits defined in 4.2.1 (*Circuits Subject to Requirements R1 – R5*).
    - 4.1.2** Generator Owner with load-responsive phase protection systems as described in PRC-023-3(X) - Attachment A, applied at the terminals of the circuits defined in 4.2.1 (*Circuits Subject to Requirements R1 – R5*).
    - 4.1.3** Distribution Provider with load-responsive phase protection systems as described in PRC-023-3(X) - Attachment A, applied at the terminals of the circuits defined in 4.2.1 (*Circuits Subject to Requirements R1 – R5*), provided those circuits have bi-directional flow capabilities.
    - 4.1.4** Planning Coordinator
  - 4.2. Circuits:**
    - 4.2.1 Circuits Subject to Requirements R1 – R5:**
      - 4.2.1.1** Transmission lines operated at 200 kV and above, except Elements that connect the GSU transformer(s) to the Transmission system that are used exclusively to export energy directly from a BES generating unit or generating plant. Elements may also supply generating plant loads.
      - 4.2.1.2** Transmission lines operated at 100 kV to 200 kV selected by the Planning Coordinator in accordance with Requirement R6.
      - 4.2.1.3** Transmission lines operated below 100 kV that are part of the BES and selected by the Planning Coordinator in accordance with Requirement R6.
      - 4.2.1.4** Transformers with low voltage terminals connected at 200 kV and above.
      - 4.2.1.5** Transformers with low voltage terminals connected at 100 kV to 200 kV selected by the Planning Coordinator in accordance with Requirement R6.
      - 4.2.1.6** Transformers with low voltage terminals connected below 100 kV that are part of the BES and selected by the Planning Coordinator in accordance with Requirement R6.
    - 4.2.2 Circuits Subject to Requirement R6:**
      - 4.2.2.1** Transmission lines operated at 100 kV to 200 kV and transformers with low voltage terminals connected at 100 kV to 200 kV, except Elements that connect the GSU transformer(s) to the Transmission system that are used exclusively to export energy directly from a BES generating unit or generating plant. Elements may also supply generating plant loads.

**4.2.2.2** Transmission lines operated below 100 kV and transformers with low voltage terminals connected below 100 kV that are part of the BES, except Elements that connect the GSU transformer(s) to the Transmission system that are used exclusively to export energy directly from a BES generating unit or generating plant. Elements may also supply generating plant loads.

- 5. Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

## **B. Requirements**

**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall use any one of the following criteria (Requirement R1, criteria 1 through 13) for any specific circuit terminal to prevent its phase protective relay settings from limiting transmission system loadability while maintaining reliable protection of the BES for all fault conditions. Each Transmission Owner, Generator Owner, and Distribution Provider shall evaluate relay loadability at 0.85 per unit voltage and a power factor angle of 30 degrees. [*Violation Risk Factor: High*] [*Time Horizon: Long Term Planning*].

### **Criteria:**

- 1.** Set transmission line relays so they do not operate at or below 150% of the highest seasonal Facility Rating of a circuit, for the available defined loading duration nearest 4 hours (expressed in amperes).
- 2.** Set transmission line relays so they do not operate at or below 115% of the highest seasonal 15-minute Facility Rating<sup>1</sup> of a circuit (expressed in amperes).
- 3.** Set transmission line relays so they do not operate at or below 115% of the maximum theoretical power transfer capability (using a 90-degree angle between the sending-end and receiving-end voltages and either reactance or complex impedance) of the circuit (expressed in amperes) using one of the following to perform the power transfer calculation:
  - An infinite source (zero source impedance) with a 1.00 per unit bus voltage at each end of the line.
  - An impedance at each end of the line, which reflects the actual system source impedance with a 1.05 per unit voltage behind each source impedance.
- 4.** Set transmission line relays on series compensated transmission lines so they do not operate at or below the maximum power transfer capability of the line, determined as the greater of:
  - 115% of the highest emergency rating of the series capacitor.
  - 115% of the maximum power transfer capability of the circuit (expressed in amperes), calculated in accordance with Requirement R1, criterion 3, using the full line inductive reactance.

---

<sup>1</sup> When a 15-minute rating has been calculated and published for use in real-time operations, the 15-minute rating can be used to establish the loadability requirement for the protective relays.

5. Set transmission line relays on weak source systems so they do not operate at or below 170% of the maximum end-of-line three-phase fault magnitude (expressed in amperes).
6. Not used.
7. Set transmission line relays applied at the load center terminal, remote from generation stations, so they do not operate at or below 115% of the maximum current flow from the load to the generation source under any system configuration.
8. Set transmission line relays applied on the bulk system-end of transmission lines that serve load remote to the system so they do not operate at or below 115% of the maximum current flow from the system to the load under any system configuration.
9. Set transmission line relays applied on the load-end of transmission lines that serve load remote to the bulk system so they do not operate at or below 115% of the maximum current flow from the load to the system under any system configuration.
10. Set transformer fault protection relays and transmission line relays on transmission lines terminated only with a transformer so that the relays do not operate at or below the greater of:
  - 150% of the applicable maximum transformer nameplate rating (expressed in amperes), including the forced cooled ratings corresponding to all installed supplemental cooling equipment.
  - 115% of the highest operator established emergency transformer rating.
- 10.1 Set load-responsive transformer fault protection relays, if used, such that the protection settings do not expose the transformer to a fault level and duration that exceeds the transformer's mechanical withstand capability<sup>2</sup>.
11. For transformer overload protection relays that do not comply with the loadability component of Requirement R1, criterion 10 set the relays according to one of the following:
  - Set the relays to allow the transformer to be operated at an overload level of at least 150% of the maximum applicable nameplate rating, or 115% of the highest operator established emergency transformer rating, whichever is greater, for at least 15 minutes to provide time for the operator to take controlled action to relieve the overload.
  - Install supervision for the relays using either a top oil or simulated winding hot spot temperature element set no less than 100° C for the top oil temperature or no less than 140° C for the winding hot spot temperature<sup>3</sup>.
12. When the desired transmission line capability is limited by the requirement to adequately protect the transmission line, set the transmission line distance relays to a maximum of 125% of the apparent impedance (at the impedance angle of the transmission line) subject to the following constraints:
  - a. Set the maximum torque angle (MTA) to 90 degrees or the highest supported by the manufacturer.

---

<sup>2</sup> As illustrated by the “dotted line” in IEEE C57.109-1993 - *IEEE Guide for Liquid-Immersed Transformer Through-Fault-Current Duration*, Clause 4.4, Figure 4.

<sup>3</sup> IEEE standard C57.91, Tables 7 and 8, specify that transformers are to be designed to withstand a winding hot spot temperature of 180 degrees C, and Annex A cautions that bubble formation may occur above 140 degrees C.

## Standard PRC-023-3(X) — Transmission Relay Loadability

---

- b. Evaluate the relay loadability in amperes at the relay trip point at 0.85 per unit voltage and a power factor angle of 30 degrees.
  - c. Include a relay setting component of 87% of the current calculated in Requirement R1, criterion 12 in the Facility Rating determination for the circuit.
- 13.** Where other situations present practical limitations on circuit capability, set the phase protection relays so they do not operate at or below 115% of such limitations.
- R2.** Each Transmission Owner, Generator Owner, and Distribution Provider shall set its out-of-step blocking elements to allow tripping of phase protective relays for faults that occur during the loading conditions used to verify transmission line relay loadability per Requirement R1. *[Violation Risk Factor: High] [Time Horizon: Long Term Planning]*
- R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that uses a circuit capability with the practical limitations described in Requirement R1, criterion 7, 8, 9, 12, or 13 shall use the calculated circuit capability as the Facility Rating of the circuit and shall obtain the agreement of the Planning Coordinator, Transmission Operator, and Reliability Coordinator with the calculated circuit capability. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning]*
- R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that chooses to use Requirement R1 criterion 2 as the basis for verifying transmission line relay loadability shall provide its Planning Coordinator, Transmission Operator, and Reliability Coordinator with an updated list of circuits associated with those transmission line relays at least once each calendar year, with no more than 15 months between reports. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]*
- R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that sets transmission line relays according to Requirement R1 criterion 12 shall provide an updated list of the circuits associated with those relays to its Regional Entity at least once each calendar year, with no more than 15 months between reports, to allow the ERO to compile a list of all circuits that have protective relay settings that limit circuit capability. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]*
- R6.** Each Planning Coordinator shall conduct an assessment at least once each calendar year, with no more than 15 months between assessments, by applying the criteria in PRC-023-3(X), Attachment B to determine the circuits in its Planning Coordinator area for which Transmission Owners, Generator Owners, and Distribution Providers must comply with Requirements R1 through R5. The Planning Coordinator shall: *[Violation Risk Factor: High] [Time Horizon: Long Term Planning]*
- 6.1** Maintain a list of circuits subject to PRC-023-3(X) per application of Attachment B, including identification of the first calendar year in which any criterion in PRC-023-3(X), Attachment B applies.
  - 6.2** Provide the list of circuits to all Regional Entities, Reliability Coordinators, Transmission Owners, Generator Owners, and Distribution Providers within its Planning Coordinator area within 30 calendar days of the establishment of the initial list and within 30 calendar days of any changes to that list.

### C. Measures

- M1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence such as spreadsheets or summaries of calculations to show that each of its transmission relays is

set according to one of the criteria in Requirement R1, criterion 1 through 13 and shall have evidence such as coordination curves or summaries of calculations that show that relays set per criterion 10 do not expose the transformer to fault levels and durations beyond those indicated in the standard. (R1)

- M2.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence such as spreadsheets or summaries of calculations to show that each of its out-of-step blocking elements is set to allow tripping of phase protective relays for faults that occur during the loading conditions used to verify transmission line relay loadability per Requirement R1. (R2)
- M3.** Each Transmission Owner, Generator Owner, and Distribution Provider with transmission relays set according to Requirement R1, criterion 7, 8, 9, 12, or 13 shall have evidence such as Facility Rating spreadsheets or Facility Rating database to show that it used the calculated circuit capability as the Facility Rating of the circuit and evidence such as dated correspondence that the resulting Facility Rating was agreed to by its associated Planning Coordinator, Transmission Operator, and Reliability Coordinator. (R3)
- M4.** Each Transmission Owner, Generator Owner, or Distribution Provider that sets transmission line relays according to Requirement R1, criterion 2 shall have evidence such as dated correspondence to show that it provided its Planning Coordinator, Transmission Operator, and Reliability Coordinator with an updated list of circuits associated with those transmission line relays within the required timeframe. The updated list may either be a full list, a list of incremental changes to the previous list, or a statement that there are no changes to the previous list. (R4)
- M5.** Each Transmission Owner, Generator Owner, or Distribution Provider that sets transmission line relays according to Requirement R1, criterion 12 shall have evidence such as dated correspondence that it provided an updated list of the circuits associated with those relays to its Regional Entity within the required timeframe. The updated list may either be a full list, a list of incremental changes to the previous list, or a statement that there are no changes to the previous list. (R5)
- M6.** Each Planning Coordinator shall have evidence such as power flow results, calculation summaries, or study reports that it used the criteria established within PRC-023-3(X), Attachment B to determine the circuits in its Planning Coordinator area for which applicable entities must comply with the standard as described in Requirement R6. The Planning Coordinator shall have a dated list of such circuits and shall have evidence such as dated correspondence that it provided the list to the Regional Entities, Reliability Coordinators, Transmission Owners, Generator Owners, and Distribution Providers within its Planning Coordinator area within the required timeframe. (R6)

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

#### **1.2. Data Retention**

The Transmission Owner, Generator Owner, Distribution Provider and Planning Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Transmission Owner, Generator Owner, and Distribution Provider shall each retain documentation to demonstrate compliance with Requirements R1 through R5 for three calendar years.

The Planning Coordinator shall retain documentation of the most recent review process required in Requirement R6. The Planning Coordinator shall retain the most recent list of circuits in its Planning Coordinator area for which applicable entities must comply with the standard, as determined per Requirement R6.

If a Transmission Owner, Generator Owner, Distribution Provider, or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit record and all requested and submitted subsequent audit records.

### **1.3. Compliance Monitoring and Assessment Processes**

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Violation Investigation
- Self-Reporting
- Complaint

### **1.4. Additional Compliance Information**

None.

2. Violation Severity Levels:

| Requirement | Lower | Moderate | High | Severe  |
|-------------|-------|----------|------|---|
| <b>R1</b>   | N/A   | N/A      | N/A  | <p>The responsible entity did not use any one of the following criteria (Requirement R1 criterion 1 through 13) for any specific circuit terminal to prevent its phase protective relay settings from limiting transmission system loadability while maintaining reliable protection of the BES for all fault conditions.</p> <p>OR</p> <p>The responsible entity did not evaluate relay loadability at 0.85 per unit voltage and a power factor angle of 30 degrees.</p> |
| <b>R2</b>   | N/A   | N/A      | N/A  | <p>The responsible entity failed to ensure that its out-of-step blocking elements allowed tripping of phase protective relays for faults that occur during the loading conditions used to verify transmission line relay loadability per Requirement R1.</p>  |
| <b>R3</b>   | N/A   | N/A      | N/A  | <p>The responsible entity that uses a circuit capability with the practical limitations described in Requirement R1 criterion 7, 8, 9, 12, or 13 did not use the calculated circuit capability as the Facility Rating of the circuit.</p>   |

**PRC-023-3(X) — Attachment A**

1. This standard includes any protective functions which could trip with or without time delay, on load current, including but not limited to:
  - 1.1. Phase distance.
  - 1.2. Out-of-step tripping.
  - 1.3. Switch-on-to-fault.
  - 1.4. Overcurrent relays.
  - 1.5. Communications aided protection schemes including but not limited to:
    - 1.5.1 Permissive overreach transfer trip (POTT).
    - 1.5.2 Permissive under-reach transfer trip (PUTT).
    - 1.5.3 Directional comparison blocking (DCB).
    - 1.5.4 Directional comparison unblocking (DCUB).
  - 1.6. Phase overcurrent supervisory elements (i.e., phase fault detectors) associated with current-based, communication-assisted schemes (i.e., pilot wire, phase comparison, and line current differential) where the scheme is capable of tripping for loss of communications.
2. The following protection systems are excluded from requirements of this standard:
  - 2.1. Relay elements that are only enabled when other relays or associated systems fail. For example:
    - Overcurrent elements that are only enabled during loss of potential conditions.
    - Elements that are only enabled during a loss of communications except as noted in section 1.6.
  - 2.2. Protection systems intended for the detection of ground fault conditions.
  - 2.3. Protection systems intended for protection during stable power swings.
  - 2.4. Not used.
  - 2.5. Relay elements used only for Remedial Action Schemes applied and approved in accordance with NERC Reliability Standards PRC-012 through PRC-017 or their successors.
  - 2.6. Protection systems that are designed only to respond in time periods which allow 15 minutes or greater to respond to overload conditions.
  - 2.7. Thermal emulation relays which are used in conjunction with dynamic Facility Ratings.
  - 2.8. Relay elements associated with dc lines.
  - 2.9. Relay elements associated with dc converter transformers.

**PRC-023-3(X) — Attachment B**

**Circuits to Evaluate**

- Transmission lines operated at 100 kV to 200 kV and transformers with low voltage terminals connected at 100 kV to 200 kV.
- Transmission lines operated below 100 kV and transformers with low voltage terminals connected below 100 kV that are part of the Bulk Electric System.

**Criteria**

If any of the following criteria apply to a circuit, the applicable entity must comply with the standard for that circuit.

- B1.** The circuit is a monitored Facility of a permanent flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection as defined by the Regional Entity, or a comparable monitored Facility in the Québec Interconnection, that has been included to address reliability concerns for loading of that circuit, as confirmed by the applicable Planning Coordinator.
- B2.** The circuit is a monitored Facility of an Interconnection Reliability Operating Limit (IROL), where the IROL was determined in the planning horizon pursuant to FAC-010.
- B3.** The circuit forms a path (as agreed to by the Generator Operator and the transmission entity) to supply off-site power to a nuclear plant as established in the Nuclear Plant Interface Requirements (NPIRs) pursuant to NUC-001.
- B4.** The circuit is identified through the following sequence of power flow analyses<sup>4</sup> performed by the Planning Coordinator for the one-to-five-year planning horizon:
- a. Simulate double contingency combinations selected by engineering judgment, without manual system adjustments in between the two contingencies (reflects a situation where a System Operator may not have time between the two contingencies to make appropriate system adjustments).
  - b. For circuits operated between 100 kV and 200 kV evaluate the post-contingency loading, in consultation with the Facility owner, against a threshold based on the Facility Rating assigned for that circuit and used in the power flow case by the Planning Coordinator.
  - c. When more than one Facility Rating for that circuit is available in the power flow case, the threshold for selection will be based on the Facility Rating for the loading duration nearest four hours.
  - d. The threshold for selection of the circuit will vary based on the loading duration assumed in the development of the Facility Rating.

---

<sup>4</sup> Past analyses may be used to support the assessment if no material changes to the system have occurred since the last assessment

## Standard PRC-023-3(X) — Transmission Relay Loadability

---

- i. If the Facility Rating is based on a loading duration of up to and including four hours, the circuit must comply with the standard if the loading exceeds 115% of the Facility Rating.
  - ii. If the Facility Rating is based on a loading duration greater than four and up to and including eight hours, the circuit must comply with the standard if the loading exceeds 120% of the Facility Rating.
  - iii. If the Facility Rating is based on a loading duration of greater than eight hours, the circuit must comply with the standard if the loading exceeds 130% of the Facility Rating.
- e. Radially operated circuits serving only load are excluded.
- B5.** The circuit is selected by the Planning Coordinator based on technical studies or assessments, other than those specified in criteria B1 through B4, in consultation with the Facility owner.
- B6.** The circuit is mutually agreed upon for inclusion by the Planning Coordinator and the Facility owner.

## Standard PRC-023-3(X) — Transmission Relay Loadability

---

### A. Introduction

1. **Title:** Transmission Relay Loadability
2. **Number:** PRC-023-3(X)
3. **Purpose:** Protective relay settings shall not limit transmission loadability; not interfere with system operators' ability to take remedial action to protect system reliability and; be set to reliably detect all fault conditions and protect the electrical network from these faults.
4. **Applicability:**
  - 4.1. **Functional Entity:**
    - 4.1.1 Transmission Owner with load-responsive phase protection systems as described in PRC-023-3(X) - Attachment A, applied at the terminals of the circuits defined in 4.2.1 (*Circuits Subject to Requirements R1 – R5*).
    - 4.1.2 Generator Owner with load-responsive phase protection systems as described in PRC-023-3(X) - Attachment A, applied at the terminals of the circuits defined in 4.2.1 (*Circuits Subject to Requirements R1 – R5*).
    - 4.1.3 Distribution Provider with load-responsive phase protection systems as described in PRC-023-3(X) - Attachment A, applied at the terminals of the circuits defined in 4.2.1 (*Circuits Subject to Requirements R1 – R5*), provided those circuits have bi-directional flow capabilities.
    - 4.1.4 Planning Coordinator
  - 4.2. **Circuits:**
    - 4.2.1 **Circuits Subject to Requirements R1 – R5:**
      - 4.2.1.1 Transmission lines operated at 200 kV and above, except Elements that connect the GSU transformer(s) to the Transmission system that are used exclusively to export energy directly from a BES generating unit or generating plant. Elements may also supply generating plant loads.
      - 4.2.1.2 Transmission lines operated at 100 kV to 200 kV selected by the Planning Coordinator in accordance with Requirement R6.
      - 4.2.1.3 Transmission lines operated below 100 kV that are part of the BES and selected by the Planning Coordinator in accordance with Requirement R6.
      - 4.2.1.4 Transformers with low voltage terminals connected at 200 kV and above.
      - 4.2.1.5 Transformers with low voltage terminals connected at 100 kV to 200 kV selected by the Planning Coordinator in accordance with Requirement R6.
      - 4.2.1.6 Transformers with low voltage terminals connected below 100 kV that are part of the BES and selected by the Planning Coordinator in accordance with Requirement R6.
    - 4.2.2 **Circuits Subject to Requirement R6:**
      - 4.2.2.1 Transmission lines operated at 100 kV to 200 kV and transformers with low voltage terminals connected at 100 kV to 200 kV, except Elements that connect the GSU transformer(s) to the Transmission system that are used exclusively to export energy directly from a BES generating unit or generating plant. Elements may also supply generating plant loads.

## Standard PRC-023-3(X) — Transmission Relay Loadability

4.2.2.2 Transmission lines operated below 100 kV and transformers with low voltage terminals connected below 100 kV that are part of the BES, except Elements that connect the GSU transformer(s) to the Transmission system that are used exclusively to export energy directly from a BES generating unit or generating plant. Elements may also supply generating plant loads.

**5. Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Deleted: s

### B. Requirements

**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall use any one of the following criteria (Requirement R1, criteria 1 through 13) for any specific circuit terminal to prevent its phase protective relay settings from limiting transmission system loadability while maintaining reliable protection of the BES for all fault conditions. Each Transmission Owner, Generator Owner, and Distribution Provider shall evaluate relay loadability at 0.85 per unit voltage and a power factor angle of 30 degrees. [*Violation Risk Factor: High*] [*Time Horizon: Long Term Planning*].

#### Criteria:

1. Set transmission line relays so they do not operate at or below 150% of the highest seasonal Facility Rating of a circuit, for the available defined loading duration nearest 4 hours (expressed in amperes).
2. Set transmission line relays so they do not operate at or below 115% of the highest seasonal 15-minute Facility Rating<sup>1</sup> of a circuit (expressed in amperes).
3. Set transmission line relays so they do not operate at or below 115% of the maximum theoretical power transfer capability (using a 90-degree angle between the sending-end and receiving-end voltages and either reactance or complex impedance) of the circuit (expressed in amperes) using one of the following to perform the power transfer calculation:
  - An infinite source (zero source impedance) with a 1.00 per unit bus voltage at each end of the line.
  - An impedance at each end of the line, which reflects the actual system source impedance with a 1.05 per unit voltage behind each source impedance.
4. Set transmission line relays on series compensated transmission lines so they do not operate at or below the maximum power transfer capability of the line, determined as the greater of:
  - 115% of the highest emergency rating of the series capacitor.
  - 115% of the maximum power transfer capability of the circuit (expressed in amperes), calculated in accordance with Requirement R1, criterion 3, using the full line inductive reactance.

<sup>1</sup> When a 15-minute rating has been calculated and published for use in real-time operations, the 15-minute rating can be used to establish the loadability requirement for the protective relays.

## Standard PRC-023-3(X) — Transmission Relay Loadability

---

5. Set transmission line relays on weak source systems so they do not operate at or below 170% of the maximum end-of-line three-phase fault magnitude (expressed in amperes).
6. Not used.
7. Set transmission line relays applied at the load center terminal, remote from generation stations, so they do not operate at or below 115% of the maximum current flow from the load to the generation source under any system configuration.
8. Set transmission line relays applied on the bulk system-end of transmission lines that serve load remote to the system so they do not operate at or below 115% of the maximum current flow from the system to the load under any system configuration.
9. Set transmission line relays applied on the load-end of transmission lines that serve load remote to the bulk system so they do not operate at or below 115% of the maximum current flow from the load to the system under any system configuration.
10. Set transformer fault protection relays and transmission line relays on transmission lines terminated only with a transformer so that the relays do not operate at or below the greater of:
  - 150% of the applicable maximum transformer nameplate rating (expressed in amperes), including the forced cooled ratings corresponding to all installed supplemental cooling equipment.
  - 115% of the highest operator established emergency transformer rating.
- 10.1 Set load-responsive transformer fault protection relays, if used, such that the protection settings do not expose the transformer to a fault level and duration that exceeds the transformer's mechanical withstand capability<sup>2</sup>.
11. For transformer overload protection relays that do not comply with the loadability component of Requirement R1, criterion 10 set the relays according to one of the following:
  - Set the relays to allow the transformer to be operated at an overload level of at least 150% of the maximum applicable nameplate rating, or 115% of the highest operator established emergency transformer rating, whichever is greater, for at least 15 minutes to provide time for the operator to take controlled action to relieve the overload.
  - Install supervision for the relays using either a top oil or simulated winding hot spot temperature element set no less than 100° C for the top oil temperature or no less than 140° C for the winding hot spot temperature<sup>3</sup>.
12. When the desired transmission line capability is limited by the requirement to adequately protect the transmission line, set the transmission line distance relays to a maximum of 125% of the apparent impedance (at the impedance angle of the transmission line) subject to the following constraints:
  - a. Set the maximum torque angle (MTA) to 90 degrees or the highest supported by the manufacturer.

---

<sup>2</sup> As illustrated by the "dotted line" in IEEE C57.109-1993 - *IEEE Guide for Liquid-Immersed Transformer Through-Fault-Current Duration*, Clause 4.4, Figure 4.

<sup>3</sup> IEEE standard C57.91, Tables 7 and 8, specify that transformers are to be designed to withstand a winding hot spot temperature of 180 degrees C, and Annex A cautions that bubble formation may occur above 140 degrees C.

## Standard PRC-023-3(X) — Transmission Relay Loadability

---

- b. Evaluate the relay loadability in amperes at the relay trip point at 0.85 per unit voltage and a power factor angle of 30 degrees.
  - c. Include a relay setting component of 87% of the current calculated in Requirement R1, criterion 12 in the Facility Rating determination for the circuit.
- 13.** Where other situations present practical limitations on circuit capability, set the phase protection relays so they do not operate at or below 115% of such limitations.
- R2.** Each Transmission Owner, Generator Owner, and Distribution Provider shall set its out-of-step blocking elements to allow tripping of phase protective relays for faults that occur during the loading conditions used to verify transmission line relay loadability per Requirement R1. *[Violation Risk Factor: High] [Time Horizon: Long Term Planning]*
- R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that uses a circuit capability with the practical limitations described in Requirement R1, criterion 7, 8, 9, 12, or 13 shall use the calculated circuit capability as the Facility Rating of the circuit and shall obtain the agreement of the Planning Coordinator, Transmission Operator, and Reliability Coordinator with the calculated circuit capability. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning]*
- R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that chooses to use Requirement R1 criterion 2 as the basis for verifying transmission line relay loadability shall provide its Planning Coordinator, Transmission Operator, and Reliability Coordinator with an updated list of circuits associated with those transmission line relays at least once each calendar year, with no more than 15 months between reports. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]*
- R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that sets transmission line relays according to Requirement R1 criterion 12 shall provide an updated list of the circuits associated with those relays to its Regional Entity at least once each calendar year, with no more than 15 months between reports, to allow the ERO to compile a list of all circuits that have protective relay settings that limit circuit capability. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]*
- R6.** Each Planning Coordinator shall conduct an assessment at least once each calendar year, with no more than 15 months between assessments, by applying the criteria in PRC-023-3(X), Attachment B to determine the circuits in its Planning Coordinator area for which Transmission Owners, Generator Owners, and Distribution Providers must comply with Requirements R1 through R5. The Planning Coordinator shall: *[Violation Risk Factor: High] [Time Horizon: Long Term Planning]*
- 6.1** Maintain a list of circuits subject to PRC-023-3(X) per application of Attachment B, including identification of the first calendar year in which any criterion in PRC-023-3(X), Attachment B applies.
  - 6.2** Provide the list of circuits to all Regional Entities, Reliability Coordinators, Transmission Owners, Generator Owners, and Distribution Providers within its Planning Coordinator area within 30 calendar days of the establishment of the initial list and within 30 calendar days of any changes to that list.

### C. Measures

- M1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence such as spreadsheets or summaries of calculations to show that each of its transmission relays is

## Standard PRC-023-3(X) — Transmission Relay Loadability

---

set according to one of the criteria in Requirement R1, criterion 1 through 13 and shall have evidence such as coordination curves or summaries of calculations that show that relays set per criterion 10 do not expose the transformer to fault levels and durations beyond those indicated in the standard. (R1)

- M2.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have evidence such as spreadsheets or summaries of calculations to show that each of its out-of-step blocking elements is set to allow tripping of phase protective relays for faults that occur during the loading conditions used to verify transmission line relay loadability per Requirement R1. (R2)
- M3.** Each Transmission Owner, Generator Owner, and Distribution Provider with transmission relays set according to Requirement R1, criterion 7, 8, 9, 12, or 13 shall have evidence such as Facility Rating spreadsheets or Facility Rating database to show that it used the calculated circuit capability as the Facility Rating of the circuit and evidence such as dated correspondence that the resulting Facility Rating was agreed to by its associated Planning Coordinator, Transmission Operator, and Reliability Coordinator. (R3)
- M4.** Each Transmission Owner, Generator Owner, or Distribution Provider that sets transmission line relays according to Requirement R1, criterion 2 shall have evidence such as dated correspondence to show that it provided its Planning Coordinator, Transmission Operator, and Reliability Coordinator with an updated list of circuits associated with those transmission line relays within the required timeframe. The updated list may either be a full list, a list of incremental changes to the previous list, or a statement that there are no changes to the previous list. (R4)
- M5.** Each Transmission Owner, Generator Owner, or Distribution Provider that sets transmission line relays according to Requirement R1, criterion 12 shall have evidence such as dated correspondence to show that it provided an updated list of the circuits associated with those relays to its Regional Entity within the required timeframe. The updated list may either be a full list, a list of incremental changes to the previous list, or a statement that there are no changes to the previous list. (R5)
- M6.** Each Planning Coordinator shall have evidence such as power flow results, calculation summaries, or study reports that it used the criteria established within PRC-023-3(X), Attachment B to determine the circuits in its Planning Coordinator area for which applicable entities must comply with the standard as described in Requirement R6. The Planning Coordinator shall have a dated list of such circuits and shall have evidence such as dated correspondence that it provided the list to the Regional Entities, Reliability Coordinators, Transmission Owners, Generator Owners, and Distribution Providers within its Planning Coordinator area within the required timeframe. (R6)

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

##### 1.2. Data Retention

## Standard PRC-023-3(X) — Transmission Relay Loadability

---

The Transmission Owner, Generator Owner, Distribution Provider and Planning Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Transmission Owner, Generator Owner, and Distribution Provider shall each retain documentation to demonstrate compliance with Requirements R1 through R5 for three calendar years.

The Planning Coordinator shall retain documentation of the most recent review process required in Requirement R6. The Planning Coordinator shall retain the most recent list of circuits in its Planning Coordinator area for which applicable entities must comply with the standard, as determined per Requirement R6.

If a Transmission Owner, Generator Owner, Distribution Provider, or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit record and all requested and submitted subsequent audit records.

### 1.3. Compliance Monitoring and Assessment Processes

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Violation Investigation
- Self-Reporting
- Complaint

### 1.4. Additional Compliance Information

None.

## Standard PRC-023-3(X) — Transmission Relay Loadability

### PRC-023-3(X) — Attachment A

1. This standard includes any protective functions which could trip with or without time delay, on load current, including but not limited to:
  - 1.1. Phase distance.
  - 1.2. Out-of-step tripping.
  - 1.3. Switch-on-to-fault.
  - 1.4. Overcurrent relays.
  - 1.5. Communications aided protection schemes including but not limited to:
    - 1.5.1 Permissive overreach transfer trip (POTT).
    - 1.5.2 Permissive under-reach transfer trip (PUTT).
    - 1.5.3 Directional comparison blocking (DCB).
    - 1.5.4 Directional comparison unblocking (DCUB).
  - 1.6. Phase overcurrent supervisory elements (i.e., phase fault detectors) associated with current-based, communication-assisted schemes (i.e., pilot wire, phase comparison, and line current differential) where the scheme is capable of tripping for loss of communications.
2. The following protection systems are excluded from requirements of this standard:
  - 2.1. Relay elements that are only enabled when other relays or associated systems fail. For example:
    - Overcurrent elements that are only enabled during loss of potential conditions.
    - Elements that are only enabled during a loss of communications except as noted in section 1.6.
  - 2.2. Protection systems intended for the detection of ground fault conditions.
  - 2.3. Protection systems intended for protection during stable power swings.
  - 2.4. Not used.
  - 2.5. Relay elements used only for [Remedial Action Schemes](#) applied and approved in accordance with NERC Reliability Standards PRC-012 through PRC-017 or their successors.
  - 2.6. Protection systems that are designed only to respond in time periods which allow 15 minutes or greater to respond to overload conditions.
  - 2.7. Thermal emulation relays which are used in conjunction with dynamic Facility Ratings.
  - 2.8. Relay elements associated with dc lines.
  - 2.9. Relay elements associated with dc converter transformers.

Deleted: Special Protection System

## Standard PRC-023-3(X) — Transmission Relay Loadability

---

### PRC-023-3(X) — Attachment B

#### Circuits to Evaluate

- Transmission lines operated at 100 kV to 200 kV and transformers with low voltage terminals connected at 100 kV to 200 kV.
- Transmission lines operated below 100 kV and transformers with low voltage terminals connected below 100 kV that are part of the Bulk Electric System.

#### Criteria

If any of the following criteria apply to a circuit, the applicable entity must comply with the standard for that circuit.

- B1.** The circuit is a monitored Facility of a permanent flowgate in the Eastern Interconnection, a major transfer path within the Western Interconnection as defined by the Regional Entity, or a comparable monitored Facility in the Québec Interconnection, that has been included to address reliability concerns for loading of that circuit, as confirmed by the applicable Planning Coordinator.
- B2.** The circuit is a monitored Facility of an Interconnection Reliability Operating Limit (IROL), where the IROL was determined in the planning horizon pursuant to FAC-010.
- B3.** The circuit forms a path (as agreed to by the Generator Operator and the transmission entity) to supply off-site power to a nuclear plant as established in the Nuclear Plant Interface Requirements (NPIRs) pursuant to NUC-001.
- B4.** The circuit is identified through the following sequence of power flow analyses<sup>4</sup> performed by the Planning Coordinator for the one-to-five-year planning horizon:
  - a. Simulate double contingency combinations selected by engineering judgment, without manual system adjustments in between the two contingencies (reflects a situation where a System Operator may not have time between the two contingencies to make appropriate system adjustments).
  - b. For circuits operated between 100 kV and 200 kV evaluate the post-contingency loading, in consultation with the Facility owner, against a threshold based on the Facility Rating assigned for that circuit and used in the power flow case by the Planning Coordinator.
  - c. When more than one Facility Rating for that circuit is available in the power flow case, the threshold for selection will be based on the Facility Rating for the loading duration nearest four hours.
  - d. The threshold for selection of the circuit will vary based on the loading duration assumed in the development of the Facility Rating.

---

<sup>4</sup> Past analyses may be used to support the assessment if no material changes to the system have occurred since the last assessment

### Standard PRC-023-3(X) — Transmission Relay Loadability

---

- i. If the Facility Rating is based on a loading duration of up to and including four hours, the circuit must comply with the standard if the loading exceeds 115% of the Facility Rating.
  - ii. If the Facility Rating is based on a loading duration greater than four and up to and including eight hours, the circuit must comply with the standard if the loading exceeds 120% of the Facility Rating.
  - iii. If the Facility Rating is based on a loading duration of greater than eight hours, the circuit must comply with the standard if the loading exceeds 130% of the Facility Rating.
- e. Radially operated circuits serving only load are excluded.
- B5.** The circuit is selected by the Planning Coordinator based on technical studies or assessments, other than those specified in criteria B1 through B4, in consultation with the Facility owner.
- B6.** The circuit is mutually agreed upon for inclusion by the Planning Coordinator and the Facility owner.

**A. Introduction**

1. **Title:** Generator Frequency and Voltage Protective Relay Settings
2. **Number:** PRC-024-1(X)
3. **Purpose:** Ensure Generator Owners set their generator protective relays such that generating units remain connected during defined frequency and voltage excursions.
4. **Applicability:**
  - 4.1. Generator Owner

**Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**B. Requirements**

- R1.** Each Generator Owner that has generator frequency protective relaying<sup>1</sup> activated to trip its applicable generating unit(s) shall set its protective relaying such that the generator frequency protective relaying does not trip the applicable generating unit(s) within the “no trip zone” of PRC-024 Attachment 1, subject to the following exceptions: [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]
- Generating unit(s) may trip if the protective functions (such as out-of-step functions or loss-of-field functions) operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.
  - Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).
  - Generating unit(s) may trip within a portion of the “no trip zone” of PRC-024 Attachment 1 for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.
- R2.** Each Generator Owner that has generator voltage protective relaying<sup>1</sup> activated to trip its applicable generating unit(s) shall set its protective relaying such that the generator voltage protective relaying does not trip the applicable generating unit(s) as a result of a voltage excursion (at the point of interconnection<sup>2</sup>) caused by an event on the

---

<sup>1</sup> Each Generator Owner is not required to have frequency or voltage protective relaying (including but not limited to frequency and voltage protective functions for discrete relays, volts per hertz relays evaluated at nominal frequency, multi-function protective devices or protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs) installed or activated on its unit.

<sup>2</sup> For the purposes of this standard, point of interconnection means the transmission (high voltage) side of the generator step-up or collector transformer.

transmission system external to the generating plant that remains within the “no trip zone” of PRC-024 Attachment 2. If the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2, then the Generator Owner shall set its protective relaying within the voltage recovery characteristics of a location-specific Transmission Planner’s study. Requirement R2 is subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) may trip in accordance with a Remedial Action Scheme (RAS).
- Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).
- Generating unit(s) may trip by action of protective functions (such as out-of-step functions or loss-of-field functions) that operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.
- Generating unit(s) may trip within a portion of the “no trip zone” of PRC-024 Attachment 2 for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.

**R3.** Each Generator Owner shall document each known regulatory or equipment limitation<sup>3</sup> that prevents an applicable generating unit with generator frequency or voltage protective relays from meeting the relay setting criteria in Requirements R1 or R2 including (but not limited to) study results, experience from an actual event, or manufacturer’s advice. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

**3.1.** The Generator Owner shall communicate the documented regulatory or equipment limitation, or the removal of a previously documented regulatory or equipment limitation, to its Planning Coordinator and Transmission Planner within 30 calendar days of any of the following:

- Identification of a regulatory or equipment limitation.
- Repair of the equipment causing the limitation that removes the limitation.
- Replacement of the equipment causing the limitation with equipment that removes the limitation.
- Creation or adjustment of an equipment limitation caused by consumption of the cumulative turbine life-time frequency excursion allowance.

**R4.** Each Generator Owner shall provide its applicable generator protection trip settings associated with Requirements R1 and R2 to the Planning Coordinator or Transmission Planner that models the associated unit within 60 calendar days of receipt of a written request for the data and within 60 calendar days of any change to those previously requested trip settings unless directed by the requesting Planning Coordinator or

---

<sup>3</sup> Excludes limitations that are caused by the setting capability of the generator frequency and voltage protective relays themselves but does not exclude limitations originating in the equipment that they protect.

Transmission Planner that the reporting of relay setting changes is not required.  
*[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

### **C. Measures**

- M1.** Each Generator Owner shall have evidence that generator frequency protective relays have been set in accordance with Requirement R1 such as dated setting sheets, calibration sheets or other documentation.
- M2.** Each Generator Owner shall have evidence that generator voltage protective relays have been set in accordance with Requirement R2 such as dated setting sheets, voltage-time curves, calibration sheets, coordination plots, dynamic simulation studies or other documentation.
- M3.** Each Generator Owner shall have evidence that it has documented and communicated any known regulatory or equipment limitations (excluding limitations noted in footnote 3) that resulted in an exception to Requirements R1 or R2 in accordance with Requirement R3 such as a dated email or letter that contains such documentation as study results, experience from an actual event, or manufacturer's advice.
- M4.** Each Generator Owner shall have evidence that it communicated applicable generator protective relay trip settings in accordance with Requirement R4, such as dated e-mails, correspondence or other evidence and copies of any requests it has received for that information.

### **D. Compliance**

#### **1. Compliance Monitoring Process**

##### **1.1. Compliance Enforcement Authority**

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases, the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

##### **1.1. Data Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall retain evidence of compliance with Requirement R1 through R4; for 3 years or until the next audit, whichever is longer.

If a Generator Owner is found non-compliant, the Generator Owner shall keep information related to the non-compliance until mitigation is complete and approved for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.2. Compliance Monitoring and Assessment Processes**

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

**1.3. Additional Compliance Information**

None

2. Violation Severity Levels

| R #       | Lower VSL   | Moderate VSL  | High VSL  | Severe VSL  |
|-----------|---|---|---|---|
| <b>R1</b> | N/A   | N/A   | N/A   | The Generator Owner that has frequency protection activated to trip a generating unit, failed to set its generator frequency protective relaying so that it does not trip within the criteria listed in Requirement R1 unless there is a documented and communicated regulatory or equipment limitation per Requirement R3.   |
| <b>R2</b> | N/A   | N/A   | N/A   | The Generator Owner with voltage protective relaying activated to trip a generating unit, failed to set its voltage protective relaying so that it does not trip as a result of a voltage excursion at the point of interconnection, caused by an event external to the plant per the criteria specified in Requirement R2 unless there is a documented and communicated regulatory or equipment limitation per Requirement R3. |
| <b>R3</b> | The Generator Owner documented the known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2 and communicated the documented | The Generator Owner documented the known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2 and communicated the documented | The Generator Owner documented the known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2 and communicated the documented | The Generator Owner failed to document any known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2.  |

## **Voltage Ride-Through Curve Clarifications**

### **Curve Details:**

1. The per unit voltage base for these curves is the nominal operating voltage specified by the Transmission Planner in the analysis of the reliability of the Interconnected Transmission Systems at the point of interconnection to the Bulk Electric System (BES).
2. The curves depicted were derived based on three-phase transmission system zone 1 faults with Normal Clearing not exceeding 9 cycles. The curves apply to voltage excursions regardless of the type of initiating event.
3. The envelope within the curves represents the cumulative voltage duration at the point of interconnection with the BES. For example, if the voltage first exceeds 1.15 pu at 0.3 seconds after a fault, does not exceed 1.2 pu voltage, and returns below 1.15 pu at 0.4 seconds, then the cumulative time the voltage is above 1.15 pu voltage is 0.1 seconds and is within the no trip zone of the curve.
4. The curves depicted assume system frequency is 60 Hertz. When evaluating Volts/Hertz protection, you may adjust the magnitude of the high voltage curve in proportion to deviations of frequency below 60 Hz.
5. Voltages in the curve assume minimum fundamental frequency phase-to-ground or phase-to-phase voltage for the low voltage duration curve and the greater of maximum RMS or crest phase-to-phase voltage for the high voltage duration curve.

### **Evaluating Protective Relay Settings:**

1. Use either the following assumptions or loading conditions that are believed to be the most probable for the unit under study to evaluate voltage protection relay setting calculations on the static case for steady state initial conditions:
  - a. All of the units connected to the same transformer are online and operating.
  - b. All of the units are at full nameplate real-power output.
  - c. Power factor is 0.95 lagging (i.e. supplying reactive power to the system) as measured at the generator terminals.
  - d. The automatic voltage regulator is in automatic voltage control mode.
2. Evaluate voltage protection relay settings assuming that additional installed generating plant reactive support equipment (such as static VAr compensators, synchronous condensers, or capacitors) is available and operating normally.
3. Evaluate voltage protection relay settings accounting for the actual tap settings of transformers between the generator terminals and the point of interconnection.

## Standard PRC-024-1 (X) — Generator Frequency and Voltage Protective Relay Settings

### A. Introduction

1. **Title:** Generator Frequency and Voltage Protective Relay Settings
2. **Number:** PRC-024-1 (X)
3. **Purpose:** Ensure Generator Owners set their generator protective relays such that generating units remain connected during defined frequency and voltage excursions.
4. **Applicability:**
  - 4.1. Generator Owner

**Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

### B. Requirements

- R1. Each Generator Owner that has generator frequency protective relaying<sup>1</sup> activated to trip its applicable generating unit(s) shall set its protective relaying such that the generator frequency protective relaying does not trip the applicable generating unit(s) within the “no trip zone” of PRC-024 Attachment 1, subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
  - Generating unit(s) may trip if the protective functions (such as out-of-step functions or loss-of-field functions) operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.
  - Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).
  - Generating unit(s) may trip within a portion of the “no trip zone” of PRC-024 Attachment 1 for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.
- R2. Each Generator Owner that has generator voltage protective relaying<sup>1</sup> activated to trip its applicable generating unit(s) shall set its protective relaying such that the generator voltage protective relaying does not trip the applicable generating unit(s) as a result of a voltage excursion (at the point of interconnection<sup>2</sup>) caused by an event on the

<sup>1</sup> Each Generator Owner is not required to have frequency or voltage protective relaying (including but not limited to frequency and voltage protective functions for discrete relays, volts per hertz relays evaluated at nominal frequency, multi-function protective devices or protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs) installed or activated on its unit.

<sup>2</sup> For the purposes of this standard, point of interconnection means the transmission (high voltage) side of the generator step-up or collector transformer.

**Deleted: 5.1.** In those jurisdictions where regulatory approval is required:¶

**5.1.1** By the first day of the first calendar quarter, two calendar years following¶ applicable regulatory approval, or as otherwise made effective pursuant to¶ the laws applicable to such ERO governmental authorities, each Generator¶ Owner shall have verified at least 40 percent of its Facilities are fully¶ compliant with Requirements R1, R2, R3, and R4.¶

**5.1.2** By the first day of the first calendar quarter, three calendar years following¶ applicable regulatory approval, or as otherwise made effective pursuant to¶ the laws applicable to such ERO governmental authorities, each Generator¶ Owner shall have verified at least 60 percent of its Facilities are fully¶ compliant with Requirements R1, R2, R3, and R4.¶

**5.1.3** By the first day of the first calendar quarter, four calendar years following¶ applicable regulatory approval, or as otherwise made effective pursuant to¶ the laws applicable to such ERO governmental authorities, each Generator¶ Owner shall have verified at least 80 percent of its Facilities are fully¶ compliant with Requirements R1, R2, R3, and R4. **5.1.4** By the first day of the first calendar quarter, five calendar years following¶ applicable regulatory approval, or as otherwise made effective pursuant to¶ the laws applicable to such ERO governmental authorities, each Generator¶ Owner shall have verified 100 percent of its Facilities are fully compliant¶ with Requirements R1, R2, R3, and R4.¶

**5.2.** In those jurisdictions where regulatory approval is not required:¶

**5.2.1** By the first day of the first calendar quarter, two calendar years following¶

## Standard PRC-024-1 (X) — Generator Frequency and Voltage Protective Relay Settings

transmission system external to the generating plant that remains within the “no trip zone” of PRC-024 Attachment 2. If the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2, then the Generator Owner shall set its protective relaying within the voltage recovery characteristics of a location-specific Transmission Planner’s study. Requirement R2 is subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) may trip in accordance with a Remedial Action Scheme (RAS).
  - Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).
  - Generating unit(s) may trip by action of protective functions (such as out-of-step functions or loss-of-field functions) that operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.
  - Generating unit(s) may trip within a portion of the “no trip zone” of PRC-024 Attachment 2 for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.
- R3.** Each Generator Owner shall document each known regulatory or equipment limitation<sup>3</sup> that prevents an applicable generating unit with generator frequency or voltage protective relays from meeting the relay setting criteria in Requirements R1 or R2 including (but not limited to) study results, experience from an actual event, or manufacturer’s advice. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*
- 3.1.** The Generator Owner shall communicate the documented regulatory or equipment limitation, or the removal of a previously documented regulatory or equipment limitation, to its Planning Coordinator and Transmission Planner within 30 calendar days of any of the following:
- Identification of a regulatory or equipment limitation.
  - Repair of the equipment causing the limitation that removes the limitation.
  - Replacement of the equipment causing the limitation with equipment that removes the limitation.
  - Creation or adjustment of an equipment limitation caused by consumption of the cumulative turbine life-time frequency excursion allowance.
- R4.** Each Generator Owner shall provide its applicable generator protection trip settings associated with Requirements R1 and R2 to the Planning Coordinator or Transmission Planner that models the associated unit within 60 calendar days of receipt of a written request for the data and within 60 calendar days of any change to those previously requested trip settings unless directed by the requesting Planning Coordinator or

**Deleted:** Special Protection System (SPS)  
or

<sup>3</sup> Excludes limitations that are caused by the setting capability of the generator frequency and voltage protective relays themselves but does not exclude limitations originating in the equipment that they protect.

## **Standard PRC-024-1 (X) — Generator Frequency and Voltage Protective Relay Settings**

Transmission Planner that the reporting of relay setting changes is not required.  
*[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

### **C. Measures**

- M1.** Each Generator Owner shall have evidence that generator frequency protective relays have been set in accordance with Requirement R1 such as dated setting sheets, calibration sheets or other documentation.
- M2.** Each Generator Owner shall have evidence that generator voltage protective relays have been set in accordance with Requirement R2 such as dated setting sheets, voltage-time curves, calibration sheets, coordination plots, dynamic simulation studies or other documentation.
- M3.** Each Generator Owner shall have evidence that it has documented and communicated any known regulatory or equipment limitations (excluding limitations noted in footnote 3) that resulted in an exception to Requirements R1 or R2 in accordance with Requirement R3 such as a dated email or letter that contains such documentation as study results, experience from an actual event, or manufacturer's advice.
- M4.** Each Generator Owner shall have evidence that it communicated applicable generator protective relay trip settings in accordance with Requirement R4, such as dated e-mails, correspondence or other evidence and copies of any requests it has received for that information.

### **D. Compliance**

#### **1. Compliance Monitoring Process**

##### **1.1. Compliance Enforcement Authority**

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases, the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

##### **1.1. Data Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall retain evidence of compliance with Requirement R1 through R4; for 3 years or until the next audit, whichever is longer.

If a Generator Owner is found non-compliant, the Generator Owner shall keep information related to the non-compliance until mitigation is complete and approved for the time period specified above, whichever is longer.

**Standard PRC-024-1(X) — Generator Frequency and Voltage Protective Relay Settings**

---

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.2. Compliance Monitoring and Assessment Processes**

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

**1.3. Additional Compliance Information**

### Voltage Ride-Through Curve Clarifications

#### Curve Details:

1. The per unit voltage base for these curves is the nominal operating voltage specified by the Transmission Planner in the analysis of the reliability of the Interconnected Transmission Systems at the point of interconnection to the Bulk Electric System (BES).
2. The curves depicted were derived based on three-phase transmission system zone 1 faults with Normal Clearing not exceeding 9 cycles. The curves apply to voltage excursions regardless of the type of initiating event.
3. The envelope within the curves represents the cumulative voltage duration at the point of interconnection with the BES. For example, if the voltage first exceeds 1.15 pu at 0.3 seconds after a fault, does not exceed 1.2 pu voltage, and returns below 1.15 pu at 0.4 seconds, then the cumulative time the voltage is above 1.15 pu voltage is 0.1 seconds and is within the no trip zone of the curve.
4. The curves depicted assume system frequency is 60 Hertz. When evaluating Volts/Hertz protection, you may adjust the magnitude of the high voltage curve in proportion to deviations of frequency below 60 Hz.
5. Voltages in the curve assume minimum fundamental frequency phase-to-ground or phase-to-phase voltage for the low voltage duration curve and the greater of maximum RMS or crest phase-to-phase voltage for the high voltage duration curve.

#### Evaluating Protective Relay Settings:

1. Use either the following assumptions or loading conditions that are believed to be the most probable for the unit under study to evaluate voltage protection relay setting calculations on the static case for steady state initial conditions:
  - a. All of the units connected to the same transformer are online and operating.
  - b. All of the units are at full nameplate real-power output.
  - c. Power factor is 0.95 lagging (i.e. supplying reactive power to the system) as measured at the generator terminals.
  - d. The automatic voltage regulator is in automatic voltage control mode.
2. Evaluate voltage protection relay settings assuming that additional installed generating plant reactive support equipment (such as static VAR compensators, synchronous condensers, or capacitors) is available and operating normally.
3. Evaluate voltage protection relay settings accounting for the actual tap settings of transformers between the generator terminals and the point of interconnection.

## A. Introduction

1. **Title:** Generator Relay Loadability

2. **Number:** PRC-025-1(X)

**Purpose:** To set load-responsive protective relays associated with generation Facilities at a level to prevent unnecessary tripping of generators during a system disturbance for conditions that do not pose a risk of damage to the associated equipment.

3. **Applicability:**

### 3.1. Functional Entities:

**3.1.1** Generator Owner that applies load-responsive protective relays at the terminals of the Elements listed in 3.2, Facilities.

**3.1.2** Transmission Owner that applies load-responsive protective relays at the terminals of the Elements listed in 3.2, Facilities.

**3.1.3** Distribution Provider that applies load-responsive protective relays at the terminals of the Elements listed in 3.2, Facilities.

**3.2. Facilities:** The following Elements associated with Bulk Electric System (BES) generating units and generating plants, including those generating units and generating plants identified as Blackstart Resources in the Transmission Operator's system restoration plan:

**3.2.1** Generating unit(s).

**3.2.2** Generator step-up (i.e., GSU) transformer(s).

**3.2.3** Unit auxiliary transformer(s) (UAT) that supply overall auxiliary power necessary to keep generating unit(s) online.<sup>1</sup>

**3.2.4** Elements that connect the GSU transformer(s) to the Transmission system that are used exclusively to export energy directly from a BES generating unit or generating plant. Elements may also supply generating plant loads.

**3.2.5** Elements utilized in the aggregation of dispersed power producing resources.

4. **Background:**

After analysis of many of the major disturbances in the last 25 years on the North American interconnected power system, generators have been found to have tripped for conditions that did not apparently pose a direct risk to those generators and associated equipment within the time period where the tripping occurred. This tripping has often been determined to have expanded the scope and/or extended the duration of that

---

<sup>1</sup> These transformers are variably referred to as station power, unit auxiliary transformer(s) (UAT), or station service transformer(s) used to provide overall auxiliary power to the generator station when the generator is running. Loss of these transformers will result in removing the generator from service. Refer to the PRC-025-1(X) Guidelines and Technical Basis for more detailed information concerning unit auxiliary transformers.

disturbance. This was noted to be a serious issue in the August 2003 “blackout” in the northeastern North American continent.<sup>2</sup>

During the recoverable phase of a disturbance, the disturbance may exhibit a “voltage disturbance” behavior pattern, where system voltage may be widely depressed and may fluctuate. In order to support the system during this transient phase of a disturbance, this standard establishes criteria for setting load-responsive protective relays such that individual generators may provide Reactive Power within their dynamic capability during transient time periods to help the system recover from the voltage disturbance. The premature or unnecessary tripping of generators resulting in the removal of dynamic Reactive Power exacerbates the severity of the voltage disturbance, and as a result changes the character of the system disturbance. In addition, the loss of Real Power could initiate or exacerbate a frequency disturbance.

5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

## B. Requirements and Measures

- R1. Each Generator Owner, Transmission Owner, and Distribution Provider shall apply settings that are in accordance with PRC-025-1(X) – Attachment 1: Relay Settings, on each load-responsive protective relay while maintaining reliable fault protection.  
*[Violation Risk Factor: High] [Time Horizon: Long-Term Planning]*
- M1. For each load-responsive protective relay, each Generator Owner, Transmission Owner, and Distribution Provider shall have evidence (e.g., summaries of calculations, spreadsheets, simulation reports, or setting sheets) that settings were applied in accordance with PRC-025-1(X) – Attachment 1: Relay Settings.

## C. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Enforcement Authority**

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

<sup>2</sup> Interim Report: Causes of the August 14th Blackout in the United States and Canada, U.S.-Canada Power System Outage Task Force, November 2003 (<http://www.nerc.com/docs/docs/blackout/814BlackoutReport.pdf>)

**1.2. Evidence Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority (CEA) may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner, Transmission Owner, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The Generator Owner, Transmission Owner, and Distribution Provider shall retain evidence of Requirement R1 and Measure M1 for the most recent three calendar years.
- If a Generator Owner, Transmission Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

**1.3. Compliance Monitoring and Assessment Processes**

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

**1.4. Additional Compliance Information**

None

**Table of Compliance Elements**

| R # | Time Horizon       | VRF  | Violation Severity Levels |              |          |   |
|-----|--------------------|------|---------------------------|--------------|----------|---|
|     |                    |      | Lower VSL                 | Moderate VSL | High VSL | Severe VSL  |
| R1  | Long-Term Planning | High | N/A                       | N/A          | N/A      | The Generator Owner, Transmission Owner, and Distribution Provider did not apply settings in accordance with PRC-025-1(X) – Attachment 1: Relay Settings, on an applied load-responsive protective relay. |

## **PRC-025-1(X) – Attachment 1: Relay Settings**

### **Introduction**

This standard does not require the Generator Owner, Transmission Owner, or Distribution Provider to use any of the protective functions listed in Table 1. Each Generator Owner, Transmission Owner, and Distribution Provider that applies load-responsive protective relays on their respective Elements listed in 3.2, Facilities, shall use one of the following Options in Table 1, Relay Loadability Evaluation Criteria (“Table 1”), to set each load-responsive protective relay element according to its application and relay type. The bus voltage is based on the criteria for the various applications listed in Table 1.

### **Generators**

Synchronous generator relay pickup setting criteria values are derived from the unit’s maximum gross Real Power capability, in megawatts (MW), as reported to the Transmission Planner, and the unit’s Reactive Power capability, in megavoltampere-reactive (Mvar), is determined by calculating the MW value based on the unit’s nameplate megavoltampere (MVA) rating at rated power factor. If different seasonal capabilities are reported, the maximum capability shall be used for the purposes of this standard.

Asynchronous generator relay pickup setting criteria values (including inverter-based installations) are derived from the site’s aggregate maximum complex power capability, in MVA, as reported to the Transmission Planner, including the Mvar output of any static or dynamic reactive power devices.

For the application case where synchronous and asynchronous generator types are combined on a generator step-up transformer or on Elements that connect the generator step-up (GSU) transformer(s) to the Transmission system that are used exclusively to export energy directly from a BES generating unit or generating plant (Elements may also supply generating plant loads.), the pickup setting criteria shall be determined by vector summing the pickup setting criteria of each generator type, and using the bus voltage for the given synchronous generator application and relay type.

### **Transformers**

Calculations using the GSU transformer turns ratio shall use the actual tap that is applied (i.e., in service) for GSU transformers with deenergized tap changers (DETC). If load tap changers (LTC) are used, the calculations shall reflect the tap that results in the lowest generator bus voltage. When the criterion specifies the use of the GSU transformer’s impedance, the nameplate impedance at the nominal GSU transformer turns ratio shall be used.

Applications that use more complex topology, such as generators connected to a multiple winding transformer, are not directly addressed by the criteria in Table 1. These topologies can result in complex power flows, and may require simulation to avoid overly conservative assumptions to simplify the calculations. Entities with these topologies should set their relays in such a way that they do not operate for the conditions being addressed in this standard.

## Multiple Lines

Applications that use more complex topology, such as multiple lines that connect the generator step-up (GSU) transformer(s) to the Transmission system that are used exclusively to export energy directly from a BES generating unit or generating plant (Elements may also supply generating plant loads) are not directly addressed by the criteria in Table 1. These topologies can result in complex power flows, and it may require simulation to avoid overly conservative assumptions to simplify the calculations. Entities with these topologies should set their relays in such a way that they do not operate for the conditions being addressed in this standard.

## Exclusions

The following protection systems are excluded from the requirements of this standard:

1. Any relay elements that are in service only during start up.
2. Load-responsive protective relay elements that are armed only when the generator is disconnected from the system, (e.g., non-directional overcurrent elements used in conjunction with inadvertent energization schemes, and open breaker flashover schemes).
3. Phase fault detector relay elements employed to supervise other load-responsive phase distance elements (e.g., in order to prevent false operation in the event of a loss of potential) provided the distance element is set in accordance with the criteria outlined in the standard.
4. Protective relay elements that are only enabled when other protection elements fail (e.g., overcurrent elements that are only enabled during loss of potential conditions).
5. Protective relay elements used only for Remedial Action Schemes that are subject to one or more requirements in a NERC or Regional Reliability Standard.
6. Protection systems that detect generator overloads that are designed to coordinate with the generator short time capability by utilizing an extremely inverse characteristic set to operate no faster than 7 seconds at 218% of full load current (e.g., rated armature current), and prevent operation below 115% of full-load current.<sup>3</sup>
7. Protection systems that detect transformer overloads and are designed only to respond in time periods which allow an operator 15 minutes or greater to respond to overload conditions.

## Table 1

Table 1 beginning on the next page is structured and formatted to aid the reader with identifying an option for a given load-responsive protective relay.

The first column identifies the application (e.g., synchronous or asynchronous generators, generator step-up transformers, unit auxiliary transformers, Elements that connect the GSU transformer(s) to the Transmission system that are used exclusively to export energy directly from a BES generating unit or generating plant. Elements may also supply generating plant

---

<sup>3</sup> IEEE C37.102-2006, "Guide for AC Generator Protection," Section 4.1.1.2.

loads). Dark blue horizontal bars, excluding the header which repeats at the top of each page, demarcate the various applications.

The second column identifies the load-responsive protective relay (e.g., 21, 50, 51, 51V-C, 51V-R, or 67) according to the applied application in the first column. A light blue horizontal bar between the relay types is the demarcation between relay types for a given application. These light blue bars will contain no text.

The third column uses numeric and alphabetic options (i.e., index numbering) to identify the available options for setting load-responsive protective relays according to the application and applied relay type. Another, shorter, light blue bar contains the word “OR,” and reveals to the reader that the relay for that application has one or more options (i.e., “ways”) to determine the bus voltage and pickup setting criteria in the fourth and fifth column, respectively. The bus voltage column and pickup setting criteria columns provide the criteria for determining an appropriate setting.

The table is further formatted by shading groups of relays associated with asynchronous generator applications. Synchronous generator applications and the unit auxiliary transformer applications are not shaded. Also, intentional buffers were added to the table such that similar options, as possible, would be paired together on a per page basis. Note that some applications may have an additional pairing that might occur on adjacent pages.

| Table 1. Relay Loadability Evaluation Criteria   |  |           |   |   |  |
|--|--|-----------|---|---|--|
| Application  | Relay Type   | Option    | Bus Voltage <sup>4</sup>  | Pickup Setting Criteria   |  |
| Synchronous generating unit(s), or Elements utilized in the aggregation of dispersed power producing resources | Phase distance relay (21) – directional toward the Transmission system | 1a        | Generator bus voltage corresponding to 0.95 per unit of the high-side nominal voltage times the turns ratio of the generator step-up transformer  | The impedance element shall be set less than the calculated impedance derived from 115% of:<br>(1) Real Power output – 100% of the gross MW capability reported to the Transmission Planner, and<br>(2) Reactive Power output – 150% of the MW value, derived from the generator nameplate MVA rating at rated power factor |  |
|  |  | <b>OR</b> |   |   |  |
|  |  | 1b        | Calculated generator bus voltage corresponding to 0.85 per unit nominal voltage on the high-side terminals of the generator step-up transformer (including the transformer turns ratio and impedance)   | The impedance element shall be set less than the calculated impedance derived from 115% of:<br>(1) Real Power output – 100% of the gross MW capability reported to the Transmission Planner, and<br>(2) Reactive Power output – 150% of the MW value, derived from the generator nameplate MVA rating at rated power factor |  |
|  |  | <b>OR</b> |   |   |  |
|  |  | 1c        | Simulated generator bus voltage coincident with the highest Reactive Power output achieved during field-forcing in response to a 0.85 per unit nominal voltage on the high-side terminals of the generator step-up transformer prior to field-forcing | The impedance element shall be set less than the calculated impedance derived from 115% of:<br>(1) Real Power output – 100% of the gross MW capability reported to the Transmission Planner, and<br>(2) Reactive Power output –100% of the maximum gross Mvar output during field-forcing as determined by simulation       |  |
| <b>The same application continues on the next page with a different relay type</b>                             |  |           |   |   |  |

<sup>4</sup> Calculations using the generator step-up (GSU) transformer turns ratio shall use the actual tap that is applied (i.e., in service) for GSU transformers with de-energized tap changers (DETC). If load tap changers (LTC) are used, the calculations shall reflect the tap that results in the lowest generator bus voltage. When the criterion specifies the use of the GSU transformer’s impedance, the nameplate impedance at the nominal GSU turns ratio shall be used.

**Rationale:**

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

**Rationale for R1:**

Requirement R1 is a risk-based requirement that requires the responsible entity to be aware of each protective relay subject to the standard and applies an appropriate setting based on its calculations or simulation for the conditions established in Attachment 1.

The criteria established in Attachment 1 represent short-duration conditions during which generation Facilities are capable of providing system reactive resources, and for which generation Facilities have been historically recorded to disconnect, causing events to become more severe.

The term, “while maintaining reliable fault protection” in Requirement R1 describes that the responsible entity is to comply with this standard while achieving their desired protection goals. Refer to the Guidelines and Technical Basis, Introduction, for more information.

**Version History**

| Version | Date            | Action                                | Change Tracking  |
|---------|-----------------|---------------------------------------|--|
| 1       | August 15, 2013 | Adopted by NERC Board of Trustees     | New  |
| 1(X)    | TBD             | Adopted by the NERC Board of Trustees | Replaced references to Special Protection System and SPS with Remedial Action Scheme and RAS |

**A. Introduction**

- 1. **Title:** Generator Relay Loadability
- 2. **Number:** PRC-025-1(X)

**Purpose:** To set load-responsive protective relays associated with generation Facilities at a level to prevent unnecessary tripping of generators during a system disturbance for conditions that do not pose a risk of damage to the associated equipment.

3. **Applicability:**

3.1. **Functional Entities:**

- 3.1.1 Generator Owner that applies load-responsive protective relays at the terminals of the Elements listed in 3.2, Facilities.
- 3.1.2 Transmission Owner that applies load-responsive protective relays at the terminals of the Elements listed in 3.2, Facilities.
- 3.1.3 Distribution Provider that applies load-responsive protective relays at the terminals of the Elements listed in 3.2, Facilities.

3.2. **Facilities:** The following Elements associated with Bulk Electric System (BES) generating units and generating plants, including those generating units and generating plants identified as Blackstart Resources in the Transmission Operator’s system restoration plan:

- 3.2.1 Generating unit(s).
- 3.2.2 Generator step-up (i.e., GSU) transformer(s).
- 3.2.3 Unit auxiliary transformer(s) (UAT) that supply overall auxiliary power necessary to keep generating unit(s) online.<sup>1</sup>
- 3.2.4 Elements that connect the GSU transformer(s) to the Transmission system that are used exclusively to export energy directly from a BES generating unit or generating plant. Elements may also supply generating plant loads.
- 3.2.5 Elements utilized in the aggregation of dispersed power producing resources.

4. **Background:**

After analysis of many of the major disturbances in the last 25 years on the North American interconnected power system, generators have been found to have tripped for conditions that did not apparently pose a direct risk to those generators and associated equipment within the time period where the tripping occurred. This tripping has often been determined to have expanded the scope and/or extended the duration of that

---

<sup>1</sup> These transformers are variably referred to as station power, unit auxiliary transformer(s) (UAT), or station service transformer(s) used to provide overall auxiliary power to the generator station when the generator is running. Loss of these transformers will result in removing the generator from service. Refer to the PRC-025-1(X) Guidelines and Technical Basis for more detailed information concerning unit auxiliary transformers.

## PRC-025-1(X)— Generator Relay Loadability

disturbance. This was noted to be a serious issue in the August 2003 “blackout” in the northeastern North American continent.<sup>2</sup>

During the recoverable phase of a disturbance, the disturbance may exhibit a “voltage disturbance” behavior pattern, where system voltage may be widely depressed and may fluctuate. In order to support the system during this transient phase of a disturbance, this standard establishes criteria for setting load-responsive protective relays such that individual generators may provide Reactive Power within their dynamic capability during transient time periods to help the system recover from the voltage disturbance. The premature or unnecessary tripping of generators resulting in the removal of dynamic Reactive Power exacerbates the severity of the voltage disturbance, and as a result changes the character of the system disturbance. In addition, the loss of Real Power could initiate or exacerbate a frequency disturbance.

5. **Effective Date:** This standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Deleted: See Implementation Plan¶

### B. Requirements and Measures

- R1. Each Generator Owner, Transmission Owner, and Distribution Provider shall apply settings that are in accordance with PRC-025-1(X) – Attachment 1: Relay Settings, on each load-responsive protective relay while maintaining reliable fault protection.  
*[Violation Risk Factor: High] [Time Horizon: Long-Term Planning]*
- M1. For each load-responsive protective relay, each Generator Owner, Transmission Owner, and Distribution Provider shall have evidence (e.g., summaries of calculations, spreadsheets, simulation reports, or setting sheets) that settings were applied in accordance with PRC-025-1(X) – Attachment 1: Relay Settings.

### C. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

<sup>2</sup> Interim Report: Causes of the August 14th Blackout in the United States and Canada, U.S.-Canada Power System Outage Task Force, November 2003 (<http://www.nerc.com/docs/docs/blackout/814BlackoutReport.pdf>)

**1.2. Evidence Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority (CEA) may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner, Transmission Owner, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The Generator Owner, Transmission Owner, and Distribution Provider shall retain evidence of Requirement R1 and Measure M1 for the most recent three calendar years.
- If a Generator Owner, Transmission Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

**1.3. Compliance Monitoring and Assessment Processes**

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

**1.4. Additional Compliance Information**

None
