Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The following guidelines are available to assist in addressing the required components of a recovery plan:

- NERC, Security Guideline for the Electricity Sector: Continuity of Business Processes and Operations Operational Functions, September 2011, online at http://www.nerc.com/docs/cip/sgwg/Continuity%20of%20Business%20and%20Operational%20Functions%20FINAL%20102511.pdf
- National Institute of Standards and Technology, Contingency Planning Guide for Federal Information Systems, Special Publication 800-34 revision 1, May 2010, online at http://csrc.nist.gov/publications/nistpubs/800-34-rev1/sp800-34-rev1_errata-Nov11-2010.pdf

The term recovery plan is used throughout this Standard to refer to a documented set of instructions and resources needed to recover reliability functions performed by BES Cyber Systems. The recovery plan may exist as part of a larger business continuity or disaster recovery plan, but the term does not imply any additional obligations associated with those disciplines outside of the Requirements.

A documented recovery plan may not be necessary for each applicable BES Cyber System. For example, the short-term recovery plan for a BES Cyber System in a specific substation may be

managed on a daily basis by advanced power system applications such as state estimation, contingency and remedial action, and outage scheduling. One recovery plan for BES Cyber Systems should suffice for several similar facilities such as those found in substations or power plants' facilities.

For Part 1.1, the conditions for activation of the recovery plan should consider viable threats to the BES Cyber System such as natural disasters, computing equipment failures, computing environment failures, and Cyber Security Incidents. A business impact analysis for the BES Cyber System may be useful in determining these conditions.

For Part 1.2, entities should identify the individuals required for responding to a recovery operation of the applicable BES Cyber System.

For Part 1.3, entities should consider the following types of information to recover BES Cyber System functionality:

1. Installation files and media;
2. Current backup tapes and any additional documented configuration settings;
3. Documented build or restoration procedures; and
4. Cross site replication storage.

For Part 1.4, the processes to verify the successful completion of backup processes should include checking for: (1) usability of backup media, (2) logs or inspection showing that information from current, production system could be read, and (3) logs or inspection showing that information was written to the backup media. Test restorations are not required for this Requirement Part. The following backup scenarios provide examples of effective processes to verify successful completion and detect any backup failures:

- Periodic (e.g. daily or weekly) backup process – Review generated logs or job status reports and set up notifications for backup failures.
- Non-periodic backup process– If a single backup is provided during the commissioning of the system, then only the initial and periodic (every 15 months) testing must be done. Additional testing should be done as necessary and can be a part of the configuration change management program.
- Data mirroring – Configure alerts on the failure of data transfer for an amount of time specified by the entity (e.g. 15 minutes) in which the information on the mirrored disk may no longer be useful for recovery.
- Manual configuration information – Inspect the information used for recovery prior to storing initially and periodically (every 15 months). Additional inspection should be done as necessary and can be a part of the configuration change management program.

The plan must also include processes to address backup failures. These processes should specify the response to failure notifications or other forms of identification.

For Part 1.5, the recovery plan must include considerations for preservation of data to determine the cause of a Cyber Security Incident. Because it is not always possible to initially

know if a Cyber Security Incident caused the recovery activation, the data preservation procedures should be followed until such point a Cyber Security Incident can be ruled out. CIP-008 addresses the retention of data associated with a Cyber Security Incident.

Requirement R2:

A Responsible Entity must exercise each BES Cyber System recovery plan every 15 months. However, this does not necessarily mean that the entity must test each plan individually. BES Cyber Systems that are numerous and distributed, such as those found at substations, may not require an individual recovery plan and the associated redundant facilities since reengineering and reconstruction may be the generic response to a severe event. Conversely, there is typically one control center per bulk transmission service area that requires a redundant or backup facility. Because of these differences, the recovery plans associated with control centers differ a great deal from those associated with power plants and substations.

A recovery plan test does not necessarily cover all aspects of a recovery plan and failure scenarios, but the test should be sufficient to ensure the plan is up to date and at least one restoration process of the applicable cyber systems is covered.

Entities may use an actual recovery as a substitute for exercising the plan every 15 months. Otherwise, entities must exercise the plan with a paper drill, tabletop exercise, or operational exercise. For more specific types of exercises, refer to the FEMA Homeland Security Exercise and Evaluation Program (HSEEP). It lists the following four types of discussion-based exercises: seminar, workshop, tabletop, and games. In particular, it defines that, "A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. [Table top exercises (TTX)] can be used to assess plans, policies, and procedures."

The HSEEP lists the following three types of operations-based exercises: Drill, functional exercise, and full-scale exercise. It defines that, "[A] full-scale exercise is a multi-agency, multi-jurisdictional, multi-discipline exercise involving functional (e.g., joint field office, Emergency operation centers, etc.) and 'boots on the ground' response (e.g., firefighters decontaminating mock victims)."

For Part 2.2, entities should refer to the backup and storage of information required to recover BES Cyber System functionality in Requirement Part 1.3. This provides additional assurance that the information will actually recover the BES Cyber System as necessary. For most complex computing equipment, a full test of the information is not feasible. Entities should determine the representative sample of information that provides assurance in the processes for Requirement Part 1.3. The test must include steps for ensuring the information is useable and current. For backup media, this can include testing a representative sample to make sure the information can be loaded, and checking the content to make sure the information reflects the current configuration of the applicable Cyber Assets.

Requirement R3:

This requirement ensures entities maintain recovery plans. There are two requirement parts that trigger plan updates: (1) lessons learned and (2) organizational or technology changes.

The documentation of lessons learned is associated with each recovery activation, and it involves the activities as illustrated in Figure 1, below. The deadline to document lessons learned starts after the completion of the recovery operation in recognition that complex recovery activities can take a few days or weeks to complete. The process of conducting lessons learned can involve the recovery team discussing the incident to determine gaps or areas of improvement within the plan. It is possible to have a recovery activation without any documented lessons learned. In such cases, the entity must retain documentation of the absence of any lessons learned associated with the recovery activation.

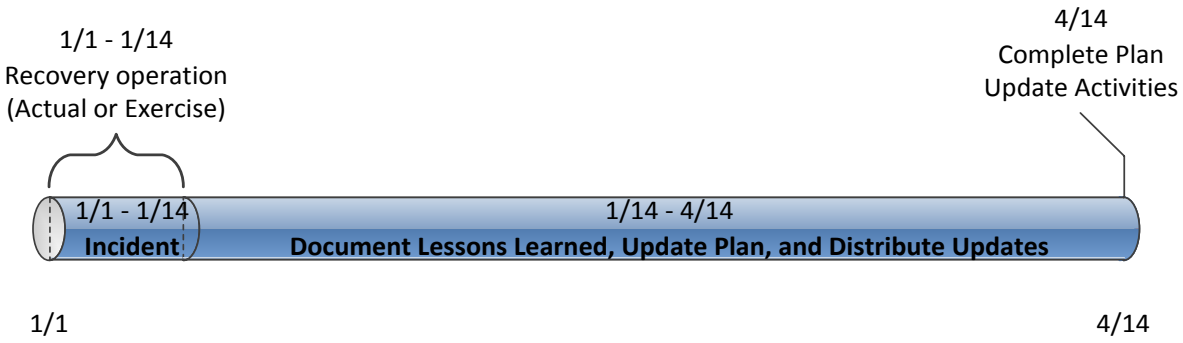

Figure 1: CIP-009-~~5~~ 6 R3 Timeline

The activities necessary to complete the lessons learned include updating the plan and distributing those updates. Entities should consider meeting with all of the individuals involved in the recovery and documenting the lessons learned as soon after the recovery activation as possible. This allows more time for making effective updates to the plan, obtaining any necessary approvals, and distributing those updates to the recovery team.

The plan change requirement is associated with organization and technology changes referenced in the plan and involves the activities illustrated in Figure 2, below. Organizational changes include changes to the roles and responsibilities people have in the plan or changes to the response groups or individuals. This may include changes to the names or contact information listed in the plan. Technology changes affecting the plan may include referenced information sources, communication systems, or ticketing systems.

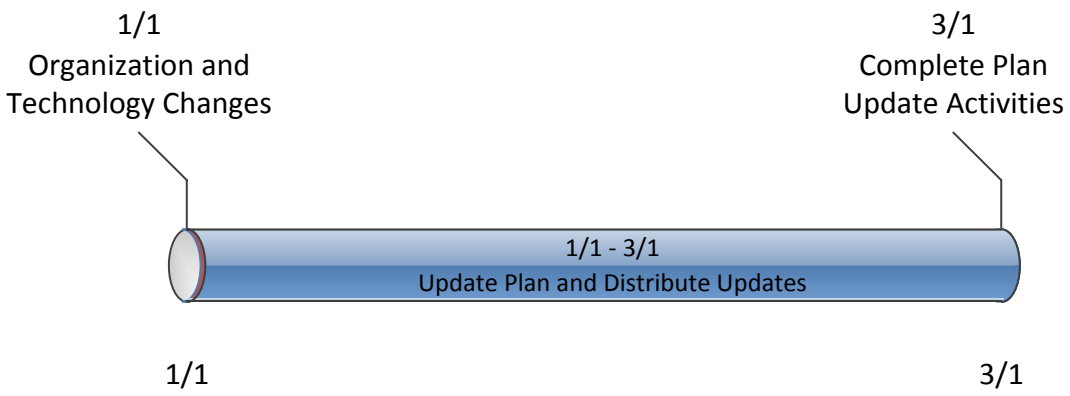

Figure 2: Timeline for Plan Changes in 3.2

When notifying individuals of response plan changes, entities should keep in mind that recovery plans may be considered BES Cyber System Information, and they should take the appropriate measures to prevent unauthorized disclosure of recovery plan information. For example, the recovery plan itself, or other sensitive information about the recovery plan, should be redacted from Email or other unencrypted transmission.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	
2	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Configuration Change Management and Vulnerability Assessments

2. Number: CIP-010-2

3. Purpose: To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-010-2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-010-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with Reliability Standard CIP-010-2, Requirement R4 until nine calendar months after the effective date of Reliability Standard CIP-010-2.

6. Background:

Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R1 – Configuration Change Management

Part	Applicable Systems	Requirements	Measures
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-010-2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-010-2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

Rationale for Requirement R2:

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

Rationale for Requirement R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment,; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

Rationale for R4:

Requirement R4 is to address FERC Order No. 791 Paragraphs 6 and 136, which require the standards to address security-related issues associated with tools specifically used for data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To that end, the requirement goals are as follows:

(1) Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and

(2) Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.

The SDT has incorporated the concepts of other requirements from FERC-approved CIP-010-1 and CIP-007-5 to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes: This is a new requirement. All requirements related to Transient Devices and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. While the requirements are similar, they are not to the same rigor of those found in CIP-007 protecting the permanent assets identified by an entity. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes.

R4. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Authorize the usage of Transient Cyber Assets prior to initial use, except for CIP Exceptional Circumstances. Authorization shall include: 4.1.1. Users, individually or by group/role; 4.1.2. Locations, individually or by group/role; 4.1.3. Defined acceptable use; and 4.1.4. Operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability).	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the authorized software for each Transient Cyber Asset, individually or by group; or • A record in an asset management system that identifies the authorized configuration for each Transient Cyber Asset individually or by group.
4.2	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Use method(s) to deter, detect, or prevent malicious code on Transient Cyber Assets (per Cyber Asset capability).	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus hardening, policies, verification of method(s) employed by vendors, etc.).

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Use method(s) to detect malicious code on Removable Media prior to use on applicable systems.	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus scanning techniques, verification of method(s) employed by vendors, etc.).
4.4	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Mitigate the threat of detected malicious code for Transient Cyber Assets and Removable Media.	Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.
4.5	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Update signatures or patterns for those methods identified in Parts 4.2 and 4.3 that use signatures or patterns.	An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.6	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Evaluate Transient Cyber Assets, prior to use, for modifications that deviate from Part 4.1.4. For a modification that deviates from the state in Part 4.1.4, either: • Remediate by returning the Transient Cyber Asset to the state in Part 4.1.4; or • Update Part 4.1.4.	An example of evidence may include but is not limited to, updated documentation with the date, evaluation results, and status of any remediation activities.
4.7	High Impact BES Cyber Systems and associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Evaluate Transient Cyber Assets, within 35 calendar days prior to use, to ensure security patches are up-to-date. For security patches that are not up-to-date, take one of the following actions: • Apply the applicable patches; • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch.	An example of evidence may include but is not limited to, updated documentation with the date, evaluation results, and status of any mitigation activities.

C. Compliance

1. Compliance Monitoring Process:

a. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

b. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be

included. Custom software installed may include scripts developed for local entity functions or other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT

believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.

2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.
3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Requirement R4:

This Requirement applies to any transient devices (i.e. Transient Cyber Assets and Removable Media) that will be connected temporarily to an applicable system. Examples of these devices include, but are not limited to:

- Hardware/software diagnostic test equipment
- Hardware/software packet sniffers
- Hardware/software used for BES Cyber System maintenance
- Hardware/software used for BES Cyber System configuration
- Hardware/software used to perform vulnerability assessments

Transient Cyber Assets can be in the form of a laptop, desktop, or tablet. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

This requirement does not cover hardware/software components that may support information system maintenance yet are a part of the system, for example the software implementing “ping,” “ls,” “ipconfig,” or the hardware and software implementing the monitoring port of a switch.

Requirement Parts 4.1, 4.3, 4.6, and 4.7 refer to the term “prior to use” related to when specific actions must occur. For purposes of this standard, "use" is considered to be the interaction between transient devices and applicable systems. The interaction between transient devices and multiple applicable systems within the same ESP or PSP would be considered a single use. For example, a technician would need to have a laptop evaluated only once according to Part 4.6 when working in the same PSP. The technician would not need to have the evaluation performed each time it connects to a different Cyber Asset.

Requirement Part 4.1:

Requirement Part 4.1 requires the entity to document and implement its process to authorize the use of Transient Cyber Assets. This allows entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection. The Transient Cyber Assets may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:

1. User(s), individually or by group/role, allowed to use Transient Cyber Assets. This is intended to provide assurance around who has physical proximity to the Transient Cyber Assets. These user(s) must have authorized electronic and unescorted physical access to the applicable system in accordance with CIP-004.
2. Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group/role of locations. Attention should be paid to Transient Cyber Assets that may be used for assets in differing impact areas (i.e. high impact, medium impact, low impact). These impact areas have differing levels of protection under the CIP Requirements, and measures should be taken to prevent the introduction of malicious code from a lower impact area. It may be reasonable to have separate Transient Cyber Assets for each impact level.
3. The intended or approved use of each Transient Cyber Asset. Activities not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals on the activities or uses that are not allowed (e.g., using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).
4. The operating system, firmware, and intentionally installed software. All of this information may not be available or relevant to each Transient Cyber Asset. Having this information facilitates the review in Part 4.6. The use of the term “intentional” was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The Standard Drafting Team does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included.

CAUTION: Entities should exercise caution when using Transient Cyber Assets and ensure they do not have wireless or Bluetooth features enabled in a manner that would allow the device to bridge an outside network to an applicable system. Doing so would cause the Transient Cyber

Asset to become an unauthorized Electronic Access Point in violation of CIP-005, Requirement R1.

Requirement Parts 4.2, 4.3, 4.4, and 4.5:

Requirement Parts 4.2 and 4.3 address the protection against the introduction of malicious code by Transient Cyber Assets or Removable Media. For Transient Cyber Assets, the entity may either pre-authorize an inventory of Cyber Assets or authorize devices at the time of connection. Pre-authorized Transient Cyber Assets may have the malicious code prevention maintained on the device and do not require specific actions for each use.

It is the responsibility of the entity to ensure that the Transient Cyber Assets it owns and manages have methods deployed to deter, detect, or prevent malicious code. It is also the entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not own or manage, including vendor assets.

For Removable Media and Transient Cyber Assets authorized at the time of connection, the detection of malicious code must be addressed prior to use. This can be performed by scanning the Transient Cyber Assets or Removable Media in an environment outside of the Electronic Security Perimeter (ESP). Entities should use caution not to place kiosks or other scanning devices used to comply with this Requirement inside the ESP.

For Requirement R4, Part 4.4, if malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

Part 4.5 requires a process to update signatures or patterns, where applicable. This process is to be documented in the overarching program. As with CIP-007-6, Requirement R3, the process is to include testing and installing of updated signatures or patterns.

Requirement Parts 4.6 and 4.7:

Requirement R4, Part 4.6 requires the entity to evaluate Transient Cyber Assets to ensure that no unauthorized modifications have been made to the operating system, firmware, or software. This is a review of the current state against what is currently documented pursuant to Part 4.1.4. If there are differences, the modified code may be removed or the documentation updated to align to the authorized or current state.

Similarly, Requirement R4, Part 4.7 requires the entity to evaluate Transient Cyber Assets to ensure that patches are up-to-date. This is a review of the patches currently installed against what is currently documented. If there are missing patches, these should be tested and applied or a mitigation plan should be created to mitigate the vulnerabilities addressed by each uninstalled security patch. This should be performed prior to connecting the Transient Cyber Asset to an applicable system. For a device that the entity does not manage (i.e. vendor laptop), this can be performed immediately prior to connecting the Transient Cyber Asset to an applicable system. For an entity-managed device, the entity can evaluate and apply the patches monthly and not have to evaluate prior to each use.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	
2	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Configuration Change Management and Vulnerability Assessments

2. Number: CIP-010-~~1~~2

3. Purpose: To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**:

All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-010-~~1~~2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-010-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with Reliability Standard CIP-010-2, Requirement R4 until nine calendar months after the effective date of Reliability Standard CIP-010-2.

6. Background:

Standard CIP-010 -1 exists as part of a suite of CIP Standards related to cyber security, which. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1 and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter. The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to

~~change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement~~**~~, in a manner that identifies, assesses, and corrects deficiencies,~~** ~~. . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~ its documented processes, but ~~they~~ it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~1~~ 2 Table R1 – Configuration Change Management

Part	Applicable Systems	Requirements	Measures
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-~~1~~ 2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-010-~~1~~ 2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-010-~~1~~ 2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

Rationale for Requirement R2:

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~1~~ 2 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

Rationale for Requirement R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ 2 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~1~~ 2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment,; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-~~1~~ 2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-~~1~~ 2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

Rationale for R4:

Requirement R4 is to address FERC Order No. 791 Paragraphs 6 and 136, which require the standards to address security-related issues associated with tools specifically used for data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To that end, the requirement goals are as follows:

(1) Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and

(2) Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.

The SDT has incorporated the concepts of other requirements from FERC-approved CIP-010-1 and CIP-007-5 to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes: This is a new requirement. All requirements related to Transient Devices and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. While the requirements are similar, they are not to the same rigor of those found in CIP-007 protecting the permanent assets identified by an entity. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes.

R4. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Authorize the usage of Transient Cyber Assets prior to initial use, except for CIP Exceptional Circumstances. Authorization shall include: 4.1.1. Users, individually or by group/role; 4.1.2. Locations, individually or by group/role; 4.1.3. Defined acceptable use; and 4.1.4. Operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability).	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the authorized software for each Transient Cyber Asset, individually or by group; or • A record in an asset management system that identifies the authorized configuration for each Transient Cyber Asset individually or by group.
4.2	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Use method(s) to deter, detect, or prevent malicious code on Transient Cyber Assets (per Cyber Asset capability).	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus hardening, policies, verification of method(s) employed by vendors, etc.).

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Use method(s) to detect malicious code on Removable Media prior to use on applicable systems.	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus scanning techniques, verification of method(s) employed by vendors, etc.).
4.4	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Mitigate the threat of detected malicious code for Transient Cyber Assets and Removable Media.	Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.
4.5	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Update signatures or patterns for those methods identified in Parts 4.2 and 4.3 that use signatures or patterns.	An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.6	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Evaluate Transient Cyber Assets, prior to use, for modifications that deviate from Part 4.1.4. For a modification that deviates from the state in Part 4.1.4, either: • Remediate by returning the Transient Cyber Asset to the state in Part 4.1.4; or • Update Part 4.1.4.	An example of evidence may include but is not limited to, updated documentation with the date, evaluation results, and status of any remediation activities.
4.7	High Impact BES Cyber Systems and associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Evaluate Transient Cyber Assets, within 35 calendar days prior to use, to ensure security patches are up-to-date. For security patches that are not up-to-date, take one of the following actions: • Apply the applicable patches; • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch.	An example of evidence may include but is not limited to, updated documentation with the date, evaluation results, and status of any mitigation activities.

C. Compliance

1. Compliance Monitoring Process:

a. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

b. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

c. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaints Text

d. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-~~1~~2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only four of the required baseline items listed in 1.1.1 through 1.1.5. (1.1) ~~OR~~ ~~The Responsible Entity has documented and implemented a configuration change management process(es) that includes all of the required baseline~~	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only three of the required baseline items listed in 1.1.1 through 1.1.5. Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be

included. Custom software installed may include scripts developed for local entity functions or other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-~~5~~6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-~~5~~ 6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT

believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.

2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.
3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Requirement R4:

This Requirement applies to any transient devices (i.e. Transient Cyber Assets and Removable Media) that will be connected temporarily to an applicable system. Examples of these devices include, but are not limited to:

- Hardware/software diagnostic test equipment
- Hardware/software packet sniffers
- Hardware/software used for BES Cyber System maintenance
- Hardware/software used for BES Cyber System configuration
- Hardware/software used to perform vulnerability assessments

Transient Cyber Assets can be in the form of a laptop, desktop, or tablet. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

This requirement does not cover hardware/software components that may support information system maintenance yet are a part of the system, for example the software implementing "ping," "ls," "ipconfig," or the hardware and software implementing the monitoring port of a switch.

Requirement Parts 4.1, 4.3, 4.6, and 4.7 refer to the term “prior to use” related to when specific actions must occur. For purposes of this standard, "use" is considered to be the interaction between transient devices and applicable systems. The interaction between transient devices and multiple applicable systems within the same ESP or PSP would be considered a single use. For example, a technician would need to have a laptop evaluated only once according to Part 4.6 when working in the same PSP. The technician would not need to have the evaluation performed each time it connects to a different Cyber Asset.

Requirement Part 4.1:

Requirement Part 4.1 requires the entity to document and implement its process to authorize the use of Transient Cyber Assets. This allows entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection. The Transient Cyber Assets may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:

1. User(s), individually or by group/role, allowed to use Transient Cyber Assets. This is intended to provide assurance around who has physical proximity to the Transient Cyber Assets. These user(s) must have authorized electronic and unescorted physical access to the applicable system in accordance with CIP-004.
2. Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group/role of locations. Attention should be paid to Transient Cyber Assets that may be used for assets in differing impact areas (i.e. high impact, medium impact, low impact). These impact areas have differing levels of protection under the CIP Requirements, and measures should be taken to prevent the introduction of malicious code from a lower impact area. It may be reasonable to have separate Transient Cyber Assets for each impact level.
3. The intended or approved use of each Transient Cyber Asset. Activities not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals on the activities or uses that are not allowed (e.g., using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).
4. The operating system, firmware, and intentionally installed software. All of this information may not be available or relevant to each Transient Cyber Asset. Having this information facilitates the review in Part 4.6. The use of the term “intentional” was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The Standard Drafting Team does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included.

CAUTION: Entities should exercise caution when using Transient Cyber Assets and ensure they do not have wireless or Bluetooth features enabled in a manner that would allow the device to bridge an outside network to an applicable system. Doing so would cause the Transient Cyber

Asset to become an unauthorized Electronic Access Point in violation of CIP-005, Requirement R1.

Requirement Parts 4.2, 4.3, 4.4, and 4.5:

Requirement Parts 4.2 and 4.3 address the protection against the introduction of malicious code by Transient Cyber Assets or Removable Media. For Transient Cyber Assets, the entity may either pre-authorize an inventory of Cyber Assets or authorize devices at the time of connection. Pre-authorized Transient Cyber Assets may have the malicious code prevention maintained on the device and do not require specific actions for each use.

It is the responsibility of the entity to ensure that the Transient Cyber Assets it owns and manages have methods deployed to deter, detect, or prevent malicious code. It is also the entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not own or manage, including vendor assets.

For Removable Media and Transient Cyber Assets authorized at the time of connection, the detection of malicious code must be addressed prior to use. This can be performed by scanning the Transient Cyber Assets or Removable Media in an environment outside of the Electronic Security Perimeter (ESP). Entities should use caution not to place kiosks or other scanning devices used to comply with this Requirement inside the ESP.

For Requirement R4, Part 4.4, if malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

Part 4.5 requires a process to update signatures or patterns, where applicable. This process is to be documented in the overarching program. As with CIP-007-6, Requirement R3, the process is to include testing and installing of updated signatures or patterns.

Requirement Parts 4.6 and 4.7:

Requirement R4, Part 4.6 requires the entity to evaluate Transient Cyber Assets to ensure that no unauthorized modifications have been made to the operating system, firmware, or software. This is a review of the current state against what is currently documented pursuant to Part 4.1.4. If there are differences, the modified code may be removed or the documentation updated to align to the authorized or current state.

Similarly, Requirement R4, Part 4.7 requires the entity to evaluate Transient Cyber Assets to ensure that patches are up-to-date. This is a review of the patches currently installed against what is currently documented. If there are missing patches, these should be tested and applied or a mitigation plan should be created to mitigate the vulnerabilities addressed by each uninstalled security patch. This should be performed prior to connecting the Transient Cyber Asset to an applicable system. For a device that the entity does not manage (i.e. vendor laptop), this can be performed immediately prior to connecting the Transient Cyber Asset to an applicable system. For an entity-managed device, the entity can evaluate and apply the patches monthly and not have to evaluate prior to each use.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the information protection requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-011-1. (Order becomes effective on 2/3/14.)	
2	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Information Protection

2. Number: CIP-011-2

3. Purpose: To prevent unauthorized access to BES Cyber System Information by specifying information protection requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-011-2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-011-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-011 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the

standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:
Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples

may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The SDT's intent of the information protection program is to prevent unauthorized access to BES Cyber System Information.

R1. Each Responsible Entity shall implement one or more documented information protection program(s) that collectively includes each of the applicable requirement parts in *CIP-011-2 Table R1 – Information Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence for the information protection program must include the applicable requirement parts in *CIP-011-2 Table R1 – Information Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Method(s) to identify information that meets the definition of BES Cyber System Information.	Examples of acceptable evidence include, but are not limited to: • Documented method to identify BES Cyber System Information from entity's information protection program; or • Indications on information (e.g., labels or classification) that identify BES Cyber System Information as designated in the entity's information protection program; or • Training materials that provide personnel with sufficient knowledge to recognize BES Cyber System Information; or • Repository or electronic and physical location designated for housing BES Cyber System Information in the entity's information protection program.

CIP-011-2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirement**	**Measure**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	Examples of acceptable evidence include, but are not limited to: • Procedures for protecting and securely handling, which include topics such as storage, security during transit, and use of BES Cyber System Information; or • Records indicating that BES Cyber System Information is handled in a manner consistent with the entity's documented procedure(s).

Rationale for Requirement R2:

The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BES Cyber System Information upon reuse or disposal.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include the applicable requirement parts in *CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the release for reuse of applicable Cyber Assets that contain BES Cyber System Information (except for reuse within other systems identified in the "Applicable Systems" column), the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media.	Examples of acceptable evidence include, but are not limited to: • Records tracking sanitization actions taken to prevent unauthorized retrieval of BES Cyber System Information such as clearing, purging, or destroying; or • Records tracking actions such as encrypting, retaining in the Physical Security Perimeter or other methods used to prevent unauthorized retrieval of BES Cyber System Information.

CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the disposal of applicable Cyber Assets that contain BES Cyber System Information, the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset or destroy the data storage media.	Examples of acceptable evidence include, but are not limited to: • Records that indicate that data storage media was destroyed prior to the disposal of an applicable Cyber Asset; or • Records of actions taken to prevent unauthorized retrieval of BES Cyber System Information prior to the disposal of an applicable Cyber Asset.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints Text

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-011-2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	N/A	N/A	N/A	The Responsible Entity has not documented or implemented a BES Cyber System Information protection program (R1).
R2	**Operations Planning**	**Lower**	N/A	The Responsible Entity implemented one or more documented processes but did not include processes for reuse as to prevent the unauthorized retrieval of BES Cyber System Information from the BES Cyber Asset. (2.1)	The Responsible Entity implemented one or more documented processes but did not include disposal or media destruction processes to prevent the unauthorized retrieval of BES Cyber System Information from the BES Cyber Asset. (2.2)	The Responsible Entity has not documented or implemented any processes for applicable requirement parts in CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal. (R2)

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

None.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Responsible Entities are free to utilize existing change management and asset management systems. However, the information contained within those systems must be evaluated, as the information protection requirements still apply.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

This requirement mandates that BES Cyber System Information be identified. The Responsible Entity has flexibility in determining how to implement the requirement. The Responsible Entity should explain the method for identifying the BES Cyber System Information in their information protection program. For example, the Responsible Entity may decide to mark or label the documents. Identifying separate classifications of BES Cyber System Information is not specifically required. However, a Responsible Entity maintains the flexibility to do so if they desire. As long as the Responsible Entity's information protection program includes all applicable items, additional classification levels (e.g., confidential, public, internal use only, etc.) can be created that go above and beyond the requirements. If the entity chooses to use classifications, then the types of classifications used by the entity and any associated labeling should be documented in the entity's BES Cyber System Information Program.

The Responsible Entity may store all of the information about BES Cyber Systems in a separate repository or location (physical and/or electronic) with access control implemented. For example, the Responsible Entity's program could document that all information stored in an identified repository is considered BES Cyber System Information, the program may state that all information contained in an identified section of a specific repository is considered BES Cyber System Information, or the program may document that all hard copies of information are stored in a secured area of the building. Additional methods for implementing the requirement are suggested in the measures section. However, the methods listed in measures are not meant to be an exhaustive list of methods that the entity may choose to utilize for the identification of BES Cyber System Information.

The SDT does not intend that this requirement cover publicly available information, such as vendor manuals that are available via public websites or information that is deemed to be publicly releasable.

Information protection pertains to both digital and hardcopy information. R1.2 requires one or more procedures for the protection and secure handling BES Cyber System Information, including storage, transit, and use. This includes information that may be stored on Transient Cyber Assets or Removable Media.

The entity's written Information Protection Program should explain how the entity handles aspects of information protection including specifying how BES Cyber System Information is to be securely handled during transit in order to protect against unauthorized access, misuse, or corruption and to protect confidentiality of the communicated BES Cyber System Information. For example, the use of a third-party communication service provider instead of organization-owned infrastructure may warrant the use of encryption to prevent unauthorized disclosure of information during transmission. The entity may choose to establish a trusted communications path for transit of BES Cyber System Information. The trusted communications path would utilize a logon or other security measures to provide secure handling during transit. The entity may employ alternative physical protective measures, such as the use of a courier or locked container for transmission of information. It is not the intent of this standard to mandate the use of one particular format for secure handling during transit.

A good Information Protection Program will document the circumstances under which BES Cyber System Information can be shared with or used by third parties. The organization should distribute or share information on a need-to-know basis. For example, the entity may specify that a confidentiality agreement, non-disclosure arrangement, contract, or written agreement of some kind concerning the handling of information must be in place between the entity and the third party. The entity's Information Protection Program should specify circumstances for sharing of BES Cyber System Information with and use by third parties, for example, use of a non-disclosure agreement. The entity should then follow their documented program. These requirements do not mandate one specific type of arrangement.

Requirement R2:

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse. However, following the

analysis, if the media is to be reused outside of a BES Cyber System or disposed of, the entity must take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

If an applicable Cyber Asset, Transient Cyber Asset, or Removable Media is removed from the Physical Security Perimeter prior to action taken to prevent the unauthorized retrieval of BES Cyber System Information or destroying the data storage media, the responsible entity should maintain documentation that identifies the custodian for the data storage media while the data storage media is outside of the Physical Security Perimeter prior to actions taken by the entity as required in R2.

Media sanitization is the process used to remove information from system media such that reasonable assurance exists that the information cannot be retrieved or reconstructed. Media sanitization is generally classified into four categories: Disposal, clearing, purging, and destroying. For the purposes of this requirement, disposal by itself, with the exception of certain special circumstances, such as the use of strong encryption on a drive used in a SAN or other media, should never be considered acceptable. The use of clearing techniques may provide a suitable method of sanitization for media that is to be reused, whereas purging techniques may be more appropriate for media that is ready for disposal.

The following information from NIST SP800-88 provides additional guidance concerning the types of actions that an entity might take to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media:

> Clear: One method to sanitize media is to use software or hardware products to overwrite storage space on the media with non-sensitive data. This process may include overwriting not only the logical storage location of a file(s) (e.g., file allocation table) but also may include all addressable locations. The security goal of the overwriting process is to replace written data with random data. Overwriting cannot be used for media that are damaged or not rewriteable. The media type and size may also influence whether overwriting is a suitable sanitization method [SP 800-36].
>
> Purge: Degaussing and executing the firmware Secure Erase command (for ATA drives only) are acceptable methods for purging. Degaussing is exposing the magnetic media to a strong magnetic field in order to disrupt the recorded magnetic domains. A degausser is a device that generates a magnetic field used to sanitize magnetic media. Degaussers are rated based on the type (i.e., low energy or high energy) of magnetic media they can purge. Degaussers operate using either a strong permanent magnet or an electromagnetic coil. Degaussing can be an effective method for purging damaged or inoperative media, for purging media with exceptionally large storage capacities, or for quickly purging diskettes. [SP 800-36] Executing the firmware Secure Erase command (for ATA drives only) and degaussing are examples of acceptable methods for purging.

Degaussing of any hard drive assembly usually destroys the drive as the firmware that manages the device is also destroyed.

Destroy: There are many different types, techniques, and procedures for media destruction. Disintegration, Pulverization, Melting, and Incineration are sanitization methods designed to completely destroy the media. They are typically carried out at an outsourced metal destruction or licensed incineration facility with the specific capabilities to perform these activities effectively, securely, and safely. Optical mass storage media, including compact disks (CD, CD-RW, CD-R, CD-ROM), optical disks (DVD), and MO disks, must be destroyed by pulverizing, crosscut shredding or burning.

In some cases such as networking equipment, it may be necessary to contact the manufacturer for proper sanitization procedure.

It is critical that an organization maintain a record of its sanitization actions to prevent unauthorized retrieval of BES Cyber System Information. Entities are strongly encouraged to review NIST SP800-88 for guidance on how to develop acceptable media sanitization processes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014

Description of Current Draft

This draft standard is being posted for an initial comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the information protection requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-011-1. (Order becomes effective on 2/3/14.)	
2	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Information Protection

2. Number: CIP-011-~~1~~2

3. Purpose: To prevent unauthorized access to BES Cyber System Information by specifying information protection requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-011-~~1~~2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-011-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-011 ~~-1~~ exists as part of a suite of CIP Standards related to cyber security, which~~. CIP-002-5~~ require~~s~~ the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1~~ and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement, **in a manner that identifies, assesses, and corrects deficiencies, . . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it~~-~~ believes necessary in ~~their~~ its documented processes, but ~~they~~ it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:
Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The SDT's intent of the information protection program is to prevent unauthorized access to BES Cyber System Information.

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented information protection program(s) that collectively includes each of the applicable requirement parts in *CIP-011-~~1~~ 2 Table R1 – Information Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence for the information protection program must include the applicable requirement parts in *CIP-011-~~1~~ 2 Table R1 – Information Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-~~1~~ 2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Method(s) to identify information that meets the definition of BES Cyber System Information.	Examples of acceptable evidence include, but are not limited to: • Documented method to identify BES Cyber System Information from entity's information protection program; or • Indications on information (e.g., labels or classification) that identify BES Cyber System Information as designated in the entity's information protection program; or • Training materials that provide personnel with sufficient knowledge to recognize BES Cyber System Information; or • Repository or electronic and physical location designated for housing BES Cyber System Information in the entity's information protection program.

CIP-011-~~1~~ 2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirement**	**Measure**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	Examples of acceptable evidence include, but are not limited to: • Procedures for protecting and securely handling, which include topics such as storage, security during transit, and use of BES Cyber System Information; or • Records indicating that BES Cyber System Information is handled in a manner consistent with the entity's documented procedure(s).

Rationale for Requirement R2:

The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BES Cyber System Information upon reuse or disposal.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include the applicable requirement parts in *CIP-011-~~1~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-011-~~1~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-~~1~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the release for reuse of applicable Cyber Assets that contain BES Cyber System Information (except for reuse within other systems identified in the "Applicable Systems" column), the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media.	Examples of acceptable evidence include, but are not limited to: • Records tracking sanitization actions taken to prevent unauthorized retrieval of BES Cyber System Information such as clearing, purging, or destroying; or • Records tracking actions such as encrypting, retaining in the Physical Security Perimeter or other methods used to prevent unauthorized retrieval of BES Cyber System Information.

CIP-011-~~1~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the disposal of applicable Cyber Assets that contain BES Cyber System Information, the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset or destroy the data storage media.	Examples of acceptable evidence include, but are not limited to: • Records that indicate that data storage media was destroyed prior to the disposal of an applicable Cyber Asset; or • Records of actions taken to prevent unauthorized retrieval of BES Cyber System Information prior to the disposal of an applicable Cyber Asset.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints Text

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-011-~~1~~2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	N/A	N/A	N/A ~~The Responsible Entity has implemented a BES Cyber System Information protection program which includes one or more methods to identify BES Cyber System Information and has identified deficiencies but did not assess or correct the deficiencies. (1.1)~~ ~~OR~~ ~~The Responsible Entity has implemented a BES Cyber System Information protection program which includes one or more methods to identify BES Cyber System Information but did not identify,~~	The Responsible Entity has not documented or implemented a BES Cyber System Information protection program (R1).

R #	Time Horizon	VRF	Violation Severity Levels (CIP-011-~~1~~2)

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Responsible Entities are free to utilize existing change management and asset management systems. However, the information contained within those systems must be evaluated, as the information protection requirements still apply.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

This requirement mandates that BES Cyber System Information be identified. The Responsible Entity has flexibility in determining how to implement the requirement. The Responsible Entity should explain the method for identifying the BES Cyber System Information in their information protection program. For example, the Responsible Entity may decide to mark or label the documents. Identifying separate classifications of BES Cyber System Information is not specifically required. However, a Responsible Entity maintains the flexibility to do so if they desire. As long as the Responsible Entity's information protection program includes all applicable items, additional classification levels (e.g., confidential, public, internal use only, etc.) can be created that go above and beyond the requirements. If the entity chooses to use classifications, then the types of classifications used by the entity and any associated labeling should be documented in the entity's BES Cyber System Information Program.

The Responsible Entity may store all of the information about BES Cyber Systems in a separate repository or location (physical and/or electronic) with access control implemented. For example, the Responsible Entity's program could document that all information stored in an identified repository is considered BES Cyber System Information, the program may state that all information contained in an identified section of a specific repository is considered BES Cyber System Information, or the program may document that all hard copies of information are stored in a secured area of the building. Additional methods for implementing the requirement are suggested in the measures section. However, the methods listed in measures are not meant to be an exhaustive list of methods that the entity may choose to utilize for the identification of BES Cyber System Information.

The SDT does not intend that this requirement cover publicly available information, such as vendor manuals that are available via public websites or information that is deemed to be publicly releasable.

Information protection pertains to both digital and hardcopy information. R1.2 requires one or more procedures for the protection and secure handling BES Cyber System Information, including storage, transit, and use. This includes information that may be stored on Transient Cyber Assets or Removable Media.

The entity's written Information Protection Program should explain how the entity handles aspects of information protection including specifying how BES Cyber System Information is to be securely handled during transit in order to protect against unauthorized access, misuse, or corruption and to protect confidentiality of the communicated BES Cyber System Information. For example, the use of a third-party communication service provider instead of organization-owned infrastructure may warrant the use of encryption to prevent unauthorized disclosure of information during transmission. The entity may choose to establish a trusted communications path for transit of BES Cyber System Information. The trusted communications path would utilize a logon or other security measures to provide secure handling during transit. The entity may employ alternative physical protective measures, such as the use of a courier or locked container for transmission of information. It is not the intent of this standard to mandate the use of one particular format for secure handling during transit.

A good Information Protection Program will document the circumstances under which BES Cyber System Information can be shared with or used by third parties. The organization should distribute or share information on a need-to-know basis. For example, the entity may specify that a confidentiality agreement, non-disclosure arrangement, contract, or written agreement of some kind concerning the handling of information must be in place between the entity and the third party. The entity's Information Protection Program should specify circumstances for sharing of BES Cyber System Information with and use by third parties, for example, use of a non-disclosure agreement. The entity should then follow their documented program. These requirements do not mandate one specific type of arrangement.

Requirement R2:

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse. However, following the

analysis, if the media is to be reused outside of a BES Cyber System or disposed of, the entity must take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

If an applicable Cyber Asset, Transient Cyber Asset, or Removable Media is removed from the Physical Security Perimeter prior to action taken to prevent the unauthorized retrieval of BES Cyber System Information or destroying the data storage media, the responsible entity should maintain documentation that identifies the custodian for the data storage media while the data storage media is outside of the Physical Security Perimeter prior to actions taken by the entity as required in R2.

Media sanitization is the process used to remove information from system media such that reasonable assurance exists that the information cannot be retrieved or reconstructed. Media sanitization is generally classified into four categories: Disposal, clearing, purging, and destroying. For the purposes of this requirement, disposal by itself, with the exception of certain special circumstances, such as the use of strong encryption on a drive used in a SAN or other media, should never be considered acceptable. The use of clearing techniques may provide a suitable method of sanitization for media that is to be reused, whereas purging techniques may be more appropriate for media that is ready for disposal.

The following information from NIST SP800-88 provides additional guidance concerning the types of actions that an entity might take to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media:

> Clear: One method to sanitize media is to use software or hardware products to overwrite storage space on the media with non-sensitive data. This process may include overwriting not only the logical storage location of a file(s) (e.g., file allocation table) but also may include all addressable locations. The security goal of the overwriting process is to replace written data with random data. Overwriting cannot be used for media that are damaged or not rewriteable. The media type and size may also influence whether overwriting is a suitable sanitization method [SP 800-36].
>
> Purge: Degaussing and executing the firmware Secure Erase command (for ATA drives only) are acceptable methods for purging. Degaussing is exposing the magnetic media to a strong magnetic field in order to disrupt the recorded magnetic domains. A degausser is a device that generates a magnetic field used to sanitize magnetic media. Degaussers are rated based on the type (i.e., low energy or high energy) of magnetic media they can purge. Degaussers operate using either a strong permanent magnet or an electromagnetic coil. Degaussing can be an effective method for purging damaged or inoperative media, for purging media with exceptionally large storage capacities, or for quickly purging diskettes. [SP 800-36] Executing the firmware Secure Erase command (for ATA drives only) and degaussing are examples of acceptable methods for purging.

Degaussing of any hard drive assembly usually destroys the drive as the firmware that manages the device is also destroyed.

Destroy: There are many different types, techniques, and procedures for media destruction. Disintegration, Pulverization, Melting, and Incineration are sanitization methods designed to completely destroy the media. They are typically carried out at an outsourced metal destruction or licensed incineration facility with the specific capabilities to perform these activities effectively, securely, and safely. Optical mass storage media, including compact disks (CD, CD-RW, CD-R, CD-ROM), optical disks (DVD), and MO disks, must be destroyed by pulverizing, crosscut shredding or burning.

In some cases such as networking equipment, it may be necessary to contact the manufacturer for proper sanitization procedure.

It is critical that an organization maintain a record of its sanitization actions to prevent unauthorized retrieval of BES Cyber System Information. Entities are strongly encouraged to review NIST SP800-88 for guidance on how to develop acceptable media sanitization processes.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

BES Cyber Asset (BCA): A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems. A Transient Cyber Asset is not a BES Cyber Asset.

Protected Cyber Assets (PCA): One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP. A Transient Cyber Asset is not a Protected Cyber Asset.

Removable Media: Portable media, connected for 30 consecutive calendar days or less, that can be used to copy, move and/or access data. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory. A Cyber Asset is not Removable Media.

Transient Cyber Asset: A Cyber Asset directly connected for 30 consecutive calendar days or less, to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

BES Cyber Asset (BCA): A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems. ~~(~~A Transient Cyber Asset is not a BES Cyber Asset. ~~if, for 30 consecutive calendar days or less, it is directly connected to a network within an ESP, a Cyber Asset within an ESP, or to a BES Cyber Asset, and it is used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.)~~

Protected Cyber Assets (PCA): One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP. A Transient Cyber Asset is not a Protected Cyber Asset. ~~if, for 30 consecutive calendar days or less, it is connected either to a Cyber Asset within the ESP or to the network within the ESP, and it is used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.~~

Removable Media: Portable media, connected for 30 consecutive calendar days or less, that can be used to copy, move and/or access data. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory. A Cyber Asset is not Removable Media.

Transient Cyber Asset: A Cyber Asset directly connected for 30 consecutive calendar days or less, to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.

Revisions to Defined Terms in the NERC Glossary

The standards drafting team proposes modifying the following defined terms in the NERC Glossary:

BES Cyber Asset (BCA)	A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems. A Transient Cyber Asset is not a BES Cyber Asset.
Protected Cyber Asset (PCA)	One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP. A Transient Cyber Asset is not a Protected Cyber Asset.

The standards drafting team proposes the following new defined terms for incorporation into the NERC Glossary:

Removable Media	Portable media, connected for 30 consecutive calendar days or less, that can be used to copy, move and/or access data. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory. A Cyber Asset is not Removable Media.
Transient Cyber Asset	A Cyber Asset directly connected for 30 consecutive calendar days or less, to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.

Effective Dates

The effective dates for each of the proposed Reliability Standards and NERC Glossary terms are provided below. Where the standard drafting team identified the need for a longer implementation period for compliance with a particular element (i.e., an entire Requirement or a portion thereof) of a proposed Reliability Standard, the additional time for compliance with that element is specified below. The compliance date for those particular elements represents the date that entities must begin to comply that particular element of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

1. CIP-003-6 — Cyber Security — Security Management Controls

   Reliability Standard CIP-003-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

   Compliance Date for CIP-003-6, Requirement R2

   Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

2. CIP-004-6 — Cyber Security — Personnel and Training

   Reliability Standard CIP-004-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is six calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

3. CIP-006-6 — Cyber Security — Physical Security

Reliability Standard CIP-006-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-006-6, Requirement R1, Part 1.10

For new high or medium impact BES Cyber Systems at Control Centers identified by CIP-002-5.1 which were not identified as Critical Cyber Assets in CIP Version 3, Registered Entities shall not be required to comply with Reliability Standard CIP-006-6, Requirement R1, Part 1.10 until nine calendar months after the effective date of Reliability Standard CIP-006-6.

4. CIP-007-6 —Cyber Security — Systems Security Management

Reliability Standard CIP-007-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-007-6, Requirement R1, Part 1.2

Registered Entities shall not be required to comply with the elements of Reliability Standard CIP-007-6, Requirement R1, Part 1.2 that apply to PCAs and nonprogrammable communication components located inside a PSP and inside an ESP and associated with High and Medium Impact BES Cyber Systems until six calendar months after the effective date of Reliability Standard CIP-007-6.

5. CIP-009-6 — Cyber Security — Recovery Plans for BES Cyber Systems

   Reliability Standard CIP–009-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. CIP-010-2 — Cyber Security — Configuration Change Management

   Reliability Standard CIP-010-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

   Compliance Date for CIP-010-2, Requirement R4

   Registered Entities shall not be required to comply with Reliability Standard CIP-010-2, Requirement R4 until nine calendar months after the effective date of Reliability Standard CIP-010-2.

7. CIP-011-2 — Cyber Security — Information Protection

   Reliability Standard CIP-011-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

8. New and Modified NERC Glossary Terms

   The new and modified NERC Glossary Terms BES Cyber Asset, Protected Cyber Asset, Removable Media, and Transient Cyber Asset shall become effective on the same compliance date as when Reliability Standard CIP-010-2, Requirement R4 is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the same compliance date as when Reliability Standard CIP-010-2, Requirement R4 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

9. Standards for Retirement

   Midnight of the day immediately prior to the Effective Date in the particular jurisdiction in which the new standard or definition is becoming effective.

Certain Compliance Dates in the Implementation Plan for Version 5 CIP Cyber Security Standards Remain the Same

The following sections of the Implementation Plan for Version 5 CIP Cyber Security Standards[1] (Version 5 Plan) remain the same:

- *Initial Performance of Certain Periodic Requirements*
  - For those requirements with recurring periodic obligations, refer to the Version 5 Plan for compliance dates. These compliance dates are not extended by the effective date of CIP Version 5 Revisions.
- *Previous Identity Verification*
  - The same concept in this section applies for CIP Version 5 Revisions. A documented identity verification performed pursuant to a previous version of the CIP Cyber Security Standards does not need to be repeated under CIP-004-6, Requirement R3, Part 3.1.
- *Planned or Unplanned Changes Resulting in a Higher Categorization*
  - The same concept applies for CIP Version 5 Revisions.

Unofficial Comment Form

Project 2014-02 CIP Version 5 Revisions – Cyber Security Standards

Please **DO NOT** use this form for submitting comments. Please use the electronic form to submit comments on the proposed draft CIP standards. The electronic comment form must be completed by **8 p.m. Eastern, July 16, 2014**.

All documents and information about this project are available on the project page. If you have questions please contact Marisa Hecht at marisa.hecht@nerc.net or by telephone at 404-446-9620 or Ryan Stewart at ryan.stewart@nerc.net or by telephone at 202-644-8091.

Background Information

On November 22, 2013, FERC issued Order No. 791, *Version 5 Critical Infrastructure Protection Reliability Standards*. In this order, FERC approved version 5 of the CIP standards, and also directed that NERC make the following modifications to those standards:

1. Modify or remove the "identify, assess, and correct" language in 17 CIP version 5 requirements.
2. Develop modifications to the CIP standards to address security controls for Low Impact assets.
3. Develop requirements that protect transient electronic devices.
4. Create a definition of "communication networks" and develop new or modified standards that address the protection of communication networks.

FERC directed NERC to submit new or modified standards responding to the directives related to the "identify, assess, and correct" language and communication networks by February 3, 2015, one year from the effective date of FERC Order No. 791. FERC did not place any time frame for NERC to respond to the Low Impact and transient electronic devices directives.

You do not have to answer all questions. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

Questions

1. The Standard Drafting Team (SDT) developed objective criteria in the processes in CIP-003, Requirement R2 to address the directive in FERC Order No. 791. Do you agree with the approach to meeting this directive? If not, please offer suggested revisions.

   Yes:

   No:

   Comments:

2. The SDT developed CIP-006, Requirement R1, Part 1.10 and revised CIP-007, Requirement R1, Part 1.2 to meet the directive in FERC Order No. 791 to address protections for nonprogrammable components of communication networks. Do you agree with the approach to meeting this directive? If not, please offer suggested revisions.

   Yes:

   No:

   Comments:

3. The SDT developed CIP-010, Requirement R4 and revised CIP-004, Requirement R1, Part 2.1.9 to meet the directive in FERC Order No. 791 to address transient devices (Transient Cyber Assets and Removable Media). Do you agree with the approach to meeting this directive? If not, please offer suggested revisions.

   Yes:

   No:

   Comments:

4. The SDT proposed new definitions for Transient Cyber Assets and Removable Media and revised definitions for BES Cyber Asset and Protected Cyber Assets. Do you agree with the new and revised definition? If not, please offer suggested revisions.

   Yes:

   No:

   Comments:

5. The SDT removed the Identify, Assess, and Correct (IAC) language from 17 requirements to meet the directive in FERC Order No. 791 to remove or modify the IAC language. Do you support this revision approach? If not, why not and what alternative approach do you recommend?

   Yes:

   No:

   Comments:

6. The Implementation Plan uses the existing effective date of the FERC approved CIP V5 Standards for CIP-003-6 Requirement R2 and provides additional time for compliance for CIP-006-6, Requirement R1, Part 1.10; CIP-007-6, Requirement R1, Part 1.2; and CIP-010-2, Requirement R4. Are the timeframes reasonable and appropriate? If not, please explain.

   Yes:

   No:

   Comments:

7. Are there any Canadian provincial or other regulatory requirements that may need to be considered during this project in order to develop a continent-wide approach to the standards? If yes, please identify the jurisdiction and specific regulatory requirements.

   Yes:

   No:

   Comments:

8. Do you have input on other areas, within the scope of the Standards Authorization Request, for the standards or implementation plan not discussed in the questions above? If so, please provide them here, recognizing that you do not have to provide a response to all questions.

   Yes:

   No:

   Comments:

Consideration of Issues and Directives

Federal Energy Regulatory Commission Order No. 791
June 2, 2014

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
67 and 76	67. For the reasons discussed below, the Commission concludes that the "identify, assess, and correct" language, as currently proposed by NERC, is unclear with respect to the obligations it imposes on responsible entities, how it would be implemented by responsible entities, and how it would be enforced. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop modifications to the CIP version 5 Standards that address our concerns. Preferably, NERC should remove the "identify, assess, and correct" language from the 17 CIP version 5 requirements, while retaining the substantive provisions of those requirements.[1] Alternatively, NERC may propose equally efficient and effective modifications that address the Commission's concerns	The Standard Drafting Team (SDT) removed the "identify, assess, and correct" language from the following 17 Requirements in the CIP standards and their related Violation Severity Levels (VSLs): CIP-003-6, Requirements R2 and R4; CIP-004-6, Requirements R2, R3, R4, and R5; CIP-006-6, Requirements R1 and R2; CIP-007-6, Requirements R1, R2, R3, R4, and R5; CIP-009-6, Requirement R2; CIP-010-2, Requirements R1 and R2; and CIP-011-2, Requirement R1.

[1] The 17 requirements are: CIP-003-5, Requirements R2 and R4; CIP-004-5, Requirements R2 through R5; CIP-006-5 Requirements R1 and R2; CIP-007-5, Requirements R1 through R5; CIP-009-5, Requirement R2; CIP-010-1, Requirements R1 and R2; and CIP-011-1, Requirement R1.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	regarding the "identify, assess, and correct" language.[2] The Commission directs NERC to submit the modifications to the CIP Reliability Standards within one year from the effective date of this Final Rule. 76. Accordingly, the Commission directs NERC, pursuant to section 215(d)(5) of the FPA, to develop modifications to the CIP version 5 Standards that address our concerns. Preferably, NERC should remove the "identify, assess, and correct" language from the 17 CIP version 5 requirements. The Commission directs NERC to submit these modifications for Commission approval within one year from the effective date of this Final Rule. Alternatively, NERC may develop a proposal to enhance the enforcement discretion afforded to itself and the Regional Entities, as discussed above.	
106	Based on the explanations provided by NERC and other commenters, we adopt the NOPR proposal with modifications. As we explain below, while we do not require NERC to develop specific controls for Low Impact	The SDT revised Requirement R2 of CIP-003-6 to include additional specificity regarding the processes that responsible entities must have for low impact facilities. In addition, the SDT developed objective criteria surrounding the controls for

[2] *See Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, at P 186, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	facilities, we do require NERC to address the lack of objective criteria against which NERC and the Commission can evaluate the sufficiency of an entity's protections for Low Impact assets. While NERC may address this concern by developing specific controls for Low Impact facilities, it has the flexibility to address it through other means, including those discussed below.	some entities based on asset-type and routability. The SDT determined that the additional specificity and objective criteria address FERC's concerns while maintaining the flexibility in controls necessary for such a diverse array of assets in the low impact category. The SDT confined these revisions in CIP-003-6, Requirement R2 to the following four technical areas: 1. **Physical Security Controls:** Parts 2.2 and 2.3 and their subparts require controls to restrict physical access to Low Impact BES Cyber Systems and require additional protections for Controls Centers. 2. **Electronic Access Controls:** Part 2.4 and its subparts address protections around external routable protocol paths and Dial-up Connectivity. 3. **Cyber Security Incident Response:** Part 2.5 and its subparts outline the criteria required to be in a Cyber Security Incident response plan. 4. **Cyber Security Awareness:** Part 2.6 requires responsible entities to implement a security awareness program with timeframes to reinforce cyber security practices and Parts 2.2 through 2.5 of Requirement R2. The SDT determined that adding

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		intervals increases the auditability of the requirement part. In addition to the revisions to the four technical areas, the SDT retained the requirement in Part 2.1 to obtain CIP Senior Manager approval of one or more documented policies that address the topics in Parts 2.2 – 2.6.
124	Accordingly, the Commission directs NERC to conduct a survey of Cyber Assets that are included or excluded under the new BES Cyber Asset definition during the CIP version 5 Standards implementation periods. Such data will help provide a better understanding of the BES Cyber Asset definition. Based on the survey data, NERC should explain in an informational filing the following: (1) specific ways in which entities determine which Cyber Assets meet the 15 minute parameter; (2) types or functions of Cyber Assets that are excluded from being designated as BES Cyber Assets and the rationale as to why; (3) common problem areas with entities improperly designating BES Cyber Assets; and (4) feedback from each region participating in the implementation study on lessons learned with the application of the BES Cyber Asset definition. The informational filing should not provide a level of detail	NERC proposes to conduct a survey of Cyber Assets, pursuant to Section 1600 of the NERC *Rules of Procedure* (ROP), regarding the scope of the term "BES Cyber Asset." In accordance with Section 1600 of the ROP, NERC may request data or information from Registered Entities that is necessary to meet NERC's obligations under Section 215 of the Federal Power Act, as authorized by Section 39.2(d) of FERC's regulations. The purpose of the proposed Data Request is to respond to FERC's directive from Order No. 791 to conduct a survey regarding the scope of the term "BES Cyber Asset" and submit an informational filing based on the data collected by February 3, 2015.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	that divulges CEII data. This filing should also help other entities implementing CIP version 5 in identifying BES Cyber Assets.	
132	Based on the explanation provided by NERC and other commenters, we will not direct modifications regarding the 30-day exemption in the definition of BES Cyber Asset. While we are persuaded that it would be unduly burdensome for responsible entities to treat all transient devices as BES Cyber Assets, we remain concerned whether the CIP version 5 Standards provide adequately robust protection from the risks posed by transient devices. Accordingly, as discussed below, we direct NERC to develop either new or modified standards to address the reliability risks posed by connecting transient devices to BES Cyber Assets and Systems.	The threat of connecting transient devices to BES Cyber Systems is addressed in the Reliability Standards through an additional requirement in CIP-010, which includes a set of controls to provide higher assurance against the propagation of malware prior to connecting transient devices. The terms Transient Cyber Asset and Removable Media have been added to the glossary to define transient devices. In addition, the terms BES Cyber Asset and Protected Cyber Asset have been modified to reference the new Transient Cyber Asset definition. The drafting team determined entities manage these transient devices in two fundamentally different ways. Some entities maintain a preauthorized inventory of transient devices while others have a checklist for transient devices prior to connecting them to a BES Cyber System. The drafting team acknowledges both methods are valid and has drafted requirements that permit either form of management.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		The Commission provides a list of security controls it expects NERC to consider for addressing transient devices, and the consideration of each security element is described as follows: 1. **Device authorization as it relates to users and locations:** CIP-010-2 Requirement R4, Part 4.1 requires entities to authorize Transient Cyber Assets and Removable Media by individual(s) and location(s) prior to connecting them to the BES Cyber System. **2. Software authorization:** CIP-010-2 Requirement R4, Part 4.1 borrows similar language from CIP-010-2 Requirement R4, Part 1.1 to authorize intentionally installed software on Transient Cyber Assets. **3. Security patch management:** CIP-010-2 Requirement R4, Part 4.7 requires entities to install patches on Transient Cyber Assets and Removable Media, at least once every 35 calendar days, or prior to use, in connecting to the BES Cyber System. 4. **Malware prevention:** CIP-010-2 Requirement R4, Part 4.2 requires entities to have malware protection on the Transient Cyber Asset. Requirement R4, Part 4.3 requires malware protection for Removable Media prior to connection, and Requirement R4, Part 4.5 requires up-to-date malware signatures. 5. **Detection controls for unauthorized physical access to a transient device:** The drafting team considered this

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		control and determined the Reliability Standards already address the vulnerabilities this control attempts to mitigate, and additional guidance is necessary in CIP-011-2 to ensure entities recognize the importance of safeguarding BES Cyber System Information on transient devices. Specifically, the drafting team determined the two primary objectives in controlling physical access to transient devices are (1) preventing the introduction of malware and (2) preventing the unauthorized release of BES Cyber System Information. The latter objective is sufficiently addressed with the requirements in CIP-011-2 to protect and securely handle BES Cyber System Information. The objective to prevent the introduction of malware is sufficiently addressed through the malware protection requirement proposed for transient devices. Ensuring the physical protection of transient devices outside of the PSP is in some cases more burdensome to the entity than receiving the full protection of the Standard, and has minimal effect to prevent the introduction of malware. 6. **Processes and procedures for connecting transient devices to systems at different security classification levels (i.e. High, Medium, Low Impact):** The drafting team has considered this control and believes the threat of connecting at multiple impact levels is sufficiently

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		addressed through the proposed Reliability Standards. Rigorous security assessment and controls between classification levels have significant importance to secure authorized information flows. However, connections between impact levels do not carry the same threat for BES Cyber Systems. The flow of BES Cyber System Information is addressed sufficiently through CIP-011-2 requirements. The more concerning threat involves transient devices connecting between BES Cyber Systems and external networks, and this threat is addressed in the proposed CIP-010-2 Requirement R4.
150	We direct NERC to create a definition of communication networks and to develop new or modified Reliability Standards to address the reliability gap discussed above. The definition of communications networks should define what equipment and components should be protected, in light of the statutory inclusion of communication networks for the reliable operation of the Bulk-Power System. The new or modified Reliability Standards should require appropriate and reasonable controls to protect the nonprogrammable aspects of communication networks. The Commission directs NERC to submit these modifications for Commission approval within one year from the effective date of	The proposed CIP-006-6 Requirement Part 1.10 requires the physical protection of nonprogrammable components of BES Cyber Systems existing outside of the PSP, and the proposed modifications to CIP-007-6 Requirement Part 1.2 include applicability for non-programmable electronic components to prevent unauthorized use of physical ports. These additional requirements address the gap in protection as discussed in the Order by ensuring the physical security for cabling and non-programmable network components not covered by the definition of Cyber Asset. The drafting team reviewed the directives related to submitting a definition for communication network and determined it could address the gap in protection and adequately provide

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	this final rule. We also direct Commission staff to include this issue in the staff-led technical conference discussed herein.3	guidance on nonprogrammable electronic components without having a definition. Communication networks can and should be defined broadly. For example, NIST Special Publication 800-53 Revision 4 refers to the CNSSI 4009 definition of Network, which is "Information system(s) implemented with a collection of interconnected components." The requirements modifications as well as the existing requirements have more targeted components. Consequently, there is not a need at this time to submit a definition for the NERC Glossary of Terms used in Reliability Standards.
181 and 184	181. The Commission also supports NERC's proposal to develop transition guidance documents and a pilot program to assist responsible entities as they move from compliance with the CIP version 3 Standards to the CIP version 5 Standards.4 The Commission agrees that a pilot program will assist responsible entities by offering best practices and lessons learned during this transition. 184. Consistent with our discussion above, the Commission directs NERC to modify the VRF assignment for CIP-006-5, Requirement R3 from	NERC modified the VRF assignment for CIP-006-5, Requirement R3 from Lower to Medium and filed the revision with FERC on 5/15/2014.

[3] *See infra* P 223.

[4] *See* NERC Comments at 39-40.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	Lower to Medium, within 90 days of the effective date of this Final Rule.	
192 and 196	192. The Commission adopts the NOPR proposal and directs NERC to modify the VRF assignment for CIP-004-5, Requirement R4 from Lower to Medium. This modification is necessary to reflect that access to operationally sensitive computer equipment should be strictly limited to employees or contractors who utilize the equipment in performance of their job responsibilities, and to prevent or mitigate disclosure of sensitive information consistent with Recommendations 40 and 44 of the 2003 Blackout Report. In addition, a Medium VRF assignment ensures consistency with the Commission's VRF guidelines. 196. Consistent with the discussion above, we direct NERC to modify the VRF assignment for CIP-004-5, Requirement R4 from Lower to Medium, within 90 days of the effective date of this Final Rule.	NERC modified the VRF assignment for CIP-004-5.1, Requirement R4 from Lower to Medium and filed the revision with FERC on 5/15/2014.
205	Consistent with the NOPR proposal, we direct NERC to develop modifications to the VSLs for certain CIP version 5 Standard requirements to: (1) remove the "identify, assess, and correct" language from the text	In conjunction with the SDT's response to the directive in PP 67 and 76, the SDT removed the "identify, assess, and correct" language from the following 17 Requirements' VSLs: CIP-003-6,

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	of the VSLs for the affected requirements; (2) address typographical errors; and (3) clarify certain unexplained elements. For the VSLs that include "identify, assess, and correct" language, we direct NERC to ensure that these VSLs are modified to reflect any revisions to the requirement language in response to our directives. We grant NERC the discretion to decide how best to address these modifications be it through an errata filing to this proceeding or separate filing.	Requirements R2 and R4; CIP-004-6, Requirements R2, R3, R4, and R5; CIP-006-6, Requirements R1 and R2; CIP-007-6, Requirements R1, R2, R3, R4, and R5; CIP-009-6, Requirement R2; CIP-010-2, Requirements R1 and R2; and CIP-011-2, Requirement R1. NERC filed the following revisions with FERC on 5/15/2014: 1. **VSLs for CIP-003-5, Requirements R1 and R2**. This standard addresses security management controls for cyber security. Requirement R1 governs management approval of policies on topics addressed in other CIP standards for medium and high impact BES Cyber Systems. Requirement R2 governs policies for low impact BES Cyber Systems. NERC staff, in consultation with the SDT, revised the VSLs in CIP-003-5, Requirements R1 and R2 to eliminate redundant language. 2. **VSLs for CIP-004-5.1, Requirement R4**. This standard includes requirements for personnel and training related to cyber security. Requirement R4 governs implementation of access management programs. NERC staff, in

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		consultation with the SDT, revised the VSLs to a percentage-based gradation. 3. **Severe VSL for CIP-008-5, Requirement R2**. This standard addresses incident reporting and response planning for cyber security. Requirement R2 governs implementation of documented Cyber Security Incident response plans. NERC staff revised the Severe VSL to reduce a gap in months between the High VSL and Severe VSL. 4. **VSLs for CIP-009-5, Requirement R3**. This standard addresses recovery plans for BES Cyber Systems. Requirement R3 governs maintenance of the recovery plans. NERC staff revised the timeframe contained in the VSLs from 90-210 days to 90-120 days.

Project 2014-02 - CIP Version 5 Revisions

Mapping Document Showing Translation of the Version 5 standards into CIP-003-6, CIP-004-6, CIP-006-6, CIP-007-6, CIP-009-6, CIP-010-2, and CIP-011-2 (CIP-002-5, CIP-005-5, and CIP-008-5 were not modified)

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-003-5 R1	CIP-003-6 R1	No change.
CIP-003-5 R1.1	CIP-003-6 R1.1	No change.
CIP-003-5 R1.2	CIP-003-6 R1.2	No change.
CIP-003-5 R1.3	CIP-003-6 R1.3	No change.
CIP-003-5 R1.4	CIP-003-6 R1.4	No change.
CIP-003-5 R1.5	CIP-003-6 R1.5	No change.
CIP-003-5 R1.6	CIP-003-6 R1.6	No change.
CIP-003-5 R1.7	CIP-003-6 R1.7	No change.
CIP-003-5 R1.8	CIP-003-6 R1.8	No change.
CIP-003-5 R1.9	CIP-003-6 R1.9	No change.

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-003-5 R2	CIP-003-6 R2, CIP-003-6, R2.1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken. The main requirement was modified to follow a similar structure to parent Requirements of those requirement parts in the table format. The CIP Senior Manager review and approval at least once every 15 months was mapped to CIP-003-6 R2.1.
CIP-003-5 R2.1	CIP-003-6 R2.6	The security awareness requirement part was mapped to Part 2.6 to reinforce cyber security practices at least quarterly, while addressing Parts 2.2 through 2.5 once every 15 calendar months. This added objective criteria to security awareness, while not to the rigor of Medium and High BES Cyber Systems.
CIP-003-5 R2.2	CIP-003-6 R2.2	Expanding the physical security controls, Part 2.2 addresses operational or procedural control(s) to restrict physical access.
NEW	CIP-003-6 R2.3	Expanding the physical security controls, Part 2.3 requires implementation of processes to include Parts 2.3.1 and 2.3.2 for low impact BES Cyber Systems at Control Centers.
NEW	CIP-003-6 R2.3.1	Expanding the physical security controls, Part 2.3.1 addresses escorted access of visitors at Control Centers.
NEW	CIP-003-6 R2.3.2	Expanding the physical security controls, Part 2.3.2 addresses monitored physical access point(s) at Control Centers with external routable protocol paths.

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-003-5 R2.3	CIP-003-6 R2.4	The electronic access controls were added as Part 2.4. The documented process(es) collectively must include Parts 2.4.1 through 2.4.3.
NEW	CIP-003-6 R2.4.1	Expanding the electronic access controls, Part 2.4.1 addresses all external routable protocol paths, if any, as needing to be through one or more identified access point(s).
NEW	CIP-003-6 R2.4.2	Expanding the electronic access controls, Part 2.4.2 addresses requiring inbound and outbound access permissions for each identified access point, including the reason for granting access, and deny all other access by default.
NEW	CIP-003-6 R2.4.3	Expanding the electronic access controls, Part 2.4.3 addresses authentication when establishing Dial-Up Connectivity, per Cyber Asset capability.
CIP-003-5 R2.4	CIP-003-6 R2.5	The incident response to a Cyber Security Incident requirement part remains in Part 2.5. The documented response plan(s) collectively must include Parts 2.5.1 through 2.5.6.
NEW	CIP-003-6 R2.5.1	Expanding the incident response controls, Part 2.5.1 address the identification, classification, and response to Cyber Security Incidents.
NEW	CIP-003-6 R2.5.2	Expanding the incident response controls, Part 2.5.2 addresses whether an identified Cyber Security Incident is reportable.
NEW	CIP-003-6 R2.5.3	Expanding the incident response controls, Part 2.5.3 addresses the notification of Reportable Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center.

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
NEW	CIP-003-6 R2.5.4	Expanding the incident response controls, Part 2.5.4 addresses the roles and responsibilities of Cyber Security Incident response groups or individuals.
NEW	CIP-003-6 R2.5.5	Expanding the incident response controls, Part 2.5.5 addresses the incident handling procedures for Cyber Security Incidents.
NEW	CIP-003-6 R2.5.6	Expanding the incident response controls, Part 2.5.6 addresses the testing of the plan(s) at least once per 36 calendar months.
CIP-003-5 R3	CIP-003-6 R3	No change.
CIP-003-5 R4	CIP-003-6 R4	To respond to the FERC Order 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R1	CIP-004-6 R1	No change.
CIP-004-5.1 R1.1	CIP-004-6 R1.1	No change.
CIP-004-5.1 R2	CIP-004-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken. The SDT has also revised the requirement to allow Responsible Entities the flexibility to have one or more cyber security training programs, as the existing CIP-004-5 R2 had Responsible Entities shall implement “a cyber security training program(s).” That modification was made for clarity and consistency across the standards.
CIP-004-5.1 R2.1	CIP-004-6 R2.1	No change.
CIP-004-5.1 R2.1.1	CIP-004-6 R2.1.1	No change.

CIP-004-5.1 R2.1.8	CIP-004-6 R2.1.8	No change.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R2.1.9	CIP-004-6 R2.1.9	To respond to the FERC Order No. 791 directives regarding transient devices, the SDT has added Transient Cyber Assets and Removable Media as contents that must be included in a Registered Entity's cyber security training program. The training must address cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with Transient Cyber Assets and Removable Media.
CIP-004-5.1 R2.2	CIP-004-6 R2.2	No change.
CIP-004-5.1 R2.3	CIP-004-6 R2.3	No change.
CIP-004-5.1 R3	CIP-004-6 R3	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken.
CIP-004-5.1 R3.1	CIP-004-6 R3.1	No change.
CIP-004-5.1 R3.2	CIP-004-6 R3.2	No change.
CIP-004-5.1 R3.2.1	CIP-004-6 R3.2.1	No change.
CIP-004-5.1 R3.2.2	CIP-004-6 R3.2.2	No change.
CIP-004-5.1 R3.3	CIP-004-6 R3.3	No change.
CIP-004-5.1 R3.4	CIP-004-6 R3.4	No change.
CIP-004-5.1 R3.5	CIP-004-6 R3.5	No change.
CIP-004-5.1 R4	CIP-004-6 R4	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken.
CIP-004-5.1 R4.1	CIP-004-6 R4.1	No change.
CIP-004-5.1 R4.1.1	CIP-004-6 R4.1.1	No change.
CIP-004-5.1 R4.1.2	CIP-004-6 R4.1.2	No change.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R4.1.3	CIP-004-6 R4.1.3	No change.
CIP-004-5.1 R4.2	CIP-004-6 R4.2	No change.
CIP-004-5.1 R4.3	CIP-004-6 R4.3	No change.
CIP-004-5.1 R4.4	CIP-004-6 R4.4	No change.
CIP-004-5.1 R5	CIP-004-6 R5	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-004-5.1 R5.1	CIP-004-6 R5.1	No change.
CIP-004-5.1 R5.2	CIP-004-6 R5.2	No change.
CIP-004-5.1 R5.3	CIP-004-6 R5.3	No change.
CIP-004-5.1 R5.4	CIP-004-6 R5.4	No change.
CIP-004-5.1 R5.5	CIP-004-6 R5.5	No change.

Standard: CIP-006-5 – Cyber Security—Physical Security of BES Cyber Systems		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-006-5 R1	CIP-006-6 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-006-5 R1.1	CIP-006-6 R1.1	No change.
CIP-006-5 R1.2	CIP-006-6 R1.2	No change.
CIP-006-5 R1.3	CIP-006-6 R1.3	No change.
CIP-006-5 R1.4	CIP-006-6 R1.4	No change.
CIP-006-5 R1.5	CIP-006-6 R1.5	No change.

Standard: CIP-006-5 – Cyber Security—Physical Security of BES Cyber Systems		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-006-5 R1.6	CIP-006-6 R1.6	No change.
CIP-006-5 R1.7	CIP-006-6 R1.7	No change.
CIP-006-5 R1.8	CIP-006-6 R1.8	No change.
CIP-006-5 R1.9	CIP-006-6 R1.9	No change.
NEW	CIP-006-6 R1.10	To respond to the FERC Order No. 791 directive to protect the nonprogrammable components of communication networks, the SDT has added a new Requirement R1, Part 1.10 to restrict physical access to cabling and other nonprogrammable components used for communication between applicable Cyber Assets within the same Electronic Security Perimeter. There are three other mechanisms for an entity to adequately protect those networks, including encryption of data that transits such cabling and components; monitoring the status of the communication link and issuing alarms to detect communication failures; or an equally effective logical protection.
CIP-006-5 R2	CIP-006-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-006-5 R2.1	CIP-006-6 R2.1	No change.
CIP-006-5 R2.2	CIP-006-6 R2.2	No change.
CIP-006-5 R2.3	CIP-006-6 R2.3	No change.
CIP-006-5 R3	CIP-006-6 R3	No change.
CIP-006-5 R3.1	CIP-006-6 R3.1	No change.

Standard: CIP-007-5 – Cyber Security—Systems Security Management		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-007-5 R1	CIP-007-6 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R1.1	CIP-007-6 R1.1	No change.
CIP-007-5 R1.2	CIP-007-6 R1.2	The applicable systems column was modified to include the Protected Cyber Assets and nonprogrammable communication components located inside both a Physical Security Perimeter and an Electronic Security Perimeter. The protection again the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media for these additions address the communication networks directive from FERC Order No. 791. Removable Media was capitalized in the requirement because it is newly defined.
CIP-007-5 R2	CIP-007-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R2.1	CIP-007-6 R2.1	No change.
CIP-007-5 R2.2	CIP-007-6 R2.2	No change.
CIP-007-5 R2.3	CIP-007-6 R2.3	No change.
CIP-007-5 R2.4	CIP-007-6 R2.4	No change.
CIP-007-5 R3	CIP-007-6 R3	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R3.1	CIP-007-6 R3.1	No change.

Standard: CIP-007-5 – Cyber Security—Systems Security Management		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**

Standard: CIP-010-1 – Cyber Security—Configuration Change Management and Vulnerability Assessments		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-010-1 R3.2.1	CIP-010-2 R3.2.1	No change.
CIP-010-1 R3.2.2	CIP-010-2 R3.2.2	No change.
CIP-010-1 R3.3	CIP-010-2 R3.3	No change.
CIP-010-1 R3.4	CIP-010-2 R3.4	No change.
NEW	CIP-010-2 R4	To respond to the FERC Order No. 791 directive to address transient devices, new Requirement R4 follows the table format to ensure Registered Entities implemented one or more documented process(es) that collectively include each of the applicable parts in CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection. All of the new Requirement Parts under Requirement R4 are in response to this directive.
NEW	CIP-010-2 R4.1	Part 4.1 ensures Responsible Entities authorize the usage of Transient Cyber Assets prior to initial use, except for CIP Exceptional Circumstances. The authorization shall include the Requirement Parts 4.1.1 through 4.1.4.
NEW	CIP-010-2 R4.1.1	Authorization shall include users, individually or by group/role.
NEW	CIP-010-2 R4.1.2	Authorization shall include locations, individually or by group/role.
NEW	CIP-010-2 R4.1.3	Authorization shall include defined acceptable use.
NEW	CIP-010-2 R4.1.4	Authorization shall include operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability).

Standard: CIP-010-1 – Cyber Security—Configuration Change Management and Vulnerability Assessments		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
NEW	CIP-010-2 R4.2	Part 4.2 ensures Responsible Entities use method(s) to deter, detect, or prevent malicious code introduction on Transient Cyber Assets (per Cyber Asset capability).
	CIP-010-2 R4.3	Part 4.3 ensures Responsible Entities use method(s) to detect malicious code on Removable Media prior to use on applicable systems.
NEW	CIP-010-2 R4.4	Part 4.4 ensures Responsible Entities mitigate the threat of detected malicious code for Transient Cyber Assets and Removable Media.
NEW	CIP-010-2 R4.5	Part 4.5 ensures Responsible Entities update signatures or patterns for those methods identified in Parts 4.2 and 4.3 that use signatures or patterns.
NEW	CIP-010-2 R4.6	Part 4.6 ensures Responsible Entities evaluate Transient Cyber Assets prior to use for modifications that deviate from Part 4.1.4.
NEW	CIP-010-2 R4.7	Part 4.7 ensures Responsible Entities evaluate Transient Cyber Assets periodically to ensure security patches are up-to-date.

Standard: CIP-011-1 – Cyber Security—Information Protection		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-011-1 R1	CIP-011-2 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-011-1 R1.1	CIP-011-2 R1.1	No change.
CIP-011-1 R1.2	CIP-011-2 R1.2	No change.

Standard: CIP-011-1 – Cyber Security—Information Protection

Frequently Asked Questions

'Identify, Assess, Correct' (IAC) and the Reliability Assurance Initiative (RAI)

1. What was the intent of IAC?

The IAC concept acknowledged that for certain CIP requirements, in a changing risk landscape, engaging entities as partners to identify and correct their own reliability issues has a positive impact on Bulk Electric System reliability.

The intent of IAC was to encourage and reward entities for establishing practices (e.g. internal controls) to effectively manage implementation of high frequency security obligations.

The IAC language obligated entities to establish processes to identify less than 100% performance of reliability standards, assess the impact of this performance gap, and implement corrective action that would ultimately improve Bulk Electric System reliability.

IAC intended to shift the emphasis of compliance monitoring and enforcement activities away from the incidents of deficiency and to focus instead on identifying areas of risk along with effective governance and business practices and implementing corrective action to ensure Bulk Electric System reliability.

2. What are the Order 791 and Industry Concerns with IAC?

From FERC Order 791, the following citations illustrate the concerns:

- Paragraph 4: "…overly-vague, lacking basic definition and guidance that is needed, for example, to distinguish a successful internal control program from one that is inadequate…"
- Paragraph 35: "…is unclear with respect to the implementation and compliance obligations that language imposes and that it is too vague to audit and enforce…"
- Paragraph 46: "…NERC has not explained what is expected of responsible entities or the intended meaning of the individual terms "identify," "assess," "correct," and "deficiencies" as they are used…"
- Paragraph 48: "…does not identify a reasonable timeframe for identifying, assessing and correcting deficiencies…"
- Paragraph 49: "…does not explain whether a responsible entity is required to disclose the identified deficiencies…"
- Paragraph 75: "…we believe that a more appropriate balance might be struck to address the underlying concerns by developing compliance and enforcement processes that would grant NERC and the Regional Entities the ability to decline to pursue low risk violations of the Reliability Standards."

3. How do the RAI program concepts relate to IAC?

RAI seeks to scale compliance monitoring activities based on risk, as well as provide an alternative to enforcement proceedings for instances of non-compliance that pose lesser risk to the BES.

Like IAC, RAI seeks to encourage entities to establish and monitor effective practices (e.g. internal controls) that promote bulk electric system reliability.

RAI seeks to apply the IAC intent at the compliance and enforcement level rather than within the Standards and goes beyond CIP by applying to the broader set of NERC Reliability Standards.

RAI shifts the paradigm from pursuing every incidence of non-compliance to identifying areas of bulk electric system risk, assessing the impact of this risk, and mitigating the root cause of risk elements.

In Order 791, FERC acknowledges in Paragraph 4: "We support NERC's move away from a "zero tolerance" approach to compliance, the development of strong internal controls by responsible entities, and NERC's development of standards that focus on the activities that have the greatest impact on Bulk-Power System reliability."

4. How has the SDT chosen to address the concerns of IAC?

The SDT discussed the concerns and options within FERC Order 791 and revised the 17 requirements containing IAC by removing the language. The approach fulfils the Order 791 directive regarding the IAC language and leaves resolution of "zero defect" or "zero tolerance" to the RAI 'discretionary path to enforcement' implementation.

5. Will RAI replace the programmatic approach contemplated under IAC?

Yes. The new processes in compliance monitoring and enforcement created through RAI will allow NERC and the Regional Entities to acknowledge the types of practices that were envisioned under IAC and to determine whether any specific noncompliance should be processed as a violation.

6. How will RAI apply to the CIP Requirements that used to contain IAC?

Under the RAI enforcement approach, NERC and the Regional Entities will evaluate an entity's overall risk to reliability and the bulk power system (e.g. registered functions, internal controls and past compliance performance) and establish a compliance monitoring and enforcement treatment commensurate with the entity's risk profile and the risk posed by any instances of noncompliance.

In determining the appropriate resolution of noncompliance, NERC and Regional Entities will take into account those practices (e.g. internal controls) that contribute to the overall reduction of risk associated with possible violations.

The RAI approach should reduce the administrative burden associated with high frequency, low risk violations by allowing qualified entities to log minimal risk noncompliance and by disposing of minimal risk noncompliance through streamlined means; including NERC and Regional Entities potentially declining to pursue such issues through enforcement.

7. What are the CIP compliance obligations under RAI? Will RAI reduce the compliance obligation of the CIP standards? How will CIP audits change? Overall, does the removal of IAC change an entity's compliance obligations?

RAI will not replace, modify or reduce the compliance obligation for reliability standards. RAI processes will help address how any areas of noncompliance will be assessed and resolved. The removal of IAC will modify compliance obligations because the standards language will change and Registered Entities will no longer have to incorporate IAC into their compliance programs.

8. What is expected of Entities in maintaining records of deficiencies?

Under RAI, entities that qualify for the logging program will maintain a log of minimal risk noncompliance to be submitted to Regional Entities on a periodic basis.

9. What is a compliance exception? How do entities qualify for compliance exception?

A compliance exception is a matter that is not to be pursued through enforcement. It represents the exercise of enforcement discretion. At this point, to qualify for enforcement discretion, the noncompliance must have posed a minimal risk to the reliability of the Bulk Electric System. Noncompliance may be recorded as a compliance exception regardless of the discovery methodology (e.g. self-assessment, audit, etc.).

10. Can entities choose to participate in RAI or to retain the traditional audit/enforcement approach? If an entity chooses to not participate in RAI, what are their alternate approaches to address the IAC concerns?

Registered Entities may choose to participate by sharing information about their internal controls demonstrating that they have policies and procedures in place to ensure compliance with NERC Reliability Standards and Bulk Electric System reliability. Consequently, Regional

Entities may be able to obtain reasonable assurance of compliance with alternative compliance monitoring engagements.

In the absence of internal controls, the Regional Entities will utilize other available information to assess Registered Entity Risk and appropriate compliance monitoring scope. Regional Entities will be utilizing other RAI techniques to assess regional risk to the Bulk Electric System. Regional Entities will perform inherent risk assessments on Registered Entities to determine how regionally identified risk may or may not affect particular entities.

Compliance monitoring scope will be based upon this inherent risk assessment, assuming that no internal controls are in place at the Registered Entity that would reduce regional reliability risk. An entity that chooses not to share information regarding internal controls or participate in the evaluation process will not be able to participate in all RAI programs (e.g. the logging program). However, enforcement discretion is available to NERC and the Regional Entities with respect to minimal risk noncompliance regardless of the result of the evaluation of internal controls of a particular registered entity.

11. Explain the roles of NERC and the Regional Entities in compliance and enforcement under RAI. Will there be Regional consistency or at least coherence across regional programs?

The enforcement processes created under RAI were developed jointly by NERC and the Regional Entities. The risk associated with a specific instance of noncompliance is the main factor in determining the disposition of the issue. The most comprehensive discussion of how risk of noncompliance is assessed by NERC and the Regional Entities is found in the Self-Report User Guide, developed jointly by NERC and the Regional Entities.

12. Is a risk assessment required for entities whether they choose to participate in the RAI program or not?

The RAI program includes a risk assessment of each registered entity to determine the following aspects:

- Assessing Reliability Risks - Every registered entity has inherent risk and control risks. The ERO Enterprise must take these risks into account when monitoring compliance to establish reasonable assurance of compliance to the reliability standards. Each registered entity can voluntarily elect to work with the appropriate Regional Entity to assess and prioritize its risks, or it can voluntarily elect not to participate.
- Scoping Compliance Monitoring - The ERO Enterprise will scope the compliance monitoring for each registered entity in accordance with results of the entity's risk assessment. An entity can voluntarily establish internal controls designed to reduce its control risk which

could have a positive influence on the scoping of compliance monitoring by the Regional Entity. Conversely, the entity can voluntarily elect not to establish internal controls or share them with the Regional Entity, which would also affect how the Regional Entity scopes monitoring for that particular entity.

- Internal Controls Evaluation - An assessment of an entity's internal controls is necessary in order for an entity to participate in the aggregation/logging program. Once a common ERO enterprise methodology for such assessment is defined, that will constitute the assessment process. Entities currently being added to the program have been assessed by the Regional Entity through the Regional Entity's existing methodology.

13. What is enforcement discretion? How do entities qualify for enforcement discretion? Does an entity need to apply for enforcement discretion prior to the effective date for CIP version 5?

Enforcement discretion is the ability of NERC and Regional Entities to decline to pursue instances of noncompliance with Reliability Standards. Noncompliance that is not pursued through an enforcement action is recorded as a compliance exception. During 2014, NERC and the Regional Entities are exercising enforcement discretion over minimal risk noncompliance arising out of specific entities, selected to participate in the program. There is no application process for enforcement discretion. NERC and the Regional Entities are expanding the program gradually during 2014 and expect that enforcement discretion will apply to minimal risk noncompliance from any registered entity in 2015.

Frequently Asked Questions

'Identify, Assess, Correct' (IAC) and the Reliability Assurance Initiative (RAI)

14. Illustrate the continuum across CIP Standards, NERC Compliance and NERC Enforcement under RAI including the entity obligations and tools used within the different divisions.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement Reminder

Project 2014-02 Critical Infrastructure Protection Standards Version 5 Revisions

Ballots and Non-Binding Polls Now Open through July 16, 2014

Now Available

Ballots for **Critical Infrastructure Protection Standards Version 5 Revisions** and Non-Binding Polls of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) are open through **8 p.m. Eastern on Wednesday, July 16, 2014.**

There are ballots and non-binding polls set-up as follows:

- CIP-003-6 — Cyber Security — Security Management Controls
- CIP-004-6 — Cyber Security — Personnel and Training
- CIP-006-6 — Cyber Security — Physical Security
- CIP-007-6 — Cyber Security — Systems Security Management
- CIP-009-6 — Cyber Security — Recovery Plans for BES Cyber Systems
- CIP-010-2 — Cyber Security — Configuration Change Management
- CIP-011-2 — Cyber Security — Information Protection

There is also a ballot for the Definition of Terms Used in the standards.

If you have questions please contact Ryan Stewart or Marisa Hecht.

Background information for this project can be found on the project page.

Instructions for Balloting

Members of the ballot pools associated with this project may log in and submit their vote for the standards and non-binding polls of the associated VRFs and VSLs by clicking here.

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standards. If the comments do not show the need for significant revisions, the standards will proceed to a final ballot.

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, or at 404-446-2560.

Standards Announcement

Project 2014-02 Critical Infrastructure Protection Standards Version 5 Revisions

Formal Comment Period Now Open through July 16, 2014
Ballot Pools Forming Now through July 1, 2014

Now Available

A 45-day formal comment period for **Critical Infrastructure Protection Standards Version 5 Revisions** is open through **8 p.m. Eastern on Wednesday, July 16, 2014.**

If you have questions please contact Ryan Stewart or Marisa Hecht.

Background information for this project can be found on the project page.

Instructions for Commenting

Please use the electronic form to submit comments on the standards. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment form is posted on the project page.

Instructions for Joining Ballot Pool

Ballots pools are being formed for the ballots of the standards and the associated non-binding polls on this project. Registered Ballot Body members must join the ballot pools to be eligible to vote in the balloting and submittal of an opinion for the non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs). Registered Ballot Body members may join the ballot pools at the following page: Join Ballot Pool

During the pre-ballot window, members of the ballot pool may communicate with one another by using their "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The list servers for this project are:

Ballot: bp-2014-02 CIPV5_STDS_in@nerc.com
Non-Binding poll: bp-2014-02 CIPV5_NB_in@nerc.com

Please note: To avoid the inconvenience for the industry to join 15 separate ballot pools, we have set up one for the ballots (on the standards and definition) and one for the non-binding polls. Once the ballot pools close, individual ballots will be created by carrying over the members of the ballot pools. There will be a separate ballot for each of the 7 standards, the definition and 7 non-binding polls.

Next Steps

Ballots for the standards, definition and non-binding polls of the associated VRFs and VSLs will be conducted **July 7-16, 2014.**

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, or at 404-446-2560.

Standards Announcement

Project 2014-02 Critical Infrastructure Protection Standards Version 5 Revisions

Ballot and Non-Binding Poll Results

Now Available

Ballots for seven standards - **Critical Infrastructure Protection Version 5 Revisions** and one definition; and seven non-binding polls of the associated Violation Risk Factors and Violation Severity Levels concluded at **8 p.m. Eastern on Wednesday, July 16, 2014**.

Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballots.

	Ballot Results	Non-Binding Poll Results
	Quorum /Approval	Quorum/Supportive Opinions
CIP-003-6	80.73% / 35.67%	77.81% / 31.86%
CIP-004-6	80.49% / 80.76%	77.27% / 77.63%
CIP-006-6	80.00% / 76.24%	77.27% / 74.56%
CIP-007-6	80.24% / 78.41%	77.27% / 75.44%
CIP-009-6	80.24% / 85.32%	77.27% / 85.59%
CIP-010-2	80.49% / 49.42%	77.54% / 39.04%
CIP-011-2	80.24% / 82.55%	77.01% / 79.74%
Definition	78.29% / 78.58%	N/A

Background information for this project can be found on the project page.

Next Steps

The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standards and post them for an additional ballot. If the comments do not show the need for significant revisions, the standards will proceed to a final ballot.

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller (via email), Standards Development Administrator, or at 404-446-2560.

No problem with 2.1, 2.2, 2.3 2.4 - Requiring the user to give a "reason" for accessing does nothing to increase security and would require a rewrite of the system. 2.5 - We just wrote an Incident Response Plan for EOP-004-2 that would cover cyber incidents. This is redundant and more work. 2.6 - ditto. And quarterly is ridiculous. And you don't define "practices" or what "reinforce" means.

Yes
FirstEnergy supports the revisions to the CIP standard in general. Although we agree with the overall approach the Standards Drafting Team has taken, FirstEnergy does have concerns around the RSAWs and support EEIs comments in regards to the RSAWs.
Yes
FirstEnergy supports the revisions to the CIP standard in general. However in the Guidelines and Technical Basis, FirstEnergy requests the addition of a clarification that entities are not expected to enforce CIP-006 on third party components that are out of the entity’s control. FirstEnergy also has concerns around the RSAWs and support EEIs comments in regards to the RSAWs.
No

FirstEnergy does not agree with this approach. Suggest the requirements for Transient Cyber Assets & Removable Media Protection be an additional requirement under CIP-007 as these devices require similar protection (i.e. malicious code prevention, security patching) as those applicable systems in CIP-007. As currently placed, Transient Cyber Assets & Removable Media have little in common with Configuration Change Management and Vulnerability Assessments creating confusion in internal programs, SMEs and RSAWs.

The proposed version provides adequate specificity relative to the strategies required. E.g. “restrict physical access”. The concern I pose, comes with the subjective nature of the enforcement review. Does the standard sufficiently cover the appropriate levels and tactics expected to be used to be compliant. (is locking the door enough?) However this COULD be addressed with a sufficiently detailed technical guidance document much like the style of the PRC-005 Technical Guidance Document. Next Section 2.5 needs some language clarification; two intervals are mentioned, quarterly and 15 calendar months. However there is some ambiguity surrounding what is to be done on those intervals. A suggested wording / format revision to clarify. Implement a security awareness program that: •Reinforces good cyber security practices at least quarterly. In addition. •Specifically cover Parts 2.2, 2.3, and 2.4 above, once every 15 calendar months.

Yes
The timeline for CIP-003-6 R2 should be sufficient. But I point out that the implementation plan does not address newly identified "Low" BES Cyber Assets. The situation could occur for some distribution assets that were not applicable at the time this standard was approved, at a later date rising to the applicability levels and as such needing to implement the "Low" requirements.
Yes
Items for the FAQ document produced by the drafting team. •Suggested approaches for compliance that address the topics in CIP-003-6, Requirement R2, and Parts 2.2 – 2.5. (See PRC-005 Technical guidance document for level of specificity.) •What levels of restrictions for physical access are expected to be performed? (Switchyard/ Substations, Generation facilities and areas within those facilities…) •Explore issues around “2.3.3 Authentication when establishing Dial-up Connectivity, per Cyber Asset capability. The documentation of the capability and or suggested approaches to establishing authentication. •Address implementation period for newly identified LOW BES Cyber Assets, currently there is NONE! •Discuss “Guilt by association” example: a substation classified by entity A as “Medium” has Protection Systems (BES Cyber System) that rely on Entity B’s substation Protection Systems, does this potential Reliability Operating Service provided by Entity B make the Entity B’s station a Medium or not? •Also explore the situation above where Entity B’s substation is a

non BES station. Does this scenario extend to those connected to "Low" substations? For CIP-003 R2, I propose the original 2 years from regulatory approval as it was originally with version 5 since it has taken longer than 3 months from V5 FERC Approval till now. More time is needed due to: •The objective criteria and the specific nature of the processes or program required for these proposed revisions that did not exist prior to now. •Entities are not only required to “develop them”. •Entities must demonstrate they have “implemented them” Please address implementation period for newly identified LOW BES cyber assets. Currently this is a situation that can arise, and without an implementation period being identified it can pose some difficult situations.

PGE is concerned about the removal of the ‘identify, assess, and correct’ language from the CIP Version 5 standards. The inclusion of this language in the CIP Version 5 standards was a large part of the reason that the industry voted to pass the standards in the first place. The intention of the IAC language was to address the standards being ‘zero defect’, an intention which FERC supported in order 791. ‘Zero defect’ standards cause undue burden and harm on the industry without supplying a meaningful reliability or security benefit. Rather than remove the IAC language entirely, it would be worthwhile to modify the language to add a qualitative aspect that would be responsive to FERC’s concern that the language is too vague. PGE understands that the Reliability Assurance Initiative may be used to address “zero defect” but its effectiveness remains to be seen. It is preferable to include language within the CIP Version 5 standards to address “zero defect”.

R2/M2 - Although CenterPoint Energy generally agrees with the approach to meeting the CIP-003 directive, one requirement for low impact assets with objective criteria, the Company questions the deletion of the link back to CIP-002-5, Requirement R1, Part R1.3. The Company recommends the following wording: “Each Responsible Entity for its assets identified in CIP-002-5 Requirement R1, Part 1.3 shall perform each of the applicable requirement parts in CIP-003-6 Table R2 – Low Impact Assets.”. (The phrase “containing low impact BES Cyber Systems” is not needed as it should be understood after asset identification in CIP-002-5.) CenterPoint Energy also recommends that M2 be revised to reflect the pattern of the other measures in CIP-003. For example, the following wording would be appropriate: “Examples of evidence may include, but are not limited to, applicable documented policies and processes that collectively include each of the applicable requirement parts in CIP-003-6 Table R2 – Low Impact Assets and additional evidence to demonstrate implementation as describe in the Measures column of the table.” Alternatively, the SDT may consider the pattern found in other Standards (ex. CIP-007-5/6) and remove the word “any” from the draft measure.

Part 2.4.3 - CenterPoint Energy also requests that the SDT review and consider the use of the term “authentication” versus “access control” in Part 2.4.3 and the supporting Guidelines and Technical Basis. Does the SDT intend for entities to have authentication or access control when establishing Dial-up Connectivity? Although this requirement is to be implemented “per Cyber Asset capability”, CenterPoint Energy proposes that access control is more appropriate and commonly feasible. Part 2.6 - The level of detail in Part 2.6 is above what is required even for High and Medium Impact BES Cyber Systems. CenterPoint Energy recommends that Part 2.6 be revised as follows: “Implement a security awareness program that reinforces cyber security practices (which may include associated physical security practices) at least quarterly.”. Delete the sentence “Once every 15 calendar months, the program shall reinforce Parts 2.2, 2.3, 2.4, and 2.5 above.”.
Yes
No
CenterPoint Energy acknowledges the risks associated with transient devices; however, the Company is concerned with management and documentation to be associated with the requirements for transient devices. CenterPoint Energy considers sustained compliance with the requirements exceptionally challenging or unattainable. CenterPoint Energy also recommends that the examples statement be removed from the Guidelines and Technical Basis on Page 41 – Requirement R4 as it is redundant to the definitions of Transient Cyber Assets and Removable Media.
Yes
Yes
CenterPoint Energy supports this revision approach for IAC. As proposed by NERC, the Company looks forward to the concepts of IAC being implemented within the final framework of the Reliability Assurance Initiative (RAI).
No
The timeframe for CIP-010-2, Requirement R4 is not appropriate. Efforts will be focused on the implementation of CIP Version 5 (High and Medium Impact Assets) through April 1, 2016. After that date, entities will have 1 year to document and implement requirements for Low Impact Assets. Although comprehensive efforts toward CIP Version 5 and the potential of CIP Version 6 compliance are occurring to date, CenterPoint Energy recommends that Registered Entities not be required to comply with Reliability Standard CIP-010-2, Requirement R4 until at least 1 year after the effective date of Reliability Standard CIP-010-2 as it, along with CIP-003-2, is the most complex of the CIP Version 5 revisions.

We recommend common control objectives. Language inconsistencies create confusion and compliance risks. Here are some examples: Example 1 – Request a definition (CIP-003-6 Rationale R2 and Part 2.4) of “external routable protocol paths” so that Entities and Auditors clearly understand the differences with External Routable Connectivity. We recommend avoiding the earlier CIP-001 confusion between Facilities and facilities. We believe “external routable protocol paths” creates a similar interpretation risk. Example 2 – security awareness (Part 2.6) is more stringent than the High / Medium in CIP-004-6 R1 Example 3 - the Low Incident Response Plan in Part 2.5 is inconsistent with High / Medium Incident Response Plan in CIP-008-5 R2 Example 4 – policy requirements for Low Impact creates different set of Requirements for Entities with Low, Medium or High. There are inconsistencies in the language of this requirement, which causes confusion to entities. Why is LOW impact rating requirements addressed in this standard versus in the applicable standards such as for High & Medium impact ratings? Example: the security awareness should be addressed in CIP 004 as it is for High & Medium. Whether the all-in-one requirement approach or the spreading out into all the standards approach is taken, the most important thing is that there is consistency between the standards and requirements and maintaining the tiering of activities to the risk.
Yes
Request CIP-007 R1 Part 1.2 Rationale be added to the Guidelines and Technical Basis section. Suggest illustrative examples be included in the Measures and Technical Guidelines so that entities and auditors have the same interpretation.
Yes
Yes
Yes
How does NERC intend to address an internal controls program? What is the time line? Refer to the comment for Question 8.
No
Request a clear, concise table of all proposed Implementation Plan updates. Ensure that all new effective and mandatory dates are after their CIP V5 dates. The current format is confusing. Please provide a clear and consistent time line for implementation of these requirements.
No
Yes
More clarity and scenarios should be provided on how RAI and CIP will work together. The NERC Project 2014-02 CIP Version 5 Revisions Standard Drafting Team should be allowed to help clarify and provide guidance for industry issues and items discovered in the pilots. In particular the following should be addressed by NERC with the SDT representing industry: 1. Transfer Trip: CIP-002-5 R1, ‘transmission stations and substations’ for medium category assets, what some refer to as the “transfer trip” issue. 2. Clarify the term “programmable devices” which is an undefined term open to strongly differing viewpoints. 3. Clarify “effect within 15 minutes” issue and the burden of evidence for proving that something does not exist. Please clarify if diversity vs redundancy can be considered as part of the Entity’s impact assessment (i.e. separate system using a different technology). Recommend adding “or” to CIP-010 R4 Part 4.1.4 to make this Part consistent with CIP-010 R1 Part1.1.1.1. Part 1.1.1 requires a baseline of Operating system(s) (including version) OR firmware where no independent operating system exists; while Part 4.1.4 requires Authorization to include Operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability). Part 4.1.4 requires Authorization of both Operating System AND

Firmware for a transient device while Part 1.1.1 requires baseline of Operating System OR firmware. We suggest the proper approach is to retain the OR. When applying R4 to a laptop we normally record the OS and version and not look to the firmware BIOS.
Group
ACES Memebers
Warren Cross
No
In regards to the requirement for physical security (R2.2), the requirement is partially focused on whether one or more processes is documented to restrict physical access. The requirement and measures should be focus on the effectiveness with specific physical access restriction criteria instead of a documented process. Would an entity have to document their processes for each asset if the means of restriction are different? If so, this effort to document each process for each location for each asset would be burdensome and ineffective in restricting physical access.
Yes
Yes
Yes
We are supportive of the approach as long as the Reliability Assurance Initiative is fully implemented by the effective date of these standards.

The Requirements proposed in 2.1, 2.2 and 2.3 are sound and apportion appropriate controls for Low Impact Cyber Systems. However, the “external routable protocol paths” language in Requirement 2.4 requires entities Low Impact Cyber Systems to provide and comply with “some form of electronic security perimeter,” regardless of risk to the Bulk Power System/Bulk Electric System. In addition, the language in the context of a CIP program is confusing. On one hand, entities would be required to identify, maintain and comply with “some form of electronic security perimeter” (ESP) for Low Impact rated BES Cyber Systems, yet on the other, CIP Version 5 (or the proposed Revisions) states that “An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required.” This is contradictive at best and should be clarified. And while it is understood that one consideration for this language is a scenario where a Low Impact Cyber System could potentially be compromised and/or utilized to compromise or misuse Medium or High rated Cyber Systems; this should be alleviated considering that Low, Medium and High BES Cyber Systems are inherently designed, deployed and operated with existing physical and electronic controls to deter this. Recommend language changes to address only Low Impact Systems which have direct access to “untrusted” networks (e.g. networks not owned and operated by the entity). Recommend adding language to address Low Impact BES Cyber Systems with “external routable protocol paths” and depending on the path and number of paths, determine the controls such as monitor and control communications, implementation of subnets, and manage external connections using boundary protection devices. Recommend the performance of an annual sampling assessment of such classified systems to determine the state of their security controls.

This sampling could be based on the NERC sampling guidelines or other generally accepted audit principles for security controls with established levels of materiality to provide a threshold or cut-off point.
Yes
Implementing physically secured cabling and alarms to components outside of PSP is an appropriate approach. Also, Part 1.10 mandates an alarm or alert to personnel with 15 minutes of detection. However Part 1.10 does not define timeframe that alert or alarm must be respond to or be investigated by personnel to determine if/how/where breach was attempted. Also recommend that periodic review of the integrity of the implemented physical protection measures and alarm processes remain intact as design and approved as part of CIP Senior Manager sign-off.
No
CIP-010-6 R4.1.4 requires the Entity to “identify and document the Operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability).” And in 4.6, the Entity is required to “Evaluate Transient Cyber Assets, prior to use, for modifications that deviate from Part 4.1.4.” For entities that depend on vendors and contract support personnel to maintain the Reliability of the Bulk Electric System, this becomes a great administrative challenge. This requirement becomes dependent upon the number of Transient Devices, the number of vendors, contractors or support personnel, and the type and variance of Transient Cyber Assets and tools used to perform their job duties. The challenge in requiring a baseline of firmware alone far exceeds the vulnerably and risk to the BES Cyber Asset. Recommend changing the language in requirements R4.1.4 and R4.6 to address Entity owned-maintained Transient Devices separately from Vendor or Contracted Support owned-maintained Transient Devices. This allows entities to reasonably develop and implement Administrative and Technical Security Controls for Transient Devices based on risk, yet monitored from a compliance standpoint. Recommend language changes to require “the implementation of a Transient Device Security Baseline for Entity and Vendor/Contracted Support Transient Devices.” This allows Entities to implement controls yet maintain the flexibility to address multiple device types and functions. This also allows Entities and their vendors or contracted support personnel to implement Administrative and Technical controls of Transient Devices based on risk. Recommend language changes to require sampling of Transient Devices Security Baseline. This allows Entities a mechanism for monitoring both Entity and Vendor/Contracted Support personnel owned-maintained Transient Devices. Recommend language changes to require a security policy for Transient Devices which includes a requirement for Transient Devices with direct access to BES Cyber Systems. This allows Entities to establish and implement Administrative Controls for Transient Devices as well as recommend Technical Security Controls in the form of Transient Device Access Portals. Recommend consider a standardized implementation of a Transient Device Security Access Portal which allows vendors to perform their work without directly accessing systems. This would allow Entities Vendors, Contractors and support personnel to use a standardized and document attestation of security baseline for Transient Cyber Assets. Recommend leveraging the NERC Guidance for Secure Interactive Remote Access jump hosts concept for transient devices with remote access capabilities.
Yes
The new definition for Transient Cyber Assets and Removable Media is an appropriate revised definition. However, there may be an issue with scope of applicability related to the 15 minute parameter classification of High BES Cyber Asset and Protected Cyber Assets. The new R4 approach should be required across all components contained within the ESP regardless of classification. Also, it is stated under Requirement "4.1 Authorization shall include 4.1.1 Users, individually or by group/role:". Recommend that authorization should always note individual user and removing "by group/role".
No
The intent to removing the specific 17 requirements related to the "Identify, Assess, and Correct (IAC)" language was to shift focus from addressing specific types of incidents to implementing better practices in identifying risks. This shift may present responsible entity with overly-vague, unclear or not detailed enough scope or definition, compliance obligations, timeframes and requirements resulting in hard to develop and implement auditable processes. Recommend defining clearer requirements, scope definitions and obligations in the NERC Compliance Monitoring and Enforcement Program.

Yes
The existing effective dates for the mentioned standards appear reasonable and appropriate.
No
Yes
In the past references have been made regarding a need to protect High BES Cyber Systems from Electro Magnetic Pulse (EMP) related to solar or intentional anomalies. This has been an ongoing topic of discussion and concern however no direction, requirements, obligation or risk considerations have been made. Recommend providing guidance on whether EMP anomalies should be considered in risk assessments or policies and procedures.
Individual
Joe O'Brien on behalf of Jerry Freese
NIPSCO
No
Although we agree with EEI and the overall approach the Standards Drafting Team has taken, we answered no to this question due to specific concerns described below. 4. Applicability The scope of dispersed generation in the CIP-003-6 Applicability section should be limited and similar to PRC-005. Suggested Revision: Under the Introduction section, 4 Applicability, 4.2 Facilities, add the following statement after 4.2.2 All BES Facilities: “For dispersed power producing resources identified through Inclusion I4 of the BES definition, the only BES Cyber Systems that meet the low impact rating criterion 3.3 in Attachment 1 of CIP-002-5.1 are any shared BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of dispersed generation units from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or above and not at an individual turbine, inverter or unit level.” This change should be made in conjunction with adding back the reference to CIP-002-5 Requirement R1.3 in CIP-003-6 R2. 6. Background With the addition of the table to Requirement R2, the Background Section should include a paragraph referencing the tables and the “Applicable Systems” Column to be consistent with the Background section of the other CIP standards with similar tables. Suggested Revision: Add the following paragraph after the first sentence of the CIP-003-6 Background Section 6: “Requirement R2 opens with, ‘Each Responsible Entity for its assets identified in CIP-002-5.1 Requirement R1.3 containing low impact BES Cyber Systems shall perform each of the applicable requirement parts in CIP-003-6 Table R2 – Low Impact Assets.’ The referenced table requires the applicable items in the procedures for the requirement’s common subject matter.” Also, add a paragraph similar to the “‘Applicable Systems’ Columns in Tables:” from other CIP standards into the Background Section 6 for CIP-003-6 for Requirement R2. Requirement R2 Add back the reference to “for its assets identified in CIP-002-5.1 Requirement R1, Part 1.3” to properly set the scope. Also, change the table reference to “CIP-003-6 Policies, Processes, Plans and Programs.” to match the proposed revision to the table title. Suggested Revision: Change R2 to: “Each Responsible Entity for its assets identified in CIP-002-5.1 Requirement R1, Part 1.3 containing low impact BES Cyber Systems shall perform each of the applicable requirement parts in CIP-003-6 Table R2 – Low Impact Assets. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] Note: An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required. Lists of authorized users are not required.” Table Title for Requirement R2 The Table title for Requirement R2 “CIP-003-6 Table R2 – Low Impact Assets” does not match the format of the tables used in the other CIP standards, which focus on the requirements not the applicable systems. Suggested Revision: Change the R2 table title to: “CIP-003-6 Table R2 – Low Impact Asset Policies, Processes, Plans, and Programs” Requirement R2, Part 2.1 An entity may not have a low impact BES Cyber System at a Control Center (R2.3) and therefore R2, Part 2.3 is not applicable. Suggested Revision: Edit text to read “that collectively address the applicable topics in CIP-003-6, Requirement R2, Parts 2.2 -2.6.” Requirement R2, Subpart 2.4.1 Clarify that an external routable protocol path is “external” to the asset identified in CIP-002-5.1 R Requirement R1, Part 1.3 containing low impact BES Cyber Systems. Suggested Revision: Delete “external” and insert “to and from the asset identified in CIP-002-5.1 Requirement R1, Part 1.3 containing low impact BES Cyber Systems” such that 2.4.1 becomes: “All routable protocol paths to and from the asset identified in CIP-002-5.1 Requirement R1, Part 1.3 containing low impact BES Cyber Systems, if any, must be through one or more identified access point(s).” Requirement R2, Subpart 2.4.2 Remove “by default” as it implies

the use of a firewall, which limits access control options. For example, an entity could use access control lists on a router or switch to provide security for traffic control. However, routers and switches do not do this by default. This will allow entities more options on how to accomplish traffic control. Also, include a statement to allow documentation of access permissions individually or by group. Reasons for granting access are included in CIP-005-5 Requirement R1, Part 1.3 for high and medium impact BES Cyber Systems. Documentation for low impact assets individually or by group is consistent with the measure, but as in CIP-005-5 Requirement R1, Part 1.3 should be added to the standard. Suggested Revision: Remove “by default” and add “and document access permission reasons individually or by group” such that 2.4.2 becomes: “For each identified access point, if any, require inbound and outbound access permissions, deny all other access, and document access permission reasons individually or by group.” Requirement R2, Part 2.6 The specificity of what must be covered and having to track two time periods is more prescriptive than the requirements for medium and high impact BES Cyber Systems. The proposed revision uses language from the medium/high impact requirement (CIP-004-R1.1) with the time period adjusted to once every 15 calendar months to differentiate for the lower risk. Cyber security awareness can be addressed during annual training for employees and contractors in addition to other ongoing cyber security awareness communications. Suggested Revision: Remove the references to the subpart requirements as they may not apply to all entities and remove the quarterly requirement such that Part 2.6 becomes: “Implement a security awareness program that reinforces cyber security practices at least once every 15 calendar months.” Guidelines and Technical Basis Align the drawings and wording in the guidelines and technical basis with the requirement language.

Yes

(EEI Comments) Guidelines and Technical Basis Add a clarification that entities are not expected to enforce CIP 006 on third party nonprogrammable components that are out of the entity’s control.

No

We agree with the following EEI comments: Although we agree with the overall approach the Standards Drafting Team has taken, we answered no to this question due to specific concerns described below. Requirement R4, Part 4.1 EEI members are concerned with unnecessary administrative burdens created by Part 4.1. For example, Authorization generally applies to users. A user of a Transient Cyber Asset should be authorized to use the particular asset with certain software installed, for a particular purpose at a particular location(s). The way Part 4.1 is written suggests that four different authorization processes are needed: one for users, one for locations, one for acceptable use, and one for software/firmware. A requirement for four different processes for user authorization adds additional, unnecessary administrative record-keeping. This language should be edited to make it clear that only one user authorization process is required. Part 4.1 also does not consider that CIP-004-6 Requirement R4, Part 4.1 also addresses authorization, which overlaps with the CIP-010-2, Requirement R4, Part 4.1. The Transient Cyber Asset requirement (Part 4.1) should not require users to be authorized twice, once under CIP-004 and again under CIP-010. Suggested Revision: EEI does not have a specific revision to suggest to address these concerns; however, we recommend a careful review of the specific concerns and suggestions raised by Registered Entities to help reduce the administrative burden of this part. Requirement R4, Part 4.7 The requirement should be tied together better such that it clearly allows mitigation instead of patching, when justified. Suggested Revision: Condense the language into one sentence to help clarify the requirement. For example: “Evaluate Transient Cyber Assets, within 35 calendar days prior to use, for applicable security patches and take one of the following actions: • Apply the applicable patches, or • Create a dated mitigation plan, or • Revise an existing mitigation plan.” Guidelines and Technical Basis The Part 4.1 guidance conflicts with the “Applicable Systems”. The guidance says the requirement (R4) “applies to any transient devices”, yet the “applicable systems” in the requirements tables are not the transient devices. Suggested Revision: Edit the language under Requirement R4 to: “This Requirement applies to Transient Cyber Assets and Removable Media that will be connected temporarily to an applicable system. Examples of these hardware/software devices include, but are not limited to: • Diagnostic test equipment • Packet sniffers • Devices used for BES Cyber System maintenance • Devices uses for BES Cyber System configuration • Devices used to perform vulnerability assessments” The guidance for Requirement Part 4.1, says “Requirement Part 4.1 requires the entity to document and implement its process to authorize the use of Transient Cyber Assets.” Requirement R4, Part 4.1 says “Authorize the usage of Transient Cyber Assets prior to initial use, except for CIP Exceptional Circumstances.” (emphasis added) The guidance language

should be edited to be consistent with the standard's requirement. Bullet 2, under Requirement Part 4.1, says "It may be reasonable to have separate Transient Cyber Assets for each impact level." Requirement R4, Part 4.1 is focused on High and Medium Impact BES Cyber Systems, not all BES Cyber Systems. The language in bullet 2 includes "low impact," which is not an applicable system for this requirement. Therefore the guidance goes beyond the scope of the standard. This guidance should also be edited to be consistent with the language of the standard's requirement.

No

We agree with the following EEI comments: BES Cyber Asset – CIP-002.5.1 Guidelines and Technical Basis The definition of BES Cyber Asset combined with the guidance creates opportunities for misinterpretation. The scope of the reliability standards under Section 215 of the Federal Power Act is limited to "(A) facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof); and (B) electric energy from generation facilities needed to maintain transmission system reliability." (emphasis added) The BES Cyber Asset definition says "if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which , if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System." (emphasis added) The Guidelines and Technical Basis section of CIP-002-5.1 (guidance) goes to some length discussing the concept of BES Reliability Operating Services (ROS) as a tool to identify the BES Cyber Systems that would be in scope. What "affect" means is made unclear by this guidance. If we arbitrarily assume that "affect" means "unable to perform one or more BES ROS" then the loss of a programmable device which provides status and magnitude of breakers, current flows, etc. for "Monitoring and Control" and "Situational Awareness", would be considered to be affecting the BES, and it would begin to do so immediately upon such loss. However, these devices are not necessary to operate "an interconnected electric energy transmission network" or "to maintain transmission system reliability." Therefore, we do not think this is what the Standard Drafting Team intended, however clarification in the guidance, which aligns with the scope of a reliability standard is needed. Removable Media There is a consistency issue. The definition for Transient Cyber Assets is very specific about what Transient Cyber Assets are directly connected to; however, the definition for Removable Media is not. It can be implied that the definition refers to connection to applicable systems, but it is not clear. It would also be clearer to switch the order of the Removable Media and Cyber Assets in the last sentence. Suggested Revision: Change the definition of Removable Media to: "Portable media, connected for 30 consecutive calendar days or less, to applicable systems. Examples of portable media that can be used to copy, move and/or access data include, include but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory. Removable Media are not Cyber Assets."

Yes

We agree with the following EEI comments: EEI supports the removal of the identify, assess, and correct language due to the expectation that NERC will refine its compliance and enforcement process under the Reliability Assurance Initiative (RAI) to move away from a zero tolerance approach to compliance. We expect the new RAI to be finalized prior to final ballot to address the zero tolerance concerns that the identify, assess, and correct language intended to address.

Yes

No

not applicable

Yes

We agree with the following EEI comments: CIP-002-5.1, CIP-005-5 and CIP-008-5 were not opened for revisions, comments or ballot. These standards contain one or more items that need to be updated to maintain consistency with the CIP standards which were opened. There are also items which need to be addressed to provide clarity for implementation and auditability. We respectfully request that the Revisions Standard Drafting Team make these "conforming changes" and other changes to the three standards regardless of whether they are opened for any other revisions. Examples include: • CIP-002-5.1, CIP-005-5 and CIP-008-5 all, in section 5, reference effective dates. These all need to be updated to be consistent with the effective date of the standards which

were opened for revision. • CIP-005-5 and CIP-008-5, in section 6, reference CIP-003-5, CIP-004-5, CIP-006-5, CIP-007-5, CIP-009-5 and CIP-010-1 and CIP-011-1. These references need to be updated to reflect -6 and -2 as appropriate

CIP-003 R2 Part 2.3.2 requires entities to implement one or more processes that include “For Control Centers with external routable protocol paths, monitoring physical access point(s)” for Low Impact BES Cyber Systems. Executing this requirement would require entities to identify physical access points to Low Impact BES Cyber Systems which, in essence, would require the identification of a Physical Security Perimeter. This was not required under CIP-006-5 for Low Impact BES Cyber Systems. The risk reduction this requirement would bring is low due to the impact designation of Control Centers, where entities would protect all of the BES cyber systems located at and associated with the operation of those Control Centers designated as either High or Medium impact.
Yes
These changes are in line with the “ORDER REMANDING PROPOSED INTERPRETATION OF RELIABILITY STANDARD CIP-006-4” issued by FERC 3/21/2013.
Yes
Yes
Yes
No
With multiple effective dates for different requirements and sub-requirements, confusion may arise and result in an increased risk of potential violations. Making all requirements effective on the same date, or grouping compliance date by High, Medium, and Low designations would make for a more consistent transition to CIP Version 5.
No

Yes
: The naming convention for the standards should be standardized to prevent confusion. There are “CIP Version 5” standards that contain requirements suffixed -5 and -1. If the proposed revisions are approved, there will be standards suffixed -2,-5,-6, and -1 if CIP-014 is included. This is contrary to the precedent set by previous versions of the standards. Version 4 only contained changes to CIP-002, but all requirements in that Version were updated to -4, even though they did not change. Now the suffix is being incremented only when requirements have changes made to them, resulting in multiple suffixes. Requirements should all be suffixed with the same number to easily identify the current set of enforceable requirements as a package.

Looking at this from a risk perspective, the probability that someone will enter into a NERC CIP facility with access control devices, cameras, on-site personnel, etc. and then try to tap into the wiring, as opposed to just entering into the PSP and utilizing the BES Cyber System is not logical. Thus, NextEra recommends the following changes to the CIP-006, Requirement R1, Part 1.10 and its measure: By adding a paragraph to the Requirements Section which states: To restrict physical access to such cabling and components, the Responsible Entity shall document and implement one or more of the following: - Secured with conduit; or - Secured with cable trays; or - Implement alternative physical security control measures that utilize a defense in depth strategy that may include, but are not limited to: o multiple physical access control layers within a non-public, controlled space; o 24 x 7 security or operational personnel; o camera/video coverage; o other alarm systems; o multi-factor authentication devices; o other related security devices; Then under the Measures Section, modify the verbiage slightly to read: An example of evidence may include, but is not limited to, records of the Responsible Entity’s implementation of the physical access restrictions (e.g., cabling and components secured through conduit or secured cable trays or alternative physical security control measures) encryption, monitoring, or equally effective logical protections.

The Low BES Cyber Systems in the Applicable Systems column of the Tables would seemingly require a detail inventory similar to that required by Highs and Mediums to determine what are BES Cyber Systems. This should not be required per the Standard. If this is not what is intende then please provide guidance in the Standard as to how to determine Low Impact BES Cyber Systems without the using the detail inventory process.

Part 2.6 of CIP-003-6 requires a quarterly "security awareness" component for entities with low impact cyber assets. For a small entity with few assets to begin with, instituting a quarterly "security awareness" communication could result in the opposite effect of what is desired. Rather than highlighting security awareness, such as is done during annual training that is already required by

FERC for hydropower licensees, a quarterly communication will take on the nature of routineness. I recommend changing Part 2.6 to require annual secuirty awareness communications.

We appreciate the approach to provide more specificity by using existing language from the other CIP Cyber Security Standards, and we support the language for all but the physical security Requirement Part 2.2. The requirement to restrict physical access does not provide sufficient criteria for entities to know they have satisfied the obligation. We suggest keeping the language of the requirement part and adding guidance to restrict physical access for BES Cyber Systems at a generation Facility and BES Cyber Systems at a substation. In particular, the guidance should confirm an approach whereby BES Cyber System components in a control house or control room can have greater physical protection applied than components distributed throughout the facility.
Yes

No
Overall, we feel the proposed timeframes are reasonable. However, we would like to submit a possible oversight in the timeframes for newly identified assets. There is currently no additional time given for newly identified assets with low impact BES Cyber Systems. It is possible for unplanned changes to result in an asset becoming part of the Bulk Electric System. In CIP-003-5, this was less of an issue because CIP-003-5 R2 was more programmatic and entities could address new assets as part of their overall program. The proposed CIP-003-6 R2 now has specific criteria, which necessitates consideration in the implementation plan for unplanned changes resulting in low impact categorization. We suggest a 12 month period for compliance implementation in this scenario. Also, we wish to express our support for the SDT completing all four Order 761 directive areas. It is important to have industry-developed objective criteria for the low-impact BES Cyber Systems when the requirements goes into effect on April 1, 2017. The industry begins its 7th year in which these Standards have been in development. It is difficult to grow and mature security programs with so much change in the compliance rules. We hope the industry, NERC and FERC can come to an agreement in the coming months and provide finality to these Reliability Standards for a time.

The Requirements proposed in 2.1, 2.2 and 2.3 are sound and apportion appropriate controls for Low Impact Cyber Systems. However, the "external routable protocol paths" language in Requirement 2.4 requires entities Low Impact Cyber Systems to provide and comply with "some form of electronic security perimeter," regardless of risk to the Bulk Power System/Bulk Electric System. Compliance to this requirement would be excessive given the risk associated with Low Impact rated BES Cyber Systems, and would require entities to maintain a list of Low Impact Cyber Systems, even though specifically not required by the standard.

SCE encourages the SDT to clearly provide entities with the choice between the physical access restrictions and the alternative means of protection, such as encryption of data, monitoring of the status of the communication link, and other logical protections. As we have a large and varied system, we will need the clear flexibility to select the best method of the system and environment. The proposed draft seems to suggest that physical protection is the first and preferred method, which could force entities to establish criteria for determining when to default to the alternative methods, thus complicating compliance.
Yes
SCE believes that the SDT's approach is sound, but believes that the final implementation plan for the entirely new Requirement 4 should reflect the additional procedural and record-keeping burden associated with it.
Yes
Yes
We accept the SDT's decision to remove the Identify, Assess, and Correct language from the 17 requirements in which it appeared, but believe that NERC must work expeditiously to complete the Reliability Assurance Initiative project and secure FERC approval of the project. The high frequency security obligations included in the CIP Version 5 Reliability Standards require that NERC and the Regional Entities exercise the enforcement discretion called for in RAI aggressively.

The Registered Entity suggests the SDT use the existing applicability tables throughout the standards to apply controls to Low Impact assets rather than consolidating in CIP-003 R2. The SDT has stated that they ‘pulled language and concepts from CIP-004, CIP-005, CIP-006 and CIP-008 to add objective criteria to each of the previous policy topic areas in CIP-003, Requirement R2’. The language and concepts that have been pulled into CIP-003-6 R2 do not belong in the CIP-003 standard. The Registered Entity suggests the drafting team maintain consistency with the applicability tables found throughout the CIP version 5 standards and keep similar concepts grouped by standard. The Registered Entity strongly encourages the SDT to add protections to Low Assets in the appropriate CIP standard using the applicability table that already exists within the standards. CIP-003-6 R2.1 should stay in CIP-003. CIP-003-6 R2.2 and R2.3 should be moved to CIP-006. CIP 003-6 R2.4 should be located in CIP-005. CIP-003-6 R2.5 should be located in CIP-008. CIP-003-6 R2.6 should be located in CIP-004. Regarding R2.4: The terms ‘external routable protocol paths’ and ‘identified access points’ are ambiguous and may lead to inconsistent application and auditor interpretation without clarification. The Registered Entity suggests glossary terms be created to provide consistent application of requirements. Regarding R2.5: Can one incident response plan encompass multiple facilities/BES Cyber Systems? Does testing of the plan mean that testing must occur for each facility?
No
A. Need clarification regarding minimum acceptable data encryption standard. B. Need clarification regarding maximum acceptable opening size for conduit to be considered ‘secure’. C. For cable enclosed in conduit that spans a locked room between PSPs, what physical access controls should be applied to the room?
No
Regarding R4.5, need clarification regarding timeliness of signature / pattern files. How frequently does this update need to occur? Regarding R4.7, need clarification regarding minimum acceptable patching / mitigation prior to use. As written, creation of a dated mitigation plan appears to satisfy this requirement. There is no stipulation that mitigation must be completed prior to use of the asset.

No
Need clarification on what is meant by ‘directly connected’. Does it include specific media types (e.g. RS232, routable protocols, USBs, etc.)?
No
The removal of IAC from the standards requires that the RAI process be clarified regarding reporting timeframe and definition of ‘minimal risk’.
No
Effective dates should be reset to start with the approval date of CIP version 6. For large registered entities the level of effort to implement the standards on ‘Low Impact’ systems may now be greater than the burden of transitioning from version 3 to version 5 ‘High Impact’ and ‘Medium Impact’ systems.
<none>
No
Need clarification for what defines the lower threshold of the ‘Low Impact’ categorization. Does the BES definition serve to establish the lower boundary of the scope of the CIP standards?
Individual
Mikhail Falkovich
PSEG
No
The requirement for the ‘Low Impact’ security awareness goes above and beyond the equivalent requirement for High and Medium assets. We recommend removing the extra language in table R2 part 2.6 “Once every 15 calendar months, the program shall reinforce Parts 2.2., 2.3,2.4, and 2.5 above”. This will bring the language more in line with the equivalent requirement in CIP-004 R1.1. Additionally, we urge the SDT to reconsider the ‘quarterly’ periodicity of the security awareness reinforcement for Low Impact assets. While higher impact assets have a need for higher frequency of security awareness, the appropriate periodicity of reinforcement for Low Impact assets should be longer (annual periodicity is adequate).
Yes
Yes
Yes
No
While PSEG supports the approach of removing the IAC language and relying on the RAI function within NERC to manage the ‘zero defect’ issues, the RAI program has not yet been rolled out to the industry, and there is significant concern with the consistency of the RAI implementation. PSEG would like to have additional clarity and finalization of the RAI process prior to the implementation of the new standard language.
No
By the time this standard will be approved, the requirements impacting the low impact assets will change from the original CIPv5 requirements. Due to this fact, the industry should be allotted additional time to implement the necessary changes, as entities may have waited for finalization prior to initializing the low impact compliance/security projects. We request that the enforcement date for CIP-003-6 R2 be extended an additional 12 months to comply with CIPv6 low impact requirements.

We agree with R2.1, R2.2, and R2.3. We do not agree with R2.4 as written. The Standard needs to clearly state that the access point can reside either at the substation OR at the remote end of an external routable protocol path. We do not agree with R2.5 as written. The language of the Standard needs to clarify that the Responsible Entity can create a holistic Incident Response plan utilizing physical security mechanisms that lead to Cyber Security Incident identification, classification, and response; and that logging and monitoring of Low Impact Cyber Systems is not required. We do not agree with R2.6 as written. The language of the Standard needs to clarify that the Responsibility Entity's security awareness program applies only to their employees, but could include non-employees, and that posters, emails, and topics at staff meetings are sufficient delivery method and that tracking of reception is not required. Overall comment, the Guidelines and Technical Basis contain the clarification language, but Responsible Entities are audited on the language of the Standard.
No
Comments: This has the potential to create significant undue burden on entities. The use of undefined terms such as "nonprogrammable" and "extended ESP" along with referencing between standards makes the requirement difficult to comply with. The sentence "In using any of these methods, care should be taken to protect the entire length of the cabling including any termination points that may be outside of a defined PSP." From of the CIP-006-6 Guidelines and Technical Basis on page 37 leaves the requirement open to interpretation with no clear stopping point. The terms should be defined to limit the scope of the requirement and even though entities may utilize defense-in-depth controls beyond what is required, the requirement should be limited to the first termination point outside the PSP.

We Energies is particularly concerned with Requirement R2.4 and its subrequirements, further explained in the Edison Electric Institute (EEI) response to question 1 on low impact requirements.
Not familiar with Canadian provincial or other regulatory requirements.
Yes
We Energies participated in the development of and supports the comments submitted by Edison Electric Institute (EEI), including suggested revisions and recommendations. Additionally, We Energies provides the following comments: * CIP-002-5.1 Attachment 1 Impact Rating Criteria 2.3 is not specific enough with respect to which BES Cyber Assets meet the criterion, or when they must be compliant. In general, it is understood that newly identified BES Cyber Assets must be compliant within one year of identification. However in this criterion, it is feasible that a generation Facility might be identified in a study looking out 5, 10 or more years with some level of uncertainty in study assumptions. Securing such a Facility is good business practice. Expending the effort to be auditably compliant years before the Facility actually becomes a limiting factor to BES reliability is wasteful of resources. Implementing compliance measures and incurring compliance risk is wasteful of resources if real world conditions change over time such that the Facility never becomes a limiting factor to BES reliability. * CIP-002-5.1, CIP-005-5 and CIP-008-5 all, in section 6, state that “An entity should include as much as it believes necessary in its documented process but it must address the applicable requirements.” It should also explicitly state that any entity-specific processes which go “above and beyond” the standard requirements will not incur regulatory compliance obligation. * CIP-003-6 Section 6 Background states that an entity should include as much as it believes necessary in its documented process but it must address the applicable requirements. It should also explicitly state that any entity-specific processes which go “above and beyond” the standard requirements will not incur regulatory compliance obligation.

Although appreciative of the drafting team's efforts in developing the CIP Version 6 revisions, LES offers the following comments for the drafting team's consideration: CIP-003-6 R2.4.2 should be a sub bullet of 2.4.1. CIP-003-6 R2.5 – Requiring incident response on the Low Impact Assets seems unnecessary in consideration of the physical and electronic protections already required in the other draft CIP-003-6 requirements at the Low Impact Assets. Recommend the drafting team either remove R2.5 or else add an exclusion for ‘Low Impact assets without routable connectivity’ in recognition that a cyber-incident at a non-routable connected substation does not affect any other Low, Medium or High Impact BES Asset. CIP-003 R2.6 – Recommend the drafting team provide additional clarification regarding general awareness for Low Impact Assets. Is it the drafting team’s intent that awareness information be posted at every Low Impact Asset or is the posting of information in crew rooms and on intranet sites sufficient to meet this requirement? Additionally, do registered entities need to be concerned with contractors at their Low Impact Facilities and ensuring they get the quarterly awareness information too? In consideration that awareness training is already required of High and Medium Assets, LES recommends the drafting team consider, at a minimum, adding an exclusion to R2.6 for the ‘Low Impact assets without routable connectivity’ in recognition that a cyber-incident at a non-routable connected substation does not affect any other Low, Medium or High Impact BES Asset.

Tacoma supports LPPC's comments on CIP-003 R2
Yes
One potentially unintended outcome of the wording of CIP-006 R1 [1.10] is a detailed cable map for each and every cable path relevant to an ESP in order to show protections for all of those that happen to fall within an ESP boundary, but not a PSP boundary. Detailed network diagrams may not be sufficient to prove whether or not a particular cable path falls inside, or outside a PSP.
No
Tacoma Power Supports LPPC's comments on CIP-010 R4 & CIP-004 R2. Additionally, Tacoma Power suggests CIP-010 R4 technical controls be moved to the like locations in CIP-007 (CIP-010 R4 [4.2-4.5] -> CIP-007 R3, CIP-010 R4 [4.7] -> CIP-007 R2). And move Authorization requirements to CIP-004 (CIP-010 R4 [4.1.1-4.1.2] -> CIP-004 R4) and Policy requirements to CIP-003 (CIP-010 R4 [4.1.3] -> CIP-003). Leaving CIP-010 R4 [4.1.4 & 4.6] in CIP-010, if they remain in the standard.
No
Offering a modification to the Removable Media definition below: "Removable Media: Media capable of removal without powering down the system, connected for 30 consecutive calendar days or less, that can be used to copy, move and/or access data. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory. A Cyber Asset is not Removable Media." This would remove the need to create a further definition of "Portable media." This definition would include hot-swop hard drives. Additionally, an argument can be made that all flash media contains a programmable microcontroller, and would therefore qualify as a Cyber Asset.
Yes
Tacoma Power Supports NERC's efforts to develop the Reliability Assurance Initiative (RAI) as a way to move away from a zero-tolerance enforcement approach.

NYPA recommends that the language added to CIP-003-6, table R2 (low Impact Assets) be moved to the specific tables in each of the Standards CIP-004-6 through CIP-011-2 where applicable. The inclusion of these control requirements with a unique table in CIP-003-6 result in Standards language inconsistencies that creates confusion and additional compliance risks. The following are some specific examples (not meant to be a complete list): A. A new definition is now needed (CIP-003-6 Rationale R2 and Part 2.4) for the phrase "external routable protocol paths" to ensure that entities and auditors clearly understand the differences between that phrase and the defined term External Routable Connectivity. This would avoid duplicating the confusion seen in earlier versions of the CIP Standards, such as the CIP-001 confusion between Facilities and facilities. The phrase "external routable protocol paths" may create a similar interpretation risk. B. With the new wording in CIP-003-6, table R2, security awareness (Part 2.6) is now more stringent for Low Cyber System than those that are High / Medium in CIP-004-6, R1 C. The Low Cyber System Incident Response Plan in Part 2.5, is very inconsistent with High / Medium Incident Response Plan required in CIP-008

R2 D. Policy requirements for Low Impact Cyber Systems would require a different set of policies to cover Low Cyber Systems for Entities with a combination of Low, Medium or High Cyber Systems. E. The shifting of the Low impact requirements to CIP-003-6, R2, breaks one of the prime objectives defined when CIP version 5 was being developed that each of the Standards (except CIP-002) be able to stand on its own. At entities with Low “and” either Medium or High Cyber systems, it would be necessary that CIP-003 “always” be referenced when any of the requirements in CIP-004-6 through CIP-011-2 are being designed and implemented, since dependencies are always possible between Cyber Systems part of any impact category. The end of result of having these Low Cyber System controls contained only in CIP-003-6, is that going forward, as the CIP requirements are refined and enhanced, the risk of new inconsistencies being created will always be a very higher. For example, if a slight change is made to a requirement in CIP-007-6, which somehow affects the set of Low Cyber Systems, then having to make a similar change to CIP-003-6, R2, in accounting for that change, may result in the change being missed or becoming inconsistent. These new set of CIP standards are already very complex, and any added confusion caused by this obvious structural problem will make it even more difficult (and costly) in meeting the Standards and likely negating the goal of improving overall reliability.

Brenda Hampton
Luminant Energy Company, LLC
Yes
Luminant appreciates the work the drafting team has put into these standards. We agree with the general direction, but do have comments to provide clarification within the language. (1) For CIP-003, R2 the Rationale section states that “external routable protocol paths” is intended to focus only on paths to the low impact BES Cyber Systems rather that other networks such as Corporate. Can this be a defined term to explicitly state that rather than rely on the Rationale section? (2) CIP-003, R2.2 lists operational and procedural controls to restrict physical access. What is the difference between these two controls? Please provide examples. (3) The intent of CIP-003, R2.4.1 is dependent upon a definition of paths that can vary for each entity. The emphasis is needed on the controls that are implemented for clarity and measurable objective criteria. Please consider the following as a revision to R2.4.1: “Access points must be used to control routable communications to destinations and/or sources external to the BES asset where Low Impact BES Cyber Systems are located.” This revision places the emphasis on documenting the controls that accomplish the goal of restricting electronic access. (4) In Section C, part 1.3 the listed “Complaints Text” is confusing. Is the inclusion of the word “text” a typo? If not, please provide some context for this statement. (5) CIP-003 VSLs table can be challenging to follow. Consider removing redundant language wherever possible. Potential text edits include: (a) R2, item 1 “but failed to address one of the topics included in Requirement R2, Parts 2.2-2.6.” instead of referencing the text that references other texts (page 18 of 32). (b) R2 applies to low impact BES cyber systems. Is it necessary to repeat “with a low impact rating” or “for assets with a low impact rating” throughout the VSLs? (6) Suggested revision for CIP-003 “Guidelines and Technical Basis Section” Paragraph 2.2. This section includes a

statement of “operational or physical controls” however this language should match the requirement language which reads “operational or procedural controls”. (7) Suggested revision for CIP-003 “Guidelines and Technical Basis Section” Paragraph 2.3. (a) This section includes a statement of “external routable connectivity” however this language should match the requirement language which reads “external routable protocol paths”. (b) Since the primary purpose of monitoring is to watch for unauthorized access. Consider the revised language for the last two sentences: “Monitoring does not imply logging and maintaining logs, but monitoring that access has occurred at an access point (e.g., a door has been opened or traversed). The monitoring does not need to be per low impact BES Cyber System but should be at the level as determined by the entity’s controls.” (8) Suggested revision for CIP-003 “Guidelines and Technical Basis Section” Paragraph 2.4. (a) Within examples of sufficient access controls, the “public internet” seems to be a preferable listing rather than “world-wide-web” to include various external locations. (b) Within examples of sufficient access controls, details are provided for dialup modem connections. Is it the intent to not allow the modem to accept calls from authorized numbers? Should the wording be revised to clarify that calls from authorized numbers can be configured to autoanswer. Does the authorized phone number represent “some form of access control”? (c) Consider the following revisions to change the access technology to be more generic to not inadvertently restrict technology changes in the future. Consider revised language: “An asset has external routable connectivity due to a BES Cyber System within it having a wireless communications card on a public carrier which allows the BES Cyber System to be reachable via a public IP address. In essence, low impact BES Cyber Systems should not be accessible from the Internet on an unrestricted basis and from search engines such as Shodan.”
Yes
(1) The language in CIP-006, R1.10 seems to be in conflict with the Applicability section of CIP-007, R1.2. CIP-006, R1.10 includes only “nonprogrammable communication components outside a PSP” while CIP-007, R1.2 includes “nonprogrammable communication components located inside both a PSP and an ESP”. This conflict could be interpreted to imply that “entity owned and managed nonprogrammable network devices”, which are also “nonprogrammable communication components” are to be exempt from CIP-007 R1.2. Consider revising the Applicability section of CIP-007, R1.2 (which is not included in the current comment and ballot scope) to state the following: “Nonprogrammable communication components that are entity owned and/or managed and located inside an ESP.” (2) For the VRFs/VSLs for CIP-006-6, R1 and R2 please provide some understanding for removing all but Severe VSL. What would this mean if an entity has a process documented and implemented but fails follow it perfectly? For instance, what if an entity has a process to retaining logs for 90 days but unfortunately actually retain all the logs. Is this not a violation since it does not rise to the level of Severe?
No
(1) The wording for the Applicable Systems and the Requirements in CIP-010-2, R4 should be consistent to avoid potential confusion across the various parts of the requirement. Potential revision is to add “on applicable systems” to R4.1, R4.6, R4.7 and “prior to use on applicable systems” to R4.5 OR remove “on applicable systems” from R4.3. (2) CIP-010-2, R4.3 and R4.6 include the language “prior to use.” This language is problematic due to the ambiguity of “use” and leaves much to interpretation. There is language provided in the Guideline and Technical Basis, but enhanced language within the standard requirements would provide more clarity of the SDT intent to all industry segments. Additionally, it does not address Medium Impact BES Cyber Systems that are not required to be inside an ESP (or even a PSP) because they do not use routable protocols. Such devices are not subject to proposed requirement R4.6 but are subject to proposed requirement R4.3. (3) There appears to be a gap in CIP-010-2, R4.5. If an entity were to have a Transient Cyber Asset connected for 29 days, that Transient Cyber Asset should not necessarily have signature files that are 29 days old. Instead, if a Transient Cyber Asset is connected during a regularly scheduled signature update for non-transient devices, that Transient Cyber Asset should also be updated. The following language is suggested as an addition to the Requirement for R4.5 to remediate this gap: Update signatures or patterns for those methods identified in Parts 4.2 and 4.3 when Transient Cyber Assets remain connected during regularly scheduled updates pursuant to CIP-007-Table R3 Part 3.3. (4) There appears to be a gap in the requirements if a PCA is used in any way other than it use as specified in R4.1.3. Consider the addition of CIP-010-2, R4.8 as follows to close this potential gap in the standards. If language is added, revisions are also needed in VRFs, VSLs and guidelines.

PART 4.8. APPLICABLE SYSTEMS: High Impact BES Cyber Systems and associated PCA, Medium Impact BES Cyber Systems at Control Centers and their associated PCA. REQUIREMENTS: Evaluate Transient Cyber Assets in accordance with 4.6 and 4.7 after any use not included in Part 4.1.3. When the evaluation results indicate the Transient Cyber Asset has been modified, take one of the following actions prior to use: -Remediate by returning the Transient Cyber Asset to the documented state in Part 4.1.4; or -Update the documented state in Part 4.1.4. MEASURES: An example of evidence may include but is not limited to, updated documentation with the date, evaluation results, and status of any remediation activities. (5) Guidelines and Technical Basis, Requirement 4. There is some good information included as a reference to support a clear understanding of the standards and requirements. The examples of transient devices that are provided could be strengthened with further specifying the intended meaning for Hardware/software diagnostic test and Hardware/software packet sniffers to clarify what the devices are used for. Possible revisions or additional language could include: ""Software diagnostic test equipment" is hardware equipment running such diagnostic software" and "Hardware/software packet sniffers" to "Hardware device running software packet sniffers. Which means an asset is categorized by a hardware component and specific associated applications or software they are running." Revisions to these bulleted items will improve the clarity and provide guidance to industry. (6) Guidelines and Technical Basis, Requirement 4, Parts 4.2, 4.3, 4.4 and 4.5. (a) The statement, "Pre-authorized Transient Cyber Assets may have the malicious code prevention maintained on the device and do not require specific actions for each use" is reasonable, but the actual requirements do not make this clear. Revisions are needed to the appropriate requirements statements to clarify the SDT intent. (b) The statement, "For Removable Media and Transient Cyber Assets authorized at the time of connection, the detection of malicious code must be addressed prior to use" has the same problem as Requirement 4.3: What is a "use" as intended for the standard? (c) A later paragraph states, "For Requirement R4, Part 4.4, if malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident." The second sentence seems ambiguous and could lead to different interpretations for entities and other stakeholders. How is an entity supposed to decide whether or not malware that is (1) detected and (2) removed before a transient device is connected qualifies as a Cyber Security Incident? It may or may not be easy to tell. Are entities expected to keep records of such occurrences? We suggest removal of the second sentence above and allow the entity to handle the malicious code detection within existing response requirements and avoid introducing this requirement here. (d) The next paragraph states, "Part 4.5 requires a process to update signatures or patterns, where applicable. This process is to be documented in the overarching program. As with CIP-007-6, Requirement R3, the process is to include testing and installing of updated signatures or patterns." The requirements in CIP-010 R4 do not require testing. This last sentence should be removed or revised to only include "process to document the installation of updated signatures or patterns." (7) Guidelines and Technical Basis, Requirement 4, Parts 4.6 and 4.7. The first paragraph states, "Requirement R4, Part 4.6 requires the entity to evaluate Transient Cyber Assets to ensure that no unauthorized modifications have been made to the operating system, firmware, or software. This is a review of the current state against what is currently documented pursuant to Part 4.1.4. If there are differences, the modified code may be removed or the documentation updated to align to the authorized or current state." The term "prior to use" can be interpreted different ways (e.g. the start of a new workday, start of work within an ESP after leaving another ESP across the hall, start of the work week due to Transient Cyber Asset not being in direct control of the employee over the weekend, etc.) The "prior to use" language needs to be amended to avoid forcing entities to perform R4.6's specified tasks in situations when it is not required or needed.

Venona Greaff
Occidental Chemical Corporation
No
Occidental appreciates the work the SDT has done in response to FERC's directive in Order 791 to "address the lack of objective criteria against which NERC and the Commission can evaluate the sufficiency of an entity's protections for Low Impact assets". However, we do not agree that the SDT developed objective criteria. Instead of establishing reasonable limits on the extent of evidence required to validate that an entity is providing sufficient physical protection, electronic access controls, cyber-incident preparation planning, and awareness training, R2 leaves the discretion up to the CEA. In order to prevent uneven application of the requirement across Regions – or changing over time – Occidental makes the following recommendations: 1) Change the focus of each sub-requirement from "implementing one or more processes" to "develop and maintain one or more processes". The 36 month recurring validation of the incident response plan (R2.5.6) would serve as a proxy for evidence of implementation – perhaps with an additional statement indicating that at least one Cyber System's physical/electrical protections must be evaluated as part of the exercise. Thus, the sample itself is under the entity's control – but the requirement could provide the minimum scope of cyber controls that must be validated. 2) Change the language in the Measures from "Examples of evidence may include, but are not limited to:" to "Each bullet point below provides an example of evidence sufficient to satisfy this requirement". A catchall bullet point would be needed to state that the entity is free to provide other equally effective evidence that satisfies the requirement. Although Occidental respects the good work that NERC has done to move away from zero-tolerance compliance methodologies, non-binding assurances that a reasonable compliance assessment will always be applied are not enough. Subjective interpretations by Regional Entities are still a very real concern. In the fast moving world of cyber security, it is far too easy to apply 20-20 hindsight to determine that an entity "should have been better prepared" for a new cyber-attack vector that did not exist when the protective strategies were developed.
Abstain
Abstain
Yes
No
In Order 791, FERC articulated that they understood the intent of the IAC language, but did not agree with the strategy taken to implement it. The Commission shared the concern that the rapid evolution of cyber-attack methods required flexibility in the protective strategies Responsible Entities deployed to address them. Forcing the industry to take mitigating steps to address future cyber-security incidents based upon the cyber environment in 2014 could be problematic. The SDT's approach in removing the IAC language and providing assurances that CEAs will apply appropriate consideration (via RAI process) for unknowable changes in the cyber-environment is somewhat concerning. Although OCCIDENTAL is a proponent of RAI and agrees that the regulatory community has taken positive steps in the direction of risk-based compliance, we have concerns that reason may not prevail in the aftermath of a destructive cyber incident. As mentioned in our comments to Question 1, subjective interpretations by Regional Entities are still a very real concern. Question 4 in the Identify, Assess, and Correct and Reliability Assurance Initiative FAQ document and its response reinforces our concern. How has the SDT chosen to address the concerns of IAC? The SDT discussed the concerns and options within FERC Order 791 and revised the 17 requirements containing IAC by removing the language. The approach fulfils the Order 791 directive regarding the IAC language and leaves resolution of "zero defect" or "zero tolerance" to the RAI 'discretionary path to enforcement' implementation. We appreciate the difficult task the SDT faced in addressing this issue because we too are hard pressed to come up with an equally effective method of addressing FERC's directive. We also recognize that delaying addressing FERC's directives with regard to IAC until RAI is officially rolled-out is problematic. But, until industry as a whole understands, and experiences first hand, a successful RAI approach, the requirements leave too much open to regulatory interpretation. The ancillary documents provide some guidance but in the end only the requirements within the Standards are subject to compliance and are enforceable. Our proposed alternative would be to encode the IAC concept into separate sub-requirements under each of the 17 affected requirements.

An example binding method might take the following form: Requirement Header: Each Responsible Entity shall implement a <program, procedure, policy> in a manner that is consistent with its best understanding of the cyber threat and protective strategies available at that time. A list must be included in the <program, procedure, policy> that captures the Responsible Entity's assumptions. Sub-Requirement A: At least once every 3 years, or after experiencing a Reportable Cyber Incident, or upon receipt of a NERC Alert related to this requirement, the Responsible Entity will perform and document an assessment of the adequacy of their <program, procedure, policy> and the assumptions. Sub-Requirement B: The Responsible Entity will develop and execute a Corrective Action Plan within 30 days of an adequacy assessment performed in accordance with Sub-Requirement A which indicates a reliability gap has been detected.

Dominion
Connie Lowe
No
Dominion suggests the SDT revise the wording of Part 2.1 to indicate "Review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the applicable topics in CIP-003-6, Requirement R2, Parts 2.2 – 2.6.". Without the word "applicable", a registered entity would have to have a policy associated with "Low Impact BES Cyber Systems at Control Centers" even if the entity doesn't have any "Low Impact BES Cyber Systems at Control Centers". Part 2.4.1 uses the term "external routable protocol paths". Clarity is needed to understand what "external" is in reference to. Provided there are no defined ESPs associated with Low Impact BES Cyber Systems, there are no defined external routable paths. Additionally, private network connections can exist between relays at different "impact rated" substations and restrictions should not exclude or preclude vendors from improving communications between relays by converting from a teltone connection to a digital connection. The requirement of defined access points and access permissions could interfere with such progress. Dominion believes that this requirement should be clarified to apply solely to external interactive access. Dominion suggests Part 2.6 should be revised to state: "Implement a security awareness program that reinforces cyber security practices at least once every 15 calendar months." As written, the requirement is more prescriptive than requirements for medium and high impact BES Cyber Systems. The language of the requirement should reflect the low impact rating of the asset class. Dominion notes that certain requirements, such as 2.3, may not apply to an entity, therefore, the language of the Part should not be overly prescriptive such that the concept of 'applicability' is excluded.
No
In general, Dominion agrees with the approach, but has concerns regarding how the last bullet in CIP-006-6, Requirement 1, Part 1.10 will be measured. The language of the last bullet states "• an equally effective logical protection". In order for this language to be auditable, a determination would have to be made on the effectiveness of the logical protection when compared to the first two bullets which state "• encryption of data that transits such cabling and components; or • monitoring the status of the communication link composed of such cabling and components and issuing an alarm or alert in response to detected communication failures to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of detection; or" If an equally effective logical protection is required to be documented, Dominion believes clarification is needed regarding 1) how the protection would be measured and 2) who would be responsible for making the determination of the effectiveness of the control.
No
Dominion suggests adding a sub-part under CIP-010-5 Part 4.1 that allows entities to authorize classes or groups of Transient Cyber Assets. The suggested language is "4.1.x. Transient Cyber Assets, individually or by class or group of like assets;" Change CIP-010-2 Part 4.1.4 to be

consistent with CIP-010-2 Part 1.1.1. Part 1.1.1 states “Operating system(s) (including version) or firmware where no independent operating system exists”. Part 4.1.4 states “Operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability).” Recommended language for CIP-010-2 Part 4.1.4 is as follows: Operating system(s) or firmware where no independent operating system exists, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability). Dominion also suggests that additional language be added to the Guidance and Technical Basis section of this Standard to clarify what “per Cyber Asset capability” means. For example, Dominion needs clarity in understanding the extent to which an entity should go to determine the Cyber Asset capability; if the device doesn’t have a direct method of providing internal diagnostic and baseline information about the device itself, does this qualify the Transient Cyber Asset as not having “the Cyber Asset capability” to provide this information? Part 4.1: CHANGE: Authorize the usage of Transient Cyber Assets prior to initial use, except for CIP Exceptional Circumstances TO: Authorize the usage of Transient Cyber Assets individually or by group prior to initial use, except for CIP Exceptional Circumstances Part 4.2 -- Clarity is needed regarding the “(per Cyber Asset Capability)” clause. Additional language should be added to the Guidelines and Technical Basis to describe the purpose of this clause. In practice, Dominion believes the clause means that when method(s) to deter, detect, or prevent malicious code can’t be technically implemented on a Transient Cyber Asset, procedural and policy controls are adequate. Additionally, where technical controls could theoretically be applied to deter, detect, or prevent malicious code on the Transient Cyber Asset, but the technical controls aren’t a recommended or approved configuration from the manufacturer of the Transient Cyber Asset, procedural and policy controls are adequate to meet this Part. Dominion is concerned that the “theoretical ability to implement a technical control per Cyber Asset capability” will be misinterpreted as requiring entities to adopt any and all technical controls per Cyber Asset capability regardless of operational feasibility. Part 4.6 -- Clarity is needed regarding the linkage of this Part to Part 4.1.4. Is an entity expected to reauthorize the baseline list of “Operating system(s) or firmware where no independent operating system exists, and intentionally installed software” for a Transient Cyber Asset when it’s changed as a result of executing Part 4.6. Dominion suggests no re-authorization is required since Part 4.1 states the authorization is required prior to initial use.
No
Dominion suggests combining the last sentence from BCA and PCA definitions and add it to the end of the proposed definition for Transient Cyber Asset to read as; A Cyber Asset directly connected for 30 consecutive calendar days or less, to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes. A Transient Cyber Asset is not a BES Cyber Asset or a Protected Cyber Asset. Dominion can’t comment further until clarity is provided on the phrase “programmable electronic device” and it’s applicability to the Bulk Electric System. Dominion believes this phrase unintentionally includes assets that would divert focus from the true intention of the standards.
No
Dominion is in support of the removal of the language as long as the removal is in conjunction with the adoption of an industry-approved RAI approach to ensure there’s relief from the administrative burden imposed by zero-tolerance. An alternative approach to RAI would be to address FERC’s concerns by modifying the individual Parts of each of the CIP Requirements.

Southwest Power Pool Regional Entity
Bob Reynolds
Yes

While the SPP RE agrees that the explicit directives in FERC Order No. 791 have been met, the SPP RE has two concerns. First, the SPP RE disagrees with the premise in the Guidelines and Technical Basis section of the Standard that compliance can be demonstrated purely through presentation of the documented processes at audit. There is an expectation that the documented processes will be implemented by the Responsible Entity. In fact, the VSLs for R2 specifically refer to implementation (or failure thereof) of the documented processes. The compliance auditor is expected to evaluate whether or not the documented processes have been implemented and it is best left to auditor discretion how to accomplish that review. Rather than asserting that there should not be an expectation of verifying process implementation, as can be inferred by the paragraph in question, the guidelines would better serve the Responsible Entity by advising them to consider how they would demonstrate implementation and compliance with their documented processes. The guidelines should inform the Responsible Entity and the auditor what is expected to comply with the requirements and not how the requirements should be audited. The comment that the SDT strongly believes sampling is not necessary is inappropriate and should be removed. Second, the protection expectation for Low impact BES Cyber System is a weak, periphery control at best. Two critical protective controls are missing, especially with respect to a control center environment, and those are security patching and anti-malware protections. The entity does not necessarily have to perform the extensive testing expected of higher impacting BES Cyber Systems, but it is well known that somewhere around 90 percent of all successful cyber compromises could have been prevented with up-to-date patches and up-to-date, active anti-virus solutions. Given the likelihood of trusted network interconnectivity between control centers with Low impact BES Cyber Systems and control centers with higher impacting BES Cyber Systems, this critical shortcoming could be the key to a successful, widespread cyber attack.

Yes

The SPP RE agrees with the approach in general, however the SPP RE believes that in the instance where monitoring is the alternative process implemented in lieu of physical access protections, the alert needs to include a follow-up response that investigates the cause of the alert, regardless of the duration of the outage or communication interruption. Ignoring a momentary interruption could result in not detecting a splice, tap, or in-line compromise (similar to a key logger placed between the keyboard and the PC). Obviously, long-haul circuit protection, especially when the communication path includes commercial carriers (such as AT&T) or third-party providers, is best provided through the use of encryption. Within a building or for short runs between PSPs as might be found at a generating plant, an investigation response is quite feasible.

No

CIP-010-2, Part 4.2 could be construed as mandating anti-malware on a transient device. If read in this manner, it would preclude the use of a hardened laptop where the laptop is booted from a read-only CD and the hard drive-based operating system has been removed. Installing and maintaining anti-malware in this instance would be an unnecessary burden. The SPP RE recommends including a discussion of alternatives to the use of anti-malware in the Guidelines and Technical Basis section at a minimum. CIP-010-2, Part 4.5 needs to be strengthened by requiring the signature files to be updated and current prior to each use of the transient device, where anti-malware solutions are used. As written, a process that calls for an annual update of the signature files, while unreasonable, would satisfy the strict language of the requirement. CIP-010-2, Part 4.7 should require the transient system to be fully patched and not permit an alternative mitigation plan. Transient devices are not operationally critical and thus there is no risk-based reason they cannot be regularly patched. As the transient device does not continuously reside within an ESP, it cannot be guaranteed of being afforded the risk-mitigating protections enabled by the ESP requirements. Introducing a transient device into an ESP effectively bypasses most, if not all, periphery (ESP) protections. That can only be mitigated by eliminating risk on the transient device itself to the maximum extent possible. The SPP RE strongly recommends that the discussion of Transient Cyber Assets in the Guidelines and Technical Basis for CIP-010-2 be updated to more clearly state the expectation with respect to “prior to use.” As written, the guidelines suggest the Transient Cyber Asset does not have to be evaluated or otherwise prepared "prior to use" as long as it does not change ESPs or PSPs. That could be construed to allow the Transient Cyber Asset to be used outside of the PSP/ESP and not have to be re-evaluated as long as it was connected back into the same PSP/ESP it was last used in. The SPP RE believes the intent, while not clearly stated, is for the Transient Cyber Asset to be evaluated or otherwise prepared for use within a defined ESP prior to use in the ESP after being used

elsewhere. The SPP RE also suggests that a Transient Cyber Asset could be used consecutively in multiple PSPs/ESPs as long as the Transient Cyber Asset is not used outside of a PSP/ESP in the interim. For example, consider the laptop used to perform maintenance on substation relays. As long as the laptop is connected only to substation relays within PSPs/ESPs, and never to anything else in the interim, the laptop could be moved and used in multiple substations without having to prepare it for first use for each substation being visited. Similarly, a laptop used for maintenance or vulnerability assessments could move between the primary and backup control centers as long as it was never connected to a non-ESP network in the interim. Once the Transient Cyber Asset has been connected to a Cyber Asset or network outside of a CIP ESP, the Transient Cyber Asset must be reevaluated and prepared for "first use" before using it again within an ESP. This provision, as suggested by the SPP RE, should be tempered by the concept found in the Guidelines of having a separate Transient Cyber Asset for each BES Cyber System impact level due to the differing degrees of protection afforded to BES Cyber Systems and Protected Cyber Assets of different impact levels. The discussion of Part 4.5 in the Guidelines and Technical Basis section of CIP-010-2 states that process to update the signature or pattern includes testing the signatures or patterns in the same manner as CIP-007-7, requirement R3. The requirement to test is not included in Part 4.5.

No

The definitions of BES Cyber Asset and Protected Cyber Assets explicitly exclude a Transient Cyber Assets, which is problematic if the definition of Transient Cyber Asset is too permissive. The definition of Transient Cyber Asset is broad enough that a Responsible Entity could, theoretically, treat BES Cyber Assets or Protected Cyber Assets as transient devices by temporarily disconnecting them from the network every 30 days. The definition should be revised to state "A Cyber Asset directly connected to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset, expressly for a pre-approved, temporary purpose and disconnected immediately upon conclusion of the temporary need. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes." Similar treatment should be given to Removable Media. In this instance, the expectation should be applied to removable media used for a temporary purpose, such as data transfer, and immediately removed upon completion of the temporary need. Portable media, such as an external hard drive, "permanently" connected to a Cyber Asset should not be considered Removable Media. To complete the distinction, the SPP RE suggests clarifying the term by referring throughout the definitions and standards to "Transient Removable Media."

No

The goal of the IAC language was to remove the expectation of 100% compliance within the standards. While the RAI program can address the handling of an issue of non-compliance through a number of enforcement options, the RAI program does not eliminate the now-restored 100% compliance expectation of the standard itself. There are a number of requirements where a less-than-100% performance expectation can be explicitly defined. For example, the change control and configuration management program is intended to prevent unauthorized changes from being implemented. A performance metric could be developed that allowed for an infrequent (frequency to be defined) occurrence as long as the entity's detective controls detected the unauthorized implementation activity within a to-be defined detection period (perhaps 24 hours) and the unauthorized change was promptly investigated. Other requirements, such as CIP-007-6, Requirement R4 (Security Event Monitoring that includes a logging component), could include a performance expectation stated in terms of percent availability over a defined period (e.g., 99.99% over a rolling 12-month period, which equates to a maximum allowable outage of approximately 53 minutes over the 12-month period). Adding performance metrics to the requirements themselves provides defined, measurable, and achievable goals and expectations and would eliminate, in many cases, the need to even refer the issue to enforcement for handling. RAI could continue to address the enforcement handling of any issues exceeding the allowable performance expectations.

No

The compliance date for CIP-006-6, Requirement R1, Part 1.10 refers exclusively to BES Cyber Systems. Under CIP Version 3, all Cyber Assets within an Electronic Security Perimeter had to reside within the PSP and were subject to the provisions now found in Part 1.10. The implementation plan for Part 1.10 should be consistent with the actual Version 3 expectation. In other words, the extended compliance period should only apply to new high or medium impact BES Cyber Systems at Control Centers identified by CIP-002-5.1 which were not previously subject to CIP-006-3,

requirement R1.1 by virtue of being contained within a CIP Version 3 Electronic Security Perimeter. The incremental changes introduced in CIP-007-6, Requirement R1, Part 1.2 are sufficiently straightforward that an additional six months to comply is not warranted. The requirement only applies to controls centers, which greatly limits the scope and potential impact of the change. With the exception of perhaps CIP-010-2, Requirement R4, Parts 4.1 and 4.6 that require an inventory of operating systems, firmware, and intentionally installed software, there is no reason the provisions of CIP-010-2, Requirement R4 cannot be in place upon the overall effective date of CIP-010-2. The expectations of Parts 4.2, 4.3, 4.4, 4.5, and 4.7 are basic security practices that are good utility practices that should already be performed. This risk of introducing malware into the Electronic Security Perimeter is too high to grant nine additional months to comply with these basis security controls.
Yes
The implementation plan for CIP-004-6 allows for the later of April 1, 2016 or first day of the first calendar quarter that is six calendar months after the date that the standard is approved by an applicable governmental authority. However, only three months is allowed if approval by a governmental authority is not required. This appears to be an inadvertent inconsistency in the implementation plan. Additionally, there have been a couple of errata changes to the Guidelines and Technical Basis section of CIP-002-5.1 that have been submitted to NERC by the SPP RE. Specifically; (1) the guidance for Criterion 2.13 should have stated: "Criterion 2.13 categorizes as medium impact *those BES Cyber Systems used by and at* BA Control Centers that "control" 1500 MW of generation or more in a single interconnection and that have not already been included in Part 1. The 1500 MW threshold is consistent with the impact level and rationale specified for Criterion 2.1." and (2) the discussion of Criterion 2.8 should state "Criterion 2.8 designates as medium impact those BES Cyber Systems that impact Transmission Facilities necessary to directly support generation that meet the criteria in Criteria 2.1 (generation Facilities with output greater than 1500 MW) *or* 2.3 (generation Facilities generally designated as "must run" for wide area reliability in the planning horizon)." These changes should be incorporated into CIP-002-5.1.

Yes
There is a concern about the last bullet in CIP-006-6 R1.10. We do appreciate the flexibility the last bullet provides and how it allows for technological solutions which may not exist today. A Responsible Entity may believe that they have implemented an “equally effective” control, but if the Compliance Enforcement Authority disagrees, then that leads to a contentious audit and possible violations and fines for the Responsible Entity. Additional examples may help to guide the Compliance Enforcement Authority and help them seek reasonable solutions when auditing.
Yes
The section of CIP-004 which was amended was Requirement R2, not R1. An additional comment would be to remove the word “with” in the addition in Part 2.1.9.
Yes
We do appreciate the clarity that removing the IAC language will provide. There is a concern that we are being asked to approve standards based on a program that is currently under development. By the time that a Responsible Entity will see how RAI is applied in audit situations, these standards, with the IAC language removed, will long have been voted upon.
Yes

Consistency of effective dates is very important in a compliance situation. Although the extra time for these standards is appreciated, having 4 dates to manage (April 1, 2016; October 1 2016 for CIP-007-6 R1 Part 1.2; January 1, 2017 for CIP-006-6 R1 Part 1.10, CIP-010-2 R4, and April 1, 2017 for CIP-003-6 R2) is a concern. We would recommend that the six month window for CIP-007-6 R1 Part 1.2 be extended to a nine month window, reducing the number of dates and outlying requirements.
N/A
Yes
We would appreciate clarification on CIP-003-6 R2 Part 2.6. That requirement could be read to mandate two training sessions: a quarterly security awareness program and an additional training once every 15 calendar months to reinforce Parts 2.2, 2.3, 2.4, and 2.5 of CIP-003-6 Requirement 2.

2.4.2, as written, would require the reason for granting access be part of the electronic access process. Suggest elilinating the phrase "including the reason for granting access", and adding 2.4.4 "maintain a record of the reason for granting access".
Yes
No
As writtine 010 R4 assumes the registered entity owns and operates the transient devices and removable media. In many cases contractors do so. The requirement should not force RE's to maintain contractor devices by patching them, nor should it force RE's to keep logs of contractor equipment. The requirement should only focus on scanning such devices prior to use.
Yes
No
The IAC language was needed to gain consensus on the V5 standards. The SDT approach was to simply remove this language without creating an alternitive to a zero tolerance standard. At a minimum, the VSLs and measures should be rewritten to allow for minor instances of errors. For example, instead of a single instance of failing to revoke access for a transfer, rewrite the requirement to requre a process that assures the access is revoked, with a low violation if the process fails to keep instances under 5% annually, or less than 2 in cases where there are small numbers of transfers each year.
Yes
Individual
Amy Casuscelli
Xcel Energy
No
Xcel Energy has several concerns as detailed below. The FERC directive requested objective criteria to be able to evaluate the efficiency of the protections of Low Impact facilities while the rationale and the inventory statements of the proposed Standard state “An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required.” The breakout of Control Centers in R2.3 seems contradictory to both the direction of FERC and the language in the proposed Standard. FERC directed objective criteria, not the identification of specific Low Impact BES Cyber Systems or a tiered level of approach of differing Low Impact BES Cyber Systems. It is recommended that R2.3 be removed entirely or combine R2.3.1 and R2.3.2 under R2.2. We would like to see additional clarity that requirements related to Low Impact systems can

be satisfied at the same time as those for Medium/High. For example, the organization can have a single incident response plan, which does not need to be tested separately for a Low system if a test covered a Medium/High as per CIP-008. These compliance requirements better align with the subject matter of their Medium/High counterparts (CIP-004, -005, -006, -008) and should be moved there, rather than stay in a CIP program governance Standard where they may be overlooked. R2.4.1 and R2.4.2 state that “all external routable protocol paths, if any, must be through one or more identified access point(s)” and “For each identified access point, if any, require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default.” Xcel Energy feels that by stating that an access point is required for network connected low impact assets, the actual scope of CIP controls significantly increases for these sites. A utility cannot arbitrarily install an access point without performing additional CIP program controls that typically support an effective access point. This would include performing a complete inventory of all assets and their connectivity, developing and establishing ESP diagrams, and performing a vulnerability assessment to verify any potential needs for additional access points. Additionally, it would require periodic controls to validate the access point including equipment inventory, configuration and ESP verifications, as well as the performance of periodic vulnerability assessments to ensure the access point is effective. By stating that an access point is required, this in effect forces entities to implement the full program of CIP controls at assets identified as having a zero to minimal impact to the BES. As worded, the scope of this requirement would be an additional 150 substations for Xcel Energy, dispersed across multiple states. In order to meet the access point requirement, full CIP controls would need to be implemented with no additional protection to the BES. This would result in a 245% increase to the number of substations where controls would need to be implemented; the cost and time of implementation does not seem commensurate with the protection added. R2.4.3 requires “Authentication when establishing Dial-up Connectivity, per Cyber Asset capability.” Xcel Energy is concerned with the scope expansion resulting from this requirement, specifically for assets that have little to no impact to the BES (Low Impact). Xcel Energy anticipates approximately 60 to 70 substations to be classified as medium impact substations under current CIP version 5 requirements. The proposed authentication requirement for dial-up connected low-impact assets would bring approximately 400 additional substations into scope. Identifying, implementing and maintaining configuration management and capabilities to ensure authentication functionality is maintained at an additional 400 substations across multiple states would be an immense effort that would have adverse impacts to utilities such as Xcel Energy. It may also deter operational capabilities as an entity could decide disconnecting dial-up communication would be a better business decision when compared to the expense and level of effort necessary to meet this requirement for low impact assets. R2.6 is much more prescriptive regarding content for the awareness program than CIP-004 R1.1 requirements for Med/High. It should be written more generally to not require specific topics. Additionally, the training and awareness frequency requirements for Low Control level assets are excessive. For example, the quarterly awareness training interval is the same as that required for Medium/High assets. This undermines the meaning of risk level and only serves to promote complacency or a tendency to ignore quarterly missives, rather than promote awareness appropriate to risk level. Because low category assets indeed have a low risk of grid disruption if compromised or lost, the training interval should be less than that of Medium or High Control level assets, to be commensurate with that risk. Xcel Energy fully appreciates that cyber threats are continuously evolving. However, we have incident alert and event management systems to provide notice and awareness of evolving threats to low level asset holders. The incident management process serves to provide awareness of emerging threats, if needed. This quarterly training interval exceeds that of many other very important grid management activities, such as node balancing, Emergency Operations Management, non CIP control center operations, etc. If these very important grid reliability activities do not require quarterly awareness reinforcement, yet have shown through operational history to operate reliably, why should CIP training be more frequent? R2.6 should be revised as follows: “Implement a security awareness program that reinforces cyber security practices at least annually. Once every 15 calendar months, the program shall reinforce Parts 2.2, 2.3, 2.4 and 2.5 above.”

No

Both the Standard and the RSAW use the wording “or an equally effective logical protection: but do not offer criteria on who or what would determine what constitutes “effective.” While we appreciate the attempt for flexibility, part of the FERC directive was to reduce ambiguity and provide concise direction for both the Registered Entity and the CEA; this vague definition does not seem to afford

that direction. We recommend either clarifying the words “logical protection” by replacing them with a level of encryption, use or armored wire, or by removing the third bullet entirely.
Yes
There is a huge dependency on RAI accomplishing the intent to remove “zero tolerance” elements of the standards.
Yes
No

No
Although we agree with the overall approach the Standards Drafting Team has taken, we answered no to this question due to specific concerns described below. ***4. Applicability*** The scope of dispersed generation in the CIP-003-6 Applicability section should be limited and similar to PRC-005. {Suggested Revision} Under the Introduction section, 4 Applicability, 4.2 Facilities, add the following statement after 4.2.2 All BES Facilities: “For dispersed power producing resources identified through Inclusion I4 of the BES definition, the only BES Cyber Systems that meet the low impact rating criterion 3.3 in Attachment 1 of CIP-002-5.1 are any shared BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of dispersed generation units from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or above and not at an individual turbine, inverter or unit level.” This change should be made in conjunction with adding back the reference to CIP-002-5 Requirement R1.3 in CIP-003-6 R2. ***6. Background*** With the addition of the table to Requirement R2, the Background Section should include a paragraph referencing the tables and the “Applicable Systems” Column to be consistent with the Background section of the other CIP standards with similar tables. {Suggested Revision} Add the following paragraph after the first sentence of the CIP-003-6 Background Section 6: “Requirement R2 opens with, ‘Each Responsible Entity for its assets identified in CIP-002-5.1 Requirement R1.3 containing low impact BES Cyber Systems shall perform each of the applicable requirement parts in CIP-003-6 Table R2 – Low Impact Assets.’ The referenced table requires the applicable items in the procedures for the requirement’s common subject matter.” Also, add a paragraph similar to the “‘Applicable Systems’ Columns in Tables:” from other CIP standards into the Background Section 6 for CIP-003-6 for Requirement R2. ***Requirement R2*** Add back the reference to “for its assets identified in CIP-002-5.1 Requirement R1, Part 1.3” to properly set the scope. Also, change the table reference to “CIP-003-6 Policies, Processes, Plans and Programs.” to match the proposed revision to the table title. {Suggested Revision} Change R2 to: “Each Responsible Entity for its assets identified in CIP-002-5.1 Requirement R1, Part 1.3 containing low impact BES Cyber Systems shall perform each of the applicable requirement parts in CIP-003-6 Table R2 – Low Impact Assets. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] Note: An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required. Lists of authorized users are not required.” ***Table Title for Requirement R2*** The Table title for Requirement R2 “CIP-003-6 Table R2 – Low Impact Assets” does not match the format of the tables used in the other CIP standards, which focus on the requirements not the applicable systems. {Suggested Revision} Change the R2 table title to: “CIP-003-6 Table R2 – Low Impact Asset Policies, Processes, Plans, and Programs” ***Requirement R2, Part 2.1*** An entity may not have a low impact BES Cyber System at a Control Center (R2.3) and therefore R2, Part 2.3 is not applicable. {Suggested Revision} Edit text to read “that collectively address the applicable topics in CIP-003-6, Requirement R2, Parts 2.2 -2.6.” ***Requirement R2, Subpart 2.4.1*** Clarify that an external routable protocol path is “external” to the asset identified in CIP-002-5.1 R Requirement R1, Part 1.3 containing low impact BES Cyber Systems. {Suggested

Revision} Insert " bi-directional" prior to " external " and insert "to and from the asset identified in CIP-002-5.1 Requirement R1, Part 1.3 containing low impact BES Cyber Systems" such that 2.4.1 becomes: "All bi-directional external routable protocol paths to and from the asset identified in CIP-002-5.1 Requirement R1, Part 1.3 containing low impact BES Cyber Systems, if any, must be through one or more identified access point(s)." ***Requirement R2, Subpart 2.4.2*** Remove "by default" as it implies the use of a firewall, which limits access control options. For example, an entity could use access control lists on a router or switch to provide security for traffic control. However, routers and switches do not do this by default. This will allow entities more options on how to accomplish traffic control. Also, include a statement to allow documentation of access permissions individually or by group to provide more contrast to CIP-005-5 Requirement R1, Part 1.3 for high and medium impact BES Cyber Systems. Documentation for low impact assets individually or by group is consistent with the measure, but should be added to the requirement. {Suggested Revision} Remove "by default" and add "and document access permission reasons individually or by group" such that 2.4.2 becomes: "For each identified access point, if any, require inbound and outbound access permissions, deny all other access, and document access permission reasons individually or by group." ***Requirement R2, Part 2.6*** The specificity of what must be covered and having to track two time periods is more prescriptive than the requirements for medium and high impact BES Cyber Systems. The proposed revision uses language from the medium/high impact requirement (CIP-004-R1.1) with the time period adjusted to once every 15 calendar months to differentiate for the lower risk. Cyber security awareness can be addressed during annual training for employees and contractors in addition to other ongoing cyber security awareness communications. {Suggested Revision} Remove the references to the subpart requirements as they may not apply to all entities and remove the quarterly requirement such that Part 2.6 becomes: "Implement a security awareness program that reinforces cyber security practices at least once every 15 calendar months." ***Guidelines and Technical Basis*** Align the drawings and wording in the guidelines and technical basis with the requirement language.

Yes

Guidelines and Technical Basis Add a clarification that entities are not expected to enforce CIP 006 on third party nonprogrammable components that are out of the entity's control.

No

Although we agree with the overall approach the Standards Drafting Team has taken, we answered no to this question due to specific concerns described below. ***Requirement R4, Part 4.1*** EEI members are concerned with unnecessary administrative burdens created by Part 4.1. For example, Authorization generally applies to users. A user of a Transient Cyber Asset should be authorized to use the particular asset with certain software installed, for a particular purpose at a particular location(s). The way Part 4.1 is written suggests that four different authorization processes are needed: one for users, one for locations, one for acceptable use, and one for software/firmware. A requirement for four different processes for user authorization adds additional, unnecessary administrative record-keeping. This language should be edited to make it clear that only one user authorization process is required. Part 4.1 also does not consider that CIP-004-6 Requirement R4, Part 4.1 also addresses authorization, which overlaps with the CIP-010-2, Requirement R4, Part 4.1. The Transient Cyber Asset requirement (Part 4.1) should not require users to be authorized twice, once under CIP-004 and again under CIP-010. {Suggested Revision} EEI does not have a specific revision to suggest to address these concerns; however, we recommend a careful review of the specific concerns and suggestions raised by Registered Entities to help reduce the administrative burden of this part. ***Requirement R4, Part 4.7*** The requirement should be tied together better such that it clearly allows mitigation instead of patching, when justified. {Suggested Revision} Condense the language into one sentence to help clarify the requirement. For example: "Evaluate Transient Cyber Assets, within 35 calendar days prior to use, for applicable security patches and take one of the following actions: (1) apply the applicable patches, or (2)create a dated mitigation plan, or (3) Revise an existing mitigation plan." ***Guidelines and Technical Basis *** The Part 4.1 guidance conflicts with the "Applicable Systems". The guidance says the requirement (R4) "applies to any transient devices", yet the "applicable systems" in the requirements tables are not the transient devices. {Suggested Revision} Edit the language under Requirement R4 to: "This Requirement applies to Transient Cyber Assets and Removable Media that will be connected temporarily to an applicable system. Examples of these hardware/software devices include, but are not limited to: - Diagnostic test equipment - Packet sniffers - Devices used for BES Cyber System

maintenance - Devices uses for BES Cyber System configuration - Devices used to perform vulnerability assessments" The guidance for Requirement Part 4.1, says "Requirement Part 4.1 requires the entity to document and implement its process to authorize the use of Transient Cyber Assets." Requirement R4, Part 4.1 says "Authorize the usage of Transient Cyber Assets ***prior to initial use***, except for CIP Exceptional Circumstances." (emphasis added) The guidance language should be edited to be consistent with the standard's requirement. Bullet 2, under Requirement Part 4.1, says "It may be reasonable to have separate Transient Cyber Assets for each impact level." Requirement R4, Part 4.1 is focused on High and Medium Impact BES Cyber Systems, not all BES Cyber Systems. The language in bullet 2 includes "low impact," which is not an applicable system for this requirement. Therefore the guidance goes beyond the scope of the standard. This guidance should also be edited to be consistent with the language of the standard's requirement.

No

Although we agree with the overall approach the Standards Drafting Team has taken, we answered no to this question due to specific concerns described below. ***BES Cyber Asset – CIP-002.5.1 Guidelines and Technical Basis*** The definition of BES Cyber Asset is inaccurately quoted on p.17 of the Guidelines and Technical Basis section of CIP-002-5.1 (guidance), which creates opportunities for confusion and misinterpretation. A BES Cyber Asset is a "Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which , if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System." By contrast, p.17 of the guidance inaccurately quotes the final phrase of the BES Cyber Asset definition as follows: "…that if rendered unavailable, degraded, or misused would, within 15 minutes adversely impact [sic] the reliable operation of the BES." This mistake in the guidance introduces an unfortunate source of potential confusion about this important definition. This error should be corrected. {Suggested Revision} In guidelines, p.17, under heading "CIP-002-5.1," replace second sentence with the following: "The Glossary defines a BES Cyber System as '[o]ne or more BES Cyber Assets logically grouped by a responsible entity to perform one or more reliability tasks for a functional entity.' The term BES Cyber Asset is defined as follows: "A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems." Generally speaking, the definition of BES Cyber Asset encompasses those programmable electronic devices that could relatively quickly (within 15 minutes) have an adverse impact on BES Facilities, systems, or equipment (without regard for redundancy) which would, in turn, affect the reliable operation of the BES." ***Removable Media*** There is a consistency issue. The definition for Transient Cyber Assets is very specific about what Transient Cyber Assets are directly connected to; however, the definition for Removable Media is not. It can be implied that the definition refers to connection to applicable systems, but it is not clear. It would also be clearer to switch the order of the Removable Media and Cyber Assets in the last sentence. {Suggested Revision} Change the definition of Removable Media to: "Portable media, connected for 30 consecutive calendar days or less, to applicable systems. Examples of portable media that can be used to copy, move and/or access data include, include but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory. Removable Media are not Cyber Assets."

Yes

EEI supports the removal of the identify, asses, and correct language due to the expectation that NERC will refine its compliance and enforcement process under the Reliability Assurance Initiative (RAI) to move away from a zero tolerance approach to compliance. We expect the new RAI to be finalized prior to final ballot to address the zero tolerance concerns that the identify, assess, and correct language intended to address.

No

Whether the timeframes in the implementation plan are reasonable and appropriate depends upon how and when the other concerns in these comments are addressed. EEI answered no to this question due to the specific concerns described in these comments.

Yes
EEI greatly appreciates the work of the Standards Drafting Team and the NERC staff. We support the efforts to have a consolidated revision to cover both the date sensitive and other FERC directives in a single filing. CIP-002-5.1, CIP-005-5 and CIP-008-5 were not opened for revisions, comments or ballot. These standards contain one or more items that need to be updated to maintain consistency with the CIP standards which were opened. There are also items which need to be addressed to provide clarity for implementation and auditability. We respectfully request that the Revisions Standard Drafting Team make these “conforming changes” and other changes to the three standards regardless of whether they are opened for any other revisions. Examples include: (1) CIP-002-5.1, CIP-005-5 and CIP-008-5 all, in section 5, reference effective dates. These all need to be updated to be consistent with the effective date of the standards which were opened for revision. (2) CIP-005-5 and CIP-008-5, in section 6, reference CIP-003-5, CIP-004-5, CIP-006-5, CIP-007-5, CIP-009-5 and CIP-010-1 and CIP-011-1. These references need to be updated to reflect -6 and -2 as appropriate. Although the RSAWs are not included in the Standards Development ballot and comment process, they are an essential aspect of Compliance Monitoring functions related to the NERC Reliability Standards. When reviewing Reliability Standards, RSAWs are reviewed as a fundamental component of the end to end review process much like definitions. As a result, EEI members ask NERC and the Standards Drafting Team to collaborate on the RSAWs to identify how comments filed separately (i.e., the standards comments and RSAW comments) will be addressed to ensure the integrity of the CIP V5, V6 Standards. Specifically, the proposed RSAWs materially change the scope and intent of the standards because they (1) impose new obligations that exceed the requirements of the standards, (2) add unnecessary administrative burdens, and (3) are inconsistent. Please see EEI’s RSAW comments filed separately for additional detailed comments.

No
The term "portable" in "removable media" may add confusion. Suggest striking "portable" and replacing with "removable without powering down cyber system."
Yes
SCL supports the approach to use RAI concepts to take the place of IAC language.
Yes
For consistency across Standards, Seattle supports a change in presentation of controls for LOW-ranked facilities and systems. LPPC and Seattle prefer that the controls for Lows be removed from CIP-003 and moved to the appropriate Part of each applicable Standard (i.e., Awareness activities for LOWs should be found with other Awareness activities in CIP-004-6, Incident Plan controls for LOWs should be found with other Incident Plan controls in CIP-008-6, and so forth). However, Seattle is aware of the substantive additional tracking burden this approach will place on small entities having only LOW-ranked facilities and system, and suggests the following alternative: 1) revised Standards as above, to include all activities for LOW-ranked facilities and system in their appropriate parent Standard. 2) Change the applicability section of these Standards (CIP-003 to CIP-011) to be applicable ONLY to registered entities with ONE or MORE facilities/systems ranked HIGH or MEDIUM through application of CIP-002-5. 3) add a new Standard CIP-012-1 that is applicable ONLY to entities with NO HIGH OR MEDIUM facilities/systems identified through application of CIP-002-5. This Standard simply collects all requirements/controls for LOWs in one place. In no case will requirements/controls for LOWs identified in new CIP-012-1 differ from those in CIP-003 to CIP-011; CIP-012 is intended as a solution that makes clear the obligations for LOW-only entities. Finally, if a new CIP-012-1 Standard is deemed impractical, Seattle strongly recommends that NERC develop an administrative solution that will very clearly identify the

obligations for LOW-only entities, perhaps by maintaining a list or spreadsheet that is kept with the CIP Standards.

CIP-003 R2.1 to R2.6: The applicability section of all these requirement parts addresses Low Impact BES Cyber Systems. It is counterintuitive to think that a list of Low Impact BES Cyber System will not be required to show compliance. CIP-002 also explicitly states that a list of Low Impact BES Cyber Systems is not required. This creates increasingly burdensome administrative work on the registered entities. The requirements for the Low Impact Assets should be measureable but not require registered entities to produce a list of Low Impact BES Cyber Systems as it would be contrary to the CIP-002 wording. The wording of these parts should be adjusted to address the Low Impact Assets and not the Low Impact BES Cyber Systems. CIP-003 R2.4 greatly increases the scope of the Low Impact requirements. Registered entities will be required to implement “identified access point(s)” for Low Impact BES Cyber Systems of which registered entities are not required to maintain a list. This will essentially require registered entities to provide a list of all Low Impact BES Cyber Systems which is explicitly stated is not required in CIP-002. Except for the time frame requirement CIP-003 R2.5 mirrors the CIP-008 requirements. Wouldn’t it be more appropriate to word the CIP-008 parts to be more all encompassing rather than creating a new requirement and part that creates additional administrative burden on the registered entities? Incident response is often handled through similar processes regardless of the impact of the system and is then categorized as a part of the incident handling process. By creating separate requirement in CIP-003 and CIP-008 it will different incident response plans each with their own evidence or the same plan that complies with both requirements with duplicate documentation and effort to show compliance with two separate standards. CIP-003 R2.6 is very similar to CIP-004 R1.1 and should be incorporated into CIP-004 R1.1 rather than having to duplicate administrative effort to show compliance with two awareness programs.
No
No issue was noted with the requirement CIP-006 R1.10 as it is written. However, it does little to meet the directive that was given in Order 791 to “create a definition of communication networks and to develop new or modified” standards. Communication components are an important part of the reliability of the grid and a definition of what and how the regulators expect the registered entities to comply with protecting them and all their many potential configurations would be an important step towards better security.
Yes
Yes
No
It is concerning that the “Identify, Assess, and Correct” (IAC) language has been so quickly discarded when it was added to move the regulations away from a zero defect approach. The RAI project certainly has potential but is still in various pilot projects that have not yet born widespread benefits to the industry. There did not seem to be any project teams focused on attempting to reword the IAC language to rectify some of the issues that were voiced and now the industry, that approved the v5 standards with the understanding the IAC language would help to move the regulations away from a zero-defect approach, is left with no time frames or guarantees of what the

RAI will become or when it will be implemented. More work should be done see if there is a way to fix the IAC language prior to it be discarded.

PNM Resources
No
General #1: Limit the scope of dispersed generation in the CIP-003-6 Applicability section, similar to PRC-005. In section 4.2.2 of the Introduction section, under 4. Applicability, 4.2 Facilities, add the following statement after 4.2.2 All BES Facilities, “For dispersed power producing resources identified through Inclusion I4 of the BES definition, the only BES Cyber Systems that meet the low impact rating criterion 3.3 in Attachment 1 of CIP-002-5.1 are any shared BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of dispersed generation units from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or above and not at an individual turbine, inverter or unit level.” This change should be made in conjunction with adding back the reference to CIP-002-5 Requirement R1.3 in CIP-003-6 R2. PNM agrees with the suggested revision posed by EEI. General #2: A number of the requirements are effectively duplicated language of existing CIP requirements. PNM strongly disagrees with the concept that Low Impact controls should be within one requirement. It begs the question why the SDT would not do the same for Medium and High, but the answer is obvious: it is not efficient. Low Impact requirements that are effectively duplicating existing requirements need to be removed and “Low Impact BCS” added to the impacted systems (applicability section) of the respective existing requirements. Having all the Low Impact controls under CIP-003-6 R2 make this requirement a “spaghetti” requirement that the SDT said would not be the updated version of the standards. Entities do not need to deal with the monitoring and enforcement implications of another “spaghetti” requirement if they should happen to have a potential violation of this requirement. R2.1: Update as an open-ended ‘pointer’ to other Low Impact requirements. Suggested alternative re-write: “Review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the topics in all enforceable CIP requirements applicable to Low-Impact BES Cyber Systems.” With such a rewrite, there’s also no reason this could not be changed to a separate CIP-003-6 R1.2 requirement. Rename R1 content to be R1.1, and include initial R1 language using the ‘starter’ language common in most other CIP requirements. R2.2: Does not identify the types of access restrictions required. Strictly speaking, a simple unlocked door still ‘restricts access’, even if it can be readily opened by turning the knob. Is this acceptable? PNM suggests that without clearer language or enforceable guidance, regional auditors will take their own initiative to self-interpret and be highly prescriptive in this regard as to what is ‘acceptable’. Entities will be at the whim of regional variances and auditor discretion. As implied above, adherence to the guidelines is not a reliable expectation to establish compliance assurance unless NERC can forthwith declare Guidance as an enforceable component of the standard. R2.3.1: Escorting where? It is only ever implied that a physical security perimeter of some sort must be established, and yet the only way to enforce and audit compliance with many of the R2 requirements is to physically create one. This sub-requirement also relies on the controls of R2.2, even though R2.2 states as allowing for operational or procedural control. Procedural controls alone cannot be reliably audited vis-à-vis R2.3.1 to ensure escorting. Regional auditors may necessarily force physical controls, regardless, as part of their ‘auditing approach’, undermining the allowances within the standard. The SDT will have pushed Low Impact BCS into Medium CIP-006-6 territory, effectively negating the very reason for writing the remaining separate physical security sub-requirements below. R2.3.2: in order to monitor physical access points they must be identified, which means that, again a physical construct must be defined to identify the access points into it, which means that the perimeter must be controlled at all other non-access locations, which means that the entire exercise of this requirement defaults back to operating effectively similar to CIP-006.

PNMRs concern is that regional auditors will be given significant latitude as to how they wish to interpret the 'effectiveness' of the controls, and thus by extension an entity's compliance with the requirement. • How does one prove that monitoring is continuously implemented, without having some form of logging? R2.4.1: Suggested alternative re-write: "The electronic access point(s) of all external routable protocol paths to Low Impact BES Cyber Systems, if any, must be identified." Access points are modified by identifying 'electronic'… otherwise, every routable connection in fact has a physical access point into the facility and it can be readily identified. R2.4.2: Suggested alternative re-write: "For each identified external routable protocol electronic access point, if any, require inbound and outbound access control rules, including the reason for allowing access, and deny all other access." The terms 'permissions' and 'granting' could also potentially imply expected authorization activities, which is not what this requirement is supposed to be overseeing. Unfortunately CIP 005-5 R1.3 suffers the same flaw, and should also be fixed. R2.4.3: Since some regional auditing entities do not understand the strict meaning of the words "authentication" and "authorization", what constitutes authentication in this case needs to be clearly prescribed (NEEDS NEW GLOSSARY DEFINITION). Perhaps a cross-reference to NIST Special Publication 800-63 would be appropriate, or at least a Guideline reference to it. R2.5: This is an unnecessary and duplicative requirement. There's no clear reason why Low Impact BCS cannot/should not be added to "Applicable Systems" within the CIP-008 standard in lieu of this sub-requirement. Update CIP-003-6 R2.1 to point to this standard. R2.6: This is an unnecessary and duplicative requirement. Again, just add Low Impact BCS to CIP-004-6 R1/R1.1 "Applicable Systems" in lieu of this sub-requirement, and update CIP-003-6 R2.1 to point to this standard. Ironically, this requirement even has additional specific and more-stringent reviews and documentation requirements (assurance of topical coverage annually) than are necessary for Medium and High BCS under CIP-004-6 R1/R1.1. The explanation recently provided by SDT personnel (at the 6/19/2014 SDT webinar) is appreciated, but it nonetheless continues to violate the new NERC standards design methodology.
Yes
Guidelines and Technical Basis Add a clarification that entities are not expected to enforce CIP 006 on third party nonprogrammable components that are out of the entity's control.

No
CIP-003-6 R2.4.2 - Reclamation suggests that the requirement should be clarified so that restrictive routing schemes are considered sufficient access permissions.
No
CIP-006-6 R1.10 - Reclamation suggests that the requirement should be clarified to account for situations where cabling outside the PSPs is located in the same facility as the separated PSPs and that facility provides physical access only to authorized personnel. For these cases where installation of conduit is not possible and installation of encryption is not technically feasible, it should be clarified that physical access controls to the facility can provide adequate protections and are compliant with the standard. Therefore, Reclamation suggests that the list of acceptable physical access restriction examples in the Measures be updated to include "facilities that provide physical

access only to authorized personnel” in addition to “cabling and components secured through conduit or secured cable trays.”
No
CIP-010-2 R4.1.4 – Reclamation suggests that the drafting team add a bullet to the Measures that allows “an automated scan of the Transient Cyber Asset” prior to use on the ESP network as evidence for satisfying this requirement. CIP-010-2 R4.6 - Reclamation suggests that the drafting team add a bullet to the Measures that allows “an automated scan of the Transient Cyber Asset” prior to use on the ESP network as evidence for satisfying this requirement. CIP-010-2 R4.7 - Reclamation suggests that the drafting team add a bullet to the Measures that allows “an automated scan of the Transient Cyber Asset” prior to use on the ESP network as evidence for satisfying this requirement.

No
These comments are submitted on behalf of the following PPL NERC Registered Affiliates: LG&E and KU Energy, LLC; PPL Electric Utilities Corporation; PPL EnergyPlus, LLC; PPL Generation, LLC; PPL Susquehanna, LLC; and PPL Montana, LLC. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. Comments: Would like to see the tie between CIP-002-5 R1.3 added back to the requirement, instead of just saying “containing low impact BES Cyber Systems”. Do not understand the removal of this tie in to CIP-002. For R2.4 shouldn’t the Applicable Systems section list “Low Impact BES Cyber Systems with external routable protocol paths Low Impact BES Cyber Systems with dial-up connectivity”, thus allowing Entities without those paths and/or connectivity, the option of not worrying about this requirement and just documenting the absence of the path and/or connectivity. For R2.6 revise the requirement to clarify the intent as follows: Implement a security awareness program that reinforces cyber security practices at least quarterly. At least once every 15 calendar months the program shall reinforce Parts 2.2, 2.3, 2.4, and 2.5 above.
Yes
Including them in one place allows for concise understanding, however, a concern is that the auditors will look to the other requirements for measures or expectations of evidence. It needs to be clear, that while the requirement “mirrors” or is similar to one for High/Medium Impact Assets, the only option for audit and evidence resides within CIP-003 R2
No
Add a clarification that entities are not expected to enforce CIP 006 on third party nonprogrammable components that are out of the entity’s control.
No

No
Add a clarification that entities are not expected to enforce CIP 006 on third party nonprogrammable components that are out of the entity's control
Yes
We assume this applies to R2, part 2.1.9, since there is no R1, part 1.1.9.
Yes

City of Tallahassee, TAL
No
The City of Tallahassee (TAL) feels that Part 2.4 does not adequately illustrate the measures necessary to prove compliance to the part 2.4.2 requirement. The term 'representative sample' needs to be defined specifically. Does this imply a sample of rule sets from more than one access point? A sample of the rule set from a single access point? If more than one access point is identified, then would the entire rule set, or only a partial rule set from a single access point qualify as a representative sample? There can be no ambiguity when direct evidence is required as proof of compliance. Part 2.4.1 states that all external routable protocol paths, if any, must be through one or more identified access point(s). Evidence includes documentation of these paths through identified access points. If there is no requirement to discretely identify low impact BES Cyber Systems, then how can we be expected to provide evidence for this requirement when we are not required to identify the access point in the first place? External routable protocol paths imply the existence of an electronic security perimeter, a specific set of connected assets that form a basis for a defined network structure. There is no language in this requirement to identify an electronic perimeter, therefore no conceptual reason to identify an access point with routable protocol paths that may or may not be external to an undefined barrier. The language of this particular requirement and the measures required to prove compliance are extremely vague. Parts 2.1 – 2.3, and 2.5 are sufficient to address FERC Order No. 791 paragraphs 106-100, and clearly provide substantive objective criteria to sufficiently measure an entity's protection of low-to-no impact cyber assets. Requiring entities to identify assets (access points) where asset identification is clearly stated as unnecessary, and provide representative samples of configurations for these unidentified assets, assets that function as external access gateways to an undefined electronic security perimeter, could create an unnecessary quagmire of compliance effort. Under the section Guidelines and Technical Basis for part 2.4 it states that the Responsible Entity must have implemented processes that include the external routable protocol and Dialup connectivity paths to the BES asset such that the low impact BES Cyber Systems located at the BES asset are protected. There is an assumption made here that at least one or more external routable protocol and/or Dialup connectivity paths exist and those access paths are being utilized to communicate directly with the asset from a remote location. This language should be rewritten to match the requirements in Part 2.4 – removing any unnecessary ambiguity with regard to direct communications pathways vs. other reasons for necessary connections via remote communications paths; e.g. "The Responsible Entity must have implemented processes that include the external routable protocol and Dialup connectivity paths, if any, to the BES asset such that the low impact BES Cyber Systems located at the BES asset are protected." Furthermore, the following sentence should be rewritten to state, "In cases where external connectivity is used to gain access to any low impact BES Cyber System at a remote site, electronic access controls should address the risk of using external connectivity." The final two sentences in this paragraph contain references to ambiguous concepts such as collection and aggregation, without stating specifically what kind of information might be collected and/or aggregated. TAL's contention is that these two sentences add nothing to the explanation and should be removed entirely. They state that these access controls are required to protect the collection and/or aggregation of low impact BES Cyber Systems, or the collection and/or aggregation of data pertaining to them, or what specifically?
Yes

No
Part 4.3 is identical to Part 4.2. I suggest collapsing 4.3 into 4.2 to include 'prior to use on applicable systems'. Both requirements are obviously meant to be done prior to use on applicable systems (intent of the standard in the first place), so there is no point in stating the same requirement twice. If the intent of this revision is meant to protect applicable systems, then the only requirement necessary is 4.3. If both requirements must stay, then remove the word 'detect' from 4.2 as detection is required prior to use as part of 4.3. It makes the most sense to collapse the two requirements into one and adjust the Measures language to include hardening policies and scanning techniques as part of the traditional antivirus … example.
Yes
No
I have no recommended alternative approach as I believe the original IAC language in the standard identified with a need to change industry perception of the spirit and intent of Critical Infrastructure Protection Reliability Standards to concentrate effective proactive compliance efforts towards identifying and correcting deficiencies rather than being focused on the fact that violations for those deficiencies may exist and subsequently turning the workplace into a reactive, audit documentation mill. The many changes in Violation Severity Levels in the revised standard will effectively result in potential violations regardless of any effort (or lack of effort) on the part of the entity to mitigate those violations. Now, with the IAC language removed, entities are no longer provided a much-needed greater degree of flexibility in detecting and remediating low-risk violations. All and any interpretation of the standards has been placed into the hands of auditors, which contributed to endless anxiety on the part of the entities with prior CIP versions. FERC stated concern over the broad and ambiguous nature of the IAC language as sufficient reason to force NERC to improve upon how the (IAC) language was written. As a result, NERC decided to assume that the enforcement process for low-risk violations would be unworkable, and remove the language altogether. This effectively disenfranchises the entity throughout the compliance auditing process.
No
Given the nature of the removal of the IAC language which results in a measurable change in how compliance programs would function under the new standard, FERC should issue an order to extend the effective date at least another full 6 months for each standard/requirement for which a modification to the language was made.

Currently, all of the new requirements for addressing FERCs concerns about Low Impact BES Cyber Assets have been shoe horned into the Standard on Security Management Control even though many requirements mirror those covered in other Standards for High and Medium Impact assets. For instance, requirements related to physical access controls for Low Impact assets appear in CIP-003 whereas physical security requirements for other asset types appear in CIP-006. Requirements related to Incident Management for Low Impact assets appear in CIP-003 even though Incident Management for Medium and High Impact Assets is covered in CIP-008, and so on. This leads to a

needlessly confusing set of standards where reference needs to be made to multiple requirement statements in multiple standards simply to determine what needs to be done in a particular subject area. This increases the effort needed to implement the Standards, increases the effort needed to demonstrate compliance, is likely to lead to duplication of effort, and could increase the likelihood that Responsible Entities will overlook or misunderstand some requirements. Requirements for Low Impact assets that mirror requirements appearing in other Standards for High and/or Medium Impact assets should be moved to those other standards. 1. In the text of the first sentence of R2, delete the words “assets containing”. As the wording currently stands, all Low Impact BES Cyber Assets would have to be located within some sort of “container” (eg. a building or yard) and the protections stipulated by Requirements R2.1 through R2.6 would have to be applied to the entire container, not simply to the Low Impact Cyber Assets themselves. 2. For Requirement R2.4: a. Demonstrating auditable compliance with R2.4.1, R2.4.2, and R2.4.3 appears almost certain to require Responsible Entities to create and maintain inventories of Low Impact Cyber systems and their associated access points and permission sets, as well as an inventory of all Low Impact assets with dial-up connectivity. This is not consistent with the statement made in the “Rationale for Requirement R2” which states that, “creating and maintaining an inventory of low impact assets for audit purposes would be unduly burdensome…..”. b. Requirement 2.4.1 refers to an “external” routable protocol path. External to what is unclear. The current wording could be read as “External to the Low Impact BES Cyber System concerned”, external to a Low Impact BES Cyber Asset, external to some (as yet unspecified) “electronic communications perimeter within which the Low Impact BES Cyber System resides”, or perhaps “external to the physical enclosure that “contains” the Low Impact BES Cyber Asset” (as implied by the unmodified text of R2). This needs to be clarified. c. As currently written, Requirement R2.4.2 applies in cases where communication with low impact assets is either routable or non-routable. This requirement provides little, if any, additional security if communications are not routable. d. Clarify whether or not the term “access point” in R2.4.2 includes places where one connects transient devices and/or removable media? 3. Modify the wording in the Table of Compliance Elements as follows: The High VSL for R2 should be revised to read, “…..but failed to address three or more of the topics as required by Requirement R2, Part 2.1 (2.1)…..”

Yes

Request CIP-007 R1 Part 1.2 Rational to be added to guidance and additional guidance provided. Suggest illustrative examples so that Entities and Auditors reach the same interpretation

Yes

1. In CIP-004 Requirement 2.1.9 delete the word “including”. Neither Transient Cyber Assets nor Removable Media are Cyber Assets. 2. In CIP-010: a. Requirement 4.1 refers to “Authorization” of usage, users, locations, acceptable use, and firmware/software. The Requirement should state clearly who it is that can provide this authorization. Possibilities include the CIP Senior Manager or Delegate, a person or group identified in the access management program pursuant to CIP-004 R4 (specifically R4.1), or the “individual or group with authority to authorize baseline changes as per Requirement CIP-010 R1.2. Recommend documented authorization as an option b. In Requirement 4.1.4 delete the word “intentionally”. Software that is installed unintentionally or illicitly should not be permitted unless it is known to be benign. c. In Requirement 4.1.4, reword Requirement 4.1.4 to read, “Operating system, firmware, installed software, including installed updates and patches, on Transient Cyber Assets (per Transient Cyber Asset Capability) d. Reword Requirement 4.3 to read “Use method(s) to detect malicious code on Removable Media and Transient Cyber Assets prior to their use on, or with, applicable systems” e. Reword R4.4 to state, “Remove or disable all malicious code detected on Transient Cyber Assets and Removable Media prior to use in, or with, Applicable Systems”. f. Reword the first portion of Requirement 4.6 to read, “Prior to use, and except under CIP Exceptional Circumstances, evaluate Transient Cyber Assets for modifications that deviate from the authorized configuration”. Reword the second portion of Requirement R4.6 to read, “for a modification that deviates from an authorized configuration, either; a) remediate by returning the Transient Cyber Asset to the most recently authorized configuration prior to use; or b) authorize the new configuration prior to use, including the parameters listed in Requirements 4.1.1 through 4.1.4 3. Reword to state that the transient cyber asset must not be interconnected between a higher security zone and a lower security zone – i.e. must not be “dual homed” 4. There need to be Requirements pertaining to the re-purposing and destruction of Transient Cyber Assets and Removable Media. This could be accomplished by expanding the scope of Applicable Systems in CIP-

011 R2 to include Transient Cyber Systems and Removable Media, or by mirroring the language of that set of Requirements.

Yes

1. The definition of “Transient Asset” should include devices which connect temporarily to EACMS (which are on, not “within”, the ESP) and/or PACS. This would provide a measure of configuration control and malware prevention to systems which are essential to the protection of BES Cyber Assets and their associated networks. For instance, without this protection a Transient Device with a legitimate connection at an ESP access point could, if compromised, jeopardize the effectiveness of the access control and/or the capability of networks or devices within the ESP.

Yes

No

Please provide a clear and consistent time line for implementation of these requirements. Ensure that all new effective and mandatory dates are after their CIP V5 dates. The current format is confusing.

No

Yes

Hydro One supports TFIST recommendations on NERC Project 2014-02 CIP Version 5 Revisions Standard. Drafting Team should be allowed to help clarify and provide guidance for industry issues and items discovered in the pilots. Hydro One also agrees that In particular the following should be addressed by NERC with the SDT representing industry: 1. Transfer Trip: CIP-002-5 R1, ‘transmission stations and substations’ for medium category assets, what some refer to as the “transfer trip” issue. 2. Clarify the term “programmable devices” which is an undefined term open to strongly differing viewpoints. 3. Clarify “effect within 15 minutes” issue and the burden of evidence for proving that something does not exist. Please clarify if diversity vs redundancy can be considered as part of the Entity’s impact assessment (i.e separate system using a different technology) Recommend adding “or” to CIP-010 R4 Part 4.1.4 to make this Part consistent with CIP-010 R1 Part1.1.1. Part 1.1.1 requires a baseline of Operating system(s) (including version) OR firmware where no independent operating system exists; while Part 4.1.4 requires Authorization to include Operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability). Part 4.1.4 requires Authorization of both Operating System AND Firmware for a transient device while Part 1.1.1 requires baseline of Operating System OR firmware. We suggest the proper approach is to retain the OR. When applying R4 to a laptop we normally record the OS and version and not look to the firmware BIOS.

Supporting Comments Requirement R1.2 pertains to a required policy for “Electronic Security Perimeters (CIP-005) including Interactive Remote Access” but the required implementation of that policy appears to have a broader scope in Requirement R2.4.1 which pertains to required processes for “All external routable protocol paths, if any, must be through one or more identified access point(s).” The latter requirement, R2.4.1, is not limited to interactive remote access that is the subject of R1.2. The Rationale for R2 explains the phrase “external routable protocol paths” is used instead of the defined term “External Routable Connectivity” because the latter term has very specific connotations relating to Electronic Security Perimeters and high and medium impact BES Cyber Systems. Using the glossary term “External Routable Connectivity” in the context of Requirement R2 is not appropriate because Requirement R2 is limited in scope to low impact BES Cyber Systems. Inconsistently, the Guidelines and Technical Basis section continues to use the term “external routable connectivity” in the discussion of R2 in the two statements below: “2.3 – The Responsible Entity must document and implement processes that include the physical security of the low impact BES Cyber Systems at Control Centers. For Control Centers, the entity should further describe the process for handling escorted access of visitors. For Control Centers that have external routable connectivity, monitoring of physical access points is also required.” 2.4 … “An asset has

external routable connectivity due to a BES Cyber System within it having a 3G/4G wireless card on a public carrier which allows the BES Cyber System to be reachable via a public IP address. In essence, low impact BES Cyber Systems should not be accessible from the Internet and search engines such as Shodan."
No
Supporting Comments The applicable scope of CIP-010-2 R4 is too narrow; it should be expanded to include the EACMS and PACS that are associated with High and Medium Impact BES Cyber Systems. EACMS and PACS need to use method(s) to deter, detect, or prevent malicious code on Transient Cyber Assets (per Cyber Asset capability). The omission of EACMS and PACS from the scope of protection under CIP-010-2 R4 is inconsistent with the protections afforded to EACMS and PACS under CIP-007-6. CIP-007-6 Requirement 3.1 provides that High and Medium Impact BES Cyber Systems, and their associated EACMS, PACS, and PCA must deploy method(s) to deter, detect, or prevent malicious code.

No
R2 – Usage of the term "external routable protocol paths" should be officially defined by NERC before being able to "judge the sufficiency" of the newly introduced controls. Assumptions a responsible entity could make surrounding this term could lead to violations. The Guidelines and Technical Basis section includes numerous references to "belief" and "intent," along with descriptions of what entities "should" be doing. The need for such language indicates that the requirement language is not able to stand on its own and results in a need to be audited by the Guidelines and Technical Basis section. In turn, language not intended to be a required action by the entity could result in a perceived additional requirement by those trying to understand the requirement. While the intent of the "Note:" section under CIP-003-6 R2 is understood, there is no way to effectively audit for the successful and complete implementation of CIP-003-6 Table R2 – Low Impact Assets without obtaining an inventory of considered assets and of authorized users. Auditors are not able to reliably issue a judgment of the effectiveness of an internal control or of adherence to requirements without ensuring that samples are pulled from a complete population. Furthermore, entities are not able to perform the functions outlined within the R2 requirements without having lists of authorized users, both for access authentication and monitoring purposes. R2.3.2 – In part because the reference to "physical access point(s)" is not in relation to a defined Physical Security Perimeter, the requirement is actually more stringent than that of CIP-006-6 R1.4 and could require more evidence in support of compliance. An entity may need to prove an evaluation was performed resulting in the derivation of an inventory of all potential access points for all Low Impact BES Cyber Systems at Control Centers. Furthermore, diagrams may be needed to support that monitoring has been considered and defined for all applicable access points. While intended to be helpful in aggregating all Low Impact BES Cyber Systems requirements into a single section, the table has resulted in a web of functionally similar, yet separated requirements that could result in confusion. KCP&L recommends that, wherever possible, the items from CIP-003-6 Table R2 – Low Impact Assets be moved to the appropriate functional section and included as an additional applicable system where requirements are also similar. R2.4 – The requirements established under R2.4 are redundant to CIP-005-5 R1. In order to effectively audit the implementation of such controls, inventories and lists will be required just as they will be for CIP-005-5 R1. Guidelines and Technical Basis Section 2.4 – The two sentences beginning with "The electronic access controls should address…" go beyond the purview of the language of the requirement and serve to dictate what "should" be addressed. It is recommended that these sentences be stricken from the Guidelines and Technical Basis section.

No

CIP-006-6: The current order and applicability for CIP-006-6 is inconsistent and does not logically flow. At no point is a requirement for use of a defined PSP introduced, yet a number of the requirements pertain exclusively to the existence of a defined PSP. Physical Access Control Systems, as defined by the NERC Glossary of Terms, are also not stated as being required. Due to the current combined applicability and requirements, an entity could theoretically have a High Impact BES Cyber System that does not reside in a PSP and does not have a Physical Access Control System. This could result in applicability of only CIP-006-6 R1.3 and R1.10, and a lack of requirement for operational or procedural controls to restrict physical access. While the entity would still have to achieve two or more physical access controls, the requirements never state that a PACS is required for a High Impact BES Cyber System to achieve this or that a PSP is required for any system. KCP&L recommends that either CIP-006-6 R1.1 be updated to require the use of a Physical Access Control System for High Impact BES Cyber Systems or that a new sub-requirement is created to require High Impact BES Cyber Systems to have a Physical Access Control System with defined operational or procedural controls to restrict physical access. In addition, consideration should be given to rewording some monitoring, logging, and alerting requirements to include monitoring, logging, and alerting provisions for non-PSP, physically protected areas. CIP-007-6 The term “nonprogrammable communication components located inside both a PSP and an ESP” is a new source of confusion and may require definition as an official NERC Glossary term. CIP-005-5 requires only for “Cyber Assets” to reside within an ESP. Unofficial guidance has already been communicated by various Regional Entities in support of excluding non-Cyber Asset, nonprogrammable “devices” from the required ESP. Therefore, it is difficult to identify where a “nonprogrammable communication component” that is also not a Cyber Asset would be located inside an ESP. Additionally, while CIP-006-6 defines certain protections that must be afforded to a Physical Security Perimeter, there is no requirement stating that a device must reside within a defined PSP. Therefore, entities are allowed to utilize other operational or procedural control measures for protecting High and Medium impact ESPs. Even if a “nonprogrammable communication component” is defined as part of an ESP, it is possible that the “nonprogrammable communication component” will not reside within a defined PSP. It should also be noted that the addition of such language will result in increased burden for entities by nature of a backdoor requirement for documentation of all considered “nonprogrammable communication components” that are not NERC-defined “Cyber Assets.” The current proposed language applicable only to “nonprogrammable communication components located inside both a PSP and an ESP,” along with other PSP-specific requirements, may serve to discourage entities from creating defined PSPs around BES Cyber Systems.

No

The administrative burdens associated with this are not practical as a response and aligned with the risk introduced to the BES. KCP&L endorses those specific comments submitted by the Edison Electric Institute.

No

KCP&L believes that the definition of Transient Cyber Asset should be clear to ensure no unintended consequences from interpretations by stakeholders involved where direct connections of devices are anticipated. Physical and electronic access control to BES Cyber Systems is a critical component of securing the overall system, and such devices should be protected from inappropriate Transient Cyber Asset connections. But the definition of such lacks clarity and thus will lack consistency in application. The language around the Transient Cyber Asset and Removable media is silent and unclear where EACMS and PACS are concerned. The new definition could read as follows: Transient Cyber Asset: A Cyber Asset directly connected for 30 consecutive calendar days or less, to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Assets associated with an ESP. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.

Yes

While KCP&L supports alternative methods of assessing maturity and effectiveness in adherence to the NERC CIP requirements, the “Identify, Assess and Correct” language was an open-ended and unstructured framework that would cause confusion and lead to the expansion of the scope of NERC CIP based on auditor judgment. This concept would be addressed in tools and frameworks accomplished through the Reliability Assurance Initiative (RAI), however, consistency in auditor training and approach will be critical to the success of the RAI program.

Yes
No
We are not aware of additional jurisdictions that should be considered at this time.
Yes
KCP&L would like to endorse those comments made in this question by the Edison Electric Institute.

Based on proposed revisions in the applicability section of the Generator Owner and Generator Operator Reliability Standards for PRC-005-2 (-3) and the approved CIP-002-5.1 Attachment 1 medium impact rating criteria 2.1, the following revisions to the applicability section of the CIP-003-6 Reliability Standard are recommended: Add a statement under 4.2.2 in the Facilities portion of the Applicability Section as follows: 4.2.2 Responsible Entities Listed in 4.1 other than Distribution Providers All BES Facilities. For dispersed power producing resources identified through Inclusion I4 of the BES definition, the only BES Cyber Systems that meet the low impact rating criterion 3.3 in

Attachment 1 of CIP-002-5.1 are any shared BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of dispersed generation units from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or above and not at an individual turbine, inverter or unit level. Proposed text for the guidelines and technical basis for this change parallels the text for similar changes to PRC-005-2 (-3): Applicability of the Requirements of CIP-003-6 to dispersed power producing resources is qualified in section 4.2.2. The intent is that for such resources, the Requirements would apply only to BES Cyber Systems used from the point where the BES dispersed power producing resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or higher and not at an individual turbine, inverter or unit level.

FMPA appreciates the SDT's efforts on this difficult task. We particularly appreciate all the outreach that the SDT has done with the stakeholders, beyond the normal development process outreach. Our comments and balloting positions are intended to be constructive and help improve the revised standards, so they will ultimately be approved. FMPA sees three issues with CIP-003-6. First, requirement R2 has been modified to remove the "IAC" language (as it has been removed from all other places in the CIP standards as well). This unfortunately has reintroduced a zero-defect tolerance due to the wording in R2. Second, while the standard states an inventory isn't required for low impact assets, use of the word "All" in part 2.4.1 implies that an inventory must be done in order to prove compliance. Third, while not a direct responsibility of the SDT, the RSAWs do not provide any level of clarity as to how the Entity can expect to be audited. FMPA suggests that R2 be reworded to address each of these three issues. FMPA proposes the following language (in a table format) to address the first two issues for R2: "Each Responsible Entity shall develop and institute Policies and Procedures designed to meet the following indicators of performance: • The Responsible Entity has an established, formal program for identifying Low Impact Assets. • The Responsible Entity has a process to evaluate the addition or removal of Low Impact Assets that can affect BES operations. • The Responsible Entity has a program to address the company's ability to detect and respond to compromise of the company's Low Impact Assets • The Responsible Entity has a program to provide training and awareness to all relevant employees. • The Responsible Entity institutes internal controls and procedures to prevent a recurrence of identified deficiencies This approach is based on the FERC "Policy Statement on Enforcement" Docket PL06-1-000. Specifically, it is taken from the Internal Compliance guidance that FERC has provided and has been instituted by the ERO in evaluating Internal Compliance programs through 13 standard questions. This approach would give entities a substitute for the IAC language promised in Version 5, plus give FERC the assurance that entities will have programs in place that can be audited. The Measures can be devised in a similar fashion to the grading system used by the regions to assess ICPs; and as such, the VSLs can be designed such that the requirement is measurable and "gradable". FMPA realizes that we are using the word "institute" in the above suggested language. We recognize that the SDT does not like to introduce new terms and/or language when possible, and FMPA supports that. The term "implement" was used in previous versions of the CIP standards. However "Implement" is not appropriate because it creates double jeopardy with the rest of the CIP standards, e.g., a violation of another standard could mean that the policy was not implemented. By using the word "Institute", it would suggest that the policy is in force and able to be enforced by the Responsible Entity, but not requiring ERO enforcement of the policies in this requirement (implement includes enforcement), but rather ERO enforcement is contained in ensuing standards. Use of the word "implement" also introduces the zero defect problem because it can be argued that any defect is a violation of implementing a policy. Hence, a word that means that the entity has adopted and enforces adherence to policies is more appropriate, such as "institute" or "establish". FMPA suggests this approach for all requirements that formerly contained the "identify, assess and correct" language in Version 5. The removal of this IAC language introduces the zero defect issue. Yes, RAI is "promised"

as a solution to this problem; however, RAI is not “solid” enough for industry to depend on when supporting this standard and it is too important to depend on an unsubstantiated promise. In addition, FERC did not direct removal of the IAC language, but rather directed that the requirements be measurable and auditable. Our suggested alternative meets the FERC directive. If a complete re-write of R2 isn’t possible, FMPA has specific comments on some of the parts of R2. For part 2.4.1, using the word "All" in the requirement could be read to mean an entity has done a complete inventory of low impact assets in order to determine "all" of the communication paths suggested in part 2.4.1. FMPA suggests replacing the word “all” with “identified”, a la 2.4.2. Under part 2.5.1, FMPA does not agree with using the defined term "Cyber Security Incidents". We feel this could add to confusion, as the definition includes "Electronic Security Perimeter or Physical Security Perimeter". FMPA is aware there is an “or” qualifier on the definition that can be used to ignore the use of ESP/PSP terms that do not apply to Low Impact – perhaps having this information in the guidance part of the standard would clear up some confusion. FMPA also suggests limiting the scope of part 2.5 to Low Impact Control Centers and removing any reference that might include out-of-scope terms such as ESP's and PSP's. FMPA is also concerned at the lengthy wording of the VSL for CIP-003-6. With so many "or" statements, it may be difficult to follow. Since all the of the revisions for this balloting had the IAC language removed and there are limited RAI details available at this time, FMPA is voting negative on all of the CIP standards/VRF/VSLs posted for this balloting.
Yes
FMPA supports APPA’s comments on this question. APPA appreciates the SDT providing flexibility to entities in complying with R1 Part 1.10. Having multiple options for controls when physical access restrictions are not possible gives entities an opportunity to select the solution that works for their specific situation. Industry has commented that encryption of data as a sole solution may reduce reliability by adding complexity to the systems and latency to data flow that will not work in a relay control environment. If the SDT removes this flexibility or expands the applicability in future drafts APPA will need to reevaluate its support for the communications controls.
No
FMPA supports SMUD’s comments on this question. SMUD prefers to remove CIP-010, R4, Requirement Part 4.1.4 requiring the maintenance of “operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability)” as well as the corresponding Requirement Part 4.6 to “evaluate the Transient Cyber Asset.” SMUD believes that this is a list making administrative activity. Requirement Part 4.1.3 has already established a “defined acceptable use” for Transient Cyber Assets that establishes how these assets are to be used within the Responsible Entity. Transient Cyber Assets are not expected to be treated like a BES Cyber Asset or associated Protected Cyber Asset considering the use of these assets may be subject to ownership by a contractor or vendor where obtaining all of this information may not be possible. SMUD supports the use of inventory, assignment, acceptable use, malicious software prevention and patching for these assets as reasonable controls to ensure the devices reduce the risks posed to BES Cyber Systems. If CIP-010, R4, Requirement Part 4.1.4 is not removed, SMUD requests that the language be aligned with CIP-010, R1, Requirement Part 1.1.1 to state “Operating system(s) (including version) or [emphasis added] firmware where no independent operating system exists.” As presented, the CIP-010, R4, Requirement Part 4.1.4 is a greater expectation than the source requirement part. SMUD is concerned with CIP-010, R4, Requirement Part 4.7 and an interpretation that entities would have to track both the 35 day update timeframe and each use to be able to show performance to the Requirement Part. SMUD does not believe that the tracking of use is the key outcome of this Requirement Part; instead it is the patching of the Transient Cyber Asset that is the expected outcome. SMUD requests guidance be included to clearly state that the tracking of each use is not expected to be maintained, but that there is evidence associated with a 35 day review.

In general the RSAWS need a significant amount of improvement. Given the removal of the IAC language in the standards, the RSAWS take on even more importance than before. The SDT could consider performing a non-binding ballot on the RSAWs as allowed for in the Rules of Procedure. At a minimum, the RSAW comments should be posted for transparency. A few specific comments on the RSAWs: • The RSAW for CIP-002 expands the standard greatly and we believe that an entity does have to list low impact assets in order to meet the RSAW requirements. • The RSAW for CIP-003 has a wrong number in 6a of R2.5 (bottom of page 19). It seems like the number 15 needs to be 36 calendar months in part “a” under the line item number 6 which has 36 in it. • We have some concerns with R2.5 items in the standard and at the bottom of page 19 of the RSAW. It adds in more criteria than what is written in the standard requirement (R2.5 and additional sub-requirements). We are unsure what R2.5.1 is asking for when it comes to “classification”. What if the auditor does not agree with our criteria for classification? What happens if we fail to identify a Cyber Security Incident (someone else identifies it)?

Exelon Companies
No
In General: Exelon supports the SDT approach to add language to CIP-003, R2. Although we agree that the approach to add greater specificity to the required processes can fulfill the directive related to communication networks in Order 791, Exelon has concerns with the requirements as currently proposed. We are concerned that the revisions blur the distinction between low and medium impact and increase the burden for low impacts beyond the benefits to security and reliability. Exelon voted negative on CIP-003. Significant adjustments are needed for Exelon to support the revisions. Discussion of our concerns and some suggested revisions are offered below. Exelon notes that the low impact category is a comprehensive category bringing into scope all BES Assets that are not medium or high. This expansion of the CIP Standards is significant for the volume of newly covered assets brought into scope. Still, first and foremost, the emphasis, burden and investment of resources must focus on the assets most important to reliability and keep the burden of the requirements commensurate with the risk those assets pose to the Bulk Electric System. Exelon concurs with keeping all the requirements applicable to lows within one Standard (i.e. CIP-003). This Standard structure allows the requirements to include some unique features important to managing the low impact assets including: The specific language that no inventory is required The opportunity to set the compliance obligations at an appropriate level (i.e.; enterprise, site or program level instead of the device level) Exelon recognizes the value that one location for all low requirements may hold for entities with only low impact assets. As an entity with High, Medium and Low Impact assets, we would like the language to allow entities the option to fulfill certain requirements in CIP-003 R2 by incorporating Lows into their processes under associated standards applicable to Mediums. For instance, an entity should have the option to add Low Impact assets to their security awareness programs under CIP -004, R1.1 as a way to fulfill the CIP-003, R2.6 obligation. While not addressed in the proposed revisions, Exelon supports consideration of revision to the CIP-003 Applicability Section 4.2.2 to address dispersed power producing resources. It is important to clarify that security control requirements are set at the point of aggregation to 75 MVA and not at an individual turbine, generating unit or panel level for dispersed generation. The Project 2014-01 SDT is addressing similar concerns in other standards. Since the CIP V5 Revision SDT is currently revising CIP-003, it is a good opportunity to address this issue. Specific Concerns with proposed language: R2: While Exelon supports removal of the IAC language from CIP-003, R2 and the other requirements, our compliance concerns remain around the potential proliferation of compliance documentation, unreasonable compliance and enforcement burdens, and increased compliance risk. R2.1: The applicability should clarify that the requirement applies to sites containing Low Impact BES Cyber Systems. Consider revising: “BES Assets containing Low Impact BES Cyber Systems”. R2.2: The applicability should clarify that the requirement applies to sites containing Low Impact BES Cyber Systems. Consider revising: “BES Assets containing Low Impact BES Cyber Systems”.

R2.3: The applicability should clarify that the requirement applies to sites containing Low Impact BES Cyber Systems. Consider revising: “Control Centers containing Low Impact BES Cyber Systems”. R2.3 Please offer more clarity on who is considered a “visitor” and the record keeping expectations/requirements for them. Discussion in the Guidelines will be helpful. R2.4: In general, R2.4 introduces significant complexity when applied to BES Assets with low impact BES Cyber Systems. This is concerning because even though FERC accepted in Order 791 (P.111) that creation and maintenance of an inventory of Low Impact assets for audit purposes would be unduly burdensome for Responsible Entities and could divert resources away from protection of High and Medium Impact assets, the currently proposed requirements make an inventory inevitable. We preferR2.4 to read similarly to R2.2 by stating: “Implement one or more documented processes that restrict logical access.” R2.4: The applicability should clarify that the requirement applies to sites containing Low Impact BES Cyber Systems. Consider revising: “BES Assets containing Low Impact BES Cyber Systems”. R2.4.2: This subpart is problematic and an aspect that prevents Exelon from supporting the revisions. The administrative documentation burden associated with this subpart shifts the work of the control from protecting access points to documenting aspects of those access points. More problematic is the shift away from keeping the protections and compliance obligations commensurate with the risk posed by sites with low impact BES Cyber Systems. , These sites are low risk to the Bulk Electric System. The potential of the risk and the probability of the risk are low, and the protections in place at High and Medium Impact assets help diffuse the risks presented by the Low Impact assets on the system. The most valuable investment of time, resources, and personnel is in instituting protections at the High and Medium Impact assets and fulfilling the requirements associated with those BES Cyber Systems. R2.4.2 should be stricken. M2.4.2: Explain how the “representative sample” would be acceptable to demonstrate compliance. R2.5: The applicability should clarify that the requirement applies to sites containing Low Impact BES Cyber Systems. Consider revising: “BES Assets containing Low Impact BES Cyber Systems”. Please also provide clear guidance stating that sites with low impact BES Cyber Systems may be covered by an enterprise-wide Cyber Security Incident response plan or other approach, and assurance that a Cyber Security Incident response plan is not required for each site. R2.6: The applicability should clarify that the requirement applies to sites containing Low Impact BES Cyber Systems. Consider revising: “BES Assets containing Low Impact BES Cyber Systems”. R2.6: The proposed requirement language is confusing and seems more restrictive than its counterpart in CIP-004-5, R1.1. Naming the subparts as topic areas adds a compliance demonstration not present for Medium and High. The language should be clarified so entities understand the subpart topics are to be covered within the quarterly program so each of the subpart topics is covered at least once within 15 calendar months. In addition, R2.6 should allow entities with awareness programs under CIP-004, R1.1 to fulfill this CIP-003 R2 obligation through the CIP-004 program. Please consider adding to the Requirement: “If not already covered by fulfillment of CIP-004, R1.1, implement …” Compliance concerns: While Exelon supports removal of the IAC language from CIP-003, R2 and the other requirements, compliance concerns remain around the potential proliferation of compliance documentation, unreasonable compliance and enforcement burdens and increased compliance risk. Enforcing these requirements in a zero-defect approach could prove overwhelming for Responsible Entities and for NERC/Regional Enforcement. Reasonableness in the NERC compliance approach is essential. In some cases, the compliance expectations are influencing the applicability of the requirement language and contradicting language of FERC Order 791. For instance, Order 791 supported the importance of not requiring an inventory; however, the currently proposed language and under the current zero-defect compliance approach, there is not an obvious way to demonstrate compliance to the requirements without having an inventory. This makes the statement in the requirement ineffectual. The Order 791 directive concerning lows (P108) cites “an unacceptable level of ambiguity and potential inconsistency to the compliance process and an unnecessary gap in reliability.” While interrelated, addressing reliability and compliance are separate challenges. Order 791 did not object to the four issue areas as those relevant to apply to low impact assets for reliability. The SDT is challenged to refine the expectations around those control aspects. Concurrently, NERC is challenged to clarify the compliance process. While not the work of the SDT, the Reliability Assurance Initiative (RAI) and the RSAWs are companion pieces to the CIP standard revisions. Unfortunately, the initial draft RSAWs didn’t provide much clarity or relief from the zero defect compliance expectation; however, additional work on the RSAWs can help. Exelon encourages the RSAW development team to continue their work and post revised RSAWs with next iteration of CIP revisions. Concurrently, RAI could use the requirements applicable to Low Impact assets to demonstrate how RAI can alleviate the

compliance concerns and create a reasonable approach to compliance. This may be essential for the passage of revised requirements on Low Impact assets.

Yes

Exelon supports the SDT approach to add requirements to CIP-006 and CIP-007 to apply requirements to non-programmable communication equipment. We agree that this approach fulfills the directive related to communication networks in Order 791. Setting the protection requirements to within an ESP are appropriate and consistent with the components controlled by Responsible Entities. Exelon supports the decision not to define communication networks as a glossary term. The term itself is not used within the revised standards, but the revised requirements address protection of the nonprogrammable communications components identified in Order 791. Use of the terminology is understood within the context of the applicable standards (CIP-006 and CIP-007). Keeping the definition within the CIP context avoids implicating any additional Reliability Standards beyond the scope of the CIP revisions. By not creating a glossary term, the SDT avoids confusing broader discussions of communication networks that may be underway. While supporting the decision not to define communication networks, Exelon asks the SDT to consider whether it is valuable to define "non-programmable communication components." Exelon voted negative on CIP - 006 and CIP-007 to encourage the SDT to make additional refinements; however, Exelon generally supports the revisions. Some requested clarifications and suggested revisions are offered below. CIP-006, R1.10 should further clarify the scope to be only for ESPs with External Routable Connectivity. The relevant concern is with the external connectivity and in bridging PSPs. For settings that have an ESP without External Routable Connectivity, no PSP is required and therefore no bridging of PSPs can occur. The language should be revised to avoid creating an administrative burden that does not provide value. Consider adding to the CIP-006, R1.10 applicability "Medium Impact BES Cyber Systems with External Routable Connectivity at Control Centers and …" OR Revise CIP-006, R1.10 to read: "For ESP's with External Routable Connectivity, restrict physical access to cabling and other nonprogrammable communication components used for connection between applicable Cyber Assets within the same ESP in those instances when …" Please confirm the understanding of the CIP-007, R1.2 applicability, "nonprogrammable communication components located inside both a PSP and an ESP" means the requirements apply to devices that reside within both and does not mean devices within a PSP and devices within an ESP. Discussion in the Guidelines could confirm if others seek confirmation of this intent.

No

Exelon supports the SDT approach to add requirements to CIP-010 and CIP-004 to apply requirements to transient devices and removable media. We agree that this approach fulfills the directive related to communication networks in Order 791; however, Exelon has concerns with the requirements as currently proposed. Exelon's concern is that, as currently proposed, there is additional administrative burden without sufficient benefit. The requirements should focus on addressing the relevant uses that present a potential to introduce malware, with emphasis on authorization/protections on the device at the time of connection rather than over various protection versions and use of the device rather than the people using it. We are very concerned that the requirements will obligate Exelon to track every use of a transient device regardless of whether contamination occurs or not. This concern is triggered primarily with the "prior to use" language (e.g., R4.6 "Evaluate Transient Cyber Assets, prior to use, for modifications that deviate from Part 4.1.4") which indicates use here is every use, and thus must be tracked. The requirements on transient devices should not be more stringent than those on BES Cyber Assets. For example, R4.7 requires that TCAs be evaluated "within 35 days of use of the transient device to ensure patches are up to date" where the requirements for Medium and High BES Cyber Systems allow 35 days to evaluate and 35 days to patch. Exelon voted negative on CIP-010. Adjustments are needed for Exelon to support the revised CIP-010. Some requested clarifications and suggested revisions are offered below. CIP-010, R4.1-4.7: Applicability of the requirements should clearly apply to those Transient Cyber Assets and Removable Media (depending on sub-part) connecting to High and Medium BES Cyber Systems and their associated PCAs. Please consider revising the applicability column to read (depending on sub-part): Transient Cyber Assets/Removable Media connected to High and Medium BES Cyber Systems and their associated PCAs. CIP-010, R4.1 – Please clarify the expectations for authorization of users. Is this to be a list of individuals? If so, a list of names is an overly burdensome administrative task and a problematic compliance risk. The measures also do not seem consistent with the requirement language. The measure starts with the software or

configuration, while the requirement starts with users. The requirement logic should track with the measure by identifying the TCA first and then the authorization information. CIP-010, 4.1.4: Please clarify the expectations, if any, for tracking patch versions on a TCA and preapprovals required if 4.1.4 is updated per 4.6. “Defined acceptable use” in R4.1.3 is more relevant to security than the administrative nature of tracking patch versions. R4.1.4 should be stricken. CIP-010, R4.2 and R4.3 present a zero tolerance evidence challenge. Please discuss further the compliance evidence expectations. Exelon has no objection to being required to use methods to address malware on transient devices. Our concern comes in meeting the measures as written, which suggest evidence may be asked for each use of the process in each case. CIP-010, R4.4 – Clarification of the language is needed to distinguish between discovery of malicious code prior to connection and following connection of the device to a BES Cyber System. The relevant focus of the requirements should be on discovery of malicious code on connected devices and responsive mitigation. Consider revising R4.4: Mitigate the threat of malicious code detected during connection of Transient Cyber Assets and Removable Media. CIP-010, R4.5 is too rigid. Is the intent to require updating signatures prior to use? If so, consider modifying to read: Update signatures or patterns for those methods identified in Parts 4.2 and 4.3 that use signatures or patterns according to the Responsible Entity’s documented signature update process. CIP-010, R4.6 and R4.7 – While Exelon recognizes the added risk level associated with control centers, it’s not clear what circumstances these sub-parts seeks to capture in going beyond the intent of R4.1 and R4.2. Incorporating R4.6 into R4.1 and R4.7 into R4.2 may be warranted; however, this consideration should be given after thorough consideration of revisions to the proposed R4.1 and R4.2. Exelon understand that R4.6 seeks to apply an added authorization step for TCAs being connected to High Impact BES Cyber Systems and to Medium Impact BES Cyber Systems at Control Centers. Since this is associated with the authorization requirements in R4.1, it makes more logical sense to move this to R4.2. R4.7 seeks to allow latitude for Responsible Entities to make updates to TCAs according to a time schedule that may be dictated by other management practices other than a time just before use of the TCA. Exelon supports this flexibility. However, as currently written, the 35 days is more aggressive than for CIP-007, R2.2 and R2.3 that allow 35 days to evaluate and 35 days to install. Since both of these requirements apply to patching, the differences can limit the efficiency and effectiveness of an entity program that manages transient devices and BES Cyber Systems together. Please discuss the limitation of “per device capability” and any expectations for accommodating those without capability and/or any compliance expectations to demonstrate such capability. As presently proposed, Exelon finds the level of rigor placed on TCAs and RMs on par with that in CIP-007 applicable to permanent assets. The sentence in the rationale referencing the relative rigor should be removed.

No Commnet
Yes
Exelon supports removal of the IAC language from the 17 requirements and finds that this fulfills the Order 791 directive. Exelon continues to have questions regarding the RAI program and its fulfillment of the IAC intent.
No
The revisions to CIP-003, R2 are significant and as currently worded, represent a significant amount of work to implement the associated compliance program. The implementation plan should allow at least a year from the effective date of CIP-003-6. The Implementation Plan should make it clear that CIP-003-6, R2 will replace CIP-003-5 R2. The Implementation plan uses “months” and “calendar months”. Please clarify whether there is a difference between the two terms and, if no difference is intended, use one for consistency.
No Comment
Yes
Guidance: Exelon strongly encourages the SDT to write guidance to more fully explain the underlying intent of the requirement language. We recognize that guidance is not the same as the requirement language, but the information goes to the spirit of the requirement language and helps Responsible Entities establish their compliance programs to fulfill the requirements. Revision Development Timeframes: Exelon supports the SDT efforts to complete revisions in response to all four of the directive issue areas. In particular for the Low Impact asset requirements, completing the revisions will potentially enable Responsible Entities to implement the requirements with a clearer

understanding of the expectations and be able to do so once by skipping to implementation of V6. The Order 791-directed revisions are under development concurrent with industry work to implement the CIP Version 5 requirements, which is a daunting and resource intensive task. Iterative implementations are confusing and costly. RSAWs: (Restated from Q1) RSAWs are companion pieces to the CIP standard revisions. Unfortunately, the initial draft RSAWs didn't provide much clarity or relief from the zero defect compliance expectation; however, additional work on the RSAWs can help. Exelon strongly encourages the RSAW development team to continue their work and post revised RSAWs with next iteration of CIP revisions. RAI: Exelon supports the RAI concept and promise, but this is completely dependent on a greater understanding of and tangible experience with RAI. For Exelon and others, filling this gap may be essential for the passage of revised requirements, in particular for Low Impact assets. Regardless of the revisions, NERC has made commitments for RAI to be in effect in time for the CIP Version 5 implementation deadline. The revisions and RAI program components can work together. For instance, the IAC requirements may offer a useful vehicle to roll out to Responsible Entities the RAI aggregation concept to manage the requirements. As well, the Low Impact asset requirements are prime candidates to demonstrate how RAI can alleviate compliance concerns and create a reasonable approach to compliance for low risk requirement.

We generally agree with the approach that the SDT has taken, yet express the following concerns described below: Applicability The scope of dispersed generation in the applicability of this standard should be limited similar to that of PRC-005. We suggest the following be inserted within the section 4.2.2: "For dispersed power producing resources identified through Inclusion I4 of the BES definition, the only BES Cyber Systems that meet the low impact rating criterion 3.3 in Attachment 1 of CIP-002-5.1 are any shared BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of dispersed generation units from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or above and not at an individual turbine, inverter or unit level." Requirement R2 The scope of R2 should be appropriately limited by restoring the reference to the assets identified in CIP-002-5.1 R1 Part 1.3. Suggest the following revision to R2: "Each Responsible Entity for its assets identified in CIP-002-5.1 Requirement R1, Part 1.3 containing low impact BES Cyber Systems shall perform each of the applicable requirement parts in CIP-003-6 Table R2 – Low Impact Assets. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] Note: An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required. Lists of authorized users are not required." Subpart 2.4.1 Clarification is needed that an external routable protocol past is "external" to the asset identified in CIP-002-5.1 R1, Part 1.3 containing low impact BES Cyber Systems. Suggest revising as follows: "All routable protocol paths to and from the asset identified in CIP-002-5.1 Requirement R1, Part 1.3 containing low impact BES Cyber Systems, if any, must be through one or more identified access point(s)." Subpart 2.4.2 As written, there is an implication that the use of a firewall is prescribed, as the term "by default" is used. Suggest revising Subpart 2.4.2 to read "For each identified access point, if any, require inbound and outbound access permissions, deny all other access, and document access permission reasons individually or by group." Part 2.6 As written in this draft, the specificity of what must be covered and the tracking of two time periods are more prescriptive than the requirements for Medium or High Impact BES Cyber Systems. Suggest the following language: "Implement a security awareness program that reinforces cyber security practices at least once every 15 calendar months."
No
General agreement; however, we request that clarification be added such that it is clear that entities are not expected to enforce CIP-006 requirements on third party non-programmable components that are not within the control of the entity.
No
We generally agree with the overall approach; however, we have specific concerns as described below. R4 part 4.1 We are concerned that Part 4.1 creates unnecessary administrative burden. For example, authorization generally applies to users. A user of a Transient Cyber Asset should be

authorized to use the particular asset with certain software installed, for a particular purpose at a particular location(s). The way Part 4.1 is written suggests that four different authorization processes are needed: one for users, one for locations, one for acceptable use, and one for software/firmware. A requirement for four different processes for user authorization adds additional, unnecessary administrative record-keeping. This language should be edited to make it clear that only one user authorization process is required. Part 4.1 also appears to overlap with CIP-004-6 R4 Part 4.1 which also addresses authorization.
No
The proposed definition for BES Cyber Asset, in conjunction with the Guidance of the Guidelines and Technical Basis create risk of misinterpretation. While a BES Cyber Asset is defined to “affect the reliable operation of the BES”, the Guidance dwells on the concept of BES Reliability Operating Services. If users interpret that to “affect” reliable operation is to be unable to perform a BES ROS, then certain devices whose loss could immediately preclude the BES ROS would have to be classified as BES Cyber Assets even though they likely do not affect the reliable operation of the BES. We suggest clarification in the Guidance that ensures perfect alignment with the definition. “Removable Media” definition lacks clarity that the portable media must be connected to “applicable systems”. Consider the proposed modification: “Portable media, connected for 30 consecutive calendar days or less, to applicable systems. Examples of portable media that can be used to copy, move and/or access data include, include but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory. Removable Media are not Cyber Assets.”
No
While the SDT has removed the IAC language from these requirements in accordance with the directive, it nevertheless leaves the industry with an inevitable zero tolerance compliance enforcement paradigm, which is problematic, given that the new Reliability Assurance Initiative may not be in place. It is essential that compliance exception allowances be in place coincident with the removal of the IAC language from these 17 requirements.
Yes
There are references in the unmodified V5 Standards (CIP-002, 005, and 008) which continue to point to superseded versions of the modified Standards.
Group
Duke Energy
Michael Lowman
No
CIP-003: In Part 2.3 of the table, Duke Energy believes that it will be difficult for an entity to determine and monitor physical access points for Low impact BES Cyber assets. These access points may or may not exist for low impact BES Cyber Systems. We suggest the SDT consider requiring Low impact BES Cyber assets at Control Centers have a PSP in order to capture the intent of Part 2.3. In addition, we believe that requiring Low impact BES Cyber Assets to have the same control measures in place as Medium impact BES Cyber assets will become extremely burdensome for the industry and will provide little benefit to reliability. A distinction needs to be made between Medium and Low impact BES Cyber Assets. As an alternative, Duke proposes the following language for Part 2.4.2: "For each identified access point, if any, include the reason for granting access anywhere direct connectivity is allowed to or from the world-wide-web."
No
CIP-006: No comments CIP-007: We suggest the following revision to the Applicable Systems sections of Part 1.2 in Table R1-Ports and Systems: “High Impact BES Cyber Systems and their associated: 1. PCA; and 2. Nonprogrammable communication components used for the connection between applicable Cyber Assets within the same ESP and within a PSP. Medium Impact BES Cyber Systems at Control Centers and their associated: 1. PCA; and 2. Nonprogrammable communication components used for the connection between applicable Cyber Assets within the same ESP and within a PSP.” We believe this adds clarity on the expectations for nonprogrammable communication components.

No
CIP-010: (1)Duke energy suggests adding an additional bullet in the Applicable Systems section throughout CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection that states the following: • “A network within a PSP” We believe this is needed for consistency with the definition of Transient Cyber Asset. (2) We are unclear of the need to include 4.1.4 and 4.6 in Table R4. We fail to see the security and reliability benefit of this type of control method. As such, we suggest removing both 4.1.4 and 4.6 from the Requirements section of the CIP-010-2 R4 Table. CIP-004: No Comments
No
Duke Energy offers the following as an alternative suggestion for the definition of Removable Media: Removable Media: Portable media, directly connected for 30 consecutive calendar days or less, to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset that can be used to copy, move and/or access data. Examples include, but are not limited to, floppy disks, compact discs, USB flash drives, external hard drives, and other flash memory cards/drives that contain non-volatile memory. A Cyber Asset is not Removable Media. We believe the addition of “directly connected,” as well as items 1-3 provides more clarity and complements effectively the definition proposed for Transient Cyber Assets.
Yes
No
We suggest making the effective date of the Medium and High impact CIP standards enforceable on the same date(January 1, 2017). Also, we suggest that the Low impact CIP requirements should be enforceable one year later(January 1, 2018). The staggering of effective/enforceable dates as proposed, is confusing to industry stakeholders, and increases the likelihood of avoidable compliance violations. Whereas a consistent, across the board effective date, provides the clarity and consistency on the expectations for implementing the CIP Version 5 standards and revisions.
No
Yes
As stated above, we believe the CIP Version 5 standards and revisions should be effective on the same date for Medium and High impact requirements and a year later for low impact requirements. Again, we feel that having consistent effective dates may prevent compliance violations that can easily be avoidable.

While we agree that protecting access to cyber assets is a valuable and a needed direction to move, we don’t believe that the additional level requirements for “Low” assets aligns with the associated risk to the BES. If assets are “Low”, then providing basic physical security and some fundamental access controls meets and is in line with the risk that classified them as “Low”. While the drafting team has tried to show in the guidance what would be acceptable and what would not, in essence they have determined the “how” the requirement will be audited by showing only a firewall solution. There are other methods to control access to facilities. The intent as we read it of the FERC comment was to have BES assets removed from direct internet access. Better language might be drafted that has utilities address that challenge, rather than force access control with firewalls for ALL low assets. This is an enormous burden increase for utilities as there are thousands upon thousands of devices to be covered as low impact, all with minimal risk to the BES. The burden on utilities will be immense as these devices are not static, and must be maintained, patched, and replaced every few years.
No
The FERC order did not require the removal of the IAC language; it does allow us to modify the language. We should either work through a solution together or remove the standard requirements entirely that contain the IAC language. As an industry, we need to find a better tool for reliability than to rely on zero tolerance in standards. We are spending too much of our time on very minor issues and it is diverting our attention away from focusing on the basics of reliability. The CIP standards quickly replaced all other standards as being the most violated due to the zero tolerance language in the standards. We would not have voted for version 5 without the IAC language. We are voting no on this version because the IAC language is being removed. To simply give up and remove it, because we can’t find a better compliance approach is disheartening. Reliability Assurance is a step in the right direction; however it is an enforcement action and not a compliance action. Simply removing the IAC language and saying Reliability Assurance will take care of the minor issues is avoiding the compliance solution. Even with Reliability Assurance, any issue is still a violation. The RSAWs for the proposed CIP Standards identify, at least 89 times for requirements and sub-requirements, where the auditor should find a violation. Reliability Assurance may help simplify the process with enforcement, but it is still a compliance violation. IT IS STILL A VIOLATION!!! The IAC language was attempting to take low risk issues and allow an entity to identify them and fix them

without any enforcement actions. Compliance, to the areas where IAC language was inserted, was tricky in version three; so we added IAC to provide a compliance solution to the requirements where we were constantly chasing violations with no value to reliability. As an analogy from our daily vehicle driving experiences, imagine driving in a vehicle where the speed limit is 45 mph. You approach a speed limit sign of 55 mph. A police officer is standing 10 feet in front of the 55 mph sign, clocks you at 46 mph and hands you a ticket for exceeding the speed limit. You're busted – you did exceed the speed limit in a posted 45 mph zone, but what is the value of the speeding ticket? Now, add NERC compliance to the speeding example and we are expected to self report each time we slightly exceed the speed limit in the above example. The value to public safety isn't controlling the speed of a vehicle that is going one mile per hour above the limit ten feet in front of a speed limit sign, but to prevent someone from excessive speeds that endanger others. Our court system and law enforcement officers have understood this for many years. Why can't we, as an industry, introduce some common sense into our reliability standards and remove zero tolerance? We remember implementing Urgent Action Standard 1200 for cyber security. We implemented the Urgent Action Standard to provide us some time to develop a sound program for cyber security. Many years ago, the need for action in developing cyber security standards was so great that we put the Urgent Action Standard in place to provide protection while we developed the NERC standards. We have deleted most of the Urgent Action Standard documents, but we did find one from February 2004 (over ten years ago). We implemented version one of the CIP standards years later. We have now approved version five and all the previous versions had similar pressures. Version 4 of the CIP standards was replaced before it was even effective. Now, we are working on version six of the CIP standards and want it effective before version five will be enforceable. What are we doing? As an industry, we are trying to implement version five, while maintaining zero tolerance to version three, but we don't know what version six will require us to do, but it will have the same effective date of version five. Does anyone wonder why so many companies are struggling with the CIP standards? We don't need to speed this version of the CIP standards through the system just to have to fix it later, like we have done with all the previous versions. We need to take our time, take a step back and try to get it right this time. We are sensing a lot of frustration in our industry over cyber security standards. The recent expedited development of CIP-014 diverted all of our attention and efforts this year, leaving little time to develop changes to the other CIP standards. We haven't implemented version five of the CIP standards, but we are already changing them before we have any experience with version five. Our recommendation is to slow down and get it right and not just try to get it done.
No
If the language as written for CIP-003-6 Requirement R2 is passed and remains unchanged, then keeping the implementation date of April 1, 2017 is not reasonable and will be difficult if not impossible for utilities to meet. Implementing access control at substations where there is none currently (or it is not as restrictive as the standards ask for) has the potential to cause failures or outages if not implemented carefully. There are numerous assets and logistical locations that would need to be addressed. Secondly, for some locations, implementing these measures may require facility outages that must be planned and coordinated months in advance, particularly in shared facilities. Larger entities will be working in 2015 to implement the High & Medium requirements, and will not turn their attention to "Low" requirements until that work is nearly complete. The resources implementing those requirements are in many cases the same ones that will perform the "Low" work, and their attention cannot be split without the potential for error. Additionally, since these changes will not be approved by FERC until late 2014 at best, we believe the effective dates should be extended using a simple calculation. From the time Version 5 was approved, to the time the changes are approved by FERC, that time should be added to the implementation date. For example, if the changes are approved in November 2014, then we add 1 year to the implementation dates. We would also suggest to make the implementation dates the same for all standards, and not have different implementation dates. It is additional administrative burden for both the entity and the auditor to have to keep a detailed tracking sheet of when each requirement is "effective". Make them consistent and the same to remove the potential error trap created with the multiple effective dates.

ATC supports the current language, however, offers one suggestion for consideration. For consistency with the application of similar NERC Glossary terms used for higher applicable impact levels, ATC requests consideration of the addition of the word "interface" following the word "access point" where the term "access point" or "access point(s)" is used in Requirement R2 Part 2.4. in order to allow entities to identify with clarity where cyber ingress and egress controls are implemented for external routable protocol paths.

Low Impact assets: PacifiCorp seeks to clarify that the external routable protocol path referenced in CIP-003-6 requirement R2.4.1 is 'external' "to the asset identified in CIP-002-5.1 Requirement R1.3 containing low impact BES Cyber Systems" in the requirement. PacifiCorp also suggests that if the intent of requirement R2.4 is as suggested in the drawings provided in the Guidelines and Technical Basis, that additional language be placed in the requirement to align with the acceptable designs indicated in those drawings.
No

No
No
Transient Cyber Assets: PacifiCorp understands that the CIP-010-2 requirements are intended to apply to Transient Cyber Assets and Removable Media. Accordingly, to heighten clarity for the industry, PacifiCorp recommends that the Applicable Systems for CIP-010-2 requirements should be revised as follows: “Transient Cyber Assets directly connected (and/or as applicable by subpart) Removable Media connected to Medium (or High) Impact BES Cyber System…”, similar to the precedent for PACS in CIP-006-5 R1.1. PacifiCorp also recommends that the standards drafting team modify the requirement of “authorize” in CIP-010-2 requirement R4.1 to “document” as authorization implies additional administrative burden not even necessary for all of the applicable systems themselves.
No
Identify, assess, correct: It is PacifiCorp’s understanding that compliance exceptions and other Reliability Assurance Initiatives concurrently being developed by NERC are expected to adequately and appropriately address the industry’s zero defect concerns in place of the “identify, assess and correct” language that was removed by the 2014-02 standards drafting team. PacifiCorp believes that responsible entities deserve some certainty from NERC of the near-final or final form of these compliance exceptions and the mechanics to avail themselves of these exceptions, from a compliance and enforcement perspective, before they have to vote on these revised standards such that the industry can feel confident their concerns are being addressed.
No
No
Yes
Communication networks: PacifiCorp appreciates the standard drafting team’s revisions in relation to communication networks and does not have any suggestions for improvement of the draft language.

The City of Tallahassee (TAL) feels that Part 2.4 does not adequately illustrate the measures necessary to prove compliance to the part 2.4.2 requirement. The term ‘representative sample’ needs to be defined specifically. Does this imply a sample of rule sets from more than one access point? A sample of the rule set from a single access point? If more than one access point is identified, then would the entire rule set, or only a partial rule set from a single access point qualify as a representative sample? There can be no ambiguity when direct evidence is required as proof of compliance. Part 2.4.1 states that all external routable protocol paths, if any, must be through one or more identified access point(s). Evidence includes documentation of these paths through identified access points. If there is no requirement to discretely identify low impact BES Cyber Systems, then how can we be expected to provide evidence for this requirement when we are not required to identify the access point in the first place? External routable protocol paths imply the existence of an electronic security perimeter, a specific set of connected assets that form a basis for a defined network structure. There is no language in this requirement to identify an electronic perimeter, therefore no conceptual reason to identify an access point with routable protocol paths that may or may not be external to an undefined barrier. The language of this particular requirement and the measures required to prove compliance are extremely vague. Parts 2.1 – 2.3, and 2.5 are sufficient to address FERC Order No. 791 paragraphs 106-100, and clearly provide substantive objective criteria to sufficiently measure an entity’s protection of low-to-no impact cyber assets. Requiring entities to identify assets (access points) where asset identification is clearly stated as unnecessary, and provide representative samples of configurations for these unidentified assets, assets that function as external access gateways to an undefined electronic security perimeter, could create an unnecessary quagmire of compliance effort. Under the section Guidelines and Technical Basis for part 2.4 it states that the Responsible Entity must have implemented processes that

include the external routable protocol and Dialup connectivity paths to the BES asset such that the low impact BES Cyber Systems located at the BES asset are protected. There is an assumption made here that at least one or more external routable protocol and/or Dialup connectivity paths exist and those access paths are being utilized to communicate directly with the asset from a remote location. This language should be rewritten to match the requirements in Part 2.4 – removing any unnecessary ambiguity with regard to direct communications pathways vs. other reasons for necessary connections via remote communications paths; e.g. “The Responsible Entity must have implemented processes that include the external routable protocol and Dialup connectivity paths, if any, to the BES asset such that the low impact BES Cyber Systems located at the BES asset are protected.” Furthermore, the following sentence should be rewritten to state, “In cases where external connectivity is used to gain access to any low impact BES Cyber System at a remote site, electronic access controls should address the risk of using external connectivity.” The final two sentences in this paragraph contain references to ambiguous concepts such as collection and aggregation, without stating specifically what kind of information might be collected and/or aggregated. TAL’s contention is that these two sentences add nothing to the explanation and should be removed entirely. They state that these access controls are required to protect the collection and/or aggregation of low impact BES Cyber Systems, or the collection and/or aggregation of data pertaining to them, or what specifically?
Yes
No
Part 4.3 is identical to Part 4.2. TAL suggests collapsing 4.3 into 4.2 to include ‘prior to use on applicable systems’. Both requirements are obviously meant to be done prior to use on applicable systems (intent of the standard in the first place), so there is no point in stating the same requirement twice. If the intent of this revision is meant to protect applicable systems, then the only requirement necessary is 4.3. If both requirements must stay, then remove the word ‘detect’ from 4.2 as detection is required prior to use as part of 4.3. It makes the most sense to collapse the two requirements into one and adjust the Measures language to include hardening policies and scanning techniques as part of the traditional antivirus … example.
Yes
No
TAL has no recommended alternative approach as the original IAC language in the standard identified with a need to change industry perception of the spirit and intent of Critical Infrastructure Protection Reliability Standards to concentrate effective proactive compliance efforts towards identifying and correcting deficiencies rather than being focused on the fact that violations for those deficiencies may exist and subsequently turning the workplace into a reactive, audit documentation mill. The many changes in Violation Severity Levels in the revised standard will effectively result in potential violations regardless of any effort (or lack of effort) on the part of the entity to mitigate those violations. Now, with the IAC language removed, entities are no longer provided a much-needed greater degree of flexibility in detecting and remediating low-risk violations. All and any interpretation of the standards has been placed into the hands of auditors, which contributed to endless anxiety on the part of the entities with prior CIP versions. FERC stated concern over the broad and ambiguous nature of the IAC language as sufficient reason to force NERC to improve upon how the (IAC) language was written. As a result, NERC decided to assume that the enforcement process for low-risk violations would be unworkable, and remove the language altogether. This effectively disenfranchises the entity throughout the compliance auditing process.
No
Given the nature of the removal of the IAC language which results in a measurable change in how compliance programs would function under the new standard, FERC should issue an order to extend the effective date at least another full 6 months for each standard/requirement for which a modification to the language was made.

The proposed CIP-003-6 has language that is sometimes inconsistent with the larger framework of the CIP Standards. MMWEC suggests moving the requirements for security controls for BES Cyber Assets associated with Low Impact assets to the appropriate CIP Standards (CIP-004, CIP-005, CIP-006, CIP-008) and revising the language to more closely align with requirements for Medium and High Impact BES Cyber Systems. Additional table entries for applicability to groups of Low Impact BES Cyber Assets should be created as needed. To assist Responsible Entities that only own BES Cyber Systems associated with Low Impact assets, NERC should publish a guidance document that identifies Standards and Requirements that apply to Low Impact BES Cyber Systems. Comments specific to CIP-003-6 2.4 - By avoiding the concepts of Electronic Security Perimeters and Electronic Access Points, requirement 2.4 becomes difficult to interpret and less effective at protecting BES Cyber Systems from unauthorized access. We suggest more closely aligning the requirements for electronic access control with CIP-005-5 requirements for Medium and High Impact assets and moving the requirements to Standard CIP-005. This may require additional requirements, such as the identification of ESPs and EAPs. This may require Responsible Entities to expend more compliance effort than is currently proposed in CIP-003-6 R2.4. The Implementation Plan for these requirements should phase in enforcement over five years in order to address the challenges faced by Responsible Entities with large numbers of geographically dispersed Low Impact assets. This approach has been used in other NERC Standards that affect a large number of assets. (Examples include MOD-025-2, PRC-024-1, PRC-019-1 and others.) The Implementation Plan should require an increasing percentage of Low Impact assets to be compliant each year. Most Responsible Entities know the network architecture and communications capability of BES Cyber Systems associated with Low Impact assets. However, it will take time and resources to sufficiently document and, in some cases, implement additional cyber security controls on those BES Cyber Systems in order to be fully compliant with more stringent CIP Standards. A phased in approach to implementation plan will steadily increase the security of BES Cyber Systems over time.
Yes
MMWEC supports the changes to CIP-006 and CIP-007. However, CIP-006-6 should also include requirements for BES Cyber Systems associated with Low Impact assets.
No
MMWEC supports the comments submitted by SMUD regarding CIP-010 and Transient Assets. Also, CIP-004 should include training and awareness requirements applicable to BES Cyber Systems associated with Low Impact assets.
No
The definition for Removable Media should not be restricted to "portable." Also, the examples are unnecessary. Suggest the definition should be as follows - "Data storage media, connected for 30 consecutive calendar days or less, that can be used to copy, move and/or access data." The definition for Transient Cyber Asset should not include examples. Suggest the definition should be as follows - Transient Cyber Asset - A Cyber Asset directly connected for 30 consecutive calendar days or less, to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset.
Yes
No
The Implementation Plan for requirements for BES Cyber Systems associated with Low Impact assets should phase in enforcement over five years in order to address the challenges faced by Responsible Entities with large numbers of geographically dispersed Low Impact assets. Entities with smaller numbers and Control Centers should be 100% compliant sooner than five years. This approach has been used in other NERC Standards that affect a large number of assets. . (Examples include MOD-025-2, PRC-024-1, PRC-019-1 and others.) The Implementation Plan should require an increasing percentage of Low Impact assets to be compliant each year. Most Responsible Entities know the network architecture and communications capability of BES Cyber Systems at Low Impact assets. However, it will take time and resources to sufficiently document and, in some cases,

implement additional cyber security controls on those BES Cyber Systems in order to be fully compliant with more stringent CIP Standards. A phased in approach to implementation plan will steadily increase the security of BES Cyber Systems over time.
Yes
Standards CIP-005 and CIP-008 should be revised to include requirements applicable to BES Cyber Systems associated with Low Impact assets.

Tampa Electric Company (TEC) participated in the development of Edison Electric Institute's (EEI's) comments on the Project 2014-02 CIP Version 5 Revisions and supports the comments as submitted by EEI for CIP-003 R2. TEC also supports the philosophy to provide objective criteria for CIP-003, Requirement R2 and recognizes the need to distinguish terminology in use for R2 from official NERC Glossary of Terms used in the other CIP Standards. For CIP-003, Requirement R2 Part 2.5, TEC recommends a rewrite; it is confusing to use the defined term Cyber Security Incident and Reportable Cyber Security Incident given that the definition only applies to one of the two scenarios that might identify an incident. Proposed alternative language: Utilize one or more programs to address the Registered Entity's ability to detect and respond to compromise of Low Impact BES Cyber Systems that may be discovered during the course of normal operations. If any deliberate or intentional disruption is discovered, the Entity should notify the Electricity Sector Information Sharing and Analysis Center (ES-ISAC). At least once every 36 months, test the program used to detect and respond to compromises, conduct a lessons learned or after action discussion, and revise the program to address lessons learned or after action items. If CIP-003, Requirement R2 Part 2.5.6 remains as it stands, TEC recommends removal of the word paper to allow for other types of drills. For CIP-003, Requirement R2 Part 2.6, TEC recommends removing the language at least quarterly and changing the frequency to annual. We do not see that the risk related to the BES from personnel at locations with Low Impact BES Cyber Systems as deserving of the quarterly frequency.
No
For CIP-006, Requirement 1 Part 1.10, TEC considers that the second bullet monitoring the status of the communication link and issuing an alarm or alert is duplicative of the requirements that TEC follows in support of the reliable operation of the BES, specifically as required for COM-001-1.1 R1.1 (provide adequate and reliable telecommunications facilities including internally) and R2 (manage, alarm, test and/or actively monitor vital telecommunications facilities and equipment). TEC considers this requirement part of day to day operation of the Bulk Electric System and not prima facie evidence of a cyber security incident. Alternatively, TEC recommends changing the language of the bullet as follows: Where physical access restrictions to such cabling and components cannot be established, the Responsible Entity shall deploy and document alternative measures such as encrypting data that transits such cabling and components; or monitoring the status of the communication link composed of such cabling and components and issuing an alarm or alert in response to detected communication failures to appropriate personnel (such as those identified in the BES Cyber Security Incident response plan, Grid Operators within the Control Center, or other individuals charged with responding to the alarm or alert) within 15 minutes of detection.
No
Tampa Electric Company (TEC) participated in the development of Edison Electric Institute's (EEI's) comments on the Project 2014-02 CIP Version 5 Revisions and supports the comments as submitted by EEI related to CIP-010 R4 and CIP-004 R1, Part 2.1.9. In addition, TEC provides the following comments for consideration. TEC appreciates the efforts of the SDT to address the FERC Directives for transient devices drafted for CIP-010, Requirement R4. The language in Requirement 4.1 indicates that the authorization is taking place prior to the initial use which is a reasonable expectation. The Guidelines contain the following clarification : For purposes of this standard, "use" is considered to be the interaction between transient devices and applicable systems. The interaction between transient devices and multiple applicable systems within the same ESP or PSP would be considered a single use. This language in the Guidelines implies that R4 would need to be applied when a device moves between PSPs. This would have the potential to negatively impact the reliable

operation of the BES. Field technicians may be working on issues in one substation and get called to another location to address trouble tickets. Since these substations are not connected to the corporate network (and definitely not connected to the Internet), it would slow the process down if the technician needed to report back to a central location to validate the Transient Device between PSPs. TEC recommends clarification of the Standard and Guidelines to allow for a Transient Device to be validated on a periodic basis instead of on a per use basis between PSP or ESPs. For CIP-010 R4, Parts 4.3, 4.4 and 4.5, TEC is concerned that not all devices will be able to provide the documentation suggested in the RSAW related to the date Removable Media was used and provide adequate documentation related to the method used to detect malicious code. If there is no External Routable Connectivity, TEC is concerned that this requirement would necessitate the introduction of External Routable Connectivity to remote locations to support kiosks or other scanning devices along with expensive system upgrades in order to scan, update, log/track when the removable media was used, comply with this Requirement. The SDT should add the “per device capability” to CIP-010-2 R4 Part 4.3 to address device limitations. Similarly, TEC is also concerned there may be issues with the updates to the signatures under CIP-010 R4 Part 4.5. Since the Removable Media may be infrequently connected to either the corporate network or within a NERC ESP, we will have challenges in updating and tracking the date of A/V signatures on these devices. TEC is also concerned that not all types of Removable Media (Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.) can provide the ability to detect malicious code. TEC recommends that the subpart be updated to include the per device capability language used in other standards; this is implied in the Guidelines where the language includes the following: Part 4.5 requires a process to update signatures or patterns, where applicable. TEC recommends clarification of the Guidelines to allow for Removable Media to be validated on a periodic basis instead of on a per use basis. CIP-010-2 R4.7: For an entity-managed device, the entity can evaluate and apply the patches monthly and not have to evaluate prior to each use. TEC recommends the SDT include potential measures that would be appropriate to vendor Transient Cyber Assets and Removable Media.
Yes
Yes
While TEC is a strong supporter of the Identify, Assess, and Correct (IAC) deficiencies approach to NERC CIP compliance, we recognize the challenge of creating objective measures for the implementation of such a program. Therefore, we agree with the SDT direction to remove the IAC language as proposed. Our understanding is that the approach under consideration is the Reliability Assurance Initiative. There is a need for transparency and open dialog between NERC and Registered Entities related to implementation of the RAI. We expect the RAI to be finalized prior to final ballot to address the current zero tolerance compliance approach that the identify, assess, and correct language intended to address. TEC also recommends that the SDT consider a potential approach to address the removal of the IAC language via the Violation Severity Levels for a future revision, possibly adding thresholds to different levels.
Yes
Not applicable to TEC
Yes
TEC greatly appreciates the work of the Standards Drafting Team and the NERC staff. We support the efforts to have a consolidated revision to cover both the date sensitive and other FERC directives in a single filing. In addition, TEC respectfully requests the SDT consider the adoption of conforming changes in CIP-002, CIP-005, and CIP-008 to address the effective dates and version numbers in the background section to provide consistency.

Yes
Regarding CIP-006-6 requirement part 1.10, ERCOT requests a CIPC guideline on acceptable encryption protocols, methods, and key management. This could help auditors better understand acceptable practices and reduce the opportunity for individual interpretations by the CEAs. The language, “an equally effective logical protection” can be considered too vague and open to interpretation. Request that the language be modified as, “a compensating measure that provides an equally effective level of logical protection as the items listed above”.
Yes
None.
No
There appears to be a gap in the requirement language regarding media that is connected longer than 30 days (i.e.: permanent asset). Since it is not programmable, it would not qualify as a Cyber Asset and subsequently not become a BES Cyber Asset or BES Cyber System. There are situations where these types of devices are needed permanently, (e.g.: software licensing dongles, flash/USB drives storing bootable image files for appliances, etc.). Request that the 30 day duration be removed from the definition and require CIP-010-2 Parts 4.2 and 4.3 for all removable media. If the definition of Removable Media continues to be limited to 30 days, request a modification of the definition to address what the media is plugged into, similar to Transient Cyber Asset. Recommended definition: “Portable media, connected for 30 consecutive calendar days or less to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset, in order to copy, move and/or access data.” Also, recommend the definition be modified to as: “Removable Media is not a Cyber Asset.”

The “external routable protocol paths” language in Requirement 2.4 requires entities Low Impact Cyber Systems to provide and comply with “some form of electronic security perimeter,” regardless of risk to the Bulk Power System/Bulk Electric System. Compliance to this requirement would be excessive given the risk associated with Low Impact rated BES Cyber Systems. The language in the CIP Requirements is confusing. On one hand, entities would be required to identify, maintain and comply with “some form of electronic security perimeter” (ESP) for Low Impact rated BES Cyber Systems, on the other, CIP Version 5 (or the proposed Revisions) states that “An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required.” This is contradictive at best and should be clarified. Recommend language changes to address only Low Impact Systems which have direct internet access. Recommend adding language which assesses risk to Low Impact BES Cyber Systems with “external routable protocol paths.”
Yes
No
No
It would make more sense if the implementation were after the CIP Version 5 Standard implementation dates.
Yes

Yes
Recommend that the CIP Standards be aligned with Risk to the BES and that the object of the Standards be clarified. In many cases the SDT refrains from clear language so as not to dictate a particular approach. This leaves the interpretation up to Entities and Auditors who don't share the same perspective. We recognize and appreciate that SDT doesn't want to dictate activities. If the risks being mitigated are clearly understood that could provide the necessary clarity without eliminating varied approaches including technological advances.

The current wording of CIP-003-6 R2 Part 2.4 should be revised to align more closely with the definition of External Routable Connectivity. Suggested wording: “2.4.1 All bi-directional external routable protocol paths must be through one or more identified access point(s).” If the suggested wording is accepted by the drafting team then the Guidelines and Technical Basis should be revised as well to include the bi-directional clarification. The measure for item 2.4.2 should be revised to remove data diodes. A data diode is not an access point to a low impact BES Cyber System if it is configured in a manner that only transmits information outside the BES Cyber System. There are no inbound access permissions that can be applied since the device is hardware limited. Documenting how outbound traffic is sent provides no security benefit to the BES and would be an unnecessary administrative burden. The current wording of Part 2.6 could be read as a quarterly requirement for the reinforcement of cyber security practices and the 15 calendar month enforcement of Parts 2.2, 2.3, 2.4, and 2.5 above. This wording is more prescriptive than the wording for high and medium impact BES Cyber Systems. The wording should be revised to better align with the CIP-004-5 R1 Part 1.1 wording. This would give the entity the flexibility to determine what items need to be included in its security awareness program based on the current threat environment or detected lapses in cyber security practices. Suggested wording for the 2.6 Requirement – “Implement a security awareness program(s) that reinforces cyber security practices at least once each calendar quarter.” In addition, the wording is confusing in 2.3 – 2.4. If the site has a defined physical boundary (DPB) are the devices outside of the DPB in scope if they are low? Is it possible to define a DPB inside of a building as a site versus the whole site?
No
CIP-007 R1 overlaps with CIP-010 R4. We suggest removing the language from CIP-007 R1.
No
Requirement R4 represents a significant administrative burden. The fact that Transient Cyber Assets and Removable Media are not connected for extended periods of time to a BES Cyber System makes the automated logging and tracking of these devices impractical. To make this a more manageable requirement with less administrative burden Requirement Part 4.1 should be removed or modified to apply to medium impact BES Cyber Systems with External Routable Connectivity. This would align the requirement part with CIP-004-5 regarding the authorization of user access. User authorization is only required for high impact and medium impact with External Routable Connectivity BES Cyber Systems. The authorizing and tracking of Transient Cyber Assets will add a significant documentation burden with minimal increase to cyber security. The most significant threat Transient Cyber Assets pose to BES Cyber Systems is the potential to be a gateway to introduce malicious code. Requirements Parts 4.2, 4.3, and 4.4 should be sufficient to address these concerns on high and medium impact BES Cyber Systems without adding a significant administrative burden. Requirement Part 4.4 appears redundant to CIP-007-5 Requirement 3 Part 3.2. The current wording reads as if the threat of detected malicious code on high or medium impact BES Cyber Systems be mitigated. Suggested wording: “Mitigate the threat of detected malicious code on Transient Cyber Assets and Removable Media associated with or that could be connected to applicable systems.” This will make it clear that the mitigation actions in regards to Part 4.4 need to be conducted on the Transient Cyber Asset and Removable Media. Requirement Part 4.7 suggested wording: “Evaluate Transient Cyber Assets prior to use for security patches related to Part 4.1.4. For security patches that are not up to date take one of the following actions:…..” In addition, AEP would recommend highlighting or separating out the unique differences between these requirements and the ones

earlier in the CIP-010 standard. Also, do the devices have to be dedicated to the ESP and not used on other networks?
Yes
It is unclear why TCAs are being associated with Removable Media in the standard.
Yes
Yes
As long as the timeframe for implementing Low impact systems is not shortened, and the guidance is released with significant time to bring the Low impact systems into compliance.

The addition of more objective criteria for Low impact BES Cyber System Requirements within CIP-003-6, R2, breaks one of the prime objectives defined when CIP version 5 was being developed that each of the Standards could stand on its own. For entities with Low “and” either Medium or High Cyber BES Cyber Systems, it would be necessary that CIP-003 “always” be referenced when any of the requirements in CIP-004-6 through CIP-011-2 when the Medium and High impact BES Cyber Systems are being designed and implemented, since dependencies are always possible between BES Cyber Systems and the parts of any impact category. It is customary in other control objective families to present controls together, but identify whether there are different impact levels. The CIP standards have implemented this approach using the Applicable Systems table. SMUD appreciates the concerns from smaller Low impact only asset owners that there is far more requirements for Medium and High impact assets than there is for Low impact. Without sacrificing the integrity of maintaining the control objectives together and facilitating a directed set of controls to the Low impact owners, SMUD would recommend to NERC to develop specific targeted outreach documents for these entities that present just the Low impact asset control objectives in a more simplified manner. For example, at SMUD we have different groups that manage certain types of devices such as Electronic Access Control and Monitoring Systems (EACMS). We have created a presentation of a subset of Requirements and Requirement parts that just cover the EACMS so that those subject matter experts have a document for just those items that affect the applicable systems they manage. Additionally, to support this approach from an audit perspective, specific RSAWs could be created for the Low impact requirements that reduce the number of RSAWs that need to be completed by the entities. The inclusion of these objective requirements with a unique table in CIP-003-6 result in Standards language inconsistencies that creates confusion and additional compliance risks. A new definition is now needed for CIP-003-6, R2, Requirement Part 2.4 for the phrase “external routable protocol paths” to ensure that entities and auditors clearly understand the differences between that phrase and the defined term External Routable Connectivity. This would avoid duplicating the confusion seen in earlier versions of the CIP Standards, such as the CIP-002 confusion between Facilities and facilities. The phrase “external routable protocol paths” may create a similar interpretation risk. SMUD recommends that the language added to CIP-003-6, table R2 for Low impact assets be moved to the specific tables in each of the Standards CIP-004-6 through CIP-011-2 where applicable. Specifically, SMUD recommends the following: 1. CIP-003, R2, be modified to return the policy language to: “Each Responsible Entity for its assets identified in CIP-002-5, Requirement R1, Part 1.3, shall implement one or more documented cyber security policies that collectively address the following topics, and review and obtain CIP Senior Manager approval for those policies at least once every 15 calendar months. 2.1 Cyber Security Awareness; 2.2 Physical

Security Controls; 2.3 Electronic access controls for external routable protocol connections and Dial-up Connectivity; and 2.4 Incident Response to a Cyber Security Incident." This allows the entity to develop specific policies that are relevant to these areas; which is consistent with the intent of the CIP-003 standard. The objective criteria is then moved into the relevant CIP standards. SMUD believes that there needs to be guidance included for entities that also have Medium and/or High impact facilities that acknowledges a separate set of specific policies just for Low Impact is not necessary. Entities are permitted to leverage the policies for Medium Impact and/or High Impact and add the Low Impact applicable requirements. 2. CIP-003, R2, Part 2.1 would be removed and rolled into the Requirement 2 language. 3. CIP-003, R2, Part 2.2 would have Low Impact BES Cyber Systems added to CIP-006, R1, Part 1.1 Applicable Systems table. 4. CIP-003, R2, Part 2.3 would be added to the CIP-006, R2 Visitor Control Program table with a new Part applicable to Low Impact BES Cyber Systems. 5. CIP-003, R2, Part 2.4 would be added to CIP-005 as a new Requirement 3 with each of the current 2.4.1 – 2.4.3 as new Requirement Parts. 6. CIP-003, R2, Part 2.5 would have Low Impact BES Cyber Systems added to the CIP-008 standard maintaining the 2.5.6, 36 calendar month timeframe specific to Low Impact BES Cyber Systems. Additionally, for the existing CIP-008, R3, Requirement Part 3.1 extending the 90 date update cycle for Medium and High Impact BES Cyber Systems to 180 days for Low Impact BES Cyber Systems. For incident response, the SDT presented all but three of the CIP-008 Requirement Parts: 2.2 – Use the Cyber Security Incident response plans(s); 2.3 – Retain records related to Reportable Cyber Security Incidents; 3.1 – set an update frequency to the Plan. SMUD believes that requiring these three other Parts do not impose a significant burden for entities with Low Impact BES Cyber Systems. SMUD believes extending the update cycle for Part 3.1 to 180 days for Low Impact BES Cyber Systems is an appropriate timeframe based on the risk to the BES. 7. CIP-003, R2, Part 2.6 would be added the CIP-004, R1 Security Awareness Program table with a new Requirement Part 1.2 applicable to Low Impact BES Cyber Systems. The language would be updated to read: "Security awareness that, at least once each quarter, reinforces cyber security practices (which may include associated physical security practices)." The proposed language from CIP-003, R2, Part 2.6 created a higher performance requirement than for Medium and High Impact BES Cyber Systems by requiring the specific Low Impact BES Cyber Systems items to be specifically covered each year. 8. With the addition of the CIP-003, R2, Part 2.4 requiring an "access point" for Low Impact BES Cyber System, the exemption for Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters" in the Introduction section, number 4.2.3, Exemptions needs to be updated to include Low Impact BES Cyber Systems since Low Impact BES Cyber Systems do not require an Electronic Security Perimeter, but it still needs to be clear that the stated exemption is still in place for the Low Impact BES Cyber Systems.

Yes

No

SMUD prefers to remove CIP-010, R4, Requirement Part 4.1.4 requiring the maintenance of "operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability) as well as the corresponding Requirement Part 4.6 to "evaluate the Transient Cyber Asset." SMUD believes that this is a list making administrative activity. Requirement Part 4.1.3 has already established a "defined acceptable use" for Transient Cyber Assets that establishes how these assets are to be used within the Responsible Entity. Transient Cyber Assets are not expected to be treated like a BES Cyber Asset or associated Protected Cyber Asset considering the use of these assets may be subject to ownership by a contractor or vendor where obtaining all of this information may not be possible. SMUD supports the use of inventory, assignment, acceptable use, malicious software prevention and patching for these assets as reasonable controls to ensure the devices reduce the risks posed to BES Cyber Systems. If CIP-010, R4, Requirement Part 4.1.4 is not removed, SMUD requests that the language be aligned with CIP-010, R1, Requirement Part 1.1.1 to state "Operating system(s) (including version) or [emphasis added] firmware where no independent operating system exists." As presented, the CIP-010, R4, Requirement Part 4.1.4 is a greater expectation than the source Requirement Part. SMUD is concerned with CIP-010, R4, Requirement Part 4.7 and an interpretation that entities would have to track both the 35 day update timeframe and each use to be able to show performance to the Requirement Part. SMUD does not believe that the tracking of use is the key outcome of this Requirement Part; instead it is the patching of the Transient Cyber Asset that is the expected outcome. SMUD requests guidance be

included to clearly state that the tracking of each use is not expected to be maintained, but that there is evidence associated with a 35 day review. One approach to removing use is that for those entities that only use their transient devices a few times a year, they can assess for patches “once every 35 days,” but prepare a mitigation plan that they will install the patch at the next use and assign a date for the mitigation plan. This does not impose the tracking of use related to transient devices and accommodates both approaches for those entities that have included their transient devices within their normal security patch processes and those entities that only use their transient devices on an irregular schedule.
No
SMUD supports the need for definitions associated with Removable Media and Transient Cyber Assets. In reviewing the proposed definition for Removable Media, SMUD believes additional clarity is needed to ensure the definition encompasses the appropriate components. SMUD requests removing the word “portable” from the beginning of the definition and adding “capable of removal without powering down the system” to the beginning of the definition. This removes a need to create a further definition of “portable” and ensures the equipment such as hot-swappable hard-drives are also included. The full requested text of the definition is below. “Removable Media: [delete:"Portable"] Media [add:"capable of removal without powering down the system,"] connected for 30 consecutive calendar days or less, that can be used to copy, move and/or access data. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory. A Cyber Asset is not Removable Media.”
Yes
SMUD supports the SDT removal of the IAC and fully supports the efforts of NERC to develop the Reliability Assurance Initiative (RAI) program. SMUD supports the shift from a zero-defect enforcement approach to a risk based method and providing alternative paths of enforcement.

There is concern regarding the faxct that the physical security requ9rements for lown mpace cyber sysrtems were put into CIP003 rather than CIP006. As we have seen repeatedly in the past, breaking up similarlysituated provisions into different CIP standards creates an interpretative and

administrative burden. It would be recommended that all physical security requirements should be in CIP006 to eliminate any confusion.

Karin Schweitzer
Texas Reliability Entity
No
All of the criteria in Table R2 are procedural with no performance requirement regarding the inventory of low-impact BES cyber systems. Texas RE recommends that specific performance requirements be added.
No
CIP-006, Requirement R1 Part 1.10--the requirement contains language that is not clear and therefore does not pass the test for NERC's "Acceptance Criteria of a Reliability Standard," item 8. The requirement of "an equally effective logical protection" is ambiguous and does not lend itself to a consistent interpretation of the required performance. If a responsible entity chooses to implement what it considers to be "an equally effective logical protection" (since it is only required to implement one item listed in Part 1.10), it is possible that a reliability benefit will not be achieved.
No
CIP-010, Requirement R4--it is unclear if the word "policies" in the Measures section of Requirement 4.2 is intended to mean application policies or a written policy that requires someone to take a certain action. Texas RE recommends that the SDT clarify the use and intent of this term.

The SRC & SWG agrees in general with the requirement approach. Additional considerations below: CIP-003 R2 • p. 8, Since the phrase “external routable protocol path” has significance in the applicability of this standard and has a peculiar meaning, it should be added to the NERC glossary. • p. 8, “The Standard Drafting Team (SDT) intent in using the phrase ‘external routable protocol paths’ is to focus only on the paths to the low impact BES Cyber Systems and not the paths to other networks (e.g., corporate paths).” Does this imply that the phrase does not account for paths from the low impact BES Cyber Systems? • p. 8, “for its assets containing low impact BES Cyber Systems”. What does “containing” mean in this context? The asset is a BES Cyber System or is not. It does not “contain” a BES Cyber System. Suggest changing it to “for its assets that constitute BES Cyber Systems.” There should also be a comma following “[e]ach Responsible Entity” and “BES Cyber Systems” in the first sentence. • R2 Note on page 9 – If a list of low impact BES Cyber Systems is not required, how can this requirement be audited? This statement worked for a policy, but not for the new sub requirements, which must be “performed.” • Table R2 contains a scaled-down cross-reference to other requirements. This should be accomplished by adding “Low Impact BES Cyber Systems” in the Applicable Systems column of applicable requirements rather than setting apart a separate set of requirements for low impact BES Cyber Systems. • R2.5 – Will this require a separate plan or can it be addressed in the CIP-008 plan? Please explain in rationale or guidance.
Yes
The SRC & SWG agrees with the requirement approach. Additional considerations below: CIP-006 R1.10 • Use of encryption should be restricted to approved protocols and methods. Should there be requirements around key management? How will this be audited? • It is not clear in the Requirement text whether an entity can simply choose not to implement physical access restrictions or if it must demonstrate that it cannot for some reason. Although the text leaves open the possibility that physical, as opposed to logical, protections are optional, the phrasing can also be read to imply that restricting physical access is a preferred or default measure. Although the accompanying guidelines state explicitly that entities may implement physical or logical measures, the requirement itself is not as explicit • It is not clear how Regional Entities will assess whether a logical protection is “equally effective.” Will the REs defer to an entity’s judgment, or will there be a process by which entities can receive assurance that a logical protection is sufficiently robust to be “equally effective”? If entities must wait until their next audit to find out whether a measure is equally effective, they may simply ignore this option despite being permitted to develop such measures. More guidance should be provided on what is acceptable (pp. 36-37)
Yes
The SRC & SWG generally agrees with the requirement approach. Additional considerations below: CIP-010 • R4.1 Authorization should include purpose for connecting the TCA, start date/time, duration, and which ESPs the TCA is authorized to connect to. Also, the “caution” on p. 42 should be woven into the requirements that TCAs must be configured not to allow network bridging via wireless or blue tooth. It should be a required configuration check prior to connection. • In Requirement 4, Part 4.1.4, the term “intentionally installed software” is vague. For instance, the accompanying guidance suggests that “notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software” are not intended to be listed in the authorization of a Transient Cyber Asset. However, such an exception is not evident from the requirement language itself. Instead, the term “intentionally installed software” could be reasonably interpreted as covering all software on a Cyber Asset other than malware or other malicious programs. We recommend that the phrase be revised to provide greater specificity with regard to the types of software that should be included in the authorization. • R4.3 Why is there no “deter” or “prevent” for Removable Media? These are required for TCAs. • Malware should be grouped together in CIP-007, not split up in different standards. • In Requirement R4.4, the phrase “mitigate the threat” is ambiguous. For instance, it is unclear what constitutes mitigation after malicious code is detected or what the timeline for such mitigation is. (On the latter point, the current language does not even require that such mitigation be completed prior to use.) We recommend that a specific outcome for such mitigation be clearly expressed as well as language indicating the required timing of such mitigation. • R4.6 – This remediation or updating should be done prior to use as well. Should be more explicit. Could be a loophole. • In

Requirement R4.7, it is unclear whether a single evaluation within 35 days prior to use would be sufficient to comply with the requirement or if the requirement's emphasis is on "ensur[ing] security patches are up-to-date." In addition, it is not clear if a monthly evaluation would be sufficient regardless of how often the Transient Cyber Asset is used, e.g. if an evaluation must be performed prior to each use or if a single evaluation covers all use occurring within 35 days afterward. The accompanying guidance suggests that "rolling" evaluations are acceptable, but the requirement language itself is vague on this point. It may be advisable for the SDT to delete Requirement 4.7 and instead add Transient Cyber Assets to the Applicable Systems for the existing patch management requirement.
Yes
The SRC & SWG agrees in general with the revised definitions. Additional considerations below: • May want to include tape as an example of Removable Media. • Removable Media: need to clarify with respect to what it's connected to, as seen in the definition for Transient Cyber Asset. • BES Cyber Asset and Protected Cyber Asset include clarification on definition of Transient Cyber Asset. These statements should be moved to the definition of Transient Cyber Asset and not woven into other definitions. • Removable Media: Given that Removable Media are not Cyber Assets, if one is connected for more than 31 consecutive days, what happens? Is it somehow subject to certain requirements? • Removable Media: "A Cyber Asset is not Removable Media" – Is this trying to say that Removable Media is not a cyber asset? Need more clarity on this. • What happens if a TCA is connected for more than 30 consecutive days? Is it still a TCA, a BES Cyber Systems, or an undefined asset that is not subject to requirements? • The definition of Removable Media should at least be revised to state that "Removable Media are not Cyber Assets."
Yes
Comments: SRC & SWG agrees with the requirement The approach. Additional considerations below: • When will we see a specific description of the RAI program as applied to CIPv5 standard compliance enforcement and expectations of RE's for collecting evidence to support the RAI process?
Yes
The SRC & SWG agrees with the requirement approach. No additional comments.
Yes
The Canadian SRC & SWG members are not aware of any other provincial or regulatory requirements that need to be considered at this time.
Yes
• The present redline changes to standards look fine as far as addressing FERC's directives for changes to the CIPv5 standards. The SDT is to be commended for bringing these changes to a reasonable state for review and ballot in such a short period given the subjects involved. • There is concern that that the different versioning of the standards may cause confusion. It would be clearer for all to be promoted to the same base version 6.

Pamela Hunter
No
Southern Company agrees, in part, with the approach for meeting the FERC directive addressing more objective criteria around protections for low impact BES Cyber Systems. Southern fully supports the continued use of the language eliminating the overwhelming burden of creating and maintaining lists of low impact BES Cyber Systems or Assets and lists of authorized users with access to low impact BES Cyber Systems. In addition, Southern fully supports the revisions under CIP-003-6 R2.3 being specifically applicable to Control Centers containing low impact BES Cyber Systems, and the incident response plan testing timeframes (once each 36 calendar months) under CIP-003-6 R2.5. However, Southern will be submitting a "No" vote on the revisions to CIP-003-6 R2 for the following reasons: 1) In the change to the tabular format, the requirements now imply that

they are at the individual low impact BES Cyber System level, rather than at the “Assets containing Low Impact BES Cyber Systems” level. The Applicable Systems column should be amended to state “Assets containing Low Impact BES Cyber Systems.” 2) Under CIP-003-6 R2.1, consider allowing approval of the cyber security policy or policies addressing CIP-003-6 R2 by the CIP Senior Manager “or delegate.” 3) Consider limiting the scope of CIP-003-6 R2.5 to “Control Centers containing Low Impact BES Cyber Systems.” 4) CIP-003-6 R2.5.6 – consider removing the word “paper” in front of “paper drill” to allow for various types of drills to be performed for incident response exercises. 5) Consider the following revisions to CIP-003-6 R2.6: “Implement a security awareness program that reinforces cyber security practices at least once each 15 calendar months” and remove the requirement to reinforce the previous requirement Parts. 6) Consider providing additional clarity in the Guidelines and Technical Basis section on what constitutes “external” in the context of the term “external routable protocol paths.” Is this strictly external to each asset containing low impact BES Cyber Systems (i.e., is every Cyber Asset at the asset considered “internal”)? 7) Consider providing additional information in the Guidelines and Technical Basis section on the use of the term “Cyber Security Incident” as it applies to low impact BES Cyber Systems. Although the defined term uses an “or” statement that would keep the scope of the definition applicable to low impact BES Cyber System, this should be explicitly noted. Southern Company also supports the following GTC comments to this question: GTC is concerned that by borrowing language from Medium Impact requirements, the SDT has introduced a substantial increase in administrative overhead to comply with the standard without an equivalent increase in security. Specifically, maintaining the documentation overhead of justifications for every firewall rule results in a significant amount of man-hours devoted to compliance and not to improving the security of the low impact BES Cyber Assets.
Yes
Southern Company agrees with the approach with meeting the directive in FERC Order No. 791 addressing protections for non-programmable components of communications networks.
No
Southern Company does not agree with the approach taken to address transient devices (Transient Cyber Assets and Removable Media). The new CIP-010-2 R4 requirements place an unachievable amount of responsibility and overwhelming administrative burden on Responsible Entities, specifically with regard to the handling and measures required for cyber assets that are not owned or maintained by the Responsible Entity, but for which there is significant dependence in order to ensure reliable operation of the Bulk Electric System. These new Standards, as well as the Guidelines and Technical Basis addressing these new Standards, strive more towards the prohibition of the use of TCAs and Removable Media, rather than providing achievable security Standards that a Responsible Entity could successfully implement. Southern Company provides the following comments to the SDT for consideration: 1) The Measures of CIP-010-2 R4.1 only address requirement R4.1.4 applicable to authorized baselines of TCAs and do not address examples of evidence for authorization of Users, Locations, or acceptable use, nor examples of how a Responsible Entity can demonstrate “prior to initial use.” 2) CIP-010-2 R4.1.2 – Southern recommends that acceptable use should not be required to be “authorized” for each initial use of a TCA, but should be separated to allow for addressing acceptable use at the policy/procedure level. See the below comments for additional recommendation/revision. 3) Under CIP-010-2 R4.6, where the requirement calls CIP-010-2 R4.1.4, the Applicable Systems are different between the two requirements. The Applicable Systems under CIP-010-2 R4.1 should either be changed from Mediums to Medium Impact BES Cyber Systems at Control Centers and their associated PCAs to match R4.6, or CIP-010-2 R4.6 should be re-written to include moving R4.1.4 into R4.6. Consider the following: CIP-010-2 R4.1: Define acceptable use of Transient Cyber Assets, and the process to authorize usage of Transient Cyber Assets, except for CIP Exceptional Circumstances. Authorization shall include: R4.1.1 - Users, individually or by group/role; R4.1.2 – Locations, individually or by group/role. CIP-010-2 R4.6: Evaluate TCAs, prior to use, and document the authorized baseline configuration of the TCA. Evaluation shall include authorization of: R4.6.1 – OS, Firmware, and intentionally installed software on TCAs (per Cyber Asset capability); R4.6.2 - For a modification that deviates from the state in Part 4.6.1, either: Remediate by returning the TCA to the state in Part 4.6.1; or Update Part 4.6.1. If the above suggested language is considered and/or included, the comments on changing the Applicable Systems under R4.1 may be ignored – no change to the Applicable Systems in R4.1 or R4.6 would be necessary given these revisions to R4.6. 4) Requirement R4.1 places a lot of

overhead on the Responsible Entity to simply maintain lists, rather than contribute significantly to security or reliability. Southern Company requests consideration that requirement R4.1 and R4.6 be applicable to just High Impact BES Cyber Systems and their associated PCAs. 5) The requirement to authorize and inventory all software on a TCA places an undue burden on those instances where a vendor needs to use their devices with their proprietary or licensed software in order to maintain or upgrade a BES Cyber System to maintain reliability. We suggest the SDT give thought to how a Responsible Entity can "authorize" proprietary hardware/software on a vendor TCA when the RE has very limited control over that device and limited or no understanding of the proprietary software contained therein. How can a Responsible Entity reasonably be expected to prove "initial use?" Does it serve a greater reliability purpose to tell vendors they cannot use their proprietary hardware or software to maintain BES assets? Or that they must buy another license of any licensed software so it can be installed on the Responsible Entity's TCA device? While we understand this is an area of increased risk, we suggest that checking patch levels and updated anti-malware use on the TCA (per Cyber Asset capability) is sufficient without inventorying the vendor's device and all that is on it and creating a baseline configuration for a device that is not owned or managed by the RE. Creating and maintaining such a list has little to no reliability benefit. The point should be to reasonably assure the RE that no malware is present on the device prior to connection a BES Cyber System. As an example, there is no reliability benefit to inventorying that a vendor device has "Siemens WinCC 7" software installed. The benefit to reliability is in scanning that system to see if that copy of WinCC has been compromised by Stuxnet. 6) Under the Guidelines and Technical Basis section, Page 41, under Section: Requirement R4: - consider removing the bullets under "Examples of these devices include…" and simply state "Examples of these devices include, but are not limited to, laptops, desktops, or tablets used for testing, maintenance, configuration changes, and/or vulnerability assessments." 7) Under the Guidelines and Technical Basis section, Page 42, first paragraph at the top of the page - consider having additional guidance on what does NOT constitute a single use. For example – Does use within the same PSP, but for different Cyber Assets at varying impact levels (high & medium) require a new evaluation? Is a new evaluation required prior to use for each instance that a TCA moves from one PSP to another at the same impact level, regardless if the authorized user maintained possession of the TCA, and/or the timeframe for traveling between PSPs is during the same day/week? 8) Under the Guidelines and Technical Basis section, Page 42, section Requirement Part 4.1, No. 1. – consider striking the term "physical proximity" as this is not required by the Standard as written, and would be impossible to prove. Recommend the following change – "This is intended to provide documentation of those personnel authorized to use TCAs." Also – consider striking "unescorted physical access" from the last sentence as there could be instances of personnel with authorized electronic access to the applicable system, but who are not authorized for unescorted physical access to the PSP it is contained within (e.g., periodic vendor support where the vendors are authorized for electronic access to the applicable systems, but are escorted to those systems to perform maintenance and/or troubleshooting.) 9) Under the Guidelines and Technical Basis section, Page 43, under the Section: Requirement Parts 4.2, 4.3, 4.4, 4.5: - the last sentence for the paragraph starting "Part 4.5 requires…" states that "process is to include testing and installing of updated signatures or patterns." This sentence should be struck as it is beyond the scope of the requirement written for CIP-010-2 R4.5. Although it is addressed in CIP-007-6 R3, it is not a requirement in CIP-010-2 R4.5. Southern Company also supports SMUD's comments on this question: 10) SMUD prefers to remove CIP-010, R4, Requirement Part 4.1.4 requiring the maintenance of "operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability)" as well as the corresponding Requirement Part 4.6 to "evaluate the Transient Cyber Asset." SMUD believes that this is a list making administrative activity. Requirement Part 4.1.3 has already established a "defined acceptable use" for Transient Cyber Assets that establishes how these assets are to be used within the Responsible Entity. Transient Cyber Assets are not expected to be treated like a BES Cyber Asset or associated Protected Cyber Asset considering the use of these assets may be subject to ownership by a contractor or vendor where obtaining all of this information may not be possible. SMUD supports the use of inventory, assignment, acceptable use, malicious software prevention and patching for these assets as reasonable controls to ensure the devices reduce the risks posed to BES Cyber Systems. 11) If CIP-010, R4, Requirement Part 4.1.4 is not removed, SMUD requests that the language be aligned with CIP-010, R1, Requirement Part 1.1.1 to state "Operating system(s) (including version) or [emphasis added] firmware where no independent operating system exists." As presented, the CIP-010, R4, Requirement Part 4.1.4 is a greater expectation than the source requirement part. 12) SMUD is

concerned with CIP-010, R4, Requirement Part 4.7 and an interpretation that entities would have to track both the 35 day update timeframe and each use to be able to show performance to the Requirement Part. SMUD does not believe that the tracking of use is the key outcome of this Requirement Part; instead it is the patching of the Transient Cyber Asset that is the expected outcome. SMUD requests guidance be included to clearly state that the tracking of each use is not expected to be maintained, but that there is evidence associated with a 35 day review. Southern Company also supports the following EEI comments to the question: CIP-010-2 Requirement R4, Part 4.1: EEI members are concerned with unnecessary administrative burdens created by Part 4.1. For example, Authorization generally applies to users. A user of a Transient Cyber Asset should be authorized to use the particular asset with certain software installed, for a particular purpose at a particular location(s). The way Part 4.1 is written suggests that four different authorization processes are needed: one for users, one for locations, one for acceptable use, and one for software/firmware. A requirement for four different processes for user authorization adds additional, unnecessary administrative record-keeping. This language should be edited to make it clear that only one user authorization process is required. Part 4.1 also does not consider that CIP-004-6 Requirement R4, Part 4.1 also addresses authorization, which overlaps with the CIP-010-2, Requirement R4, Part 4.1. The Transient Cyber Asset requirement (CIP-010-2 Part 4.1) should not require users to be authorized twice, once under CIP-004 and again under CIP-010. Southern Company also supports the following GTC comments to the question: In CIP-010-2 Requirement Part 4.4, the SDT proposes language that states that the entity must mitigate the threat of detected malicious code for Transient Cyber Assets and Removable Media. The threat for Transient Cyber Assets and Removable Media is not important. The BES Cyber Asset should be protected from detected malicious code on the Transient Cyber Asset or Removable Media. The SDT should consider resolving this issue by eliminating 4.4 and modifying 4.2 and 4.3 as follows: “Use method(s) to detect malicious code on [the Transient Cyber Asset or Removable Media] prior to use on applicable systems and, if detected, do not allow of the use of [the Transient Cyber Asset or Removable Media] until the threat of the detected malicious code to the applicable systems has been mitigated.”
No
Southern Company provides the below comments to the SDT for consideration with regard to new or revised definitions: 1) Removable Media definition should be more specific to the higher risk forms of media, such as USB media, and other diagnostic type devices. 2) Transient Cyber Assets, as written and defined, could include Removable Media as well, which could be interpreted at audit to include additional requirements for Removable Media. The Removable Media definition says that a Cyber Asset is not Removable Media, but the Transient Cyber Asset definition does not exclude it. Southern Company suggests both definitions need to be mutually exclusive for clarity.
Yes
Southern Company fully supports this approach to simply remove the IAC language from the 17 applicable requirements given the development and supporting processes of the Reliability Assurance Initiative (RAI). Southern Company commends NERC on the RAI effort and fully supports it as an alternative to the IAC language and a move away from a zero tolerance approach to compliance.
Yes
Southern Company agrees that the timeframes established in the revised Implementation Plan are reasonable and appropriate.
Yes
Southern Company also supports the following GTC comments to the question: GTC recommends that the SDT clarify the meaning of “associated with” in CIP-002. This clarification comes as a result of the CIP Version 5 Implementation Study and is therefore consistent with the SDT’s SAR. NERC has recently indicated that location is a determinant factor when classifying cyber asset impact. (Reference page 111 from the slides delivered by NERC Compliance at the June CIPC: http://www.nerc.com/comm/CIPC/Agendas%20Highlights%20and%20Minutes%202013/Presentations%20--%20June%2010-11,%202014.pdf) As such, the SDT should update CIP-002 Attachment 1 Section 2 to indicate that medium impact BES Cyber Assets are those “associated with and located at” the Facilities meeting the criteria of Attachment 1 section 2 in order to clarify the intent of the Standard.

SCE&G agrees with the approach to address the directive concerning Low Impact assets from FERC Order No. 791. With regards to CIP-003-6 R2.4.1, SCE&G believes the SDT must clarify the term "external routable protocol paths". SCE&G proposes the following language to clarify the term: "All external routable bi-directional protocol paths, if any, must be through one or more identified access point(s). With regards to CIP-003 R2.2, SCE&G believes the language "to restrict physical access" included in the requirement is different from what is described in the Technical Guidelines. The Guidelines state that CIP-003 R2.2 can be accomplished using a fence and a lock. Inherently a fence does not "restrict" access; instead, it is a point of demarkation and establishes a boundary. A determined adversary can circumvent a fence in many ways including: climbing over, cutting through, etc. To truly "restrict" access entity's would have to implement additional controls beyond a lock and fence. To align with the controls described in the Technial Guidelines, which SCE&G agrees are adequate for Low Impact Assets, the SDT should consider the following revision: "Implement one or more controls to establish a physical boundary and implement access control(s) to allow access only to legitimate users."
Yes
No
SCE&G believes the SDT needs to reconsider the authorizations and baseline configuration records required under CIP-010 R4.1. Recording such authorizations and configurations will be administratively burdensome for entities. Personnel authorized for access to High and Medium BES Cyber Systems should not require additional authorizations to use Transient Cyber Assets. SCE&G proposes the SDT revise the requirement to require procedures defining the acceptable use of Transient Cyber Assets and a listing of authorized Transient Cyber Assets. Such a list needs to be generic allowing entities to authorize groups of Transient Cyber Assets (e.g. flashdrives issued by the entity). Per NIST 800-53 MA-5, entities should also be allowed to designate personnel with required access permissions to supervise the maintenance actiivities of personnel who do not possess the required access authorizations.

No
NERC has advised that the IAC language will be replaced by the RAI process. Final ballot on the removal of the IAC language must not occur until RAI is approved. It is unreasonable to ask entities to remove such language without an approved alternate process to take its place.
No
Implementation has been negatively impacted by the everchanging state of the CIP V5 standards. To ensure cost-effective and appropriate implementation for their customers and shareholders, entities do not want to extensively begin implementation until the target stops moving. As is now the case, entities have lost precious months on the already time constrained implementation timeframe. This, in addition to the delay in the much needed Transition Guidance from the NERC Implementation Study, must be taken into consideration by NERC/FERC. Steady-state standards and clear transition guidance are essential to entities being able to successfully implement the new CIP

standards. SCE&G proposes that all standard implementation start dates be revised to reflect the completion of the CIP V6 revisions and the issuance of the Transition Guidance from NERC.

The Requirements proposed in 2.1, 2.2 and 2.3 provide appropriate controls for Low Impact Cyber Systems. However, the “external routable protocol paths” language in Requirement 2.4 requires entities with Low Impact Cyber Systems to provide and comply with “some form of electronic security perimeter,” regardless of risk to the Bulk Power System/Bulk Electric System. Compliance to this requirement would be excessive given the risk associated with Low Impact rated BES Cyber Systems. Additionally, entities would be required to identify, maintain and comply with “some form of electronic security perimeter” (ESP) for Low Impact rated BES Cyber Systems, yet additional revisions state that “An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required.” This is contradictive at best and should be clarified. Recommend language changes to address only Low Impact Systems which have direct internet access. Recommend adding language which assesses risk to Low Impact BES Cyber Systems with “external routable protocol paths.”
Yes
No
CIP-010-6 R4.1.4 requires the Entity to “identify and document the Operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability).” And in 4.6, the Entity is required to “Evaluate Transient Cyber Assets, prior to use, for modifications that deviate from Part 4.1.4.” For entities that depend on vendors and contract support personnel to maintain the Reliability of the Bulk Electric System, this becomes a great administrative challenge. This requirement becomes dependent upon the number of Transient Devices, the number of vendors, contractors or support personnel, and the type and variance of Transient Cyber Assets and tools used to perform their job duties. The challenge in requiring a baseline of firmware alone far exceeds the vulnerably and risk to the BES Cyber Asset. Recommend changing the language in requirements R4.1.4 and R4.6 to address Entity owned-maintained Transient Devices separately from Vendor or Contracted Support owned-maintained Transient Devices. This allows entities to reasonably develop and implement Administrative and Technical Security Controls for Transient Devices based on risk, yet monitored from a compliance standpoint. Recommend language changes to require “the implementation of a Transient Device Security Baseline for Entity and Vendor/Contracted Support Transient Devices.” This allows Entities to implement controls yet maintain the flexibility to address multiple device types and functions. This also allows Entities and their vendors or contracted support personnel to implement Administrative and Technical controls of Transient Devices based on risk. Recommend language changes to require sampling of Transient Devices Security Baseline. This allows Entities a mechanism for monitoring both Entity and Vendor/Contracted Support personnel owned-maintained Transient Devices. Recommend language changes to require a security policy for Transient Devices which includes a requirement for Transient Devices with direct access to BES Cyber Systems. This allows Entities to establish and implement Administrative Controls for Transient Devices.

AECI agrees with NRECA comments. Regarding 2.3.1 - Escorted should be removed. Typically, these facilities are smaller work environments that can manage appropriate access to visitors via a policy without the need to require escort. Regarding 2.4.2 - This requirement should be removed or reduced to not include inbound and outbound access permissions, and more importantly remove the reason for granting access. This requirement is a very specific control that FERC specifically stated was not needed. Although this is common practice for most entities, the compliance burden created to prepare for audit exceeds the benefit gained in reliability. Management of all firewall rules at all low impact facilities is a tremendous effort for small entities, and the largest gain in reliability is realized with the creation of processes to address these items, not specifically listing each. If requirement 2.4 stated "Implement one or more documented processes that collectively address the following…" and it is understood that entities would only be required to have implemented procedures that consider these items, and not specifically list them, then AECI would argue this more accurately represents the FERC order by creating a requirement that could be used to evaluate the sufficiency of a program without developing specific controls such as this draft currently has. The corresponding measure would also need to include language that allows for flexibility of procedures to not include every specific inbound and outbound permission rule. Entities with sufficient resources and capability could include specific listings of these rules to demonstrate exceptional compliance, however those without the means would not be held liable for over-specific controls on facilities that have no impact to the BES.

We are concerned that by borrowing language from Medium Impact requirements, the SDT has introduced a substantial increase in administrative overhead to comply with the standard without an equivalent increase in security. Specifically, maintaining the documentation of justifications for every

firewall rule results in a significant amount of man-hours devoted to compliance and not to improving the security of the low impact assets. We instead recommend the following language for CIP-003 R2: R2. Each Responsible Entity for its assets identified in CIP-002-5, Requirement R1, Part R1.3 (assets containing low impact BES Cyber Systems), shall: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] 2.1 Review and obtain CIP Senior Manager approval at least once every 15 calendar months for a cyber security policy that addresses CIP-003-5, Requirement R2, Part 2.2. 2.2 The Responsible Entity shall implement one or more documented processes that collectively address the following topics: 2.2.1 Operational or procedural control(s) that restrict physical access to low impact BES Cyber Systems; 2.2.2 Access control(s) to restrict electronic access to low impact BES Cyber Systems via the asset's external routable protocol connections and Dial-up Connectivity, if any; 2.2.3 Cyber security incident response including conditions for activation of the response plan(s), roles and responsibilities of responders, and determination if an identified Cyber Security Incident is a Reportable Cyber Security Incident with notification of the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), unless prohibited by law; and 2.2.4 Security awareness for the Responsible Entity's personnel that, at least once each calendar quarter, reinforces cyber security practices. An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required.
Yes
Yes
No
Similar to its comments on Low Impact, we disagree with simply borrowing requirement language from Medium impact requirements for Transient devices. In this case, we believe that the SDT has provided unnecessary administrative overhead and introduced constructs that are not ideal for transient devices. Requirement part 4.1 requires authorization, but provides little security benefit. In particular, the SDT proposes that defined acceptable be authorized. Almost all companies have an existing acceptable use policy. However, it seems this may not be the intent of the SDT. The SDT should be clearer about the intent so that it is simply requiring entities to create lists and perform administrative exercises in order to prove compliance. In requirement part 4.4, the SDT proposes language that says that the entity must mitigate the threat of detected malicious code for Transient Cyber Assets and Removable Media. The threat for Transient Cyber Assets and Removable Media is not important. It is the BES Cyber Asset that should be protected from detected malicious code on the Transient Cyber Asset or Removable Media. The SDT could resolve this issue by eliminating 4.4 and modifying 4.2 and 4.3 as follows: "Use method(s) to detect malicious code on [the Transient Cyber Asset or Removable Media] prior to use on applicable systems and if detected, do not use this [Transient Cyber Asset or Removable Media] until the threat of the detected malicious code to the applicable systems has been mitigated."
Yes

American Public Power Association (APPA)
No
APPA agrees that some of the changes the SDT has made in the draft standards address the recommendation in order 791 the Commission “defining with greater specificity the processes that responsible entities must have for Low Impact facilities under CIP-003-5.” However, APPA believes the SDT has gone too far in certain aspects of this specificity to include requirements that impose compliance costs that exceed the reliability benefit to the BES. Cost of compliance with CIP standards must be in line with the risk of malicious actions that could cause instability, uncontrolled separation or cascading failures. The thresholds for the high and medium impact categories were selected to ensure that specific security controls are in place in facilities that can cause instability, uncontrolled separation or cascading failures. The programmatic controls for low impact facilities were designed to ensure security policies and procedures covered all BES Cyber Systems. In particular, APPA believes the SDT has not taken into consideration this cost to risk evaluation in the development of the new requirements in CIP-003 R2 Part 2.3. The new requirement in Part 2.3.1 which requires escorted access for visitors will impose a significant burden without a commensurate reduction in cyber security risk for reliable operation of the BES. APPA believes the cost of developing and implementing a documented process for escorted visitor access for Control Centers that control multiple facilities by voice instruction only is out of line with the risk to reliable operation of the BES. For example, APPA members report that CMEP personnel rely on FAQs developed for previous versions of CIP standards to conclude that Control Centers that “control” remote Facilities through voice commands only are subject to the CIP standards. See NERC link: http://www.nerc.com/docs/standards/sar/Revised_CIP-002-009_FAQs_06Mar06.pdf (Question 9). If it was the intent of the SDT to limit the scope of 2.3.1 to Control Centers with capability to control multiple facilities automatically or remotely, this must be stated specifically in the standard. Ultimately, APPA recommends that the SDT remove 2.3.1 since this requirement would not significantly reduce the risk of instability, uncontrolled separation or cascading failures on the BES. The intent of segmenting out Low Impact facilities was to assure that programmatic controls were in place for those facilities that had “Low Impact” on the BES. The compliance burden on these systems must be in proportion to its impact on the BES. APPA recommends that the SDT evaluate compliance costs in any changes they make to the revised standards prior to the final ballot.
Yes
APPA appreciates the SDT providing flexibility to entities in complying with R1 Part 1.10. Having multiple options for controls when physical access restrictions are not possible gives entities an opportunity to select the solution that works for each specific situation. Industry has commented that encryption of data as a sole solution may reduce reliability by adding complexity to the systems and introducing latency to data flow that will not work in a relay control environment. If the SDT removes this flexibility or expands the applicability in future drafts APPA will need to reevaluate its support for the communications controls.
No
APPA supports the comments of SMUD on this question
No
APPA supports the comments of SMUD on this question
Yes
APPA supports the removal of the Identify, Assess, and Correct (IAC) language from the 17 requirements. APPA encourages the SDT to provide guidance to NERC staff on the development of the proposed RSAWs. This guidance will give regional auditors insight to the intent of the SDT in drafting the standards and the reliability outcomes. APPA members would appreciate a commitment from NERC staff to timely complete development and publish details of the RAI program to give industry an indication of the proposed enforcement discretion program. This may give them more confidence to cast an affirmative vote for these changes in the final ballot.
No
If the draft requirements for Low Impact Control Centers remain then a new implementation date for these requirements must be considered. APPA recommends a 1 year extension to April 1, 2018 for Low Impact Control Centers since entities will need time to budget and implement security controls

in addition to developing compliance plans. Due to the uncertainty created by this revision process and not knowing what the Commission will order or when the final rule will be issued, the SDT needs to revise the implementation options for CIP-003-6 R2. APPA recommends modifying the implementation plan for CIP-003-6 to become enforceable 2 years after Commission approval or April 1, 2017, whichever is later.
Yes
The SDT proposals will increase the compliance burden by adding requirements to the Low Impact sections. APPA urges NERC to survey registered entities, especially small entities, to estimate the real compliance cost of CIP V6 Revisions before the standards are submitted to FERC for approval. APPA in its comments to the Commission in the CIP V5 NOPR asked that FERC require NERC to do this survey. However in P261 of the Final Rule FERC stated, “To the extent that entities provide NERC with such information, we encourage NERC to submit the cost data along with the associated new or revised Reliability Standards requirements.”

Proposed "Transient Cyber Asset & Removable Media Protection" requirements 4.3 and 4.6 of CIP-010-2 compel malicious code detection (4.3) and an evaluation of current configurations against a previously established baseline (4.6) “prior to use.” These two requirements are unacceptably ambiguous by virtue of the fact a “use” is not defined within the language of any CIP V5 requirement. The SDT has attempted to define “use" in the Guidelines and Technical Basis section as follows: "For purposes of this standard, ‘use' is considered to be the interaction between transient devices and applicable systems. The interaction between transient devices and multiple applicable systems within the same ESP or PSP would be considered a single use.” However, as NERC representatives often point out, guidelines are non-binding. Moreover, N&ST believes the suggested definition of “use,” if widely adopted as an audit benchmark, could create unacceptable and counter-productive administrative and compliance burdens for Responsible Entities. If a technician used a laptop to test BES Cyber Systems at a Control Center and then drove directly to the backup Control Center, the Responsible Entity would be at risk of being found non-compliant with R4.6 unless the prescribed evaluation was performed before the technician used that same laptop to perform similar BES Cyber System testing. N&ST appreciates the importance of minimizing the risk of introducing malicious code to BES Cyber Systems via transient devices and removable media. However, N&ST believes these requirements should be modified to avoid a negative impact on BES operations. One option the SDT might consider is to make R4.3 and R4.6 time-based requirements (e.g. every 30-60 days), with the additional provision of requiring R4.3 malicious code detection and R4.6 evaluations to be performed “prior to use” for any transient devices or removable media that have been used for any purpose other than for interaction with applicable systems.

The addition of more objective criteria for Low impact BES Cyber System Requirements within CIP-003-6, R2, breaks one of the prime objectives defined when CIP version 5 was being developed that each of the Standards could stand on its own. Entities with Low “and” either Medium or High Cyber BES Cyber Systems, it would be necessary that CIP-003 “always” be referenced when any of the

requirements in CIP-004-6 through CIP-011-2 for the Medium and High Impact BES Cyber Systems are being designed and implemented, since dependencies are always possible between Cyber Systems part of any impact category. The inclusion of these objective requirements with a unique table in CIP-003-6 result in Standards language inconsistencies that creates confusion and additional compliance risks. A new definition is now needed for CIP-003-6, R2, Requirement Part 2.4 for the phrase “external routable protocol paths” to ensure that entities and auditors clearly understand the differences between that phrase and the defined term External Routable Connectivity. This would avoid duplicating the confusion seen in earlier versions of the CIP Standards, such as the CIP-001 confusion between Facilities and facilities. The phrase “external routable protocol paths” may create a similar interpretation risk.
Yes
No
AE prefers to remove CIP-010, R4, Requirement Part 4.1.4 requiring the maintenance of “operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability) as well as the corresponding Requirement Part 4.6 to “evaluate the Transient Cyber Asset.” AE believes that this is a list making administrative activity. Requirement Part 4.1.3 has already established a “defined acceptable use” for Transient Cyber Assets that establishes how these assets are to be used within the Responsible Entity. Transient Cyber Assets are not expected to be treated like a BES Cyber Asset or associated Protected Cyber Asset considering the use of these assets may be subject to ownership by a contractor or vendor where obtaining all of this information may not be possible. AE supports the use of inventory, assignment, acceptable use, malicious software prevention and patching for these assets as reasonable controls to ensure the devices reduce the risks posed to BES Cyber Systems. If CIP-010, R4, Requirement Part 4.1.4 is not removed, SMUD requests that the language be aligned with CIP-010, R1, Requirement Part 1.1.1 to state “Operating system(s) (including version) or [emphasis added] firmware where no independent operating system exists.” As presented, the CIP-010, R4, Requirement Part 4.1.4 is a greater expectation than the source requirement part. AE is concerned with CIP-010, R4, Requirement Part 4.7 and an interpretation that entities would have to track both the 35 day update timeframe and each use to be able to show performance to the Requirement Part. AE does not believe that the tracking of use is the key outcome of this Requirement Part; instead it is the patching of the Transient Cyber Asset that is the expected outcome. AE requests guidance be included to clearly state that the tracking of each use is not expected to be maintained, but that there is evidence associated with a 35 day review.

National Rural Electric Cooperative Association (NRECA)
No
NRECA understands that the approach to add greater specificity and auditability to the required processes in CIP-003 R2 can fulfill the FERC directive in Order No. 791. However, NRECA has

concerns with the requirements in the current proposed draft. From a policy level, we are concerned that the revisions go beyond what the FERC directive required and that the distinction between low and medium impact BES Cyber Systems is becoming less and less clear. Additionally, the current proposed revisions are increasing the financial, compliance and operational burdens on entities for low impacts beyond the benefits it will provide to BES security and reliability. The emphasis, burden and investment of resources for entities must continue to focus on their finite resources on addressing the most impactful first (High and Medium), and then the least impactful (Low). NRECA believes that the primary focus on cyber security must remain with the Medium and High Impact classified facilities. By definition, Low Impact facilities are categorized as low because failure or degradation of those assets have minimal to no impact on BES reliability. The financial, compliance and operational burdens must be commensurate with the risk to the reliability of the BES, which specifically applies to preventing instability, cascading or uncontrolled separation of the BES. It is difficult to see how the CIP-003 R2 revisions and additions could help to limit BES instability, cascading or uncontrolled separation. NRECA requests that the SDT demonstrate how all changes to CIP-003 R2 will contribute to preventing instability, cascading or uncontrolled separation of the BES. NRECA is concerned that by borrowing language from Medium Impact requirements, the SDT has introduced a substantial increase in administrative overhead – staffing and financial -- to comply with the standard without a commensurate impact on BES reliability and security. Specifically, maintaining the documentation of justifications for every firewall rule results in a significant amount of man-hours devoted to compliance and not to improving the reliability and security of the low impact assets. NRECA instead recommends the following language for CIP-003 R2: R2. Each Responsible Entity for its assets identified in CIP-002-5, Requirement R1, Part R1.3 (assets containing low impact BES Cyber Systems), shall: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] 2.1 Review and obtain CIP Senior Manager approval at least once every 15 calendar months for a cyber security policy that addresses CIP-003-5, Requirement R2, Part 2.2. 2.2 The Responsible Entity shall implement one or more documented processes that collectively address the following topics: 2.2.1 Operational or procedural control(s) that restrict physical access to low impact BES Cyber Systems; 2.2.2 Access control(s) to restrict electronic access to low impact BES Cyber Systems via the asset's external routable protocol connections and Dial-up Connectivity, if any; 2.2.3 Cyber security incident response including conditions for activation of the response plan(s), roles and responsibilities of responders, and determination if an identified Cyber Security Incident is a Reportable Cyber Security Incident with notification of the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), unless prohibited by law; and 2.2.4 Security awareness for the Responsible Entity's personnel that, at least once each calendar quarter, reinforces cyber security practices. An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required. Mandating specific controls could have the undesirable consequence of stunting the development of the range of controls necessary to protect the diversity of Low Impact assets. Entities should be afforded discretion to utilize their experience and expertise to develop controls that protect their assets commensurate with the BES reliability risk posed. At this juncture, a one-size-fits-all approach that imposes greater obligations on Low Impact BES Cyber Systems would simply increase costs and burden, without commensurate benefits, to both the Registered Entities and the Regional Entities charged with ensuring compliance with the CIP standards. NRECA supports the SDT position that entities subject to the Low Impact BES Cyber System requirements in CIP-003-5 R2 to keep an inventory or list to help ensure that they have properly identified and categorized the location of its BES Cyber Systems. However, the currently proposed requirements all but require the development of such a list. NRECA request that the SDT revise the requirements so that such a list is not indirectly or directly required. Requiring entities to maintain a discrete list of Low Impact BES Cyber Systems, as opposed to the location of such assets, will involve considerably more time and cost, again without any commensurate benefit to BES reliability and security. While not the work of the SDT, RAI and the RSAWs are companion pieces to the CIP V5 standard revisions. Unfortunately, the initial draft RSAWs don't provide the needed clarity or relief from the zero defect compliance expectation. NRECA encourages NERC to continue their work and collaboration with the SDT and to post revised RSAWs with next comment and ballot period for CIP V5 revisions. Regarding RAI, NRECA recommends that NERC use the requirements on Low Impact assets to demonstrate how RAI can alleviate the compliance concerns and create a reasonable approach to compliance. This may be essential for the passage of revised requirements on Low Impact assets. Additionally, if RAI is not adequately explained and clearly understood before the next comment and ballot period, NRECA believes that ballots for the CIP V5 revisions may be

negatively impacted. Some “affirmative” ballots may change to “negative” without a better understanding of RAI and how it relates to the CIP V5 revisions.
Yes
NRECA views Requirement CIP-007 R1.2, as only specifying how to be compliant with other requirements within the suite of CIP Standards. Adding duplicative requirements only increases the compliance burden and audit confusion, without commensurate value to increased BES security and reliability. NRECA requests the SDT review this issue and remove duplicative requirements from the CIP standards. NRECA is concerned that the new and undefined term of “nonprogrammable communication components.” We request that the SDT provide more clarity around the meaning of the this term. NRECA requests additional guidance related to CIP-006 R1.10 on what constitutes adequate physical protection of connectors joining separate conduit sections. This is needed to minimize confusion at audit.
No
NRECA recommends the SDT remove new CIP-010 R4.1.4. Defining users, locations and acceptable use of these devices should be sufficient to protect these devices from unauthorized or harmful use. This requirement expands in R4.6 and R4.7 and becomes extremely difficult to manage. A detailed listing of all software and hardware is not necessary to fulfill requirements R4.6 and R4.7. An effective change management procedure coupled with documents required in R4.1.1 R4.1.2 and R4.1.3 will allow for objective criteria against which NERC and the Commission can evaluate the sufficiency of an entity’s protections without the need for a prescriptive list. Further, compliance with R4.6 and R4.7 will likely be met through the use of software whitelisting, not documentation. A documented list of operating system, firmware, and software on transient devices is not needed for such an implementation and provides no benefit to BES reliability and security which should be focused on preventing instability, cascading and uncontrolled separation of the BES.
No
NRECA believes the Transient Cyber Asset definition language is overly broad. Using "directly connected" would apply to any programmable device, whereas the focus should be towards devices that can infect, alter, or transfer files to a BES Cyber Asset. Recommended language for a revised definition is as follows:: Transient Cyber Asset: A Cyber Asset directly connected, and able to infect, alter, or transfer files to BES Cyber Assets, for 30 consecutive calendar days or less, to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes. NRECA disagrees with the SDT’s borrowing requirement language from Medium impact requirements for Transient devices. In this case, we believe that the SDT has provided unnecessary administrative overhead and introduced constructs that are not ideal for transient devices. Requirement part 4.1 requires authorization, but provides little security benefit. In particular, the SDT proposes that “defined acceptable use” be authorized. Almost all companies have an existing acceptable use policy. However, it seems this may not be the intent of the SDT. The SDT should be clearer about the intent so that it is not simply requiring entities to create lists and perform administrative exercises in order to prove compliance. In requirement part 4.4, the SDT proposes language that says the entity must mitigate the threat of detected malicious code for Transient Cyber Assets and Removable Media. The threat for Transient Cyber Assets and Removable Media is not important. It is the BES Cyber Asset that should be protected from detected malicious code on the Transient Cyber Asset or Removable Media. The SDT could resolve this issue by eliminating 4.4 and modifying 4.2 and 4.3 as follows: “Use method(s) to detect malicious code on [the Transient Cyber Asset or Removable Media] prior to use on applicable systems and if detected, do not use this [Transient Cyber Asset or Removable Media] until the threat of the detected malicious code to the applicable systems has been mitigated.”
Yes
NRECA believes removal of IAC language clarifies those requirements and what is expected during audit; but without RAI adequately explained and clearly understood before the next comment and ballot period, NRECA believes that ballots for the CIP V5 revisions may be negatively impacted. Some “affirmative” ballots may change to “negative” without a better understanding of RAI and how it relates to the CIP V5 revisions.
No

NRECA has several significant concerns with the proposed Implementation Plan (IP). First, it appears that the IP is posted only for comment, but not for ballot. NRECA asserts that this potentially violates the NERC Standards Process Manual (SPM). While there are many references in the SPM requiring the IP to be balloted, NRECA directs SDT and NERC attention to SPM Sections 4.4.3, 4.6, 4.8, 4.16 for provisions that clearly require the IP to be balloted. In this current formal comment and ballot period, entities can only submit comments on IP – there is no provision or ability to cast a ballot on the IP as the SPM requires. NRECA requests that this potential SPM violation be addressed expeditiously as possible to ensure the CIP V5 revisions are developed in clear compliance with the FERC approved NERC SPM. NRECA believes the proposed IP does not adequately provide enough additional time to comply with the currently proposed revisions and new requirements to the CIP V5 standards. For those revised and new requirements, NRECA requests additional time be included in the IP that matches the time entities were originally provided upon FERC's approval of CIP V5. If the original amount of time that was provided for CIP V5 was adequate then, it should also be adequate for revised or new requirements for the CIP V5 revisions. This is especially critical for the new requirements in CIP-003-6 R2. NRECA also requests that the SDT consider using the same additional time for compliance for all revised or new requirements under the current CIP V5 revision project. One of NRECA's members estimates that its implementation burden for the currently proposed CIP-003-6 R2.4.2 will take over 4000 hours initially and 2000 hours annually. Depending on the final requirements, these estimates could increase.

Yes

NRECA supports addressing FERC's four directives in the current project. Industry needs stability, closure, and a steady state of CIP standards so that industry can comply with a non-moving target of requirements. NRECA supports the RAI concept, but is seeking greater understanding of and informative experience with RAI. For NRECA and its members, filling this gap may be essential for the passage of revised requirements, in particular for Low Impact assets. Low Impact asset requirements are ideal to demonstrate how RAI can alleviate the compliance concerns and create a reasonable approach to compliance.

Bonneville Power Administration

Andrea Jessup

No

Although the proposed controls and objectives are clear as written, BPA believes they are insufficient to adequately provide protection of the BES. If the low impact assets represent the majority of the BES, the proposed NERC CIP standards should address risk due to aggregated impact and reduce the extremely large attack surface. BPA suggests the requirement language should include an annual assessment of BES LIA to baseline and monitor their security status. In addition, BPA believes the LIA requirements should be distributed throughout each of the proposed standards (CIP-002 through CIP-014.)

No

Although the proposed scope is clear and auditable, BPA believes the control coverage is insufficient to provide adequately assured protection of the BES. If the low impact assets represent the majority of the BES, and non-routable communications are no longer considered "safe," the proposed NERC CIP standards should address risks related to all open system interconnection layers (physical to application.) Attacks against communication networks have evolved where protocol types are no longer relevant.

No

While BPA agrees that CIP-010 R4 addresses the risks related to High and Medium impact assets, the proposed requirement language should also address Low Impact Assets. In addition, BPA suggests requirement language should be added to include implementation of Transient Device baselines, with periodic sampling, for entity and vendor managed devices. Entities may also consider removing direct-access to BES assets by Transient Devices (e.g. jumpbox, proxy, etc.) Furthermore, standards addressing transient devices must acknowledge the nature of these devices and the fact that the responsible entity does not always exercise continuing controls over these devices. Policies, procedures, and technological solutions must focus on transient devices at the time of connection

and on controlling the interfaces to the system rather than attempting to exercise continuous control over control over a device of a transient nature.
Yes
No
BPA supports the removal of the IAC language and the move away from “zero defect” requirements. However, BPA believes the lack of clearly defined measures results in inconsistent audit approaches and findings. In addition, BPA expects the RAI will be fully vetted publicly.
Yes
The additional timelines are sufficient. However, BPA suggests that all CIP Version 5/6 requirements become effective on this revised date to avoid confusion, with the exception of Low assets which are afforded a minimum of an additional 12 months before the initial compliance date.

CIP-006 R1.10: “monitoring the status of the communication link composed of such cabling and components and issuing an alarm or alert in response to detected communication failures to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of detection…” When does “detection” actually occur? A 15 minute window for notification is typically not sufficient to respond to an automated alert during regular business hours, and would be impossible after hours. The last bullet of R1.10, “an equally effective logical protection” is ambiguous. Who/what would determine the effectiveness of logical protection other than the two previous bullets? Tri-State suggests removing this bullet. Tri-State believes that there is still a need to define what a communication network is. This was ordered by FERC and we do not agree that this has been clarified in the current draft.
Yes
How does the SDT anticipate that RE’s enforce/assess Transient Cyber Assets and Removable Media that are owned and maintained by consultant services? CIP-004 R1 should read R2 in the question above. For R2.1.9, it reads better as “…and interoperability with other Cyber Assets, including Transient Cyber Assets and Removable Media.”
Yes
No
The FERC Order “directed NERC to remove the “identify, assess, and correct” language or to propose modifications that addressed the Commission’s concerns about the ambiguity and enforceability of that language.” Tri-State feels that the IAC language is helpful and the removal solution attempted was overly complicated and left gaps that were not all adequately addressed. The removal of identify, assess, and correct also diminishes the value of the standards. It would have been much simpler to have “proposed modifications that addressed the Commission’s concerns about the ambiguity and enforceability of that language.” The easiest solution is to define “identify, assess, and correct” as one defined term rather than as three separate words. Tri-State also recommends that the term “deficiencies” when referenced with IAC language be changed to “possible violations” as defined in NERC’s Compliance Monitoring and Enforcement Program to remove ambiguity.

In an effort to differentiate the compliance responsibilities for entities between Medium and Low Impact Assets, the SDT has in effect ended up creating a greater burden on entities to create, manage and define programs that meet compliance. The requirements of this revision are inconsistent and overly complex. Examples include but may not be limited to; ¬ Ambiguous and inconsistent terms “External Routable Paths” versus “External Routable Connectivity”. ¬ More restrictive requirements for Low Impact Assets. ¬ Inconsistent Testing Time frames. ¬ Instances where there was a Failure to extend implementation Time frame beyond the original version 5 effective compliance date.
Yes
Please expand on the expectations for meeting this requirement with regard to "patch panels". 1. If the Cyber Assets in the ESP are meeting the requirements by disabling unneeded ports on the device, is there any action needed on the patch panel? 2. The patch panel may have connectors that are not used or may be connected to ports that are disabled. Is signage or tamper tape truly required on the patch panel in that situation?
No
Please expound upon the “CAUTION” statement in the Guidelines and Technical Basis. For example, would it be permissible to have a Transient Cyber Asset use a secure wireless network to only access a secured network drive containing relay configuration data. For Transient Cyber Assets, please consider adding a statement in the Guidelines and Technical Basis from CIP-007-5 R3 “If a specific Transient Cyber Asset has no updateable software and its executing code cannot be altered, then that Transient Cyber Asset is considered to have its own internal method of deterring malicious code.” With the proliferation of IEC61850 substations, test equipment with proprietary software and executing code are commonly used. Please provide examples where a transient cyber asset had wireless enabled such that the transient cyber asset was not an electronic access point.

No
Oncor supports comments submitted by EEI and Southern Company with the following additional comments: CIP-010-2 R4.1 – Authorize the usage of Transient Cyber Assets prior to initial use, except for CIP Exceptional Circumstances. This requirement places a lot of overhead to maintain lists

or some form of documentation that documents for each transient cyber asset that connects to a Medium Impact BES Cyber System and tying it to some defined initial use time to show compliance. Most of the assets in Medium Impact BES Cyber systems are assets in substations that don't have communication external to the substation therefore the stated "initial use" would be hard to determine let alone document to the level of accuracy needed to establish compliance. Additionally, this burdensome requirement of creating and maintaining such lists adds little or no benefit to reliability or security. Oncor's requests consideration that requirement 4.1 not be applicable to Medium Impact BES Cyber Systems. A better alternative would be authorized users whose transient devices meet 4.1.4 compliance of having pre-authorized operating system, firmware, and intentionally installed software.

Limit the applicability for dispersed generation to the point where those resources aggregate to greater than 75 MVA to a common point of interconnection at 100 kV or above and not at an individual turbine, inverter or unit level in the CIP-003-6 Applicability section similar to PRC-005. This applicability change would apply only in CIP-003-6 standard for the low impact asset requirements. See comments on question 8. // Table titles in other standards reflect the requirements not the applicability. We recommend changing the table title for consistency to: "CIP-003-6 Policies, Processes, Plans and Programs." // Background Section 6: With the addition of the tables, the Introduction Background Section 6 should include a paragraph referencing the tables and the "Applicable Systems" Columns in Tables section that is included in the Background section for other standards. ***The paragraph for CIP-003-6 Background Section 6 would be: "Requirement R2 opens with, "Each Responsible Entity for its assets identified in CIP-002-5.1 Requirement R1.3 containing low impact BES Cyber Systems shall perform each of the applicable requirement parts in CIP-003-6 Table R2 –Policies, Processes, Plans and Programs." The referenced table requires the applicable items in the procedures for the requirement's common subject matter." Insert the Applicable Systems boiler plate from other CIP standards into the Background Section 6 for CIP-003-6 with regard to Requirement R2. // In R2: Add back: "for its assets identified in CIP-002-5.1 Requirement R1.3" in CIP-003-6 R2 for clarification. ***Revise the requirement to: "Each Responsible Entity for its assets identified in CIP-002-5.1 Requirement R1.3 containing low impact BES Cyber Systems shall perform each of the applicable requirement parts in CIP-003-6 Table R2 – Policies, Processes, Plans and Programs. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] Note: An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required. Lists of authorized users are not required." // Requirement R2, Part 2.1 – An entity may not have a low impact BES Cyber System at a Control Center (R2.3) and therefore R2, Part 2.3 is not applicable. ***Revise the requirement text to: "that collectively address the applicable topics in CIP-003-6, Requirement R2, Parts 2.2 -2.6." // Requirement R2, Subpart 2.4.2 - Remove "by default" as it implies the use of a firewall, which limits access control options. For example, an entity could use access control lists on a router or switch to provide security for traffic control. However, routers and switches do not do this by default. This will allow entities more options on how to accomplish traffic control. Include allowance for access permission reasons by individual or group in the requirement. ***Revise requirement R2.4.2 to: "For each identified access point, if any, require inbound and outbound access permissions and deny all other

access. Document access permission reasons individually or by group." // Requirement R2, Part 2.6 - The specificity of what must be covered and tracking two time periods is more prescriptive than the requirements for medium and high impact BES Cyber Systems and is not commensurate with the risk. The proposed revision uses language from the medium/high impact requirement (CIP-004-R1.1) with the time period adjusted to once every 15 calendar months to differentiate for the lower risk. Cyber security awareness can be addressed during annual training for employees and contractors in addition to other ongoing cyber security awareness communications. Remove references to other subpart requirements as all subparts may not apply to all entities. ***Revise requirement to: "Implement a security awareness program that reinforces cyber security practices at least once every 15 calendar months." // Guidelines and technical basis – Clarify the drawings by more specifically identifying the external routable path(s). It appears that users of the guidelines are to infer the business network is a separate external routable protocol path. Please reconsider the drawings.
Yes
We agree with the approach to address protections for nonprogrammable components of communication networks. // We have concerns regarding the removal of the "identify, assess and correct" language. See comments on question 5. // We recommend an addition to the guidelines and technical basis for CIP-006-6 R1.10 to capture FERC's clarification that entities are not expected to enforce this requirement on third party nonprogrammable components that are out of the entities' control.
No
No changes are needed for the malicious code and signatures/patterns Parts 4.2, 4.3, 4.4 and 4.5. // We do not agree with Part 4.1. FERC's Order 791 noted the approach to addressing the risks associated with transient devices should be done without imposing unduly burdensome requirements on responsible entities. The controls in Parts 4.1 should be revised to reduce burden. Subpart 4.1.1 should not require users to be authorized for the Transient Cyber Asset if users are already authorized for the applicable systems. Duplicate authorization would be unduly burdensome. Subpart 4.1.2 and 4.1.4 are unduly burdensome by requiring the additional obligation of authorization for locations and software. FERC's directive can be addressed by documenting the locations and software, without requiring authorization. Subpart 4.1.3 and 4.1.4 require documenting defined acceptable use, operating systems or firmware, which is exceeds FERC's directive. Part 4.6 references Subpart 4.1.4. // We recommend revising Part 4.1 to only address user authorization. We recommend a separate part for documenting locations. We recommend a separate part for documenting software. Retain the applicable systems in 4.1 for the revised 4.1 and the two new Parts (High and Medium Impact and associated PCA.) *** Recommended text *** Part 4.1 – "Authorize, except for CIP Exceptional Circumstances, users individually or by group/role for electronic access to the Transient Cyber Asset when it is not required to authorize users for electronic access to the applicable systems to which the user is connecting. Authorization is based on need, as determined by the Responsible Entity. (When users are already authorized for electronic access to the applicable systems the user is connecting to, additional authorizations for the Transient Cyber Asset are not required.) OR Designate organizational personnel with required electronic access authorizations and technical competence to supervise the maintenance activities of personnel who do not possess the required electronic access authorizations." This is from NIST 800-53 Control MA-5, which provides an option for escorted electronic access. FERC Order 791 paragraph 136 refers to the MA and MP NIST controls. ***Recommended text Part 4.X – "Document locations of applicable systems, individually or by group/role where the Transient Cyber Assets can be directly connected to applicable systems. Document if the Transient Cyber Asset may be directly connected to non-applicable systems. A list of non-BES locations is not required." (Separate Transient Cyber Assets are not required for different BES impact levels or non-BES and are not practical for substations.) *** Recommended text Part 4.Y – "Document software installed on Transient Cyber Assets (per Cyber Asset capability.)" // In Part 4.6, revise the reference to Subpart 4.1.4 to the new Part 4.Y. // We propose a few changes for Part 4.7. ***Revise the requirement to: "Evaluate Transient Cyber Assets, within 35 calendar days prior to use, for applicable security patches and take one of the following actions: (bullet) Apply the applicable patches; or (next bullet) Create a mitigation plan; or (next bullet) Revise an existing mitigation plan. // The goal is to protect the applicable system(s) to which the Transient Cyber Asset will be connected. To clarify this, the structure of the applicable systems column should be revised to follow the model used for PACS in CIP-006-5 R1.1. For

example, ***revise applicability to: “Transient Cyber Assets directly connected to (bullet) High Impact BES Cyber Systems and their associated PCA, (next bullet) Medium Impact BES Cyber Systems and their associated PCA”. If this change is made the guidance won’t need to be revised, Requirement R4: This requirement applies to any transient devices...” // Guidance also suggests, “It may be reasonable to have separate Transient Cyber Assets for each impact level.” It is not reasonable. It would be cost-prohibitive and complicated to track. // “Prior to use” for every transient device every time the device is moved from one ESP (or PSP) to another is not practical for the associated level of risk.
No
We agree with the revised definitions and with the new definition for Transient Cyber Assets. However, although the definition for Transient Cyber Assets is very specific about what Transient Cyber Assets are directly connected to, the definition for Removable Media does not name what Removable Media are connected to. Also, the final sentence sounds backwards. We recommend the following ***revised definition: “Removable Media: Portable media, connected for 30 consecutive calendar days or less to (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset, that can be used to copy, move and/or access data. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory. Removable Media are not Cyber Assets.”
No
We agree with the standard drafting team’s approach to remove the “identify, assess and correct” language and the concept of compliance exceptions to address the resulting gap. However, we are concerned compliance exceptions have not been implemented for all entities. Similar concerns were expressed at the MRC pre-meeting on July 16. NERC can support Standard Drafting Team efforts by implementing compliance exceptions prior to the second or final ballot.
No
The implementation plan should provide for skipping CIP version 5 in the scenario where CIP version 6 is ordered before the CIP version 5 effective date (for medium and high, for example), but results in a CIP version 6 effective date after the CIP version 5 effective date. The implementation plan may not be supported until the low impact asset requirements are approved.
No comments.
Yes
Limit the applicability for dispersed generation to the point where those resources aggregate to greater than 75 MVA to a common point of interconnection at 100 kV or above and not at an individual turbine, inverter or unit level in the CIP-003-6 Applicability section similar to PRC-005. Suggested revision: Under the Introduction section, 4 Applicability, 4.2 Facilities, ***add the following statement after 4.2.2 All BES Facilities: “For dispersed power producing resources identified through Inclusion I4 of the BES definition, the only BES Cyber Systems that meet the low impact rating criterion 3.3 in Attachment 1 of CIP-002-5.1 are any shared BES Cyber Systems that could, within 15 minutes, adversely impact the reliable operation of dispersed generation units from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or above and not at an individual turbine, inverter or unit level.” This change should be made in conjunction with adding back “for its assets identified in CIP-002-5.1 Requirement R1.3” in CIP-003-6 R2. The SAR for the CIP version 5 revisions project 2014-02 includes the following statement, “This project may also consider input that may be provided from CIP version 5 transition activities, for example from the NERC transition study or CIP Version 5 transition program.” At least one NERC transition study participant has identified the need to address dispersed generation in the CIP standards. Also, the dispersed generation project 2014-01 SAR includes the following phrase, “for standard drafting teams developing new or revised Standards, so that they do not incorrectly apply requirements to dispersed generation unless such an application is technically sound and promotes the reliable operation of the BES.” // Correct the errata in the Guidelines and Technical Basis for CIP-007-5 R2.2 in the last sentence of the second to last paragraph where it references a TFE. Technical feasibility exceptions are not included in Requirement R2.2 of CIP-007-5. // MidAmerican Energy Company supports Edison Electric Institute comments. MidAmerican Energy Company thanks the Standards Drafting Team for their technical competence, diligent work and collaboration with industry.

R2 – Usage of the term “external routable protocol paths” should be officially defined by NERC before being able to “judge the sufficiency” of the newly introduced controls. Assumptions a responsible entity could make surrounding this term could lead to violations. The Guidelines and Technical Basis section includes numerous references to “belief” and “intent,” along with descriptions of what entities “should” be doing. The need for such language indicates that the requirement language is not able to stand on its own and results in a need to be audited by the Guidelines and Technical Basis section. In turn, language not intended to be a required action by the entity could result in a perceived additional requirement by those trying to understand the requirement. While the intent of the “Note:” section under CIP-003-6 R2 is understood, there is no way to effectively audit for the successful and complete implementation of CIP-003-6 Table R2 – Low Impact Assets without obtaining an inventory of considered assets and of authorized users. Auditors are not able to reliably issue a judgment of the effectiveness of an internal control or of adherence to requirements without ensuring that samples are pulled from a complete population. Furthermore, entities are not able to perform the functions outlined within the R2 requirements without having lists of authorized users, both for access authentication and monitoring purposes. R2.3.2 – In part because the reference to “physical access point(s)” is not in relation to a defined Physical Security Perimeter, the requirement is actually more stringent than that of CIP-006-6 R1.4 and could require more evidence in support of compliance. An entity may need to prove an evaluation was performed resulting in the derivation of an inventory of all potential access points for all Low Impact BES Cyber Systems at Control Centers. Furthermore, diagrams may be needed to support that monitoring has been considered and defined for all applicable access points. While intended to be helpful in aggregating all Low Impact BES Cyber Systems requirements into a single section, the table has resulted in a web of functionally similar, yet separated requirements that could result in confusion. KCP&L recommends that, wherever possible, the items from CIP-003-6 Table R2 – Low Impact Assets be moved to the appropriate functional section and included as an additional applicable system where requirements are also similar. R2.4 – The requirements established under R2.4 are redundant to CIP-005-5 R1. In order to effectively audit the implementation of such controls, inventories and lists will be required just as they will be for CIP-005-5 R1. Guidelines and Technical Basis Section 2.4 – The two sentences beginning with “The electronic access controls should address…” go beyond the purview of the language of the requirement and serve to dictate what “should” be addressed. It is recommended that these sentences be stricken from the Guidelines and Technical Basis section.
No
CIP-006-6: The current order and applicability for CIP-006-6 is inconsistent and does not logically flow. At no point is a requirement for use of a defined PSP introduced, yet a number of the requirements pertain exclusively to the existence of a defined PSP. Physical Access Control Systems, as defined by the NERC Glossary of Terms, are also not stated as being required. Due to the current combined applicability and requirements, an entity could theoretically have a High Impact BES Cyber System that does not reside in a PSP and does not have a Physical Access Control System. This could result in applicability of only CIP-006-6 R1.3 and R1.10, and a lack of requirement for operational or procedural controls to restrict physical access. While the entity would still have to achieve two or more physical access controls, the requirements never state that a PACS is required for a High Impact BES Cyber System to achieve this or that a PSP is required for any system. KCP&L recommends that either CIP-006-6 R1.1 be updated to require the use of a Physical Access Control System for High Impact BES Cyber Systems or that a new sub-requirement is created to require High Impact BES Cyber Systems to have a Physical Access Control System with defined operational or procedural controls to restrict physical access. In addition, consideration should be given to rewording some monitoring, logging, and alerting requirements to include monitoring, logging, and alerting provisions for non-PSP, physically protected areas. CIP-007-6 The term “nonprogrammable communication components located inside both a PSP and an ESP” is a new source of confusion and may require definition as an official NERC Glossary term. CIP-005-5 requires only for “Cyber Assets”

to reside within an ESP. Unofficial guidance has already been communicated by various Regional Entities in support of excluding non-Cyber Asset, nonprogrammable “devices” from the required ESP. Therefore, it is difficult to identify where a “nonprogrammable communication component” that is also not a Cyber Asset would be located inside an ESP. Additionally, while CIP-006-6 defines certain protections that must be afforded to a Physical Security Perimeter, there is no requirement stating that a device must reside within a defined PSP. Therefore, entities are allowed to utilize other operational or procedural control measures for protecting High and Medium impact ESPs. Even if a “nonprogrammable communication component” is defined as part of an ESP, it is possible that the “nonprogrammable communication component” will not reside within a defined PSP. It should also be noted that the addition of such language will result in increased burden for entities by nature of a backdoor requirement for documentation of all considered “nonprogrammable communication components” that are not NERC-defined “Cyber Assets.” The current proposed language applicable only to “nonprogrammable communication components located inside both a PSP and an ESP,” along with other PSP-specific requirements, may serve to discourage entities from creating defined PSPs around BES Cyber Systems.
No
Although we agree with the overall approach the Standards Drafting Team has taken, we answered no to this question due to specific concerns described in the comments submitted by the Edison Electric Institute. While we have previously stated that additional controls are necessary in this area for security and to ensure reliability, implementation of such controls will need to occur with a view toward practicality and sustainability.
No
KCP&L believes that the definition of Transient Cyber Asset should be clear to ensure no unintended consequences from interpretations by stakeholders involved where direct connections of devices are anticipated. Physical and electronic access control to BES Cyber Systems is a critical component of securing the overall system, and such devices should be protected from inappropriate Transient Cyber Asset connections. But the definition of such lacks clarity and thus will lack consistency in application. The language around the Transient Cyber Asset and Removable media is silent and unclear where EACMS and PACS are concerned. The new definition could read as follows: Transient Cyber Asset: A Cyber Asset directly connected for 30 consecutive calendar days or less, to: (1) a BES Cyber Asset, or (2) a network within an ESP. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes. Note: Clarity needed for issues identified previously.
Yes
While KCP&L supports alternative methods of assessing maturity and effectiveness in adherence to the NERC CIP requirements, the “Identify, Assess and Correct” language was an open-ended and unstructured framework that would cause confusion and lead to the expansion of the scope of NERC CIP based on auditor judgment. This concept would be addressed in tools and frameworks accomplished through the Reliability Assurance Initiative (RAI), however, consistency in auditor training and approach will be critical to the success of the RAI program.
Yes
No
We are not aware of additional jurisdictions that should be considered at this time.
Yes
KCP&L would like to endorse those comments made in this question by the Edison Electric Institute.
Individual
Kalem Long
The Empire District Electric Company
No
Parts 2.2 through 2.6 all require us to "implement one or more documented processes that..." However, the measures are about the documentation of operational controls, and nothing to prove implementation. There is an inconsistency between the requirement and what will be needed to show compliance to the requirement.

No
Though the intent is appreciated, CIP-006 Part 1.10 adds ambiguity with the verbiage "an equally effective logical protection." An entity may believe that they are compliant with full evidence, but this may not meet what auditor believes is "equally effective."
Yes
No
EDE agrees with EEI's comments: "There is a consistency issue. The definition for Transient Cyber Assets is very specific about what Transient Cyber Assets are directly connected to; however, the definition for Removable Media is not. It can be implied that the definition refers to connection to applicable systems, but it is not clear. It would also be clearer to switch the order of the Removable Media and Cyber Assets in the last sentence. {Suggested Revision} Change the definition of Removable Media to: “Portable media, connected for 30 consecutive calendar days or less, to applicable systems. Examples of portable media that can be used to copy, move and/or access data include, include but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory. Removable Media are not Cyber Assets.”
Yes
Though Empire votes to approve the removal of IAC, we agree with SPP that "We do appreciate the clarity that removing the IAC language will provide. There is a concern that we are being asked to approve standards based on a program that is currently under development. By the time that a Responsible Entity will see how RAI is applied in audit situations, these standards, with the IAC language removed, will long have been voted upon."

Consideration of Comments: Project 2014-02 CIP Version 5 Revisions

The Project 2014-02 Standard Drafting Team (SDT) thanks all commenters who submitted comments on the draft Critical Infrastructure Protection (CIP) Reliability Standards. These Reliability Standards were posted for a 45-day public comment period from June 2, 2014 through July 16, 2014. Stakeholders were asked to provide feedback on the Reliability Standards and associated documents through a special electronic comment form. There were 98 sets of comments, including comments from approximately 196 different people from approximately 142 companies representing all 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the CIP Version 5 Revisions SDT project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, please contact Valerie Agnew, the Director of Standards, at 404-446-2566 or valerie.agnew@nerc.net. There is also a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process can be found in the Standard Processes Manual.
http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

Introduction

The SDT appreciates industry comments on the revisions to the CIP Reliability Standards. During the development of the revised standards prior to posting, the SDT made it a priority to conduct outreach as modifications were made to the standards. The SDT conducted two face-to-face meetings to revise the standards, Implementation Plan, Violation Risk Factors (VRFs), and Violation Severity Levels (VSLs) in order to appropriately consider all comments received. The SDT continued its rigorous conference call schedule as it understands the importance of getting these standards to steady state.

Background

On November 22, 2013, FERC issued Order No. 791, Version 5 Critical Infrastructure Protection Reliability Standards. In this order, FERC approved version 5 of the CIP standards and also directed that NERC make the following modifications to those standards:

1. Modify or remove the "identify, assess, and correct" (IAC) language in 17 CIP version 5 requirements.
2. Develop modifications to the CIP standards to address security controls for to assets containing low impact BES Cyber Systems.
3. Develop requirements that protect transient electronic devices.
4. Create a definition of "communication networks" and develop new or modified standards that address the protection of communication networks.

FERC directed NERC to submit new or modified standards responding to the directives related to the IAC language and communication networks by February 3, 2015, one year from the effective date of Order No. 791. FERC did not place any time frame for NERC to respond to the low impact and transient electronic devices directives. The purpose of the proposed project is to address the directives from FERC Order No. 791 to develop or modify the CIP standards.

Question 1: CIP-003-6

1. *The Standard Drafting Team (SDT) developed objective criteria in the processes in CIP-003, Requirement R2 to address the directive in FERC Order No. 791. Do you agree with the approach to meeting this directive? If not, please offer suggested revisions.*

Question 1 deals with the directive to develop modifications to the CIP standards to address security controls for assets containing low impact BES Cyber Systems. The SDT sought comments on its approach in modifying CIP-003-6, Requirement R2.

Placement

During the development prior to the initial posting, the SDT discussed the placement of the low impact requirements on many occasions. There were many commenters who suggested spreading out the requirement parts into the relating standards (for instance, CIP-008 for incident response), while a similar amount of commenters suggested keeping the requirements in CIP-003. The commenters supporting the allocation of the low impact requirements to the relating standards suggested to use existing applicability tables and sought justification for why the low impact requirements were in CIP-003 Requirement R2. In response, the SDT has modified the approach to the assets containing low impact BES Cyber Systems to require a plan to address the Order No. 791 directive for more objective criteria. The applicability tables are no longer being used.

In response to comments that CIP-003 is a policy standard, the SDT developed the attachment approach where the requirement requires a plan whose elements are detailed in an attachment to the standard. The team also added language to CIP-003 clarifying that Responsible Entities with multiple impact BES Cyber Systems ratings can utilize policies, procedures, and processes for their high or medium impact BES Cyber Systems to fulfill the elements for the development of low impact cyber security plans. The SDT discussed the costs and benefits of the placement issue and came to the conclusion that having the low impact requirements reside in CIP-003 was the best approach because it allows those with only assets containing low impact BES Cyber Systems to focus on one standard. As well, the SDT determined that an entity's management of low impact protections may differ from the medium and high impact protections (such as site level program implementation versus device level program implementation) and therefore the requirements are best suited to reside in one standard.

Reference to CIP-002-5.1

CenterPoint Energy questioned why the SDT deleted the link back to CIP-002-5.1, Requirement R1, Part 1.3. The SDT had removed the link in the previous version believing using "low impact assets" was sufficient. In response to this comment, the SDT has updated the requirement language to return the link to CIP-002-5, Requirement R1, Part 1.3. The SDT has updated the reference to CIP-002 to read, "Each Responsible Entity with at least one asset identified in CIP-002 containing a low impact BES Cyber System." The SDT states that this creates the direct link between the CIP-003-6, R2 and CIP-002-5, R1, Part 1.3 language.

Part 2.1

Pacific Gas and Electric, Colorado Springs Utilities, Phillips 66, Consumers Energy Company, City of Tallahassee, and Salt River Project supported the proposed Requirement R2, Part 2.1 as written for reviewing and obtaining CIP Senior Manager approval.

Southern Company: Southern Company Services, Inc.; Alabama Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing, and Oncor suggested allowing a delegate for CIP Senior Manager approval of policies. In initial crafting of revisions based on industry comment, the SDT did provide the option for a delegate to approve the documented cyber security policies. However, in the most recent revisions,

the SDT rolled the low impact policy requirements into the existing Requirement R1. In that requirement, CIP Senior Managers and not delegates must sign off on the policies for any impact rating. Therefore, only the CIP Senior Manager can approve the policies applicable to assets containing low impact BES Cyber Systems under Requirement R1, Part 1.2.

For the applicability, Exelon proposed "BES Assets containing Low Impact BCS." In response, the SDT has modified the approach to the assets containing low impact BES Cyber Systems. The SDT has updated the reference to CIP-002 to read, "Each Responsible Entity with at least one asset identified in CIP-002 containing a low impact BES Cyber System."

Dominion suggested removing the word "applicable" because it would have to apply controls at Control Centers even if it does not have one. In response, the SDT has modified the approach to the assets containing low impact BES Cyber Systems to require the evaluation of specific elements related to the assets containing low impact BES Cyber Systems. The evaluation provides the entity with the ability to determine applicability.

Part 2.2

ACES members asked if Part 2.2 was by site or collection of sites. In response, the SDT has modified the approach to the assets containing low impact BES Cyber Systems to require a plan. Within the plan, the SDT has stated that entities can develop their plans by "asset or groups of assets."

Pacific Gas and Electric, Colorado Springs Utilities, Phillips 66, Consumers Energy Company, City of Tallahassee, TAL, and Salt River Project supported the proposed Requirement R2, Part 2.2 as written for restricting physical access.

Arkansas Electric Cooperative Corporation, PNM Resources Resources, Luminant Energy Company, LLC, and South Carolina Electric and Gas stated that restricting physical access does not provide sufficient criteria. The entities asked for clarification on what the difference is between operational or procedural controls. The entities also requested that the Guidelines and Technical basis section align with the requirement part language. In response, the SDT has modified the approach to the assets containing low impact BES Cyber Systems. Entities now evaluate possible physical security objective criteria and develop an entity-specific plan.

Similar to its comment for Part 2.1, Exelon proposed that the applicability read, "BES Assets containing Low Impact BCS." In response, the SDT has modified the approach to the assets containing low impact BES Cyber Systems. The SDT is now using "The SDT has updated the reference to CIP-002 to read, "Each Responsible Entity with at least one asset identified in CIP-002 containing a low impact BES Cyber System."

Part 2.3

Pacific Gas and Electric, Colorado Springs Utilities, Phillips 66, Consumers Energy Company, City of Tallahassee, TAL, and Salt River Project supported the proposed Requirement R2, Part 2.3 as written for monitoring.

Dominion and Xcel Energy commented to remove this requirement part completely since the breakout of Control Centers is contradictory to FERC Order No. 791. In response, the SDT agrees and has removed the reference to Control Centers.

Duke Energy pointed out that it is difficult to determine and monitor physical access points for lows. Duke suggested requiring a Physical Security Perimeter (PSP) to capture the intent. In response, the SDT has modified the approach to the assets containing low impact BES Cyber Systems. Registered Entities now evaluate possible physical security objective criteria and develop an entity specific plan.

Kansas City Power & Light commented that because reference to physical access points is not in relation to defined PSP, the requirement part is more stringent than CIP-006-5, Requirement R1, Part 1.4. In response, the SDT has modified the approach to the assets containing low impact BES Cyber Systems. Entities now evaluate possible physical security objective criteria and develop an entity-specific plan.

Similar to its comments for Parts 2.1 and 2.2, Exelon proposed that the applicability read, "BES Assets containing Low Impact BCS." Exelon further asked who is considered a visitor. In response, the SDT has modified the approach to the assets containing low impact BES Cyber Systems. The SDT has updated the reference to CIP-002 to read, "Each Responsible Entity with at least one asset identified in CIP-002 containing a low impact BES Cyber System." The SDT no longer has specific carve-outs for "Control Centers." With regard to the visitor question posed by Exelon, the SDT has removed that language from the requirement part and attachment, as well as the Guidelines and Technical basis section.

Part 2.4

Northeast Power Coordinating Council, Pacific Gas and Electric, Colorado Springs Utilities, Tennessee Valley Authority, Dominion, Edison Electric Institute, Florida Municipal Power Authority, NiSource, Oncor Electric Delivery Company LLC, PPL NERC Registered Entities (multiple), PacifiCorp, Western Area Power Administration, Large Public Power Council, Tacoma Public Utilities, New York Power Authority, Sacramento Municipal Utility District, Hydro One, Kansas City Power & Light, NV Energy, Salt River Project, Austin Energy, Northeast Utilities, Independent System Operator/Regional Transmission Organization (ISO/RTO) Standards Review Committee (ISO/RTO SRC), Luminant Energy Company, LLC, and South Carolina Electric and Gas had comments on the phrase "external routable protocol paths." There were concerns that this phrase implies some sort of Electronic Security Perimeter (ESP) and inventory, as well as suggestions to address "untrusted" networks (those not owned by the entity). Clarifications were requested to what the phrase means and, more specifically, what "external" was in reference to. In response, the SDT has modified the approach to the assets containing low impact BES Cyber Systems. The SDT does not use the phrase "external routable protocol paths" and has created definitions for Low Impact BES Cyber System Electronic Access Point (LEAP) and Low Impact External Routable Connectivity (LERC) to further clarify the lows requirement.

CenterPoint Energy, Bureau of Reclamation, and Duke Energy suggested consider of using "authentication" instead of "access control." In response, authentication was considered by the SDT, but the implications of a required list prevented this inclusion. The SDT states that the language as stated does not require a firewall to control access. The SDT developed two definitions and added explanatory guidance to help clarify the intent of the "access control" requirement.

PACIFIC GAS & ELECTRIC, Colorado Springs Utilities, Florida Municipal Power Agency, Xcel Energy, Idaho Power, Hydro One, and Exelon Companies stated that this requirement part implies an inventory must be done to prove compliance. In response, the SDT notes that an inventory may be the best option for proving compliance, but is not the only option and is not the required option.

Southern Company: Southern Company Services, Inc.; Alabama Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing, Oncor Electric Delivery Company LLC, Associated Electric Cooperative, Inc., Phillips 66, Liberty Electric Power LLC, and Georgia Transmission Company commented that requiring justification for every firewall rule results in a significant amount of man-hours. Furthermore, the entities suggested to remove or reduce the part to not include inbound and outbound access permissions and remove the reason for granting access. In response, the SDT has modified the approach to the assets containing low impact BES Cyber Systems to require the development of a plan to address objective criteria. The electronic access controls have been modified to "For any Low Impact External Routable Connectivity, establish a Low Impact BES Cyber System Electronic Access Point that permits only necessary inbound and outbound access and denies all

other access." The SDT has removed "reasons for granting access." The SDT has modified the Guidance to explain that entities should maintain some documentation and be able to explain why the access permissions are in place.

Nebraska Public Power District and MidAmerican Energy Company suggested removing "default" as written as it appears that a firewall is the only solution. In response, the SDT removed "by default" and the language as stated does not require a firewall to control access. The SDT included additional discussion in the Guidance section for element 2.4.

Consumers Energy Company commented that the part should clearly state access points can reside either at the sub or at remote end of external routable protocol path. In response, the examples provided in guidance depict examples that the access points can be at the substation specifically or located at a regional or centralized location.

Massachusetts Municipal Wholesale Electric Company suggested to align this part more closely with CIP-005 because by avoiding the ESP and Electronic Access Point (EAP) requirements it becomes difficult to interpret and less effective at protecting. In response, the SDT has modified the approach to the assets containing low impact BES Cyber Systems to require the development of a plan to address objective criteria. The SDT has created two new definitions for Low Impact BES Cyber System Electronic Access Point (LEAP) and Low Impact External Routable Connectivity (LERC).

Part 2.5

Northeast Power Coordinating Council commented that the incident response plan requirement part is inconsistent with CIP-008-5 Requirement R2's incident response plan for Medium/High. In response, the SDT has modified the approach to the assets containing low impact BES Cyber Systems to require the development of a plan to address objective criteria. In Attachment 1, Responsible Entities with multiple impact BES Cyber Systems ratings can utilize policies, procedures, and processes for their high or medium impact BES Cyber Systems to fulfill the elements for the development of low impact cyber security plans. Each Responsible Entity can develop a cyber security plan either by individual asset or groups of assets.

Tennessee Valley Authority and Exelon asked if one incident response plan can encompass multiple facilities/BES Cyber Systems and if testing of the plan means that testing must occur for each facility. In response, the SDT has modified the approach to require that entities with assets containing low impact BES Cyber Systems develop a plan to address objective criteria in CIP-003-6, Attachment 1. The team intends for entities to have the latitude to develop a plan encompassing multiple facilities if they see fit and added "Each Responsible Entity can develop a cyber security plan either by individual asset or groups of assets" to the Attachment language. Responsible Entities with multiple impact BES Cyber Systems ratings can utilize policies, procedures, and processes for their high or medium impact BES Cyber Systems to fulfill the elements for the development of low impact cyber security plans.

Florida Municipal Power Authority, Tampa Electric Co., and Southern suggested limiting the scope of part 2.5 to low impact Control Centers and removing any reference that might include out-of-scope terms such as ESPs and PSPs. In response, the SDT has removed all specific carve-outs to "Control Centers."

Large Public Power Council commented that CIP-003 Requirement R2, Part 2.5 for low impact BES Cyber Systems should be added to the CIP-008 standard maintaining the 36 calendar months timeframe specific to low impact BES Cyber Systems. In response, the SDT has modified the approach to assets containing low impact BES Cyber Systems to require the development of a plan to address objective criteria. In Attachment 1, Responsible Entities with multiple impact BES Cyber Systems ratings can utilize policies, procedures, and processes for their high or medium impact BES Cyber Systems to fulfill the elements for the development of low impact cyber security plans. Each Responsible Entity can develop a cyber security plan either by individual asset or groups of assets.

Phillips 66 commented that the incident response plan is duplicative of EOP-004 that covers cyber incidents. In response, the SDT states that the Cyber Security Incident response is required to be a part of the CIP standards and not covered in EOP-004.

Tampa Electric Co. and Southern suggested removing the word "paper" to allow for all types of drills. In response, the SDT has modified the incident response elements with the plan.

Consumers Energy commented that the language of the standard needs to clarify that the Responsible Entity can create a holistic incident response plan utilizing physical security mechanisms that lead to Cyber Security Incident identification, classification, and response; and that logging and monitoring of low impact BES Cyber Systems is not required. In response, the SDT has utilized language from CIP-008-5, which is exclusive to cyber security.

Lincoln Electric System recommended either removing Requirement R2, Part 2.5 or add an exclusion for 'Low Impact assets without routable connectivity' in recognition that a cyber-incident at a non-routable connected substation does not affect any other Low, Medium or High Impact BES Asset. In response, the SDT has utilized the language from CIP-008-5, which is exclusive to Cyber Security and does not exclude non-routable connections.

Idaho Power and PNM Resources suggested moving part 2.5 to CIP-008. Similar to the comments earlier regarding placement, the SDT notes that keeping the low impact obligations in one standard is the best place for the objective criteria to reside based on feedback from industry. The SDT has modified the approach to assets containing low impact BES Cyber Systems to require the development of a plan to address objective criteria. In Attachment 1, Responsible Entities with multiple impact BES Cyber Systems ratings can utilize policies, procedures, and processes for their high or medium impact BES Cyber Systems to fulfill the elements for the development of low impact cyber security plans. Each Responsible Entity can develop a cyber security plan either by individual asset or groups of assets.

Exelon suggested the SDT provide clear guidance stating that sites with low impact BES Cyber Systems may be covered by an enterprise-wide Cyber Security Incident response plan or other approach, and assurance that a Cyber Security Incident response plan is not required for each site. In response, the SDT has modified the approach to assets containing low impact BES Cyber Systems to require the development of a plan to address objective criteria. In Attachment 1, Responsible Entities with multiple impact BES Cyber Systems ratings can utilize policies, procedures, and processes for their high or medium impact BES Cyber Systems to fulfill the elements for the development of low impact cyber security plans. Each Responsible Entity can develop a cyber security plan either by individual asset or groups of assets.

Southern Company suggested providing additional information in the Guidelines and Technical Basis section on the use of the term "Cyber Security Incident" as it applies to low impact BES Cyber Systems. In response, the SDT has added language in the guidance that the entity should have a documented Cyber Security Incident response plan that includes each of the topics listed. For assets that have limited or no connectivity external to the asset, it is not the intent to increase their risk by increasing the level of connectivity in order to have real-time monitoring. The intent is if in the normal course of business suspicious activities are noted at an asset containing low impact BES Cyber Systems, there is a Cyber Security Incident response plan that will guide the entity through responding to the incident and reporting the incident if it rises to the level of a Reportable Cyber Security Incident.

Part 2.6

CenterPoint, Northeast Power Coordinating Council, Dominion, Edison Electric Institute, Large Public Power Council, Southern, NiSource, Public Service Enterprise Group, New York Power Authority, Xcel, PNM Resources, Exelon, NV, American Electric Power, Georgia Transmission Corporation, Northeast Utilities, MEC commented that the level of detail for security awareness is beyond what is required for mediums and highs. In response, the SDT has modified the language for security awareness to align with CIP-004, Requirement R1.

Tennessee Valley Authority, Idaho Power, PNM Resources, Exelon, and MidAmerican stated that this part should be located in CIP-004. In response, the SDT notes that keeping the low impact obligations in one standard is the best place for the objective criteria to reside based on feedback from industry. The SDT has modified the approach to assets containing low impact BES Cyber Systems to require the development of a plan to address objective criteria. In Attachment 1, Responsible Entities with multiple impact BES Cyber Systems ratings can utilize policies, procedures, and processes for their high or medium impact BES Cyber Systems to fulfill the elements for the development of low impact cyber security plans. Each Responsible Entity can develop a cyber security plan either by individual asset or groups of assets.

Edison Electric Institute, Tampa Electric Co., NiSource, and Oncor suggested removing the references to the subpart requirements as they may not apply to all entities. The commenters also suggested removing the quarterly component. In response, the SDT has modified the language for security awareness to align with CIP-004.

PPL, Edison Electric Institute, Tampa Electric Co., Southern, Phillips66, NiSource, Public Service Enterprise Group, Xcel, and NV Energy recommended removing the language surrounding quarterly and modifying it to annually. In response, the SDT has modified the language to “at least once every 15 calendar months” from “quarterly.”

Consumers Energy commented that the language of the standard needs to clarify that the Responsibility Entity’s security awareness program applies only to its employees, but could include non-employees, and that posters, emails, and topics at staff meetings are sufficient delivery method and that tracking of reception is not required. LES had a similar comment regarding how security awareness is provided and proven on a per asset basis. In response, the SDT notes that methods of delivery are addressed in the guidance, and that the scope of awareness training is left to Responsible Entities to determine (non-employee vs. employee).

Dispersed Generation Resources (DGR)

Edison Electric Institute, Tampa Electric Co., NiSource, Oncor, We Energies, PNM Resources, Exelon, NV Energy, Florida Power & Light, and MidAmerican commented that the scope of dispersed generation in the CIP-003-6 Applicability section should be limited and similar to PRC-005. In response, the CIP SDT notes that coordination with the DGR SDT has been occurring and will continue to occur. Since CIP-002-5.1 is not being revised from the FERC Order No. 791 directives, the DGR SDT is best suited to modify the applicability and post the revised changes to CIP-002-5.1 for an initial comment and ballot period. Not slated as a “high priority standard” in the DGR’s project plan, CIP applicability changes can fall into the DGR’s “medium priority” bucket as it continues its work on modifying certain standards to address dispersed power producing resources. The DGR SDT has an upcoming meeting in September 2014 and the CIP applicability change is on its agenda. The CIP SDT will continue to coordinate with the DGR SDT as necessary to provide technical basis and justification for any work the DGR SDT provides in revising CIP-002-5.1. A timeline for that posting should come out relatively soon to give commenters assurance that work will continue through the DGR SDT’s SAR.

Reliability Standard Audit Worksheets (RSAWs)

Pacific Gas & Electric recommended the performance of an annual sampling assessment of such classified systems to determine the state of their security controls. This could be done using NERC sampling guidelines. In response, the SDT notes that this is most appropriately addressed through the RSAW approach.

Florida Municipal Power Authority commented that the RSAWs do not provide any level of clarity as to how an entity can expect to be audited. Large Public Power Council, Tacoma, New York Power Authority, and Sacramento Municipal Utilities District commented that specific RSAWs can be created for the low impact requirements that reduce the number of RSAWs that need to be completed by entities. In response, the SDT notes that there is a

specific RSAW working group focused on revising the posted RSAWs. That team will take into account the RSAW comments and revise them accordingly.

Exelon encouraged the RSAW development team to continue its work in modifying the RSAWs and possibly include RAI components for the assets containing low impact BES Cyber Systems to demonstrate how RAI can alleviate compliance concerns. In response, the SDT notes the RSAW working group will take into account the RSAW comments and revise them accordingly.

FirstEnergy had concerns with the RSAWs and support Edison Electric Institute's comments. In response, the SDT notes that there is a specific RSAW working group focused on revising the posted RSAWs. That team will take into account the RSAW comments and revise them accordingly.

General Comments

CenterPoint commented that Measure M2 should be revised to reflect the pattern in other Measures of CIP-003. CenterPoint further suggested that the SDT consider the pattern found in other standards and remove the word "any" from the draft Measure. In response, the SDT has made the appropriate modifications to the Measures based on the revised language in CIP-003.

Edison Electric Institute, Tampa Electric Co., NiSource, Oncor, and We Energies suggested revisions to the background and guidelines and technical basis sections to align the drawings and the words of the requirement. In response, the SDT has modified the current language to remove the table within Requirement R2, electing to maintain "policy and program" level within the requirement and including additional objective language within an associated Attachment.

Duke Energy commented that there are the same control measures in place as medium impact BES Cyber Assets, which will become extremely burdensome and provide little benefit to reliability. In response, the SDT has modified the language to ensure a compliance burden less than high and medium impact BES assets based on risk to the BES.

Southern commented that the Applicable Systems column should be amended to state "Assets containing low impact BES Cyber Systems." In response, the SDT has modified the current language to remove the table within R2, electing to maintain "policy and program" level within the requirement and including additional objective language within an associated Attachment.

Rayburn asked if the standard sufficiently covers the appropriate levels and tactics expected to be used to be compliant. In response, the SDT has modified the current language to remove the table within R2, electing to maintain "policy and program" level within the requirement and including additional objective language within an associated Attachment.

Dynegy requested the SDT provide guidance in the standard as to how to determine low impact BES Cyber Systems without using the detailed inventory process. In response, the SDT has modified the current language to maintain "policy and program" level within the requirement and include additional objective language within an associated Attachment.

Occidental commented that subjective interpretations by Regional Entities are still a very real concern. In response, the SDT has forwarded the comments to NERC.

Idaho Power suggested that the applicability section of all these requirement parts addresses low impact BES Cyber Systems. It is counterintuitive to think that a list of low impact BES Cyber System will not be required to show compliance. In response, the SDT states that anticipating high counts of low impact BES Cyber Systems, the

SDT intends to allow Responsible Entities to shift their compliance approach away from rigorous Cyber Asset list maintenance and toward consistent maintenance of the low impact controls identified in CIP-003-6. The SDT believes the list of assets containing low impact BES Cyber Systems generated as a result of CIP-002-5.1, R1 is sufficient. However, Responsible Entities are not prohibited from developing and maintaining individual inventories of their low impact BES Cyber Systems components for their own business needs.

Hydro One suggested modifications to the VSLs. The SDT has made the revisions to the VSLs.

Encari commented that the Guidelines and Technical Basis section continues to use "external routable connectivity" in the discussion of Requirement R2 in parts 2.3 and 2.4. In response, the SDT has modified the current language to maintain "policy and program" level within the requirement and including additional objective language within an associated Attachment.

Kansas City Power & Light suggested that the Guidelines and Technical Basis section includes references to "belief" and "intent" along with descriptions of what entities "should" be doing. The need for such language indicates that the requirement language is not able to stand on its own and results in a need to be audited by the Guidelines and Technical Basis section. Section 2.4 - The two sentences beginning with "The electronic access controls should address..." go beyond the purview of the language of the requirement and serve to dictate what "should" be addressed. It is recommended that these sentences be stricken from the Guidelines and Technical Basis section. In response, the SDT has modified the Guidelines and Technical Basis section throughout the standard based on the comments received and the revisions made.

Nebraska Public Power District commented that while the drafting team has tried to show in the guidance what would be acceptable and what would not, in essence they have determined the "how" the requirement will be audited by showing only a firewall solution. In response, the SDT has modified the language to provide clearer objective criteria which allows for flexibility to Registered Entities.

American Public Power Association and National Rural Electric Cooperative Association commented that the SDT has gone too far in certain aspects of specificity of the requirement parts and the compliance costs exceed the reliability benefit to the BES. In response, the SDT has modified the language to provide clearer objective criteria and allows flexibility to Registered Entities. This allows for entities to tailor their internal plans to cover the risk that to assets containing low impact BES Cyber Systems pose.

National Rural Electric Cooperative Association recommended that NERC use the Requirements on low impact assets to demonstrate how RAI can alleviate the compliance concerns and create a reasonable approach to compliance. The SDT notes that it has forwarded these comments on to NERC.

Northeast Utilities commented that there are inconsistent testing time frames. Instances where there was a failure to extend implementation time-frame beyond the original version 5 effective compliance date. In response, the SDT has modified the implementation schedule to address inconsistencies.

MidAmerican provided suggested revisions to the Background section to include a paragraph referencing the tables and applicable systems column. The SDT has modified the approach to the low impact directive. The tables and applicable systems column are no longer being used.

Empire commented that the measures are about the documentation of operational controls and show nothing to prove implementation. There is an inconsistency between the requirement and what will be needed to show compliance to the requirement. In response, the Measures have been revised according to the revisions made to the Requirement and Attachment 1. A Measure provides identification of the evidence or types of evidence that

may demonstrate compliance with the associated requirement. Entities must show evidence of implementation of their plans to demonstrate compliance to the Requirement.

Southwest Power Pool Regional Entity disagreed with the premise in the Guidelines and Technical Basis section of the standard that compliance can be demonstrated purely through presentation of the documented processes at audit. There is an expectation that the documented processes will be implemented by the Responsible Entity. The guidelines should inform the Responsible Entity and the auditor what is expected to comply with the requirements and not how the requirements should be audited. The comment that the SDT strongly believes sampling is not necessary is inappropriate and should be removed. In response, the SDT has revised this section and removed the sampling component from this section.

Manitoba Hydro commented that section C of the Compliance section 1.3 is unclear, specifically that the meaning of “Complaints Text” is unclear. In response, the SDT has removed the word “Text” to be consistent with the other NERC Reliability Standards.

Luminant provided suggested revisions to multiple aspects of the Guidelines and Technical Basis section. The SDT has considered those suggestions as it went through the section as a whole and provided updates based not only on comments received, but also on the revisions made to CIP-003-6.

Massachusetts Municipal Wholesale Electric Company suggested that the Implementation Plan allow for a phased in approach. In response, the SDT agrees and has proposed a phased approach to the Implementation Plan allowing an additional implementation time for physical and electronic access.

Question 2: CIP-006-6 and CIP-007-6

2. *The SDT developed CIP-006, Requirement R1, Part 1.10 and revised CIP-007, Requirement R1, Part 1.2 to meet the directive in FERC Order No. 791 to address protections for nonprogrammable components of communication networks. Do you agree with the approach to meeting this directive? If not, please offer suggested revisions.*

Question 2 deals with the directive to create a definition of "communication networks" and develop new or modified standards that address the protection of communication networks.

CIP-006-6, Requirement R1, Part 1.10

Encryption

In response to ISO/RTO SRC and Tennessee Valley Authority, the SDT does not believe the Reliability Standards are an appropriate location for approved cryptographic protocols. This is due primarily to the ever-changing number of protocols and vulnerabilities in cryptosystems. Also, an approved encryption concerns both protocol and implementation. This type of information is best left to guidelines.

ERCOT suggested a Critical Infrastructure Protection Committee (CIPC) guideline be developed on acceptable encryption protocols, methods, and key management. In response, the SDT notes that CIPC may develop guidelines as part of its charter, which states that guidelines are documents that suggest approaches or behavior in a given technical area for the purpose of improving reliability. Reliability guidelines are not binding norms or mandatory requirements. Reliability guidelines may be adopted by a Responsible Entity in accordance with its own facts and circumstances. Any entity may submit a request for the CIPC to develop guidance, and the SDT will consider this suggestion after the second posting and discuss with NERC staff.

American Public Power Association and Florida Municipal Power Authority showed support for encryption as an option, but would reevaluate if encryption were removed or scope expanded. The SDT thanks those entities for their comments.

Tampa Electric Co. commented that monitoring the status of communication link is duplicative of COM-001-1.1 R1.1. Failure of communication links does not necessarily need to be reported through the BES Cyber Security Incident Response Plan. In response, the SDT states the communication link failure is specific only to the nonprogrammable components outside of the PSP and not the communication to other entities covered by COM-001-1.1 R1.1. The incident response component is only necessary if the monitoring/response option is used to protect the cabling and components. The incident response is included because monitoring alone does not provide the necessary physical security to the BES Cyber System.

NextEra Energy commented that rather than allow encryption and monitoring, require secure conduit, cable trays or defense-in depth approach for the BES facility. In response, the SDT notes that secure conduit and cable trays meet the obligation to restrict physical access. These options are mentioned specifically in the Guidelines and Technical Basis section for CIP-006-6. The defense-in-depth approach for the BES facility may also meet the same obligation, but encryption and monitoring are provided as specific and measurable options.

Tri-State commented that for monitoring controls, a 15-minute window for notification is typically not enough time to respond to an event. In response, the 15-minute window is to issue the alert or alarm in response to an event. The actual response does not have a time obligation. The SDT agrees time measured responses are not appropriate for this requirement part.

Pacific Gas & Electric and Southwest Power Pool Regional Entity commented that for monitoring controls, a timeframe does not exist for response or investigation and that ignoring a momentary interruption could result in not detecting a tap. Also, for short-run cables, investigation is not feasible. In response, the SDT does not believe a time obligation for response is appropriate for this requirement part. Operational variances in responding to an incident are best left to the entity's incident response plan. In response to Southwest Power Pool Regional Entity regarding tap detection, the entity would contemplate this scenario when selecting this option for protection. The SDT states that the controls, as written, sufficiently guard against this risk.

Pacific Gas & Electric recommended that for monitoring controls, a CIP Senior Manager sign-off should be required to ensure implementation remains intact as designed. In response, the CIP Senior Manager sign-off would not change the obligation for the entity. An entity may choose to employ a sign-off as part of their internal controls program, but this should not be a requirement.

Kansas City Power & Light commented that a Physical Access Control System (PACS) or PSP is not specifically required, and it may be possible to comply with CIP-006 without having a PACS or PSP. Kansas City Power & Light suggested requiring these as part of CIP-006 Requirement R1. In response, this comment is outside the scope of the Standards Authorization Request for this project. A PSP is not specifically required because an entity may be able to meet the objectives of physically securing the BES Cyber System without a PSP or PACS.

Tacoma Public Utilities stated a concern that a detailed cable map for every cable path relevant to the ESP will be required to demonstrate compliance. In response, the obligation to maintain a detailed cable map is not a Requirement of the Reliability Standards. The SDT has passed these concerns to the NERC Compliance staff to guide development of the RSAW.

Exelon suggested clarification that applicability only applies to ESPs with External Routable Connectivity. The SDT has provided additional guidance to clarify the bounds of this Requirement Part is the ESP. By definition, Electronic Access Points provide External Routable Connectivity.

Luminant Energy Company commented that for CIP-006-6 R1 and R2, a reason for removing all but the Severe VSL needs to be provided. For example, what if an entity had a process to retain logs for 90 days but instead retained all of the logs? In response, the CIP-006 VSLs have been binary (i.e. Severe only) since version 2 because of the FERC Order addressing VSLs for CIP stating: "Requirements where a single lapse in protection can compromise computer network security, i.e., the "weakest link" characteristic, should apply binary rather than gradated Violation Severity Levels."

Equally Effective Solution and Suggested Revisions

Dominion, Bureau of Reclamation, Xcel Energy, Texas Reliability Entity, Tri-State, Empire District, Southwest Power Pool Regional Transmission Organization, ISO/RTO SRC, ERCOT asked how "equally effective logical protection" be measured. The commenters suggested possibilities: (1) equal to other options, (2) describe how protection would be measured, (3) cable travels through facilities that provide physical access only to authorized personnel, (4) use of armored wire, (5) level of encryption, or (6) altogether removal of the 3rd bullet. In response, the SDT notes that the intent of including other effective logical protection is to allow entities the option of defining this protection. An entity may demonstrate compliance by showing how it protects the cabling and nonprogrammable components similar to the other options listed in the Requirement Part. The guidance for CIP-006-6 has been updated to make this clear. The specific suggestion to have cable travel through facilities that provide physical access to only authorized personnel would be considered physical access restrictions and has been included in the Guidelines and Technical Basis of CIP-006-6. The use of armored wire is functionally equivalent to the required physical access restrictions.

Similar to the comment raised above, Southwest Power Pool Regional Transmission Organization, ISO/RTO SRC, and Southern California Edison Company stated concerns on whether evidence will be necessary to show that physical access restrictions cannot be implemented. Suggestion to make clear that there is a choice between physical access restriction and alternative means of protection. In response, if an entity selects one of the alternatives in this Requirement Part, the Requirement language makes clear this is when such physical access restrictions *"are not"* implemented. Therefore, there is no additional obligation for the entity to demonstrate it cannot apply physical access restrictions. The Requirement leads with physical access restrictions to make sure the physical security objective is maintained.

Bonneville Power Administration and Massachusetts Municipal Wholesale Electric Company commented that control coverage is insufficient to provide adequate protection of the BES. Massachusetts Municipal Wholesale Electric Company further suggested CIP-006-6 should also include requirements for low impact BES Cyber Systems. In response, the SDT proposes the standards revisions as adequate and appropriate to protect the reliability of the BES. In doing so, the level of effort to meet the Requirement has been weighed against the risk posed to the BES.

CIP-007-6, Requirement R1, Part 1.2

Associated Electric Cooperative, Inc., National Rural Electric Cooperative Association, and American Electric Power stated that this requirement part is duplicative and overlaps with CIP-010-2 Requirement R4. In response, the Requirement to protect ports for Removable Media is different than the CIP-010-2 R4 Requirement for Removable Media. CIP-010-2 Requirement R4 concerns the Removable Media while CIP-007-6 Requirement Part 1.2 concerns the BES Cyber System ports.

Northeast Power Coordinating Council, New York Power Authority, and Hydro One suggested adding rationale for part 1.2 to the guidelines. Furthermore, the commenters suggested adding illustrative examples to the Measures and guidelines so entities and auditors will have the same interpretation. In response, additional clarification regarding the applicability has been added to the Technical Guidelines to make clear the scope of this Requirement Part as well as approaches to meeting the Requirement.

Duke and Exelon sought clarification that applicability means (a) devices located inside both a PSP and an ESP and not (b) devices within a PSP and devices within an ESP. Furthermore, the comments suggested the following for clarity: "Nonprogrammable communication components used for the connection between applicable Cyber Assets within the same ESP and within a PSP." In response, the SDT confirms that the applicability means devices located inside both a PSP and ESP. The SDT has added illustrations to the Guidelines and Technical Basis section to assist entities in understanding the applicability.

Associated Electric Cooperative, Inc. and National Rural Electric Cooperative Association sought more clarity around the term "nonprogrammable communication components." In response the SDT has provided additional examples in the Guidelines and Technical Basis that nonprogrammable communication components include unmanaged switches, hubs, and patch panels. This requirement only covers those portions of cabling and nonprogrammable communications components that are located outside of the PSP, but inside the ESP. Where this cabling and nonprogrammable communications components exist inside the PSP, that protection is afforded to these communication elements and therefore this requirement no longer applies. The requirement focuses on physical protection of the communications cabling and components as this is a requirement in a physical security standard and the gap in protection identified by FERC in Order No. 791 is one of the physical protections. However, the requirement part recognizes that there is more than one way to provide protection to communication cabling and nonprogrammable components. In particular, the requirement provides a mechanism for entities to select an alternative to physical security protection that may be chosen in a situation where an entity cannot implement physical security or simply chooses not to implement physical security. The entity is under no obligation to justify

or explain why it chose another protection mechanism. It may choose physical security protections or the logical protections identified in the requirement at its choice.

Northeast Utilities requested additional guidance on meeting this requirement for patch panels. The entity asked, 1) if cyber assets in the ESP have disabled unnecessary ports and services, is additional protection necessary? And 2) is signage or tamper tape required for all ports that are not used or disabled? In response, there are several options to protect against the use of these unnecessary ports. The entity should select the controls that make the most sense in their environment. Disabling ports, signage or tamper tape are all possible controls.

Definitions

Consumers Energy Company, Kansas City Power & Light, and Exelon suggested defining "nonprogrammable electronic components." The SDT does not agree defining nonprogrammable communication devices would provide additional clarity. The SDT suggests the term with the use of examples provides the common understanding necessary to meet the new Requirements.

Idaho Power and Tri-State stated that this does not address the FERC directive to create a definition of communication networks and developing new or modified standards. In response, the SDT reviewed the directives related to submitting a definition for communication networks and determined it could address the gap in protection and adequately provide guidance on nonprogrammable electronic components without having a definition. Communication networks can and should be defined broadly. For example, NIST Special Publication 800-53 Revision 4 refers to the CNSSI 4009 definition of Network, which is "Information system(s) implemented with a collection of interconnected components." The existing and modified requirements cover more targeted components. Consequently, there is not a need at this time to submit a definition for the NERC Glossary of Terms used in Reliability Standards.

Kansas City Power & Light raised a concern that entities will have an obligation to keep an inventory of nonprogrammable electronic components. In response, the obligation to maintain an inventory of nonprogrammable electronic components is not a Requirement of the NERC Reliability Standards. The SDT has passed these concerns to the NERC Compliance staff to guide development of the RSAWs.

Question 3: CIP-010-2

3. *The SDT developed CIP-010, Requirement R4 and revised CIP-004, Requirement R1, Part 2.1.9 to meet the directive in FERC Order No. 791 to address transient devices (Transient Cyber Assets and Removable Media). Do you agree with the approach to meeting this directive? If not, please offer suggested revisions.*

Applicability and Placement

ISO/RTO SRC, FirstEnergy, and Tacoma Public Utilities commented to move the requirement parts to the applicability of relevant CIP-007 requirements. In response, the SDT has not moved the requirements to the applicability of other standards. Since the use of these devices is limited to the context of change management and vulnerability assessment, the SDT determined that placing the requirements within CIP-010 is appropriate. While the requirements are similar to other standards, the requirements for Transient Cyber Assets and Removable Media are not the same as the requirements for BES Cyber Systems and other permanent assets.

Encari suggested that the applicable systems should be expanded to include the EACMS and PACS that are associated with high and medium impact BES Cyber Systems. In response, the SDT has chosen to focus the requirements to the assets that are to be connected to the BES Cyber Systems that provide a BES reliability operating services, as well as those residing within the same ESP. The goal is to protect the systems that can have a direct impact on real-time operations.

San Diego Gas & Electric sought clarification that devices not directly connected to the BES Cyber System should be exempt or considered out of scope such that other devices or media that are connected to the Transient Cyber Asset would be out of NERC CIP scope. In response, the SDT considers any other Cyber Asset or Removable Media connected to a Transient Cyber Asset to require the same protections as the Transient Cyber Asset or any other Removable Media.

Duke Energy, Southern Company: Southern Company Services, Inc., Alabama Power Company, Southern Company Generation, Southern Company Generation and Energy Marketing, Luminant Energy Company, LLC, Exelon Companies, and MidAmerican Energy Company stated that there were inconsistencies in the use of the applicability part of the table. In response, the SDT notes the tables supporting CIP-010-2 Requirement R4 have been eliminated. Please refer to the definitions of Transient Cyber Asset and Removable Media for specifics of the assets in scope.

Measures

Southern Company: Southern Company Services, Inc.; Alabama Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing, Exelon Companies, Texas Reliability Entity, and Bureau of Reclamation commented that the measures do not align with the requirement language and that some of the measure language is unclear on the meaning. In response, the tables supporting CIP-010-2 R4 have been eliminated. The requirement obligates the entity to create and implement plans for Transient Cyber Assets and Removable Media. The measure supports this requirement. Clarification of many topics has been added to the guidance.

Guidance

CenterPoint Energy recommended removing examples of statements from Guidelines and Technical Basis to reduce redundancies with definitions of Transient Cyber Asset and Removable Media. The SDT notes that while the examples are similar to those in the definitions, the examples in the guidance are more defined and provide guidance that has been requested by industry.

Dominion requested additional language to clarify the phrase "per Cyber Asset capability." The SDT has modified the guidance to clarify "per Cyber Asset capability."

Southern Company: Southern Company Services, Inc.; Alabama Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing recommended striking the term "physical proximity" as this is not required by the standard as written. In addition, these entities recommended removing the phrase "process is to include testing and installing of updated signatures or patterns." In response, the SDT removed the language.

Edison Electric Institute and NiSource suggested the SDT correct inconsistencies in the "Applicable Systems" of the Guidelines and Technical Basis. The SDT modified the guidance to align to the attachment sections.

Southern Company: Southern Company Services, Inc.; Alabama Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing, and Luminant Energy Company, LLC suggested the SDT consider removing the bullets under "Examples of these devices include…" and consider strengthening the intended meaning of the list of examples to improve clarity and provide guidance to industry. The SDT considers the example list of asset types to be appropriate guidance for the industry. These are examples and are not intended to be an all-inclusive or exhaustive list.

Edison Electric Institute, NiSource, San Diego Gas & Electric, and MidAmerican Energy Company commented that the guidance goes beyond the scope of the standard in Bullet 2 under Requirement Part 4.1 of the guidance because it includes low impact. These entities further commented that the SDT should consider that transient devices should be required to have a uniform level of protection sufficient to ensure that a designated and approved transient device could be used at any facility. The SDT notes that the requirements do not apply to low impact. However, the SDT believes it is worth providing guidance to the industry that the higher impact assets should be protected from the vulnerabilities from any other asset.

Southwest Power Pool Regional Entity and Northeast Utilities recommended that the SDT add alternatives to the use of anti-malware in the Guidelines and Technical Basis. The SDT modified the standard to include an attachment with options that may be applied to address malware prevention.

Tampa Electric Company recommended clarification of the Guidelines to allow for Removable Media to be validated on a periodic basis instead of on a per-use basis. The SDT modified the requirement to obligate the entity to create and implement management plans for Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization.

Northeast Utilities suggested the SDT expound upon the "CAUTION" statement in the Guidelines and Technical Basis regarding the use of secure wireless network to only access a secured network drive containing relay configuration data. The SDT defined more guidance and Requirement language for the use of secure, restricted communications in Attachment 1.

Part 4.1 – Authorization

Dominion, Duke Energy, Large Public Power Council, Southern Company: Southern Company Services, Inc.; Alabama Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing, Florida Municipal Power Authority, Exelon Companies, Austin Energy, and National Rural Electric Cooperative Association commented that the requirement to authorize "Operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability)" should be removed. In response, the SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that

are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the standard. For assets owned by the entity, the entity is required to document its defined acceptable use of the device, limiting the activities to business functions.

Southern Company: Southern Company Services, Inc.; Alabama Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing, and American Electric Power requested Requirement R4, Parts 4.1 and R4.6 be applicable to just high impact BES Cyber Systems and their associated PCAs and Part 4.1 be removed or modified to apply to medium impact BES Cyber Systems with External Routable Connectivity. In response, due to the wide-area impact of the high and medium impact assets, the SDT considers the application of these requirements to these assets as appropriate. The SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization.

Hydro One commented that the requirement Part 4.1 should state clearly who can authorize the Transient Cyber Assets. In response, the SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization. Any process or plan meeting compliance requirements should be owned and maintained by the appropriate parties within the entity's organization.

ISO/RTO SRC, MidAmerican Energy Company, Southern Company: Southern Company Services, Inc.; Alabama Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing commented that: 1) Authorization should include purpose for connecting the Transient Cyber Asset, start date/time, duration, and which ESPs the Transient Cyber Asset is authorized to connect to; 2) Authorization of acceptable use exceeds FERC's directive; and 3) Acceptable use should not be required to be "authorized" for each initial use of a Transient Cyber Asset, but should be separated to allow for addressing acceptable use at the policy/procedure level. In response, the SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the standard. For assets owned by the entity, the entity is required to document its defined acceptable use of the device, limiting the activities to business functions. This also allows for assets to be documented individually, by group, or by type.

Hydro One, ISO/RTO SRC, MidAmerican Energy Company, Oncor Electric Delivery Company LLC, PACIFIC GAS & ELECTRIC, Salt River Project, and South Carolina Electric and Gas recommended revising or removing the phrase "internally installed software," requested revision of the language to allow for pre-authorized operating system, firmware, and intentionally installed software, and recommended changes to require sampling of transient devices security baselines. In response, The SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the standard. For assets owned by the entity, the entity is required to document its defined acceptable use of the device, limiting the activities to business functions. This also allows for assets to be documented individually, by group, or by type.

MidAmerican Energy Company, Edison Electric Institute, Southern Company: Southern Company Services, Inc.; Alabama Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing, NiSource, and NV Energy commented that authorization of users should not be required for the Transient Cyber Asset if users are already authorized for the applicable systems. Part 4.1 also does not consider that CIP-004-6 Requirement R4, Part 4.1 also addresses authorization, which overlaps with the CIP-010-2, Requirement R4, Part 4.1. The Transient Cyber Asset requirement (Part 4.1) should not require users to be authorized twice, once under CIP-004 and again under CIP-010. In response, the SDT modified the requirement to obligate the entity to create

and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the Standard. The entity could use its other authorization processes to document those authorized to use Transient Cyber Assets in its plan. However, the entity needs to review the appropriateness for every person with physical access to a facility or every user with logical access to a BES Cyber System to be able to use a Transient Cyber Asset.

South Carolina Electric and Gas, Dominion, and Pacific Gas & Electric 1) recommended language changes to allow entities to implement controls and maintain flexibility to address multiple device types and functions; 2) Requested clarification that allows entities to authorize classes or groups of Transient Cyber Assets; and 3) Requested revisions to require procedures defining the acceptable use of Transient Cyber Assets and a listing of authorized Transient Cyber Assets. Such a list needs to be generic allowing entities to authorize groups of Transient Cyber Assets. In response, the SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the standard. The plan allows for assets to be documented individually, by group, or by type.

Parts 4.2, 4.3, 4.4, and 4.5 - Malware

City of Tallahassee, ISO/RTO SRC, and Hydro One stated that parts 4.2 and 4.3 appear to be identical. In response, while the requirements are similar, there are key differences. Cyber Assets are programmable devices that may be capable of running antivirus. Removable Media are not programmable, and therefore unable to run antivirus.

Southwest Power Pool Regional Entity suggested that CIP-010-2, Part 4.2 could be construed as mandating anti-malware on a transient device. In response, the SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the standard including optional provisions for mitigation of vulnerabilities.

Tampa Electric Co. suggested that the SDT should add the “per device capability” to CIP-010-2 R4 Part 4.3 to address device limitations. In response, the SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the Standard including provisions for mitigation of vulnerabilities. “Per Transient Cyber Asset capability” is addressed where appropriate within the attachment.

American Electric Power, Southern Company: Southern Company Services, Inc.; Alabama Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing, Exelon Companies, ISO/RTO SRC, and Hydro One requested clarification that remediation or updating completion is required prior to use of the device and clarification on the handling of discovery of malicious code following connection of the device to a BES Cyber System. In response, the SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the standard including optional provisions for mitigation of vulnerabilities. Elements were added to the attachment that require the device to be managed or updated on demand before connection to an applicable BES Cyber System.

National Rural Electric Cooperative Association commented that Part 4.4 focused on mitigating the threat of malicious code to Transient Cyber Assets and Removable Media but should focus on protecting the BES Cyber Asset. In response, the SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the

program and controls that are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the Standard including provisions for mitigation of vulnerabilities. “Per Transient Cyber Asset capability” is addressed where appropriate within the attachment.

Part 4.6 - Inspection

Southern Company: Southern Company Services, Inc.; Alabama Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing, Florida Municipal Power Agency, and Duke Energy commented to consider requiring the definition of acceptable use of Transient Cyber Assets, and the process to authorize usage and evaluation of Transient Cyber Assets. The commenters requested removal of CIP-010-2 Requirement R4, Part 4.1.4 and Part 4.6. In response, the SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the standard including provisions for mitigation of vulnerabilities. For assets owned by the entity, the entity is required to document its defined acceptable use of the device, limiting the activities to business functions.

Salt River Project recommended changing the language to address Entity-owned and -maintained transient devices separately from vendor or contracted support-owned and -maintained transient devices. In response, the SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the Standard including provisions for mitigation of vulnerabilities. The attachment addresses assets owned by the entity, as well as those owned by vendors and contractors.

Luminant Energy Company, LLC and ISO/RTO SRC suggested considering adding an additional requirement to remediate anything found in the evaluations conducted in accordance with the requirement related to patching or unauthorized physical access and requested strengthening of the requirement to mandate that remediation or updating completion prior to use of the device. In response, The SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the standard including provisions for mitigation of vulnerabilities. The attachment requires implementation of one or more of the protective measures before connecting the device.

Dominion commented that clarity is needed regarding whether an entity expected to reauthorize the baseline list of “Operating system(s) or firmware where no independent operating system exists, and intentionally installed software” for a Transient Cyber Asset when it’s changed as a result of executing Part 4.6. In response, the SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the standard including provisions for mitigation of vulnerabilities. This removed the concept of base-lines from the requirements.

Exelon Companies and Hydro One suggested to consider incorporating R4.6 into R4.1 and requested rewording of Requirement R4, Part 4.6. The SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the standard including provisions for mitigation of vulnerabilities.

Part 4.7 - Patching

Southwest Power Pool Regional Entity, Tennessee Valley Authority, Edison Electric Institute, NiSource, Large Public Power Council, American Electric Power, MidAmerican Energy Company stated that CIP-010-2, Part 4.7 should require the transient device to be fully patched and not permit an alternative mitigation plan. The commenters suggested that clarification is needed that any mitigation of a vulnerability must be completed prior to use of the asset. Lastly, the commenters suggested that the requirement should clearly note that mitigation of a vulnerability is permitted in lieu of applying a patch, when justified. In response, the SDT states that there may be instances where patching the device is not permitted or advised. Therefore, the option to create a plan to mitigate the specific vulnerability addressed by the patch would be appropriate. The SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the standard including provisions for mitigation of vulnerabilities.

Tampa Electric Co., Florida Municipal Power Authority, Large Public Power Council, Southern Company: Southern Company Services, Inc.; Alabama Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing, Exelon Companies, and ISO/RTO SRC sought clarification as to whether the entity can evaluate and apply the patches monthly and not have to evaluate prior to each use. The commenters also had concerns with the need to track both the 35-day update timeframe and each use to be able to show performance to the requirement part, that the 35-day update requirement is more aggressive than for CIP-007, R2.2 and R2.3 that allow 35 days to evaluate and 35 days to install, and whether a single evaluation within 35 days prior to use would be sufficient to comply with the requirement. In response, the SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the standard including provisions for mitigation of vulnerabilities. The attachment addresses assets owned by the entity, as well as those owned by vendors and contractors. The attachment also allows for the entity to perform activities either in a managed program state or through on demand activities.

Other

CenterPoint Energy, Kansas City Power & Light, and Southern California Edison Company commented that the administrative burden associated with Transient Cyber Assets and Removable Media is exceptionally challenging or even unattainable, and is not aligned with the risk introduced to the BES. In response, the tables supporting CIP-010-2 Requirement R4, have been removed since the initial posting. The requirement obligates the entity to create and implement plans for Transient Cyber Assets and Removable Media. The measure supports this requirement. Clarification of many topics has been added to the guidance.

Pacific Gas & Electric recommended language changes to require a security policy for transient devices. In response, the SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan elements are addressed in Attachment 1 of the standard.

Bonneville Power Administration and Pacific Gas & Electric commented that the use of direct remote access should be prohibited and to consider an implementation of a method which allows vendors to perform their work without directly accessing systems. In response, the SDT states that any vendor connecting to a BES Cyber System remotely is subject to Interactive Remote Access requirements. The SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization.

Bonneville Power Administration suggested that the proposed requirement language should also address assets containing low impact BES Cyber Systems. In response, due to the wide-area impact of the high and medium impact assets, the SDT limited the requirements to these assets. This includes protection from lower impact assets.

Exelon Companies commented that the sentence in the rationale referencing the relative rigor should be removed. In response, the SDT notes that the sentence has been removed.

Southwest Power Pool Regional Transmission Organization, Hydro One, and Tri-State G&T, for CIP-004 Requirement R2, Part 2.1.9, suggested deleting the word "including" as neither TCAs nor Removable Media are Cyber Assets and also suggested removing the word "with." In response, the SDT notes Transient Cyber Assets are Cyber Assets. The requirement is to address the interconnection of Cyber Assets, which includes Transient Cyber Assets. The requirement is also to address the interconnection with Removable Media, which is not a Cyber Asset.

Bonneville Power Administration, Network & Security Technologies, MidAmerican Energy Company, Exelon Companies, and Luminant Energy Company, LLC commented that 1) the requirements should focus on transient devices at the time of connection; 2) the meaning of "use" and "prior to use" is ambiguous; and 3) there are concerns with having to track each and every use of the transient device. In response, the SDT notes that the requirement for Transient Cyber Assets and Removable Media is included in CIP-010 to allow entities to align their recordkeeping of the devices to the change management activities being supported. The SDT modified the requirement to obligate the entity to create and implement plans for Transient Cyber Assets and Removable Media. The plan approach allows the entity the flexibility to define the program and controls that are most appropriate to its organization. The plan elements are addressed in Attachment 1 of the standard and are focused on addressing security vulnerabilities and malicious code protections.

Question 4: Definitions

4. *The SDT proposed new definitions for Transient Cyber Assets and Removable Media and revised definitions for BES Cyber Asset and Protected Cyber Assets. Do you agree with the new and revised definition? If not, please offer suggested revisions.*

BES Cyber Asset

Edison Electric Institute, NiSource, We Energies, PNM Resources Resources, and Oncor commented that the BES Cyber Asset definition is inaccurately quoted in the Guidelines and Technical basis in CIP-002-5.1. The SDT appreciates the comments but is not revising CIP-002-5.1 at this time. The scope of the SDT's Standard Authorization Request is focused mainly on the directives contained in FERC Order No. 791. Therefore, the SDT revised only those standards that should include language addressing the directives.

Nevada Energy suggested the SDT revise the guidance regarding BES Cyber Asset because it seems that devices whose loss could preclude a BES Reliability Operating Services (BROS) would be a BES Cyber Asset. The SDT appreciates the comments. The proposal to revise CIP-002-5.1 guidance is out of the defined Standards Authorization Request for this SDT, but we submit additional context in which the BES Cyber Asset and guidance language was drafted in CIP-002-5.1. The BES reliability operating services are provided in guidance to assist entities with a more granular description of adverse impact to the BES. For CIP Version 5, the more generic definition and specific guidance struck a balance with industry comments to provide enough granularity but still allow flexibility in the Requirement language.

Dominion and ISO/RTO SRC suggested moving the clarification on Transient Cyber Assets into that definition rather than keeping it in the BES Cyber Asset definition. The SDT removed the last sentence regarding Transient Cyber Assets from the BES Cyber Asset definition.

Protected Cyber Asset

Dominion and ISO/RTO SRC suggested moving the clarification on Transient Cyber Assets into that definition rather than keeping it in the Protected Cyber Asset definition. The SDT removed the last sentence regarding Transient Cyber Assets from the Protected Cyber Asset definition.

Transient Cyber Asset

Tennessee Valley Authority requested clarification on what "directly connected" means and if it includes specific media types. The SDT clarifies that "directly connected" means that there is nothing in between the Transient Cyber Asset and the Cyber Asset or network to which it is connected.

Southwest Power Pool Regional Entity commented that the Transient Cyber Asset definition is broad so that entities could disconnect assets categorized as BES Cyber Assets and Protected Cyber Assets as Transient Cyber Assets. ISO/RTO SRC questioned what would happen to a Transient Cyber Asset that has been connected longer than 30 days. The SDT considers any device connected for more than 30 days to be part of the BES Cyber System.

Kansas City Power & Light and Hydro One commented that the Transient Cyber Asset definition needs clarification regarding electronic access control and physical access control. The SDT has chosen to focus the requirements to the assets that are to be connected to the BES Cyber Systems that provide BES reliability operating services, as well as those residing within the same ESP. The goal is to protect the systems that can have a direct impact on real-time operations.

Massachusetts Municipal Wholesale Electric Company commented that the Transient Cyber Asset definition should not include examples. The SDT appreciates the comment. The SDT notes that other glossary terms use examples in the definitions. The SDT determined that the examples add clarity to assist the Responsible Entity in determining the scope and breadth of the term.

National Rural Electric Cooperative Association and Associated Electric Cooperative, Inc. commented that the Transient Cyber Asset definition is broad because directly connected could apply to any programmable device. The SDT added a clarification to the definition to indicate that Transient Cyber Assets are those devices "capable of transmittal of executable code" to the Cyber Assets and networks listed in the definition.

Removable Media

Southwest Power Pool Regional Entity commented that the certain portable media, such as external hard drives, should not be considered Removable Media and suggested clarification in the name of the term. The SDT appreciates the comment but determined that external hard drives should be included in the Removable Media definition. The SDT reasons that any media capable of introducing malicious software to the BES Cyber System should be subject to the appropriate requirements.

Edison Electric Institute, NiSource, We Energies, PNM Resources Resources, Oncor, Empire District Electric Company, ISO/RTO SRC, Seattle City Light, Large Public Power Council, Massachusetts Municipal Wholesale Electric Company, and American Public Power Association commented that the Removable Media definition is not consistent with the Transient Cyber Asset definition because it does not clarify to what the Removable Media is connected. Duke Energy and MidAmerican Energy Company suggested adding the three items listed in the Transient Cyber Asset definition as well as "directly connected" to the Removable Media definition. The SDT added "directly" in front of connected in the Removable Media definition and revised it to indicate that the device is "capable of the transmittal of executable code to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset," which is similar to the Transient Cyber Asset definition. This makes the definitions consistent and gives clarity on the device's connection.

Seattle City Light, Large Public Power Council, Massachusetts Municipal Wholesale Electric Company, and American Public Power Association suggested that the SDT remove "portable media" from the definition because it may add confusion. Large Public Power Council and American Public Power Association suggested adding "capable of removal without powering down the system." The SDT removed "portable" from the definition and added "capable of the transmittal of executable code" to the definition.

Southern Company and Oncor suggested that the Removable Media definition be more specific to higher risk forms of media and other diagnostic devices. The SDT reasons that any media capable of introducing malicious software to BES Cyber Systems should be subject to the appropriate requirements. Each type of Removable Media has an element of risk and should be reviewed.

Southern Company and Oncor commented that the Removable Media definition states that a Cyber Asset is not Removable Media but that the Transient Cyber Asset definition does not explicitly exclude Removable Media. The SDT appreciates the comment but notes that because a Transient Cyber Asset is a Cyber Asset, Removable Media cannot be a Transient Cyber Asset because it is not a Cyber Asset.

Kansas City Power & Light commented that the Removable Media definition needs clarification regarding electronic access control and physical access control. The SDT has chosen to focus the requirements to the assets that are to be connected to the BES Cyber Systems that provide BES reliability operating services, as well as those residing within the same ESP. The goal is to protect the systems that can have a direct impact on real-time operations.

ISO/RTO SRC commented that the SDT should include tape as an example of Removable Media. The SDT considered the addition of tape as an example of Removable Media; however, determined that tape systems are not traditionally connected directly to BES Cyber Systems.

ISO/RTO SRC commented that the SDT should clarify if "A Cyber Asset is not Removable Media" is trying to say that Removable Media are not a Cyber Assets. The SDT revised the language to read "Removable Media are not Cyber Assets."

ISO/RTO SRC questioned whether Removable Media need to comply with additional requirements once they have been connected longer than 30 days. The SDT considers any portable media connected for more than 30 days to be part of the BES Cyber System.

American Electric Power requested clarity on why Transient Cyber Assets are associated with Removable Media in the standard. The SDT moved the language in the requirements to an attachment and separated the elements applicable to Transient Cyber Assets from those elements applicable to Removable Media.

Other

PacifiCorp, South Carolina E&G, Georgia Transmission Corporation, National Rural Electric Cooperative Association, and Pacific Gas & Electric suggested the SDT revise CIP-010-2, Requirement R4.

PacifiCorp recommended that the SDT revise the applicability columns in CIP-010-2, Requirement R4, Table 1 to include Transient Cyber Assets and Removable Media. The tables supporting CIP-010-2 Requirement R4, have been eliminated and the elements of a plan for Transient Cyber Assets and Removable Media has been moved to an attachment.

PacifiCorp, Georgia Transmission Corporation, National Rural Electric Cooperative Association, and South Carolina Electric & Gas commented that part 4.1 would be administratively burdensome. The SDT agrees and has modified its approach in CIP-010-2.

Georgia Transmission Corporation commented that the SDT should not borrow from medium impact requirements for transient devices. The SDT agrees and has modified its approach in CIP-010-2.

South Carolina SG&E commented that personnel with high and medium impact BES Cyber Systems access should not need additional authorizations and that entities should be able to designate personnel who can supervise unauthorized maintenance personnel (similar to NIST 800-53 MA-5). The SDT clarifies that users may be authorized by group in the plan(s) for Transient Cyber Assets and Removable Media. Therefore, an entity may choose to list an authorized user group as those that already have been authorized for access to high and medium impact BES Cyber Systems.

Pacific Gas & Electric commented that Requirement R4 should be required across all components within the ESP regardless of classification. In response, the SDT maintains that the requirements are targeting those BES Cyber Systems that have a direct impact on the BES.

Pacific Gas & Electric commented that user authorization should be by individual and not by group. The SDT appreciates the comment but notes that it is important to give entities the flexibility to capture authorization by group. For example, an entity may choose to list an authorized user group as those that already have been authorized for access to high and medium impact BES Cyber Systems. This eliminates redundancy of individual user authorization but ensures entities designate users of entity-owned or managed Transient Cyber Assets.

ACES commented that it is supportive of the revisions as long as RAI is fully implemented by the effective date. The SDT refers ACES to the question 5 comment response.

MRO NERC Standards Review Forum commented that CIP-002-5.1 should be updated with the new and revised definitions. The SDT appreciates the comments but is not revising CIP-002-5.1 at this time. The scope of the SDT's Standards Authorization Request (SAR) is focused on the directives contained in FERC Order No. 791. Therefore, the SDT revised only those standards that should include language addressing the directives.

Question 5: Identify, Assess, and Correct

5. *The SDT removed the Identify, Assess, and Correct (IAC) language from 17 requirements to meet the directive in FERC Order No. 791 to remove or modify the IAC language. Do you support this revision approach? If not, why not and what alternative approach do you recommend?*

Support Removal

Dominion, Bonneville Power Administration, Public Service Enterprise Group; MidAmerican Energy Company, CenterPoint Energy, ACES Members, MRO NERC Standards Review Forum, Edison Electric Institute; Seattle City Light, Peak Reliability, Florida Municipal Power Authority, Large Public Power Council, Southern Company, NiSource, IESO, Southern California Edison Company, Tacoma Public Utilities, PNM Resources Resources, Kansas City Power & Light, Exelon Companies, American Public Power Association, National Rural Electric Cooperative Association, Oncor, The Empire District Electric Company, and Southwest Power Pool Regional Transmission Organization supported the removal of the IAC language. In response, the SDT thanks those entities for their comments.

Oppose IAC Removal

Portland General Electric, Nebraska Public Power District, City of Tallahassee, Tri-State G & T, and Idaho Power commented that the inclusion of this language in the CIP Version 5 standards was a large part of the reason that the industry voted to pass the standards in the first place and that the directive allowed for a modification of the IAC language. The SDT appreciates the concerns raised with the removal of IAC. However, the majority of stakeholders indicated a preference in removing the IAC language to address the FERC directive. NERC continues to develop Reliability Assurance Initiative (RAI) to address the compliance concerns that IAC sought to address. The comments opposing the removal of IAC and the underlying compliance concerns that remain are being forward to NERC Compliance.

Modify IAC/Standard Language

Dominion commented that an alternative approach to RAI would be to address FERC's concerns by modifying the individual Parts of each of the CIP Requirements. The SDT appreciates the suggestions to modify the IAC language to meet the FERC Directive. However, the majority of stakeholders indicated a preference in removing the IAC language to address the FERC directive.

Southwest Power Pool Regional Entity suggested that a performance metric could be developed that allowed for an infrequent (frequency to be defined) occurrence as long as the entity's detective controls detected the unauthorized implementation activity within a to-be defined detection period (perhaps 24 hours) and the unauthorized change was promptly investigated. In response, the Cyber Security Order 706 SDT previously explored incorporating performance metrics into the requirements, but the approach proved problematic by triggering a new host of questions related to the metric. As a consequence, the requirement lost focus on the real intent of the security measure. The IAC language attempted to balance the security objective with reasonable compliance expectations. At present, NERC continues to develop RAI to address the compliance concerns that IAC sought to address. The comments received on IAC are being forwarded to NERC Compliance. Performance or qualitative metrics may have a useful role under the RAI program whether as part of a risk assessment methodology or other element.

Portland General Electric commented that it would be worthwhile to modify the language to add a qualitative aspect to address zero tolerance concerns, and Occidental Chemical Corporation suggested to encode the IAC concept into separate sub-requirements under each of the affected requirements. The SDT appreciates the

comments on including a qualitative aspect and IAC in a different structure in the language. During development, the SDT explored options in the requirement language to address the zero defect concern rather than just removal of IAC. Ultimately, the SDT determined that this additional language did not provide clarity on performance obligations in the requirement and did not address zero tolerance concerns. The SDT noted that NERC continues to develop RAI to address the compliance concerns that IAC sought to address. The comments opposing the removal of IAC and the underlying compliance concerns that remain are being forward to NERC Compliance.

Liberty Electric System commented that, at a minimum, the VSLs and Measures should be rewritten to allow for minor instances of errors. For example, instead of a single instance of failing to revoke access for a transfer, rewrite the requirement to require a process that assures the access is revoked, with a low violation if the process fails to keep instances under 5% annually, or less than two in cases where there are small numbers of transfers each year. Tampa Electric Co. expressed a similar comment to modify the VSLs for a future revision. In response, the SDT notes that VSLs define the degree to which compliance with a requirement was not achieved. The SDT states that RAI is the appropriate mechanism to address the zero tolerance concern.

Idaho Power stated that more work should be done to see if there is a way to fix the IAC language prior to it be discarded. In response, the SDT is supportive of the removal of the language as the IAC paradigm will be addressed in RAI.

Tri-State G&T suggested defining IAC as one defined term instead of three separate words. The entity further commented to change “deficiencies” to “possible violations.” In response, the CMEP program, from the auditing and enforcing perspective, handles possible violations and it is not appropriate for reference to violations to reside within the Requirement language itself.

Clarify RAI and Compliance

Pacific Gas & Electric commented that defining clearer requirements, scope definitions and obligations in the NERC Compliance Monitoring and Enforcement Program. In response, the comments relative to RAI and other compliance concerns are being forwarded to NERC. The SDT will emphasize the concerns about RAI implementation timing.

Tennessee Valley Authority requested clarity on the RAI process regarding reporting timeframe and definition of “minimal risk.” In response, NERC notes that assessment of risk is based on facts and circumstances. For a more detailed explanation of assessing risk and the factors to consider in the assessment, NERC encourages entities to refer to the Self-Report User Guide, located here. Also, NERC has posted more than 1,100 minimal risk CIP FFTs on its webpage to provide Registered Entities with information on what constitutes minimal risk and how to mitigate minimal risk noncompliance.

Bonneville Power Administration commented that a lack of clearly defined measures results in inconsistent audit approaches and findings. In response, NERC notes that NERC and the Regional Entities have developed the ERO Enterprise Compliance Auditor Manual and Handbook and the ERO Auditor Checklist to define techniques, tools, and methods to perform compliance monitoring in a consistent manner. The ERO Enterprise is hosting training webinars prior to full implementation in the fourth quarter of 2014.

Idaho Power stated that industry is left with no time frames or guarantees of what RAI will become or when it is implemented. Nebraska Public Power District stated that RAI is an enforcement mechanism and not a compliance action. In response, NERC notes that several RAI projects have begun implementation in 2014, including the user guides, triage process, compliance exceptions, and aggregation of minimal risk issues programs. Development of the compliance monitoring-related programs is underway for implementation in 2015. The lessons learned from the development and early implementation of these programs will inform a filing to FERC in the fourth quarter of 2014. A current timeline and description of RAI activities is available on the RAI webpage, located here. The

aggregation of minimal risk issues and compliance exceptions are the two programs most relevant to these Standards. With aggregation, select Registered Entities[2] may track their minimal risk noncompliance without having to submit a Self-Report for each failure to comply with a Requirement. Such noncompliance would presumably be treated as a compliance exception. A compliance exception is a minimal risk noncompliance that is mitigated or can be mitigated within one year. Compliance exceptions do not become Possible Violations and do not initiate an enforcement process.

Peak Reliability suggested that concrete threshold reporting criteria for certain Requirements should be set. The SDT has chosen not to set such concrete threshold reporting criteria in the Requirements.

ISO/RTO SRC asked when will industry see a specific description of the RAI program as applied to CIPv5 standard compliance enforcement and expectations of RE's for collecting evidence to support the RAI process. In response, NERC conducted a joint webinar on June 19 for both the CIP Version 5 revisions activity and the RAI program. NERC will look into conducting something similar in the future and is continuing outreach on the RAI program.

Kansas City Power & Light commented that this concept would be addressed in tools and frameworks accomplished through the RAI, however, consistency in auditor training and approach will be critical to the success of the RAI program. In response, NERC agrees with the importance of auditor training and RAI components are a crucial aspect of the ERO training now and going forward.

Clarify RAI Prior to Implementation or Final Ballot

Public Service Enterprise Group commented that it would like to have additional clarity and finalization of the RAI process prior to the implementation of the new standard language. In response, the SDT understands that RAI is one of the biggest goals of the ERO. NERC's continued outreach on RAI will help alleviate industry's concerns. ACES Members are supportive of the approach as long as RAI is fully implemented.

MidAmerican and NV Energy stated that NERC can support the SDT efforts by implementing compliance exceptions prior to the second or final ballot. In response, NERC notes that it began implementation of the compliance exceptions program as of November 2013 for select Registered Entities. Eligibility expanded to additional Registered Entities in May 2014, and compliance exception treatment will be available January 1, 2015 to all Registered Entities for minimal risk noncompliance discovered through any method.

Need to address zero tolerance

Dominion, Southwest Power Pool Regional Entity, Bonneville Power Administration; Portland General Electric, Public Service Enterprise Group, We Energies, Occidental Chemical Corporation, Liberty Electric Power LLC, Idaho Power, City of Tallahassee, NV Energy; Nebraska Public Power District, Edison Electric Institute, Florida Municipal Power Authority, Large Public Power Council, ISO/RTO SRC, Southern Company, NiSource, Tacoma Public Utilities, Xcel Energy, PNM Resources Resources, and Oncor commented that the zero tolerance issue needs to be addressed. In response, while the removal of the IAC language returns the requirements to a zero tolerance construct, NERC committed to alleviate the zero tolerance concerns through the implementation of the RAI compliance approach (see the Q4 response and others in the FAQs document). In response, the comments relative to compliance concerns will be forwarded to the NERC Compliance department.

Other

American Public Power Association encouraged the SDT to provide guidance to NERC staff on the development of the proposed RSAWs. In response, while the SDT is not part of the RSAW development team, the SDT submitted

[2] The Enforcement Activities Overview, available on the RAI webpage, contains further details on eligibility for the aggregation program.

team comments on the RSAWs posted for comment during the initial comment period. The SDT continues to engage with the RSAW development team to provide input on the RSAWs.

Question 6: Implementation Plan

6. *The Implementation Plan uses the existing effective date of the FERC approved CIP V5 Standards for CIP-003-6 Requirement R2 and provides additional time for compliance for CIP-006-6, Requirement R1, Part 1.10; CIP-007-6, Requirement R1, Part 1.2; and CIP-010-2, Requirement R4. Are the timeframes reasonable and appropriate? If not, please explain.*

CIP-003-6

Duke Energy, Nebraska Public Power District, American Public Power Association, and Bonneville Power Administration suggested a later enforcement date, specifically that the low impact requirements should be enforceable one year later (January 1, 2018). American Public Power Association suggested that the implementation plan should call out two years after FERC approval or April 1, 2017, whichever is later for compliance. In response, the SDT understands the additional specification for Requirements applying to low impact BES Cyber Systems requires additional resources for implementation. In weighing the specificity with the already approved deadline of April 1, 2017, the SDT proposes an implementation plan which considers both the effort of implementation and the general impact to the BES. Requirements that entities can implement organizationally retain the same date of April 1, 2017. These Requirements include cyber security policy, awareness, and incident response plan. The physical and electronic access Requirements have obligations which generally necessitate deployment of technical controls. For these, we have graduated the implementation based on the technical controls. This approach balances the objective to implement on a similar schedule as CIP-003-5 with the additional effort to meet the new specific Requirements.

Similar to the comments above, Exelon Companies commented that the implementation plan should allow at least a year from the effective date of CIP-003-6. The Implementation Plan should make it clear that CIP-003-6, Requirement R2 will replace CIP-003-5 Requirement R2. In response, in addition to the SDT's response above, CIP-003-5 is retired with the implementation of CIP-003-6 and the Requirement applying to low impact BES Cyber Systems will be replaced as suggested.

CIP-006-6/CIP-007-6

Southwest Power Pool Regional Entity commented that the implementation plan for CIP-006-6, Requirement R1, Part 1.10 should be consistent with the actual Version 3 expectation and that additional time is not needed for CIP-007-6 Requirement R1, Part 1.2. In response, the Implementation Plan for CIP-006-6 Requirement Part 1.10 does consider the version 3 expectation and only provides additional time "for new high or medium impact BES Cyber Systems at Control Centers identified by CIP-002-5.1 which were not identified as Critical Cyber Assets in CIP Version 3". Regarding CIP-007-6, the additional 9 months may be necessary depending on how entities disable physical ports. This is an additional effort on top of what is necessary to implement version 5. For large control centers, this may require additional inventory work to ensure nonprogrammable components meet this Requirement.

Southwest Power Pool Regional Transmission Organization recommended that the six-month window for CIP-007-6 R1, Part 1.2 be extended to a nine-month window, reducing the number of dates and outlying requirements. In response, the additional requirements in CIP-006-6 and CIP-007-6 now have the same additional 9 months for compliance.

CIP-010-2

CenterPoint Energy stated that the timeframe for CIP-010-2 Requirement R4 is not appropriate, and recommended that Registered Entities not be required to comply with Reliability Standard CIP-010-2,

Requirement R4 until at least one year after the effective date of Reliability Standard CIP-010-2. In response, the SDT notes that the implementation period for CIP-010-2 Requirement R4 calls for nine calendar months after the effective date of CIP-010-2 which allows entities enough time to prepare for compliance based on SDT discussion of all the implementation compliance dates for modified requirements.

Southwest Power Pool Regional Entity commented that CIP-010-2 Requirement R4 does not need nine additional months. In response, this Requirement has been modified and the additional time is necessary for entities to develop and implement their plan(s) to address transient devices.

Overall Implementation

Colorado Springs Utilities, Tennessee Valley Authority, Western Area Power Administration, and Salt River Project recommended changing the Implementation Plan time schedule to fall after the CIP Version 5 standards implementation dates. In response, the SDT states that the implementation plan is drafted to account for the Version 5 Standards as suggested. The Version 5 effective dates are used as the minimum bound for Version 5 Revisions. This ensures a seamless transition across versions on April 1, 2016 and April 1, 2017. Additional time beyond the version 5 effective dates is given for all but the Requirements in which the IAC language was removed. The IAC removal does not provide any additional obligations to Responsible Entities.

City of Tallahassee commented that FERC should issue an order to extend the effective date at least another full six months for each standard/requirement for which a modification to the language was made. In response, additional time beyond the version 5 effective dates is given for all but the Requirements in which the IAC language was removed. The IAC removal does not provide any additional obligations to Responsible Entities.

Exelon Companies commented that the Implementation plan uses “months” and “calendar months” and requested clarity whether there is a difference between the two terms and, if no difference is intended, suggested to use one for consistency. In response, the SDT has modified the Implementation Plan to address this inconsistency.

National Rural Electric Cooperative Association commented that not balloting the Implementation Plan separately was a violation of the Standards Processes Manual (SPM). In response, in section 4.4.3 of the SPM, “The implementation plan is posted with the associated Reliability Standard or Standards during the 45 (calendar) day formal comment period and is balloted with the associated Reliability Standard.” Therefore, the implementation plan was included as a component of the Reliability Standard comment period and ballot.

National Rural Electric Cooperative Association also requested that the SDT consider using the same additional time for compliance for all revised or new requirements under the current CIP V5 revision project. In response, the additional requirements in CIP-006-6 and CIP-007-6 now have the same additional nine months for compliance. The SDT has modified the Implementation Plan for low impact Requirements in response to other commenters.

Arkansas Electric Cooperative Corporation expressed support for addressing all four directive areas in the one-year timeframe. Arkansas Electric Cooperative Corporation went on to further comment that it is important to have industry-developed objective criteria for the low impact BES Cyber Systems when the requirements go into effect on April 1, 2017. The industry begins its 7th year in which these standards have been in development. It is difficult to grow and mature security programs with so much change in the compliance rules. Arkansas Electric Cooperative Corporation stated they hope the industry, NERC, and FERC can come to an agreement in the coming months and provide finality to these Reliability Standards for a time. The SDT thanks you for your comments.

Question 7: Canadian or Other Regulatory Requirements

7. *Are there any Canadian provincial or other regulatory requirements that may need to be considered during this project in order to develop a continent-wide approach to the standards? If yes, please identify the jurisdiction and specific regulatory requirements.*

There were no commenters who responded to this question identifying any jurisdictional specific regulatory requirements.

Question 8: Other Areas Within SAR

8. *Do you have input on other areas, within the scope of the Standards Authorization Request, for the standards or implementation plan not discussed in the questions above? If so, please provide them here, recognizing that you do not have to provide a response to all questions.*

Low Impact

Tennessee Valley Authority requested clarification on the threshold for the low impact categorization and whether the BES definition establishes the lower boundary. In response, the Applicability section and Attachment 1, Section 3 of CIP-002-5.1 establishes the lower boundary, and while the BES definition is a basis for the lower boundary, it does not always establish it. The use of Facilities in the Applicability section ties back to the BES definition, but it is possible to have systems or equipment, such as Control Centers and systems or those critical to system restoration.

Southwest Power Pool Regional Transmission Organization sought clarification on the security awareness component of CIP-003-6. South Feather Power Project and Seattle City Light commented that the security awareness requirement should be annual instead of quarterly. The SDT has modified the language to "at least once every 15 calendar months" from "quarterly." In addition, the SDT removed the training component from CIP-003-6 because training is addressed in CIP-004-6.

Seattle City Light also suggested that the SDT change the presentation of the low impact controls, either by dispersing them throughout the other standards or creating a CIP-012-1. The SDT considered dispersing the low impact controls throughout the CIP standards but determined that they could not fit into the table format because the medium and high impact controls apply at the system level whereas the low impact controls apply at the asset containing low impact BES Cyber System level. The SDT also considered drafting CIP-012-1 to include low impact requirements. However, the SDT determined that it was more appropriate to keep the low impact policy requirement in CIP-003-6 because the policy requirements for high and medium impact were located there as well. To address comments on reorganizing low impact requirements, the SDT determined that it would put the low impact technical requirements into an attachment to CIP-003-6, Requirement R2, which requires a plan to address the elements in the attachment. In addition, the SDT placed the low impact policy requirement into CIP-003-6, Requirement R1 to consolidate the policy requirements for low, medium, and high impact into one requirement.

MidAmerican Energy Company also suggested adding "for its assets identified in CIP-002-5.1" into Requirement R2 to clarify the assets to which it applies. The SDT added "Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BES Cyber Systems" into Requirement R2 to clarify applicability.

Rayburn Country Electric Cooperative and Wisconsin Electric Power Company suggested the SDT develop guidance in CIP-003-6 to address compliance concerns. In response Rayburn County Electric Cooperative, see the comment response summary for Question 1. The SDT has provided more specific examples and guidance to the Requirement applying to low impact BES Cyber Systems. In response to Wisconsin Electric Power Company's concern that entities cannot go beyond the Requirement objective, the NERC Reliability Standards should not contain language about compliance and notes that the language included in the background sections of these standards may be inappropriate to include. The SDT may revisit the background sections of the standards at a later date.

American Public Power Association commented on compliance concerns and suggested a survey of entities to determine the administrative workload for the low impact requirements. In response, the SDT notes that NERC

will consider the need for a survey. If you have any information on this topic that would assist NERC, please submit them in your comments.

Exelon Companies and National Rural Electric Cooperative Association expressed support of getting the low impact requirements to a steady-state. The SDT continues to develop revisions to the low impact requirements in an effort to build consensus and gain approval prior to the February 3, 2015 FERC filing.

Revise CIP-002-5.1, CIP-005-5, and CIP-008-5

Edison Electric Institute, Tampa Electric Company, NiSource, and Nevada Energy suggested the SDT make conforming changes to CIP-002-5.1, CIP-005-5, and CIP-008-8 to maintain consistency throughout the CIP suite of standards. Southwest Power Pool Regional Entity submitted errata changes to the Guidelines and Technical Basis section of CIP-002-5.1. ISO/RTO SRC and Entergy recommended making all CIP standards version 6. Manitoba Hydro and Duke Energy suggested changing the effective dates of the Version 5 standards to make all consistent. Southern Company and Georgia Transmission Corporation requested clarification of "associated with" in CIP-002-5.1. Wisconsin Electric Power Company commented that Criterion 2.3 of CIP-002-5.1 Attachment 1 is not specific enough as to which BES Cyber Assets meet the criterion and recommended that CI-002-5.1, CIP-005-5, and CIP-008-5 clarify in guidance that those entities going above and beyond the requirements would not incur additional compliance obligations. Massachusetts Municipal Wholesale Electric Company suggested revising CIP-005-5 and CIP-008-5 to reference low impact BES Cyber Systems.

The SDT appreciates the comments regarding revisions to CIP-002-5.1, CIP-005-5, and CIP-008-5. At this time the SDT continues to focus on the four main directive areas from Order No. 791. As a result, the SDT will not revise CIP-002-5.1, CIP-005-5, and CIP-008-5 during this phase of development.

Reliability Standard Audit Worksheets (RSAWs)

Florida Municipal Power Agency (Florida Municipal Power Authority) requested that NERC run non-binding polls and post comments received on the RSAWs. Edison Electric Institute, Florida Municipal Power Authority, and First Energy commented that the CIP-002-5.1 RSAW expands beyond the scope of the standard. Florida Municipal Power Authority noted that the CIP-003 RSAW has the wrong number in 6a of Requirement 2.5. Edison Electric Institute and FirstEnergy emphasized that the SDT and the RSAW development team should continue coordination during the standards development. Exelon Companies commented that the RSAWs do not provide relief from zero tolerance concerns and suggested the RSAWs be revised and posted for industry comment during the next revisions to the standards.

The SDT coordinated with the RSAW development team during drafting activities and will continue this coordination for the next revisions. As part of this collaboration, the SDT will pass the comments received on the RSAWs to the RSAW development team.

Reliability Assurance Initiative (RAI)

Northeast Power Coordinating Council (Northeast Power Coordinating Council), Exelon Companies, and National Rural Electric Cooperative Association requested more scenarios as to how CIP requirements will work in the RAI context and suggested using the low impact or "identify, assess, and correct" (IAC) requirements to demonstrate RAI concepts. Avista and National Rural Electric Cooperative Association commented that RAI should be finalized prior to final ballot.

The SDT appreciates the comments regarding RAI and recognizes the relationship between the removal of IAC language and RAI. The SDT continues its coordination with NERC staff on RAI and will pass on these and other relevant comments to NERC staff involved in the development of RAI.

Other Comments

Northeast Power Coordinating Council and Hydro One commented that the SDT should be able to help clarify issues discovered during the CIP Version 5 Implementation Study, particularly on the transfer trip issue, programmable devices definition, and clarification on "effect within 15 minutes." The SDT appreciates these comments but continues to focus effort on the four main directive areas from FERC Order 791. NERC has employed an industry stakeholder group to review and provide guidance toward these issues outside of the standards setting process.

Northeast Power Coordinating Council and Hydro One suggested adding "or" to CIP-010-2, Requirement R4, Part 4.1.4 to make it consistent with Requirement R1, Part 1.1.1. The SDT proposes to revise Requirement R4 to have an attachment with the elements related to transient devices.

Pacific Gas & Electric requested guidance on how Electro Magnetic Pulse (EMP) anomalies should be considered in risk assessments or policies and procedures, and in response, the SDT notes the CIP Cyber Security Standards have the objective of protecting BES Cyber Systems against cyber security risks. EMP and other related threats associated with the BES and BES Cyber Systems are outside the scope of this SDT.

Southwest Power Pool Regional Entity commented that there is an inconsistency in the implementation plan for CIP-004-6 because six months is allowed if government authority is required and only three months is allowed if government authority is not required. In response, this has been corrected to allow three calendar months after approval by a government authority.

PacifiCorp agrees with the communication networks revisions and does not recommend further edits. The SDT appreciates the comment and PacifiCorp's support of the revisions.

Dynegy requested that the webinars on the SDT's revisions and on RAI be posted to the website. The SDT's webinar and slides may be found here and here. The RAI webinar and slides may be found here and here.

Western Area Power Administration requested clarity on the object of the standards and align them with the risk to the BES so auditors and entities have a consistent approach. The SDT appreciates these comments but notes the rapidly changing and variant cyber security risk profile across the BES make this approach particularly unsuitable for Reliability Standards development. The approach is to develop standards for cyber security controls that address a wide set of common cyber security vulnerabilities.

Manitoba Hydro noted that the Compliance Enforcement Authority (CEA) definition is incorrect in Section C1.1 of the standards because Public Utility Board is its CEA. In response, the purpose of the compliance section of the standard is to describe the CEA's activities. If a province in Canada is not subject to the ROP provisions related to the CMEP and has its own enforcement, then these provisions simply would not apply.

Exelon Companies requested more guidance language be developed to support the requirements. The SDT appreciates the comment and will draft guidance language to support the proposed Requirements and additional revisions.

Texas Reliability Entity commented that entities should be required to demonstrate evidence of the effective execution of controls and not just that they have a policy or procedure. The SDT appreciates the comment and notes that the "implement" term in the requirements means that entities should execute the performance requirements and provide documentation of the implementation.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014

Description of Current Draft

This draft standard is being posted for an additional comment period and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period	September 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-6

3. Purpose: To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-003-6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Dates:

Reliability Standard CIP-003-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Requirement R1, Part 1.2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 1 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 2 until the later of April 1, 2018 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 3 until the later of September 1, 2018 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 4 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

6. Background:

Standard CIP-003 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

The term *policy* refers to one or a collection of written documents that are used to communicate the Responsible Entities' management goals, objectives and expectations for how the Responsible Entity will protect its BES Cyber Systems. The use of *policies* also establishes an overall governance foundation for creating a culture of security and compliance with laws, regulations, and standards.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures provide examples of evidence to show documentation and implementation of the requirement. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save

the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

B. Requirements and Measures

Rationale for Requirement R1:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to its BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements.

Annual review and approval of the cyber security policy ensures that the policy is kept-up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

R1. Each Responsible Entity shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1 For its high impact and medium impact BES Cyber Systems, if any:

1.1.1. Personnel and training (CIP-004);

1.1.2. Electronic Security Perimeters (CIP-005) including Interactive Remote Access;

1.1.3. Physical security of BES Cyber Systems (CIP-006);

1.1.4. System security management (CIP-007);

1.1.5. Incident reporting and response planning (CIP-008);

1.1.6. Recovery plans for BES Cyber Systems (CIP-009);

1.1.7. Configuration change management and vulnerability assessments (CIP-010);

1.1.8. Information protection (CIP-011); and

1.1.9. Declaring and responding to CIP Exceptional Circumstances.

1.2 For its assets identified in CIP-002 containing low impact BES Cyber Systems, if any:

1.2.1. Cyber security awareness;

1.2.2. Physical security controls;

1.2.3. Electronic access controls for Low Impact External Routable Connectivity and Dial-up Connectivity; and

1.2.4. Cyber Security Incident Response

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

Rationale for Requirement R2:

The requirement to implement a cyber security plan for assets containing low impact BES Cyber Systems provides a minimum set of cyber security controls for assets containing low impact BES Cyber Systems. Individually, these low impact BES Cyber Systems pose a relatively lower risk to the BES than other BES Cyber Systems, but in aggregate or through communication dependencies, they have the potential to create an adverse reliability impact if compromised. To that end, Requirement R2 requires Responsible Entities to implement documented cyber security plans covering four subject matter areas – (1) cyber security awareness, (2) physical access controls, (3) electronic access controls, and (4) cyber security incident response. In response to directives in FERC Order No. 791, Requirement R2 provides for the specific elements that must be included in the cyber security plan(s). Attachment 1 provides these elements. These plans, along with the cyber security policies required under Requirement R1, Part 1.2, provide sufficient operational, procedural, and technical safeguards for assets containing low impact BES Cyber Systems.

Considering the varied types of low impact BES Cyber Systems across the Bulk-Power System, Attachment 1 provides Responsible Entities flexibility on how to apply the required security controls. Additionally, the SDT recognizes that many Responsible Entities have multiple impact rated BES Cyber Systems and has provided the ability to use high and medium impact BES Cyber System policies, procedures, and processes to implement the objective criteria within Attachment 1.

Responsible Entities will utilize their list of assets that contain low impact BES Cyber System(s) that is created as a result of applying CIP-002 to substantiate the sites or locations associated with low impact BES Cyber Systems. However, there continues to be no compliance expectation for Responsible Entities to maintain a list(s) of individual low impact BES Cyber Systems and their associated cyber assets or to maintain a list of authorized users.

R2. Each Responsible Entity with at least one asset identified in CIP-002 containing low impact BES Cyber Systems shall implement one or more documented cyber security plan(s) for its low impact BES Cyber Systems that include the elements in Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

Note: An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required. Lists of authorized users are not required.

M2. Evidence shall include each of the documented cyber security plan(s) that collectively include each of the elements in Attachment 1 and additional evidence to demonstrate implementation of cyber security plan(s). Additional examples of evidence per element are located in Attachment 2.

Rationale for Requirement R3:

The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the *Glossary of Terms used in NERC Reliability Standards* so that it may be used across the body of CIP standards without an explicit cross-reference.

FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the senior manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent basis.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

Rationale for Requirement R4:

The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.

In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.

R4. The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior

Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-003-6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL

CIP-003-6 - Attachment 1

Required Elements for Cyber Security Plan(s) for Assets Containing Low Impact BES Cyber Systems

Responsible Entities shall include each of the elements provided below in the cyber security plan(s) required under Requirement R2.

Responsible Entities with multiple impact BES Cyber Systems ratings can utilize policies, procedures, and processes for their high or medium impact BES Cyber Systems to fulfill the elements for the development of low impact cyber security plan(s). Each Responsible Entity can develop a cyber security plan(s) either by individual asset or groups of assets.

1. Cyber security awareness: Each Responsible Entity shall reinforce, once every 15 calendar months, its cyber security practices, using one or a combination of the following methods:

- Direct communications (for example, e-mails, memos, computer-based training);
- Indirect communications (for example, posters, intranet, or brochures); or
- Management support and reinforcement (for example, presentations or meetings).

2. Physical access controls: Each Responsible Entity shall implement controls to restrict physical access to (1) the asset or the locations of the low impact BES Cyber Systems within the asset, and (2) the Low Impact BES Cyber System Electronic Access Point, if any, based on need as determined by the Responsible Entity, through one or more of the following:

- Access controls;
- Monitoring controls; or
- Other operational, procedural, or technical physical security controls.

3. Electronic access controls: Each Responsible Entity shall implement controls to restrict electronic access for Low Impact External Routable Connectivity and Dial-up Connectivity, which shall include the following, or other electronic access controls that provide an equal or greater level of protection:

3.1 For any Low Impact External Routable Connectivity, establish a Low Impact BES Cyber System Electronic Access Point that permits only necessary inbound and outbound access and denies all other access; and

3.2 Authentication of all Dial-up Connectivity that provides access to low impact BES Cyber Systems, per Cyber Asset capability.

4. Cyber Security Incident response: Each Responsible Entity shall have one or more Cyber Security Incident response plan(s), either by asset or group of assets, which shall include:

4.1 Identification, classification, and response to Cyber Security Incidents.

4.2 Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and subsequent notification to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), unless prohibited by law.

4.3 Identification of the roles and responsibilities for Cyber Security Incident response by groups or individuals.

4.4 Incident handling for Cyber Security Incidents.

4.5 Testing the Cyber Security Incident response plan at least once every 36 calendar months by: (1) responding to an actual Reportable Cyber Security Incident; (2) using a drill or tabletop exercise of a Reportable Cyber Security Incident; or (3) using an operational exercise of a Reportable Cyber Security Incident.

4.6 Record retention related to Reportable Cyber Security Incidents.

4.7 Updating the Cyber Security Incident response plan within 180 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident.

CIP-003-6 - Attachment 2

Examples of Evidence for Cyber Security Plan(s) for Assets Containing Low Impact BES Cyber Systems

Element 1: An example of evidence for element 1 may include, but is not limited to documentation that the reinforcement of cyber security practices once every 15 months has been provided through dated copies of the information used to reinforce security awareness via direct communications, indirect communications or management support and reinforcement.

Element 2: Examples of evidence for element 2 may include, but are not limited to:

1. Documentation of one or more access controls (e.g. card key, special locks), monitoring controls (e.g. alarm systems, human observation), or other operational, procedural or technical physical security controls to restrict physical access to both:
    a. The asset, if any, or the locations of the low impact BES Cyber Systems within the asset; and
    b. The Cyber Asset, if any, containing the Low Impact BES Cyber System Electronic Access Point.
2. Documentation showing that the physical access restrictions cited above are based on need, which may include, but is not limited to, a policy describing the high level operational or business need(s) for physical access.

Element 3: Examples of evidence for element 3 may include, but are not limited to:

- Documentation showing that inbound and outbound connections (e.g. IP addresses, ports, services) for any Low Impact BES Cyber System Electronic Access Point are confined to only those the Responsible Entity deems necessary; and documentation of authentication for Dial-up Connectivity (e.g. dial out only to a preprogrammed number to deliver data, dial-back modems, modems that must be remotely controlled by the control center or control room, access control on the BES Cyber System); or
- Documentation of other electronic access controls that provide an equal or greater level of protection.

Element 4: An example of evidence for element 4 may include, but is not limited to, dated documentation such as policies, procedures or process documents of one or more Cyber Security Incident response plan(s); either by asset or group of assets that include the following processes:

1. to identify, classify and respond to Cyber Security Incidents; to determine whether an identified Cyber Security Incident is a Reportable Cyber Security incident and for notifying the Electricity Sector Information Sharing and Analysis Center (ES-ISAC);

2. the identification and documentation of the roles and responsibilities for Cyber Security Incident response by groups of individuals (e.g. initiating, documenting, monitoring, reporting, etc.);
3. for incident handling of a Cyber Security Incident (e.g. containment, eradication, recovery/incident resolution);
4. for testing the plan(s) along with the dated documentation that a test has been completed at least once every 36 calendar months; and
5. to retain records related to Reportable Cyber Security Incidents (e.g. security logs, police reports, emails, response forms or checklists, forensic analysis results, restoration records, and post-incident review notes).

Also include dated revised Cyber Security Incident response plan(s) that identify that the plan(s) were updated within 180 calendar days after a completion of a test or actual Reportable Cyber Security Incident.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section “4. Applicability” of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section “4.1. Functional Entities” is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section “4.2. Facilities” defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term “Facilities” already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The number of policies and their specific language are guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. If a Responsible Entity has any high or medium impact BES Cyber Systems, the cyber security policy must cover in sufficient detail the nine topical areas required by CIP-003-6, Requirement R1.1. If a Responsible Entity has any assets from CIP-002 containing low impact BES Cyber Systems, the cyber security policy must cover in sufficient detail the four topical areas required by Requirement R1.2. The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-6, Requirement R1. For Responsible Entities that have multiple impact rated BES Cyber Systems, they are not required to create separate cyber security policies for high or medium and low impact BES Cyber Systems. Implementation of the cyber security policy is not specifically included in CIP-003-6, Requirement R1 as it is envisioned that the implementation of this policy is evidenced through successful implementation of CIP-004 through CIP-011. However, Responsible Entities are encouraged not to limit the scope of their cyber security policies to only those requirements from CIP-004 through CIP-011, but rather to put together a holistic cyber security policy appropriate to its organization. The assessment through the Compliance Monitoring and Enforcement Program

of policy items that extend beyond the scope of CIP-004 through CIP-011 should not be considered candidates for potential violations. The Responsible Entity should consider the following for each of the required topics in its cyber security policy:

1.1 Personnel and training (CIP-004)

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account management

1.2 Electronic Security Perimeters (CIP-005) including Interactive Remote Access

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points
- Maintaining up-to-date anti-malware software before initiating Interactive Remote Access
- Maintaining up-to-date patch levels for operating systems and applications used to initiate Interactive Remote Access
- Disabling VPN “split-tunneling” or “dual-homed” workstations before initiating Interactive Remote Access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity’s Interactive Remote Access controls

1.3 Physical security of BES Cyber Systems (CIP-006)

- Strategy for protecting Cyber Assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress

1.4 System security management (CIP-007)

- Strategies for system hardening
- Acceptable methods of authentication and access control
- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

1.5 Incident reporting and response planning (CIP-008)

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident

- Obligations to report Cyber Security Incidents

1.6 Recovery plans for BES Cyber Systems (CIP-009)

- Availability of spare components
- Availability of system backups

1.7 Configuration change management and vulnerability assessments (CIP-010)

- Initiation of change requests
- Approval of changes
- Break-fix processes

1.8 Information protection (CIP-011)

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

1.9 Declaring and responding to CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

The Standard Drafting Team (SDT) has removed requirements relating to exceptions to a Responsible Entity's security policies since it is a general management issue that is not within the scope of a reliability requirement. The SDT considers it to be an internal policy requirement and not a reliability requirement. However, the SDT encourages Responsible Entities to continue this practice as a component of its cyber security policy.

In this and all subsequent required approvals in the NERC CIP Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R2:

Using the list of assets from CIP-002, the intent of the requirement is for each Responsible Entity to create, document, and implement one or more cyber security plan(s) that addresses the protection of all low impact BES Cyber Systems. The SDT is balancing the fact that low impact BES Cyber Systems are indeed low impact to the BES, but they do meet the definition of having a 15-minute adverse impact so some protections are needed. The intent is that such protections are part of a program that covers the low impact BES Cyber Systems collectively either at an asset or site level (assets containing low impact BES Cyber Systems), not an individual device or system level.

There are four main areas detailed in Attachment 1 that must be covered by this plan: cyber security awareness, physical security, electronic access controls for Low Impact External Routable Connectivity and Dial-up Connectivity, and cyber security incident response.

Requirement R2 Attachment 1

Attachment 1 contains the elements that must be in the cyber security plan(s). The SDT's intent is to allow entities that have a combination of high, medium, and low impact BES Cyber Systems the flexibility to choose to cover their low impact BES Cyber Systems (or any subset) under their programs used for the high or medium impact BES Cyber Systems and not maintain two separate programs. Guidance for each of the 4 subject matter areas of Attachment 1 is provided below.

Requirement R2 Attachment 1 – Security Awareness

The intent of the security awareness program is for entities to reinforce good cyber security practices with their personnel at least once every 15 calendar months. It is up to the entity as to the topics and how it schedules these topics. The Responsible Entity should be able to produce the awareness material that was delivered and the delivery method(s) (posters, emails, topics at staff meetings, etc.) that were used. The SDT does not intend that the Responsible Entity must maintain lists of recipients and track the reception of the awareness material by personnel.

Although the focus of the awareness is cyber security, it does not mean that only technology-related topics can be used in the program. Appropriate physical security topics (e.g. tailgating awareness and protection of badges for physical security, "If you see something, say something" campaigns, etc.) are valid for cyber security awareness. The intent is to cover topics concerning any aspect of the protection of BES Cyber Systems.

Requirement R2 Attachment 1 – Physical Security

The Responsible Entity must document and implement controls to restrict physical access to the low impact BES Cyber Systems at a BES asset and Low Impact BES Cyber System Electronic Access Points (LEAP) (see Electronic Access Controls section below). If the LEAP is located within the BES asset and inherits the same controls outlined in element 2, this can be noted by the Responsible Entity to avoid duplicate documentation of the same controls. If the LEAP is located at another location, possibly a location without any BES Cyber Systems, then separate documentation and implementation of the physical security controls of the LEAP are required.

The Responsible Entity has flexibility in the controls used to restrict physical access to low impact BES Cyber Systems at a BES asset using one or a combination of access controls, monitoring controls, or other operational, procedural, or technical physical security controls. Entities may utilize perimeter controls (e.g., fences with locked gates, guards, site access policies, etc.) and/or more granular areas of physical access control in areas where low impact BES Cyber Systems are located, such as control rooms or control houses. User authorization programs and lists of authorized users are not required.

The objective is to restrict physical access based on need and the need can be established at the policy level based on higher level operational or business needs for access to the site or systems. The SDT intent is that this need at the higher level be documented such that the requirement cannot be interpreted to mean that any and all access must be restricted. The

requirement does not imply that a specific business need must be documented for each access or authorization of a user for access.

Monitoring as a physical security control can be used as a complement or an alternative to access control. Examples of monitoring controls include, but are not limited to: (i) alarm systems to detect motion or entry into a controlled area, or (ii) human observation of a controlled area. Monitoring does not imply logging and maintaining logs, but monitoring that physical access has occurred or been attempted (e.g., door alarm or human observation, etc.). The monitoring does not need to be per low impact BES Cyber System but should be at the level as determined by the entity's controls.

Requirement R2 Attachment 1 – Electronic Access Controls

Where Low Impact External Routable Connectivity (LERC) or Dial-up Connectivity exists, the Responsible Entity must document and implement controls that include the LERC and Dial-up Connectivity to the BES asset such that the low impact BES Cyber Systems located at the BES asset are protected. Two glossary terms are included in order to help clarify and simplify the language in Attachment 1. The SDT's intent in creating these terms is to avoid confusion with the similar concepts and requirements (ESP, EAP, ERC, EACMS) needed for high and medium impact BES Cyber Systems by utilizing separate terms that apply only to assets containing low impact BES Cyber Systems.

> **Low Impact External Routable Connectivity (LERC)** – includes any bi-directional routable protocol based connectivity between low impact BES Cyber Systems within a BES asset and Cyber Assets outside the BES asset containing the low impact BES Cyber Systems. The SDT, in order to avoid future technology issues, is specifically excluding from the definition direct Intelligent Electronic Device (IED) to IED communication used for protection and/or control between low impact BES Cyber Systems at different BES assets, such as IEC 61850 messaging. The SDT does not intend for the requirement to have an electronic access point even though there is LERC or to preclude the use of such time-sensitive (for example 4 ms or less) reliability enhancing functions if they use a routable protocol in the future.
>
> **Low Impact BES Cyber System Electronic Access Point (LEAP)** – is the interface on a Cyber Asset that allows and controls the LERC. Examples include, but are not limited to, the internal (facing the low impact BES Cyber Systems) interface on a firewall, the internal interface on a router that has implemented an access control list (ACL), or an internal interface on a unidirectional gateway that physically enforces outbound-only data flows. LEAP are not to be considered EACMS or meet EACMS specific requirements (as utilized for the Electronic Security Perimeter protecting high and medium impact BES Cyber Systems). However they are required, as per element 2 of the cyber security plan elements, to have physical security controls. The location of the LEAP is not prescriptive and does not have to reside at the BES asset containing low impact BES Cyber Systems. This flexibility is included so that the standard does not require a unique LEAP per BES asset. Responsible Entities can have a single LEAP that controls the LERC from more than one BES asset containing low impact BES Cyber Systems. However the LERC between assets "behind" the LEAP and another asset containing a low impact BES Cyber

System must also pass through the single LEAP. Locating the LEAP at an external location with multiple BES assets containing low impact BES Cyber Systems "behind" it should not allow unfettered access from one BES asset to all other BES assets sharing the LEAP. It is also not the intent of the SDT where low impact BES Cyber Systems do not have any LERC that additional connectivity be established nor that a LEAP be established.

The electronic access controls should address the risk of using the asset's LERC or Dial-up Connectivity to gain access to the low impact BES Cyber Systems. For LERC, a LEAP shall be implemented that permits only necessary inbound and outbound access and denies all other access.

Examples of sufficient access controls may include:

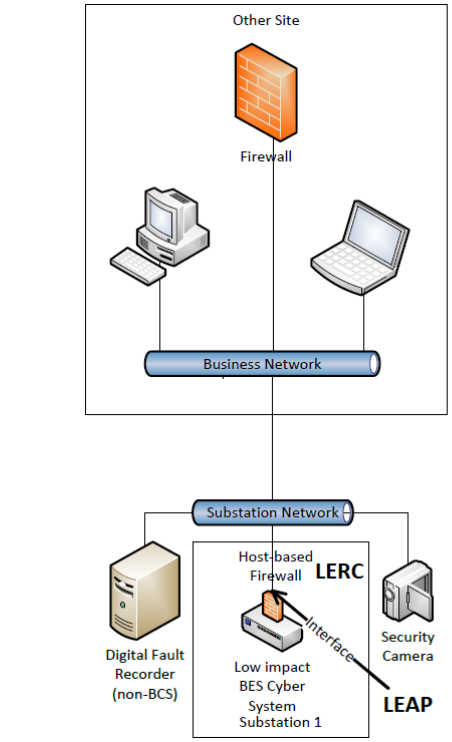
- Any LERC for the asset passes through a LEAP that denies all traffic by default with explicit inbound and outbound access permissions defined, or equivalent method by which both inbound and outbound connections are confined to only those that the Responsible Entity deems necessary (e.g. IP addresses, ports, services) for scenarios representative of the Responsible Entity's sites having Low Impact BES Cyber Systems.
- Dial-up Connectivity to a low impact BES Cyber System is set to dial out only (no autoanswer) to a preprogrammed number to deliver data. Incoming Dial-up Connectivity is to a dialback modem, a modem that must be remotely controlled by the control center or control room, has some form of access control, or the low impact BES Cyber System has access control.

Some examples of situations that would lack sufficient access controls to meet the intent of this requirement include:

- An asset has Dial-up Connectivity and a low impact BES Cyber System is reachable via an auto-answer modem that connects any caller to the Cyber Asset that has a default password. There is no access control in this instance.
- An asset has external routable connectivity due to a BES Cyber System within it having a 3G/4G wireless card on a public carrier which allows the BES Cyber System to be reachable via a public IP address. In essence, low impact BES Cyber Systems should not be accessible from the Internet and search engines such as Shodan.

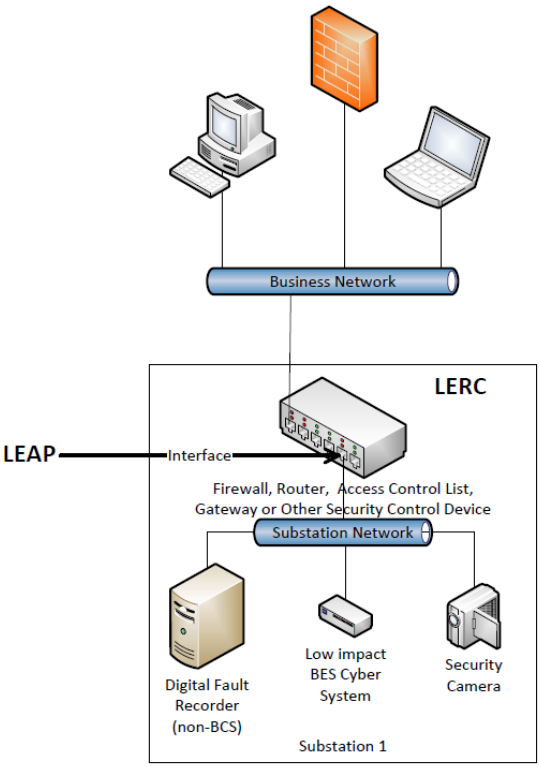
The SDT also notes it uses the term "electronic access control" in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing.

The following diagrams explain the SDT's rationale.



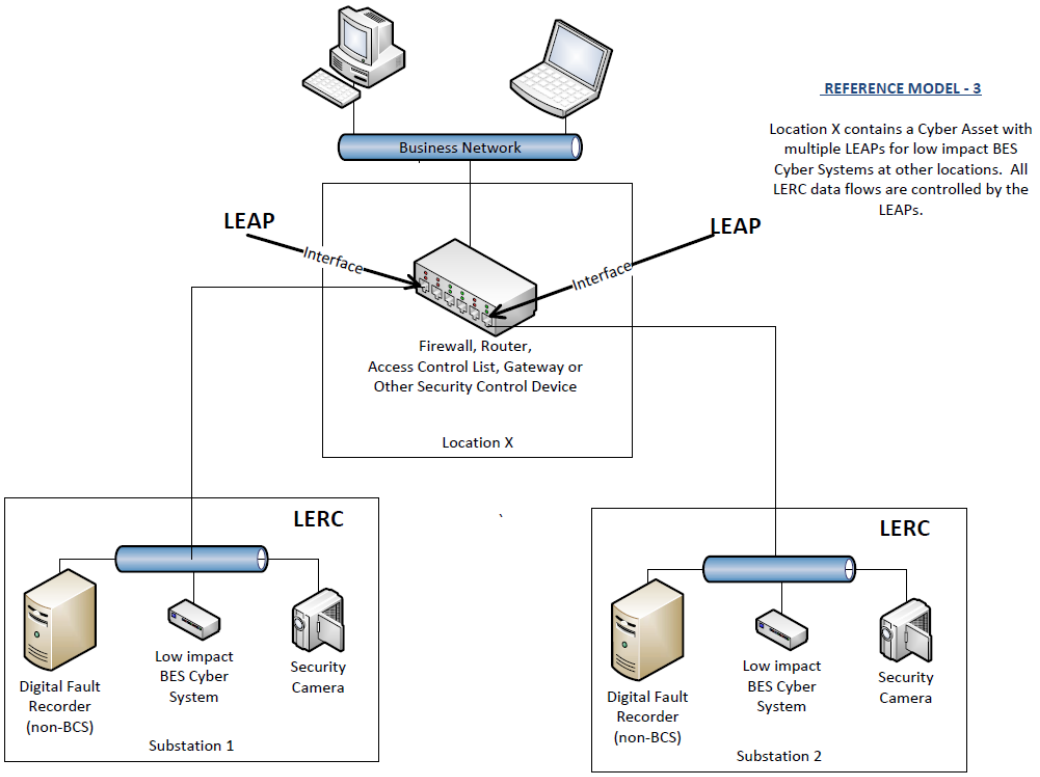
REFERENCE MODEL - 1

The low impact BES Cyber System is behind a LEAP. In this example, the LEAP is the network interface on the low impact BES Cyber System. The host-based firewall restricts electronic access for Low Impact External Routable Connectivity (LERC).



REFERENCE MODEL - 2

All LERC to the low impact BES Cyber System is controlled by an LEAP.



Requirement R2 Attachment 1 – Cyber Security Incident Response

The entity should have one or more documented cyber security incident response plans that include each of the topics listed. For assets that do not have LERC, it is not the intent to increase their risk by increasing the level of connectivity in order to have real-time monitoring. The intent is if in the normal course of business suspicious activities are noted at an asset containing low impact BES Cyber Systems, there is a cyber security incident response plan that will guide the entity through responding to the incident and reporting the incident if it rises to the level of a Reportable Cyber Security Incident.

The plan(s) must be tested once every 36 months. This is not an exercise per low impact BES Cyber Asset or per type of BES Cyber Asset but an exercise of each incident response plan the entity created to meet this requirement. An actual Reportable Cyber Security Incident counts as an exercise as well as other forms of tabletop exercises or drills. NERC-led exercises such as GridEx participation would also count as an exercise if the entity's response plan is followed. It is the intent of the SDT to have the cyber security incident response plan(s) kept current which includes updating the plan(s) within 180 days following a test or an actual incident.

In the event of a Reportable Cyber Security Incident, Attachment 1, element 4.6 specifies entities must retain relevant records for Reportable Cyber Security Incidents. Example evidence may include, but is not limited to, dated documentation, such as security logs, police reports,

emails, response forms or checklists, forensic analysis results, restoration records, and post-incident review notes. Entities should refer to their handling procedures to determine the types of evidence to retain. The evidence retention period for records related to Reportable Cyber Security Incidents is defined in Section C.1.2 of this Standard, which is the same for all requirements in CIP-003-6.

For low impact BES Cyber Systems, the only portion of the definition of Cyber Security Incident that would apply is, "A malicious act or suspicious event that disrupts, or was an attempt to disrupt, the operation of a BES Cyber System." The other portion of that definition is not to be used to require ESPs and PSPs for low impact BES Cyber Systems.

Requirement R3:

The intent of CIP-003-6, Requirement R3 is effectively unchanged since prior versions of the standard. The specific description of the CIP Senior Manager has now been included as a defined term rather than clarified in the Standard itself to prevent any unnecessary cross-reference to this standard. It is expected that this CIP Senior Manager play a key role in ensuring proper strategic planning, executive/board-level awareness, and overall program governance.

Requirement R4:

As indicated in the rationale for CIP-003-6, Requirement R4, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the SDT was not to impose any particular organizational structure, but, rather, the Responsible Entity should have significant flexibility to adapt this requirement to their existing organizational structure. A Responsible Entity may satisfy this requirement through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to its organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records provides a clear line of authority back to the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

The Responsible Entity must keep its documentation of the CIP Senior Manager and any delegations up to date. This is to ensure that individuals do not assume any undocumented authority. However, delegations do not have to be re-instated if the individual who delegated the task changes roles or is replaced. For instance, assume that John Doe is named the CIP Senior Manager and he delegates a specific task to the Substation Maintenance Manager. If John Doe is replaced as the CIP Senior Manager, the CIP Senior Manager documentation must be updated within the specified timeframe, but the existing delegation to the Substation Maintenance Manager remains in effect as approved by the previous CIP Senior Manager, John Doe.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014

Description of Current Draft

This draft standard is being posted for an initial additional comment period and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
First 45-Day Comment Period Opens	June 2014
Additional 45-Day Comment Period (if necessary)	August September 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5.	
6	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-6

3. Purpose: To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**:

All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-003-6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Dates:

Reliability Standard CIP-003-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Requirement R1, Part 1.2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 1 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 2 until the later of April 1, 2018 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 3 until the later of September 1, 2018 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 4 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

6. Background:

Standard CIP-003 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

The term *policy* refers to one or a collection of written documents that are used to communicate the Responsible Entities' management goals, objectives and expectations for how the Responsible Entity will protect its BES Cyber Systems. The use of *policies* also establishes an overall governance foundation for creating a culture of security and compliance with laws, regulations, and standards.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures provide examples of evidence to show documentation and implementation of the requirement. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save

the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

B. Requirements and Measures

Rationale for Requirement R1:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to ~~personnel who have authorized electronic access and/or authorized unescorted physical access to~~ its BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements.

Annual review and approval of the cyber security policy ensures that the policy is kept-up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

R1. Each Responsible Entity~~, for its high impact and medium impact BES Cyber Systems~~ shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

1.1 For its high impact and medium impact BES Cyber Systems, if any:

- **1.1.1.** Personnel and~~&~~ training (CIP-004);
- **1.1.2.** Electronic Security Perimeters (CIP-005) including Interactive Remote Access;
- **1.1.3.** Physical security of BES Cyber Systems (CIP-006);
- **1.1.4.** System security management (CIP-007);
- **1.1.5.** Incident reporting and response planning (CIP-008);
- **1.1.6.** Recovery plans for BES Cyber Systems (CIP-009);
- **1.1.7.** Configuration change management and vulnerability assessments (CIP-010);
- **1.1.8.** Information protection (CIP-011); and
- **1.1.9.** Declaring and responding to CIP Exceptional Circumstances.

1.2 For its assets identified in CIP-002 containing low impact BES Cyber Systems, if any:

- **1.2.1.** Cyber security awareness;
- **1.2.2.** Physical security controls;

1.2.3. Electronic access controls for Low Impact External Routable Connectivity and Dial-up Connectivity; and

~~**1.1.9.**~~**1.2.4.** Cyber Security Incident Response

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

Rationale for Requirement R2:

The requirement to implement a cyber security plan for assets containing low impact BES Cyber Systems provides a minimum set of cyber security controls for assets containing low impact BES Cyber Systems. Individually, these low impact BES Cyber Systems pose a relatively lower risk to the BES than other BES Cyber Systems, but in aggregate or through communication dependencies, they have the potential to create an adverse reliability impact if compromised. To that end, Requirement R2 requires Responsible Entities to implement documented cyber security plans covering four subject matter areas – (1) cyber security awareness, (2) physical access controls, (3) electronic access controls, and (4) cyber security incident response. In response to directives in FERC Order No. 791, Requirement R2 provides for the specific elements that must be included in the cyber security plan(s). Attachment 1 provides these elements. These plans, along with the cyber security policies required under Requirement R1, Part 1.2, provide sufficient operational, procedural, and technical safeguards for assets containing low impact BES Cyber Systems.

Considering the varied types of low impact BES Cyber Systems across the Bulk-Power System, Attachment 1 provides Responsible Entities flexibility on how to apply the required security controls. Additionally, the SDT recognizes that many Responsible Entities have multiple impact rated BES Cyber Systems and has provided the ability to use high and medium impact BES Cyber System policies, procedures, and processes to implement the objective criteria within Attachment 1.

Responsible Entities will utilize their list of assets that contain low impact BES Cyber System(s) that is created as a result of applying CIP-002 to substantiate the sites or locations associated with low impact BES Cyber Systems. However, there continues to be no compliance expectation for Responsible Entities to maintain a list(s) of individual low impact BES Cyber Systems and their associated cyber assets or to maintain a list of authorized users.

~~One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to low impact BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the~~

~~accountability and responsibility necessary for effective implementation of the standard's requirements by CIP Senior Manager approval of the policies specified in Part 2.1.~~

~~The language in Requirement R2, Part 2.4 "external routable protocol paths" and "Dial-up Connectivity" was included to acknowledge the support given in FERC Order No. 761, paragraph 87, for electronic security perimeter protections "of some form" to be applied to all BES Cyber Systems, regardless of impact. Part 2.4 uses the phrase "external routable protocol paths" instead of the defined term "External Routable Connectivity," because the latter term has very specific connotations relating to Electronic Security Perimeters and high and medium impact BES Cyber Systems. Using the glossary term "External Routable Connectivity" in the context of Requirement R2 would not be appropriate because Requirement R2 is limited in scope to low impact BES Cyber Systems. The Standard Drafting Team (SDT) intent in using the phrase "external routable protocol paths" is to focus only on the paths to the low impact BES Cyber Systems and not the paths to other networks (e.g., corporate paths).~~

~~The additions to Requirement R2, in particular the processes required under Parts 2.2-2.6, address FERC Order No. 791 paragraphs 106-110, which require the standard to address the lack of objective criteria against which NERC and the Commission can evaluate the sufficiency of an entity's protections for low impact assets. The SDT pulled language and concepts from CIP-004, CIP-005, CIP-006, and CIP-008 in order to add objective criteria to each of the previous policy topic areas in CIP-003, Requirement R2.~~

~~In FERC Order No. 791 paragraphs 111-112, FERC upheld that creating and maintaining an inventory of low impact assets for audit purposes would be unduly burdensome, so the inventory statements remain unchanged.~~

R2. Each Responsible Entity ~~for its assets~~with at least one asset identified in CIP-002 containing low impact BES Cyber Systems shall ~~perform each of the applicable requirement parts in *CIP-003-6 Table R2 – Low Impact Assets*~~implement one or more documented cyber security plan(s) for its low impact BES Cyber Systems that include the elements in Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

Note: An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required. Lists of authorized users are not required.

M2. Evidence shall include each of the documented cyber security plan(s) that collectively include each of the elements in Attachment 1 and additional evidence to demonstrate implementation of cyber security plan(s). Additional examples of evidence per element are located in Attachment 2. ~~Evidence must include each of the applicable documented policies and processes that collectively include each of the applicable requirement parts in *CIP-003-6 Table R2 – Low Impact Assets* and any additional evidence to demonstrate implementation as described in the Measures column of the table~~

CIP-003-6 Table R2 – Low Impact Assets			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	Low Impact BES Cyber Systems	Review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the topics in CIP-003-6, Requirement R2, Parts 2.2 – 2.6.	An example of evidence may include, but is not limited to, one or more documented cyber security policies that address each of the areas in Requirement R2, Parts 2.2 – 2.6 and includes evidence of review and CIP Senior Manager approval at least every 15 calendar months.
2.2	Low Impact BES Cyber Systems	Implement one or more documented processes that include operational or procedural control(s) to restrict physical access.	An example of evidence may include, but is not limited to, documentation of the operational or procedural control(s).
2.3	Low Impact BES Cyber Systems at Control Centers	Implement one or more documented processes that collectively include the following: 2.3.1. Escorted access of visitors; and 2.3.2. For Control Centers with external routable protocol paths, monitoring physical access point(s).	Examples of evidence may include, but are not limited to: • For 2.3.1, documentation of visitor escort procedure(s) at Control Centers. • For 2.3.2, documentation describing how the Responsible Entity monitors physical access points into Control Centers that have external routable protocol paths.

CIP-003-6 Table R2 – Low Impact Assets			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	Low Impact BES Cyber Systems	Implement one or more documented processes that collectively include the following: 2.4.1. All external routable protocol paths, if any, must be through one or more identified access point(s). 2.4.2. For each identified access point, if any, require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default. 2.4.3. Authentication when establishing Dial-up Connectivity, per Cyber Asset capability.	Examples of evidence may include, but are not limited to: • For 2.4.1, documentation of external routable protocol paths through identified access points. • For 2.4.2, a representative sample of a list of restrictions (e.g., firewall rules, access control lists, data diode, etc.) that demonstrates that only permitted access is allowed and that each access rule has a reason documented individually or by group. • For 2.4.3, documentation of authentication controls applied to dial-up access connections.

CIP-003-6 Table R2 – Low Impact Assets			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.5	Low Impact BES Cyber Systems	Implement one or more Cyber Security Incident response plan(s) that collectively include the following: 2.5.1. Identification, classification, and response to Cyber Security Incidents. 2.5.2. Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident. 2.5.3. Notification of Reportable Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), unless prohibited by law. 2.5.4. The roles and responsibilities of Cyber Security Incident response groups or individuals. 2.5.5. Incident handling procedures for Cyber Security Incidents. 2.5.6. Testing of the plan(s) at least once per 36 calendar months, either through a paper drill, tabletop exercise, or a response to an actual Reportable Cyber Security Incident.	Examples of evidence may include, but are not limited to: • One or more documented cyber security incident response plans that include the requirement parts. • Dated evidence that shows the testing or execution of the plan(s) at least once per 36 calendar months, either through a paper drill, tabletop exercise, or a response to an actual Reportable Cyber Security Incident.

CIP-003-6 Table R2 – Low Impact Assets			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.6	Low Impact BES Cyber Systems	Implement a security awareness program that reinforces cyber security practices at least quarterly. Once every 15 calendar months, the program shall reinforce Parts 2.2, 2.3, 2.4, and 2.5 above.	An example of evidence may include, but is not limited to, one or more documents describing how the Responsible Entity is implementing its cyber security awareness program per 2.6.

Rationale for Requirement R3:

The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the *Glossary of Terms used in NERC Reliability Standards* so that it may be used across the body of CIP standards without an explicit cross-reference.

FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the senior manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent basis.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

Rationale for Requirement R4:

The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.

In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.

R4. The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

CIP-003-6 - Attachment 1

Required Elements for Cyber Security Plan(s) for Assets Containing Low Impact BES Cyber Systems

Responsible Entities shall include each of the elements provided below in the cyber security plan(s) required under Requirement R2.

Responsible Entities with multiple impact BES Cyber Systems ratings can utilize policies, procedures, and processes for their high or medium impact BES Cyber Systems to fulfill the elements for the development of low impact cyber security plan(s). Each Responsible Entity can develop a cyber security plan(s) either by individual asset or groups of assets.

1. Cyber security awareness: Each Responsible Entity shall reinforce, once every 15 calendar months, its cyber security practices, using one or a combination of the following methods:

- Direct communications (for example, e-mails, memos, computer-based training);
- Indirect communications (for example, posters, intranet, or brochures); or
- Management support and reinforcement (for example, presentations or meetings).

2. Physical access controls: Each Responsible Entity shall implement controls to restrict physical access to (1) the asset or the locations of the low impact BES Cyber Systems within the asset, and (2) the Low Impact BES Cyber System Electronic Access Point, if any, based on need as determined by the Responsible Entity, through one or more of the following:

- Access controls;
- Monitoring controls; or
- Other operational, procedural, or technical physical security controls.

3. Electronic access controls: Each Responsible Entity shall implement controls to restrict electronic access for Low Impact External Routable Connectivity and Dial-up Connectivity, which shall include the following, or other electronic access controls that provide an equal or greater level of protection:

3.1 For any Low Impact External Routable Connectivity, establish a Low Impact BES Cyber System Electronic Access Point that permits only necessary inbound and outbound access and denies all other access; and

3.2 Authentication of all Dial-up Connectivity that provides access to low impact BES Cyber Systems, per Cyber Asset capability.

4. Cyber Security Incident response: Each Responsible Entity shall have one or more Cyber Security Incident response plan(s), either by asset or group of assets, which shall include:

4.1 Identification, classification, and response to Cyber Security Incidents.

4.2 Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and subsequent notification to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), unless prohibited by law.

4.3 Identification of the roles and responsibilities for Cyber Security Incident response by groups or individuals.

4.4 Incident handling for Cyber Security Incidents.

4.5 Testing the Cyber Security Incident response plan at least once every 36 calendar months by: (1) responding to an actual Reportable Cyber Security Incident; (2) using a drill or tabletop exercise of a Reportable Cyber Security Incident; or (3) using an operational exercise of a Reportable Cyber Security Incident.

4.6 Record retention related to Reportable Cyber Security Incidents.

4.7 Updating the Cyber Security Incident response plan within 180 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident.

CIP-003-6 - Attachment 2

Examples of Evidence for Cyber Security Plan(s) for Assets Containing Low Impact BES Cyber Systems

Element 1: An example of evidence for element 1 may include, but is not limited to documentation that the reinforcement of cyber security practices once every 15 months has been provided through dated copies of the information used to reinforce security awareness via direct communications, indirect communications or management support and reinforcement.

Element 2: Examples of evidence for element 2 may include, but are not limited to:

1. Documentation of one or more access controls (e.g. card key, special locks), monitoring controls (e.g. alarm systems, human observation), or other operational, procedural or technical physical security controls to restrict physical access to both:
    a. The asset, if any, or the locations of the low impact BES Cyber Systems within the asset; and
    b. The Cyber Asset, if any, containing the Low Impact BES Cyber System Electronic Access Point.
2. Documentation showing that the physical access restrictions cited above are based on need, which may include, but is not limited to, a policy describing the high level operational or business need(s) for physical access.

Element 3: Examples of evidence for element 3 may include, but are not limited to:

- Documentation showing that inbound and outbound connections (e.g. IP addresses, ports, services) for any Low Impact BES Cyber System Electronic Access Point are confined to only those the Responsible Entity deems necessary; and documentation of authentication for Dial-up Connectivity (e.g. dial out only to a preprogrammed number to deliver data, dial-back modems, modems that must be remotely controlled by the control center or control room, access control on the BES Cyber System); or
- Documentation of other electronic access controls that provide an equal or greater level of protection.

Element 4: An example of evidence for element 4 may include, but is not limited to, dated documentation such as policies, procedures or process documents of one or more Cyber Security Incident response plan(s); either by asset or group of assets that include the following processes:

1. to identify, classify and respond to Cyber Security Incidents; to determine whether an identified Cyber Security Incident is a Reportable Cyber Security incident and for notifying the Electricity Sector Information Sharing and Analysis Center (ES-ISAC);
2. the identification and documentation of the roles and responsibilities for Cyber Security Incident response by groups of individuals (e.g. initiating, documenting, monitoring, reporting, etc.);

3. for incident handling of a Cyber Security Incident (e.g. containment, eradication, recovery/incident resolution);
4. for testing the plan(s) along with the dated documentation that a test has been completed at least once every 36 calendar months; and
5. to retain records related to Reportable Cyber Security Incidents (e.g. security logs, police reports, emails, response forms or checklists, forensic analysis results, restoration records, and post-incident review notes).

Also include dated revised Cyber Security Incident response plan(s) that identify that the plan(s) were updated within 180 calendar days after a completion of a test or actual Reportable Cyber Security Incident.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The number of policies and their specific language are guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. If a Responsible Entity has any high or medium impact BES Cyber Systems, ~~The~~ the cyber security policy must cover in sufficient detail the nine topical areas required by CIP-003-6, Requirement R1.1. If a Responsible Entity has any assets from CIP-002 containing low impact BES Cyber Systems, the cyber security policy must cover in sufficient detail the four topical areas required by Requirement R1.2. The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-6, Requirement R1. For Responsible Entities that have multiple impact rated BES Cyber Systems, they are not required to create separate cyber security policies for high or medium and low impact BES Cyber Systems. Implementation of the cyber security policy is not specifically included in CIP-003-6, Requirement R1 as it is envisioned that the implementation of this policy is evidenced through successful implementation of CIP-004 through CIP-011. However, Responsible Entities are encouraged not to limit the scope of their cyber security policies to only those requirements from CIP-004 through CIP-011, but rather to put together a holistic cyber security policy appropriate to its organization. The assessment through the Compliance Monitoring and Enforcement Program

of policy items that extend beyond the scope of CIP-004 through CIP-011 should not be considered candidates for potential violations. The Responsible Entity should consider the following for each of the required topics in its cyber security policy:

1.1 Personnel ~~&~~ and training (CIP-004)

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account management

1.2 Electronic Security Perimeters (CIP-005) including Interactive Remote Access

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points
- Maintaining up-to-date anti-malware software before initiating Interactive Remote Access
- Maintaining up-to-date patch levels for operating systems and applications used to initiate Interactive Remote Access
- Disabling VPN "split-tunneling" or "dual-homed" workstations before initiating Interactive Remote Access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity's Interactive Remote Access controls

1.3 Physical security of BES Cyber Systems (CIP-006)

- Strategy for protecting Cyber Assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress

1.4 System security management (CIP-007)

- Strategies for system hardening
- Acceptable methods of authentication and access control
- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

1.5 Incident reporting and response planning (CIP-008)

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident

- Obligations to report Cyber Security Incidents

1.6 Recovery plans for BES Cyber Systems (CIP-009)

- Availability of spare components
- Availability of system backups

1.7 Configuration change management and vulnerability assessments (CIP-010)

- Initiation of change requests
- Approval of changes
- Break-fix processes

1.8 Information protection (CIP-011)

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

1.9 Declaring and responding to CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

The Standard Drafting Team (SDT) has removed requirements relating to exceptions to a Responsible Entity's security policies since it is a general management issue that is not within the scope of a reliability requirement. The SDT considers it to be an internal policy requirement and not a reliability requirement. However, the SDT encourages Responsible Entities to continue this practice as a component of its cyber security policy.

In this and all subsequent required approvals in the NERC CIP Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R2:

~~The~~ Using the list of assets from CIP-002, the intent of the requirement is for each Responsible Entity to create, document, and implement one or more cyber security plan(s) that addresses the protection of~~to outline a set of protections designed for~~ all low impact BES Cyber Systems. The SDT is balancing the fact that low impact BES Cyber Systems are indeed low impact to the BES, but they do meet the definition of having a 15-minute adverse impact so some protections are needed. The intent is that such protections are part of a program that covers the low impact BES Cyber Systems collectively either at an asset ~~programmatic~~ or site level (assets containing low impact BES Cyber Systems), not an individual device or system level.

There are four main areas detailed in Attachment 1 that must be covered by this ~~security program~~plan: cyber security awareness, physical security, electronic access controls for Low

Impact External Routable Connectivity and ~~for all external routable protocol paths or~~ Dial-up Connectivity~~, a security awareness program~~, and cyber security incident response ~~plans~~.

Requirement R2 Attachment 1

Attachment 1 contains the elements that must be in the cyber security plan(s). The SDT's intent is to allow entities that have a combination of high, medium, and low impact BES Cyber Systems the flexibility to choose to cover their low impact BES Cyber Systems (or any subset) under their programs used for the high or medium impact BES Cyber Systems and not maintain two separate programs. Guidance for each of the 4 subject matter areas of Attachment 1 is provided below.

Requirement R2 Attachment 1 – Security Awareness

The intent of the security awareness program is for entities to reinforce good cyber security practices with their personnel at least once every 15 calendar months. It is up to the entity as to the topics and how it schedules these topics. The Responsible Entity should be able to produce the awareness material that was delivered and the delivery method(s) (posters, emails, topics at staff meetings, etc.) that were used. The SDT does not intend that the Responsible Entity must maintain lists of recipients and track the reception of the awareness material by personnel.

Although the focus of the awareness is cyber security, it does not mean that only technology-related topics can be used in the program. Appropriate physical security topics (e.g. tailgating awareness and protection of badges for physical security, "If you see something, say something" campaigns, etc.) are valid for cyber security awareness. The intent is to cover topics concerning any aspect of the protection of BES Cyber Systems.

Requirement R2 Attachment 1 – Physical Security

The Responsible Entity must document and implement controls to restrict physical access to the low impact BES Cyber Systems at a BES asset and Low Impact BES Cyber System Electronic Access Points (LEAP) (see Electronic Access Controls section below). If the LEAP is located within the BES asset and inherits the same controls outlined in element 2, this can be noted by the Responsible Entity to avoid duplicate documentation of the same controls. If the LEAP is located at another location, possibly a location without any BES Cyber Systems, then separate documentation and implementation of the physical security controls of the LEAP are required.

The Responsible Entity has flexibility in the controls used to restrict physical access to low impact BES Cyber Systems at a BES asset using one or a combination of access controls, monitoring controls, or other operational, procedural, or technical physical security controls. Entities may utilize perimeter controls (e.g., fences with locked gates, guards, site access policies, etc.) and/or more granular areas of physical access control in areas where low impact BES Cyber Systems are located, such as control rooms or control houses. User authorization programs and lists of authorized users are not required.

The objective is to restrict physical access based on need and the need can be established at the policy level based on higher level operational or business needs for access to the site or systems. The SDT intent is that this need at the higher level be documented such that the

requirement cannot be interpreted to mean that any and all access must be restricted. The requirement does not imply that a specific business need must be documented for each access or authorization of a user for access.

Monitoring as a physical security control can be used as a complement or an alternative to access control. Examples of monitoring controls include, but are not limited to: (i) alarm systems to detect motion or entry into a controlled area, or (ii) human observation of a controlled area. Monitoring does not imply logging and maintaining logs, but monitoring that physical access has occurred or been attempted (e.g., door alarm or human observation, etc.). The monitoring does not need to be per low impact BES Cyber System but should be at the level as determined by the entity's controls.

~~2.2 – The Responsible Entity must document and implement processes that include the physical security of the low impact BES Cyber Systems at a BES asset. The Responsible Entity has flexibility in the controls used and the granularity of those controls. The entity is to document its operational or physical controls that restrict access to the low impact BES Cyber Systems at the asset. Entities may utilize perimeter controls (fences with locked gates, guards, site access policies, etc.) and/or more granular areas of access control in areas where low impact BES Cyber Systems are located, such as control rooms or control houses. Lists of authorized users are not required.~~

~~2.3 – The Responsible Entity must document and implement processes that include the physical security of the low impact BES Cyber Systems at Control Centers. For Control Centers, the entity should further describe the process for handling escorted access of visitors. For Control Centers that have external routable connectivity, monitoring of physical access points is also required. Monitoring does not imply logging and maintaining logs, but monitoring that access has been granted through an access point (door alarm, etc.). The monitoring does not need to be per low impact BES Cyber System but should be at the level as determined by the entity's controls.~~**Requirement R2 Attachment 1 – Electronic Access Controls**

~~2.4 – The~~ Where Low Impact External Routable Connectivity (LERC) or Dial-up Connectivity exists, the Responsible Entity must ~~have implemented processes~~document and implement controls that include the LERC ~~external routable protocol~~ and Dial-up ~~connectivity~~ Connectivity ~~paths~~ to the BES asset such that the low impact BES Cyber Systems located at the BES asset are protected. Two glossary terms are included in order to help clarify and simplify the language in Attachment 1. The SDT's intent in creating these terms is to avoid confusion with the similar concepts and requirements (ESP, EAP, ERC, EACMS) needed for high and medium impact BES Cyber Systems by utilizing separate terms that apply only to assets containing low impact BES Cyber Systems.

> **Low Impact External Routable Connectivity (LERC)** – includes any bi-directional routable protocol based connectivity between low impact BES Cyber Systems within a BES asset and Cyber Assets outside the BES asset containing the low impact BES Cyber Systems. The SDT, in order to avoid future technology issues, is specifically excluding from the definition direct Intelligent Electronic Device (IED) to IED communication used for protection and/or control between low impact BES Cyber Systems at different BES assets, such as IEC 61850 messaging. The SDT does not intend for the requirement to

have an electronic access point even though there is LERC or to preclude the use of such time-sensitive (for example 4 ms or less) reliability enhancing functions if they use a routable protocol in the future.

Low Impact BES Cyber System Electronic Access Point (LEAP) – is the interface on a Cyber Asset that allows and controls the LERC. Examples include, but are not limited to, the internal (facing the low impact BES Cyber Systems) interface on a firewall, the internal interface on a router that has implemented an access control list (ACL), or an internal interface on a unidirectional gateway that physically enforces outbound-only data flows. LEAP are not to be considered EACMS or meet EACMS specific requirements (as utilized for the Electronic Security Perimeter protecting high and medium impact BES Cyber Systems). However they are required, as per element 2 of the cyber security plan elements, to have physical security controls. The location of the LEAP is not prescriptive and does not have to reside at the BES asset containing low impact BES Cyber Systems. This flexibility is included so that the standard does not require a unique LEAP per BES asset. Responsible Entities can have a single LEAP that controls the LERC from more than one BES asset containing low impact BES Cyber Systems. However the LERC between assets "behind" the LEAP and another asset containing a low impact BES Cyber System must also pass through the single LEAP. Locating the LEAP at an external location with multiple BES assets containing low impact BES Cyber Systems "behind" it should not allow unfettered access from one BES asset to all other BES assets sharing the LEAP. It is also not the intent of the SDT where low impact BES Cyber Systems do not have any LERC that additional connectivity be established nor that a LEAP be established.

The electronic access controls should address the risk of using the asset's LERC or Dial-up Connectivity~~external connectivity~~ to gain access to the low impact BES Cyber Systems. For LERC, a LEAP shall be implemented that permits only necessary inbound and outbound access and denies all other access.~~The entity should be able to describe how its electronic access controls on the external connectivity paths protect the collection of low impact BES Cyber Systems at the site. The intent is to reduce the risk of aggregation of numerous low impact BES Cyber Systems at the site or across multiple sites through external connectivity.~~

Examples of sufficient access controls may include:

- ~~All the external routable protocol connectivity paths to~~Any LERC for the asset passes through a ~~firewall~~ LEAP that denies all traffic by default with explicit inbound and outbound access permissions defined, or equivalent method by which both inbound and outbound connections are ~~shielded from or to the world wide web~~confined to only those that the Responsible Entity deems necessary (e.g. IP addresses, ports, services~~, and/or data diode~~) for scenarios representative of the Responsible Entity's sites having Low Impact BES Cyber Systems.
- Dial-up Connectivity to a low impact BES Cyber System is set to dial out only (no autoanswer) to a preprogrammed number to deliver data. Incoming Dial-up Connectivity is to a dialback modem, a modem that must be remotely

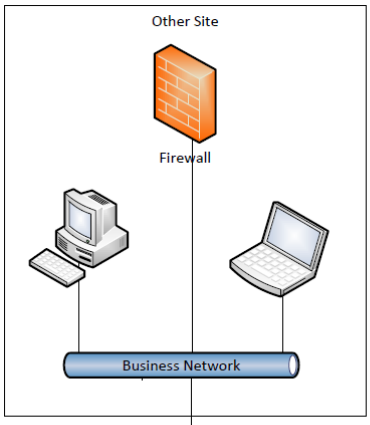
controlled by the control center or control room, has some form of access control, or the low impact BES Cyber System has access control.

Some examples of situations that would lack sufficient access controls to meet the intent of this requirement include:

- An asset has ~~dialup~~ Dial-up ~~connectivity~~ Connectivity and a low impact BES Cyber System is reachable via an auto-answer modem that connects any caller to the Cyber Asset ~~which~~ that has a default password. There is no access control in this instance.
- An asset has external routable connectivity due to a BES Cyber System within it having a 3G/4G wireless card on a public carrier which allows the BES Cyber System to be reachable via a public IP address. In essence, low impact BES Cyber Systems should not be accessible from the Internet and search engines such as Shodan.

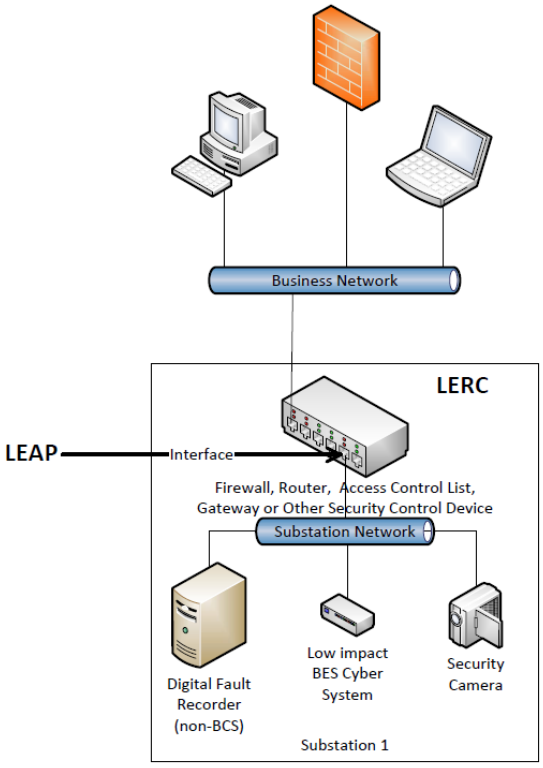
The SDT also notes ~~that in topic 2.4, the SDT~~it uses the term "electronic access control" in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing.

The following diagrams explain the SDT's rationale.



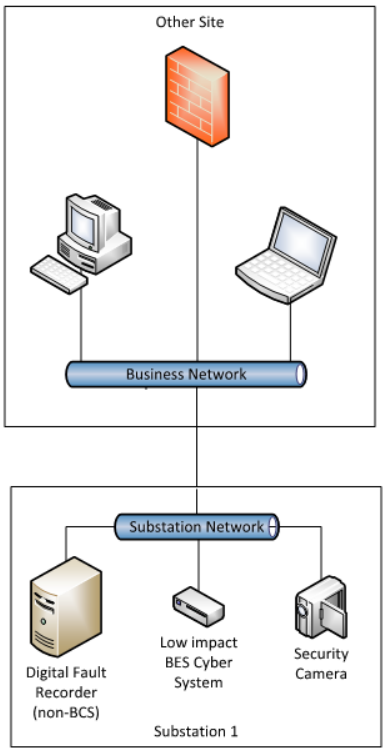
REFERENCE MODEL - 1

The low impact BES Cyber System is behind a LEAP. In this example, the LEAP is the network interface on the low impact BES Cyber System. The host-based firewall restricts electronic access for Low Impact External Routable Connectivity (LERC).



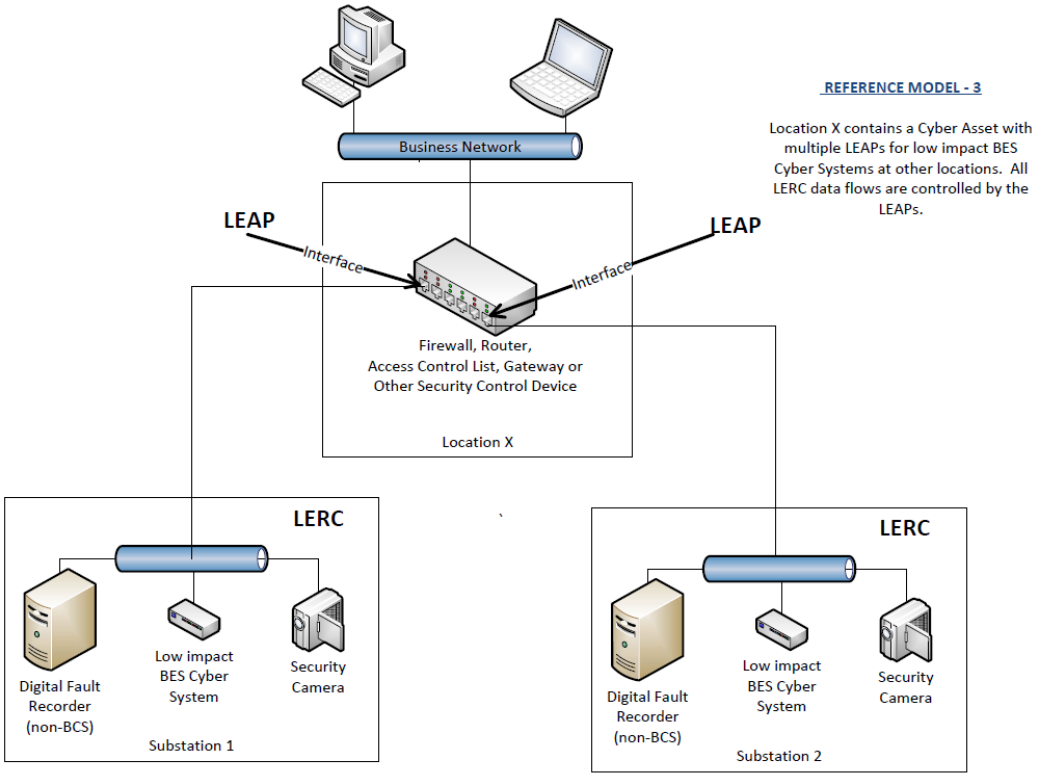
REFERENCE MODEL - 2

All LERC to the low impact BES Cyber System is controlled by an LEAP.



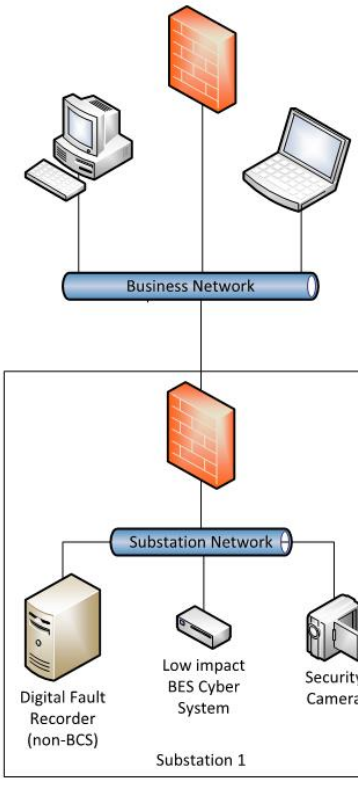
NOT OK

The BES Cyber System is behind an access point, however all external routable protocol paths to the BES Cyber System are not controlled by an access point if they originate on the business network.



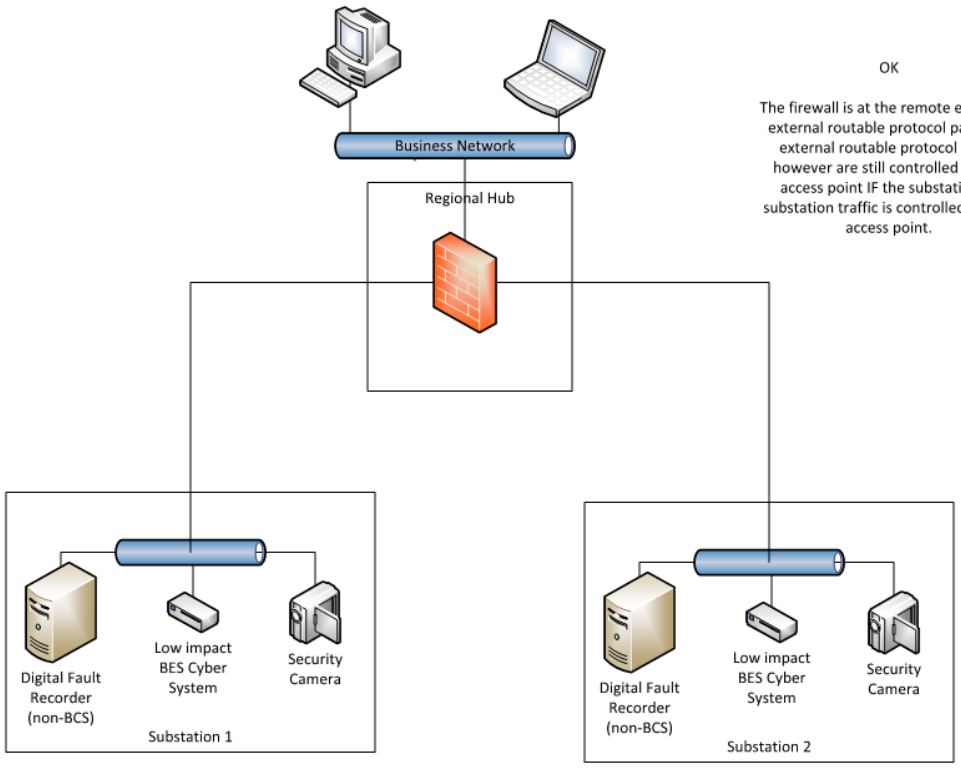
REFERENCE MODEL - 3

Location X contains a Cyber Asset with multiple LEAPs for low impact BES Cyber Systems at other locations. All LERC data flows are controlled by the LEAPs.



OK

All the external traffic to the BES Cyber System is controlled by an access point.



Requirement R2 Attachment 1 – Cyber Security Incident Response~~2.5 –~~

The entity should have ~~a~~ one or more documented cyber security incident response plans that include~~s~~ each of the topics listed. For assets that do not have LERC~~have limited or no connectivity~~, it is not the intent to increase their risk by increasing the level of connectivity in order to have real-time monitoring. The intent is if in the normal course of business suspicious activities are noted at an asset containing low impact BES Cyber Systems, there is a cyber security incident response plan that will guide the entity through responding to the incident and reporting the incident if it rises to the level of a Reportable Cyber Security Incident.

The plan(s) must be tested once every 36 months. This is not an exercise per low impact BES Cyber Asset or per type of BES Cyber Asset but an exercise of each incident response plan the entity created to meet this requirement. An actual Reportable Cyber Security Incident counts as an exercise as well as other forms of tabletop exercises or ~~paper~~ drills. NERC-led exercises such as GridEx participation would also count as an exercise if the entity's response plan is followed. It is the intent of the SDT to have the cyber security incident response plan(s) kept current which includes updating the plan(s) within 180 days following a test or an actual incident.

In the event of a Reportable Cyber Security Incident, Attachment 1, element 4.6 specifies entities must retain relevant records for Reportable Cyber Security Incidents. Example evidence may include, but is not limited to, dated documentation, such as security logs, police reports, emails, response forms or checklists, forensic analysis results, restoration records, and post-

incident review notes. Entities should refer to their handling procedures to determine the types of evidence to retain. The evidence retention period for records related to Reportable Cyber Security Incidents is defined in Section C.1.2 of this Standard, which is the same for all requirements in CIP-003-6.

For low impact BES Cyber Systems, the only portion of the definition of Cyber Security Incident that would apply is, "A malicious act or suspicious event that disrupts, or was an attempt to disrupt, the operation of a BES Cyber System." The other portion of that definition is not to be used to require ESPs and PSPs for low impact BES Cyber Systems.

~~2.6 - The intent of the security awareness program is for entities to reinforce good cyber security practices with their personnel on at least a quarterly basis. The physical security, electronic access controls, and the cyber security incident response plan should be covered at least every 15 months. It is up to the entity as to the topics and how it schedules these topics. It should be sufficient for an entity to produce the awareness material that it delivered quarterly and the delivery method(s) (posters, emails, topics at staff meetings, etc.). The intent is that tracking of reception of the messages by personnel is not required.~~**Requirement R3:**

The intent of CIP-003-6, Requirement R3 is effectively unchanged since prior versions of the standard. The specific description of the CIP Senior Manager has now been included as a defined term rather than clarified in the Standard itself to prevent any unnecessary cross-reference to this standard. It is expected that this CIP Senior Manager play a key role in ensuring proper strategic planning, executive/board-level awareness, and overall program governance.

Requirement R4:

As indicated in the rationale for CIP-003-6, Requirement R4, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the SDT was not to impose any particular organizational structure, but, rather, the Responsible Entity should have significant flexibility to adapt this requirement to their existing organizational structure. A Responsible Entity may satisfy this requirement through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to its organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records provides a clear line of authority back to the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

The Responsible Entity must keep its documentation of the CIP Senior Manager and any delegations up to date. This is to ensure that individuals do not assume any undocumented authority. However, delegations do not have to be re-instated if the individual who delegated the task changes roles or is replaced. For instance, assume that John Doe is named the CIP Senior Manager and he delegates a specific task to the Substation Maintenance Manager. If John Doe is replaced as the CIP Senior Manager, the CIP Senior Manager documentation must be updated within the specified timeframe, but the existing delegation to the Substation

Maintenance Manager remains in effect as approved by the previous CIP Senior Manager, John Doe.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First Comment and Ballot Period concluded on July 16, 2014

Description of Current Draft

This draft standard is being posted for an additional comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period	September 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	
2	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Configuration Change Management and Vulnerability Assessments

2. Number: CIP-010-2

3. Purpose: To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-010-2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-010-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with Reliability Standard CIP-010-2, Requirement R4 until nine calendar months after the effective date of Reliability Standard CIP-010-2.

6. Background:

Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R1 – Configuration Change Management

Part	Applicable Systems	Requirements	Measures
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 4. EACMS; 5. PACS; and 6. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-010-2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-010-2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

Rationale for Requirement R2:

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: **1.** EACMS; and **2.** PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

Rationale for Requirement R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment,; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

Rationale for R4:

Requirement R4 responds to the directive in FERC Order No. 791, at Paragraphs 6 and 136, to address security-related issues associated with tools used on a temporary basis for tasks such as data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To mitigate the risks associated with such tools, the Requirement R4 is a new requirement developed to accomplish the following security objectives:

- Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and
- Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.

Requirement R4 incorporates the concepts from other CIP requirements in CIP-010-1 and CIP-007-5 to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes: This is a new requirement. All requirements related to Transient Devices and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes.

R4. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems and associated Protected Cyber Assets, shall implement one or more documented plan(s) for Transient Cyber Assets and Removable Media that include the elements in Attachment 1, except under CIP Exceptional Circumstances. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence shall include each of the documented plan(s) for Transient Cyber Assets and Removable Media that collectively include each of the applicable elements in Attachment 1 and additional evidence to demonstrate implementation of plan(s) for Transient Cyber Assets and Removable Media. Additional examples of evidence per element are located in Attachment 2. If a Responsible Entity does not use Transient Cyber Asset(s) or Removable Media, examples of evidence include, but are not limited to, a statement, policy, or other document that states the Responsible Entity does not use Transient Cyber Asset(s) or Removable Media.

C. Compliance

1. Compliance Monitoring Process:

a. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

b. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

c. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Investigations

Self-Reporting

Complaints

d. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only four of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only three of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only two of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has not documented or implemented any configuration change management process(es). (R1) OR The Responsible Entity has documented and implemented a configuration change management process(es) that includes only one of the required baseline items listed in 1.1.1 through 1.1.5. (1.1) OR The Responsible Entity does not have a process(es) that

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						requires authorization and documentation of changes that deviate from the existing baseline configuration. (1.2) OR The Responsible Entity does not have a process(es) to update baseline configurations within 30 calendar days of completing a change(s) that deviates from the existing baseline configuration.(1.3) OR The Responsible Entity does not have a process(es) to determine required security controls in CIP-005 and CIP-007

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						that could be impacted by a change(s) that deviates from the existing baseline configuration. (1.4.1) OR The Responsible Entity has a process(es) to determine required security controls in CIP-005 and CIP-007 that could be impacted by a change(s) that deviates from the existing baseline configuration but did not verify and document that the required controls were not adversely affected following the change. (1.4.2 & 1.4.3)

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						OR The Responsible Entity does not have a process for testing changes in an environment that models the baseline configuration prior to implementing a change that deviates from baseline configuration. (1.5.1) OR The Responsible Entity does not have a process to document the test results and, if using a test environment, document the differences between the test and production environments. (1.5.2)

CIP-010-2 - Attachment 1

Required Elements for Plans for Transient Cyber Assets and Removable Media

Responsible Entities shall include each of the elements provided below in their plan(s) for Transient Cyber Assets and Removable Media as required under Requirement R4.

1. Transient Cyber Asset(s) Owned or Managed by the Responsible Entity.

1.1. Transient Cyber Asset management: Responsible Entities shall manage Transient Cyber Asset(s), individually or by group: (1) in an ongoing manner to ensure compliance with applicable requirements at all times, (2) in an on-demand manner applying the applicable requirements before connection to a BES Cyber System, or (3) a combination of both (1) and (2) above.

1.2. Transient Cyber Asset authorization: For each individual or group of Transient Cyber Asset(s), each Responsible Entity shall specify:

1.2.1. Authorized users, either individually or by group or role;

1.2.2. Authorized locations, either individually or by group; and

1.2.3. Authorized uses, which shall be limited to what is necessary to perform business functions.

1.3. Security vulnerability mitigation: To mitigate security vulnerabilities (per Transient Cyber Asset capability), each Responsible Entity shall use one or a combination of the following methods:

- Security patching, including manual or managed updates;
- Live operating system and software executable only from read-only media;
- System hardening; or
- Other method(s) to mitigate security vulnerabilities.

1.4. Introduction of malicious code mitigation: To mitigate the introduction of malicious code (per Transient Cyber Asset capability), each Responsible Entity shall use one or a combination of the following methods:

- Antivirus software, including manual or managed updates of signatures or patterns;
- Application whitelisting;
- Restricted communication to limit the exchange of data to only the Transient Cyber Asset and the Cyber Assets to which it is connected; or
- Other method(s) to mitigate the introduction of malicious code.

1.5. Risk of unauthorized use mitigation: To mitigate the risk of unauthorized use, each Responsible Entity shall use one or a combination of the following methods:

- Transient Cyber Asset resides within a location with restricted physical access;
- Full-disk encryption with authentication;
- Multi-factor authentication;
- Theft recovery tools; or
- Other method(s) to mitigate the risk of unauthorized use.

2. Transient Cyber Asset(s) Owned or Managed by Vendors or Contractors.

2.1 Security vulnerability mitigation: To mitigate security vulnerabilities (per Transient Cyber Asset capability), each Responsible Entity shall use one or a combination of the following methods:

- Review of installed security patch(es);
- Review of security patching process used by the vendor or contractor;
- Review of other vulnerability mitigation performed by the vendor or contractor; or
- Other method(s) to mitigate security vulnerabilities.

2.2 Malicious code mitigation: To mitigate malicious code, each Responsible Entity shall use one or a combination of the following methods:

- Review of antivirus update level;
- Review of antivirus update process used by the vendor or contractor;
- Review of application whitelisting used by the vendor or contractor;
- Review use of live operating system and software executable only from read-only media;
- Review of system hardening used by the vendor or contractor; or
- Other method(s) to mitigate malicious code.

2.3 For any method used to mitigate security vulnerabilities or malicious code as specified in 2.1 and 2.2, Responsible Entities shall determine whether additional mitigation actions are necessary, and implement such actions prior to connecting the vendor- or contractor-owned Transient Cyber Asset.

3. Removable Media

3.1. Removable Media authorization: For each individual or group of Removable Media, each Responsible Entity shall specify:

3.1.1. Authorized users, either individually or by group or role; and

3.1.2. Authorized locations, either individually or by group.

3.2. Malicious code mitigation: To mitigate malicious code, each Responsible Entity shall scan Removable Media outside of the BES Cyber System.

CIP-010-2 - Attachment 2

Examples of Evidence for Plans for Transient Cyber Assets and Removable Media

Element 1.1: Examples of evidence for element 1.1 may include, but are not limited to, the method(s) of management for the Transient Cyber Asset(s). This can be included as part of the Transient Cyber Asset plan(s), part of the documentation related to authorization of Transient Cyber Asset(s) Owned or Managed by the Responsible Entity or part of a security policy.

Element 1.2: Examples of evidence for element 1.2 may include, but are not limited to, documentation from asset management systems, human resource management systems, forms or spreadsheets that shows authorization of Transient Cyber Asset(s) Owned or Managed by the Responsible Entity. The documentation must identify the Transient Cyber Asset, individually or by group of Transient Cyber Asset(s) along with the authorized users, either individually or by group or role, the authorized locations, either individually or by group and the authorized uses associated with what is necessary to perform business functions.

Element 1.3: Examples of evidence for element 1.3 may include, but are not limited to, documentation of the method(s) used to mitigate security vulnerabilities such as security patch management implementation, the use of live operating systems, system hardening practices or other method(s) to mitigate security vulnerability. Evidence can be from change management systems, automated patch management solutions, procedures or processes associated with using live operating systems, or procedures or processes associated with system hardening practices. If a Transient Cyber Asset is unable to perform any of the capabilities, evidence may include system documentation developed by the vendor or Responsible Entity that identifies why the Transient Cyber Asset cannot perform the capability.

Element 1.4: Examples of evidence for element 1.4 may include, but are not limited to, documentation of the method(s) used to mitigate malicious code such as antivirus software and processes for managing signature or pattern updates, application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a Transient Cyber Asset is unable to perform any of the capabilities, evidence may include system documentation developed by the vendor or Responsible Entity that identifies why the Transient Cyber Asset cannot perform the capability.

Element 1.5: Examples of evidence for element 1.5 may include, but are not limited to documentation through policies or procedures of the method(s) to restrict physical access; method(s) of the full-disk encryption solution along with the authentication protocol; method(s) of the multi-factor authentication solution; method(s) of the theft recovery tools; or documentation of other method(s) to mitigate the risk of unauthorized use. If a Transient Cyber Asset is unable to perform any of the capabilities, evidence may include system documentation developed by the vendor or Responsible Entity that identifies why the Transient Cyber Asset cannot perform the capability.

Element 2.1: Examples of evidence for element 2.1 may include, but are not limited to documentation from change management systems, electronic mail or procedures that document a review of installed security patch(es); memorandums, electronic mail, policies or contracts from vendors or contractors that identify the security patching process or vulnerability mitigation performed by the vendor or contractor; evidence from change management systems, electronic mail, system documentation or contracts that identifies acceptance by the Responsible Entity of the vendor or contractor practices are acceptable; or documentation of other method(s) to mitigate security vulnerabilities for Transient Cyber Asset(s) Owned of Managed by Vendors or Contractors. If a Transient Cyber Asset is unable to perform any of the capabilities, evidence may include system documentation developed by the vendor or Responsible Entity that identifies why the Transient Cyber Asset cannot perform the capability.

Element 2.2: Examples of evidence for element 2.2 may include, but are not limited to documentation from change management systems, electronic mail or procedures that document a review of installed the antivirus update level; memorandums, electronic mail, system documentation, policies or contracts from vendors or contractors that identify the antivirus update process, the use of application whitelisting, use of live of operating systems or system hardening performed by the vendor or contractor; evidence from change management systems, electronic mail or contracts that identifies acceptance by the Responsible Entity of the vendor or contractor practices are acceptable; or documentation of other method(s) to mitigate malicious code for Transient Cyber Asset(s) Owned or Managed by Vendors or Contractors. If a Transient Cyber Asset is unable to perform any of the capabilities, evidence may include system documentation developed by the vendor or Responsible Entity that identifies why the Transient Cyber Asset cannot perform the capability.

Element 2.3: Examples of evidence for element 2.3 may include, but are not limited to documentation from change management systems, electronic mail, contracts that identifies a review to determine whether additional mitigations are necessary and that they have been implemented prior to connecting the vendor or contractor owned Transient Cyber Asset.

Element 3.1: Examples of evidence for element 3.1 may include, but are not limited to documentation from asset management systems, human resource management systems, forms or spreadsheets that shows authorization of Removable Media. The documentation must identify Removable Media, individually or by group of Removable Media, along with the authorized users, either individually or by group or role and the authorized locations, either individually or by group.

Element 3.2: Examples of evidence for element 3.2 may include, but are not limited to documentation of the method(s) used to mitigate malicious code such as results of scans of the media, or documented confirmation by the entity that the media was deemed to be free of malicious code. Confirmation can be documented through email or within change management record(s).

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included. Custom software installed may include scripts developed for local entity functions or

other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a

major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.
2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.

3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Requirement R4:

Most BES Cyber Assets and BES Cyber Systems are isolated from external public or untrusted networks. Because of this, Transient Cyber Assets and Removable Media are a means for cyber-attack. Transient Cyber Assets and Removable Media are often the only way to transport files to and from secure areas that are needed to maintain, monitor, or troubleshoot critical systems. To protect the BES Cyber Assets and BES Cyber Systems, entities are required to document and implement a plan for how they will manage the use of Transient Cyber Assets and Removable Media. The approach of defining a plan allows the Responsible Entity to document the processes that are supportable within its organization and in alignment with its change management processes.

Transient Cyber Assets and Removable Media are those connected temporarily to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. These assets do not provide BES reliability services and are not part of the BES Cyber Asset to which they are connected. Examples of these temporarily connected devices include, but are not limited to:

- Diagnostic test equipment
- Packet sniffers
- Equipment used for BES Cyber System maintenance

- Equipment used for BES Cyber System configuration
- Equipment used to perform vulnerability assessments

Transient Cyber Assets can be one of many types of devices from a specially-designed device for maintaining equipment in support of the BES to a platform such as a laptop, desktop, or tablet that may just interface with or run applications that support BES Cyber Systems and is capable of transmitting executable code. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

While the definitions of Transient Cyber Asset and Removable Media include a conditional provision that requires them to be connected for 30 days or less, element 1.1 of Attachment 1 allows the Responsible Entity to include provisions in its plan(s) that allow continuous or on-demand treatment and applications of controls independent of the connected state. Please note that for on-demand treatment, the requirements only apply when Transient Cyber Assets and Removable Media are being connected to a BES Cyber System or Protected Cyber Asset. Once the transient device is disconnected, the requirements listed herein are not applicable.

The attachment was created to specify the capabilities and possible security methods available to Responsible Entities based upon asset type, ownership, and management. These are broken down as follows:

1. Transient Cyber Asset(s) Owned or Managed by the Responsible Entity
2. Transient Cyber Asset(s) Owned or Managed by Vendors or Contractors
3. Removable Media

<u>Per Transient Cyber Asset Capability</u>

As with other CIP standards, the requirements are intended for an entity to perform the security functions that the system is capable of doing. The use of this phrase is to eliminate the need for a technical feasibility exception when it is understood that the device cannot perform a function. Using the example of malicious code, many types of appliances are not capable of implementing antivirus software and therefore the software would not be required since it is not a capability of the device.

With the list of options provided in Attachment 1 for each control area, the entity has the discretion to use the option that is most appropriate. The entity should avoid implementing a security function that jeopardizes reliability by taking actions that would negatively impact the performance or support of the device.

Requirement 4 Attachment 1 Transient Cyber Asset(s) Owned or Managed by the Responsible Entity

Element 1.1: Entities have a high level of control for the assets that they own or manage. The requirements listed herein allow entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection or use a combination of these methods.

Element 1.2: Entities are to document and implement their process(es) to authorize the use of Transient Cyber Assets for which they have direct ownership or management. The Transient Cyber Assets may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:

1.2.1 User(s), individually or by group/role, allowed to use the Transient Cyber Asset(s). This can be done by listing a specific person, department, or job function. These user(s) must have authorized electronic access to the applicable system in accordance with CIP-004.

1.2.2 Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group of locations.

1.2.3 The intended or approved use of each individual, type, or group of Transient Cyber Asset. This should also include the software or application packages that are authorized with the purpose of performing defined business functions or tasks, and approved network interfaces (e.g. wireless including near field communication or Bluetooth and wires connections). Activities, and software or application packages, not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals through the CIP-004 Security Awareness Program and Cyber Security Training Program about authorized and unauthorized activities or uses (e.g., using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).

Entities should exercise caution when using Transient Cyber Assets and ensure they do not have features enabled (e.g. wireless or Bluetooth features) in a manner that would allow the device to bridge an outside network to an applicable system. Doing so would cause the Transient Cyber Asset to become an unauthorized Electronic Access Point in violation of CIP-005, Requirement R1.

Attention should be paid to Transient Cyber Assets that may be used for assets in differing impact areas (i.e. high impact, medium impact, and low impact). These impact areas have differing levels of protection under the CIP Requirements, and measures should be taken to prevent the introduction of malicious code from a lower impact area. An entity may want to consider the need to have separate Transient Cyber Assets for each impact level.

Element 1.3: Entities are to document and implement their process(es) to mitigate security vulnerabilities through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. Recognizing there is a huge diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in security vulnerability management solutions, options are listed that include the alternative for the entity to use a technology or process that effectively mitigates vulnerabilities.

- Security patching, including manual or managed updates provides flexibility to the Responsible Entity to determine how their Transient Cyber Asset(s) will be used. It is possible for an entity to have their Transient Cyber Asset be part of an enterprise

patch process and receive security patches on a regular schedule or the entity can verify and apply security patches prior to connecting the Transient Cyber Asset to an applicable Cyber Asset. Unlike, CIP-007, R2, there is no expectation of creating dated mitigation plans or other documentation other than what is necessary to identify that the Transient Cyber Asset is receiving appropriate security patches.

- Live operating system and software executable only from read-only media is provided to allow a protected operating system that cannot be modified to deliver malicious software. When entities are creating customer live operating systems, they should check the image during the build to ensure that there is not malicious software on the image.
- System hardening, also called operating system hardening, helps minimize security vulnerabilities by removing all non-essential software programs and utilities and only installing the bare necessities that the computer needs to function. While other programs may provide useful features, they can provide "back-door" access to the system, and should be removed to harden the system.
- When selecting to use other methods that mitigate security vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet security vulnerability mitigation.

Element 1.4: Entities are to document and implement their process(es) to mitigate malicious code through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. As with vulnerability management, there is diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in malicious code protections. When addressing malicious code protection, the Responsible Entity should address methods deployed to deter, detect, or prevent malicious code. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

- Antivirus software, including manual or managed updates of signatures or patterns provides flexibility just as with security patching, to manage their Transient Cyber Asset(s) by deploying antivirus or endpoint security tools that maintain a scheduled update of the signatures or patterns. Also, it is possible that entities can choose for devices that do not regularly connect to receive scheduled updates, to scan the Transient Cyber Asset prior to connection to ensure no malicious software is present.
- Application whitelisting is a method of authorizing only the applications and processes that are necessary on the Transient Cyber Asset. This reduces the opportunity that malicious software could become resident, much less propagate from the Transient Cyber Asset to the BES Cyber Asset of BES Cyber System.
- Restricted communication to limit the exchange of data to only the Transient Cyber Asset and the Cyber Assets to which it is connected by restricting or disabling serial

or network (including wireless) communications on a managed Transient Cyber Asset can be used to minimize the opportunity to introduce malicious code onto the Transient Cyber Asset while it is not connected to BES Cyber Systems. This renders the device unable to communicate with devices other than the one to which it is connected.

- When selecting to use other methods that mitigate the introduction of malicious code to those listed, entities need to have documentation that identifies how the other method(s) meet mitigation of the introduction of malicious code.

Element 1.5: Entities are to document and implement their process(es) to protect and evaluate Transient Cyber Assets to ensure they mitigate the risks of unauthorized use to the Transient Cyber Asset.

- Transient Cyber Asset resides within a location with restricted physical access. The intent is that the Transient Cyber Asset is maintained within a Physical Security Perimeter or other physical location that manages unauthorized physical access to the device.
- Full disk encryption with authentication is an option that can be used to protect a Transient Cyber Asset from unauthorized physical access. However, it is important that authentication be required to decrypt the device. For example, pre-boot authentication, or power-on authentication, provides a secure, tamper-proof environment external to the operating system as a trusted authentication layer. Authentication prevents anything being read from the hard disk until the user has confirmed they have the correct password or other credentials.
- Multi-factor authentication is used to ensure the identity of the person accessing the device.
- Theft recovery tools that can be used to remotely wipe or lockout systems if they are stolen or lost.
- When selecting to use other methods that mitigate the risk of unauthorized use to those listed, entities need to have documentation that identifies how the other method(s) meet mitigation of the risk of unauthorized use.

Requirement 4 Attachment 1 Transient Cyber Asset(s) Owned or Managed by Vendors or Contractors

The attachment also recognizes the lack of control for Transient Cyber Assets that are owned or managed by vendors or contractors. However, this does not obviate the Responsible Entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not own or manage. The requirements listed herein allow entities the ability to review the assets to the best of their capability and meet their obligations.

To facilitate these controls, Responsible Entities may choose to execute agreements with vendors and contractors to provide support services to BES Cyber Systems and BES Cyber Assets that may involve the use of Transient Cyber Assets. Entities may consider using the Department Of Energy Cybersecurity Procurement Language for Energy Delivery dated April 2014. [1] Elements from the procurement language may unify vendor and entity actions supporting the BES Cyber Systems and BES Cyber Assets. CIP Program elements may be considered including roles and responsibilities, access controls, monitoring, logging, vulnerability, and patch management along with incident response and back up recovery may be part of the vendor's support. Entities should consider the elements of the "General Cybersecurity Procurement Language" and "The Supplier's Life Cycle Security Program" when drafting Master Service Agreements, Contracts, and the CIP program processes and controls.

Element 2.1: Entities are to document and implement their process(es) to mitigate security vulnerabilities through the use of one or more of the protective measures listed.

- Conduct a review of the vendor or contractor managed Transient Cyber Asset to determine whether the security patch level of the device is adequate to mitigate the risk of security vulnerabilities before connecting the Transient Cyber Asset to an applicable system.
- Conduct a review of the vendor or contractor security patching process. This can be done either at the time of contracting but no later than prior to connecting the Transient Cyber Asset to an applicable system. Just as with reviewing the security patch level of the device, selecting to use this approach aims to ensure that the Responsible Entity has mitigated the risk of security vulnerabilities to applicable systems.
- Conduct a review of other processes that the vendor or contactor uses to mitigate the risk of security vulnerabilities. This can be reviewing system hardening, application whitelisting, virtual machines, etc.
- When selecting to use other methods to mitigate security vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet mitigation of the risk of security vulnerabilities

Element 2.2: Entities are to document and implement their process(es) to mitigate malicious code through the use of one or more of the protective measures listed.

- Review the use of antivirus software and signature or pattern levels to ensure that the level is adequate to the Responsible Entity to mitigate the risk of malicious software being introduced to an applicable system.
- Review the antivirus or endpoint security processes of the vendor or contactor to ensure that their processes are adequate to the Responsible Entity to reduce the risk of introducing malicious software to an applicable system.

[1] http://www.energy.gov/oe/downloads/cybersecurity-procurement-language-energy-delivery-april-2014

- Review the use of application whitelisting used by the vendor or contractor to reduce the risk of introducing malicious software to an applicable system.
- Review the use of live operating systems or software executable only from read-only media to ensure that the media is free from malicious software itself. Entities should review the processes to build the read-only media as well as the media itself.
- Review system hardening practices used by the vendor or contractor to ensure that unnecessary ports, services, applications, etc have been disabled or removed. This will limit the chance of introducing malicious software to an applicable system.

Element 2.3: Determine whether additional mitigation actions are necessary, and implement such actions prior to connecting the vendor or contractor owned Transient Cyber Asset. The intent of this element is to ensure that after conducting the selected review from elements 2.1 and 2.2, if there are deficiencies that do not meet the Responsible Entities security posture, the vendor or contractor is required to complete the mitigations prior to connecting their devices to an applicable system.

Requirement 4 Attachment 1 Removable Media

Entities have a high level of control for Removable Media that are going to be connected to their BES Cyber Assets.

Element 3.1: Entities are to document and implement their process(es) to authorize the use of Removable Media. The Removable Media may be listed individually or by type.

- Document the user(s), individually or by group/role, allowed to use the Removable Media. This can be done by listing a specific person, department, or job function. These user(s) must have authorized electronic access to the applicable system in accordance with CIP-004.
- Locations where the Removable Media may be used. This can be done by listing a specific location or a group/role of locations.

Element 3.2: Entities are to document and implement their process(es) to mitigate malicious code through the use of scanning the Removable Media before it is connected to a BES Cyber Asset. The scanning is expected to occur from a system that is not part of the BES Cyber System to reduce the risk of propagating malicious code into the BES Cyber System network or onto one of the BES Cyber Assets. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First Comment and Ballot Period concluded on July 16, 2014

Description of Current Draft

This draft standard is being posted for an ~~initial~~ additional comment and ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
~~First 45-Day Comment Period Opens~~	~~June 2014~~
Additional 45-Day Comment Period ~~(if necessary)~~	~~August~~ September 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	
2	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** Cyber Security — Configuration Change Management and Vulnerability Assessments

2. **Number:** CIP-010-2

3. **Purpose:** To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the BES.

4. **Applicability:**

4.1. **Functional Entities:** For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 **Balancing Authority**

4.1.2 **Distribution Provider** that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**:

All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-010-2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-010-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with Reliability Standard CIP-010-2, Requirement R4 until nine calendar months after the effective date of Reliability Standard CIP-010-2.

6. Background:

Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R1 – Configuration Change Management

Part	Applicable Systems	Requirements	Measures
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 4. EACMS; 5. PACS; and 6. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-010-2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-010-2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

Rationale for Requirement R2:

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: **1.** EACMS; and **2.** PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

Rationale for Requirement R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment,; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

Rationale for R4:

Requirement R4 ~~is to address~~responds to the directive in FERC Order No. 791, at Paragraphs 6 and 136, ~~which require the standards~~ to address security-related issues associated with tools ~~specifically~~ used on a temporary basis for tasks such as~~for~~ data transfer, vulnerability assessment, maintenance, or troubleshooting. These tools are potential vehicles for transporting malicious code into a facility and subsequently into Cyber Assets or BES Cyber Systems. To ~~that end~~mitigate the risks associated with such tools, the R~~r~~equirement R4 ~~goals are as follows~~is a new requirement developed to accomplish the following security objectives:

- Preventing unauthorized access or malware propagation to BES Cyber Systems through Transient Cyber Assets or Removable Media; and
- Preventing unauthorized access to BES Cyber System Information through Transient Cyber Assets or Removable Media.

~~The SDT has incorporated~~Requirement R4 incorporates the concepts ~~of~~from other CIP requirements ~~from FERC-approved~~in CIP-010-1 and CIP-007-5 to help define the requirements for Transient Cyber Assets and Removable Media.

Summary of Changes: This is a new requirement. All requirements related to Transient Devices and Removable Media are included within a single standard, CIP-010. Due to the newness of the requirements and definition of asset types, the SDT determined that placing the requirements in a single standard would help ensure that entities were able to quickly identify the requirements for these asset types. ~~While the requirements are similar, they are not to the same rigor of those found in CIP-007 protecting the permanent assets identified by an entity.~~ A separate standard was considered for these requirements. However, the SDT determined that these types of assets would be used in relation to change management and vulnerability assessment processes and should, therefore, be placed in the same standard as those processes.

R4. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems and associated Protected Cyber Assets, shall implement one or more documented ~~process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media* Protection~~ plan(s) for Transient Cyber Assets and Removable Media that include the elements in Attachment 1, except under CIP Exceptional Circumstances. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M4. Evidence shall include each of the documented plan(s) for Transient Cyber Assets and Removable Media that collectively include each of the applicable elements in Attachment 1 and additional evidence to demonstrate implementation of plan(s) for Transient Cyber Assets and Removable Media. Additional examples of evidence per element are located in Attachment 2. If a Responsible Entity does not use Transient Cyber Asset(s) or Removable Media, examples of evidence include, but are not limited to, a statement, policy, or other document that states the Responsible Entity does not use Transient Cyber Asset(s) or

Removable MediaEvidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems and their associated: • PCA	Authorize the usage of Transient Cyber Assets prior to initial use, except for CIP Exceptional Circumstances. Authorization shall include: 4.1.1. Users, individually or by group/role; 4.1.2. Locations, individually or by group/role; 4.1.3. Defined acceptable use; and 4.1.4. Operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability).	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the authorized software for each Transient Cyber Asset, individually or by group; or • A record in an asset management system that identifies the authorized configuration for each Transient Cyber Asset individually or by group.

~~CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection~~			
~~Part~~	~~Applicable Systems~~	~~Requirements~~	~~Measures~~
~~4.2~~	~~High Impact BES Cyber Systems and their associated:~~ ~~• PCA~~ ~~Medium Impact BES Cyber Systems and their associated:~~ ~~• PCA~~	~~Use method(s) to deter, detect, or prevent malicious code on Transient Cyber Assets (per Cyber Asset capability).~~	~~An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus hardening, policies, verification of method(s) employed by vendors, etc.).~~
~~4.3~~	~~High Impact BES Cyber Systems and their associated:~~ ~~• PCA~~ ~~Medium Impact BES Cyber Systems and their associated:~~ ~~• PCA~~	~~Use method(s) to detect malicious code on Removable Media prior to use on applicable systems.~~	~~An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus scanning techniques, verification of method(s) employed by vendors, etc.).~~
~~4.4~~	~~High Impact BES Cyber Systems and their associated:~~ ~~• PCA~~ ~~Medium Impact BES Cyber Systems and their associated:~~ ~~• PCA~~	~~Mitigate the threat of detected malicious code for Transient Cyber Assets and Removable Media.~~	~~Examples of evidence may include, but are not limited to:~~ ~~• Records of response processes for malicious code detection~~ ~~• Records of the performance of these processes when malicious code is detected.~~
~~4.5~~	~~High Impact BES Cyber Systems and their associated:~~ ~~• PCA~~ ~~Medium Impact BES Cyber Systems and their associated:~~ ~~• PCA~~	~~Update signatures or patterns for those methods identified in Parts 4.2 and 4.3 that use signatures or patterns.~~	~~An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.~~

CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection			
Part	Applicable Systems	Requirements	Measures
4.6	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Evaluate Transient Cyber Assets, prior to use, for modifications that deviate from Part 4.1.4. For a modification that deviates from the state in Part 4.1.4, either: • Remediate by returning the Transient Cyber Asset to the state in Part 4.1.4; or • Update Part 4.1.4.	An example of evidence may include but is not limited to, updated documentation with the date, evaluation results, and status of any remediation activities.
4.7	High Impact BES Cyber Systems and associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Evaluate Transient Cyber Assets, within 35 calendar days prior to use, to ensure security patches are up-to-date. For security patches that are not up-to-date, take one of the following actions: • Apply the applicable patches; • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch.	An example of evidence may include but is not limited to, updated documentation with the date, evaluation results, and status of any mitigation activities.

C. Compliance

1. Compliance Monitoring Process:

a. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

b. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

c. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance ~~Violation~~ Investigations

Self-Reporting

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only four of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only three of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only two of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has not documented or implemented any configuration change management process(es). (R1) OR The Responsible Entity has documented and implemented a configuration change management process(es) that includes only one of the required baseline items listed in 1.1.1 through 1.1.5. (1.1) OR The Responsible Entity does not have a process(es) that

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						requires authorization and documentation of changes that deviate from the existing baseline configuration. (1.2) OR The Responsible Entity does not have a process(es) to update baseline configurations within 30 calendar days of completing a change(s) that deviates from the existing baseline configuration.(1.3) OR The Responsible Entity does not have a process(es) to determine required security controls in CIP-005 and CIP-007

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						that could be impacted by a change(s) that deviates from the existing baseline configuration. (1.4.1) OR The Responsible Entity has a process(es) to determine required security controls in CIP-005 and CIP-007 that could be impacted by a change(s) that deviates from the existing baseline configuration but did not verify and document that the required controls were not adversely affected following the change. (1.4.2 & 1.4.3)

R #	Time Horizon	VRF	Violation Severity Levels (CIP-010-2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						OR The Responsible Entity does not have a process for testing changes in an environment that models the baseline configuration prior to implementing a change that deviates from baseline configuration. (1.5.1) OR The Responsible Entity does not have a process to document the test results and, if using a test environment, document the differences between the test and production environments. (1.5.2)

CIP-010-2 - Attachment 1

Required Elements for Plans for Transient Cyber Assets and Removable Media

Responsible Entities shall include each of the elements provided below in their plan(s) for Transient Cyber Assets and Removable Media as required under Requirement R4.

1. Transient Cyber Asset(s) Owned or Managed by the Responsible Entity.

1.1. Transient Cyber Asset management: Responsible Entities shall manage Transient Cyber Asset(s), individually or by group: (1) in an ongoing manner to ensure compliance with applicable requirements at all times, (2) in an on-demand manner applying the applicable requirements before connection to a BES Cyber System, or (3) a combination of both (1) and (2) above.

1.2. Transient Cyber Asset authorization: For each individual or group of Transient Cyber Asset(s), each Responsible Entity shall specify:

1.2.1. Authorized users, either individually or by group or role;

1.2.2. Authorized locations, either individually or by group; and

1.2.3. Authorized uses, which shall be limited to what is necessary to perform business functions.

1.3. Security vulnerability mitigation: To mitigate security vulnerabilities (per Transient Cyber Asset capability), each Responsible Entity shall use one or a combination of the following methods:

- Security patching, including manual or managed updates;
- Live operating system and software executable only from read-only media;
- System hardening; or
- Other method(s) to mitigate security vulnerabilities.

1.4. Introduction of malicious code mitigation: To mitigate the introduction of malicious code (per Transient Cyber Asset capability), each Responsible Entity shall use one or a combination of the following methods:

- Antivirus software, including manual or managed updates of signatures or patterns;
- Application whitelisting;
- Restricted communication to limit the exchange of data to only the Transient Cyber Asset and the Cyber Assets to which it is connected; or
- Other method(s) to mitigate the introduction of malicious code.

1.5. Risk of unauthorized use mitigation: To mitigate the risk of unauthorized use, each Responsible Entity shall use one or a combination of the following methods:

- Transient Cyber Asset resides within a location with restricted physical access;
- Full-disk encryption with authentication;
- Multi-factor authentication;
- Theft recovery tools; or
- Other method(s) to mitigate the risk of unauthorized use.

2. Transient Cyber Asset(s) Owned or Managed by Vendors or Contractors.

2.1 Security vulnerability mitigation: To mitigate security vulnerabilities (per Transient Cyber Asset capability), each Responsible Entity shall use one or a combination of the following methods:

- Review of installed security patch(es);
- Review of security patching process used by the vendor or contractor;
- Review of other vulnerability mitigation performed by the vendor or contractor; or
- Other method(s) to mitigate security vulnerabilities.

2.2 Malicious code mitigation: To mitigate malicious code, each Responsible Entity shall use one or a combination of the following methods:

- Review of antivirus update level;
- Review of antivirus update process used by the vendor or contractor;
- Review of application whitelisting used by the vendor or contractor;
- Review use of live operating system and software executable only from read-only media;
- Review of system hardening used by the vendor or contractor; or
- Other method(s) to mitigate malicious code.

2.3 For any method used to mitigate security vulnerabilities or malicious code as specified in 2.1 and 2.2, Responsible Entities shall determine whether additional mitigation actions are necessary, and implement such actions prior to connecting the vendor- or contractor-owned Transient Cyber Asset.

3. Removable Media

3.1. Removable Media authorization: For each individual or group of Removable Media, each Responsible Entity shall specify:

3.1.1. Authorized users, either individually or by group or role; and

3.1.2. Authorized locations, either individually or by group.

3.2. Malicious code mitigation: To mitigate malicious code, each Responsible Entity shall scan Removable Media outside of the BES Cyber System.

CIP-010-2 - Attachment 2

Examples of Evidence for Plans for Transient Cyber Assets and Removable Media

Element 1.1: Examples of evidence for element 1.1 may include, but are not limited to, the method(s) of management for the Transient Cyber Asset(s). This can be included as part of the Transient Cyber Asset plan(s), part of the documentation related to authorization of Transient Cyber Asset(s) Owned or Managed by the Responsible Entity or part of a security policy.

Element 1.2: Examples of evidence for element 1.2 may include, but are not limited to,~~:~~ documentation from asset management systems, human resource management systems, forms or spreadsheets that shows authorization of Transient Cyber Asset(s) Owned or Managed by the Responsible Entity. The documentation must identify the Transient Cyber Asset, individually or by group of Transient Cyber Asset(s) along with the authorized users, either individually or by group or role, the authorized locations, either individually or by group and the authorized uses associated with what is necessary to perform business functions.

Element 1.3: Examples of evidence for element 1.3 may include, but are not limited to, documentation of the method(s) used to mitigate security vulnerabilities such as security patch management implementation, the use of live operating systems, system hardening practices or other method(s) to mitigate security vulnerability. Evidence can be from change management systems, automated patch management solutions, procedures or processes associated with using live operating systems, or procedures or processes associated with system hardening practices. If a Transient Cyber Asset is unable to perform any of the capabilities, evidence may include system documentation developed by the vendor or Responsible Entity that identifies why the Transient Cyber Asset cannot perform the capability.

Element 1.4: Examples of evidence for element 1.4 may include, but are not limited to, documentation of the method(s) used to mitigate malicious code such as antivirus software and processes for managing signature or pattern updates, application whitelisting practices, processes to restrict communication, or other method(s) to mitigate the introduction of malicious code. If a Transient Cyber Asset is unable to perform any of the capabilities, evidence may include system documentation developed by the vendor or Responsible Entity that identifies why the Transient Cyber Asset cannot perform the capability.

Element 1.5: Examples of evidence for element 1.5 may include, but are not limited to documentation through policies or procedures of the method(s) to restrict physical access; method(s) of the full-disk encryption solution along with the authentication protocol; method(s) of the multi-factor authentication solution; method(s) of the theft recovery tools; or documentation of other method(s) to mitigate the risk of unauthorized use. If a Transient Cyber Asset is unable to perform any of the capabilities, evidence may include system documentation developed by the vendor or Responsible Entity that identifies why the Transient Cyber Asset cannot perform the capability.

Element 2.1: Examples of evidence for element 2.1 may include, but are not limited to documentation from change management systems, electronic mail or procedures that document a review of installed security patch(es); memorandums, electronic mail, policies or contracts from vendors or contractors that identify the security patching process or vulnerability mitigation performed by the vendor or contractor; evidence from change management systems, electronic mail, system documentation or contracts that identifies acceptance by the Responsible Entity of the vendor or contractor practices are acceptable; or documentation of other method(s) to mitigate security vulnerabilities for Transient Cyber Asset(s) Owned of Managed by Vendors or Contractors. If a Transient Cyber Asset is unable to perform any of the capabilities, evidence may include system documentation developed by the vendor or Responsible Entity that identifies why the Transient Cyber Asset cannot perform the capability.

Element 2.2: Examples of evidence for element 2.2 may include, but are not limited to documentation from change management systems, electronic mail or procedures that document a review of installed the antivirus update level; memorandums, electronic mail, system documentation, policies or contracts from vendors or contractors that identify the antivirus update process, the use of application whitelisting, use of live of operating systems or system hardening performed by the vendor or contractor; evidence from change management systems, electronic mail or contracts that identifies acceptance by the Responsible Entity of the vendor or contractor practices are acceptable; or documentation of other method(s) to mitigate malicious code for Transient Cyber Asset(s) Owned or Managed by Vendors or Contractors. If a Transient Cyber Asset is unable to perform any of the capabilities, evidence may include system documentation developed by the vendor or Responsible Entity that identifies why the Transient Cyber Asset cannot perform the capability.

Element 2.3: Examples of evidence for element 2.3 may include, but are not limited to documentation from change management systems, electronic mail, contracts that identifies a review to determine whether additional mitigations are necessary and that they have been implemented prior to connecting the vendor or contractor owned Transient Cyber Asset.

Element 3.1: Examples of evidence for element 3.1 may include, but are not limited to documentation from asset management systems, human resource management systems, forms or spreadsheets that shows authorization of Removable Media. The documentation must identify Removable Media, individually or by group of Removable Media, along with the authorized users, either individually or by group or role and the authorized locations, either individually or by group.

Element 3.2: Examples of evidence for element 3.2 may include, but are not limited to documentation of the method(s) used to mitigate malicious code such as results of scans of the media, or documented confirmation by the entity that the media was deemed to be free of malicious code. Confirmation can be documented through email or within change management record(s).

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included. Custom software installed may include scripts developed for local entity functions or

other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a

major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.
2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.

3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Requirement R4:

Most BES Cyber Assets and BES Cyber Systems are isolated from external public or untrusted networks. Because of this, Transient Cyber Assets and Removable Media are a means for cyber-attack. Transient Cyber Assets and Removable Media are often the only way to transport files to and from secure areas that are needed to maintain, monitor, or troubleshoot critical systems. To protect the BES Cyber Assets and BES Cyber Systems, entities are required to document and implement a plan for how they will manage the use of Transient Cyber Assets and Removable Media. The approach of defining a plan allows the Responsible Entity to document the processes that are supportable within its organization and in alignment with its change management processes.

Transient Cyber Assets and Removable Media are those connected temporarily to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. These assets do not provide BES reliability services and are not part of the BES Cyber Asset to which they are connected. Examples of these temporarily connected devices include, but are not limited to:

~~This Requirement applies to any transient devices (i.e. Transient Cyber Assets and Removable Media) that will be connected temporarily to an applicable system. Examples of these devices include, but are not limited to:~~

- ~~Hardware/software~~ Ddiagnostic test equipment

- ~~Hardware/software P~~packet sniffers
- ~~Hardware/software~~Equipment used for BES Cyber System maintenance
- ~~Hardware/software~~Equipment used for BES Cyber System configuration
- ~~Hardware/software~~Equipment used to perform vulnerability assessments

Transient Cyber Assets can be one of many types of devices from a specially-designed device for maintaining equipment in support of the BES to a platform such as a laptop, desktop, or tablet that may just interface with or run applications that support BES Cyber Systems and is capable of transmitting executable code. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

While the definitions of Transient Cyber Asset and Removable Media include a conditional provision that requires them to be connected for 30 days or less, element 1.1 of Attachment 1 allows the Responsible Entity to include provisions in its plan(s) that allow continuous or on-demand treatment and applications of controls independent of the connected state. Please note that for on-demand treatment, the requirements only apply when Transient Cyber Assets and Removable Media are being connected to a BES Cyber System or Protected Cyber Asset. Once the transient device is disconnected, the requirements listed herein are not applicable.

The attachment was created to specify the capabilities and possible security methods available to Responsible Entities based upon asset type, ownership, and management. These are broken down as follows:

1. Transient Cyber Asset(s) Owned or Managed by the Responsible Entity
2. Transient Cyber Asset(s) Owned or Managed by Vendors or Contractors
3. Removable Media

Per Transient Cyber Asset Capability

As with other CIP standards, the requirements are intended for an entity to perform the security functions that the system is capable of doing. The use of this phrase is to eliminate the need for a technical feasibility exception when it is understood that the device cannot perform a function. Using the example of malicious code, many types of appliances are not capable of implementing antivirus software and therefore the software would not be required since it is not a capability of the device.

With the list of options provided in Attachment 1 for each control area, the entity has the discretion to use the option that is most appropriate. The entity should avoid implementing a security function that jeopardizes reliability by taking actions that would negatively impact the performance or support of the device.

Requirement 4 Attachment 1 Transient Cyber Asset(s) Owned or Managed by the Responsible Entity

Element 1.1: Entities have a high level of control for the assets that they own or manage. The requirements listed herein allow entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection or use a combination of these methods.

Element 1.2: Entities are to document and implement their process(es) to authorize the use of Transient Cyber Assets for which they have direct ownership or management. The Transient Cyber Assets may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:

1.2.1 User(s), individually or by group/role, allowed to use the Transient Cyber Asset(s). This can be done by listing a specific person, department, or job function. These user(s) must have authorized electronic access to the applicable system in accordance with CIP-004.

1.2.2 Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group of locations.

1.2.3 The intended or approved use of each individual, type, or group of Transient Cyber Asset. This should also include the software or application packages that are authorized with the purpose of performing defined business functions or tasks, and approved network interfaces (e.g. wireless including near field communication or Bluetooth and wires connections). Activities, and software or application packages, not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals through the CIP-004 Security Awareness Program and Cyber Security Training Program about authorized and unauthorized activities or uses (e.g., using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).

~~Transient Cyber Assets can be in the form of a laptop, desktop, or tablet. Removable Media in scope of this requirement can be in the form of floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.~~

~~This requirement does not cover hardware/software components that may support information system maintenance yet are a part of the system, for example the software implementing "ping," "ls," "ipconfig," or the hardware and software implementing the monitoring port of a switch.~~

~~Requirement Parts 4.1, 4.3, 4.6, and 4.7 refer to the term "prior to use" related to when specific actions must occur. For purposes of this standard, "use" is considered to be the interaction between transient devices and applicable systems. The interaction between transient devices and multiple applicable systems within the same ESP or PSP would be considered a single use. For example, a technician would need to have a laptop evaluated only once according to Part 4.6 when working in the same PSP. The technician would not need to have the evaluation performed each time it connects to a different Cyber Asset.~~

~~**Requirement Part 4.1:**~~

~~Requirement Part 4.1 requires the entity to document and implement its process to authorize the use of Transient Cyber Assets. This allows entities the flexibility to either pre-authorize an inventory of devices or authorize devices at the time of connection. The Transient Cyber Assets~~

~~may be listed individually or by asset type. To meet this requirement part, the entity is to document the following:~~

~~**1.** User(s), individually or by group/role, allowed to use Transient Cyber Assets. This is intended to provide assurance around who has physical proximity to the Transient Cyber Assets. These user(s) must have authorized electronic and unescorted physical access to the applicable system in accordance with CIP-004.~~

~~**2.** Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group/role of locations. Attention should be paid to Transient Cyber Assets that may be used for assets in differing impact areas (i.e. high impact, medium impact, low impact). These impact areas have differing levels of protection under the CIP Requirements, and measures should be taken to prevent the introduction of malicious code from a lower impact area. It may be reasonable to have separate Transient Cyber Assets for each impact level.~~

~~**3.** The intended or approved use of each Transient Cyber Asset. Activities not specifically listed as acceptable should be considered as prohibited. It may be beneficial to educate individuals on the activities or uses that are not allowed (e.g., using the device to browse the Internet or to check email or using the device to access wireless networks in hotels or retail locations).~~

~~**4.** The operating system, firmware, and intentionally installed software. All of this information may not be available or relevant to each Transient Cyber Asset. Having this information facilitates the review in Part 4.6. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The Standard Drafting Team does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be included.~~

~~CAUTION:~~ Entities should exercise caution when using Transient Cyber Assets and ensure they do not have ~~wireless or Bluetooth~~ features enabled (e.g. wireless or Bluetooth features) in a manner that would allow the device to bridge an outside network to an applicable system. Doing so would cause the Transient Cyber Asset to become an unauthorized Electronic Access Point in violation of CIP-005, Requirement R1.

Attention should be paid to Transient Cyber Assets that may be used for assets in differing impact areas (i.e. high impact, medium impact, and low impact). These impact areas have differing levels of protection under the CIP Requirements, and measures should be taken to prevent the introduction of malicious code from a lower impact area. An entity may want to consider the need to have separate Transient Cyber Assets for each impact level.

Element 1.3: Entities are to document and implement their process(es) to mitigate security vulnerabilities through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. Recognizing there is a huge diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in

security vulnerability management solutions, options are listed that include the alternative for the entity to use a technology or process that effectively mitigates vulnerabilities.

- Security patching, including manual or managed updates provides flexibility to the Responsible Entity to determine how their Transient Cyber Asset(s) will be used. It is possible for an entity to have their Transient Cyber Asset be part of an enterprise patch process and receive security patches on a regular schedule or the entity can verify and apply security patches prior to connecting the Transient Cyber Asset to an applicable Cyber Asset. Unlike, CIP-007, R2, there is no expectation of creating dated mitigation plans or other documentation other than what is necessary to identify that the Transient Cyber Asset is receiving appropriate security patches.
- Live operating system and software executable only from read-only media is provided to allow a protected operating system that cannot be modified to deliver malicious software. When entities are creating customer live operating systems, they should check the image during the build to ensure that there is not malicious software on the image.
- System hardening, also called operating system hardening, helps minimize security vulnerabilities by removing all non-essential software programs and utilities and only installing the bare necessities that the computer needs to function. While other programs may provide useful features, they can provide "back-door" access to the system, and should be removed to harden the system.
- When selecting to use other methods that mitigate security vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet security vulnerability mitigation.

Element 1.4: Entities are to document and implement their process(es) to mitigate malicious code through the use of one or more of the protective measures listed. This needs to be applied based on the capability of the device. As with vulnerability management, there is diversity of the types of devices that can be included as Transient Cyber Assets and the advancement in malicious code protections. When addressing malicious code protection, the Responsible Entity should address methods deployed to deter, detect, or prevent malicious code. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

- Antivirus software, including manual or managed updates of signatures or patterns provides flexibility just as with security patching, to manage their Transient Cyber Asset(s) by deploying antivirus or endpoint security tools that maintain a scheduled update of the signatures or patterns. Also, it is possible that entities can choose for devices that do not regularly connect to receive scheduled updates, to scan the Transient Cyber Asset prior to connection to ensure no malicious software is present.

- Application whitelisting is a method of authorizing only the applications and processes that are necessary on the Transient Cyber Asset. This reduces the opportunity that malicious software could become resident, much less propagate from the Transient Cyber Asset to the BES Cyber Asset of BES Cyber System.
- Restricted communication to limit the exchange of data to only the Transient Cyber Asset and the Cyber Assets to which it is connected by restricting or disabling serial or network (including wireless) communications on a managed Transient Cyber Asset can be used to minimize the opportunity to introduce malicious code onto the Transient Cyber Asset while it is not connected to BES Cyber Systems. This renders the device unable to communicate with devices other than the one to which it is connected.
- When selecting to use other methods that mitigate the introduction of malicious code to those listed, entities need to have documentation that identifies how the other method(s) meet mitigation of the introduction of malicious code.

Element 1.5: Entities are to document and implement their process(es) to protect and evaluate Transient Cyber Assets to ensure they mitigate the risks of unauthorized use to the Transient Cyber Asset.

- Transient Cyber Asset resides within a location with restricted physical access. The intent is that the Transient Cyber Asset is maintained within a Physical Security Perimeter or other physical location that manages unauthorized physical access to the device.
- Full disk encryption with authentication is an option that can be used to protect a Transient Cyber Asset from unauthorized physical access. However, it is important that authentication be required to decrypt the device. For example, pre-boot authentication, or power-on authentication, provides a secure, tamper-proof environment external to the operating system as a trusted authentication layer. Authentication prevents anything being read from the hard disk until the user has confirmed they have the correct password or other credentials.
- Multi-factor authentication is used to ensure the identity of the person accessing the device.
- Theft recovery tools that can be used to remotely wipe or lockout systems if they are stolen or lost.
- When selecting to use other methods that mitigate the risk of unauthorized use to those listed, entities need to have documentation that identifies how the other method(s) meet mitigation of the risk of unauthorized use.

~~**Requirement Parts 4.2, 4.3, 4.4, and 4.5:**~~

~~Requirement Parts 4.2 and 4.3 address the protection against the introduction of malicious code by Transient Cyber Assets or Removable Media. For Transient Cyber Assets, the entity may either pre-authorize an inventory of Cyber Assets or authorize devices at the time of connection. Pre-authorized Transient Cyber Assets may have the malicious code prevention maintained on the device and do not require specific actions for each use.~~

~~It is the responsibility of the entity to ensure that the Transient Cyber Assets it owns and manages have methods deployed to deter, detect, or prevent malicious code. It is also the entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not own or manage, including vendor assets.~~

~~For Removable Media and Transient Cyber Assets authorized at the time of connection, the detection of malicious code must be addressed prior to use. This can be performed by scanning the Transient Cyber Assets or Removable Media in an environment outside of the Electronic Security Perimeter (ESP). Entities should use caution not to place kiosks or other scanning devices used to comply with this Requirement inside the ESP.~~

~~For Requirement R4, Part 4.4, if malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.~~

~~Part 4.5 requires a process to update signatures or patterns, where applicable. This process is to be documented in the overarching program. As with CIP-007-6, Requirement R3, the process is to include testing and installing of updated signatures or patterns.~~

~~Requirement Parts 4.6 and 4.7:~~

~~Requirement R4, Part 4.6 requires the entity to evaluate Transient Cyber Assets to ensure that no unauthorized modifications have been made to the operating system, firmware, or software. This is a review of the current state against what is currently documented pursuant to Part 4.1.4. If there are differences, the modified code may be removed or the documentation updated to align to the authorized or current state.~~

~~Similarly, Requirement R4, Part 4.7 requires the entity to evaluate Transient Cyber Assets to ensure that patches are up-to-date. This is a review of the patches currently installed against what is currently documented. If there are missing patches, these should be tested and applied or a mitigation plan should be created to mitigate the vulnerabilities addressed by each uninstalled security patch. This should be performed prior to connecting the Transient Cyber Asset to an applicable system. For a device that the entity does not manage (i.e. vendor laptop), this can be performed immediately prior to connecting the Transient Cyber Asset to an applicable system. For an entity managed device, the entity can evaluate and apply the patches monthly and not have to evaluate prior to each use.~~

~~Requirement Parts 4.2, 4.3, 4.4, and 4.5:~~

~~Requirement Parts 4.2 and 4.3 address the protection against the introduction of malicious code by Transient Cyber Assets or Removable Media. For Transient Cyber Assets, the entity may either pre-authorize an inventory of Cyber Assets or authorize devices at the time of~~

~~connection. Pre-authorized Transient Cyber Assets may have the malicious code prevention maintained on the device and do not require specific actions for each use.~~

~~It is the responsibility of the entity to ensure that the Transient Cyber Assets it owns and manages have methods deployed to deter, detect, or prevent malicious code. It is also the entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not own or manage, including vendor assets.~~

~~For Removable Media and Transient Cyber Assets authorized at the time of connection, the detection of malicious code must be addressed prior to use. This can be performed by scanning the Transient Cyber Assets or Removable Media in an environment outside of the Electronic Security Perimeter (ESP). Entities should use caution not to place kiosks or other scanning devices used to comply with this Requirement inside the ESP.~~

~~For Requirement R4, Part 4.4, if malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.~~

~~Part 4.5 requires a process to update signatures or patterns, where applicable. This process is to be documented in the overarching program. As with CIP-007-6, Requirement R3, the process is to include testing and installing of updated signatures or patterns.~~

~~Requirement Parts 4.6 and 4.7:~~

~~Requirement R4, Part 4.6 requires the entity to evaluate Transient Cyber Assets to ensure that no unauthorized modifications have been made to the operating system, firmware, or software. This is a review of the current state against what is currently documented pursuant to Part 4.1.4. If there are differences, the modified code may be removed or the documentation updated to align to the authorized or current state.~~

~~Similarly, Requirement R4, Part 4.7 requires the entity to evaluate Transient Cyber Assets to ensure that patches are up-to-date. This is a review of the patches currently installed against what is currently documented. If there are missing patches, these should be tested and applied or a mitigation plan should be created to mitigate the vulnerabilities addressed by each uninstalled security patch. This should be performed prior to connecting the Transient Cyber Asset to an applicable system. For a device that the entity does not manage (i.e. vendor laptop), this can be performed immediately prior to connecting the Transient Cyber Asset to an applicable system. For an entity-managed device, the entity can evaluate and apply the patches monthly and not have to evaluate prior to each use.~~

Requirement 4 Attachment 1 Transient Cyber Asset(s) Owned or Managed by Vendors or Contractors

The attachment also recognizes the lack of control for Transient Cyber Assets that are owned or managed by vendors or contractors. However, this does not obviate the Responsible Entity's responsibility to ensure that methods have been deployed to deter, detect, or prevent malicious code on Transient Cyber Assets it does not own or manage. The requirements listed herein allow entities the ability to review the assets to the best of their capability and meet their obligations.

To facilitate these controls, Responsible Entities may choose to execute agreements with vendors and contractors to provide support services to BES Cyber Systems and BES Cyber Assets that may involve the use of Transient Cyber Assets. Entities may consider using the Department Of Energy Cybersecurity Procurement Language for Energy Delivery dated April 2014.[1] Elements from the procurement language may unify vendor and entity actions supporting the BES Cyber Systems and BES Cyber Assets. CIP Program elements may be considered including roles and responsibilities, access controls, monitoring, logging, vulnerability, and patch management along with incident response and back up recovery may be part of the vendor's support. Entities should consider the elements of the "General Cybersecurity Procurement Language" and "The Supplier's Life Cycle Security Program" when drafting Master Service Agreements, Contracts, and the CIP program processes and controls.

Element 2.1: Entities are to document and implement their process(es) to mitigate security vulnerabilities through the use of one or more of the protective measures listed.

- Conduct a review of the vendor or contractor managed Transient Cyber Asset to determine whether the security patch level of the device is adequate to mitigate the risk of security vulnerabilities before connecting the Transient Cyber Asset to an applicable system.
- Conduct a review of the vendor or contractor security patching process. This can be done either at the time of contracting but no later than prior to connecting the Transient Cyber Asset to an applicable system. Just as with reviewing the security patch level of the device, selecting to use this approach aims to ensure that the Responsible Entity has mitigated the risk of security vulnerabilities to applicable systems.
- Conduct a review of other processes that the vendor or contactor uses to mitigate the risk of security vulnerabilities. This can be reviewing system hardening, application whitelisting, virtual machines, etc.
- When selecting to use other methods to mitigate security vulnerabilities to those listed, entities need to have documentation that identifies how the other method(s) meet mitigation of the risk of security vulnerabilities

Element 2.2: Entities are to document and implement their process(es) to mitigate malicious code through the use of one or more of the protective measures listed.

- Review the use of antivirus software and signature or pattern levels to ensure that the level is adequate to the Responsible Entity to mitigate the risk of malicious software being introduced to an applicable system.
- Review the antivirus or endpoint security processes of the vendor or contactor to ensure that their processes are adequate to the Responsible Entity to reduce the risk of introducing malicious software to an applicable system.

[1] http://www.energy.gov/oe/downloads/cybersecurity-procurement-language-energy-delivery-april-2014

- Review the use of application whitelisting used by the vendor or contractor to reduce the risk of introducing malicious software to an applicable system.
- Review the use of live operating systems or software executable only from read-only media to ensure that the media is free from malicious software itself. Entities should review the processes to build the read-only media as well as the media itself.
- Review system hardening practices used by the vendor or contractor to ensure that unnecessary ports, services, applications, etc have been disabled or removed. This will limit the chance of introducing malicious software to an applicable system.

Element 2.3: Determine whether additional mitigation actions are necessary, and implement such actions prior to connecting the vendor or contractor owned Transient Cyber Asset. The intent of this element is to ensure that after conducting the selected review from elements 2.1 and 2.2, if there are deficiencies that do not meet the Responsible Entities security posture, the vendor or contractor is required to complete the mitigations prior to connecting their devices to an applicable system.

Requirement 4 Attachment 1 Removable Media

Entities have a high level of control for Removable Media that are going to be connected to their BES Cyber Assets.

Element 3.1: Entities are to document and implement their process(es) to authorize the use of Removable Media. The Removable Media may be listed individually or by type.

- Document the user(s), individually or by group/role, allowed to use the Removable Media. This can be done by listing a specific person, department, or job function. These user(s) must have authorized electronic access to the applicable system in accordance with CIP-004.
- Locations where the Removable Media may be used. This can be done by listing a specific location or a group/role of locations.

Element 3.2: Entities are to document and implement their process(es) to mitigate malicious code through the use of scanning the Removable Media before it is connected to a BES Cyber Asset. The scanning is expected to occur from a system that is not part of the BES Cyber System to reduce the risk of propagating malicious code into the BES Cyber System network or onto one of the BES Cyber Assets. If malicious code is discovered, it must be removed or mitigated to prevent it from being introduced into the BES Cyber Asset or BES Cyber System. Entities should also consider whether the detected malicious code is a Cyber Security Incident.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Note: The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X standards were redlined to the industry-approved version 5 language for ease of reading revisions.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives

Description of Current Draft

This draft standard is being posted for an additional comment and ballot to ballot the removal of "identify, assess, and correct" language. The draft includes modifications to meet the FERC Order No. 791 directive to remove or modify the "identify, assess, and correct" language from CIP-003.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period	September 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5.	
X	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-X

3. Purpose: To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-003-X:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Dates:

Reliability Standard CIP-003-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-X, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-X.

6. Background:

Standard CIP-003 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures provide examples of evidence to show documentation and implementation of the requirement. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an “or,” and numbered items are items that are linked with an “and.”

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

B. Requirements and Measures

Rationale for Requirement R1:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements.

Annual review and approval of the cyber security policy ensures that the policy is kept-up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

R1. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems, shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

- **1.1** Personnel & training (CIP-004);
- **1.2** Electronic Security Perimeters (CIP-005) including Interactive Remote Access;
- **1.3** Physical security of BES Cyber Systems (CIP-006);
- **1.4** System security management (CIP-007);
- **1.5** Incident reporting and response planning (CIP-008);
- **1.6** Recovery plans for BES Cyber Systems (CIP-009);
- **1.7** Configuration change management and vulnerability assessments (CIP-010);
- **1.8** Information protection (CIP-011); and
- **1.9** Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

Rationale for Requirement R2:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to low impact BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements.

The language in Requirement R2, Part 2.3 ". . . for external routable protocol connections and Dial-up Connectivity . . ." was included to acknowledge the support given in FERC Order No. 761, paragraph 87, for electronic security perimeter protections "of some form" to be applied to all BES Cyber Systems, regardless of impact. Part 2.3 uses the phrase "external routable protocol connections" instead of the defined term "External Routable Connectivity," because the latter term has very specific connotations relating to Electronic Security Perimeters and high and medium impact BES Cyber Systems. Using the glossary term "External Routable Connectivity" in the context of Requirement R2 would not be appropriate because Requirement R2 is limited in scope to low impact BES Cyber Systems.

R2. Each Responsible Entity for its assets identified in CIP-002-5, Requirement R1, Part R1.3, shall implement one or more documented cyber security policies that collectively address the following topics, and review and obtain CIP Senior Manager approval for those policies at least once every 15 calendar months: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- **2.1** Cyber security awareness;
- **2.2** Physical security controls;
- **2.3** Electronic access controls for external routable protocol connections and Dial-up Connectivity; and
- **2.4** Incident response to a Cyber Security Incident.

An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required.

M2. Examples of evidence may include, but are not limited to, one or more documented cyber security policies and evidence of processes, procedures, or plans that demonstrate the implementation of the required topics; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

Rationale for Requirement R3:

The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the *Glossary of Terms used in NERC Reliability Standards* so that it may be used across the body of CIP standards without an explicit cross-reference.

FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the senior manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent basis.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

Rationale for Requirement R4:

The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.

In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.

R4. The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These

delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section “4. Applicability” of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section “4.1. Functional Entities” is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section “4.2. Facilities” defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term “Facilities” already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The number of policies and their specific language are guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. The cyber security policy must cover in sufficient detail the nine topical areas required by CIP-003-X, Requirement R1. The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-X, Requirement R1. Implementation of the cyber security policy is not specifically included in CIP-003-X, Requirement R1 as it is envisioned that the implementation of this policy is evidenced through successful implementation of CIP-004 through CIP-011. However, Responsible Entities are encouraged not to limit the scope of their cyber security policies to only those requirements from CIP-004 through CIP-011, but rather to put together a holistic cyber security policy appropriate to its organization. The assessment through the Compliance Monitoring and Enforcement Program of policy items that extend beyond the scope of CIP-004 through CIP-011 should not be considered candidates for potential violations. The Responsible Entity should consider the following for each of the required topics in its cyber security policy:

1.1 Personnel & training (CIP-004)

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account management

1.2 Electronic Security Perimeters (CIP-005) including Interactive Remote Access

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points
- Maintaining up-to-date anti-malware software before initiating Interactive Remote Access
- Maintaining up-to-date patch levels for operating systems and applications used to initiate Interactive Remote Access
- Disabling VPN “split-tunneling” or “dual-homed” workstations before initiating Interactive Remote Access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity’s Interactive Remote Access controls

1.3 Physical security of BES Cyber Systems (CIP-006)

- Strategy for protecting Cyber Assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress

1.4 System security management (CIP-007)

- Strategies for system hardening
- Acceptable methods of authentication and access control
- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

1.5 Incident reporting and response planning (CIP-008)

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

1.6 Recovery plans for BES Cyber Systems (CIP-009)

- Availability of spare components

- Availability of system backups

1.7 Configuration change management and vulnerability assessments (CIP-010)

- Initiation of change requests
- Approval of changes
- Break-fix processes

1.8 Information protection (CIP-011)

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

1.9 Declaring and responding to CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

The Standard Drafting Team (SDT) has removed requirements relating to exceptions to a Responsible Entity's security policies since it is a general management issue that is not within the scope of a reliability requirement. The SDT considers it to be an internal policy requirement and not a reliability requirement. However, the SDT encourages Responsible Entities to continue this practice as a component of its cyber security policy.

In this and all subsequent required approvals in the NERC CIP Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R2:

As with Requirement R1, the number of policies and their specific language would be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization or as components of specific programs. The cyber security policy must cover in sufficient detail the four topical areas required by CIP-003-X, Requirement R2. The Responsible Entity has flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-X, Requirement R2. The intent of the requirement is to outline a set of basic protections that all low impact BES Cyber Systems should receive without requiring a significant administrative and compliance overhead. The SDT intends that demonstration of this requirement can be reasonably accomplished through providing evidence of related processes, procedures, or plans. While the audit staff may choose to review an example low impact BES Cyber System, the SDT believes strongly that the current method (as of this writing) of reviewing a statistical sample of systems is not

necessary. The SDT also notes that in topic 2.3, the SDT uses the term "electronic access control" in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing.

Requirement R3:

The intent of CIP-003-X, Requirement R3 is effectively unchanged since prior versions of the standard. The specific description of the CIP Senior Manager has now been included as a defined term rather than clarified in the Standard itself to prevent any unnecessary cross-reference to this standard. It is expected that this CIP Senior Manager play a key role in ensuring proper strategic planning, executive/board-level awareness, and overall program governance.

Requirement R4:

As indicated in the rationale for CIP-003-X, Requirement R4, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the SDT was not to impose any particular organizational structure, but, rather, the Responsible Entity should have significant flexibility to adapt this requirement to their existing organizational structure. A Responsible Entity may satisfy this requirement through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to its organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records provides a clear line of authority back to the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

The Responsible Entity must keep its documentation of the CIP Senior Manager and any delegations up to date. This is to ensure that individuals do not assume any undocumented authority. However, delegations do not have to be re-instated if the individual who delegated the task changes roles or is replaced. For instance, assume that John Doe is named the CIP Senior Manager and he delegates a specific task to the Substation Maintenance Manager. If John Doe is replaced as the CIP Senior Manager, the CIP Senior Manager documentation must be updated within the specified timeframe, but the existing delegation to the Substation Maintenance Manager remains in effect as approved by the previous CIP Senior Manager, John Doe.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Note: The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X standards were redlined to the industry-approved version 5 language for ease of reading revisions.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. ~~2.~~ First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives

Description of Current Draft

This draft standard is being posted for an additional ~~initial~~ comment and ballot to ballot the removal of "identify, assess, and correct" language. The draft includes modifications to meet the ~~directives of~~ FERC Order No. 791 directive to remove or modify the "identify, assess, and correct" language from CIP-003.

Anticipated Actions	Anticipated Date
~~First 45-Day Comment Period Opens~~	~~June 2014~~
Additional 45-Day Comment Period ~~(if necessary)~~	~~August~~ September 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5.	
X	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-~~5~~X

3. Purpose: To specify consistent and sustainable security management controls that establish responsibility and accountability to protect BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-003-~~5~~X:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Dates:

Reliability Standard CIP-003-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with Reliability Standard CIP-003-X, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-X.

6. Background:

Standard CIP-003~~-5~~ exists as part of a suite of CIP Standards related to cyber security, which ~~-CIP-002-5.1~~ require~~s~~ the initial identification and categorization of BES Cyber Systems~~-CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1~~ and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.~~ This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement~~**~~, in a manner that identifies, assesses, and corrects deficiencies, . . .~~**

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~ its documented processes,

but ~~they~~ it must address the applicable requirements. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures provide examples of evidence to show documentation and implementation of the requirement. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

B. Requirements and Measures

Rationale for Requirement R1:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements.

Annual review and approval of the cyber security policy ensures that the policy is kept-up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

R1. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems, shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

- **1.1** Personnel & training (CIP-004);
- **1.2** Electronic Security Perimeters (CIP-005) including Interactive Remote Access;
- **1.3** Physical security of BES Cyber Systems (CIP-006);
- **1.4** System security management (CIP-007);
- **1.5** Incident reporting and response planning (CIP-008);
- **1.6** Recovery plans for BES Cyber Systems (CIP-009);
- **1.7** Configuration change management and vulnerability assessments (CIP-010);
- **1.8** Information protection (CIP-011); and
- **1.9** Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

Rationale for Requirement R2:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to ~~its~~ low impact BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements.

The language in Requirement R2, Part 2.3 ". . . for external routable protocol connections and Dial-up Connectivity . . ." was included to acknowledge the support given in FERC Order No. 761, paragraph 87, for electronic security perimeter protections "of some form" to be applied to all BES Cyber Systems, regardless of impact. Part 2.3 uses the phrase "external routable protocol connections" instead of the defined term "External Routable Connectivity," because the latter term has very specific connotations relating to Electronic Security Perimeters and high and medium impact BES Cyber Systems. Using the glossary term "External Routable Connectivity" in the context of Requirement R2 would not be appropriate because Requirement R2 is limited in scope to low impact BES Cyber Systems.

R2. Each Responsible Entity for its assets identified in CIP-002-5, Requirement R1, Part R1.3, shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented cyber security policies that collectively address the following topics, and review and obtain CIP Senior Manager approval for those policies at least once every 15 calendar months: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- **2.1** Cyber security awareness;
- **2.2** Physical security controls;
- **2.3** Electronic access controls for external routable protocol connections and Dial-up Connectivity; and
- **2.4** Incident response to a Cyber Security Incident.

An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required.

M2. Examples of evidence may include, but are not limited to, one or more documented cyber security policies and evidence of processes, procedures, or plans that demonstrate the implementation of the required topics; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

Rationale for Requirement R3:

The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the *Glossary of Terms used in NERC Reliability Standards* so that it may be used across the body of CIP standards without an explicit cross-reference.

FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the senior manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent basis.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

Rationale for Requirement R4:

The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.

In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.

R4. The Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The number of policies and their specific language are guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. The cyber security policy must cover in sufficient detail the nine topical areas required by CIP-003-~~5~~X, Requirement R1. The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-~~5~~X, Requirement R1. Implementation of the cyber security policy is not specifically included in CIP-003-~~5~~X, Requirement R1 as it is envisioned that the implementation of this policy is evidenced through successful implementation of CIP-004 through CIP-011. However, Responsible Entities are encouraged not to limit the scope of their cyber security policies to only those requirements from CIP-004 through CIP-011, but rather to put together a holistic cyber security policy appropriate to its organization. The assessment through the Compliance Monitoring and Enforcement Program of policy items that extend beyond the scope of CIP-004 through CIP-011 should not be considered candidates for potential violations. The Responsible Entity should consider the following for each of the required topics in its cyber security policy:

1.1 Personnel & training (CIP-004)

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account management

1.2 Electronic Security Perimeters (CIP-005) including Interactive Remote Access

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points
- Maintaining up-to-date anti-malware software before initiating Interactive Remote Access
- Maintaining up-to-date patch levels for operating systems and applications used to initiate Interactive Remote Access
- Disabling VPN "split-tunneling" or "dual-homed" workstations before initiating Interactive Remote Access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity's Interactive Remote Access controls

1.3 Physical security of BES Cyber Systems (CIP-006)

- Strategy for protecting Cyber Assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress

1.4 System security management (CIP-007)

- Strategies for system hardening
- Acceptable methods of authentication and access control
- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

1.5 Incident reporting and response planning (CIP-008)

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

1.6 Recovery plans for BES Cyber Systems (CIP-009)

- Availability of spare components

- Availability of system backups

1.7 Configuration change management and vulnerability assessments (CIP-010)

- Initiation of change requests
- Approval of changes
- Break-fix processes

1.8 Information protection (CIP-011)

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

1.9 Declaring and responding to CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

The Standard Drafting Team (SDT) has removed requirements relating to exceptions to a Responsible Entity's security policies since it is a general management issue that is not within the scope of a reliability requirement. The SDT considers it to be an internal policy requirement and not a reliability requirement. However, the SDT encourages Responsible Entities to continue this practice as a component of its cyber security policy.

In this and all subsequent required approvals in the NERC CIP Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R2:

As with Requirement R1, the number of policies and their specific language would be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization or as components of specific programs. The cyber security policy must cover in sufficient detail the four topical areas required by CIP-003-~~5~~X, Requirement R2. The Responsible Entity has flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-~~5~~X, Requirement R2. The intent of the requirement is to outline a set of basic protections that all low impact BES Cyber Systems should receive without requiring a significant administrative and compliance overhead. The SDT intends that demonstration of this requirement can be reasonably accomplished through providing evidence of related processes, procedures, or plans. While the audit staff may choose to review an example low impact BES Cyber System, the SDT believes strongly that the current method (as of this writing) of reviewing a statistical sample of systems

is not necessary. The SDT also notes that in topic 2.3, the SDT uses the term "electronic access control" in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing.

Requirement R3:

The intent of CIP-003-~~5~~X, Requirement R3 is effectively unchanged since prior versions of the standard. The specific description of the CIP Senior Manager has now been included as a defined term rather than clarified in the Standard itself to prevent any unnecessary cross-reference to this standard. It is expected that this CIP Senior Manager play a key role in ensuring proper strategic planning, executive/board-level awareness, and overall program governance.

Requirement R4:

As indicated in the rationale for CIP-003-~~5~~X, Requirement R4, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the SDT was not to impose any particular organizational structure, but, rather, the Responsible Entity should have significant flexibility to adapt this requirement to their existing organizational structure. A Responsible Entity may satisfy this requirement through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to its organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records provides a clear line of authority back to the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

The Responsible Entity must keep its documentation of the CIP Senior Manager and any delegations up to date. This is to ensure that individuals do not assume any undocumented authority. However, delegations do not have to be re-instated if the individual who delegated the task changes roles or is replaced. For instance, assume that John Doe is named the CIP Senior Manager and he delegates a specific task to the Substation Maintenance Manager. If John Doe is replaced as the CIP Senior Manager, the CIP Senior Manager documentation must be updated within the specified timeframe, but the existing delegation to the Substation Maintenance Manager remains in effect as approved by the previous CIP Senior Manager, John Doe.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Note: The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X standards were redlined to the industry-approved version 5 language for ease of reading revisions.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives

Description of Current Draft

This draft standard is being posted for an additional comment and ballot to ballot the removal of "identify, assess, and correct" language. The draft includes modifications to meet FERC Order No. 791 directive to remove or modify the "identify, assess, and correct" language from CIP-004.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period	September 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-004-5.	
X	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Personnel & Training

2. Number: CIP-004-X

3. Purpose: To minimize the risk against compromise that could lead to misoperation or instability in the BES from individuals accessing BES Cyber Systems by requiring an appropriate level of personnel risk assessment, training, and security awareness in support of protecting BES Cyber Systems.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1. Balancing Authority

4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2. Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3. Generator Operator

4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-X:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-004-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-004 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.

- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

Rationale for Requirement R1:

Ensures that Responsible Entities with personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Assets take action so that those personnel with such authorized electronic or authorized unescorted physical access maintain awareness of the Responsible Entity's security practices.

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-X Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-X Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-X Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or • indirect communications (for

CIP-004-X Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
			example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

Rationale for Requirement R2:

To ensure that the Responsible Entity's training program for personnel who need authorized electronic access and/or authorized unescorted physical access to BES Cyber Systems covers the proper policies, access controls, and procedures to protect BES Cyber Systems and are trained before access is authorized.

R2. Each Responsible Entity shall implement one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-X Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-X Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-X Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for BES Cyber Systems; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with other Cyber Assets.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-X Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to applicable Cyber Assets, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 at least once every 15 calendar months.	Examples of evidence may include, but are not limited to, dated individual training records.

Rationale for Requirement R3:

To ensure that individuals who need authorized electronic or authorized unescorted physical access to BES Cyber Systems have been assessed for risk. Whether initial access or maintaining access, those with access must have had a personnel risk assessment completed within the last 7 years.

R3. Each Responsible Entity shall implement one or more documented personnel risk assessment program(s) to attain and retain authorized electronic or authorized unescorted physical access to BES Cyber Systems that collectively include each of the applicable requirement parts in *CIP-004-X Table R3 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M3. Evidence must include the documented personnel risk assessment programs that collectively include each of the applicable requirement parts in *CIP-004-X Table R3 – Personnel Risk Assessment Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-X Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to confirm identity.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to confirm identity.

CIP-004-X Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to perform a seven year criminal history records check as part of each personnel risk assessment that includes: 3.2.1. current residence, regardless of duration; and 3.2.2. other locations where, during the seven years immediately prior to the date of the criminal history records check, the subject has resided for six consecutive months or more. If it is not possible to perform a full seven year criminal history records check, conduct as much of the seven year criminal history records check as possible and document the reason the full seven year criminal history records check could not be performed.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to perform a seven year criminal history records check.

CIP-004-X Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process to evaluate criminal history records checks for authorizing access.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to evaluate criminal history records checks.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process for verifying that personnel risk assessments performed for contractors or service vendors are conducted according to Parts 3.1 through 3.3.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's criteria or process for verifying contractors or service vendors personnel risk assessments.

CIP-004-X Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 to 3.4 within the last seven years.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

Rationale for Requirement R4:

To ensure that individuals with access to BES Cyber Systems and the physical and electronic locations where BES Cyber System Information is stored by the Responsible Entity have been properly authorized for such access. "Authorization" should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants and included in the delegations referenced in CIP-003-X. "Provisioning" should be considered the actions to provide access to an individual.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e., physical access control system, remote access system, directory services).

CIP Exceptional Circumstances are defined in a Responsible Entity's policy from CIP-003-X and allow an exception to the requirement for authorization to BES Cyber Systems and BES Cyber System Information.

Quarterly reviews in Part 4.5 are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to access the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that the error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

R4. Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in *CIP-004-X Table R4 – Access Management Program. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-X Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-X Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; 4.1.2. Unescorted physical access into a Physical Security Perimeter; and 4.1.3. Access to designated storage locations, whether physical or electronic, for BES Cyber System Information.	An example of evidence may include, but is not limited to, dated documentation of the process to authorize electronic access, unescorted physical access in a Physical Security Perimeter, and access to designated storage locations, whether physical or electronic, for BES Cyber System Information.

CIP-004-X Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or • Dated documentation of the verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).

CIP-004-X Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	An example of evidence may include, but is not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

CIP-004-X Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once every 15 calendar months that access to the designated storage locations for BES Cyber System Information, whether physical or electronic, are correct and are those that the Responsible Entity determines are necessary for performing assigned work functions.	An example of evidence may include, but is not limited to, the documentation of the review that includes all of the following: 1. A dated listing of authorizations for BES Cyber System information; 2. Any privileges associated with the authorizations; and 3. Dated evidence showing a verification of the authorizations and any privileges were confirmed correct and the minimum necessary for performing assigned work functions.

Rationale for Requirement R5:

The timely revocation of electronic access to BES Cyber Systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform his or her assigned functions, that access should be revoked. This is of particular importance in situations where a change of assignment or employment is involuntary, as there is a risk the individual(s) involved will react in a hostile or destructive manner.

In considering how to address directives in FERC Order No. 706 directing "immediate" revocation of access for involuntary separation, the SDT chose not to specify hourly time parameters in the requirement (e.g., revoking access within 1 hour). The point in time at which an organization terminates a person cannot generally be determined down to the hour. However, most organizations have formal termination processes, and the timeliest revocation of access occurs in concurrence with the initial processes of termination.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (e.g., physical access control system, remote access system, directory services).

R5. Each Responsible Entity shall implement one or more documented access revocation program(s) that collectively include each of the applicable requirement parts in *CIP-004-X Table R5 – Access Revocation*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-X Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-X Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	A process to initiate removal of an individual's ability for unescorted physical access and Interactive Remote Access upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.

CIP-004-X Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For reassignments or transfers, revoke the individual's authorized electronic access to individual accounts and authorized unescorted physical access that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible Entity determines is not necessary.

CIP-004-X Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For termination actions, revoke the individual's access to the designated storage locations for BES Cyber System Information, whether physical or electronic (unless already revoked according to Requirement R5.1), by the end of the next calendar day following the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form verifying access removal to designated physical areas or cyber systems containing BES Cyber System Information associated with the terminations and dated within the next calendar day of the termination action.

CIP-004-X Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Parts 5.1 or 5.3) within 30 calendar days of the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.

CIP-004-X Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.5	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: • Workflow or sign-off form showing password reset within 30 calendar days of the termination; • Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or • Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-X)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Lower**	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so between 10 and 30 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so within the subsequent quarter but beyond 30 calendar days after the start of that calendar quarter. (1.1)	The Responsible Entity did not document or implement any security awareness process(es) to reinforce cyber security practices. (R1) OR The Responsible Entity did not reinforce cyber security practices and associated physical security practices for at least two consecutive calendar quarters. (1.1)
R2	**Operations Planning**	**Lower**	The Responsible Entity implemented a cyber security training program but failed to include one of the training	The Responsible Entity implemented a cyber security training program but failed to include two of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR	The Responsible Entity implemented a cyber security training program but failed to include three of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR	The Responsible Entity did not implement a cyber security training program appropriate to individual roles, functions, or responsibilities. (R2) OR The Responsible Entity

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-X)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR The Responsible Entity implemented a cyber security training program but failed to train one individual (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (2.2)	The Responsible Entity implemented a cyber security training program but failed to train two individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (2.2) OR The Responsible Entity implemented a cyber security training program but failed to train two individuals with authorized electronic or authorized unescorted physical access within 15 calendar months of the previous training completion date. (2.3)	The Responsible Entity implemented a cyber security training program but failed to train three individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (2.2) OR The Responsible Entity implemented a cyber security training program but failed to train three individuals with authorized electronic or authorized unescorted physical access within 15 calendar months of the previous training completion date. (2.3)	implemented a cyber security training program but failed to include four or more of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR The Responsible Entity implemented a cyber security training program but failed to train four or more individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (2.2) OR The Responsible Entity implemented a cyber security training

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The security awareness program is intended to be an informational program, not a formal training program. It should reinforce security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show that each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Examples of possible mechanisms and evidence, when dated, which can be used are:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

Requirement R2:

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the required items appropriate to personnel roles and responsibilities from Table R2. The Responsible Entity has the flexibility to define the training program and it may consist of multiple modules and multiple delivery mechanisms, but

a single training program for all individuals needing to be trained is acceptable. The training can focus on functions, roles or responsibilities at the discretion of the Responsible Entity.

One new element in the training content is intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems as per FERC Order No. 706, Paragraph 434. This is not intended to provide technical training to individuals supporting networking hardware and software, but educating system users of the cyber security risks associated with the interconnectedness of these systems. The users, based on their function, role, or responsibility, should have a basic understanding of which systems can be accessed from other systems and how the actions they take can affect cyber security.

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for CIP Exceptional Circumstances. To retain the authorized accesses, individuals must complete the training at least one every 15 months.

Requirement R3:

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response. Identity should be confirmed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. Identity only needs to be confirmed prior to initially granting access and only requires periodic confirmation according to the entity's process during the tenure of employment, which may or may not be the same as the initial verification action.

A seven year criminal history check should be performed for those locations where the individual has resided for at least six consecutive months. This check should also be performed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven-year check could not be performed. Examples of this could include individuals under the age of 25 where a juvenile criminal history may be protected by law, individuals who may have resided in locations from where it is not possible to obtain a criminal history records check, violates the law or is not allowed under the existing collective bargaining agreement. The Responsible Entity should consider the absence of information for the full seven years when assessing the risk of granting access during the process to evaluate the criminal history check. There needs to be a personnel risk assessment that has been completed within the last seven years for each individual with access. A new criminal history records check must be performed as part of the new PRA. Individuals who have been granted access under a previous version of these standards need a new PRA within seven years of the date of their last

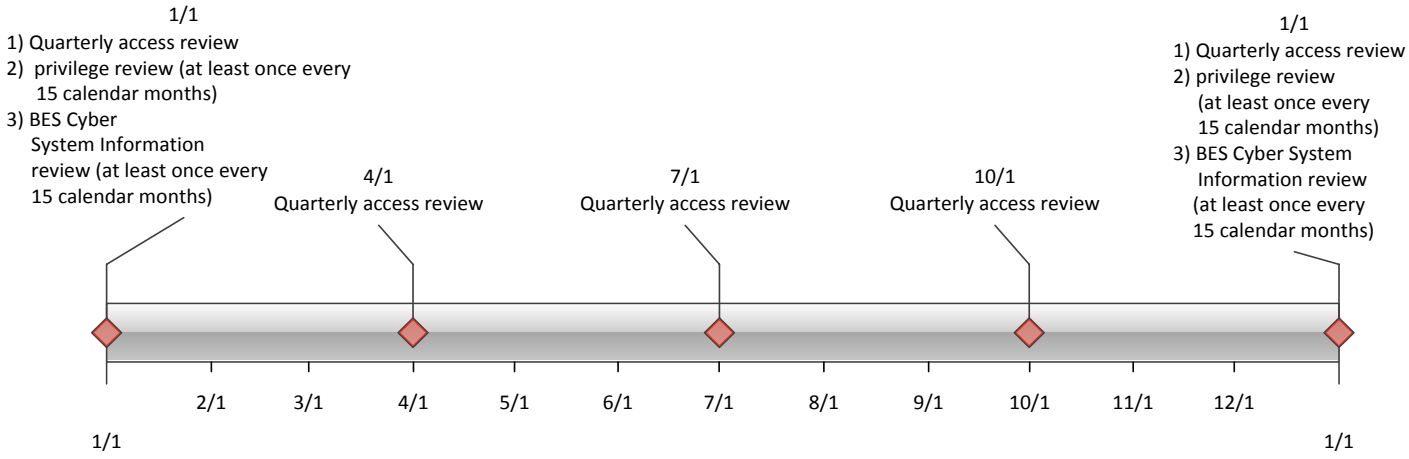
PRA. The clarifications around the seven year criminal history check in this version do not require a new PRA be performed by the implementation date.

Requirement R4:

Authorization for electronic and unescorted physical access and access to BES Cyber System Information must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included. To ensure proper segregation of duties, access authorization and provisioning should not be performed by the same person where possible.

This requirement specifies both quarterly reviews and reviews at least once every 15 calendar months. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

The privilege review at least once every 15 calendar months is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function (i.e., least privilege). Entities can more efficiently perform this review by implementing role-based access. This involves determining the specific roles on the system (e.g., system operator, technician, report viewer, administrator, etc.) then grouping access privileges to the role and assigning users to the role. Role-based access does not assume any specific software and can be implemented by defining specific provisioning processes for each role where access group assignments cannot be performed. Role-based access permissions eliminate the need to



perform the privilege review on individual accounts. An example timeline of all the reviews in Requirement R4 is included below.

Separation of duties should be considered when performing the reviews in Requirement R4. The person reviewing should be different than the person provisioning access.

If the results of quarterly or at least once every 15 calendar months account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that this error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R5:

The requirement to revoke access at the time of the termination action includes procedures showing revocation of access concurrent with the termination action. This requirement recognizes that the timing of the termination action may vary depending on the circumstance. Some common scenarios and possible processes on when the termination action occurs are provided in the following table. These scenarios are not an exhaustive list of all scenarios, but are representative of several routine business practices.

Scenario	Possible Process
Immediate involuntary termination	Human resources or corporate security escorts the individual off site and the supervisor or human resources personnel notify the appropriate personnel to begin the revocation process.
Scheduled involuntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Voluntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Retirement where the last working day is several weeks prior to the termination date	Human resources personnel coordinate with manager to determine the final date access is no longer needed and schedule the revocation of access on the determined day.
Death	Human resources personnel are notified of the death and work with appropriate personnel to begin the revocation process.

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to or known by the individual(s) whose access privileges are being revoked. Steps taken to accomplish this outcome may include deletion or deactivation of accounts used by the

individual(s), but no specific actions are prescribed. Entities should consider the ramifications of deleting an account may include incomplete event log entries due to an unrecognized account or system services using the account to log on.

The initial revocation required in Requirement R5.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts (i.e., accounts on the Cyber Asset itself) on BES Cyber Assets, then the Responsible Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents a Responsible Entity from performing all of the access revocation at the time of termination.

For transferred or reassigned individuals, a review of access privileges should be performed. This review could entail a simple listing of all authorizations for an individual and working with the respective managers to determine which access will still be needed in the new position. For instances in which the individual still needs to retain access as part of a transitory period, the entity should schedule a time to review these access privileges or include the privileges in the quarterly account review or annual privilege review.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

Requirement 5.5 specified that passwords for shared account are to the changed within 30 calendar days of the termination action or when the Responsible Entity determines an individual no longer requires access to the account as a result of a reassignment or transfer. The 30 days applies under normal operating conditions. However, circumstances may occur where this is not possible. Some systems may require an outage or reboot of the system in order to complete the password change. In periods of extreme heat or cold, many Responsible Entities may prohibit system outages and reboots in order to maintain reliability of the BES. When these circumstances occur, the Responsible Entity must document these circumstances and prepare to change the password within 10 calendar days following the end of the operating circumstances. Records of activities must be retained to show that the Responsible Entity followed the plan they created.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Note: The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X standards were redlined to the industry-approved version 5 language for ease of reading revisions.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. ~~2.~~ First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives

Description of Current Draft

This draft standard is being posted for an additional~~initial~~ comment and ballot to ballot the removal of "identify, assess, and correct" language. The draft includes modifications to meet ~~the directives of~~ FERC Order No. 791 directive to remove or modify the "identify, assess, and correct" language from CIP-004.

Anticipated Actions	Anticipated Date
~~First 45-Day Comment Period Opens~~	~~June 2014~~
Additional 45-Day Comment Period ~~(if necessary)~~	~~August~~ September 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-004-5.	
X	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** Cyber Security — Personnel & Training

2. **Number:** CIP-004-~~5.1~~X

3. **Purpose:** To minimize the risk against compromise that could lead to misoperation or instability in the BES from individuals accessing BES Cyber Systems by requiring an appropriate level of personnel risk assessment, training, and security awareness in support of protecting BES Cyber Systems.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3. Generator Operator

   4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-~~5.1~~X:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-004-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-004~~-5.1~~ exists as part of a suite of CIP Standards related to cyber security, which~~.~~ ~~CIP-002-5~~ require~~s~~ the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1~~ and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards.*~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement, **in a manner that identifies, assesses, and corrects deficiencies, . . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~ its documented processes, but ~~they~~ it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements~~

~~described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.

- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

Rationale for Requirement R1:

Ensures that Responsible Entities with personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Assets take action so that those personnel with such authorized electronic or authorized unescorted physical access maintain awareness of the Responsible Entity's security practices.

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~X Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~X Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-~~5.1~~X Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or • indirect communications (for

CIP-004-~~5.1~~X Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
			example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

Rationale for Requirement R2:

To ensure that the Responsible Entity's training program for personnel who need authorized electronic access and/or authorized unescorted physical access to BES Cyber Systems covers the proper policies, access controls, and procedures to protect BES Cyber Systems and are trained before access is authorized.

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ ~~a~~ one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-~~5.1~~X Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-~~5.1~~X Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-~~5.1~~X Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for BES Cyber Systems; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with other Cyber Assets.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-~~5.1~~X Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to applicable Cyber Assets, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 at least once every 15 calendar months.	Examples of evidence may include, but are not limited to, dated individual training records.

Rationale for Requirement R3:

To ensure that individuals who need authorized electronic or authorized unescorted physical access to BES Cyber Systems have been assessed for risk. Whether initial access or maintaining access, those with access must have had a personnel risk assessment completed within the last 7 years.

R3. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented personnel risk assessment program(s) to attain and retain authorized electronic or authorized unescorted physical access to BES Cyber Systems that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~X Table R3 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M3. Evidence must include the documented personnel risk assessment programs that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~X Table R3 – Personnel Risk Assessment Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-~~5.1~~X Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to confirm identity.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to confirm identity.

CIP-004-~~5.1~~X Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to perform a seven year criminal history records check as part of each personnel risk assessment that includes: 3.2.1. current residence, regardless of duration; and 3.2.2. other locations where, during the seven years immediately prior to the date of the criminal history records check, the subject has resided for six consecutive months or more. If it is not possible to perform a full seven year criminal history records check, conduct as much of the seven year criminal history records check as possible and document the reason the full seven year criminal history records check could not be performed.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to perform a seven year criminal history records check.

CIP-004-~~5.1~~X Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process to evaluate criminal history records checks for authorizing access.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to evaluate criminal history records checks.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process for verifying that personnel risk assessments performed for contractors or service vendors are conducted according to Parts 3.1 through 3.3.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's criteria or process for verifying contractors or service vendors personnel risk assessments.

CIP-004-~~5.1~~X Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 to 3.4 within the last seven years.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

Rationale for Requirement R4:

To ensure that individuals with access to BES Cyber Systems and the physical and electronic locations where BES Cyber System Information is stored by the Responsible Entity have been properly authorized for such access. "Authorization" should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants and included in the delegations referenced in CIP-003-~~5~~X. "Provisioning" should be considered the actions to provide access to an individual.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e., physical access control system, remote access system, directory services).

CIP Exceptional Circumstances are defined in a Responsible Entity's policy from CIP-003-~~5~~ X and allow an exception to the requirement for authorization to BES Cyber Systems and BES Cyber System Information.

Quarterly reviews in Part 4.5 are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to access the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that the error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

R4. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented access management program(s) that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~X Table R4 – Access Management Program. [Violation Risk Factor: ~~Lower~~Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~X Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-~~5.1~~X Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; 4.1.2. Unescorted physical access into a Physical Security Perimeter; and 4.1.3. Access to designated storage locations, whether physical or electronic, for BES Cyber System Information.	An example of evidence may include, but is not limited to, dated documentation of the process to authorize electronic access, unescorted physical access in a Physical Security Perimeter, and access to designated storage locations, whether physical or electronic, for BES Cyber System Information.

CIP-004-~~5.1~~X Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or • Dated documentation of the verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).

CIP-004-~~5.1~~X Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	An example of evidence may include, but is not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

CIP-004-~~5.1~~X Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once every 15 calendar months that access to the designated storage locations for BES Cyber System Information, whether physical or electronic, are correct and are those that the Responsible Entity determines are necessary for performing assigned work functions.	An example of evidence may include, but is not limited to, the documentation of the review that includes all of the following: 1. A dated listing of authorizations for BES Cyber System information; 2. Any privileges associated with the authorizations; and 3. Dated evidence showing a verification of the authorizations and any privileges were confirmed correct and the minimum necessary for performing assigned work functions.

Rationale for Requirement R5:

The timely revocation of electronic access to BES Cyber Systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform his or her assigned functions, that access should be revoked. This is of particular importance in situations where a change of assignment or employment is involuntary, as there is a risk the individual(s) involved will react in a hostile or destructive manner.

In considering how to address directives in FERC Order No. 706 directing "immediate" revocation of access for involuntary separation, the SDT chose not to specify hourly time parameters in the requirement (e.g., revoking access within 1 hour). The point in time at which an organization terminates a person cannot generally be determined down to the hour. However, most organizations have formal termination processes, and the timeliest revocation of access occurs in concurrence with the initial processes of termination.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (e.g., physical access control system, remote access system, directory services).

R5. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented access revocation program(s) that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~X Table R5 – Access Revocation*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~X Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-~~5.1~~X Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	A process to initiate removal of an individual's ability for unescorted physical access and Interactive Remote Access upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.

CIP-004-~~5.1~~X Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For reassignments or transfers, revoke the individual's authorized electronic access to individual accounts and authorized unescorted physical access that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible Entity determines is not necessary.

CIP-004-~~5.1~~X Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For termination actions, revoke the individual's access to the designated storage locations for BES Cyber System Information, whether physical or electronic (unless already revoked according to Requirement R5.1), by the end of the next calendar day following the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form verifying access removal to designated physical areas or cyber systems containing BES Cyber System Information associated with the terminations and dated within the next calendar day of the termination action.

CIP-004-~~5.1~~X Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Parts 5.1 or 5.3) within 30 calendar days of the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.

CIP-004-~~5.1~~ X Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.5	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: • Workflow or sign-off form showing password reset within 30 calendar days of the termination; • Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or • Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-~~5~~ 1X)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Lower**	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so between 10 and 30 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so within the subsequent quarter but beyond 30 calendar days after the start of that calendar quarter. (1.1)	The Responsible Entity did not document or implement any security awareness process(es) to reinforce cyber security practices. (R1) OR The Responsible Entity did not reinforce cyber security practices and associated physical security practices for at least two consecutive calendar quarters. (1.1)

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The security awareness program is intended to be an informational program, not a formal training program. It should reinforce security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show that each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Examples of possible mechanisms and evidence, when dated, which can be used are:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

Requirement R2:

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the required items appropriate to personnel roles and responsibilities from Table R2. The Responsible Entity has the flexibility to define the training program and it may consist of multiple modules and multiple delivery mechanisms, but

a single training program for all individuals needing to be trained is acceptable. The training can focus on functions, roles or responsibilities at the discretion of the Responsible Entity.

One new element in the training content is intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems as per FERC Order No. 706, Paragraph 434. This is not intended to provide technical training to individuals supporting networking hardware and software, but educating system users of the cyber security risks associated with the interconnectedness of these systems. The users, based on their function, role, or responsibility, should have a basic understanding of which systems can be accessed from other systems and how the actions they take can affect cyber security.

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for CIP Exceptional Circumstances. To retain the authorized accesses, individuals must complete the training at least one every 15 months.

Requirement R3:

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response. Identity should be confirmed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. Identity only needs to be confirmed prior to initially granting access and only requires periodic confirmation according to the entity's process during the tenure of employment, which may or may not be the same as the initial verification action.

A seven year criminal history check should be performed for those locations where the individual has resided for at least six consecutive months. This check should also be performed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven-year check could not be performed. Examples of this could include individuals under the age of 25 where a juvenile criminal history may be protected by law, individuals who may have resided in locations from where it is not possible to obtain a criminal history records check, violates the law or is not allowed under the existing collective bargaining agreement. The Responsible Entity should consider the absence of information for the full seven years when assessing the risk of granting access during the process to evaluate the criminal history check. There needs to be a personnel risk assessment that has been completed within the last seven years for each individual with access. A new criminal history records check must be performed as part of the new PRA. Individuals who have been granted access under a previous version of these standards need a new PRA within seven years of the date of their last

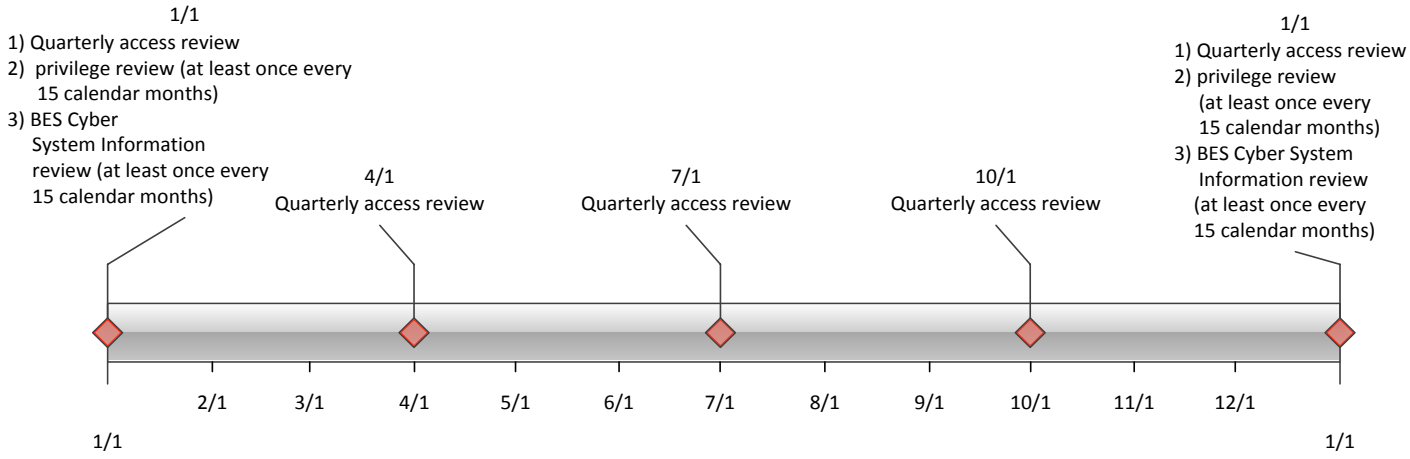
PRA. The clarifications around the seven year criminal history check in this version do not require a new PRA be performed by the implementation date.

Requirement R4:

Authorization for electronic and unescorted physical access and access to BES Cyber System Information must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included. To ensure proper segregation of duties, access authorization and provisioning should not be performed by the same person where possible.

This requirement specifies both quarterly reviews and reviews at least once every 15 calendar months. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

The privilege review at least once every 15 calendar months is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function (i.e., least privilege). Entities can more efficiently perform this review by implementing role-based access. This involves determining the specific roles on the system (e.g., system operator, technician, report viewer, administrator, etc.) then grouping access privileges to the role and assigning users to the role. Role-based access does not assume any specific software and can be implemented by defining specific provisioning processes for each role where access group assignments cannot be performed. Role-based access permissions eliminate the need to



perform the privilege review on individual accounts. An example timeline of all the reviews in Requirement R4 is included below.

Separation of duties should be considered when performing the reviews in Requirement R4. The person reviewing should be different than the person provisioning access.

If the results of quarterly or at least once every 15 calendar months account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that this error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R5:

The requirement to revoke access at the time of the termination action includes procedures showing revocation of access concurrent with the termination action. This requirement recognizes that the timing of the termination action may vary depending on the circumstance. Some common scenarios and possible processes on when the termination action occurs are provided in the following table. These scenarios are not an exhaustive list of all scenarios, but are representative of several routine business practices.

Scenario	Possible Process
Immediate involuntary termination	Human resources or corporate security escorts the individual off site and the supervisor or human resources personnel notify the appropriate personnel to begin the revocation process.
Scheduled involuntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Voluntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Retirement where the last working day is several weeks prior to the termination date	Human resources personnel coordinate with manager to determine the final date access is no longer needed and schedule the revocation of access on the determined day.
Death	Human resources personnel are notified of the death and work with appropriate personnel to begin the revocation process.

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to or known by the individual(s) whose access privileges are being revoked. Steps taken to accomplish this outcome may include deletion or deactivation of accounts used by the

individual(s), but no specific actions are prescribed. Entities should consider the ramifications of deleting an account may include incomplete event log entries due to an unrecognized account or system services using the account to log on.

The initial revocation required in Requirement R5.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts (i.e., accounts on the Cyber Asset itself) on BES Cyber Assets, then the Responsible Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents a Responsible Entity from performing all of the access revocation at the time of termination.

For transferred or reassigned individuals, a review of access privileges should be performed. This review could entail a simple listing of all authorizations for an individual and working with the respective managers to determine which access will still be needed in the new position. For instances in which the individual still needs to retain access as part of a transitory period, the entity should schedule a time to review these access privileges or include the privileges in the quarterly account review or annual privilege review.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

Requirement 5.5 specified that passwords for shared account are to the changed within 30 calendar days of the termination action or when the Responsible Entity determines an individual no longer requires access to the account as a result of a reassignment or transfer. The 30 days applies under normal operating conditions. However, circumstances may occur where this is not possible. Some systems may require an outage or reboot of the system in order to complete the password change. In periods of extreme heat or cold, many Responsible Entities may prohibit system outages and reboots in order to maintain reliability of the BES. When these circumstances occur, the Responsible Entity must document these circumstances and prepare to change the password within 10 calendar days following the end of the operating circumstances. Records of activities must be retained to show that the Responsible Entity followed the plan they created.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Note: The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X standards were redlined to the industry-approved version 5 language for ease of reading revisions.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives

Description of Current Draft

This draft standard is being posted for an additional comment and ballot to ballot the removal of "identify, assess, and correct" language. The draft includes modifications to meet the FERC Order No. 791 directive to remove or modify the "identify, assess, and correct" language from CIP-007.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period	September 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-007-5.	
X	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — System Security Management

2. Number: CIP-007-X

3. Purpose: To manage system security by specifying select technical, operational, and procedural requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-007-X:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-007-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with the elements of Reliability Standard CIP-007-X, Requirement R1, Part 1.2 that apply to PCAs and nonprogrammable communication components located inside a PSP and inside an ESP and associated with High and Medium Impact BES Cyber Systems until nine calendar months after the effective date of Reliability Standard CIP-007-X.

6. Background:

Standard CIP-007 exists as part of a suite of CIP Standards related to cyber security, which requires the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System in the applicability column. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The requirement is intended to minimize the attack surface of BES Cyber Systems through disabling or limiting access to unnecessary network accessible logical ports and services and physical I/O ports.

In response to FERC Order No. 791, specifically FERC's reference to NIST 800-53 rev. 3 security control PE-4 in paragraph 149, Part 1.2 has been expanded to include PCAs and nonprogrammable communications components. This increase in applicability expands the scope of devices that receive the protection afforded by the defense-in-depth control included in Requirement R1, Part 1.2.

The applicability is limited to those nonprogrammable communications components located both inside a PSP and an ESP in order to allow for a scenario in which a Responsible Entity may implement an extended ESP (with corresponding logical protections identified in CIP-006, Requirement R1, Part 1.10). In this scenario, nonprogrammable components of the communication network may exist out of the Responsible Entity's control (i.e. as part of the telecommunication carrier's network).

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-X Table R1 – Ports and Services*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M1. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-007-X Table R1 – Ports and Services* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-X Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.	Examples of evidence may include, but are not limited to: • Documentation of the need for all enabled ports on all applicable Cyber Assets and Electronic Access Points, individually or by group. • Listings of the listening ports on the Cyber Assets, individually or by group, from either the device configuration files, command output (such as netstat), or network scans of open ports; or • Configuration files of host-based firewalls or other device level mechanisms that only allow needed ports and deny all others.

CIP-007-X Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP. Medium Impact BES Cyber Systems at Control Centers and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP.	Protect against the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media.	An example of evidence may include, but is not limited to, documentation showing types of protection of physical input/output ports, either logically through system configuration or physically using a port lock or signage.

Rationale for Requirement R2:

Security patch management is a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner to gain control of or render a BES Cyber Asset or BES Cyber System inoperable.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-X Table R2 – Security Patch Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-X Table R2 – Security Patch Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-X Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	A patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for applicable Cyber Assets that are updateable and for which a patching source exists.	An example of evidence may include, but is not limited to, documentation of a patch management process and documentation or lists of sources that are monitored, whether on an individual BES Cyber System or Cyber Asset basis.

CIP-007-X Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 35 calendar days, evaluate security patches for applicability that have been released since the last evaluation from the source or sources identified in Part 2.1.	An example of evidence may include, but is not limited to, an evaluation conducted by, referenced by, or on behalf of a Responsible Entity of security-related patches released by the documented sources at least once every 35 calendar days.

CIP-007-X Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For applicable patches identified in Part 2.2, within 35 calendar days of the evaluation completion, take one of the following actions: • Apply the applicable patches; or • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch and a timeframe to complete these mitigations.	Examples of evidence may include, but are not limited to: • Records of the installation of the patch (e.g., exports from automated patch management tools that provide installation date, verification of BES Cyber System Component software revision, or registry exports that show software has been installed); or • A dated plan showing when and how the vulnerability will be addressed, to include documentation of the actions to be taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch and a timeframe for the completion of these mitigations.

CIP-007-X Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For each mitigation plan created or revised in Part 2.3, implement the plan within the timeframe specified in the plan, unless a revision to the plan or an extension to the timeframe specified in Part 2.3 is approved by the CIP Senior Manager or delegate.	An example of evidence may include, but is not limited to, records of implementation of mitigations.

Rationale for Requirement R3:

Malicious code prevention has the purpose of limiting and detecting the addition of malicious code onto the applicable Cyber Assets of a BES Cyber System. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the availability or integrity of the BES Cyber System.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-X Table R3 – Malicious Code Prevention*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations].*

M3. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-X Table R3 – Malicious Code Prevention* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-X Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Deploy method(s) to deter, detect, or prevent malicious code.	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus, system hardening, policies, etc.).

CIP-007-X Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Mitigate the threat of detected malicious code.	Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For those methods identified in Part 3.1 that use signatures or patterns, have a process for the update of the signatures or patterns. The process must address testing and installing the signatures or patterns.	An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.

Rationale for Requirement R4:

Security event monitoring has the purpose of detecting unauthorized access, reconnaissance and other malicious activity on BES Cyber Systems, and comprises of the activities involved with the collection, processing, alerting and retention of security-related computer logs. These logs can provide both (1) the detection of an incident and (2) useful evidence in the investigation of an incident. The retention of security-related logs is intended to support post-event data analysis.

Audit processing failures are not penalized in this requirement. Instead, the requirement specifies processes which must be in place to monitor for and notify personnel of audit processing failures.

R4. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-X Table R4 – Security Event Monitoring*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Assessment.]*

M4. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-X Table R4 – Security Event Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-X Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	Examples of evidence may include, but are not limited to, a paper or system generated listing of event types for which the BES Cyber System is capable of detecting and, for generated events, is configured to log. This listing must include the required types of events.
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Generate alerts for security events that the Responsible Entity determines necessitates an alert, that includes, as a minimum, each of the following types of events (per Cyber Asset or BES Cyber System capability): 4.2.1. Detected malicious code from Part 4.1; and 4.2.2. Detected failure of Part 4.1 event logging.	Examples of evidence may include, but are not limited to, paper or system-generated listing of security events that the Responsible Entity determined necessitate alerts, including paper or system generated list showing how alerts are configured.

CIP-007-X Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, retain applicable event logs identified in Part 4.1 for at least the last 90 consecutive calendar days except under CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, documentation of the event log retention process and paper or system generated reports showing log retention configuration set at 90 days or greater.
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Review a summarization or sampling of logged events as determined by the Responsible Entity at intervals no greater than 15 calendar days to identify undetected Cyber Security Incidents.	Examples of evidence may include, but are not limited to, documentation describing the review, any findings from the review (if any), and dated documentation showing the review occurred.

Rationale for Requirement R5:

To help ensure that no authorized individual can gain electronic access to a BES Cyber System until the individual has been authenticated, i.e., until the individual's logon credentials have been validated. Requirement R5 also seeks to reduce the risk that static passwords, where used as authenticators, may be compromised.

Requirement Part 5.1 ensures the BES Cyber System or Cyber Asset authenticates individuals that can modify configuration information. This requirement addresses the configuration of authentication. The authorization of individuals is addressed elsewhere in the CIP Cyber Security Standards. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Requirement Part 5.2 addresses default and other generic account types. Identifying the use of default or generic account types that could introduce vulnerabilities has the benefit ensuring entities understand the possible risk these accounts pose to the BES Cyber System. The Requirement Part avoids prescribing an action to address these accounts because the most effective solution is situation specific, and in some cases, removing or disabling the account could have reliability consequences.

Requirement Part 5.3 addresses identification of individuals with access to shared accounts. This Requirement Part has the objective of mitigating the risk of unauthorized access through shared accounts. This differs from other CIP Cyber Security Standards Requirements to authorize access. An entity can authorize access and still not know who has access to a shared account. Failure to identify individuals with access to shared accounts would make it difficult to revoke access when it is no longer needed. The term “authorized” is used in the requirement to make clear that individuals storing, losing, or inappropriately sharing a password is not a violation of this requirement.

Requirement 5.4 addresses default passwords. Changing default passwords closes an easily exploitable vulnerability in many systems and applications. Pseudo-randomly system generated passwords are not considered default passwords.

For password-based user authentication, using strong passwords and changing them periodically helps mitigate the risk of successful password cracking attacks and the risk of accidental password disclosure to unauthorized individuals. In these requirements, the drafting team considered multiple approaches to ensuring this requirement was both effective and flexible enough to allow Responsible Entities to make good security decisions. One of the approaches considered involved requiring minimum password entropy, but the calculation for true information entropy is more highly complex and makes several assumptions in the passwords users choose. Users can pick poor passwords well below the calculated minimum entropy.

Rationale for Requirement R5 (continued):

The drafting team also chose to not require technical feasibility exceptions for devices that cannot meet the length and complexity requirements in password parameters. The objective of this requirement is to apply a measurable password policy to deter password cracking attempts, and replacing devices to achieve a specified password policy does not meet this objective. At the same time, this requirement has been strengthened to require account lockout or alerting for failed login attempts, which in many instances better meets the requirement objective.

The requirement to change passwords exists to address password cracking attempts if an encrypted password were somehow attained and also to refresh passwords which may have been accidentally disclosed over time. The requirement permits the entity to specify the periodicity of change to accomplish this objective. Specifically, the drafting team felt determining the appropriate periodicity based on a number of factors is more effective than specifying the period for every BES Cyber System in the Standard. In general, passwords for user authentication should be changed at least annually. The periodicity may increase in some cases. For example, application passwords that are long and pseudo-randomly generated could have a very long periodicity. Also, passwords used only as a weak form of application authentication, such as accessing the configuration of a relay may only need to be changed as part of regularly scheduled maintenance.

The Cyber Asset should automatically enforce the password policy for individual user accounts. However, for shared accounts in which no mechanism exists to enforce password policies, the Responsible Entity can enforce the password policy procedurally and through internal assessment and audit.

Requirement Part 5.7 assists in preventing online password attacks by limiting the number of guesses an attacker can make. This requirement allows either limiting the number of failed authentication attempts or alerting after a defined number of failed authentication attempts. Entities should take caution in choosing to limit the number of failed authentication attempts for all accounts because this would allow the possibility for a denial of service attack on the BES Cyber System.

R5. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-X Table R5 – System Access Controls*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M5. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-X Table 5 – System Access Controls* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-X Table R5 – System Access Control			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Have a method(s) to enforce authentication of interactive user access, where technically feasible.	An example of evidence may include, but is not limited to, documentation describing how access is authenticated.

CIP-007-X Table R5 – System Access Control

5.7	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, either: • Limit the number of unsuccessful authentication attempts; or • Generate alerts after a threshold of unsuccessful authentication attempts.	Examples of evidence may include, but are not limited to: • Documentation of the account-lockout parameters; or • Rules in the alerting configuration showing how the system notified individuals after a determined number of unsuccessful login attempts.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Requirement R1 exists to reduce the attack surface of Cyber Assets by requiring entities to disable known unnecessary ports. The SDT intends for the entity to know what network accessible ("listening") ports and associated services are accessible on their assets and systems, whether they are needed for that Cyber Asset's function, and disable or restrict access to all other ports.

1.1. This requirement is most often accomplished by disabling the corresponding service or program that is listening on the port or configuration settings within the Cyber Asset. It can also be accomplished through using host-based firewalls, TCP_Wrappers, or other means on the Cyber Asset to restrict access. Note that the requirement is applicable at the Cyber Asset level. The Cyber Assets are those which comprise the applicable BES Cyber Systems and their associated Cyber Assets. This control is another layer in the defense against network-based attacks, therefore the SDT intends that the control be on the device itself, or positioned inline in a non-bypassable manner. Blocking ports at the ESP border does not substitute for this device level requirement. If a device has no provision for disabling or restricting logical ports on the device (example - purpose built devices that run from firmware with no port configuration available) then those ports that are open are deemed 'needed.'

1.2. Examples of physical I/O ports include network, serial and USB ports external to the device casing. BES Cyber Systems should exist within a Physical Security Perimeter in which

case the physical I/O ports have protection from unauthorized access, but it may still be possible for accidental use such as connecting a modem, connecting a network cable that bridges networks, or inserting a USB drive. Ports used for 'console commands' primarily means serial ports on Cyber Assets that provide an administrative interface.

The protection of these ports can be accomplished in several ways including, but not limited to:

- Disabling all unneeded physical ports within the Cyber Asset's configuration
- Prominent signage, tamper tape, or other means of conveying that the ports should not be used without proper authorization
- Physical port obstruction through removable locks

The network ports included in the scope of this requirement part are not limited to those on the BES Cyber System itself. The scope of physical network ports includes those ports that may exist on nonprogrammable devices such as unmanaged switches, hubs, or patch panels.

This is a 'defense in depth' type control and it is acknowledged that there are other layers of control (the PSP for one) that prevent unauthorized personnel from gaining physical access to these ports. Even with physical access, it has been pointed out there are other ways to circumvent the control. This control, with its inclusion of means such as signage, is not meant to be a preventative control against intruders. Signage is indeed a directive control, not a preventative one. However, with a defense-in-depth posture, different layers and types of controls are required throughout the standard with this providing another layer for depth in Control Center environments. Once physical access has been achieved through the other preventative and detective measures by authorized personnel, a directive control that outlines proper behavior as a last line of defense are appropriate in these highest risk areas. In essence, signage would be used to remind authorized users to "think before you plug anything into one of these systems" which is the intent. This control is not designed primarily for intruders, but for example the authorized employee who intends to plug his possibly infected smartphone into an operator console USB port to charge the battery.

The Applicable Systems column was updated on CIP-007-6 Requirement 1, Part 1.2 to include "Nonprogrammable communication components located inside both a PSP and an ESP." This should be interpreted to apply to only those nonprogrammable communication components that are inside both an ESP and a PSP in combination, not those components that are in only one perimeter.

Requirement R2:

The SDT's intent of Requirement R2 is to require entities to know, track, and mitigate the known software vulnerabilities associated with their BES Cyber Assets. It is not strictly an "install every security patch" requirement; the main intention is to "be aware of in a timely manner and manage all known vulnerabilities" requirement.

Patch management is required for BES Cyber Systems that are accessible remotely as well as standalone systems. Stand alone systems are vulnerable to intentional or unintentional introduction of malicious code. A sound defense-in-depth security strategy employs additional measures such as physical security, malware prevention software, and software patch

management to reduce the introduction of malicious code or the exploit of known vulnerabilities.

One or multiple processes could be utilized. An overall assessment process may exist in a top tier document with lower tier documents establishing the more detailed process followed for individual systems. Lower tier documents could be used to cover BES Cyber System nuances that may occur at the system level.

2.1. The Responsible Entity is to have a patch management program that covers tracking, evaluating, and installing cyber security patches. The requirement applies to patches only, which are fixes released to handle a specific vulnerability in a hardware or software product. The requirement covers only patches that involve cyber security fixes and does not cover patches that are purely functionality related with no cyber security impact. Tracking involves processes for notification of the availability of new cyber security patches for the Cyber Assets. Documenting the patch source in the tracking portion of the process is required to determine when the assessment timeframe clock starts. This requirement handles the situation where security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they can be assessed and applied in order to not jeopardize the availability or integrity of the control system. The source can take many forms. The National Vulnerability Database, Operating System vendors, or Control System vendors could all be sources to monitor for release of security related patches, hotfixes, and/or updates. A patch source is not required for Cyber Assets that have no updateable software or firmware (there is no user accessible way to update the internal software or firmware executing on the Cyber Asset), or those Cyber Assets that have no existing source of patches such as vendors that no longer exist. The identification of these sources is intended to be performed once unless software is changed or added to the Cyber Asset's baseline.

2.2. Responsible Entities are to perform an assessment of security related patches within 35 days of release from their monitored source. An assessment should consist of determination of the applicability of each patch to the entity's specific environment and systems. Applicability determination is based primarily on whether the patch applies to a specific software or hardware component that the entity does have installed in an applicable Cyber Asset. A patch that applies to a service or component that is not installed in the entity's environment is not applicable. If the patch is determined to be non-applicable, that is documented with the reasons why and the entity is compliant. If the patch is applicable, the assessment can include a determination of the risk involved, how the vulnerability can be remediated, the urgency and timeframe of the remediation, and the steps the entity has previously taken or will take. Considerable care must be taken in applying security related patches, hotfixes, and/or updates or applying compensating measures to BES Cyber System or BES Cyber Assets that are no longer supported by vendors. It is possible security patches, hotfixes, and updates may reduce the reliability of the system, and entities should take this into account when determining the type of mitigation to apply. The Responsible Entities can use the information provided in the Department of Homeland Security "Quarterly Report on Cyber Vulnerabilities of Potential Risk to Control Systems" as a source. The DHS document "Recommended Practice for Patch Management of Control Systems" provides guidance on an evaluative process. It uses severity

levels determined using the Common Vulnerability Scoring System Version 2. Determination that a security related patch, hotfix, and/or update poses too great a risk to install on a system or is not applicable due to the system configuration should not require a TFE.

When documenting the remediation plan measures it may not be necessary to document them on a one to one basis. The remediation plan measures may be cumulative. A measure to address a software vulnerability may involve disabling a particular service. That same service may be exploited through other software vulnerabilities. Therefore disabling the single service has addressed multiple patched vulnerabilities.

2.3. The requirement handles the situations where it is more of a reliability risk to patch a running system than the vulnerability presents. In all cases, the entity either installs the patch or documents (either through the creation of a new or update of an existing mitigation plan) what they are going to do to mitigate the vulnerability and when they are going to do so. There are times when it is in the best interest of reliability to not install a patch, and the entity can document what they have done to mitigate the vulnerability. For those security related patches that are determined to be applicable, the Responsible Entity must within 35 days either install the patch, create a dated mitigation plan which will outline the actions to be taken or those that have already been taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch, or revise an existing mitigation plan. Timeframes do not have to be designated as a particular calendar day but can have event designations such as “at next scheduled outage of at least two days duration.” “Mitigation plans” in the standard refers to internal documents and are not to be confused with plans that are submitted to Regional Entities in response to violations.

2.4. The entity has been notified of, has assessed, and has developed a plan to remediate the known risk and that plan must be implemented. Remediation plans that only include steps that have been previously taken are considered implemented upon completion of the documentation. Remediation plans that have steps to be taken to remediate the vulnerability must be implemented by the timeframe the entity documented in their plan. There is no maximum timeframe in this requirement as patching and other system changes carries its own risk to the availability and integrity of the systems and may require waiting until a planned outage. In periods of high demand or threatening weather, changes to systems may be curtailed or denied due to the risk to reliability.

Requirement R3:

3.1. Due to the wide range of equipment comprising the BES Cyber Systems and the wide variety of vulnerability and capability of that equipment to malware as well as the constantly evolving threat and resultant tools and controls, it is not practical within the standard to prescribe how malware is to be addressed on each Cyber Asset. Rather, the Responsible Entity determines on a BES Cyber System basis which Cyber Assets have susceptibility to malware intrusions and documents their plans and processes for addressing those risks and provides evidence that they follow those plans and processes. There are numerous options available including traditional antivirus solutions for common operating systems, white-listing solutions, network isolation techniques, Intrusion Detection/Prevention (IDS/IPS) solutions, etc. If an entity has numerous BES Cyber Systems or Cyber Assets that are of identical architecture, they

may provide one process that describes how all the like Cyber Assets are covered. If a specific Cyber Asset has no updateable software and its executing code cannot be altered, then that Cyber Asset is considered to have its own internal method of deterring malicious code.

3.2. When malicious code is detected on a Cyber Asset within the applicability of this requirement, the threat posed by that code must be mitigated. In situations where traditional antivirus products are used, they may be configured to automatically remove or quarantine the malicious code. In white-listing situations, the white-listing tool itself can mitigate the threat as it will not allow the code to execute, however steps should still be taken to remove the malicious code from the Cyber Asset. In some instances, it may be in the best interest of reliability to not immediately remove or quarantine the malicious code, such as when availability of the system may be jeopardized by removal while operating and a rebuild of the system needs to be scheduled. In that case, monitoring may be increased and steps taken to insure the malicious code cannot communicate with other systems. In some instances the entity may be working with law enforcement or other governmental entities to closely monitor the code and track the perpetrator(s). For these reasons, there is no maximum timeframe or method prescribed for the removal of the malicious code, but the requirement is to mitigate the threat posed by the now identified malicious code.

3.3. In instances where malware detection technologies depend on signatures or patterns of known attacks, the effectiveness of these tools against evolving threats is tied to the ability to keep these signatures and patterns updated in a timely manner. The entity is to have a documented process that includes the testing and installation of signature or pattern updates. In a BES Cyber System, there may be some Cyber Assets that would benefit from the more timely installation of the updates where availability of that Cyber Asset would not jeopardize the availability of the BES Cyber System's ability to perform its function. For example, some HMI workstations where portable media is utilized may benefit from having the very latest updates at all times with minimal testing. Other Cyber Assets should have any updates thoroughly tested before implementation where the result of a 'false positive' could harm the availability of the BES Cyber System. The testing should not negatively impact the reliability of the BES. The testing should be focused on the update itself and if it will have an adverse impact on the BES Cyber System. Testing in no way implies that the entity is testing to ensure that malware is indeed detected by introducing malware into the environment. It is strictly focused on ensuring that the update does not negatively impact the BES Cyber System before those updates are placed into production.

Requirement R4:

Refer to NIST 800-92 and 800-137 for additional guidance in security event monitoring.

4.1. In a complex computing environment and faced with dynamic threats and vulnerabilities, it is not practical within the standard to enumerate all security-related events necessary to support the activities for alerting and incident response. Rather, the Responsible Entity determines which computer generated events are necessary to log, provide alerts and monitor for their particular BES Cyber System environment.

Specific security events already required in Version 4 of the CIP Standards carry forward in this version. This includes access attempts at the Electronic Access Points, if any have been identified for a BES Cyber Systems. Examples of access attempts include: (i) blocked network access attempts, (ii) successful and unsuccessful remote user access attempts, (iii) blocked network access attempts from a remote VPN, and (iv) successful network access attempts or network flow information.

User access and activity events include those events generated by Cyber Assets within the Electronic Security Perimeter that have access control capability. These types of events include: (i) successful and unsuccessful authentication, (ii) account management, (iii) object access, and (iv) processes started and stopped.

It is not the intent of the SDT that if a device cannot log a particular event that a TFE must be generated. The SDT's intent is that if any of the items in the bulleted list (for example, user logouts) can be logged by the device then the entity must log that item. If the device does not have the capability of logging that event, the entity remains compliant.

4.2. Real-time alerting allows the cyber system to automatically communicate events of significance to designated responders. This involves configuration of a communication mechanism and log analysis rules. Alerts can be configured in the form of an email, text message, or system display and alarming. The log analysis rules can exist as part of the operating system, specific application or a centralized security event monitoring system. On one end, a real-time alert could consist of a set point on an RTU for a login failure, and on the other end, a security event monitoring system could provide multiple alerting communications options triggered on any number of complex log correlation rules.

The events triggering a real-time alert may change from day to day as system administrators and incident responders better understand the types of events that might be indications of a cyber-security incident. Configuration of alerts also must balance the need for responders to know an event occurred with the potential inundation of insignificant alerts. The following list includes examples of events a Responsible Entity should consider in configuring real-time alerts:

- Detected known or potential malware or malicious activity
- Failure of security event logging mechanisms
- Login failures for critical accounts
- Interactive login of system accounts
- Enabling of accounts
- Newly provisioned accounts
- System administration or change tasks by an unauthorized user
- Authentication attempts on certain accounts during non-business hours
- Unauthorized configuration changes
- Insertion of removable media in violation of a policy

4.3 Logs that are created under Part 4.1 are to be retained on the applicable Cyber Assets or BES Cyber Systems for at least 90 days. This is different than the evidence retention period

called for in the CIP standards used to prove historical compliance. For such audit purposes, the entity should maintain evidence that shows that 90 days were kept historically. One example would be records of disposition of event logs beyond 90 days up to the evidence retention period.

4.4. Reviewing logs at least every 15 days (approximately every two weeks) can consist of analyzing a summarization or sampling of logged events. NIST SP800-92 provides a lot of guidance in periodic log analysis. If a centralized security event monitoring system is used, log analysis can be performed top-down starting with a review of trends from summary reports. The log review can also be an extension of the exercise in identifying those events needing real-time alerts by analyzing events that are not fully understood or could possibly inundate the real-time alerting.

Requirement R5:

Account types referenced in this guidance typically include:

- Shared user account: An account used by multiple users for normal business functions by employees or contractors. Usually on a device that does not support Individual User Accounts.
- Individual user account: An account used by a single user.
- Administrative account: An account with elevated privileges for performing administrative or other specialized functions. These can be individual or shared accounts.
- System account: Accounts used to run services on a system (web, DNS, mail etc). No users have access to these accounts.
- Application account: A specific system account, with rights granted at the application level often used for access into a Database.
- Guest account: An individual user account not typically used for normal business functions by employees or contractors and not associated with a specific user. May or may not be shared by multiple users.
- Remote access account: An individual user account only used for obtaining Interactive Remote Access to the BES Cyber System.
- Generic account: A group account set up by the operating system or application to perform specific operations. This differs from a shared user account in that individual users do not receive authorization for access to this account type.

5.1 Reference the Requirement's rationale.

5.2 Where possible, default and other generic accounts provided by a vendor should be removed, renamed, or disabled prior to production use of the Cyber Asset or BES Cyber System. If this is not possible, the passwords must be changed from the default provided by the vendor. Default and other generic accounts remaining enabled must be documented. For common

configurations, this documentation can be performed at a BES Cyber System or more general level.

5.3 Entities may choose to identify individuals with access to shared accounts through the access authorization and provisioning process, in which case the individual authorization records suffice to meet this Requirement Part. Alternatively, entities may choose to maintain a separate listing for shared accounts. Either form of evidence achieves the end result of maintaining control of shared accounts.

5.4. Default passwords can be commonly published in vendor documentation that is readily available to all customers using that type of equipment and possibly published online.

The requirement option to have unique password addresses cases where the Cyber Asset generates or has assigned pseudo-random default passwords at the time of production or installation. In these cases, the default password does not have to change because the system or manufacturer created it specific to the Cyber Asset.

5.5. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Technical or procedural enforcement of password parameters are required where passwords are the only credential used to authenticate individuals. Technical enforcement of the password parameters means a Cyber Asset verifies an individually selected password meets the required parameters before allowing the account to authenticate with the selected password. Technical enforcement should be used in most cases when the authenticating Cyber Asset supports enforcing password parameters. Likewise, procedural enforcement means requiring the password parameters through procedures. Individuals choosing the passwords have the obligation of ensuring the password meets the required parameters.

Password complexity refers to the policy set by a Cyber Asset to require passwords to have one or more of the following types of characters: (1) lowercase alphabetic, (2) uppercase alphabetic, (3) numeric, and (4) non-alphanumeric or “special” characters (e.g. #, $, @, &), in various combinations.

5.6 Technical or procedural enforcement of password change obligations are required where passwords are the only credential used to authenticate individuals. Technical enforcement of password change obligations means the Cyber Asset requires a password change after a specified timeframe prior to allowing access. In this case, the password is not required to change by the specified time as long as the Cyber Asset enforces the password change after the next successful authentication of the account. Procedural enforcement means manually changing passwords used for interactive user access after a specified timeframe.

5.7 Configuring an account lockout policy or alerting after a certain number of failed authentication attempts serves to prevent unauthorized access through an online password

guessing attack. The threshold of failed authentication attempts should be set high enough to avoid false-positives from authorized users failing to authenticate. It should also be set low enough to account for online password attacks occurring over an extended period of time. This threshold may be tailored to the operating environment over time to avoid unnecessary account lockouts.

Entities should take caution when configuring account lockout to avoid locking out accounts necessary for the BES Cyber System to perform a BES reliability task. In such cases, entities should configure authentication failure alerting.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Note: The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X standards were redlined to the industry-approved version 5 language for ease of reading revisions.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives

Description of Current Draft

This draft standard is being posted for an additional ~~initial~~ comment and ballot to ballot the removal of "identify, assess, and correct" language. The draft includes modifications to meet the ~~directives of~~ FERC Order No. 791 directive to remove or modify the "identify, assess, and correct" language from CIP-007.

Anticipated Actions	Anticipated Date
~~First 45-Day Comment Period Opens~~	~~June 2014~~
Additional 45-Day Comment Period ~~(if necessary)~~	~~August~~ September 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-007-5.	
X	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — System Security Management

2. Number: CIP-007-~~6~~X

3. Purpose: To manage system security by specifying select technical, operational, and procedural requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-007-~~6~~X:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-007-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Registered Entities shall not be required to comply with the elements of Reliability Standard CIP-007-X, Requirement R1, Part 1.2 that apply to PCAs and nonprogrammable communication components located inside a PSP and inside an ESP and associated with High and Medium Impact BES Cyber Systems until nine calendar months after the effective date of Reliability Standard CIP-007-X.

6. Background:

Standard CIP-007 ~~-5~~ exists as part of a suite of CIP Standards related to cyber security, which~~. CIP-002-5.1~~ requires the initial identification and categorization of BES Cyber Systems~~. CIP-003-5~~6, ~~CIP-004-5~~6, ~~CIP-005-5, CIP-006-5~~6, ~~CIP-007-5~~6, ~~CIP-008-5, CIP-009-5~~6, ~~CIP-010-1~~2, ~~and CIP-011-1~~ 2~~-~~ and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on~~

~~*whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement, **in a manner that identifies, assesses, and corrects deficiencies,** . . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~ its documented processes, but ~~they~~ it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is

specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System in the applicability column. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The requirement is intended to minimize the attack surface of BES Cyber Systems through disabling or limiting access to unnecessary network accessible logical ports and services and physical I/O ports.

In response to FERC Order No. 791, specifically FERC's reference to NIST 800-53 rev. 3 security control PE-4 in paragraph 149, Part 1.2 has been expanded to include PCAs and nonprogrammable communications components. This increase in applicability expands the scope of devices that receive the protection afforded by the defense-in-depth control included in Requirement R1, Part 1.2.

The applicability is limited to those nonprogrammable communications components located both inside a PSP and an ESP in order to allow for a scenario in which a Responsible Entity may implement an extended ESP (with corresponding logical protections identified in CIP-006, Requirement R1, Part 1.10). In this scenario, nonprogrammable components of the communication network may exist out of the Responsible Entity's control (i.e. as part of the telecommunication carrier's network).

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ X Table R1 – Ports and Services*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M1. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ X Table R1 – Ports and Services* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~6~~ X Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.	Examples of evidence may include, but are not limited to: • Documentation of the need for all enabled ports on all applicable Cyber Assets and Electronic Access Points, individually or by group. • Listings of the listening ports on the Cyber Assets, individually or by group, from either the device configuration files, command output (such as netstat), or network scans of open ports; or • Configuration files of host-based firewalls or other device level mechanisms that only allow needed ports and deny all others.

CIP-007-~~6~~ X Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP. Medium Impact BES Cyber Systems at Control Centers and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP.	Protect against the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media.	An example of evidence may include, but is not limited to, documentation showing types of protection of physical input/output ports, either logically through system configuration or physically using a port lock or signage.

Rationale for Requirement R2:

Security patch management is a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner to gain control of or render a BES Cyber Asset or BES Cyber System inoperable.

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ X Table R2 – Security Patch Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ X Table R2 – Security Patch Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~6~~ X Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	A patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for applicable Cyber Assets that are updateable and for which a patching source exists.	An example of evidence may include, but is not limited to, documentation of a patch management process and documentation or lists of sources that are monitored, whether on an individual BES Cyber System or Cyber Asset basis.

CIP-007-~~6~~ X Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 35 calendar days, evaluate security patches for applicability that have been released since the last evaluation from the source or sources identified in Part 2.1.	An example of evidence may include, but is not limited to, an evaluation conducted by, referenced by, or on behalf of a Responsible Entity of security-related patches released by the documented sources at least once every 35 calendar days.

CIP-007-~~6~~ X Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For applicable patches identified in Part 2.2, within 35 calendar days of the evaluation completion, take one of the following actions: • Apply the applicable patches; or • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch and a timeframe to complete these mitigations.	Examples of evidence may include, but are not limited to: • Records of the installation of the patch (e.g., exports from automated patch management tools that provide installation date, verification of BES Cyber System Component software revision, or registry exports that show software has been installed); or • A dated plan showing when and how the vulnerability will be addressed, to include documentation of the actions to be taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch and a timeframe for the completion of these mitigations.

CIP-007-~~6~~ X Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For each mitigation plan created or revised in Part 2.3, implement the plan within the timeframe specified in the plan, unless a revision to the plan or an extension to the timeframe specified in Part 2.3 is approved by the CIP Senior Manager or delegate.	An example of evidence may include, but is not limited to, records of implementation of mitigations.

Rationale for Requirement R3:

Malicious code prevention has the purpose of limiting and detecting the addition of malicious code onto the applicable Cyber Assets of a BES Cyber System. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the availability or integrity of the BES Cyber System.

R3. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ X Table R3 – Malicious Code Prevention*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations].*

M3. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ X Table R3 – Malicious Code Prevention* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~6~~ X Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Deploy method(s) to deter, detect, or prevent malicious code.	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus, system hardening, policies, etc.).

CIP-007-~~6~~ X Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Mitigate the threat of detected malicious code.	Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For those methods identified in Part 3.1 that use signatures or patterns, have a process for the update of the signatures or patterns. The process must address testing and installing the signatures or patterns.	An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.

Rationale for Requirement R4:

Security event monitoring has the purpose of detecting unauthorized access, reconnaissance and other malicious activity on BES Cyber Systems, and comprises of the activities involved with the collection, processing, alerting and retention of security-related computer logs. These logs can provide both (1) the detection of an incident and (2) useful evidence in the investigation of an incident. The retention of security-related logs is intended to support post-event data analysis.

Audit processing failures are not penalized in this requirement. Instead, the requirement specifies processes which must be in place to monitor for and notify personnel of audit processing failures.

R4. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ X Table R4 – Security Event Monitoring*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Assessment.]*

M4. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ X Table R4 – Security Event Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~6~~ X Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	Examples of evidence may include, but are not limited to, a paper or system generated listing of event types for which the BES Cyber System is capable of detecting and, for generated events, is configured to log. This listing must include the required types of events.

CIP-007-~~6~~ X Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Generate alerts for security events that the Responsible Entity determines necessitates an alert, that includes, as a minimum, each of the following types of events (per Cyber Asset or BES Cyber System capability): 4.2.1. Detected malicious code from Part 4.1; and 4.2.2. Detected failure of Part 4.1 event logging.	Examples of evidence may include, but are not limited to, paper or system-generated listing of security events that the Responsible Entity determined necessitate alerts, including paper or system generated list showing how alerts are configured.

CIP-007-~~6~~ X Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, retain applicable event logs identified in Part 4.1 for at least the last 90 consecutive calendar days except under CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, documentation of the event log retention process and paper or system generated reports showing log retention configuration set at 90 days or greater.
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Review a summarization or sampling of logged events as determined by the Responsible Entity at intervals no greater than 15 calendar days to identify undetected Cyber Security Incidents.	Examples of evidence may include, but are not limited to, documentation describing the review, any findings from the review (if any), and dated documentation showing the review occurred.

Rationale for Requirement R5:

To help ensure that no authorized individual can gain electronic access to a BES Cyber System until the individual has been authenticated, i.e., until the individual's logon credentials have been validated. Requirement R5 also seeks to reduce the risk that static passwords, where used as authenticators, may be compromised.

Requirement Part 5.1 ensures the BES Cyber System or Cyber Asset authenticates individuals that can modify configuration information. This requirement addresses the configuration of authentication. The authorization of individuals is addressed elsewhere in the CIP Cyber Security Standards. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Requirement Part 5.2 addresses default and other generic account types. Identifying the use of default or generic account types that could introduce vulnerabilities has the benefit ensuring entities understand the possible risk these accounts pose to the BES Cyber System. The Requirement Part avoids prescribing an action to address these accounts because the most effective solution is situation specific, and in some cases, removing or disabling the account could have reliability consequences.

Requirement Part 5.3 addresses identification of individuals with access to shared accounts. This Requirement Part has the objective of mitigating the risk of unauthorized access through shared accounts. This differs from other CIP Cyber Security Standards Requirements to authorize access. An entity can authorize access and still not know who has access to a shared account. Failure to identify individuals with access to shared accounts would make it difficult to revoke access when it is no longer needed. The term “authorized” is used in the requirement to make clear that individuals storing, losing, or inappropriately sharing a password is not a violation of this requirement.

Requirement 5.4 addresses default passwords. Changing default passwords closes an easily exploitable vulnerability in many systems and applications. Pseudo-randomly system generated passwords are not considered default passwords.

For password-based user authentication, using strong passwords and changing them periodically helps mitigate the risk of successful password cracking attacks and the risk of accidental password disclosure to unauthorized individuals. In these requirements, the drafting team considered multiple approaches to ensuring this requirement was both effective and flexible enough to allow Responsible Entities to make good security decisions. One of the approaches considered involved requiring

minimum password entropy, but the calculation for true information entropy is more highly complex and makes several assumptions in the passwords users choose. Users can pick poor passwords well below the calculated minimum entropy.

Rationale for Requirement R5 (continued):

The drafting team also chose to not require technical feasibility exceptions for devices that cannot meet the length and complexity requirements in password parameters. The objective of this requirement is to apply a measurable password policy to deter password cracking attempts, and replacing devices to achieve a specified password policy does not meet this objective. At the same time, this requirement has been strengthened to require account lockout or alerting for failed login attempts, which in many instances better meets the requirement objective.

The requirement to change passwords exists to address password cracking attempts if an encrypted password were somehow attained and also to refresh passwords which may have been accidentally disclosed over time. The requirement permits the entity to specify the periodicity of change to accomplish this objective. Specifically, the drafting team felt determining the appropriate periodicity based on a number of factors is more effective than specifying the period for every BES Cyber System in the Standard. In general, passwords for user authentication should be changed at least annually. The periodicity may increase in some cases. For example, application passwords that are long and pseudo-randomly generated could have a very long periodicity. Also, passwords used only as a weak form of application authentication, such as accessing the configuration of a relay may only need to be changed as part of regularly scheduled maintenance.

The Cyber Asset should automatically enforce the password policy for individual user accounts. However, for shared accounts in which no mechanism exists to enforce password policies, the Responsible Entity can enforce the password policy procedurally and through internal assessment and audit.

Requirement Part 5.7 assists in preventing online password attacks by limiting the number of guesses an attacker can make. This requirement allows either limiting the number of failed authentication attempts or alerting after a defined number of failed authentication attempts. Entities should take caution in choosing to limit the number of failed authentication attempts for all accounts because this would allow the possibility for a denial of service attack on the BES Cyber System.

R5. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ X Table R5 – System Access Controls*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M5. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~6~~ X Table 5 – System Access Controls* and additional evidence to demonstrate implementation as described in the Measures column of the table.

5.7	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, either: • Limit the number of unsuccessful authentication attempts; or • Generate alerts after a threshold of unsuccessful authentication attempts.	Examples of evidence may include, but are not limited to: • Documentation of the account-lockout parameters; or • Rules in the alerting configuration showing how the system notified individuals after a determined number of unsuccessful login attempts.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

None

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

None.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Requirement R1 exists to reduce the attack surface of Cyber Assets by requiring entities to disable known unnecessary ports. The SDT intends for the entity to know what network accessible ("listening") ports and associated services are accessible on their assets and systems, whether they are needed for that Cyber Asset's function, and disable or restrict access to all other ports.

1.1. This requirement is most often accomplished by disabling the corresponding service or program that is listening on the port or configuration settings within the Cyber Asset. It can also be accomplished through using host-based firewalls, TCP_Wrappers, or other means on the Cyber Asset to restrict access. Note that the requirement is applicable at the Cyber Asset level. The Cyber Assets are those which comprise the applicable BES Cyber Systems and their associated Cyber Assets. This control is another layer in the defense against network-based attacks, therefore the SDT intends that the control be on the device itself, or positioned inline in a non-bypassable manner. Blocking ports at the ESP border does not substitute for this device level requirement. If a device has no provision for disabling or restricting logical ports on the device (example - purpose built devices that run from firmware with no port configuration available) then those ports that are open are deemed 'needed.'

1.2. Examples of physical I/O ports include network, serial and USB ports external to the device casing. BES Cyber Systems should exist within a Physical Security Perimeter in which

case the physical I/O ports have protection from unauthorized access, but it may still be possible for accidental use such as connecting a modem, connecting a network cable that bridges networks, or inserting a USB drive. Ports used for 'console commands' primarily means serial ports on Cyber Assets that provide an administrative interface.

The protection of these ports can be accomplished in several ways including, but not limited to:

- Disabling all unneeded physical ports within the Cyber Asset's configuration
- Prominent signage, tamper tape, or other means of conveying that the ports should not be used without proper authorization
- Physical port obstruction through removable locks

The network ports included in the scope of this requirement part are not limited to those on the BES Cyber System itself. The scope of physical network ports includes those ports that may exist on nonprogrammable devices such as unmanaged switches, hubs, or patch panels.

This is a 'defense in depth' type control and it is acknowledged that there are other layers of control (the PSP for one) that prevent unauthorized personnel from gaining physical access to these ports. Even with physical access, it has been pointed out there are other ways to circumvent the control. This control, with its inclusion of means such as signage, is not meant to be a preventative control against intruders. Signage is indeed a directive control, not a preventative one. However, with a defense-in-depth posture, different layers and types of controls are required throughout the standard with this providing another layer for depth in Control Center environments. Once physical access has been achieved through the other preventative and detective measures by authorized personnel, a directive control that outlines proper behavior as a last line of defense are appropriate in these highest risk areas. In essence, signage would be used to remind authorized users to "think before you plug anything into one of these systems" which is the intent. This control is not designed primarily for intruders, but for example the authorized employee who intends to plug his possibly infected smartphone into an operator console USB port to charge the battery.

The Applicable Systems column was updated on CIP-007-6 Requirement 1, Part 1.2 to include "Nonprogrammable communication components located inside both a PSP and an ESP." This should be interpreted to apply to only those nonprogrammable communication components that are inside both an ESP and a PSP in combination, not those components that are in only one perimeter.

Requirement R2:

The SDT's intent of Requirement R2 is to require entities to know, track, and mitigate the known software vulnerabilities associated with their BES Cyber Assets. It is not strictly an "install every security patch" requirement; the main intention is to "be aware of in a timely manner and manage all known vulnerabilities" requirement.

Patch management is required for BES Cyber Systems that are accessible remotely as well as standalone systems. Stand alone systems are vulnerable to intentional or unintentional introduction of malicious code. A sound defense-in-depth security strategy employs additional measures such as physical security, malware prevention software, and software patch

management to reduce the introduction of malicious code or the exploit of known vulnerabilities.

One or multiple processes could be utilized. An overall assessment process may exist in a top tier document with lower tier documents establishing the more detailed process followed for individual systems. Lower tier documents could be used to cover BES Cyber System nuances that may occur at the system level.

2.1. The Responsible Entity is to have a patch management program that covers tracking, evaluating, and installing cyber security patches. The requirement applies to patches only, which are fixes released to handle a specific vulnerability in a hardware or software product. The requirement covers only patches that involve cyber security fixes and does not cover patches that are purely functionality related with no cyber security impact. Tracking involves processes for notification of the availability of new cyber security patches for the Cyber Assets. Documenting the patch source in the tracking portion of the process is required to determine when the assessment timeframe clock starts. This requirement handles the situation where security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they can be assessed and applied in order to not jeopardize the availability or integrity of the control system. The source can take many forms. The National Vulnerability Database, Operating System vendors, or Control System vendors could all be sources to monitor for release of security related patches, hotfixes, and/or updates. A patch source is not required for Cyber Assets that have no updateable software or firmware (there is no user accessible way to update the internal software or firmware executing on the Cyber Asset), or those Cyber Assets that have no existing source of patches such as vendors that no longer exist. The identification of these sources is intended to be performed once unless software is changed or added to the Cyber Asset's baseline.

2.2. Responsible Entities are to perform an assessment of security related patches within 35 days of release from their monitored source. An assessment should consist of determination of the applicability of each patch to the entity's specific environment and systems. Applicability determination is based primarily on whether the patch applies to a specific software or hardware component that the entity does have installed in an applicable Cyber Asset. A patch that applies to a service or component that is not installed in the entity's environment is not applicable. If the patch is determined to be non-applicable, that is documented with the reasons why and the entity is compliant. If the patch is applicable, the assessment can include a determination of the risk involved, how the vulnerability can be remediated, the urgency and timeframe of the remediation, and the steps the entity has previously taken or will take. Considerable care must be taken in applying security related patches, hotfixes, and/or updates or applying compensating measures to BES Cyber System or BES Cyber Assets that are no longer supported by vendors. It is possible security patches, hotfixes, and updates may reduce the reliability of the system, and entities should take this into account when determining the type of mitigation to apply. The Responsible Entities can use the information provided in the Department of Homeland Security "Quarterly Report on Cyber Vulnerabilities of Potential Risk to Control Systems" as a source. The DHS document "Recommended Practice for Patch Management of Control Systems" provides guidance on an evaluative process. It uses severity

levels determined using the Common Vulnerability Scoring System Version 2. Determination that a security related patch, hotfix, and/or update poses too great a risk to install on a system or is not applicable due to the system configuration should not require a TFE.

When documenting the remediation plan measures it may not be necessary to document them on a one to one basis. The remediation plan measures may be cumulative. A measure to address a software vulnerability may involve disabling a particular service. That same service may be exploited through other software vulnerabilities. Therefore disabling the single service has addressed multiple patched vulnerabilities.

2.3. The requirement handles the situations where it is more of a reliability risk to patch a running system than the vulnerability presents. In all cases, the entity either installs the patch or documents (either through the creation of a new or update of an existing mitigation plan) what they are going to do to mitigate the vulnerability and when they are going to do so. There are times when it is in the best interest of reliability to not install a patch, and the entity can document what they have done to mitigate the vulnerability. For those security related patches that are determined to be applicable, the Responsible Entity must within 35 days either install the patch, create a dated mitigation plan which will outline the actions to be taken or those that have already been taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch, or revise an existing mitigation plan. Timeframes do not have to be designated as a particular calendar day but can have event designations such as "at next scheduled outage of at least two days duration." "Mitigation plans" in the standard refers to internal documents and are not to be confused with plans that are submitted to Regional Entities in response to violations.

2.4. The entity has been notified of, has assessed, and has developed a plan to remediate the known risk and that plan must be implemented. Remediation plans that only include steps that have been previously taken are considered implemented upon completion of the documentation. Remediation plans that have steps to be taken to remediate the vulnerability must be implemented by the timeframe the entity documented in their plan. There is no maximum timeframe in this requirement as patching and other system changes carries its own risk to the availability and integrity of the systems and may require waiting until a planned outage. In periods of high demand or threatening weather, changes to systems may be curtailed or denied due to the risk to reliability.

Requirement R3:

3.1. Due to the wide range of equipment comprising the BES Cyber Systems and the wide variety of vulnerability and capability of that equipment to malware as well as the constantly evolving threat and resultant tools and controls, it is not practical within the standard to prescribe how malware is to be addressed on each Cyber Asset. Rather, the Responsible Entity determines on a BES Cyber System basis which Cyber Assets have susceptibility to malware intrusions and documents their plans and processes for addressing those risks and provides evidence that they follow those plans and processes. There are numerous options available including traditional antivirus solutions for common operating systems, white-listing solutions, network isolation techniques, ~~portable storage media policies,~~ Intrusion Detection/Prevention (IDS/IPS) solutions, etc. If an entity has numerous BES Cyber Systems or Cyber Assets that are

of identical architecture, they may provide one process that describes how all the like Cyber Assets are covered. If a specific Cyber Asset has no updateable software and its executing code cannot be altered, then that Cyber Asset is considered to have its own internal method of deterring malicious code.

3.2. When malicious code is detected on a Cyber Asset within the applicability of this requirement, the threat posed by that code must be mitigated. In situations where traditional antivirus products are used, they may be configured to automatically remove or quarantine the malicious code. In white-listing situations, the white-listing tool itself can mitigate the threat as it will not allow the code to execute, however steps should still be taken to remove the malicious code from the Cyber Asset. In some instances, it may be in the best interest of reliability to not immediately remove or quarantine the malicious code, such as when availability of the system may be jeopardized by removal while operating and a rebuild of the system needs to be scheduled. In that case, monitoring may be increased and steps taken to insure the malicious code cannot communicate with other systems. In some instances the entity may be working with law enforcement or other governmental entities to closely monitor the code and track the perpetrator(s). For these reasons, there is no maximum timeframe or method prescribed for the removal of the malicious code, but the requirement is to mitigate the threat posed by the now identified malicious code.

3.3. In instances where malware detection technologies depend on signatures or patterns of known attacks, the effectiveness of these tools against evolving threats is tied to the ability to keep these signatures and patterns updated in a timely manner. The entity is to have a documented process that includes the testing and installation of signature or pattern updates. In a BES Cyber System, there may be some Cyber Assets that would benefit from the more timely installation of the updates where availability of that Cyber Asset would not jeopardize the availability of the BES Cyber System's ability to perform its function. For example, some HMI workstations where portable media is utilized may benefit from having the very latest updates at all times with minimal testing. Other Cyber Assets should have any updates thoroughly tested before implementation where the result of a 'false positive' could harm the availability of the BES Cyber System. The testing should not negatively impact the reliability of the BES. The testing should be focused on the update itself and if it will have an adverse impact on the BES Cyber System. Testing in no way implies that the entity is testing to ensure that malware is indeed detected by introducing malware into the environment. It is strictly focused on ensuring that the update does not negatively impact the BES Cyber System before those updates are placed into production.

Requirement R4:

Refer to NIST 800-92 and 800-137 for additional guidance in security event monitoring.

4.1. In a complex computing environment and faced with dynamic threats and vulnerabilities, it is not practical within the standard to enumerate all security-related events necessary to support the activities for alerting and incident response. Rather, the Responsible Entity determines which computer generated events are necessary to log, provide alerts and monitor for their particular BES Cyber System environment.

Specific security events already required in Version 4 of the CIP Standards carry forward in this version. This includes access attempts at the Electronic Access Points, if any have been identified for a BES Cyber Systems. Examples of access attempts include: (i) blocked network access attempts, (ii) successful and unsuccessful remote user access attempts, (iii) blocked network access attempts from a remote VPN, and (iv) successful network access attempts or network flow information.

User access and activity events include those events generated by Cyber Assets within the Electronic Security Perimeter that have access control capability. These types of events include: (i) successful and unsuccessful authentication, (ii) account management, (iii) object access, and (iv) processes started and stopped.

It is not the intent of the SDT that if a device cannot log a particular event that a TFE must be generated. The SDT's intent is that if any of the items in the bulleted list (for example, user logouts) can be logged by the device then the entity must log that item. If the device does not have the capability of logging that event, the entity remains compliant.

4.2. Real-time alerting allows the cyber system to automatically communicate events of significance to designated responders. This involves configuration of a communication mechanism and log analysis rules. Alerts can be configured in the form of an email, text message, or system display and alarming. The log analysis rules can exist as part of the operating system, specific application or a centralized security event monitoring system. On one end, a real-time alert could consist of a set point on an RTU for a login failure, and on the other end, a security event monitoring system could provide multiple alerting communications options triggered on any number of complex log correlation rules.

The events triggering a real-time alert may change from day to day as system administrators and incident responders better understand the types of events that might be indications of a cyber-security incident. Configuration of alerts also must balance the need for responders to know an event occurred with the potential inundation of insignificant alerts. The following list includes examples of events a Responsible Entity should consider in configuring real-time alerts:

- Detected known or potential malware or malicious activity
- Failure of security event logging mechanisms
- Login failures for critical accounts
- Interactive login of system accounts
- Enabling of accounts
- Newly provisioned accounts
- System administration or change tasks by an unauthorized user
- Authentication attempts on certain accounts during non-business hours
- Unauthorized configuration changes
- Insertion of removable media in violation of a policy

4.3 Logs that are created under Part 4.1 are to be retained on the applicable Cyber Assets or BES Cyber Systems for at least 90 days. This is different than the evidence retention period

called for in the CIP standards used to prove historical compliance. For such audit purposes, the entity should maintain evidence that shows that 90 days were kept historically. One example would be records of disposition of event logs beyond 90 days up to the evidence retention period.

4.4. Reviewing logs at least every 15 days (approximately every two weeks) can consist of analyzing a summarization or sampling of logged events. NIST SP800-92 provides a lot of guidance in periodic log analysis. If a centralized security event monitoring system is used, log analysis can be performed top-down starting with a review of trends from summary reports. The log review can also be an extension of the exercise in identifying those events needing real-time alerts by analyzing events that are not fully understood or could possibly inundate the real-time alerting.

Requirement R5:

Account types referenced in this guidance typically include:

- Shared user account: An account used by multiple users for normal business functions by employees or contractors. Usually on a device that does not support Individual User Accounts.
- Individual user account: An account used by a single user.
- Administrative account: An account with elevated privileges for performing administrative or other specialized functions. These can be individual or shared accounts.
- System account: Accounts used to run services on a system (web, DNS, mail etc). No users have access to these accounts.
- Application account: A specific system account, with rights granted at the application level often used for access into a Database.
- Guest account: An individual user account not typically used for normal business functions by employees or contractors and not associated with a specific user. May or may not be shared by multiple users.
- Remote access account: An individual user account only used for obtaining Interactive Remote Access to the BES Cyber System.
- Generic account: A group account set up by the operating system or application to perform specific operations. This differs from a shared user account in that individual users do not receive authorization for access to this account type.

5.1 Reference the Requirement's rationale.

5.2 Where possible, default and other generic accounts provided by a vendor should be removed, renamed, or disabled prior to production use of the Cyber Asset or BES Cyber System. If this is not possible, the passwords must be changed from the default provided by the vendor. Default and other generic accounts remaining enabled must be documented. For common

configurations, this documentation can be performed at a BES Cyber System or more general level.

5.3 Entities may choose to identify individuals with access to shared accounts through the access authorization and provisioning process, in which case the individual authorization records suffice to meet this Requirement Part. Alternatively, entities may choose to maintain a separate listing for shared accounts. Either form of evidence achieves the end result of maintaining control of shared accounts.

5.4. Default passwords can be commonly published in vendor documentation that is readily available to all customers using that type of equipment and possibly published online.

The requirement option to have unique password addresses cases where the Cyber Asset generates or has assigned pseudo-random default passwords at the time of production or installation. In these cases, the default password does not have to change because the system or manufacturer created it specific to the Cyber Asset.

5.5. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Technical or procedural enforcement of password parameters are required where passwords are the only credential used to authenticate individuals. Technical enforcement of the password parameters means a Cyber Asset verifies an individually selected password meets the required parameters before allowing the account to authenticate with the selected password. Technical enforcement should be used in most cases when the authenticating Cyber Asset supports enforcing password parameters. Likewise, procedural enforcement means requiring the password parameters through procedures. Individuals choosing the passwords have the obligation of ensuring the password meets the required parameters.

Password complexity refers to the policy set by a Cyber Asset to require passwords to have one or more of the following types of characters: (1) lowercase alphabetic, (2) uppercase alphabetic, (3) numeric, and (4) non-alphanumeric or “special” characters (e.g. #, $, @, &), in various combinations.

5.6 Technical or procedural enforcement of password change obligations are required where passwords are the only credential used to authenticate individuals. Technical enforcement of password change obligations means the Cyber Asset requires a password change after a specified timeframe prior to allowing access. In this case, the password is not required to change by the specified time as long as the Cyber Asset enforces the password change after the next successful authentication of the account. Procedural enforcement means manually changing passwords used for interactive user access after a specified timeframe.

5.7 Configuring an account lockout policy or alerting after a certain number of failed authentication attempts serves to prevent unauthorized access through an online password

guessing attack. The threshold of failed authentication attempts should be set high enough to avoid false-positives from authorized users failing to authenticate. It should also be set low enough to account for online password attacks occurring over an extended period of time. This threshold may be tailored to the operating environment over time to avoid unnecessary account lockouts.

Entities should take caution when configuring account lockout to avoid locking out accounts necessary for the BES Cyber System to perform a BES reliability task. In such cases, entities should configure authentication failure alerting.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Note: The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X standards were redlined to the industry-approved version 5 language for ease of reading revisions.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives

Description of Current Draft

This draft standard is being posted for an additional comment and ballot to ballot the removal of "identify, assess, and correct" language. The draft includes modifications to meet the FERC Order No. 791 directive to remove or modify the "identify, assess, and correct" language from CIP-010.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period	September 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	
X	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Configuration Change Management and Vulnerability Assessments

2. Number: CIP-010-X

3. Purpose: To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-010-X:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-010-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident

response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-X Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-X Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-X Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-X Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-010-X Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-010-X Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

Rationale for Requirement R2:

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-X Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-X Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-X Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

Rationale for Requirement R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-X Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-X Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-X Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment,; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-X Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-X Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

C. Compliance

1. Compliance Monitoring Process:

a. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

b. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

c. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaints

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be

included. Custom software installed may include scripts developed for local entity functions or other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT

believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.

2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.
3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Note: The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X standards were redlined to the industry-approved version 5 language for ease of reading revisions.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. ~~2.~~ First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives

Description of Current Draft

This draft standard is being posted for an additional ~~initial~~ comment and ballot to ballot the removal of "identify, assess, and correct" language. The draft includes modifications to meet the ~~directives of~~ FERC Order No. 791 directive to remove or modify the "identify, assess, and correct" language from CIP-010.

Anticipated Actions	Anticipated Date
~~First 45-Day Comment Period Opens~~	~~June 2014~~
Additional 45-Day Comment Period ~~(if necessary)~~	~~August~~ September 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	
X	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Configuration Change Management and Vulnerability Assessments

2. Number: CIP-010-~~1~~X

3. Purpose: To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**:

All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-010-~~1~~X:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-010-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-010 ~~-1~~ exists as part of a suite of CIP Standards related to cyber security, which~~. CIP-002-5~~ require~~s~~ the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1~~ and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.~~ This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, . . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~ its documented processes, but ~~they~~ it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability

standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ X Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ X Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~1~~ X Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-~~1~~ X Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-010-~~1~~ X Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-010-~~1~~ X Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

Rationale for Requirement R2:

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ X Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ X Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~1~~ X Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

Rationale for Requirement R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ X Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~1~~ X Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~1~~ X Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment,; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-~~1~~ X Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-~~1~~ X Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

C. Compliance

1. Compliance Monitoring Process:

a. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

b. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

c. Compliance Monitoring and Assessment Processes:

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be

included. Custom software installed may include scripts developed for local entity functions or other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-~~5~~6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-~~5~~ 6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT

believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.

2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.
3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Note: The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X standards were redlined to the industry-approved version 5 language for ease of reading revisions.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives

Description of Current Draft

This draft standard is being posted for an additional comment and ballot to ballot the removal of "identify, assess, and correct" language. The draft includes modifications to meet the FERC Order No. 791 directive to remove or modify the "identify, assess, and correct" language from CIP-011.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period	September 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the information protection requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-011-1. (Order becomes effective on 2/3/14.)	
X	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Information Protection

2. Number: CIP-011-X

3. Purpose: To prevent unauthorized access to BES Cyber System Information by specifying information protection requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-011-X:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:
